Answer. Achievement of annual performance goals is contingent on a number of external factors and our performance plan reflects this. First, achievement is based on anticipated budget. If appropriations differ substantially from these projections, achievement of the plan would be affected. Second, OCE activity involves coordinating information and analyses from a variety of other agencies. OCE staff chair many interagency committees to achieve goals. To the extent that other agencies alter their resource commitments to these activities, plan achievement would be affected. Third, OCE workload depends partially on legislative and government-wide regulatory activity over which OCE has no control. Fluctuations in activity in these areas would alter the distribution of resources across plan objectives. For example, during fiscal year 2000, OCE has expended unexpected resources on rule making activities related to organic agriculture and animal product imports. Fourth, allocation of OCE resources and achievement of the plan will also depend on developments in agricultural markets.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. To prepare, anticipate, and plan for such influences, OCE has acquired and maintained a highly experienced staff to manage activities, plan and initiate response actions, and work closely with the other agencies on which OCE is dependent for support so that OCE has early warning of possible cutbacks in their support. However, if the support provided by other agencies changed, OCE would have to re-allocate resources to continue to provide essential services. OCE has no control over that portion of its responsibilities that are required by legislative and government-wide regulatory activity. OCE's capability to anticipate some market developments enables managers to exercise some internal flexibility in shifting organizational resources and in making the Secretary aware of the likelihood of these developments.

Question. What impact might external factors have on your resource estimates?

Answer. As indicated above, the impact on resource estimates depends on which external factor is affected.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. OCE has not identified any overlapping functions or program duplication.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. OCE's has not identified any overlapping functions or program duplication.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Duplication and overlapping functions, if they exist, should be addressed in GPRA plans by eliminating them or clarifying their purposes.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. The Chief Economist and managers developed an agency strategic plan that facilitated setting long-term goals, prioritizing accomplishments, and scheduling goal implementation. To facilitate decision making, general goals and objectives were developed in the strategic and performance plans which allowed assessment to be made throughout the year on whether the goals were being achieved.

Question. Will this use increase in the future and if so in what ways?

Answer. GPRA is increasingly being used as a planning tool by all OCE managers. Strategic and performance plans have reinforced the importance of paying particular attention to the service provided to all customers and the need to correlate budget, goals, and results. As managers' skills improve in refining strategic and performance plans to reflect their priorities, goals, and progress, they will likely utilize these planning tools.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Current OCE performance measures are sufficiently mature to serve as a means for checking accountability on how efficiently funding has been used and outcomes achieved. With the development of each annual performance plan, OCE managers have added to their skills in developing new measures and refining current indicators. OCE believes that established measures are highly reliable given the process through which they have been developed. This process has been highly iterative in that performance goals and indicators have been examined and re-examined through a series of reviews by OCE staff, managers, USDA's Office of the Chief Financial Officer, other Department organizations, OMB, and the Congress.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. As OCE is assigned new responsibilities, some degree of inexperience is a factor that must be considered. For example, OCE faced an unexpected level of responsibility for coordinating three activities in fiscal year 1999. OCE assumed management of the OEPNU previously located in ERS. OCE has major outreach and internal responsibilities in operating the Global Change Program Office. OCE had responsibility for advancing USDA's policies and principles relating to small farms. This latter assignment followed from the Secretary's decision to combine the tasks of OCE's Director of Sustainable Development with small farms activities. Nonetheless, OCE managers met the performance goals that were set for all three of these expanded OCE areas of responsibility.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. OCE is not requesting any waivers of non-statutory administrative requirements at this time.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. OCE is not requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The primary revision OCE is making in its strategic plan issued on September 30, 1997 is to incorporate OEPNU.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

Question. How are the Agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. They are directly linked. The five functional components of the Agency's budget structure (Pest and Disease Exclusion, Plant and Animal Health Monitoring, Pest and Disease Management, Animal Care, and Scientific and Technical Services) correspond to the five general goals of the APHIS Strategic Plan. In its annual performance plan, APHIS has developed a set of annual performance targets for each goal of its strategic plan. The objectives listed under each goal in the annual performance plan correspond directly to funded pest and disease programs under each functional component of the budget.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. APHIS organized its strategic plan using the structure of our budget as a pattern. The five functional components of the Agency's budget structure (Pest and Disease Exclusion, Plant and Animal Health Monitoring, Pest and Disease Management, Animal Care, and Scientific and Technical Services) correspond to the five general goals of the APHIS Strategic Plan. In its annual performance plan, APHIS has developed a set of annual performance targets for each goal of its strategic plan.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The design of our strategic plan along budget lines eliminated any difficulties in linking performance goals to budget activities.

Question. Does the Agency's Performance Plan link performance measures to its budget?

Answer. Yes. The performance measures are organized by objectives which correspond directly to funded pest and disease programs under each functional component of the budget.

Question. Does each account have performance measures?

Answer. Yes, each account has performance measures. Treasury accounts such as those associated with hazardous waste or buildings and facilities are represented with performance measures for the pest and disease programs, as the funds from those accounts are used to support those programs.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Our performance planning structure was patterned after the structure of the budget. It does not differ from the account and activity structure.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001? *Answer.* APHIS does not plan to propose any changes to its account structure for fiscal year 2001. We do not believe that changes to the account struc-

ture would significantly improve linkage between resource amounts and performance goals.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. APHIS does not plan to propose any changes to the program activities under its current account structure.

Question. How were performance measures chosen?

Answer. Criteria used to choose useful performance measures included how effectively the measure represented APHIS' degree of success in achieving our goals and accomplishing our mission, the level of reliability of the data reported for the measure, how completely we could document the accuracy of the data, and whether the benefits of the data collected outweighed the cost of collection.

Question. How did the Agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. For each proposed performance measure, APHIS determined the cost of collecting the data required. We then compared this cost with the benefits the measure offered towards illustrating our degree of success in achieving our goals and data reliability and validity. In some cases, the most valid and reliable method to measure program performance was too costly, given the level of funding for the program. In those cases, APHIS developed reasonable alternatives that were more acceptable given the amount of resources available.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Data was not available in time for a few of the measures included in our fiscal year 1999 Annual Performance Report. When data was not available, it was noted in the report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"). State the long term (fiscal year 2003) general goal and objective from the Agency Strategic Plan to which the annual goal is linked.

Answer. APHIS managers included, in their Annual Performance Plans and in their first Annual Performance Report, all of the key performance goals that could prove useful to the subcommittee in tracking the program results of our diverse agency. However, if it is useful to narrow down our priorities further, we could make reference to those key measures which APHIS selected for inclusion in USDA's Annual Financial Statement, a document which summarizes the mission of USDA and provides those key measures that the Secretary intends to use to demonstrate effective and efficient program delivery in support of USDA's strategic goals.

The performance goals from the USDA fiscal year 1999 Annual Financial Statements are: (1) under APHIS' Strategic Goal to: "Safeguard U.S. plant and animal resources against introductions of foreign pests and diseases, while meeting international trade obligations;" (a) to minimize the number of fruit fly outbreaks in the U.S. (outcome oriented) and (b) to increase the number and value of agriculture products exported from the U.S. (a measure which is a combination of output, since "Number of sanitary/phytosanitary (SPS) issues resolved" is a target, and outcome, since the significance and value to the U.S. of SPS issues resolved will also be discussed in an accompanying report issued by APHIS; (2) Under APHIS' Strategic Goal to "Effectively manage plant and animal pests and diseases and wildlife damage which pose risks to agriculture, natural resources, or public health;" (a) to increase passenger safety by reducing the risk of aircraft striking wildlife (an outcome oriented goal that will report on the risk reduced at our nation's airports), (b) to eradicate brucellosis (outcome oriented goal), and (c) to minimize the introduction and establishment of foreign weeds in the U.S. (an outcome oriented goal); and (3) under APHIS' Strategic Goal to "Facilitate the development of safe and effective veterinary biologics, biotechnology-derived products, and other scientific methods for the benefit of agricultural producers and consumers and to protect the health of American agriculture," to "Develop useful, appropriate methods" (an output oriented goal).

In addition to those measures in the Financial Statements, a few others from the APHIS Revised fiscal year 2000 and fiscal year 2001 Annual Performance Plans will prove useful in tracking APHIS' progress in achieving its strategic goals 1 and 4, including: (1) under APHIS' Strategic Goal to "Safeguard U.S. Plant and animal resources against introductions of foreign pests and diseases, while meeting international trade obligations," "To minimize the risk of exotic pests and diseases intro-

duced to the U.S.” (an outcome oriented goal); (2) under APHIS’ Strategic Goal to “Effectively manage plant and animal pests and diseases and wildlife damage which pose risks to agriculture, natural resources, or public health.” (a) to eradicate tuberculosis (outcome oriented) and (b) to eradicate pseudorabies (outcome oriented); and (3) under APHIS’ Strategic Goal to “Ensure the humane care and treatment of animals covered under the Animal Welfare Act and the Horse Protection Act,” “To increase the percentage of facilities in compliance” (outcome oriented).

Question. In developing your Annual Performance Plan, what efforts did your Agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. APHIS’ planning and evaluation specialists, and APHIS’ budget analysts worked together to provide developmental and consultative assistance to managers of all APHIS programs to assist them in defining outcome oriented goals and measures.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. APHIS’ budget and policy offices have worked hard to provide guidance to program managers that describes the differences and to develop formats for budget submissions and measurement development that reinforce and encourage both types of measures. APHIS believes that the traditional focus on “outputs” can continue to be relevant and useful in decision making only insofar as various levels of outputs are tracked and communicated in the context of the eventual outcomes and results which are being achieved.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The Plant Protection and Quarantine Program tracks customer satisfaction within the Agricultural Quarantine Inspection program. The program measures the satisfaction level of international air travelers and international travelers on land borders. APHIS’ National Animal Health Monitoring System, (NAHMS), includes a reporting process on the health status of U.S. Livestock and poultry. Producers who participate in these studies and/or receive the results of these studies have traditionally been asked to evaluate whether the information being provided is helpful to them in managing their operations, and this practice will continue, since APHIS has a performance goal to report on the “percentage of surveyed producers using information from NAHMS.” APHIS’ Animal Care program plans to survey animal welfare organizations this year to assess customer satisfaction with the program. APHIS’ Wildlife Services program commissioned the National Agricultural Statistical Service, (NASS), to conduct a survey which could give them a very complete picture of the satisfaction levels of livestock producers who receive direct assistance from the program.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. Program performance as measured by the goals in APHIS’ Annual Performance Plan was a key factor in the development of the fiscal year 2001 budget. For example, the success of the Brucellosis Program as measured by the reduction in the number of infected herds resulted in the decision to request a reduction in funding for that line item in fiscal year 2001.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. APHIS will be able to report the effect of funding level changes on program performance and our ability to achieve our goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the Agency can be properly managed to achieve the desired results?

Answer. Being able to measure and report program performance on a regular basis is a goal for all APHIS programs, but there are varying degrees to which each program has been able to accomplish this goal thus far. Two good examples for the rest of the agency reside in APHIS’ Plant Protection and Quarantine, (PPQ), and in APHIS’ Animal Care programs.

APHIS’ PPQ program measures and reports program performance for their AQI program throughout the year. The AQI Monitoring System measures the amount of pest threat to U.S. agriculture by collecting information on the efforts to monitor various pathways and the commodities entering through them into the U.S. The information is then used to explain and explore the characteristics of the various pathways to assist in managing the risk they present to U.S. agriculture. These data allow a more accurate estimation of approach rates for prohibited agricultural

items and cargo pests arriving at U.S. ports of entry and compliance rates of international travelers, transportation companies, and cargo customers. Approach rate refers to the ratio of quarantine material approaching U.S. borders to the number of international travelers or vehicles approaching U.S. borders.

Animal Care field employees have been creating inspection reports at the conclusion of each inspection of a facility, and data from the reports has been entered into the automated Licensing and Registration Information System, (LARIS). LARIS has recently undergone a complete redesign and upgrade, and now data for fiscal year 2000 will be entered by field employees directly into the electronic database via laptops and modems. Reports are being designed to enable program managers to run summary reports quickly and easily. Reports will even be provided to inspected facilities so that inspectors and regulated entities can catch errors and correct them.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. APHIS seeks to provide access to performance information to all levels of management. There are varying degrees to which each program has been able to accomplish this goal thus far. APHIS' PPQ and Animal Care programs illustrate the progress APHIS has made.

All levels of the agency have access to and use the data and information generated from the AQI monitoring system. Local work locations use the results to verify the risk of various entry pathways and to shift resources to activities that are most effective in managing risks. State and regional offices use the results to assess the relative risks of various entry pathways and locations. At a national level, the information is used to assess risk, redesign regulations and operations, and justify budget requests. In the near future, Animal Care's LARIS information will be available to lower, mid, and upper level managers.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. APHIS is in the process of improving access to the various sources of performance information used throughout the Agency. APHIS' PPQ and Animal Care programs illustrate the progress the Agency has made. Program personnel gain access easily to the data housed in the AQI system. Soon, information from Animal Care's LARIS system will also be easily accessible.

Question. The Government Performance and Results Act requires that your Agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. APHIS has not faced any difficulties in linking dollars to results in a clear and meaningful way. Our goals and objectives are structured to mirror the organization of our budget.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. We do not believe that changes to the budget account and activity structure would significantly improve the linkage between resource amounts and the results of our performance.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your Agency and to this committee than the present structure?

Answer. We do not believe that it is necessary to modify the budget account structure.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We do not believe that it is necessary to modify the budget account structure.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate Agency resources to perform these functions. Could you comment on your Agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better

trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting methods standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all Federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as “Activity-Based Costing”, whereby the full cost is calculated for each of the activities of an Agency. What is the status of your Agency’s implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based costing?

Answer. USDA is in compliance with FASAB’s cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department’s current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The dollars associated with specific Agency performance goals are limited by total available funding which consists of appropriated funds and projected funding from other sources. In the current budget era, APHIS has had to turn more frequently to its partners either at other levels of government, in other agencies, or in private industry to help support its goals. Increases in cooperative agreements, user fees, and other “fee for service” opportunities have helped narrow the gap between diminishing federal funds and true costs to run agency programs, but there are times when the gap still exists.

Opportunity costs are often incurred by the agricultural community as well, and they are not necessarily captured in the dollar amounts reported by APHIS for each performance goal.

APHIS does not have a separate line item for overhead costs. The dollars associated with specific performance goals include overhead costs.

Question. Please identify any significant regulatory reform measures that have been put in place by your Agency in conjunction with the development of the Agency’s performance plan.

Answer. There have been no significant regulatory reform measures put in place by APHIS in conjunction with the development of the Agency’s performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Based on GAO feedback that it was important to identify external factors that might influence program results, APHIS identified relevant external factors in many of its performance goal discussions in the Annual Performance Plan, particularly under the “Means and Strategies” sections of the plan.

Question. If so, what steps have you identified to prepare, anticipate, and plan for such influences?

Answer. Where additional resources could potentially be necessary to mitigate particular external factors, this was also mentioned in the plan.

Question. What impact might external factors have on your resource estimates?

Answer. External factors can have a large influence on resource estimates. For example, in many areas APHIS works toward achieving its goals cooperatively with local, State, and foreign governments. The extent to which these entities participate and contribute funding towards successfully reaching our joint goals has a great deal of influence on APHIS' resource estimates.

Question. Through the development of the Performance Plan, has the Agency identified overlapping functions or program duplication?

Answer. APHIS has not identified overlapping functions or program duplication through the development of the Annual Performance Plan.

Question. If so, does the plan identify the overlap or duplication?

Answer. APHIS has not identified overlapping functions or program duplication through the development of the Annual Performance Plan.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Management challenges are addressed in the Management Initiatives section of APHIS' Annual Performance Plan. We do not address potential duplication and overlapping functions as none were identified in the process of developing the plan.

Question. To what extent has GPRA been used by Agency leadership to guide decision making?

Answer. In meeting the requirements of the GPRA to conduct strategic planning, performance planning, and to report on results, APHIS managers throughout the Agency have been devoting an unprecedented amount of attention and effort toward defining goals and determining the best ways to measure and report on true program outcomes. Agency leaders find themselves with a greater platform of measurement information that they can use for decisionmaking purposes. The Administrator has been able to better support decisions to invest in one area over another based on program results that are desired or program needs to enhance information systems and other infrastructure support that is essential to achieve important goals.

Question. Will this use increase in the future and, if so, in what ways?

Answer. In the near future, the revision of APHIS' strategic plan will give all agency leaders the opportunity to update agency-level priorities and to engage agency employees in helping to identify information needs that will assist them in making more informed program decisions.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. For the past few years, APHIS' performance measures have steadily improved as we travel along the learning curve for the GPRA process. We believe that our measures are useful for decision making. As time passes and we gain experience, we look forward to improving their utility.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Several factors affect the accuracy of resource estimates. They include the level of funding available for developing and improving data measurement systems and the fact that GPRA is relatively new and we are still on the learning curve. For new initiatives and activities within our programs there is always a period of analysis to determine the best way to measure performance and the most effective and cost efficient data gathering method. It also takes time to set realistic baselines. In the early stages of performance measure development for a new initiative, resource estimates may be less accurate.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. APHIS is not requesting any waivers of non-statutory administrative requirements.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability requirements?

Answer. APHIS is not requesting any relaxation of transfer or reprogramming controls in return for specific accountability requirements.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. APHIS intends to revise its strategic plan. The need for revisions is based partly on new issues which are reflected in APHIS' fiscal year 2000/2001 performance plan, and partly on the need to allow newly appointed leaders of various APHIS programs to contribute their thoughts and expertise to the revision of the

strategic direction of the agency. Given that the performance plan is organized by objective and program line items, the strategic plan can re-articulate trends and issues in a more macro/global sense, tying together the past, present, and future in a different format that discusses current cross cutting themes and describes progress the Agency has made since the last strategic plan.

AGRICULTURAL RESEARCH SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The ARS Annual Performance Plan parallels the structure of the ARS Strategic Plan, which was developed to meet the requirements of the Government Performance and Results Act of 1993. In the Annual Performance Plan, the Goals, Objectives, Strategies, and Performance Goals are linked to specific accomplishments that the Agency expects to achieve in fiscal year 2001 with the funds requested. All the activities identified in the Strategic and Performance Plans link directly to the Mission Statement which, in turn, directly reflects the statutory authorities that underpin the Agency's work. A crosswalk is shown for each of the five Goals and for Initiative 2 linking program activities to the budget request. The Annual Performance Report has a parallel structure and highlights significant accomplishments for fiscal year 1999.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. ARS carries out its research through over 1,100 Current Research Information System (CRIS) research projects which are aligned with the 6 Budget objectives, 23 National Programs and the 5 Goals of the Strategic and Performance Plans. The CRIS research projects are the primary level of funding and accountability and provide the linkage essential to crosswalk this information.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. GPRA requires us to anticipate the longer-term outcomes and impacts of our work, which is more difficult in a research environment than it is in many other areas. Several years ago we developed a performance plan based on numerical metrics. We counted the number of scientific papers published in journals, licenses granted, CRADAs, and patent applications. This approach, while fully complying with the letter of GPRA, did not begin to meet the spirit of the law. In fact, providing this numerical data conveyed little meaningful information to Congress or our customers and stakeholders on the significant work of the Agency. In January 1998, ARS requested a waiver from OMB to allow us to use the narrative alternative approach provided for in GPRA. In the last several years, we have structured the Annual Performance Plan around narrative indicators that describe anticipated accomplishments which will, if achieved, demonstrate progress towards the Strategic Plan's goals and objectives.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, the funding resources are identified at the level of the 5 Agency Goals and Initiative 2, which relates to the work of the National Agricultural Library.

Question. Does each account have performance measures?

Answer. No. The budget is presented to Congress in the traditional accounting structure that has been used for many years. The ARS Strategic Plan 1997-2003, the Annual Performance Plan, and the Annual Performance Report are all structured around the five REE-wide General Goals. The Performance Goals are contained in the Strategic Plan and progress is reported in the Annual Performance Report. There is a crosswalk at the General Goal level which is the only linkage between the budget accounts and the performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. There are substantial differences between the ARS Strategic and Performance planning structure, our National Programs and the Program Activity structure contained in the Budget. The budget activity structure is presented on the following areas: Soil, Water, and Air Sciences; Plant Sciences; Animal Sciences; Commodity Conversion and Delivery; Human Nutrition; the Integration of Agricultural Systems, and Agricultural Information and Library Services. The Strategic Plan is outcome oriented and includes the following 5 broad societal Outcomes: An agricultural production system that is highly competitive in the global economy; A safe and secure food and fiber system; A healthy, well nourished population; An ag-

ricultural system which protects natural resources and the environment; Enhanced economic opportunity and quality of life for Americans. In addition, three management initiatives, which includes the National Agricultural Library, are identified in the Strategic Annual Performance Plans.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No, the Agency will continue to present its budget through the Program Activity Structure. This accounting system tracks each project to ensure compliance with appropriations measures and Congressional reports. The CRIS project system provides a linkage to the major planning and financial systems utilized by the Agency.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No, we have no current plans to change the accounting structure.

Question. How were performance measures chosen?

Answer. The Performance Goals used in the Annual Performance Plans and Report are taken directly from the ARS Strategic Plan. The Indicators of Progress for each Performance Goal in the Annual Performance Plans and Report, that accompany the fiscal year 2001 budget, were developed by the National Program Staff. Input was obtained from each of the National Program Leaders who, in consultation with the key Research Leaders and Lead Scientists, identified the performance indicators.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. ARS has various mechanisms in place to retrieve financial and programmatic data on all aspects of its research program. Two years ago we substantially revised the annual CRIS project reporting requirements in part to better support the data needs of GPRA and the National Programs. At the present time, a committee is reviewing the revised format and process to see if it needs further refinement. We do not anticipate that the cost of data collection needed to validate future performance will be much greater than current costs.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Across the five programmatic goals we have identified scores of indicators, that can be tracked and reported by the National Program Staff. Accomplishing these performance indicators will clearly demonstrate progress towards achieving the Goals and Objectives identified in the ARS Strategic Plan. In fact, ARS submitted an Annual Performance Report for fiscal year 1998 in March of 1999, a full year ahead of the statutory requirement. We are still developing some of the performance measures under Initiative 3, Creative Leadership, but we expect to have most of these indicators in place to meet the March 2000 reporting date.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. Measuring performance in research provides some unique challenges that may not exist in other programs. The approach used in the fiscal year 2000 ARS Annual Performance Plans is to identify, under each Performance Goal, intermediate outcomes (indicators) that are tangible and measurable. If ARS achieves all or most of these indicators, it will be a clear demonstration of progress towards meeting the longer-term Strategies, Objectives, and Goals in the Strategic Plan 1997-2002. We would recommend that the subcommittee track the performance goals under the 5 programmatic Goals: Goal I: Through Research and Education, Empower the Agricultural System with Knowledge that Will Improve Competitiveness in Domestic Production, Processing, and Marketing. Goal II: To Ensure an Adequate Food Supply and Improved Detection, Surveillance, Prevention, and Educational Programs for the American Public's Health, Safety and Well-Being. Goal III: A Healthy and Well-Nourished Population Who Have Knowledge, Desire, and Means to Make Health Promoting Choices. Goal IV: To Enhance the Quality of the Environment through Better Understanding of and Building on Agriculture's and Forestry's Complex Links with Soil, Water, Air, and Biotic Resources. Goal V: Empower People and Communities, Through Research-based Information and Education, to Address the Economic and Social Challenges of Our Youth, Families, and Communities.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. Several years ago ARS developed its Annual Performance Plan around "output" measures such as the number of scientific papers published in peer review

journals, the number of patent applications pending, and so forth. Based in large part on the consensus that this use of numeric metrics told the reader very little about the substance of the Agency's research accomplishments, OMB granted a waiver and allowed ARS to use the alternative narrative approach provided in the statute. Except for a few Performance Goals in the areas of technology transfer and creative management, all of the other General Goals, Objectives, Strategies, and Performance Goals measure outcomes. These outcomes are tangible accomplishments that demonstrate progress to achieving the General Goals and Objectives.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The five General Goals in the ARS Strategic Plan can be viewed in both the long-term or short-term. In addition, ARS incorporated the "Purposes of Agricultural Research, Extension, and Education" from section 801 of the Federal Agriculture Improvement and Reform Act of 1996 into its Strategic Plan as Objectives. Below the Objectives are a number of Strategies and Performance Goals. The fiscal year 2000–2001 Annual Performance Plans contain the same organizing matrix (General Goals, Objectives, Strategies, and Performance Goals) as does the ARS Strategic Plan. The fiscal year 2001 budget request is linked by crosswalks to the General Goals of the Strategic Plan. The Annual Performance Plans, that will soon be transmitted to Congress, contain indicators (anticipated accomplishments) for fiscal year 2000–2001 that can be achieved with base funding. The fiscal year 2001 plan also identifies activities that will be initiated or expanded with the new funds requested in the President's budget.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Because of the unique nature of research, ARS uses the narrative approach provided under a waiver in GPRA to measure and report the outcomes of its work. One or more narrative indicators of progress is developed for each performance goal. Successfully achieving these indicators demonstrates progress towards achieving each goal. Specifically, ARS identified approximately 240 performance indicators for fiscal year 2000 and 275 performance indicators for fiscal year 2001 in the Annual Performance Plans. In the fiscal year 1999 Annual Performance Report, ARS reported progress against approximately 200 performance indicators under 75 performance goals. As we have gained experience in implementing the GPRA performance and reporting processes, we have become better able to identify meaningful performance goals and indicators that reflect the special needs of a research agency.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, the Agency's senior managers are fully aware of the difference in output and outcome. This information has been delivered through a number of meetings, briefings, and written instructions. The message that the Agency's focus is on tangible outcomes and accomplishments that have a real benefit to our customers and stakeholders is repeated at all appropriate forums.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. ARS has a long history of positive interaction with its customers and stakeholders but a formal process of more systematically measuring customer satisfaction is still evolving. Some components, such as the National Agricultural Library and the National Arboretum, periodically survey their users and visitors to measure and improve the quality of their services and general satisfaction. The Administrative and Financial Management units regularly measure customer satisfaction from the agencies and components they support. The National Programs Staff surveys the participants of National Program planning workshops in order to measure the effectiveness of that process in gaining input from our customers and stakeholders.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The fiscal year 2000–2001 Annual Performance Plans and the fiscal year 2001 budget were developed on parallel tracks with crosswalks showing the linkages.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes. The version of the fiscal year 2000–2001 Annual Performance Plans currently before the subcommittee reflects the President's budget proposal for fiscal year 2001. Once the appropriations process is completed, ARS will revise the Annual

Performance Plans to show the level of program performance that can be expected with the actual level of resources that are appropriated.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. ARS, in part in response to GPRA, revised the type and amount of data which it requests from each research unit. This enhanced data collection has helped the National Program Staff and the Area Offices to better monitor and manage the research program. We are currently reviewing the reporting process. To avoid an undue burden on the research leaders, we plan to collect most of the data on an annual basis, rather than at multiple times during the year.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Almost all of the reporting information from the ARS research programs is collected electronically on an annual basis by the Agency's Research Management Information System. That information is widely available at all levels in ARS. The material is reviewed and summarized by the National Program Staff for inclusion in the Annual Performance Plans and Reports, the National Program Annual Reports, the Explanatory Notes, and for other purposes as needed. Much of this information is also available to the general public on the ARS homepage (www.ars.usda.gov).

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes, but data collection for GPRA reporting using the alternative narrative approach is more difficult than it would be if we were using numerical metrics. As we have gained experience with GPRA and revised the CRIS project reporting format and process we have made the task easier.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. This Agency will not have any difficulty linking dollars to results. As stated, ARS CRIS research projects underpin budget and program activities and the goals/outcomes as established under GPRA. The over 1,100 research projects are the bases for allocating and accounting for the Agency's research funds. This is the principal level of fiscal accountability in this Agency and this information can be crosswalked or translated into the other systems of programmatic management and accountability.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No. The existing budget account structure does not need to be modified.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. The Agency's CRIS projects are the accountability unit and aggregate and crosswalk to the major program, budget, management and review systems.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. There is no need to modify the existing accountability systems for budget activities.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial

Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation.

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the programs, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. A basic tenet of ARS' financial management and budget execution process is that the specific research project or activity capture both direct and indirect costs attributable to the research. Indirect costs, such as utilities, security, facility maintenance, administrative, etc., are allocated to the various projects based on approved cost accounting standards. The summary costs for ARS' goals and objectives therefore include a share of the distributed indirect costs.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. ARS research may be used as the basis for regulations issued by other agencies but the Agency does not issue regulations.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Annual Performance Plan does not refer to external factors but the working version of the ARS Strategic Plan 1997–2002, which is available as a publication and on the ARS Homepage (ars.usda.gov), contains the following discussion of the external factors that impact on ARS:

Consumer, Socio-Economic, and Policy Trends.—The abundance and affordability of the American food supply is greatly due to U.S. agricultural research. The Nation's ability to sustain this plentiful and inexpensive food supply continues to be paramount. But in recent years, consumer and producer attention has expanded somewhat to other areas of concern such as food safety and quality, the relationship of agriculture and the environment, the profitability of the agricultural enterprise, and the impact of government regulations, land use restrictions, and economic options that diminish the supply of farm and grazing land. The long-term sustainability of the Nation's food and fiber production systems will be determined not only by the continued profitability of farming and ranching, but also by how these production systems affect the environment. The capacity of U.S. agriculture to adapt to environmental changes is also a concern, as are the availability and quality of natural resources. Another key environmental issue is how human activities affect weather patterns, atmospheric composition, and soil and water quality and produc-

tivity. Global population increases, demographic changes, and economic growth will substantially increase the demand for agricultural products and lead to the development of new markets. At the same time, increased agricultural efficiency in other countries will force U.S. agriculture to be more competitive.

Funding.—The ability of ARS to respond to the many and diverse needs of producers and consumers is determined by annual appropriations.

1996 Farm Bill and the Pending Revision of the Research Title.—The 1996 Farm Bill, the Federal Agriculture Improvement and Reform Act, set a new direction for American agriculture by beginning the process of phasing out farm subsidy payments based on production levels and introducing free market disciplines. The effect of this legislation will be to heighten the importance of agricultural research as one form of a safety net beneath producers. Research to maintain and improve productivity; to detect, control, and eradicate diseases and pests (insects, weeds, etc.); and to promptly address nontariff trade barriers, especially sanitary and phytosanitary conditions will take on even greater importance in a global market. The 1996 Farm Bill also updated and expanded the “Purposes of Agricultural Research” which were first enacted in 1990. As described elsewhere in these responses, ARS incorporated the Purposes into this strategic plan adopting them as the agency’s objectives. Congressional reauthorization of the Research Title will have an impact on ARS, but we are still too early in the legislative process to anticipate what that impact will be.

Competition.—The Department of Labor projects an increase of 19 percent in the size of the general workforce in the next decade, which is slightly lower than the rate of growth for the preceding decade. The labor market during this period is also expected to be highly competitive for many occupations that require an advanced education, including scientists, engineers, economists, and computer specialists. The high earning potential of professions, such as law and medicine, will continue to make a career in science less attractive to many young men and women who have the creative intelligence needed for professional success in agricultural research. Consequently, a major emphasis on recruitment, student employment, upward mobility, and training programs will be needed to attract and retain a quality workforce. The trend toward increasing workforce diversity is also expected to continue, and opportunities for encouraging women and minorities into careers in science, engineering, and economics will need to be given a high priority.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. External factors were not explicitly addressed in the fiscal year 2000–2001 ARS Annual Performance Plans. However, an in-depth examination of the major external factors affecting American agriculture was part of the Agency’s strategic planning process and the process for developing the new National Programs. The five Vision Conferences are a specific example of how ARS identified and considered external factors in its strategic and programmatic planning processes. The visioning process consisted of a pilot conference in January 1995, followed by five regional conferences held in June and July of 1995. The conferences brought together over 400 participants, representing a broad cross section of the Agency’s customers, stakeholders, and partners, who worked in more than 30 breakout groups to provide input that was used to develop the ARS Strategic Plan 1997–2002. ARS is continuing to actively engage a wide-range of customers, stakeholders, and partners in developing its new National Programs. All 1,100+ CRIS projects have been aggregated into 23 National Programs. One or more National Program workshops, involving customers, stakeholders and partners has been or will be held for each program to ensure the relevancy of the research agenda in each National Program.

Question. What impact might external factors have on your resource estimates?

Answer. The most important and direct external factor identified in the ARS Strategic Plan is the level of Congressional support for the Agency’s research activities. Other key external factors include the heightened concern about the impact of agriculture on the environment, concerns about food safety, and the impact of global population growth and economic changes on American agriculture and the research priorities needed to sustain it. All of these concerns have been taken into consideration in developing the research agendas for the National Programs. In addition, changes in the American workforce may also impact ARS’ ability to attract and retain the wide range of skilled individuals needed to meet the agricultural research needs of the next century.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No. In managing the ARS research program, the National Program Staff seeks to avoid unnecessary duplication while ensuring coordination between research units and locations. Agricultural research must be conducted at different lo-

cations to account for climatic, regional, and geographic variations as well as different combinations of pests, diseases, and agricultural products, each with specialized problems calling for unique research approaches and solutions. The development and implementation of the new National Program structure have further strengthened the multi-disciplinary, multi-location focus of ARS research.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. In developing the Annual Performance Plan we did not find any areas of program duplication.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. When the Research, Education, and Economics (REE) Agencies met with key Congressional Staff members during the consultation process we came away with the strong impression that our strategic plans should focus primarily on programmatic issues. In the REE mission area, ARS' Administrative and Financial Management (AFM) component provides support to all four REE Agencies and to the Offices of the Under Secretary. AFM has developed its own internal strategic plan, established performance measures, and it regularly measures customer satisfaction. We are not aware of specific issues of duplication that would need to be addressed in the ARS Strategic Plan.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. In response to GPRA, the ARS senior leadership decided to make a number of major changes in the way we manage the Agency's research program. The over 1,100 CRIS research projects were aggregated into 23 National Programs which are focused on solving high priority national problems confronting American agriculture. Reflecting the influence of GPRA, the National Programs are designed to have a strong and on-going interaction with their customers and stakeholders. In addition, the National Program structure focuses the research units on the ultimate outcomes or impacts of their work. Through the mechanism of the Annual Performance Plans and Reports ARS projects future accomplishments for the purpose of establishing programmatic accountability.

Question. Will this use increase in the future and if so in what ways?

Answer. Yes, as the implementation of the National Programs continues, the GPRA principles will become more firmly established within the Agency's culture.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. In our working version of our Strategic Plan we discuss the difficulty of predicting the ultimate outcome of research and the near impossibility of applying numerical measures to research, especially basic research. Having said that, we are confident that the use of a large number of tangible intermediate outcomes (indicators) will enable the subcommittee to determine whether ARS is making reasonable progress towards reaching the goals and objectives identified in the Strategic and Performance Plans.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The great unpredictability of research, particularly its unanticipated benefits, makes it extremely difficult for scientists to formally offer predictions for fear they will engender unrealistic expectations. Predicting what problems will need to be addressed, how to reasonably measure on-going research, how best to express "future" research accomplishments, and how to accurately align resources to produce out year research results are all areas where we lack experience. As we work our way through several planning and reporting cycles, we will gain the experience we need to more meaningfully adapt GPRA to the ARS research environment.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No, we have no plans to ask for such waivers at this time.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, we have no current plans to do so.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. We did not identify issues in developing the Annual Performance Plans for fiscal year 2000–2001 that would require substantive revisions in the Agency's Strategic Plan. GPRA, however, requires a review and revision of the Strategic Plan this year. Since the Strategic Plan 1997–2002 was developed, ARS has substantially revised the way we manage our research program. ARS, in reviewing its Strategic

Plan, is planning to reflect its new National Program structure in the revised plan and will also consider any revisions in the REE mission area 5-year strategic plan.

DEPARTMENTAL ADMINISTRATION

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The Departmental Administration (DA) performance goals directly reflect the agency mission and strategic goals and objectives. Budget requests are developed and reviewed in the same structure as the goals and objectives and each activity justified in the Budget is identified with a specific performance goal.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. During the budget formulation process, DA managers are asked to identify how their budget proposals would contribute to the accomplishment of performance objectives in each area. The budget justifications published for the Congress identify specifically what goal and objective is supported by each budget request. Because the organization, performance goals and the budget material are aligned, we did not encounter any difficulty in tying our budget request to our performance goals.

We have tried to identify key performance indicators in each of the major functional areas and link them to the resources used. Although "outcomes" such as percent yearly increase in contract set-asides for small and disadvantaged business can easily be seen as related to the level of program effort in the small business program, other measures such as the reduction in utility use is harder to relate to specific program activities.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. DA Staff Offices carry out many varied activities, therefore the appropriations each have several performance measures. The Performance Plan shows resources being applied to achieve goals and measures related to each account.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification? Do you plan to propose any changes to your account structure for fiscal year 2001? Will you propose any changes to the program activities described under that account structure?

Answer. The DA performance planning structure is the same as the organizational and budget justification structure. For fiscal year 2001, we have proposed no major changes either to the performance planning or major activity structure. We have made some minor organizational changes to enhance operational performance in a few areas.

Question. How were performance measures chosen? How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data? Does your plan include performance measures for which reliable data are not likely to be available in time for your first Performance Report in March 2000?

Answer. Our performance measures were chosen as the best quantifiable measures of the "outcomes" in each of our major functional areas. Where "outcome" data was unavailable or not quantifiable, reliable output data was used. We found that reliable data were available in time for the first Performance Report. In all cases, the collection of accomplishment data was achieved well within the normal cost of managing the programs.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"). State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. Because DA is composed of so many varied responsibilities, it would be difficult to select a few performance measures to track the overall program result. In the most basic terms, our success depends upon our being able to provide the USDA headquarters and the program agencies with adequate work space and services for them to carry out their program responsibilities.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Measures of “outcome” were used in our performance indicators wherever possible. However, one of the most important goals, that all USDA employees and customers are treated fairly and equitably with dignity and respect, cannot be measured empirically. In cases where outcome measures are not possible, the measures of output such as “backlog of complaints” and “employees trained” are still very valuable. We have used the best measures we can to ensure that the goals and objectives are vigorously pursued and that the managers are held accountable.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. During the strategic planning process, the nature of “outcome” and “output” measures was rigorously examined. I believe it is well understood by managers and key personnel at all levels of the organization.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers?

Answer. At the present time, the only measure related to customer satisfaction used in our performance planning process is the number of buildings and facility complaints. Customer surveys, for both internal and external customers, are being considered in certain areas as a program management tool.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget? If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Consideration of the performance goals was an important part of the budget formulation process. Budget proposals such as Alternative Dispute Resolution were a direct result of our seeking ways to meet our objectives in the civil rights program to reduce formal complaints and decrease the time to settle complaints. Many of the performance goals respond directly to changes in the Budget. For example, objectives like reducing customer building customer complaints, reduced use of utilities and rental office space depend solely on our ability to obtain funding for the Agricultural South Building Renovation. However, making specific quantifiable projections of performance indicators would be a challenge.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results? If so, who has access to the information—senior management only, or mid- and lower-level program managers, too? Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Data on most DA performance indicators is available on an on-going basis with little technical difficulty in capturing the data. Managers at all levels have access to the information. The data is valuable for program management except in cases where the data does not present a regular trend. For example, where the performance measure is the number of personnel trained, the schedule of training classes may not be scheduled evenly throughout the period.

Question. The Government Performance and Results Act requires that your agency’s Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Have you faced such difficulty? Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure? How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. The performance objectives and indicators fit well within the organizational and budget structure of DA. No major changes are needed at this time.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency’s cost accounting expertise and plans to link GPRA to the budget process?

Answer. Because DA includes so many varied activities, cost comparisons between programs may not be very meaningful. For example, reducing the average time for the resolution of a civil rights case by one month might cost \$1,000. It is difficult to compare the value of this accomplishment with the installation of a communication capability to provide security information which might cost the same amount.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all Federal agencies are required to have a system of Managerial

Cost Accounting. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this Committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improved data for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing including overhead costs.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. DA expenses would be more accurately associated with the overhead costs of the program agencies.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. Yes, subject to the limitations explained above.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Under the current system, the cost of office space is not distributed to each performance goal in the Annual Performance Plan. Similarly, There are certain accrued leave costs which are not identified to each organization separately. The Chief Financial Officer conducts an analysis each year to address some of these costs.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's Performance Plan.

Answer. The means and strategies for accomplishment of DA's performance goals did not involve any major regulatory reforms.

Question. Does your fiscal year 2000 Performance Plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Virtually all the performance goals in DA require adequate resources for achievement. This is particularly true of the objectives in space utilization, safety and renovation of the headquarters work space. The 10-year Agriculture South Building renovation project was approved by Congress in 1995. Yet, funding for the project has been inconsistent and the work may be suspended later this year.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. We have taken every opportunity to explain the relationship between the continued renovation of the Agriculture and our goals and objectives for safety and economy and the relationship to a productive USDA workforce. Funds to get the project back on track are included in the President's budget. We are hopeful that the project will be continued to completion.

Question. What impact might external factors have on your resource estimates?

Answer. As the renovation project is delayed, inflation in the construction industry can be expected to increase the eventual cost. Also, the requirement to absorb the mandatory pay cost increases erodes the organization's capability to fully complete the performance objectives.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. We have not identified any overlapping functions, but many of our Staff Offices have responsibilities under the same Strategic Goals. For example, the Office of Civil Rights and the Conflict Prevention and Resolution Center have joint responsibility for the Alternative Dispute Resolution Program.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. This has not been a problem in DA.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Duplication and overlap should be addressed before an Annual Performance Plan is put into effect. In DA, we have made some minor organizational changes and transferred personnel to avoid such situations. The GPRA plans should help overcome management challenges by clearly delineating responsibilities and identifying resources available to achieve goals and objectives in each area.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. To be valuable in managing agency responsibilities, the key elements of the organizations Strategic Plan and the Annual Performance Plan must be a factor in operating decisions made every day. Shortly after being appointed to this post, I held a workshop with my senior managers and key personnel and addressed this operating philosophy. To ensure that the performance objectives are meaningful in terms of the decisions managers face every day, I am reviewing the DA Strategic Plan. I expect to establish goals and objectives which will clearly guide my managers in making their operational decisions.

Question. Will this use increase in the future and if so in what ways?

Answer. Based on my philosophy concerning the role of performance goals and objectives in day to day management of operations, I feel certain that the use GPRA will increase in the future.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. A blanket statement is very hard to make in this case. My experience has been that low performance against a program goal sometimes means more resources are needed in that area and in other cases it means that the activity needs to be de-emphasized.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. We are seeking no such changes at this time.

Question. Based on your fiscal year 2000 Performance Plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. As discussed above, I am in the process of examining the DA Strategic Plan. I am factoring in the experience my managers have had in operating under GPRA for a few years. I am looking at the goals, objectives, and performance factors which are measurable and will be useful and in guiding day-to-day operations.

OFFICE OF THE CHIEF INFORMATION OFFICER

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The performance goals for the Office of the Chief Information Officer (OCIO) measures the progress of activities that directly support the mission, strategic goals and program activities as described in the Agency budget request.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The Program Managers developed their budget requests as well as the performance measures to support the performance goals. Program Managers utilize the following procedure to link performance goals to budget activities: prepare action plan, identify major milestones, determine strategy to meet milestones, identify performance measures, determine budget requirements necessary to meet milestones and performance measure, compare planned versus actual performance to validate budget request and adjust action plan and budget based on outcome of previous step.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The difficulty arises when funds have not been appropriated for programs that are identified in the agency Strategic Plan. In addition, acquiring and maintaining staff expertise in the areas needed to perform program activities is become an ongoing issue.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. During the fiscal year 2001 budget development process, OCIO staff made certain that all increases were aligned with the Strategic Plan and the Annual Performance Plan.

Question. Does each account have performance measures?

Answer. OCIO has only one account and the performance measures support this account.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The OCIO planning structure does not differ from the account and activity structure.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. There are no plans to propose any changes to this structure.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. There are no plans to propose any changes to the program activities under the account structure.

Question. How were performance measures chosen?

Answer. The performance measures were developed to identify the key component for determining if the program was successfully meeting the goal. For example, the need for validating and verifying data for the Y2K effort and measuring the progress of Service Center Initiatives (SCI) and implementation of the capital planning and investment control process were all deemed essential to USDA mission areas.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The agency determined that the mission critical nature of both the Y2K initiative and SCI justified any costs associated with performing reliable and meaningful independent validation and verifications for these programs.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. The performance data was verified through the independent validation and verification of the SCI and Y2K programs. Several of the performance measures from the fiscal year 1999 Annual Performance Report were modified for fiscal year 2000 in order to more accurately describe the activity. The performance measures for the new cyber-security initiative were modified and will be updated again as the Cyber-Security Program grows.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. OCIO has established several performance goals based on three strategic goals. The key performance goals OCIO recommends this subcommittee track based on the fiscal year 2000 Annual Performance plan are: Establish USDA policy on IT management using the Capital Planning and Investment Control Methodology; Develop and Implement USDA architecture; Infuse government and electronic data interchange technologies into business processes where applicable; Ensure that the Service Center technology improvements are driven by business needs and support re-engineered business processes; Establish a Central Cyber Security Office; Establish a department-level Risk Management Program and develop a USDA Enterprise Network. Each of these goals will be measured to track program results and will be available to the committee for review.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. OCIO has identified three goals: Ensure decisions regarding the selection and deployment of information technology are based on USDA needs (outcome measure); Develop Department-wide information and technical infrastructures that will improve service delivery through more effective information systems and data management (outcome measure) and; Be a leading innovative information technology services organization, experienced in providing quality and cost-effective services for centralized and distributed computing, and applications support (output measure).

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The following describes the key performance goals and their linkage to the agency general goals. (1) Establish USDA policy on IT management using the Capital Planning and Investment Control Methodology; Develop and Implement USDA architecture—Goal 1; (2) Infuse government and electronic data interchange technologies into business processes where applicable—Goal 1; (3) Ensure that the

Service Center technology improvements are driven by business needs and support re-engineered business processes—Goal 1; (4) Establish a Central Cyber Security Office—Goal 2; (5) Establish a department-level Risk Management Program—Goal 2 and; (6) Develop a USDA Enterprise Network—Goal 2.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. OCIO made a conscious effort to develop a minimum number of solid performance measures that effectively measure program outcomes. This minimized data collection costs when verifying the results. OCIO senior management reviewed these goals to ensure the plan includes a significant number of outcome measures.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. OCIO program managers do have an understanding of the differences between goals that measure output and those that measure outcome.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Customer satisfaction is measured differently for the Working Capital Fund OCIO cost centers the National Information Technology Center (NITC) and the Telecommunications Services Office (TSO) and the OCIO appropriated programs. Both NITC and TSO meet regularly with the customers to review performance. There are also service level agreements between these Working Capital Fund (WCF) activities and customers to define an acceptable level of service. The appropriated activities also meet regularly with their customers to discuss how the programs should be implemented. As far as internal customers, OCIO does measure the satisfaction of its employees directly in its plans and reports by gauging their level of morale and monitoring complaints.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. OCIO goals and performance measures were used as part of the basis for planning the fiscal year 2001 budget. The performance measures were reviewed to make sure that we are applying the most effective measure for monitoring performance. The cost of these measures was also reviewed. As the fiscal year 2001 budget was developed, program managers were required to verify that their performance measures aligned with the Strategic Plan.

Question. If a proposed budget number is changed, up or down, by this committee will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, we would be able to inform you of the impact of such changes on program performance in meeting our goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis so that the agency can be properly managed to achieve the desired results?

Answer. OCIO does have the technological capability to measure and report program performance throughout the year.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Information concerning performance is available to all managers.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. The USDA information technology capital planning and investment control (CPIC) process continues to expand utilization of the Information Technology Investment Portfolio System (ITIPS) a web-based tool that facilitates the data collection and analysis necessary track USDA IT projects throughout the selection, control, and evaluation phases of the CPIC process. Information from this application is readily available.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. No, we have not faced any such difficulty. OCIO maintains only one account for appropriated activity. The WCF accounts are closely monitored by the Working Capital Fund Executive Board to assure performance meets the expected outcome.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. There is currently no need to modify the budget account structure for either the appropriated or WCF accounts.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. There is currently no need to modify the budget account structure for either the appropriated or WCF accounts.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. There is currently no need to modify the budget account structure for either the appropriated or WCF accounts.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, the additional fiscal year 2001 resources and a better-trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfounded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected out activities. OCIO is scheduled to start using the USDA Foundation Financial Information System (FFIS) on October 1, 2001. At that time, OCIO should meet all requirements for Managerial Cost Accounting.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed. OCIO is scheduled to start using the USDA Foundation Financial Information System (FFIS) on October 1, 2001. At that time, OCIO should meet all requirements for Managerial Cost Accounting. Our WCF accounts already show depreciation. Appropriated accounts do not generally depreciate capital equipment.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization. OCIO is scheduled to start using the USDA Foundation Financial Information System (FFIS) on October 1, 2001. At that time, OCIO should meet all requirements for Managerial Cost Accounting.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. OCIO already allocates overhead costs to its goals in its Annual Performance Plans.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. There are no regulatory reform measures that have been put in place in conjunction with the development of the OCIO performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. External factors were not identified in either the OCIO Annual Performance Plan or the Strategic Plan as having an impact on achieving the goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. External factors were not identified in either the OCIO Annual Performance Plan or the Strategic Plan as having an impact on achieving the goals.

Question. What impact might external factors have on your resource estimates?

Answer. External factors were not identified in either the OCIO Annual Performance Plan or the Strategic Plan as having an impact on achieving the goals.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No overlapping or duplicated functions have been identified as a result of the development of the OCIO Annual Performance Plan.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. No overlapping or duplicated functions have been identified as a result of the development of the OCIO Annual Performance Plan.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Agencies can indeed use GPRA plans to identify such issues, particularly through management initiatives. OCIO has two management initiatives related to professional development of its employees. However, currently OCIO deals with issues of duplication and overlapping functions through other channels.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. OCIO leadership is committed to the principles of GPRA. OCIO has sponsored several workshops to discuss strategic planning. These sessions have also been used to review the status of our goals and if necessary, revise our strategy for accomplishing these goals.

Question. Will this use increase in the future and if so in what ways?

Answer. OCIO managers have been full participants in the development of our goals and performance measures, and they will carry their understanding of these principles forward as we begin the process of developing the 2002 appropriated budget.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Our performance measures are in their adolescence, as we gain more experience with each planning and reporting cycle they will mature and become more reliable.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The highest priorities in OCIO are based on a rapidly changing technology. Therefore, OCIO must maintain a position of flexibility in order to meet these highly technical challenges. The difficulty in transferring this flexibility to performance measures is demonstrated in the OCIO Annual Performance Plan for the past few years. As cyber security vulnerabilities have increased with the growth of the Internet, performance measures must be continuously revised to accurately identify outcomes for this program.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. OCIO will not be requesting any waivers of non-statutory administrative requirements.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. OCIO will not be requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. Yes, the OCIO Strategic Plan needs to be revised to reflect changes in technology and changes in the priorities within the organization. OCIO is now in the process of making these adjustments.

HAZARDOUS MATERIALS MANAGEMENT PROGRAM

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. Annual performance goals and program activities are linked to the Hazardous Materials Management Program (HMMP) mission and strategic goals by assigning targets to measure the progress of activities conducted pursuant to the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the Resource Conservation and Recovery Act (RCRA). It is the statutory requirements within these and other acts that form the basis for the HMMP mission.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The Hazardous Waste Management Appropriation (HWMA) was established in 1988 to provide targeted funding for priority hazardous materials cleanup projects. In the fiscal year 2001 appropriations language, the account name will change to the Hazardous Materials Management Appropriation to more accurately reflect its purpose and scope. The Hazardous Materials Management Group (HMMG) recommends policies regarding management and cleanup, provides technical assistance and oversight, and prepares consolidated HMMA budget requests, annual performance plans, accomplishments reports, and annual program performance reports, using data submitted by USDA agencies.

Annually, USDA agencies prepare prioritized funding requests for planning-year HMMP activities, revise their proposed programs of work at the start of the current fiscal year based on factors that include the availability of appropriated funds, and report HMMP accomplishments using a spreadsheet-based system developed by HMMG. Key reporting parameters include specific project activities requiring funding, performance targets for work to be undertaken, project priority, status, and cost data. All activities must be identified as supporting one of the allowable program activities shown in the table of codes for project activities provided.

[The information follows:]

CODES FOR PROJECT ACTIVITIES, BY INDICATOR TYPE AND GROUP

Indicator	Indicator Group	Activity Code	Program	OBPA Crosscut Category	GPRA Goal	P, M, or I ¹	Activity Description/Summary
Site Identification, Investigation, and Cleanup Planning.	1	
	1	3016	RCRC ...	Compliance	1	P	RCRA section 3016 inventory.
	1	STID	SFND ...	Other	1	P	CERCLA site identification—40 CFR 300.405.
	1	PA	SFND ...	Compliance	1	P	CERCLA Preliminary Assessment (by NCP—40 CFR 300.410(b) for removal PA or 40 CFR 300.420.420(b) for remedial PA, and EPA guidance).
	1	SI	SFND ...	Compliance	1	P	CERCLA Site Inspection (all types, by NCP—40 CFR 300.410(d) for removal SI or 40 CFR 300.420.420(c) for remedial SI and EPA guidance).
	1	PASI	SFND ...	Compliance	1	P	Combined category that includes both PA and SI.
	1	EECA ...	SFND ...	Cleanup	1	P	Engineering evaluation/cost analysis (i.e., for non-time-critical removal)—40 CFR 300.415(b)(4)—may include National Argonne Lab's Expedited Site Characterization when done IAW NCP.
	1	RIFS	SFND ...	Cleanup	1	P	Remedial investigation/feasibility study—40 CFR 300.430.
	1	RMVD ..	SFND ...	Cleanup	1	P	Removal design—40 CFR 300.415.
	1	REMD ..	SFND ...	Cleanup	1	P	Remedial design—40 CFR 300.435.
	1	CESA ...	SFND ...	Other	1	P	CERCLA Section 120(h) Property Assessment, "due diligence".
	1	BRWP ..	SFND ...	Other	1	P	Brownfields redevelopment investigation/planning.
	1	RPLN ...	RCRD ...	Cleanup	1	P	RCRA subtitle C or D planning (e.g., closure plan, corrective action plan).
	1	RISK ...	PGMT ...	Compliance	1	P	Risk assessment (ecological or human health) for CERCLA or RCRA compliance.
	1	UPLN ...	RCRI	Cleanup	1	P	RCRA subtitle I planning (e.g., plans for UST removal, UST cleanups).
	1	CHAR ...	SFND ...	Other	1	P	Other site characterization/investigation (i.e., not PA, SI, ESA, or by NCP)—may include Argonne National Lab's Expedited Site Characterization.
Cleanup (Including UST)	2	

CODES FOR PROJECT ACTIVITIES, BY INDICATOR TYPE AND GROUP—Continued

Indicator	Indicator Group	Activity Code	Program	OBPA Crosscut Category	GPRA Goal	P, M, or I ¹	Activity Description/Summary
	2	USTC ...	RCRI	Cleanup	1	I	UST removals and cleanup of contamination from releases—40 CFR 280.
	2	RMVA ...	SFND ...	Cleanup	1	I	CERCLA removal action—40 CFR 300.415, 300.820.

 RCRI—RCRA Subtitle I, UST RD—Rural Development SFND—Superfund, CERCLA.

Each allowable activity is explicitly linked to a specific performance goal. Regulatory references are provided to further ensure that budget requests support HMM's performance goals. By requiring that all reported data be linked to a standard list of program activities defined in applicable regulations (e.g., the National Contingency Plan for CERCLA preliminary assessments, site inspections, and response actions), correlation is high between budget activities and performance goals.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The current spreadsheet-based system used to monitor program activities was implemented at the end of fiscal year 1997 to improve data consistency and accessibility to management. It has also made it easier to link budget activities to performance targets. Difficulties encountered in implementing the new system were largely the result of affected agencies using different information system platforms and software and the variability in system users' proficiency. Use of commercially available software has helped ease the problem of quality data acquisition and processing. An unresolved difficulty is that of linking specific project activities to budget object data on a project-by-project basis. A work group was recently formed to address this issue.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, the HMMP budget is built up from prioritized activities that are explicitly linked to specific performance goals and measures.

Question. Does each account have performance measures?

Answer. Yes, HMMP appropriated funds are allocated and distributed to several USDA agencies who draw from the same list of performance measures in requesting funds and reporting accomplishments.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure is based upon compliance with two statutes, CERCLA and RCRA, whereas the account and activity structure in the budget justification is a single line item. Two performance goals are associated with the single line item for the HMMA. About 90–95 percent of the HMMP budget supports investigation and cleanup under CERCLA of past contamination on lands and facilities under USDA jurisdiction, custody, and control, plus leaking underground storage tank cleanup under RCRA. The remaining 5–10 percent of the budget is for other RCRA compliance.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. HMMG does not plan to propose any changes to the account structure for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No changes are proposed.

Question. How were performance measures chosen?

Answer. Performance measures were selected to provide the accomplishment information the House Agriculture Appropriations Committee requested in relation to compliance with CERCLA and RCRA.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The spreadsheet-based reporting system was developed to meet data needs at minimal cost. It has been designed to improve data reliability as well as program management. The performance data needed is a measure of progress toward meeting the goals of USDA's cleanup program, namely completing 150 cleanups by 2002 and the entire cleanup program by 2045.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. The plan does not include performance measures for which reliable data will not be available in time for the first performance report in March 2000.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The performance measures recommended for tracking program results are those appearing under Goal 1 in HMMP's Annual Performance Plan for fiscal year 2001. Specifically, these are:

- number of sites assessed/characterized on need for cleanup,
- number of cleanup plans completed,
- number of cleanups completed,

- number of inactive and abandoned mine cleanups completed,
- number of agreements reached with potentially responsible parties (PRPs), and
- estimated value of cleanup/restoration work performed by PRPs (\$millions).

Question. For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

Answer. All are output measures in support of the larger desired outcome of restored facilities, lands, and watersheds. Cleaning up contamination is necessary for attaining the larger outcome, which is best addressed in the performance measures of the individual agencies receiving HMMP funds. For example, the cleanup of inactive and abandoned mines in the HMMP is an integral part of Forest Service activities under USDA Goal 3 and the Clean Water Action Plan.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. Goal #1: Improve the quality of the work environment for all employees, improve regulatory compliance and environmental awareness, and improve and restore facilities and lands under USDA stewardship, seeking compensation from those responsible for the contamination. Objective #1–1: Restoration of lands and facilities contaminated by hazardous substances, seeking compensation from those who caused the contamination.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. HMMP performance measures are intentionally established as output measures which contribute to the desired outcome. The desired outcome of the HMMP is completing the entire cleanup program. In 1995, USDA set the goal of achieving this outcome by 2045.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The HMMP program managers fully understand the difference.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. While HMMP does not have specific measures for customer satisfaction in its GPRA plans, a primary measure of customer satisfaction is the minimal number of environmental enforcement actions and lawsuits by private parties brought to date against USDA agencies. Such activity is closely monitored by USDA through both the HMMP and the Office of the General Counsel.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. Planned HMMP activities, the prioritized funding request, and performance goals for the fiscal year 2001 budget were based on the agencies’ best estimate of progress in the remainder of fiscal year 1999 and the goals in the program of work for fiscal year 2000. Each year’s specific goals are somewhat independent, because there is considerable variability in the costs and course of environmental investigations and cleanups. Each year’s goals build upon the actual and planned work of all preceding years.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of the various goals?

Answer. The likely impact of a change in a proposed budget number can be indicated. Detailed project lists are provided with each budget request, and the agency’s priority for each project is shown. To determine the program impact, the lower priority projects would be deferred to reach the proposed budget number, with the understanding that regulatory and other requirements may not allow some activities to be deferred.

If the budget number is changed upward, work planned for a later year would be advanced into the earlier year. Priorities are not currently assigned to outyear projects, but the effect on program goals could be generally estimated.

In practice, environmental cleanups require flexibility in project implementation and funding. Within USDA, plans for some unfunded priority projects are typically prepared along with the funded projects to allow for adjustment in the program if a funded project is delayed or additional funding becomes available. This proactive approach provides maximum efficiency and cost effectiveness in conducting investigations and cleanups.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes, the spreadsheet reporting system and other records provide this capability. Currently, program performance is assessed at the Department level at the beginning of the fourth quarter and at the close of the fiscal year. Aggregated program performance, in the form of National Finance Center reports, is monitored monthly. Agencies submit reports and are encouraged to monitor their HMMP activities on a regular basis.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. All levels of management have access to program status reports.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes, a single spreadsheet-based system is used to maintain HMMP data at the USDA level.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. HMMP has not faced difficulties as a result of the budget account structure.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Linkages would not necessarily be clearer if the budget account structure was modified.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. This question is not applicable.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. This question is not applicable.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. The HMMP relies on systems and expertise of the National Finance Center and the individual financial offices of the affected agencies for accounting services.

There is already a linkage, even before planned improvements are implemented. The prioritized project list submitted with the HMMP budget package includes information on the funding needed for each activity, the relationship of the planned activities to the GPRA performance goals and indicators, the specific desired output, and the governing statutory or regulatory authorities. Information is also presented on the location of each proposed activity, its current status, the goal for the end of the year, and other planning information.

At the end of each fiscal year, agencies report on their activity-specific obligations and carryover, which activities were completed that year, and other financial and performance data. The data is in spreadsheet format, so it can be readily summarized and analyzed by management. Attainment of performance goals is evaluated, as are such indicators of program performance as obligation rates, the balance of "old" versus "new" work being undertaken, and the balance of investigative versus cleanup work.

Work is ongoing to improve the linkage of budgets and results. Training of system users is ongoing to increase efficiency and improve data quality. Agency management will be asked to attest to the quality of HMMP data they submit throughout the budget cycle as well as their contribution to the GPRA performance goals of the HMMP. Development, testing, and implementation of a network-based system that could be used for real-time project management as well as reporting is being considered. The feasibility of tracking obligations and expenditures by budget object as well as by activity is being evaluated.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agen-

cy's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. Currently, we rely on the individual agencies and the National Finance Center for cost accounting of HMMP expenditures.

As noted in an earlier response, a USDA work group will try to identify feasible alternatives for improving HMMP accounting and accountability systems, but the solution is expected to be dependent on USDA-wide changes in current systems.

Question. Will you be able in the future to show this committee the full and accurate cost of each activity in the program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. After a USDA-wide system is implemented, we will be able to show the committee the full and accurate cost of each activity in the HMMP.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. The goals and activities of the HMMP are confined to CERCLA and RCRA compliance activities. Current systems already provide a substantially complete picture of the funds spent on the HMMP and the results obtained.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. The spreadsheet activity-based budgeting and reporting system used by the HMMP is already able to provide substantially complete unit costs, although a small portion of total actual costs may not be reflected in all cases, because the individual agencies may or may not be using full-cost accounting methods.

To illustrate, a table summarizing fiscal year 1999 HMMP accomplishments by project status and performance indicator is provided.

The fact that the average cost of the 21 federally funded cleanups that were finished was about \$13,500 suggests that these were relatively small and simple cleanups. The average obligation on ongoing cleanups was nearly ten times as much, and work greater than the entire HMMA budget was performed by potentially responsible parties or cost recovered on two larger cleanups.

[The information follows:]

SUMMARY OF FISCAL YEAR 1999 ACCOMPLISHMENTS, USDA HAZARDOUS MATERIALS MANAGEMENT PROGRAM, BY STATUS AND PRIORITY

[Dollars in thousands]

Project status when fiscal year 1999 ended	Year-end fiscal year 1999 data type	Indicator group								Grand total
		Investiga-tions	Cleanups	Natural resource damage	Enforce-ment support	UST cleanups	Pollution preven-tion and environ-mental auditing	Legal sup-port	Program manage-ment, in-cluding PRP over-sight	
Finished	Sum of HMMA Obligated Amount	\$1,385.7	\$148.1	\$10.2	\$104.9	\$1,648.8
	Count of HMMA Obligated Amount	9	12	1	3	25

Total Count of Estimated Value of PRP Work	6	1	12	19

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The HMMP is funded with HMMA and agency funds. HMMA funds are allocated and distributed to a number of agencies. Some do full cost accounting, and others do not. In general, the dollars associated with an activity approach the full costs. This issue may also be addressed by the recently created working group.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. The HMMP is governed by CERCLA, RCRA, and their implementing regulations. No regulatory reform measures related to the cleanup program were implemented by USDA.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The primary external factors that affect goal achievement are availability of sufficient funds, the time it takes to negotiate complex agreements with regulatory agencies and responsible parties, and the many unexpected developments in environmental investigations and cleanups.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. The steps found to be most effective in minimizing the impact of external influences is to maintain a highly experienced staff to manage HMMP activities; to closely coordinate and plan response actions; and to work closely with other Federal agencies, state agencies, and stakeholders.

Question. What impact might external factors have on your resource estimates?

Answer. If viable responsible parties cannot be identified at sites where environmental problems are the result of non-USDA activities, the costs of cleanup must be borne by USDA, even if USDA activities did not cause or contribute to the problem. Most of the biggest and most expensive contaminated sites on lands and facilities under USDA jurisdiction, custody, and control resulted from the activities of others.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No overlapping functions or program duplication were identified.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. This does not apply, because no overlapping functions or program duplication were identified.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Annual performance plans should focus on defining and pursuing desired outputs and outcomes; other mechanisms should be employed to assess and report the extent to which management systems are supporting, facilitating, or impeding the work of the organization and to redesign organizational structure and processes to improve effectiveness and efficiency in producing results.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. GPRA considerations are increasingly a factor in HMMP decision making. Taken together with the potential liabilities associated with environmental contamination, GPRA has helped focus management attention on the short- and long-term goals and resource needs of the HMMP.

Question. Will this use increase in the future and if so in what ways?

Answer. To some degree, but regulatory requirements and public interest are expected to continue to be the primary program drivers. To the extent possible, changes in these forces will be addressed through GPRA planning.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. There is a one-to-one correlation between the HMMP performance measures and the statutory or regulatory requirements they address. Completed investigations and cleanups are the mission of the HMMP, but these activities only contribute to the larger desired outcomes of restored lands and watersheds on lands under USDA jurisdiction, custody, and control. Recognizing this limited role of the HMMP in USDA's management of lands and facilities, the performance measures are important, but we are still early in the implementation of this new approach.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The difficulties of accurately estimating the cost and course of projects involving environmental contamination are well known. There may be more or less contamination than expected from the limited investigative work that was done at the start of the project. What appeared to be a routine project may become complicated in other ways as well. Regulatory agencies, potentially responsible parties, and stakeholders all play a vital role in cleanup decisions on lands under USDA jurisdiction, custody, and control, and this role will only increase as the larger cleanups are taken up. Environmental cleanups will always require substantial flexibility in project implementation and funding.

At current HMMP funding levels, it is difficult to maintain the experienced staff needed to improve program efficiency and effectiveness. This is particularly evident in the Forest Service, where retirements and staffing cuts have been greatest. The inventory of cleanups that are ready to go is being depleted as we struggle to maintain the pace of actual cleanups in the face of these staffing reductions and "flat-lined" HMMA funding for the past six years.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No waivers of non-statutory administrative requirements are being requested.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No relaxation of transfer or reprogramming controls are being requested.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. Modifications to performance measures will reflect our experience under GPRA, but at this point there have not been substantial revisions to the strategic plan.

FOOD SAFETY AND INSPECTION SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The mission of FSIS is to ensure that meat, poultry, and egg products moving in interstate commerce, imported from other countries, or exported to other countries are safe, wholesome, and accurately labeled. In 1996, FSIS issued the HACCP final rule, which serves as a blueprint for changes in meat, poultry, and egg products' inspection for the future.

All FSIS programs and priorities lead to one goal: enhancing the public health by minimizing foodborne illness from meat, poultry, and egg products. The Strategic Plan reflects this one goal and the strategies FSIS is currently using to reach this goal. Unlike agencies with many, perhaps conflicting, priorities, FSIS can concentrate on developing the best strategies to reach this one overriding goal. The Agency created its Strategic Plan with a mission statement, goal, objectives, and measures. In order to link the Strategic Plan with the Annual Performance Plan (APP), FSIS converted its strategic objectives into annual performance goals for the APP. The Agency's program activities and corresponding budget requests support the Agency's mission and the performance goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The Agency recognizes the importance of linking performance goals and budget activities through the Agency mission. The goals represent our mission objectives, while the budget activities represent our mission activities. To accomplish this, FSIS management guides the budget and planning staffs as they work together in the preparation of budget initiatives and the APP to ensure that budget requests reflect the performance goals contained in the Agency's APP and support program activities derived from the Agency's mission.

Question. What difficulties, if any, did you encounter and what lessons did you learn?

Answer. FSIS has faced the challenge of developing performance measures for which reliable data is available. Agency staffs researched data availability and compared options for performance measures, choosing performance measures for which data which could be more readily obtained, verified, and validated.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. FSIS uses both its Strategic Plan and budget plan to design the APP. The performance goals are specific to achieving a reduction in foodborne illness, and the measures in the APP indicate progress in achieving these goals. FSIS provides

a new performance measure for each requested budget increase. For example, in the 2001 budget, FSIS requests additional funding for visiting more establishments during foreign reviews to ensure that equivalency standards are being met. To link performance measures to the budget, the 2001 APP includes a performance measure to illustrate that reviews are projected to increase in 2001 if the Agency receives its budgetary request.

Question. Does each account have performance measures?

Answer. Most of FSIS' budget is in one appropriated salaries and expenses account for which the Agency designed performance measures. Many of the performance measures do not apply to the Agency's small Trust Fund account because the HACCP final rule does not cover voluntary inspection. The Agency has not designed separate performance measures for the Trust Fund account.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The FSIS performance planning structure is built around specific steps that must be carried out to achieve the strategic goal of minimizing foodborne illness associated with meat, poultry, and egg products. The account and activity structure used in the budget submission is organized along program activity lines that capture the range of infrastructure and support activities necessary to carry out a total food safety program.

Question. Do you plan to propose any changes to your account and/or program activity structure for fiscal year 2001?

Answer. FSIS has added an activity for Codex Alimentarius in the 2001 budget. Codex Alimentarius was formerly included under the Import/Export Inspection activity.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. The addition of Codex Alimentarius as a budget activity is the only change identified to date. FSIS does not anticipate proposing any further changes to our program activities described under this account structure.

Question. How were performance measures chosen?

Answer. The FSIS Strategic Plan contains one goal and six objectives with associated performance measurements. The same objectives and measures detailed in the Strategic Plan are used in the APP. The six objectives, written as performance goals in the APP, have been slightly modified to help Agency managers focus on the need to collect and track data for the fiscal years listed in the APP. The annual goals are written in measurable, performance-oriented terms so that annual program evaluations can more easily gauge progress for each performance goal. Maintaining a common set of objectives and performance goals provides a strong linkage between the long-range Strategic Plan objectives and the more output-oriented performance goals in the Annual Performance Plan. Performance measures are derived from performance goals based on measurable activities directed toward achieving goals. In addition to measures of ongoing program activity, FSIS also provides performance measures for each requested budget initiative. This is done to illustrate how additional funding would be used if the Agency receives its budget request.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. In designing performance indicators, FSIS has relied on information that is readily available within the Agency. Therefore, the data collected for activities contained in the Strategic Plan will be consistent and comparable with other activity data collected over time, ensuring a stream of reliable and valid performance data for the Plan's goals and objectives. Data quality should continue to be high since the Agency will rely on the same data sources it has used in the past, e.g., in-plant records.

There should be little increased cost specifically related to the collection of data for meeting GPRA requirements. FSIS will continue to improve the Agency's information management systems, which will primarily benefit the food safety program, but also improve the quality of GPRA data.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. FSIS has submitted its first performance report and believes that all data incorporated are reliable. Consistent with the 2000 report, performance measures for 2001 are based on both available and reliable information sources.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. FSIS uses a mix of outcome and output measures to assess progress made in achieving its goal, and recommends that the subcommittee use performance goals one, two, three, and four to track FSIS program results. They are as follows:

- Reduce pathogens on raw products by continuing the implementation of the Pathogen Reduction/HACCP rule.
- Establish effective working relationships with other public health agencies and stakeholders to support the President's National Food Safety Initiative.
- Promote food safety from farm-to-table.
- Complete the necessary cultural change to support HACCP and food safety.

The Agency believes that HACCP, along with microbiological testing, will improve the safety of inspected products and reduce foodborne illness. Measurable declines in pathogen contamination of federally inspected product, which correlate with HACCP implementation, validate HACCP as a model system for production and inspection. This has increased the Agency's effectiveness in completing its own HACCP-related cultural change and working with other public health agencies and stakeholders to promote food safety and support the President's Food Safety Initiative.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency strategic plan to which the annual goal is linked.

Answer. The current FSIS strategic goal is to enhance the public health by minimizing foodborne illness from meat, poultry, and egg products. The outcome of achieving this goal is a 25 percent reduction in the number of foodborne illnesses associated with meat, poultry, and egg products by the year 2000. The 2000/2001 APP is the last to be submitted under the current 1997–2001 Strategic Plan. FSIS is currently working with the President's Council on Food Safety to design a new Strategic Plan for the Agency, which will set a new long term general goal and performance objectives for fiscal year 2002 through 2006.

Question. In developing your APP, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. FSIS managers provided guidance on developing performance indicators that would provide significant measures of progress toward achieving performance goals and the overall strategic goal based on sources of available data. For example, reducing pathogens on raw products through the HACCP-based inspection system is a major focus of FSIS initiatives, which could be measured and has produced impressive results. The APP has incorporated outcome measures for this and other performance goals by using data available through FSIS information sources.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The Agency has provided training for its managers over the last several years to meet the requirements of GPRA. Agency managers are actively involved in the formulation of the APP and in budgetary discussions. While substantial progress has been made, continued training is needed as GPRA concepts and requirements are integrated into ongoing program operations.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Customer satisfaction measures are based, in part, on feedback from stakeholders, including our own employee groups, representatives from the regulated industry, consumer groups, academia, State and local governments, and foreign governments. A primary vehicle for obtaining this feedback was the FSIS Customer Satisfaction Initiative conducted last year as part of the National Performance Review's customer survey initiative. Stakeholders participated in the development of the HACCP rule and implementation of the HACCP final rule through numerous public meetings that FSIS has conducted over the past several years. Achievement of a 25 percent reduction in foodborne illnesses associated with meat, poultry, and egg products in 2000, the outcome for the Agency's strategic goal, is a powerful measure that relates to customer satisfaction with the federal food safety program.

Question. How were the measurable goals of your fiscal year 2000 APP used to develop your fiscal year 2001 budget?

Answer. FSIS is currently in the process of transitioning into a post Pathogen Reduction/HACCP phase and is working to develop a new Strategic Plan in coordination with the President's Council on Food Safety. The Council is looking at the classic risk analysis model which includes risk assessment, risk management, and risk communication as the basis for developing a Strategic Plan vision statement, and drafting food safety goals that create the framework for its food safety Strategic Plan. The Agency used the concepts from these draft goals and vision statement as

major tools in developing the FSIS fiscal year 2001 program initiatives, APP, and corresponding budget proposals.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and achievement of various goals?

Answer. FSIS would be able to indicate a likely general impact from a budget change on the level of program performance and achievement of various goals. The degree of precision would depend on the proposed budgetary change.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. As previously stated, Agency management data is used in designing performance measures. FSIS reports program performance internally throughout the year in managing to achieve desired results. However, FSIS does need to improve its corporate databases to improve the quality of data gathered and disseminated, including its accessibility, accuracy, timeliness, type, and complexity. These data improvements would also improve program measurements.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Relevant program performance data is shared throughout FSIS among senior, mid-level and lower-level managers to achieve desired results. Performance data guides the Agency's work at all levels of food safety program management.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. As indicated previously, improvements in Agency data systems are needed. Data and information management needs will be addressed in the new FSIS draft Strategic Plan.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. FSIS has one strategic goal, which encompasses all activities in the present budget account structure. The Means and Strategies sections in the APP highlight budget proposals in the same manner as the Explanatory Notes justifications, and enable the Agency to link the budget activities with the performance goals and measures in a clear and meaningful way. The activities included in the budget account structure are sufficiently broad to cover the use of budgetary resources and are also specific enough to account for the Agency's use of particular resources, such as Grants-to-States, the Field Automation and Information Management (FAIM) initiative, and Codex Alimentarius.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. FSIS has not found the need to modify the account structure significantly. As indicated previously, Codex Alimentarius is proposed as a new budget activity in the 2001 budget, and will provide a stronger linkage with the results of that activity.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. No modification is needed at this time.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. No modification is needed at this time.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. FSIS' cost accounting structure reflects both direct and indirect costs of the budget activities under which funding is appropriated to the Agency. The current FSIS strategic plan has a single goal: "Enhance public health by minimizing foodborne illness from meat, poultry, and egg products." All Agency costs are directed toward achievement of this single goal.

fiscal year 2001 will be a transition year for FSIS after completing the third and final phase of HACCP implementation. FSIS will proceed to the next steps of its plans for HACCP through a new strategic plan that involves coordination with the

President's Council on Food Safety. Under a new strategic plan, FSIS expects to maintain the capability to link the costs by budget activity with the costs of achieving one or more GPRA goals. FSIS will allocate the costs associated with GPRA goals either manually, or on an automated basis through new purchases of software to complement the accounting system. New software packages for a "Managerial Cost Accounting" system and an "Activity-Based Costing" system will also meet GPRA requirements for reporting costs by both performance measure and activity. However, implementation of new software will require an increase over the Agency's baseline funding level for software and staffing.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all Federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. FSIS implemented the new USDA Foundation Financial Information System (FFIS) accounting system October 1, 1999. FFIS is configured to report costs by budget activity, which can accommodate the "full cost" requirement to report on the Agency's mission activities. FFIS does not use an "Activity-Based Costing" system and would require additional resources to incorporate it into its overall financial management system.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. FSIS is currently able to report the "full and accurate cost" of each Agency budget activity, including administration, employee benefits, and depreciation using the automated FFIS accounting system.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. FSIS currently reports the true costs of the budget activities conducted by the food safety program. The Agency is also making an ongoing effort to link the information contained in both the Explanatory Notes budget activity presentation and the performance information in the Annual Performance Plan. The President's Council on Food Safety is in the process of developing a 5-year comprehensive strategic plan and a coordinated food safety budget for the Federal food safety agencies. The 5-year strategic plan, its derivative annual performance plans and reports, and coordinated food safety budget will present the costs and results of food safety activities government-wide.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. In most instances, data that is not resident in the accounting system must be combined manually with cost information to obtain activity unit costs. An example is the numbers and locations of enforcement actions, data that is not part of the accounting system. Assuming the future addition of new software packages for a "Managerial Cost Accounting" system and an "Activity-Based Costing" system, these systems will be designed to show the per-unit cost of each activity and result.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. FSIS currently calculates the full cost of its performance measures manually in relation to the current automated "Activity" reporting method. These cost figures include the applicable overhead costs. Additional software to automate this process would incorporate the same methodology used in manual calculations.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. The major FSIS strategy for reaching the goal of reducing foodborne illness is requiring plants to develop and implement HACCP-based production systems. HACCP has proven to be an effective system for preventing microbiological and other hazards from getting into meat, poultry, and egg products. FSIS believes that it is far better, and much more effective, to prevent hazards than to try to remove hazards after they occur. Publication of the HACCP final rule in 1996 and the resulting regulatory reform efforts have guided the development of the Strategic Plan and the succeeding Annual Performance Plans and Reports. FSIS has undergone a major cultural change in moving the inspection program from a command-and-control orientation to a system of performance standards. FSIS has begun a

major training and education effort to prepare the workforce to monitor plants for prevention of hazards rather than dealing with the negative results of hazardous conditions in plant operations. At the same time, FSIS is reemphasizing that plants are responsible for producing safe products by using HACCP systems to prevent hazards.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Where appropriate, a brief explanation of external factors that could influence goal achievement is included by performance goal at the end of the section titled “Discussion of Performance Goal.”

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. As an example of external factors, international trade issues have increased the importance of U.S. participation in the Codex Alimentarius Commission to ensure that Codex standards are based on science-based factors to promote U.S. food safety standards and trade interests in the international arena. In many arenas, increasing awareness of external influences and strengthening working relationships with stakeholders has enabled FSIS to prepare, anticipate, and plan for such influences in a proactive manner with positive outcomes for food safety efforts.

Question. What impact might external factors have on your resource estimates?

Answer. Several external factors have had an impact on FSIS resource requirements, including the following examples. Regarding international trade issues, FSIS became convinced that a significant increase in resources for U.S. Codex Alimentarius is required to persuade international Codex delegates of the need for science-based standards and to promote U.S. interests at home and abroad. Legislation introduced in the Senate to permit the interstate shipment of State inspected product requires a comprehensive review of all State meat and poultry programs by October 1, 2001. To prepare for passage of this legislation, the 2001 budget requests an increase for State program reviews. As these examples illustrate, external factors often highlight the need for additional resources.

Question. Through the development of the Performance Plan, has the agency identified overlapping function or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. The Agency has not identified internal nor external overlapping functions or program duplication through the APP. There are areas where there are mutual responsibilities. As a result, FSIS has identified areas where enhanced cooperation among agencies would be beneficial to improved food safety. For the past couple of years, the Agency has been working closely with the Food and Drug Administration (FDA) and State government agencies to address food safety gaps in the transportation and retail areas. Through the President’s Council on Food Safety, FSIS is working with other food safety agencies to identify common goals, objectives, and cross cutting issues. The President’s Council on Food Safety is currently developing a food safety Strategic Plan, which will further enhance the future collaboration among food safety agencies.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Yes, within the strategic planning framework of the President’s Council on Food Safety, plans developed by FSIS are being coordinated with those of other Federal food safety and public health agencies, namely FDA and the Centers for Disease Control and Prevention.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. During the development of the current Strategic Plan, FSIS leadership recognized the importance of linking human health outcomes to HACCP implementation, which was a revolutionary change in the manner in which the Agency conducted meat, poultry and egg product inspection. Consequently, the Agency Strategic Plan and corresponding APPs reflected Agency senior management decisions to establish performance measures that were related to human health outcomes. In the past, the Agency measured its progress in terms of outputs, such as number of plants inspected or number of pounds of inspected product, rather than the true societal outcomes of reduced foodborne illnesses. The Agency is now working more closely with CDC and others to utilize measures with a public health focus. FSIS budget submissions and APPs reflect top management decisions based on GPRA-related performance goals. This process is being continued and enhanced in the current development of a new Agency Strategic Plan.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. FSIS has established performance measures that demonstrate progress toward the achievement of each performance goal. That is, the measures used correlate directly to the targeted performance. The targets reflect both trend data and baseline data. For instance, FSIS and CDC use trend data on foodborne illness. FSIS also uses baseline data on the occurrence of microbiological hazards in meat, poultry, and egg products. Performance targets have been developed using baseline data and assumptions about the extent to which HACCP systems can reduce microbiological and other hazards that result in foodborne illness. These measures are based on the best available sources of data and should be viewed as indicators of the impact of the overall food safety program, which covers a broad range of activities.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. While recent data indicate, for example, that plants are overwhelmingly meeting targets, attention to the interpretation of performance data is needed regarding funding decisions to cover the full range of food safety activities. Resource estimates are based on more than current performance data, especially for proposed initiatives that are still in the concept stage. The Agency's experience with related activities often serves as a guide for resource estimates. Recent budget history indicates that resource estimates are sufficient to support proposed activities.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specially, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, the Agency is not requesting any such waivers.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in the strategic plan you issued on September 30, 1997? If so, what revisions are needed and when do you plan to make them?

Answer. The Agency is currently drafting a new Strategic Plan for fiscal year 2002 through 2007, which will be completed by September 30, 2000 and which will tie to the Food Safety Strategic Plan being developed by the President's Council on Food Safety.

FOREIGN AGRICULTURAL SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. FAS' program activities are restated as unique strategic objectives with key operating strategies and performance goals. Each FAS objective, in turn, is directly associated with FAS' strategic goals and mission. FAS' strategic goals are directly linked to the Department's objectives and goals.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Prior to the 1998 budget, FAS had developed its long-term Agricultural Trade Strategy (LATS) report which identified five (5) key drivers of long-term success. In the 1998 budget submission, FAS revised its program activities to correspond to these key drivers. As FAS began developing and refining its Strategic and Annual Performance plans, and following consultations with Senate Agriculture Committee staff on its initial draft strategic plan, FAS identified that it had two goals: (1) expand export opportunities for U.S. agricultural, fish, and forest products; and (2) promote world food security. FAS recognized that with a few modifications, its five program activities were actually objectives that support the achievement of FAS' two goals. The first four program activities (market access, market development etc., market intelligence, and financial assistance) all support FAS' goal to expand export opportunities. The last program activity (long term market and infrastructure development) supports FAS' goal to promote world food security. With the fiscal year 1999 and fiscal year 2000 performance planning process FAS further understood that the five objectives are actually a set of market expansion tools that support one another within markets. As a result of this progression towards better operational focus, the next strategic plan and annual performance plans will have objectives reflecting U.S. export goals for five regional markets and the program activities will have focused performance goals for each region. This will support the management of program activities as a set of tools to affect an outcome within a region.

Like other agencies across the Federal Government, FAS learned that in order to implement GPRA, planning needs to drive the budget. The five program activities in the fiscal year 1999 budget submission reflected slight modifications in the five program activities in the fiscal year 1998 budget. These modifications are a result of FAS' realization that it needed to realign its budget activities to its goals and objectives. As FAS learns more about institutionalizing performance-based management processes, it anticipates that there will be further changes to the budget structure to accommodate changes in legislation, the annual performance plan, international trade, and technology. For the fiscal year 2002 plan, the regional objectives approach will require the budget to be further subdivided by program activity along regional lines.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Performance measures contained in the agency's Performance Plan are linked to budgeted program activities. Additionally, each account has performance measures which are displayed in FAS' Annual Performance Plan.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. FAS' performance planning structure is an adaptation of the performance-based management structure commonly used in the private sector. The account and activity structure is just beginning to change from the traditional approach of associating costs to either: (1) a broad category of personnel, travel, training, and operating costs at the budget's identified activity categories; or (2) funding tied specifically to legislated programs, such as the GSM program, Market Access Program, and the Dairy Export Incentive Program. Following pending guidance from the department, a cost-accounting system that provides direct one-to-one linkages of specific performance measures for each budgeted account will have to be adopted to align the two structures.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No changes are planned at the present time. However, as FAS institutionalizes its performance-based management processes and as Federal Government agencies transition to a cost accounting system, FAS may propose changes in its account structure to facilitate aligning performance goals with all operating costs and appropriated/non-appropriated program activities.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No, however, the fiscal year 2002 Performance Plan currently under development will approach the performance goals, and hence the current budget accounts, subdivided by five geographic, regional markets (Africa, Asia, Europe, NIS, and Western Hemisphere). This is intended to provide focus and better management to agency goals and expenditures.

Question. How were performance measures chosen?

Answer. FAS believes that leadership starts at the top but performance comes from the front line. Following this principle, FAS' senior management created a draft strategic plan with objectives and the Strategic Operations Staff of the Office of the Administrator facilitated a series of one-day workshops for nearly every division in the agency. The purpose of these workshops was threefold: (1) to begin the education process of all employees and supervisors on GPRA and performance management; (2) to validate and improve the draft strategic plan prepared by senior management; and (3) to assist the divisions in preparing division-level performance plans which identified performance measures that are aligned to the agency's strategic goals and objectives. Following these workshops, FAS senior management participated in the validation of the revised draft strategic plan and the performance measures identified by the divisions prior to their submission to OMB and Congress.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The process of making GPRA a reality in FAS is more than two years in the making and still ongoing. Current performance measures were selected and balanced on the basis of (1) how the measures reflected the program activity's performance as an output or outcome; (2) as a management tool for operations and budgeting, or an illustration of end product (outcome) for a higher audience—not the same at all in real life operations; and (3) whether the data can be collected and verified at a reasonable cost. Since FAS's budget has been falling in real terms for several years, easy data availability took precedence over ideal performance measures in many cases. The struggle over an annual performance plan that is inward looking (a management tool) versus an outward looking tool (for high-level overview), is still in the balancing stages.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Some performance measures will not have reliable data be available in time for your first performance report in March 2000. More than 90 percent of FAS' performance measures will have reliable data on performance results. Those few exceptions are due to the character of data and we are in the process of defining data collection procedures, such as the customer surveys and obtaining OMB approval. FAS conducted GPRA workshops from April through June 1999 with every division (approximately 23) that has direct responsibility for developing and tracking the performance data necessary to meet the March 2000 performance reporting requirement. The primary purpose of these workshops was to ensure that FAS has meaningful performance measures and procedures in place to verify and validate that it is capturing the right performance data.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome ("how well"). State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. FAS suggests that the subcommittee focus on FAS' two agency general goals for which we have identified measurable outcomes. These are (1) Expanding export market opportunities for U.S. agricultural products (FAS has set a goal of U.S. exports returning to 22 percent of total foreign imports by the year 2010); and (2) Promoting world food security (FAS' goal is a reduction in the number of undernourished people by one-half of the 1998 FAO population estimate). Each of these two general goals have important annual performance measures (with annual goal) for our major program activities. These include legislated and agency-funded activities to enhance market access, market development, market finance, intelligence gathering, and long-term market enhancing and food aid programs. If these are successful, our overall goals may be successful as well.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Using independent analysis from the Economic Research Service, FAS was able to calculate the impact (i.e., outcome) of the exports supported by its program on rural communities and the national economy as a whole. Calculating impact of market development relies on procedures established and approved by the Trade Promotion Coordinating Committee (TPCC) and used in preparation of the annual National Export Strategy submitted to the Congress. This includes calculating the impact of FAS market development programs on exports. Estimating national and rural economic impacts involves combining the export impacts with trade multipliers associated with direct and indirect effects of agricultural exports.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. They are beginning to develop a greater understanding of the difference. In order to institutionalize strategic planning at every level of the organization, strategic planning workshops were held over the spring and summer of 1997 for every division in the agency. FAS conducted workshops again in 1998 and 1999. These workshops continued the process of teaching managers and their staffs that all activities support the organization-wide goals, and that data collection, verification, and validation, is a vital part of GPRA. This process of education is an ongoing requirement for FAS due to the high proportion of rotating foreign service officers (FSO) into Washington headquarters management positions. Typical FSOs have been overseas for 5 to 8 years and are unfamiliar with GPRA management concepts. FAS has instituted a critical performance standard for all FAS managers for GPRA and EEO planning and reporting. GPRA and EEO progress is monitored through quarterly reports, using computer technology. FAS' overseas personnel will be fully incorporated into this GPRA reporting technology by fiscal year 2002.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. For internal customers, FAS will perform two separate types of surveys. The first is the Peer Evaluations of FAS' headquarters and overseas offices' performance and customer satisfaction. The second survey will be a Work-life survey in which the employees and managers will be asked to identify trends in the work place which inhibit or promote productivity and employee development.

For external customers, FAS has numerous listening sessions with various customer groups to identify areas of improvement. For instance, FAS works in partnership with the Private Voluntary Organization (PVO) community in implementing the Food for Progress program. FAS has a yearly listening session where ideas are shared and new initiatives announced. These listening sessions have helped both groups (FAS and the PVOs) to focus on reducing red tape and improving the focus of specific projects. Also, FAS has listening sessions with U.S. banks participating in the GSM Export Credit Guarantee program. Again, these sessions have identified areas of improvement and cooperation. Finally, as a measure of customer satisfaction with FAS' market intelligence activities and publically distributed materials, two separate surveys for internal government users and private sector users are planned for fiscal year 2000. FAS managers are currently working with NASS/USDA professional statisticians to develop a survey tool.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The budget is a major factor in reaching our goal of regaining a 22 percent market share of foreign imports by the year 2010 (the measurable target for General Goal 1: Expand market access for U.S. agriculture . . .). Without competitive resources, it will be very difficult to compete with our foreign competitors. U.S. market promotion and development assistance is a pale second to support provided by our major foreign competitors. At a minimum, the U.S. must assure that trade agreements are fulfilled through U.S. monitoring and enforcement. While FAS may fulfill its annual performance goals, our foreign competitors continue to take a larger proportion of new, expanding market opportunities than the U.S. does, thereby eroding the U.S.'s market share. We're winning our battles but losing the war. The fiscal year 2001 FAS budget request asked for a marginal addition for trade agreement monitoring and enforcement and market promotion and development monies. However, since foreign government competitors continue to out spend the U.S. by 3-to-1 in export promotion funding, the U.S. share of total foreign imports, even through long-term foreign imports are climbing, will likely decline even further.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, for the most part, depending upon the size of the increase/decrease, FAS would be able to estimate changes in the associated performance goals and indicators. However, given current systems and the lack of a cost-accounting system in USDA, most responses will be estimates based upon knowledge of the business instead of a detailed one-to-one relationship between the funding and the specific output and/or outcome indicators.

Question. Do you have the technical capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes, FAS has built a GPRA tracking, evaluation, and reporting system that has proven to be an acceptable reporting tool, but for stateside operations only. Every supervisor's critical job performance standard requires GPRA planning, goal setting, and activity evaluation for improvement, guided by the Strategic Operations staff. The Administrator receives a quarterly agency-level GPRA report and summary from the Strategic Operations staff, which is then followed by a senior-level managers meeting to review progress.

Question. Who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. All managers, information and correspondence personnel, the legislative affairs staff, and the EEO staff have access passwords. In addition, while only managers have the ability to "write" reports, by the end of fiscal year 2000, all FAS employees will have access to searching, viewing and printing GPRA reports by topic.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Some, high-level outcome results are derived from public data resources, such as the resulting U.S. agricultural exports or the reduction in the number of undernourished people, through Economic Research Service annual studies. However, data on most performance results are collected by the contributing divisions within the agency and reported by them in the GPRA reporting system as a cumulative success towards the agency-level annual targets. Each GPRA report identifies the division manager to contact for data details.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many

agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. Because of the lack of a cost-accounting system to track expenditures against the budget, it is difficult to show a direct one-to-one relationship between expenditures and specific performance measure results.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Yes it would and some changes can be made now, before a cost-accounting system is in place, that would provide a better match.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Currently FAS' general program activities and budget relate directly to our mission and legislated mandates. However, if additional resources were available our current budget account structure could be modified so that most expenditures are related to an appropriate GPRA performance objective, and to performance goals for major program activities within objectives. This would include expenses such as travel and training, in addition to salaries and appropriated/non-appropriated program expenditures. Such a modification would improve managerial accountability by assessing the relative costs and benefits of various program activities and performance goals. This would provide FAS better information to make future resource allocation decisions.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. The adoption of a true cost accounting structure that allows for the establishment of direct links between operating expenses and program dollars in the budget and performance measures in the performance plan would permit both the agency and the committee to account for the actual costs and benefits of the various program activities, and assist in setting spending priorities in future years.

Question. Spending significant resources on performance systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. All financial accounting and reporting support is provided to FAS by the Farm Service Agency (FSA) on a reimbursable basis. As such, FAS has no internal cost accounting expertise. With respect to the linkage of GPRA and the budget process, FAS budget formulation has been following the underlying GPRA tenets of strategic planning and performance measurement/reporting since fiscal year 1998.

Question. What is the status of your agency's implementation of the Managerial Cost Accounting Requirement, and are you using Activity-Based Costing?

Answer. The Farm Service Agency has been exploring Activity-Based-Costing for certain administrative services provided to FAS. However, departmental standards for uniform development of Managerial Cost Accounting systems have yet to be issued. Further work in this area is dependent on issuance of unified departmental standards and the significant budgetary resources that will be needed to develop and implement these systems.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. In the absence of uniform standards, it is difficult to say what the reporting capabilities may be.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true cost of the activities conducted by the program, and the results of these activities?

Answer. Again, in the absence of uniform standards, it is difficult to say what the reporting capabilities may be.

Question. To what extent do the dollars associated with any particular goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Total, true cost accounting and specific performance goal alignment are not in place.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan?

Answer. FAS' Market Access Program (MAP) and Foreign Market Development (FMD) program application process has changed significantly over the last 3 years

to align with the concepts and legislative directions within the Results Act. These changes were made to improve the operation of the program and coordinate program administration. This effort, and the MAP/FMD programs, will be more fully integrated with GPRA with the release of the fiscal year 2002 performance plan that will have regional U.S. export share goals as its objectives—and focused performance goals within regions for FAS programs, such as MAP/FMD, that support the objective.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes, both FAS' strategic plan and annual performance plan cite several external factors. These include overcoming foreign competitors' continued use of export subsidies, direct credits and credit guarantee programs, non-price export promotion, monopolistic marketing boards, and various technical assistance programs. Additional external factors outside FAS' span of control include variability in crop production due to weather conditions, both at home and abroad; effect of foreign exchange fluctuations on the price of U.S. products abroad; political instability that may undermine demand in key importing countries; and reductions in resources of other USDA and Federal agencies with whom FAS works in partnership to fulfill its mission and goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. FAS, in its GPRA fiscal year 1999 Report and in Congressional testimony, took the unusual step of placing our performance goals and successes in perspective with our overall mission of expanding U.S. agricultural export opportunities. While our annual program activity goals were, in fact, successfully accomplished—and will be in the future, the U.S. share of total foreign imports has been falling since 1981. The current funding levels of U.S. agricultural export promotion activities will cushion the continued decline in U.S. market share. These efforts will be supported by FAS continuing to effectively use the GSM program to inject liquidity into developing country markets suffering short-term liquidity crunches similar to the successful program activities in Asian countries during the fiscal year 1998 financial crisis. Additionally, FAS will use the Dairy Export Incentive Program, Foreign Market Development and Market Access Programs, and other activities.

Question. What impact might external factors have on your resource estimates?

Answer. The impact will vary based on FAS' span of control over the external factors.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance plan identify the overlap or duplication?

Answer. Yes, in conjunction with other USDA agencies within the Department dealing with SPS issues, FAS has, as a result of a General Accounting Office review of USDA's approach to resolving SPS issues, recently been tasked with the responsibility to support the Special Assistant to the Secretary on International Affairs. The objective is to coordinate USDA wide goals and objectives and facilitate the integration of USDA-wide processes to improve USDA's efficiency and effectiveness in prioritizing SPS issues and bringing them to resolution. Since this initiative is currently ongoing, FAS/USDA is actively determining how all of the USDA agencies will jointly plan and coordinate this effort.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how.

Answer. A mixed approach is necessary. Goals to address management challenges are appropriate within agency plans to address their unique issues and improvement plans. Overlapping issues and goals are impossible for a single agency to resolve unilaterally and ought to be lead and addressed at a level of authority over both or all the particular agencies involved. Only department level authority can effectively address and direct the distribution of work and program breath by individual agencies or seek legislative changes as needed to reduce overlap.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. For FAS the performance plan has been particularly useful in addressing reductions in budget levels over the past 3 years, especially for fiscal year 2000. Annual performance goals were reviewed and activity areas were listed for possible resource reductions in order to maintain sufficient staff levels to operate critical activities. Operating resources for travel, training, and FAS's foreign market store promotion activities, which had an fiscal year 1999 "in-store" performance success rate of \$22.5 of U.S. export sales per \$1 of promotion activity, had to be cut by 50 percent. In addition, the fiscal year 2001 budget testimony was enhanced with informa-

tion provided by the fiscal year 1999 strategic plan report. The report brought into focus a number of agency general goal comparisons, including the declining U.S. world market share of foreign imports and highly funded, and very successful, export promotion support by other governments that take "first advantage" of newly opened market opportunities. The current strategic plan also exposed the current lack of focus on horizontal (across-agency) planning and performance results. The new fiscal year 2001 annual performance plan will be a significant improvement over fiscal year 2000, focusing on market access, development, and financial planning according to markets and opportunities. It will illustrate how all FAS programs work in concert to fulfill market share objectives for four geographic regions, by helping U.S. firms take greater advantage of market access opportunities.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The initial performance measures identified in FAS' fiscal year 1999 Annual Performance Plan were focused primarily on outputs, and were not sufficiently mature to allow use in measuring program effectiveness. As the intent of GPRA is to learn and change behavior, FAS leaders continued to work with all FAS managers to address the immaturity of the fiscal year 1999 plan. By the second quarter, managers had reviewed the fiscal year 1999 plan and combined overlapping and duplicate measures, dropped measures that had little management use, or identified a number of new, and better, outcome goals—all in time to collect and report data on successes for fiscal year 1999. Managers actually reduced the number of measures by 40 percent while focusing on real and important outcomes for programs and activities. At the same time, managers were learning to use the newly developed computer-based GPRA performance reporting system. The current GPRA annual performance plan, as intended in the Results Act, is maturing and changing and will be of greater use in the future.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Yes, a major factor is the lack of a true cost-accounting system which would provide accurate data on costs related to each budgeted program activity.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No, we are not.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No, however, the new fiscal year 2001–2006 strategic plan will be significantly improved.

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2001

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

[The following testimonies were received by the Subcommittee on Agriculture, Rural Development, and Related Agencies for inclusion in the record. The submitted materials relate to the fiscal year 2001 budget request for programs within the subcommittee's jurisdiction.]

PREPARED STATEMENT OF THE AD HOC COALITION

Mr. Chairman, Members of the Subcommittee, this statement is respectfully submitted for the hearing record on behalf of the ad hoc coalition¹ supporting sustained funding for title I of Public Law 480 at a baseline level which will preserve the program as a long-term market development initiative for American agriculture.

In addition to its request for sustained title I funding, the coalition strongly supports the administration's request for \$837 million for title II donations. Under the Food for Progress program, the administration estimates that \$118 million in CCC funds will be used to support Food for Progress donations in fiscal year 2001, including \$88 million for the purchase of commodities and \$30 million for transportation and other non-commodity costs. The coalition welcomes this continued commitment of CCC funding for Food for Progress.

Unfortunately, the administration again this year recommends no funding for Public Law 480's title III program. While up to 15 percent of funds available for title I and/or title II can be used to support donations to least developed countries under title III, the coalition believes the Administrator of the Agency for International Development ("AID") should aggressively carry out his duties under title III to "negotiate and execute agreements with least developed countries to provide commodities to such countries on a grant basis" (7 U.S.C. § 1727(b)), and should have a sustained baseline level of funding for this purpose.

From fiscal year 1991 through fiscal year 1997, the commodity value of all title III grant assistance was \$977.9 million, according to U.S. AID's annual reports. This represents an average of \$139.7 million per year under the title III program, on a commodity value basis. In the coalition's view, Congress should establish a baseline level of funding for title III, and direct the Administrator to fulfill his statutory mandate.

The principal focus of this testimony, as noted above, is to request that title I funding for fiscal year 2001 be restored to a sustainable level for market development for American agricultural products. The direct loan level for fiscal year 2000 covered by new budget authority for title I, after a 0.38 percent adjustment, is only \$145.3 million. The administration proposes to increase this amount to nearly \$160

¹The ad hoc coalition is composed of the U.S.A. Rice Federation, the National Association of Wheat Growers and the Wheat Export Trade Education Committee, the National Corn Growers Association, the National Council of Farmer Cooperatives, the American Soybean Association, the National Sunflower Association, the U.S. Canola Association, the American Maritime Congress, the Maritime Institute for Research and Industrial Development, the Transportation Institute, TECO Transport Corporation, and Liberty Maritime Corporation.

million for fiscal year 2001. At the very least, Congress should accept the administration's recommendation for increased funding, and should evaluate carefully the need to increase significantly the title I program level in each succeeding year.

LARGE SECTION 416(B) DONATIONS HAVE DEPRESSED TITLE I PROGRAM LEVELS

The actual experience under title I during fiscal years 1999 and 2000 has been distorted by events which were unanticipated when Congress appropriated funding for the program. Under the President's Food Aid Initiative, approximately \$648 million was transferred from CCC to title I for humanitarian assistance to the Russian Federation. In addition to this increased title I programming, section 416(b) donations in fiscal year 1999 reached a record 5.5 million metric tons, including more than 5 million metric tons of wheat and wheat products. According to the White House press release of February 10, 2000, overall food donations reached nearly 9 million metric tons in fiscal year 1999, and food donations planned for fiscal year 2000 will total about the same tonnage.

Because of record-level donations under section 416(b) authority, the demand for title I program shipments (other than to Russia) declined significantly in fiscal year 1999. According to USDA sources, the unobligated balances carried over from fiscal year 1999 to fiscal year 2000 included more than \$98.6 million for title I subsidy and \$8.2 million for title I ocean freight differential. The carryover for the title II program was in excess of \$71 million. These large carryover balances were the result of extraordinary events, and should not be considered indicative of a systemic decline in demand for either a long-term concessional sales program or traditional food aid funding.

For reasons which are not apparent, the administration chose to transfer \$648 million from the CCC to fund the title I component of the Russian food aid initiative, rather than use unobligated balances in the title I account until such balances were exhausted. From the perspective of the Congress, title I should retain its vitality and significance, as the extraordinary Russian commitment to the program demonstrates.

THE TITLE I PROGRAM PROMOTES LONG-TERM MARKET DEVELOPMENT

Mr. Chairman, the 1996 Farm Bill directs the Secretary of Agriculture to give priority in negotiating agreements under title I to developing countries that have the demonstrated potential to become commercial markets for competitively priced U.S. agricultural commodities. With the availability of section 416(b) donations, title II donations, and Food for Progress arrangements, the primary purpose of the title I program has become market development for American farmers. The concessional sales market of today will become the commercial market of tomorrow. In an intensely competitive world agricultural marketplace, the United States must use its concessional sales program to gain access, establish a foothold and build relationships upon which future commercial trade in agricultural commodities can depend.

Under the Public Law 480 title I program, the United States has made concessional sales of commodities with a total value of about \$31 billion since 1955. Along with other export enhancement programs, title I has proved to be a catalyst for strong, long-term growth in U.S. agricultural exports. Over the life of the title I program, from 1955 through 1999, the total commodity value of U.S. agricultural exports has been more than \$1.1 trillion. With the benefit of sustained market-development initiatives, the value of U.S. farm exports rose to an all-time high of nearly \$60 billion in 1996. Unfortunately, commodity exports have declined since then, due to economic upheavals in Asia and other factors. This year the value of U.S. agricultural exports will not exceed \$49 billion, about the same as last year's level.

The United States must intensify its efforts to develop new overseas markets for U.S. farm commodities. With world food stocks at high levels, deeply depressed farm prices, and strong competition from a host of producing countries, the need for enhanced market development funding has seldom been greater. Congress should sharply increase its market development program funding, including funding for the title I program—a program that has proved its worth over decades of experience.

THE SHARP DECLINE IN TITLE I FUNDING

Mr. Chairman, the Public Law 480 title I concessional sales program has had an illustrious history of Congressional support and success in the marketplace. As shown on Chart I (attached), title I shipments reached their peak commodity value of \$1.3 billion in 1965. From 1957 through 1990, in fact, the commodity value of title I shipments fell below \$600 million in only a single year. The parallel between sustained title I funding and growth in agricultural exports cannot be ignored or

dismissed. The linkage between title I market development and subsequent commercial trade is apparent and unbroken over the decades.

Throughout the 1980s, Congress maintained high funding levels for the title I program. From 1980 to 1990, in every year except one, the commodity value of title I shipments exceeded \$700 million. See Chart II. Unfortunately, title I program levels experienced a sharp drop at the beginning of the last decade—from \$725.3 million in 1990 to \$395.3 million in 1991. The value of commodities shipped dropped below \$200 million for the first time in 1995, and (except for extraordinary CCC-funded Russian shipments in 1999) has remained near this historically low level since then. See Chart III.

Mr. Chairman, the title I funding requested for fiscal year 2001 represents little more than 12 percent of the 1965 program level, when the title I concessional sales record was established. In inflation-adjusted dollars, the title I program has lost about 97 percent of its value to American farmers since the record-setting year of 1965. The coalition believes that it is important now to stabilize title I funding, stop the persistent downward trend, and begin to increase resources devoted to this critical and proven program. With this in mind, we recommend an increase in funding for fiscal year 2001 as part of a long-term commitment to market development.

A RENEWED COMMITMENT TO MARKET DEVELOPMENT FOR AMERICAN AGRICULTURE

Mr. Chairman, Congress has maintained a strong bipartisan commitment to market development for U.S. agricultural commodities since World War II. Until recent years, this commitment included high funding levels for the Food for Peace title I concessional sales program. Until the mid-1960s, title I shipments accounted for about 20 percent of the annual value of all U.S. agricultural exports. As recently as fiscal year 1990, as shown on the attached Charts, title I export values regularly exceeded \$700 million on an annual basis.

The title I concessional sales program was a principal catalyst for market development through the 1970s, when the total value of U.S. agricultural exports increased nearly six-fold—from about \$7 billion in 1970 to \$40.5 billion in 1980. The program was funded at high levels during periods of war and peace, even during periods of large Federal budget deficits. Throughout the Cold War period, America's commitment to title I never wavered, due principally to the demonstrated value of the program as a pathfinder to commercial trade relationships with a host of developing countries.

The time has come, Mr. Chairman, to reemphasize the importance of concessional sales and to revitalize the title I program. The time has come for a renewed commitment to this historic initiative, a program that has blazed a trail for billions of dollars in commercial shipments of American agricultural products. However, in making this renewed commitment, both Congress and the administration should seek to improve the program's effectiveness in the economy of the Twenty-First Century.

Under current criteria, a developing country is considered eligible for Public Law 480 title I if it has a shortage of foreign exchange earnings and has difficulty meeting all of its food needs through commercial channels. The program managers at FAS should review country eligibility standards, ensuring that all eligible countries are actively engaged. There must surely be a substantial market for title I concessional sales—during 1999 and 2000, donations of food, according to the administration's announcements, will approach 18 million metric tons. Many countries currently receiving section 416(b) donations should graduate to title I concessional sales arrangements in short order. The shift from section 416(b) donations to title I participation could be rapid, and both FAS and Congress should prepare for this eventuality.

There has been legitimate concern that many eligible countries are reluctant to sign title I agreements following allocation at the beginning of a fiscal year. Perhaps FAS should establish a reasonable deadline for participation under concessional sales terms. The allocations for countries choosing not to participate could be shifted to other countries, well in advance of the close of the fiscal year. This reform could reduce the carryover of unobligated balances, and help ensure that program benefits are extended to eligible countries that want to participate under reasonable terms and conditions.

As Congress turns to farm legislation next year, the need for more program flexibility should be addressed. The current cap of 500,000 metric tons of shipments under Food for Progress seems to make little sense. If this cap were lifted, title I funding in greater amounts could be allocated to Food for Progress, either on long-term credit or grant terms. This and other reforms could strengthen the title I concessional sales program, along with its companion program, Food for Progress.

CONCLUSION

Mr. Chairman, the United States has shipped food assistance in record amounts over the past 18 months, and large shipments are expected to continue throughout the remainder of this year. Congress and the administration deserve great credit for this humanitarian effort. But extraordinary food aid shipments will not last forever. American farmers require strong commercial markets to maintain their share of world trade in agricultural commodities.

In 1996, U.S. agricultural exports accounted for nearly 23 percent of total world agricultural trade by commodity value. As noted above, the value of U.S. agricultural exports has declined by more than 18 percent since the record was set in 1996. Farm prices are down. Overseas competitors have enjoyed record crops. Traditional markets have been destabilized by economic upheavals. The response must include a renewed commitment to proven market development strategies—particularly title I of Public Law 480.

Mr. Chairman, the coalition urges this Subcommittee to begin restoring the historical commitment to Food for Peace. Our future markets and sustained prosperity for American agriculture will depend upon this initiative, along with others designed to increase farm income over the long term.

PREPARED STATEMENT OF THE ALACHUA COUNTY BOARD OF COMMISSIONERS

Mr. Chairman: Thank you for allowing the Alachua County Board of Commissioners to submit written testimony before your Subcommittee regarding a major initiative for which the County seeks your support.

Alachua County has embarked on a local land conservation program, which the County Commission has selected as one of its highest program priorities for 2000. A separate citizen-initiated referendum called Alachua County Forever is anticipated to raise \$17 million from ad valorem property taxes to match Federal and State land acquisition funds. The County's Land Conservation Advisory Committee (appointed in November, 1999) is finalizing a system to prioritize which local lands should be conserved, and is creating the tools to accomplish these goals. Eastern Alachua County has been included in the St. John's River American Heritage River designation, with three suggested projects. A number of eco-tourism and recreational opportunities are being pursued to capitalize on the County's protection of its natural areas. The County, in cooperation with the City of Gainesville, is actively seeking Federal and State partnerships to achieve its land conservation goal of an emerald necklace comprising gems of conserved natural areas throughout this part of "the Real Florida."

Land acquisition priorities.—Alachua County has five large-scale projects (5,000+ acres) on Florida's Conservation and Recreation Lands (CARL) acquisition list. These include:

- Paynes Prairie additions (a large freshwater wetland and watershed, operated as a State preserve)
- San Felasco Hammock additions (a mature hammock and sandhill forest, with ravines)
- Watermelon Pond (an upland sandhill and scrub forest with important ephemeral wetlands)
- Newnans Lake (a diverse flatwoods forest surrounding a lake with declining water quality)
- Lochloosa Forest (a flatwoods forest, largely in commercial production surrounding two large lakes)

Each of these CARL projects has outstanding land acquisition needs, with State matching money available from Florida Forever (formerly Preservation 2000). The lack of a local source of matching funds has hurt the ability of Alachua County's projects to compete favorably with other local governments which have local land conservation programs, so Federal matching funds (either grants or loans) would greatly assist in finishing the acquisition of these lands before development further fragment them. If the Alachua County Forever referendum passes in November 2000, the County will have a source of matching funds. Federal agencies could help by "challenging" the County with the promise of matching funds for projects of national significance, such as Paynes Prairie.

For this initiative, the City of Gainesville and Alachua County have identified three project areas. The first is Newnans Lake, a large lake in a semi-wild setting with mysteriously increasing eutrophication, yet spectacular recreational and scenic resources. Specific projects requiring funding assistance include: investigations into water quality issues, remedying muck build-up (possibly through a draw-down or mechanical removal), land acquisition (including less-than-fee opportunities with

large forestry companies), a multi-user trail system circling the lake and connecting two existing rail-trails, and the designation and enhancement of an informal, but exceptional canoe trail connecting Newnans and Orange Lake down Prairie Creek and the River Styx. The St. Johns River Water Management District is a willing partner, having made substantial commitments in the past and with expressed interest in continuing to conserve the lands and waters of this area, while enhancing public access.

The second project is to clean-up and mitigate Sweetwater Branch, and its impacts on Paynes Prairie (a National Natural Landmark) as well as the Floridan Aquifer. As one of the major watersheds flowing through eastern Gainesville, this creek has all the problems of urban stormwater and wastewater outfall into natural areas. While substantial funds have been received from Federal sources for the Depot Stormwater Park, the cost of cleaning up this brownfield area is considerably more than the local governments can handle.

The third project is to clean-up and mitigate impacts to Hogtown Creek, the major watershed in western Gainesville. The City and State have acquired over \$3 million of property comprising the Hogtown Creek Greenway, however funds are needed for development of recreational trails, and for sedimentation control. We are seeking an \$10 million in Federal support.

We hope that the Subcommittee will find this critically important project worthy of your support.

Thank you for your consideration.

PREPARED STATEMENT OF THE AMERICAN CHEMICAL SOCIETY

The American Chemical Society (ACS) would like to thank Chairman Thad Cochran and Senator Herb Kohl for the opportunity to submit testimony for the record on the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations bill for fiscal year 2001.

As you may know, ACS is a non-profit scientific and educational organization, chartered by Congress, representing 161,000 individual chemical scientists and engineers. The world's largest scientific society, ACS advances the chemical enterprise, increases public understanding of chemistry, and brings its expertise to bear on state and national matters. ACS firmly believes that no investment the government makes generates a higher rate of return for the economy than research and development (R&D). In fact, economic experts maintain that today's unprecedented economic growth would not have been realized but for the substantial research investments by the public and private sectors over the past few decades. Looking ahead, ACS is concerned that constant dollar declines in federal support for basic research over the past decade, particularly in the physical sciences, have weakened the roots of innovation in all fields and put future economic growth at risk. In order to sustain our technological leadership and living standards, increased funding for basic research should be a top priority for use of the non-Social Security budget surpluses. As a framework for increasing R&D funding, ACS supports doubling federal spending on research within a decade, as well as balanced funding among different areas of science.

U.S. DEPARTMENT OF AGRICULTURE BUDGET RECOMMENDATIONS

The United States Department of Agriculture (USDA) plays a key role in the nation's R&D enterprise. The research supported by the Department through its in-house laboratories and extramural grants is critical to the biological and physical sciences and provides the scientific foundation for a vast array of advances being made in agriculture and related industries. At a time when greater investments in agricultural research are necessary to improve environmental quality, food safety, agricultural productivity, and renewable chemical and energy resources, ACS is concerned that USDA's research budget has decreased 9 percent in constant dollars over the last 5 years. To reverse this decline, ACS recommends that research supported by USDA's Agricultural Research Service (ARS) and the Cooperative State Research, Education, and Extension Service (CSREES) increase by 7 percent or greater in fiscal year 2001.

AGRICULTURAL RESEARCH SERVICE

The Society strongly supports the request for an increase of \$64 million for ARS for fiscal year 2001, a 7.7-percent increase over last year. Strengthening USDA's main in-house research is important for developing the scientific knowledge that provides the foundation for new technologies produced by the private sector. ARS

scientists conduct fundamental and advanced research to address some of the most pressing problems in food quality and safety, pest and disease resistance, and human nutrition.

Increased funding would help ARS continue solving problems for agriculture producers and consumers, while meeting the food and fiber requirements of our nation in a better, safer, and more nutritious way. ARS research can accelerate environmentally sound production practices, increase our understanding of global climate change's impacts on food production, and improve air quality. ACS also supports ARS's key role in funding research on bioenergy and biobased products. This research would benefit the environment by advancing cleaner energy sources that reduce our dependency on imported oil and lower greenhouse gas emissions. Moreover, the development of such fuels and other biobased materials and commercial products—including chemicals, adhesives, lubricants, and building materials—can potentially increase farm income and productivity growth by advancing non-food uses for agricultural technology.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

ACS believes it is extremely important for USDA to expand its support for competitive, peer-reviewed extramural research at colleges and universities. CSREES provides leadership for and develops research and education partnerships with states, land-grant universities, and other research and education institutions. These partnerships are focused on national and regional priorities.

ACS particularly supports the administration's request for a 26-percent increase (\$150 million) for the National Research Initiative (NRI), USDA's hallmark competitive research grants program. The NRI supports highly meritorious fundamental and mission-oriented research in critical areas such as genetics, biobased products, food safety, and pest and disease management. This program has enormous potential to contribute to major breakthroughs in agricultural production but has been hampered by underfunding. Expanding resources for NRI are needed to increase grant size and duration and to encourage outstanding agricultural and other researchers to submit proposals.

CONCLUSION

Overall, USDA research provides a greater understanding of the risks associated with our food sources and helps in the formation of scientifically sound policies that reduce our exposure to harmful substances while enhancing technological advances in food production and distribution. Investing in USDA R&D programs can ensure that U.S. agriculture will remain competitive in international markets, an important factor in ensuring a strong U.S. economy. Growth in USDA R&D funding will help ensure a safe food supply, improve the environmental performance of the sector, and help the food, fiber, and chemical sectors compete internationally.

PREPARED STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION

The American Farm Bureau Federation has identified three USDA program areas for which adequate fiscal year 2000 funding is essential. They are:

- programs key to the proper implementation of the Food Quality Protection Act (FQPA);
- programs to expand foreign markets for agriculture; and,
- funding for research to keep American agriculture competitive.

These priorities are highlighted in the first portion of this statement. The second portion contains a list of additional programs supported by Farm Bureau.

FOOD QUALITY PROTECTION ACT

Farm Bureau supports the administration's request for \$107.3 million to fund USDA's Food Quality Protection Act (FQPA) implementation activities. Proper implementation of this law based on sound science is critical to assure the availability of vital crop protection products.

Agriculture Research Service (ARS).—A total of \$27.131 million is needed for FQPA activities under the ARS as follows: \$6 million for area wide Integrated Pest Management (IPM) research, \$2 million for minor use clearance (IR-4), \$16.5 million for alternatives to methyl bromide, and \$2.58 million for Office of Pest Management Policy.

Cooperative State Research and Extension Service (CSREES).—A total of \$55.3 million is needed for FQPA activities under CSREES as follows: \$2.73 million for IPM research grant, \$12.27 million for IPM application, \$4.2 million for pest man-

agement alternatives, \$260,000 for expert IPM decision support system, \$10.7 million for minor crop pest management (IR-4), \$3 million for crops at risk from FQPA implementation, \$10 million for FQPA risk avoidance and mitigation program for major food crop systems, \$5 million for methyl bromide transition program, \$1 million for regional crop information and policy centers, \$4.64 million for Pesticide Impact Assessment Program (PIAP), and \$1.5 million for pesticide applicator training.

Economic Research Service (ERS).—A total of \$2.5 million is needed for FQPA activities under ERS as follows: \$500,000 for IPM research, \$1.7 million for pesticide use analysis, and \$300,000 for National Ag Pesticide Impact Assessment Program (NAPIAP).

Other.—Additional funding for FQPA implementation activities is needed as follows: \$7.3 million for National Ag Statistics Service (NASS) pesticide use surveys, \$754,000 for Food Safety Inspection Service (FSIS) increased residue sampling and analysis, \$14.28 million for Agriculture Marketing Service (AMS) and the Pesticide Data Program (PDP).

EXPORT PROGRAMS

Creating new overseas markets and expanding those that we have is essential for a healthy agricultural economy. Continued funding of export development programs is fundamental to improving farm income, both in the short and long term. We recommend maximum funding of all export development programs consistent with our commitments under the World Trade Organization (WTO) trade rules.

Public Law 480.—We support increased funding for Public Law 480 programs, the primary means by which the United States provides foreign food assistance. Public Law 480 should be supported at no less than the \$1.1078 billion recommended by the Administration. Enormous opportunity exists for humanitarian and public relations benefits, in addition to an opportunity to impact market prices. The Public Law 480 program should not only be used to help move product to traditional customers, but also be increased to include customers who may not currently qualify for General Sales Manager (GSM) credit.

GSM Credits.—The USDA budget includes funding for GSM credits at a program level of \$3.792 billion. However, recent spending has been much less. Farm Bureau supports full use of funds available for GSM credits during fiscal year 2001.

Market Access Program (MAP) and Foreign Market Development Program (FMD).—Congress should fully fund the MAP at \$90 million and provide necessary funding for FMD. These programs need the expertise of a fully supported Foreign Agricultural Service (FAS) that is expanded to cover all existing and potential market posts.

Export Enhancement Program (EEP).—The FAIR Act provided \$1.5 billion over seven years for the EEP, but the administration has used little of those funds. The fiscal year 2001 budget figure for EEP is \$478 million. The Administration should use EEP to its maximum to maintain foreign markets for U.S. farmers.

Dairy Export Incentive Program (DEIP).—DEIP allows U.S. dairy producers to compete with foreign nations that subsidize their commodity exports. Farm Bureau supports the \$66 million for DEIP as recommended by the administration.

Inspections.—Food safety programs, including inspections of foreign commodities, should be funded at the highest levels possible. Funding should be at least the current budget level of \$771 million.

Sanitary/Phytosanitary Management.—We support the Administration's request of \$9.5 million for Sanitary and Phytosanitary Management within APHIS-International Services to strengthen international foreign animal disease surveillance and intelligence gathering for risk analysis for threats to the U.S. industries.

Codex Alimentarius Commission.—We support a minimum of \$2 million for Food Safety and Inspection Service (FSIS) to increase U.S. leadership in the Codex Alimentarius Commission. Codex develops the international food safety standards for the World Trade Organization. Funding is needed to ensure full U.S. participation in Codex functions.

AGRICULTURAL RESEARCH

Agricultural research and the distribution of that research to producers is critical to the future of our industry. One of the areas of agreement when the 1996 farm bill was enacted was that funding for agricultural research would be increased to allow U.S. producers to maintain their competitive position in world markets.

National Research Initiative (NRI).—Farm Bureau supports the administration's request of \$150 million for the National Research Initiative Competitive Grants Program to the Cooperative State Research, Education, and Extension Service (CSREES). This research provides the keys to the long-term prosperity as farmers

and ranchers strive for greater involvement in more stages of the food supply chain and effective use of new technology.

Animal Genomics.—We support the administration's request of \$1.5 million for animal genomic research in the Agricultural Research Service (ARS.) This will allow ARS to focus on developing genomic approaches for improving economical traits of importance in livestock and poultry that affect animal health and reproductive efficiency.

National Antimicrobial Resistance Monitoring.—We support the administration's request of \$6.3 million to the Food and Drug Administration Center for Veterinary Medicine (CVM) for the Food Safety Initiative. Within this initiative is increased funding for the National Antimicrobial Resistance Monitoring System (NARMS). NARMS is the data collection method that is being used to monitor the level of antimicrobial resistance that will be used to implement science-based standards.

Aquaculture.—The annual value of aquaculture production in 1998 was just under \$1 billion. To stimulate the technology development and enhance domestic production, aquaculture research is vital. The four regional CSREES aquaculture centers should be funded at \$7 million as authorized by Congress. USDA Agricultural Research Service (ARS) funding for aquaculture research should continue at \$19.3 million so that projects begun last year can be completed.

National Animal Health Emergency Management System.—The National Animal Health Emergency Management System was developed in cooperation with the states, industry and the veterinary profession. We support the administration's request of \$5.9 million to APHIS for this program. This will enhance APHIS's emergency preparedness and response capabilities to address emergency animal disease issues that threaten the U.S. food supply.

Emerging Diseases and Exotic Pests Research.—We support the administration's request of \$3.8 million for Agricultural Research Service (ARS) funding for emerging diseases and exotic pests research. The research funding request is urgently needed to develop rapid diagnostics, vaccines, and products necessary to protect our U.S. commodities. Animal Health Monitoring and Surveillance: We support for the administration's request of \$69.5 million to the Animal and Plant Health Inspection Service (APHIS) for the Animal Health Monitoring and Surveillance program line item. There should be specific disease line items for aquaculture, brucellosis, pseudorabies, scrapie and tuberculosis. We support \$17.7 million for veterinary diagnostics and operation of the APHIS National Veterinary Services Laboratory in Ames, Iowa.

ARS & APHIS Laboratory Facilities.—We support the administration's request of \$9 million for the Joint NADC–NVSL–CVB Modernization Plan at Ames, Iowa. This proposal for a joint APHIS and ARS research facility is important to meet national needs for research, diagnosis and product testing for animal health. Secondly, we support the Administration's request of \$7 million for the general maintenance and continued modernization of the ARS foreign animal disease laboratory at Plum Island, New York, and to provide \$3.2 million for the APHIS funding portion of the ARS Plum Island facility. The unique biocontainment facility at Plum Island allows scientists to work safely with foreign and emerging disease agents.

Binational Agricultural Research and Development (BARD).—BARD should be funded at the administration's recommended level of \$2 million.

OTHER ISSUES

Conservation Operations.—We are concerned about adequate Natural Resources Conservation Service (NRCS) conservation operation funding. Conservation program delivery and technical assistance should be a priority for NRCS funding. No new initiatives should be funded in the conservation operations budget. Emphasis should be placed on traditional technical assistance and the development of reliable resource data for assisting producers to deal with nutrient management. We support funding for technical assistance under the Grazing Lands Conservation Initiative.

Environmental Quality Incentive Program (EQIP).—With regard to conservation programs under the Commodity Credit Corporation Program (CCC), we believe that emphasis should be placed on EQIP. EQIP is an important program for assisting producers dealing with increased water quality regulation. We support EQIP funding as proposed by the administration to bring spending to \$325 million.

Forestry Incentive Program (FIP).—We oppose the Administration's zero funding for the Forestry Incentive Program and suggest funding of \$5 million.

Farmland Protection Program.—We support the proposed new funding of \$65 million for the farmland protection program.

Ag in the Classroom.—Most students no longer have firsthand farm experience and, therefore, lack a basic understanding of our food and fiber system. The Agri-

culture in the Classroom program provides real world examples that teach about agriculture production food safety, nutrition and healthy lifestyles, and career opportunities. CSREES funding for this program has been locked at \$208,000 for more than 7 years. Farm Bureau supports an increase to \$1,000,000 for Ag in the Classroom.

Mandatory Price Reporting.—Farm Bureau supports \$5.9 million as proposed by the administration to continue mandatory price reporting for livestock. Increased market news reporting is needed to ensure that all participants have the same access to accurate market information.

Grain Inspection, Packers and Stockyards Administration (GIPSA).—Farm Bureau supports the administration's proposed \$1.2 million increase in funding for efforts to determine anti-competitive behavior and \$1.3 million increase to investigate time-sensitive financial, trade and anti-competitive behavior issues.

Wildlife Services.—Wildlife Services should be funded at \$12.6 million for methods development, and \$31.9 million for operations.

Aerial Application Technology Program.—Farm Bureau supports \$1.3 million for the ARS Aerial Application Technology Program. This funding is needed because of the significant and necessary role aerial application provides to our nation's farmers and because of the need to increase the environmental safety of aerial applications.

Farm Labor Housing Program.—Providing housing for migrant farm workers continues to be a difficult challenge for farm employers and community groups alike. We support the administration's budget proposal to increase the Farm Labor Housing loan programs (Section 514) by \$5 million to \$30 million and the Farm Labor Housing grant program by \$1 million to \$15 million.

Nutrition Assistance Program for Puerto Rico.—Farm Bureau supports efforts to implement an electronic benefits transfer (EBT) distribution system for the Nutrition Assistance Program (NAP) in Puerto Rico, but is concerned about the potential misuse of federal funds intended for nutritional purposes that are currently being distributed in Puerto Rico. We support report language to direct a minimum of 75 percent of NAP funds to be spent on food at businesses that sell food items.

Rural Cooperative Grants.—We support an increase in funding for grants for rural cooperatives from the \$7 million to \$11.5 million. Cooperatives are one way that farmers and ranchers can increase income by retaining ownership of raw agricultural products and turning them into value added products.

PREPARED STATEMENT OF THE AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES

Mr. Chairman and members of the Subcommittee, thank you for allowing me the opportunity to provide testimony for the record in connection with the fiscal year 2001 budget hearings. My name is Steven M. Hollis. I am the President of AFGE Local 3354 at the United States Department of Agriculture, Rural Development and Farm Service Agency (FSA). I hope my comments are helpful to your subcommittee.

RURAL AMERICA SHOULD GET ITS FAIR SHARE!

Family farmers, the ill-housed rural poor, and small rural communities must receive a share of the budget surplus because they are not sharing in the overall growth of the economy! We urge you to do whatever you can to make sure the budget allocations for agriculture and rural development are sufficient to enable the appropriations requested below.

That must be our first request to the Members of this Subcommittee. In addition, we ask Members of Congress to ensure that our tax dollars get to the majority of low-income rural Americans who need help and opportunity. Too much of the recent disaster funding has gone to wealthy landowners, and too little has gone to rural citizens who may no longer be able to farm. The Rural Development mission area—its programs and staff—is just as critical to rural economic recovery as are the Farm Service Agency programs and staff.

RURAL DEVELOPMENT SHOULD GET ITS FAIR SHARE!

Increased Salaries & Expenses funding for the Department of Agriculture's Rural Development mission area is AFGE's No. 1 priority for the Subcommittee's Appropriations for Agriculture, Rural Development, and Related Agencies! Congress should at least, appropriate the \$581 million for Rural Development salaries and expenses in 2001, which was requested in the President's Budget. This is an increase of \$47 million, from almost \$534 million in 2000.

WE CAN'T DELIVER ANY MORE PROGRAMS WITHOUT MORE SALARIES & EXPENSE FUNDING.

Both the House fiscal year 2000 Supplemental Appropriation bill, and the President's fiscal year 2001 budget, include much-needed increases in program funding for Water and Waste Grants, Community Facility Grants, Section 515 Multi-Family Housing Loans, the Rental Assistance Program, Section 502 Single Family Housing Loans, Section 504 Very Low Income Repair Loans, Mutual and Self-Help Housing Grants, Rural Housing Assistance Grants, Migrant and Seasonal Farmworker Grants, and Rural Electrification Loans. These Rural Development (RD) loan and grant programs are just as important, even more so in terms of number of people reached, as the various programs delivered by FSA. Please don't forget—RD needs staff to deliver these programs, just like FSA needs staff to deliver its programs!

Since 1995, the Congress has increased Rural Development programs by 69 percent overall; yet, our staffing levels have been cut by 28 percent.

Our servicing areas in the Field, and our workload in the National and Finance Offices, has doubled or tripled. With decreased staffing, customer service suffers. Almost no funds have been allocated to training for the past three years!

The situation has deteriorated to the point where State Directors have had to stop all overtime work. Use of privately owned vehicles for official travel has been prohibited, and use of government-owned vehicles has been limited to 1200 miles per month. In most states, these restrictions on travel and overtime make it next to impossible for our employees to do our jobs! Timely inspections are not completed. Interviews of potential borrowers have to be conducted by phone. Night meetings of housing developers, water districts, and community development committees cannot be attended.

It is laborers and white and blue-collar workers that are the infrastructure of our rural communities, in addition to our farmers. If we can't provide housing, utilities, and jobs to enable them to be productive taxpaying citizens, how can we say the cost outweighs the benefits? Low-income rural Americans need public servants, with sufficient expense funds to support travel, overtime, training and information technology, to deliver these housing, community, and business development programs.

"If we're going to have meaningful programs supporting family farmers and rural communities, we need to maintain USDA's infrastructure of county offices, with sufficient staff, that is responsible and accountable to deliver these programs." Bill Christison, President, National Family Farm Coalition

Increases requested in the President's Budget for rural housing, community development, and farm loan and grant programs should be appropriated, with minor adjustments.

AFGE urges Members of Congress to appropriate funds to support the following program requests in the President's fiscal year 2001 Budget:

\$1.3 billion in direct loans and \$3.7 billion in guaranteed loans for single family housing.

For the first time since 1993, this is a much-needed increase above the previous year program levels of \$1.1 billion in direct loans and \$3.2 billion in guaranteed loans. It is still way below even the 1994 levels, however, as shown in the enclosed chart.

For many low income rural families the only opportunity they have to improve their housing conditions is through housing assistance offered by the USDA's rural housing programs. The average borrower income for the 502 SFH program is \$15,000. In fiscal year 1997, 44 percent of the loans under this program went to female-headed households and one-third went to minority households. Under the self-help housing program, incomes are about 10-20 percent lower and two-thirds of the families participating in self-help housing are minorities and one-third are female-headed households.

Since its inception in 1950, the Section 502 direct program has produced over 1.9 million units of safe, decent, sanitary housing and supported a variety of innovative housing development opportunities such as the mutual self-help housing program. Over the past ten years, however, the program's production capacity has declined 41 percent, from 26,203 units in 1988 to only 15,561 in 1998. It is even more startling to compare the paltry 1998 production to the over 132,000 units produced in 1976.

The budget authority necessary to support the higher program levels increases from about \$118 million in 2000 to about \$216 million in 2001, due to an increase in interest rates and net of a proposal to raise the fee on guaranteed loans from 1 percent to 2 percent. AFGE would prefer not to see this guaranteed loan fee increased. The guaranteed rural housing loan program attempts to aid families with good jobs and decent credit but with very little to no cash to become homeowners and contributing taxpayers in their communities. Pushing a closing cost total to as

much as 6 percent (\$3,000 to \$4,000) could take the program out of reach for many younger families, or older families on fixed income. It is our understanding that the current 1.0 percent fee has been more than adequate to offset any loss claims we have experienced to date in this program.

\$120 million for direct loans and \$200 million in guaranteed loans for multifamily housing, plus \$680 million for rural rental assistance payments.

The Section 515 Multifamily Housing Loan Program would be funded at \$120 million in 2001, which compares to about \$114 million available for 2000. This program provides direct loans to construct and maintain multifamily rental projects that serve low and very low-income families. Projects receive payment assistance to make rents affordable. The average annual income of a Section 515 tenant is \$7,300. The 2001 budget provides for the construction of 1,400 new units and the rehabilitation of over 4,100 existing units.

The Section 538 Multifamily Housing Loan Guarantee Program guarantees loans that are made by private lenders. It differs from the Section 515 Direct Loan Program in that the projects it finances serve tenants with incomes up to 115 percent of the area median, rather than those below 80 percent of the area median. The 2001 request of \$200 million would provide for the construction of over 6,400 units.

The 2001 budget provides \$680 million for the Rental Assistance Program, an increase of \$40 million over the 2000 level. Rental assistance is provided to project owners to make up the difference between the 30 percent of income the low-income tenant pays and the rent required for the project owner to meet debt servicing requirements. The 2001 budget provides funding for the renewal of over 42,000 units, support for new section 515 and farm labor housing projects, and limited funding for servicing existing projects.

It costs money to house the poorest of the poor, both construction and rental assistance. We subsidize homeownership some \$98 billion per year in the form of interest deductions. Rebuilding the 515 program costs less than homelessness or nursing homes.

A total of \$50 million is proposed for Farm Labor Housing Programs, with \$30 million for direct loans, \$15 million for grants, and \$5 million for emergency assistance to migrant farmworkers.

This is an increase of almost \$3 million from the \$30 million in loans and \$17 million in grants provided in 2000, which included \$3 million in grants and \$5 million in loans in emergency funding. The \$50 million level will improve the availability and quality of housing for one of the most poorly housed groups in the country.

\$507 million in grants, \$1.03 billion in direct loans, and \$75 million in guaranteed loans for water and waste disposal projects.

\$5 million for the Rural Cooperative Development Grants (RCDG) program

\$10 million for Outreach and Technical Assistance Program for Minority Farmers

The Outreach and Technical Assistance program is the most effective tool developed to carry out the mission of USDA as the technical provider for small farmers. For a very small investment, the program has significant multiplier effects in poor communities where there exist few other possibilities for sustainable economic development.

\$700 million for direct farm operating loans and \$2.5 billion for farm operating loan guarantees.

Since the loan limits have been raised to \$717,000, and since the farm economy continues in depression mode, this funding level may not be sufficient.

Our major concern regarding farm operating loans is the years of eligibility restriction placed on direct operating loans in the current Farm Bill. As Congress begins to write new farm policy legislation, we urge the Agriculture Committees to remove the restrictions on years of eligibility for direct farm operating loans, at least for limited resource farmers. Many small farmers may not be able to continue in business from year to year without the option of direct operating loans.

\$128 million for direct farm ownership loans

Funding for direct farm ownership loans would decrease from \$178 million in 2000 to \$128 million in 2001. The magnitude of this reduction reflects the fact that there was some unused carryover in 2000. We have the following concerns regarding the unused funds from 2000, and the funding level of the direct farm ownership loans:

In many states, as much as 70 percent of the farm land will change ownership over the next fifteen years. Unless the direct farm ownership loan program is significantly enhanced, most of that farm land will go to the existing large farms, and the benefits and productivity of family farming will continue to be wiped out.

On the other hand, under current farm policy (which determines commodity prices as shown by USDA data on the last 25 year trends), 100-year low commodity prices make it next to impossible for socially disadvantaged or beginning farmers to purchase land. What many smaller existing farmers need, but can't get through guaranteed private sector loans, is the ability to use their real estate to refinance existing debt. The 1996 Farm Bill eliminated the option of using direct farm ownership loans to refinance existing debt. As Congress begins to write new farm policy legislation, we urge the Agriculture Committees to remove the restriction on use of direct farm ownership loans to refinance existing debt, where that makes the most sense.

AFGE supports the National Association of County Office Employees (NASCOE) request to add \$77 million above the President's request to the Farm Service Agency's Salaries & Expenses, provided the Congress increases the President's budget request for Rural Development Salaries & Expenses by a similar percentage.

However,

FSA should be required to allocate more staff resources to the Farm Loan Programs.

The farm loan functions have been understaffed by about 1600 employees since they were transferred to FSA in 1995. The program management standard for excellence in our direct farm loan programs is that each responsible loan officer should never have a caseload of more than 56 borrowers. Today, our farm loan officers in many states have an average caseload of 150 to 200 borrowers. This makes it impossible to adequately perform the supervised credit functions, which ensure the success of the program. The Appropriations Subcommittees should allocate at least 30 percent (cf. USDA County-Based Agency Study) of FSA's Salaries & Expenses to support of the Farm Loan Program. The Agricultural Credit Insurance Fund could be used for this purpose by changing the legal language and increasing the appropriation for S&E from this account.

AFGE is also asking the Government Affairs/Reform Committees to reject legislation the Department intends to submit to convert County Office employees to the Federal civil service—unless the language is changed to meet our concerns.

We believe that all FSA employees should come under the Federal Civil Service employment system, so that all FSA employees will have the same rights, including the right to collective bargaining, the right to seniority protections in RIF situations, whistle blower protections and other Merit Systems rights and protections. Through the Federal Performance Management system, the Secretary will have the direct authority to hold all employees accountable to the program performance goals of the Department, including Civil Rights goals.

The conversion of the County Office Committee employees to Federal Civil Service status must be accomplished in a manner that is fair to the civil service employees of the former Farmers Home Administration (both FSA and Rural Development) who are represented by the American Federation of Government Employees (AFL-CIO). The problem with past (and current USDA) proposals is that they would allow CO employees to assume responsibilities for aspects of the Farm Loan Program regardless of the employee's experience, training, or qualifications to perform that work. Proposals to "deem" County Executive Directors qualified to supervise FLP activities, without proper training or resolution of conflict of interest concerns, will be opposed by AFGE. So will proposals which would allow former CO employees to use special civil service seniority rights based on years of service in the COC system administering commodity programs to bump current FSA or Rural Development federal employees out of their jobs in a RIF.

Let us be clear: AFGE opposes any further staffing reductions in FSA. We believe the 1996 "Freedom to Farm" bill has failed, and needs to be replaced by a new comprehensive farm and food policy. At the same time, we will continue to fight against any effort to bump any employees we represent out of their jobs in order to save jobs for former CO employees whose programs have been eliminated or cut back.

AFGE believes the No. 1 management improvement needed to achieve a Common Computing Environment, or otherwise more effectively deliver USDA programs to the people we serve, is to reduce the waste of funds for poor quality work that results from current USDA contracting out practices. Until this problem is addressed, we cannot support other Administration proposals to improve management of the Information Technology and administrative support functions!

An increasing amount of work, which could be performed more effectively by USDA employees, has been contracted out without even performing a cost comparison, in the name of "reducing government". As the Chairman and other Members of this Subcommittee have noted, the too many front-line USDA employees have been cut! We can no longer adequately deliver programs to rural America! And we're not really any closer to a Common Computing Environment than we were with InfoShare in 1990! The Service Center Implementation and Modernization Initiatives have been over-relying on private contractors. These contractors have no business interest in accomplishing a Common Computing Environment for USDA front-line employees—then they would be out of a job!

Before USDA takes any other steps to "improve management of Information Technology or administrative support," the 11,000-plus service contracts should also be put on the table for review. We hope to work with the Chairman and Members of this Subcommittee to place language in the Agriculture Appropriations bill that will require USDA to perform cost comparisons on all major service contracting decisions, and to bring the work back in-house wherever that would be more cost effective.

Appendix I documents these concerns relative to the information technology support functions for the Rural Development, NRCS, and Farm Service agencies.

Additional examples of problems with contracting out which have been provided to our Union through extensive interviews and surveys of Field Office employees include the following:

"It takes a month to receive an appraisal and it can mean a difference between us funding a loan or running out of money. Appraisals can be done quicker by the employees. . . ."

"FP year-end analysis, chattel checks, and 1951-S servicing help—very poor quality in most cases—These functions should always be performed by an in-house government employee. . . . We are supposed to be a servicing agency. How can we contract out to analyze the farmer's next year's production and expenses, and help the borrowers. If we are going to be farmer friendly, we need to do our own work."

"Loan making/loan servicing contractor—\$20,000–\$25,000 per year. Appraisal contracting—approx. \$22,700 per year. The administrative cost of contracting was not included in above. Am sure this cost would be staggering, considering the process we go through. I have shown the District Director the savings in performing the work ourselves rather than contracting out. Over 2 million dollars a year could be saved each year in the state of Montana alone. A GS-7 Asst. Co. Supervisor could be hired for each of the 24 county offices in Montana at an annual salary of \$23,000 plus benefits of approximately \$5,000, and provide each assistant with a \$10,000/year training budget for less cost than contracting. The end result would be better quality work performed in a timely manner at less cost to the taxpayer. To me, this satisfies the criteria desired by this administration. Better service at less cost!"

Appendix II contains the language that AFGE proposes be added to the Agriculture Appropriations bill. It is based on language from H.R. 3766, which already has over 100 co-sponsors, including Ms. Kaptur and other Members of the Agriculture Appropriations Subcommittee in the House. AFGE can only support the appropriation of the \$75 million requested by the USDA Chief Information Officer if such funding will not reduce the funding available to any of our priorities, identified above, and only if USDA works with labor, instead of working against labor, to stop contracting out when Federal employees can do it better.

APPENDIX I—USDA OVER-RELIANCE ON COMMERCIAL SUPPORT CONTRACTS FOR INFORMATION TECHNOLOGY

The real point about balancing the budget should be taxpayer dollars, not Federal employee jobs. We need to ensure that Administrative Convergence (in any form) does not just lead to replacing Federal employees with more expensive contractors who can't do as good a job. AFGE is very concerned about this, because in DOD and other agencies, the Administration has consolidated administrative functions—and then tried to contract them out. The following numbers come from the Agencies' A-11 submissions to OMB, reporting on "Obligations for Information Systems".

(In thousands of dollars)

	Commercial Support Services	Personnel
Fiscal year 1993:		
ASCS	39,029	27,657
FAS	4,366	3,033
OICD	183	245
FCIC	8,572	3,627
FmHA/RDA	40,627	36,181
REA	618	1,506
SCS	17,419	38,131
Fiscal year 1998:		
FSA	90,894	44,898
FAS	7,252	4,206
RMA	8,597	15,048
RD	26,148	25,516
NRCS	23,223	
Percent Change (1993–1998):		
FSA/FAS/RMA ¹	+ 51	+ 30
RD	– 36	– 60
NRCS	+ 25	– 33

¹ Some amount of the Rural Development decrease, and the FSA increase, from fiscal year 1993 to fiscal year 1998, consisted of the transfer of Farm Credit functions from FmHA/RD to FSA.

During 1998, an Information Technology Functional Team, consisting of labor and management from the IT organizations of Rural Development, NRCS, and FSA, developed “Information Technology Contracting Recommendations”. This official agency document recommends that Federal staffing for IT support be increased, through reductions in more expensive contractor personnel, as the “least cost solution” when considering total cost to the government of contracting out. The reason for this conclusion was simple: the cost of the average Federal Information Technology staff year is \$69,250 whereas the total cost per contract staff year support of “average complexity and skill” is \$119,733. It costs \$50,000 per FTE less, on average, to utilize Federal employees, rather than contractors, to provide Information Technology support to the USDA county-based agencies!

APPENDIX II—PROPOSED LANGUAGE ON CONTRACTING OUT FOR THE FISCAL YEAR 2001
AGRICULTURE APPROPRIATIONS BILL

SEC. ____ . None of the funds appropriated or otherwise made available by this Act or any other Act shall be available to privatize, outsource, contract or contract out, including the exercise of options, extensions, and renewals of any contracts, except in accordance with the following procedures:

(a) IN GENERAL.—After the date of the enactment of this Act, any decision by the Secretary or any Agency of the Department of Agriculture to privatize, outsource, contract or contract out, including the exercise of options, extensions, and renewals of any contracting efforts, for the performance of a function shall be based on the results of a public-private competition process that—

(1) formally compares the costs of Federal employee performance of the function with the costs of the performance by a contractor;

(2) employs the most efficient organization process described in OMB Circular A–76; and

(3) is conducted in consultation or through bargaining with the exclusive representative of the Federal employees performing the function, if applicable. This subsection applies only to contracting efforts undertaken on or after the date of the enactment of this Act.

(d) DETERMINATION OF COSTS.—The Secretary or any Agency of the Department shall commence or continue the performance of a function by Federal employees if, under a cost comparison performed pursuant to a public-private competition process described in subsection (a), the Secretary or the Agency determines that at least a 10-percent cost savings would not be achieved by performance of the function by a contractor.

(e) INAPPLICABILITY OF CERTAIN LIMITATIONS.—Notwithstanding any limitation on the number of Federal employees established by law, regulation, or policy, the Sec-

retary or an Agency of the Department may continue to employ, or may hire, such Federal employees as are necessary to perform work acquired through public-private competition required by this section.

(f) WAIVER.—(1) The provisions of this section shall only apply to service contracts above the \$25,000 formal contract threshold. In no case may a function be modified, reorganized, divided or in anyway changed for the purpose of exempting from the requirements of section (a) the change of all or any part of such function to performance by a private contractor.

(2) Any component of the Department may submit to the Deputy Secretary a request for a waiver of this section with regard to a particular function. Such a waiver request shall

- (A) identify the facilities, units, or activities affected;
- (B) specify the reason a waiver is needed;
- (C) identify the duration sought; and
- (D) explain the justification for the waiver.

(3) The Deputy Secretary may grant a waiver with regard to a particular function if the Deputy Secretary determines that a waiver—

(A) is necessary to obtain support services to combat natural disasters, such as forest fires, insect infestations, plant and animal diseases, which require immediate attention, exceed the capacity of in-house resources, and will last for less than one year;

(B) is critical to obtain particular expertise not available within the Department, or unbiased judgements as in environmental impact studies, and will last for less than one year; or

(C) is required to avoid a violation of laws which encourage the use of minority owned businesses.

(4) The Deputy Secretary may not grant a waiver under this section until—

(A) the Agency has consulted with the employees in the affected unit regarding the waiver;

(B) the waiver request has been concurred in by the exclusive representative of the Federal employees in the affected unit, where applicable; and

(C) the Deputy Secretary has published the request for the waiver in the Federal Register.

PREPARED STATEMENT OF THE AMERICAN HONEY PRODUCERS ASSOCIATION, INC.

My name is Richard Adee. I am President of the American Honey Producers Association, Inc. and I am submitting this statement in its behalf. The American Honey Producers Association, Inc. is a national organization of commercial beekeepers with activities in most of the States in this country.

First, the Association wishes to thank you for the support the Subcommittee has provided in the past for agricultural research activities in behalf of the beekeeping industry. It has enabled the Agricultural Research Service to staff its bee laboratories at the minimum level necessary to meet with critical needs of the industry. To continue this research, the Association supports approval of the President's budget proposal for an additional appropriation of \$300,000 in fiscal year 2001 for bee research at the ARS facility at Weslaco, Texas. The Association also recommends an increase of \$300,000 in the level of funding for the ARS honey bee breeding, genetics, and physiology laboratory at Baton Rouge, Louisiana.

Background.—Honey bees pollinate over 90 cultivated crops whose estimated value exceeds \$14.6 billion and produce an average of 200 million pounds of honey annually. Since 1984, the survival of the honey bee has been threatened by continuing infestations of mites and pests for which appropriate controls have not yet been developed and research must provide the answers. Unfortunately, there is no simple solution to these problems. The honey bee industry is too small to support the cost of the needed research, particularly with the current depressed state of the industry. As you know, there are no longer any federal subsidies on honey. Further, there are no funds, facilities, or personnel elsewhere available in the private sector for this purpose. Accordingly, the beekeeping industry is dependent on research from public sources for the scientific answers. The key to the survival of the honey industry lies with the honey bee research program conducted by the Agricultural Research Service.

Research at the ARS Weslaco, Texas, Laboratory.—Parasitic mites, primarily the varroa mite, are causing a crisis for the U.S. beekeeping and pollination industry. Tens of thousands of domestic honey bee colonies are being lost annually to varroa mites. Wild bee colonies have been decimated. The only chemical which has received a general registration for varroa mite control, fluvalinate, is being rendered ineffec-

tive by the development of resistant mite populations. The USDA honey bee lab at Weslaco, Texas, has been working hard trying to find alternative chemicals to control the varroa mite. It appears that they have found a chemical, coumaphos, which has the potential of being equally effective as fluvalinate. This is a real break through for the bee industry, but as of today we have only been able to obtain a section 18 emergency registration. Much work still remains to be done before a section 3 general registration is granted by EPA.

A new pest, the small hive beetle, found in Florida has caused severe bee colony losses. Apparently, it originated in South Africa. Estimates put the losses in just one season at over 30,000 colonies. There is evidence that the beetles are spreading to other areas in the East coast. As the beetles spread, they will just devastate the bee industry. In order to contain the beetle, several states have quarantined bees from Florida, North Carolina, South Carolina, and Georgia or are actively considering such quarantines. If the beetle should be found in California, it will spread rapidly and be difficult to control because of similarity of soil conditions with those in Florida. It seems that coumaphos may help control this insect as well as the varroa mite, but as previously stated it has not received a section 3 registration and it is unclear when such a registration will be granted by EPA.

The USDA-ARS honey bee research scientists at the Weslaco laboratory have been working overtime to find chemicals, techniques, pheromones, or other methods of controlling the beetle. Time is of the essence, as a control must be found immediately as all the bee colonies in the Western Hemisphere are at risk.

Additionally, the Weslaco lab is responsible for finding new and improved methods for control of other parasitic mites, such as the tracheal mite, as well as solving beekeeping problems that interfere with honey production and effective crop pollination, and determining the impact and spread of Africanized honey bees.

The additional appropriation recommended by the Administration would help in finding a chemical solution to our most pressing problems.

Research at the ARS Baton Rouge, Louisiana, Laboratory.—The Association also recommends an increase of \$300,000 in the appropriation for the ARS laboratory at Baton Rouge, Louisiana. The Baton Rouge lab is the only laboratory world-wide focusing on the development of long-term, genetics-based solutions to the varroa mite. Their research programs have taken them to the far corners of the world looking for mite resistant bees. In eastern Russia, they found bees that have co-existed for decades with the mites and survived. The bees were brought to the United States and are in the process of being evaluated to assure that the resistance holds up under a wide range of environmental and beekeeping conditions. Attributes such as vigor, pollination, and honey production are being tested. There is an immediate need to propagate the resistant queen bees in large numbers for wide scale distribution to beekeepers so that this evaluation can be accomplished. The work is slow and tedious. It is also costly. The requested appropriation will accelerate the research, development, and transfer of queen bee stock resistant to varroa mites by providing for the employment of another research scientist and supporting staff.

Summary.—In conclusion, we wish to thank you again for your support of honey bee research in the past. We would appreciate your continued support by approving the additional funding of \$300,000 that the Administration would add to the fiscal year 2001 appropriation for the Weslaco, Texas, lab, by adding another \$300,000 to the appropriation for the Baton Rouge bee facility, and by otherwise supporting the Administration's request for bee research. Only through research can we achieve and maintain profitability in the U.S. beekeeping industry and continue to provide stable and affordable supplies of bee pollinated crops which make up fully one-third of the U.S. diet.

I would be pleased to respond to any questions that you may have.

PREPARED STATEMENT OF THE AMERICAN INDIAN HIGHER EDUCATION CONSORTIUM

INTRODUCTION

Mr. Chairman and Members of the Subcommittee, on behalf of the American Indian Higher Education Consortium (AIHEC) and the 30 Tribal Colleges that comprise the 1994 Land-Grant Institutions, we thank you for this opportunity to share our funding requests for fiscal year 2001.

We respectfully recommend the following funding levels for fiscal year 2001 for our 1994 programs. Specifically, we request: \$5 million for our extension grants program; \$7.1 million for the Native American endowment fund, and report language that will give the Tribal Colleges the flexibility to use this funding to address the critical infrastructure needs at the 1994 Institutions; \$3 million for our equity

grants; \$3 million for our 1994 research program; and \$1.7 million for institution capacity building grants. These requested funding levels are fully supported by the National Association of State Universities and Land Grant Colleges (NASULGC) and are included in their fiscal year 2001 budget recommendations.

This statement will cover two areas: First, it provides a brief background on the Tribal Colleges and our long-awaited inclusion in this nation's land-grant system; and second, it lays out the 1994 Institutions' ambitious plan through our authorized land-grant programs to fulfill the agricultural potential of American Indian communities and to ensure that American Indians have the skills needed to maximize the economic development potential of our resources.

BACKGROUND ON TRIBAL COLLEGES

Today, almost 140 years after enactment of the first land-grant legislation, Tribal Colleges, more than any other institutions, truly exemplify the original intent of the land-grant legislation. The first Morrill Act was enacted in 1862 specifically to bring education to the people and to serve their fundamental needs. This is the definition and mission of the Tribal Colleges. We truly are institutions by, of, and for our people.

The dismal statistics concerning the American Indian experience in education brought tribal leaders to the realization that only through local, culturally-based education could many American Indians succeed in higher education and help bring desperately needed economic development to the reservations. In the late 1960s and early 1970s, the first Tribal Colleges were chartered by their respective tribal governments, to be governed by boards comprised of local tribal people. These first colleges were started, with little money and a lot of determination, in abandoned and even condemned government buildings and old trailers, often using three-legged desks, wood crates for shelves and typewriters with missing keys. In 1972, six tribally-controlled institutions came together to form the American Indian Higher Education Consortium. Today, AIHEC is a cooperatively sponsored effort and integral support network for 33 member institutions in the United States and Canada, 30 of which are 1994 Land-Grant Institutions.

Located in 12 states, Tribal Colleges and Universities now serve more than 25,000 students from over 250 federally recognized tribes. Tribal Colleges offer primarily two-year degrees, with some colleges offering four-year and graduate degrees. All of the Tribal Colleges, with the exception of four institutions that are accreditation candidates, are fully accredited by mainstream regional accreditation associations.

Tribal Colleges serve as community centers, providing libraries, tribal archives, career centers, economic development and business centers, public meeting places, and child care centers. Despite our many obligations, functions, and notable achievements, Tribal Colleges remain the most poorly funded institutions of higher education in this country. Most of the 1994 Institutions are located on federal trust territory; states have no obligation and in most cases, do not fund the Tribal Colleges. In fact, most states do not even fund the institutions for the non-Indian students who attend our colleges despite the fact that non-Indian enrollment at the Tribal Colleges averages 20 percent.

1994 LAND-GRANT PROGRAMS—AMBITIOUS EFFORTS TO REACH ECONOMIC DEVELOPMENT POTENTIAL

Current land-grant programs at the Tribal Colleges are modest, yet, our 1994 authorizing legislation is vitally important to us because of the nature of our land base. Of the 54.5 million acres that comprise American Indian reservations, 75 percent are agricultural lands and 15 percent are forestry holdings.

Tragically, due to lack of expertise and training, millions of acres lie fallow, under-used, or have been developed through methods that render the resources non-renewable. The Educational Equity in Land-Grant Status Act of 1994 is our hope for turning this situation around. It is essential that American Indians learn more about new and evolving technologies for managing our lands. We are committed to becoming, as we were when your forefathers came to this land centuries ago, productive contributors to this nation's—and the world's—agricultural base.

Extension Program.—Recent years show impressive efforts to address economic development through land use, as 1994 Land-Grants enter into partnerships with 1862 Institutions through extension projects. Our extension program represents an ideal combination of federal resources and Tribal College-state institution expertise, with the overall impact being far greater than the sum of its parts. Some examples of the innovative programs that are funded through competitively awarded extension grants include:

—United Tribes Technical College and North Dakota State University Extension Service are collaborating to provide diabetes prevention education to Native Americans through the creation of an Inter-Tribal Diabetes Education Center. Diabetes has spread epidemically in Indian Country. Through nutrition, health and wellness education programs, which are culturally appropriate and community supported, participants will have a greater understanding of how to control and even prevent this disease. The first phase of this vital project is now underway through a survey to determine the health habits and diet intake of Tribal College students statewide. This nutrition study will provide baseline data to share with tribal stakeholders and will assist in developing relevant health and wellness educational programs.

—The Native American Pastoral Textile Project at the Institute of American Indian Arts in Santa Fe, New Mexico provides educational outreach through workshops and seminars to utilize traditional methods of weaving natural fibers into products that can be widely marketed generating revenue that will help families and their communities achieve economic self-sufficiency.

Additional funding to support such efforts is needed because extension services provided by the states on our reservations are woefully inadequate, and the Tribal Colleges need to fill the gap. It is important to note that this program is not duplicative of ongoing extension activities, as it is specifically designed to complement and build upon the Indian Reservation Extension Agent program.

In fiscal year 2000, the 1994 institutions were awarded \$3,060,000 for extension grants. We request that Congress build on the \$3.5 million proposed in the President's fiscal year 2001 budget, and raise funding for this vital program to \$5 million, the authorized level.

Native American Endowment Fund.—The endowment installments paid to the 1994 Institutions, remains with the U.S. Treasury, only the interest is distributed to our colleges. It is important to note that these funds are not scored as current budget outlay or authority. The fiscal year 1999 interest payment distributed among the thirty 1994 Land Grant Institutions totaled \$980,913.

Just as other land-grant institutions historically received large grants of land or endowments in lieu of land, this sum assists the 1994 Institutions in establishing and strengthening our academic programs in such areas as curricula development, faculty preparation, and instruction delivery. As earlier stated, Tribal Colleges often serve as primary community centers. Although conditions at some have improved substantially, many of the colleges still operate in trailers, cast-off buildings, and facilities with crumbling foundations, substandard and exposed wiring and leaking roofs. In order for the 1994 Institutions to become full partners in this nation's great land-grant system we need and deserve the facilities and infrastructure necessary to engage in education and research programs vital to the future health and well-being of our reservation communities. We respectfully request Congress to build this much needed endowment by increasing the endowment fund payment to \$7.1 million for fiscal year 2001, and further support this program with report language giving the 1994 Institutions the flexibility to use the interest income from this fund to address the critical infrastructure issues so prevalent at the Tribal Colleges.

1994 Institutions' Educational Equity Grant Program.—Closely linked with the endowment fund, this program has for the last two years provided almost \$52,000 per 1994 Institution to assist in academic programs. Given that current authority for this program is \$50,000 per Institution, this level of funding reflects recognition by Congress that the current authorization is simply insufficient. The fiscal year 2001 budgets of the USDA and the Administration also, acknowledge that the 1994 Equity Grant program has outgrown its current authority by requesting funds above the authorized level. We respectfully request that the Subcommittee expand on this program and fund it at \$3 million to allow the colleges to build upon the courses and activities that the initial funding launched. Through the appropriations made available since fiscal year 1996, the Tribal Colleges have been able to begin to support vital courses and planning activities specifically targeted to meet the unique needs of our respective reservations. Some examples of this include:

—Fort Peck Community College in Poplar, Montana has designed a program to strengthen the college's instructional delivery system by providing telecommunication courses and workshops from Montana State University (MSU) Bozeman, MSU Northern and Rocky Mountain College, in business and Agribusiness. The program has also allowed Fort Peck to hire an administrative assistant for community outreach services, and offer programs that promote home economics through Native customs, values and traditions.

—Northwest Indian College (NWIC) has used its Equity Grant funds to develop and implement a Bachelor of Technology degree program in Natural Resources Management, with options in (1) Fisheries and Shellfish Management (to in-

clude Aquaculture and Processing); (2) Water Quality Management; (3) Environmental Technology; and (4) Forest and Land Use Management. NWIC has chosen to combine its share of the interest income from the Land-Grant Institutions Endowment Fund with the Equity fund to achieve the goals of this project. Other Tribal Colleges have started courses and programs in natural resource management; environmental sciences; horticulture; forestry; as well as in dietetic programs and buffalo production and management, which are helping to address the chronic problem of diabetes among American Indian people.

1994 Research Program.—We are requesting increased funding for our research program, which was authorized in the Agriculture Research, Extension, and Education Reform Act of 1998, at “such sums as necessary”. The program was initially funded in fiscal year 2000 at \$500,000. We recognize the budget constraints that Congress is working under yet, with 30 institutions competing for these research dollars, we feel the President’s suggested level of \$1 million is simply not adequate. Therefore, we respectfully request an appropriation of \$3 million with the intention of building this funding over time to a level adequate to address the pressing agricultural and nutritional research needs of the communities we serve.

This research program is vital to ensuring that Tribal Colleges finally become full partners in this nation’s land-grant system. Many of our institutions are currently conducting applied agriculture-based research projects, yet they struggle to find the resources to conduct this research and meet their communities’ needs. Some of the projects in progress include soil and water quality projects; amphibian propagation; pesticide and wildlife research; range cattle species enhancement; and native plant preservation for medicinal and economic purposes. We urge the subcommittee to fund this program at \$3 million allow our institutions to develop and strengthen their research potential.

1.7 million Institutional Capacity Building Grant Program.—This competitive grant program, which requires a non-federal match, would provide the 1994 Institutions with the investment necessary to allow us to strengthen and more fully develop our educational infrastructure. Facilities maintenance and improvement are urgently needed at Tribal Colleges, many of which are still operating in donated, abandoned and even condemned buildings. As discussed earlier, many of our colleges are in serious disrepair with leaking roofs, asbestos insulation, exposed wiring, and crumbling foundations, being the norm rather than the exception. The results of a recent needs assessment suggest that a minimum of \$120 million is needed just to address the critical safety issues at the nation’s Tribal Colleges. These improvements are needed to provide American Indian students with the education necessary to fully compete in the modern agricultural world.

CONCLUSION

The 1994 Institutions have proven to be efficient and effective tools for bringing education to American Indians and bringing opportunity and hope for self-sufficiency to some of this nation’s poorest regions. The modest federal investment in the Tribal Colleges has already paid great dividends in terms of employment, education, and economic development, and continuation of this investment makes sound moral and fiscal sense. American Indian reservation communities are second to none in their need for land-grant programs and no institutions better exemplify the original intent of land-grant concept than the 1994 Institutions.

We appreciate your long-standing support of the Tribal Colleges and are grateful for your commitment to making our communities self-sufficient. We look forward to continuing our partnership with you, the U.S. Department of Agriculture, and the other members of the nation’s land-grant system—a partnership that will bring equal educational, agricultural, and economic opportunities to Indian Country.

Thank you.

PREPARED STATEMENT OF AMERICAN RIVERS

Mr. Chairman and Members of the Subcommittee on Agriculture, Rural Development, and Related Agencies, on behalf of more than 450 conservation and recreation organizations, community groups, religious affiliations, companies, and other groups across the country, American Rivers would like to thank you for the opportunity to testify before you today.

We urge you to support increased funding for Natural Resources Conservation Service soil and water conservation programs, including \$400 million for the Environmental Quality Incentives Program (EQIP) and \$25 million for the Wildlife Habitat Incentives Program (WHIP).

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

We urge you to appropriate \$400 million for EQIP, a voluntary program designed to help farmers and ranchers facing threats to soil, water, and other natural resources develop successful resource conservation practices. The program provides financial, technical, and educational assistance to help landowners implement conservation plans that address issues such as nutrient management, manure management, integrated pest management, irrigation and water management, and wildlife habitat management. Participants join in five- to ten-year contracts that provide financial incentives and cost sharing to implement these conservation practices.

Appropriating \$400 million for EQIP will permit the Natural Resources Conservation Service (NRCS) to meet demand for assistance, increase conservation opportunities for low-income farmers, and more effectively target watersheds and subwatersheds that are significant contributors of nutrients.

WILDLIFE HABITAT INCENTIVES PROGRAM

We urge you to appropriate \$25 million for WHIP, which provides financial incentives to landowners to voluntarily develop and implement practices that will protect and preserve important wildlife habitat. By helping improve wildlife and fish habitat, WHIP can help improve the quality of life for participants and have a positive impact on local economies. According to the Fish and Wildlife Service, wildlife watchers spent \$29.2 billion on trips, equipment, and other related expenditures in 1996 alone.

WHIP is a valuable tool for restoring aquatic habitat, adjacent streambanks, and uplands, benefiting many species of wildlife and fish. In Maine, WHIP has restored habitat for Atlantic salmon and brook trout and critical habitat for other important fish and wildlife species. In Illinois, seventy-five counties secured a total of 333 WHIP contracts through fiscal year 1999, covering 7448 acres.

We urge you to increase funds for NRCS programs that conserve our soil and water resources, including \$400 million for the Environmental Quality Incentives Program and \$25 million for the Wildlife Habitat Incentives Program.

Thank you for your consideration of our requests. We strongly believe that these funding levels will be excellent investments in the long-term health of our nation's watersheds, the urban and rural communities they serve and the economies they sustain.

 PREPARED STATEMENT OF THE AMERICAN SEED TRADE ASSOCIATION

Mr. Chairman and members of the Subcommittee, we appreciate this opportunity to provide you with our views on the fiscal year 2000 agricultural appropriations bill. The American Seed Trade Association (ASTA) strongly urges you to provide a \$20 million increase for the USDA National Plant Germplasm System for fiscal year 2001.

The ASTA, founded in 1883, is one of the oldest trade associations in the United States. With over 900 members, the ASTA is the premiere advocate for the seed industry and related interests. Our diverse membership consists of the leading companies that are developing, providing, supporting, and promoting new varieties that hold tremendous promise and opportunity for farmers and consumers everywhere.

Our request for a \$20 million increase for the NPGS is the number one appropriations issue and the number one legislative issue for ASTA. This increase will allow seed companies to meet the diverse challenges facing our customers. Support for significant increases to the NPGS goes well beyond industry; we, also, have the support of our customers and the scientific community since they recognize that this will pay huge dividends. In addition to ASTA, the following organizations support a \$20 million increase for the NPGS:

- American Farm Bureau Federation
- American Society of Agronomy
- American Soybean Association
- Association of Seed Certifying Agencies
- Crop Science Society of America
- National Association of Wheat Growers
- National Barley Growers Association
- National Corn Growers Association
- Society of American Florists.

This past year, the Department of Agriculture, also, recognized the need for a significant increase for the NPGS when it requested an increase of \$19.4 million for the NPGS in its fiscal year 2001 budget submission to the OMB. Unfortunately, the

OMB reduced the increase to the \$5.6 million level included in the Administration's budget request. While we appreciate the increase, it is simply not sufficient to maintain the NPGS.

The NPGS germplasm collections underpin crop-breeding efforts throughout the U.S. Preservation of and filling gaps in the base collections is a unique Federal responsibility. The NPGS:

- acquires germplasm;
- develops and documents information on the germplasm;
- preserves and distributes germplasm; and
- maintains quarantine facilities for testing imported germplasm for pests and pathogens before introduction in the U.S.

Many of the challenges confronting the U.S. can be met through the application of plant-based technologies. Continued use of and access to a broad diversity of germplasm is necessary, if we are to develop varieties to meet new and changing circumstances and if we are to sustain agricultural productivity. The improvement of plants is based on the utilization of genetic diversity. Unless we have a wide diversity of genetic resources, there will be nothing available, eventually, to improve plants or to prevent plants from becoming genetically susceptible to plant pathogens.

With sufficient genetic resources, we will have an abundant, safe, nutritious, and affordable supply of food and fiber that is produced in an environmentally friendly manner and that ensures a reasonable return for our farmers and livestock producers. In addition to food and fiber, American agriculture can provide continually renewable resources for a wide range of consumer products if diverse genetic resources are available and accessible to U.S. scientists and plant breeders.

Narrow genetic bases can result in widespread crop losses. For example, in 1970, Southern corn leaf blight cost farmers 15 percent of the corn crop; in the 1950s and early 1960s, about 70 percent of the wheat crop in the Pacific Northwest was wiped out by stripe rust; and the Irish potato famine of the 1840s was the result of the reliance on only a single variety of the potato. Breeders must have open access to extensive, well-maintained, and well-documented genetic resources.

Preserving the genetic diversity of plants is essential to the future of agriculture as the genes to add new traits, such as tolerance to diseases and resistance to insects, are often present in wild relatives of the major crops. Wild ancestors and relatives of cultivated plants give us the sustained ability to develop new varieties. Most of the U.S. crops raised and used for food, fiber, ornamentals, and industrial feedstocks originated from outside of the U.S. Consequently, the plant breeding community is highly dependent upon germplasm from other countries, some of which is endangered. Once lost, the germplasm cannot be fully reconstructed.

To ensure that these genetic resources are accessible and that they remain available, the NPGS must obtain a significant increase in funding. In 1991, the NPGS reported that an annual budget of \$40 million would be required to remedy shortfalls in secure storage, backup, evaluation, and development of core germplasm collections. Funding for the NPGS has not come close to approaching the \$40 million considered as necessary in 1991. We recognize the tight budget constraints under which the Subcommittee must operate; however, the following list outlines the precarious situation of the NPGS:

- Funding for the NPGS has declined by more than 14 percent, in constant dollars, since 1992, jeopardizing vital germplasm;
- Lack of funding has resulted in decreased supplies of germplasm that limits distribution and impedes the progress of research and breeding programs;
- 93 percent of all clonally-propagated samples and 19 percent of all seed samples are not duplicated and are at high risk of catastrophic loss, which could result in lost opportunities for biodiversity and, perhaps, a wonder drug;
- No backup has been made for citrus and nearly all tropical fruit crops in the NPGS collections, due to lack of funds to develop effective storage methods;
- Long-term backup methods do not exist for many clonal crops and will not be developed without a significant infusion of funds;
- Without a significant infusion of funds, many of the clonally-propagated crops in the collection will remain at risk of catastrophic loss;
- NPGS cannot assume that duplicates of "lost" germplasm can be obtained elsewhere;
- Internationally, destruction of natural habitats, limited gene bank capacity, inadequate management, and lack of consistent funding has left much of the world's germplasm at high risk of loss;
- Acquisition of endangered germplasm will slow or stop completely without an increase in funding;

- Due to funding constraints, the Plant Germplasm Quarantine Office has found it necessary to establish quotas for importing germplasm thereby restricting the amount of materials available to U.S. scientists and plant breeders;
- Funding is insufficient for the Quarantine Office to take full advantage of molecular diagnostic techniques;
- 99.9 percent of the germplasm accessions at Griffin, GA, and 68 percent of the accessions at Pullman, WA, have not been tested for viability within the past 10 years due to lack of funding;
- At least 30 percent of all NPGS accessions need to be regenerated during the next couple of years and with current funding it will take at least 9 years;
- 18 percent of NPGS accessions are unavailable for distribution primarily due to lack of funding; and
- Without an increase in funding, many NPGS sites will be unable to pay for utilities, general operations, and facility repairs.

To fulfill its mission to provide access to diverse genetic resources, the NPGS must have a balanced program that includes (1) acquisition of germplasm to fill gaps in the collections and to preserve endangered germplasm; (2) maintenance and preservation of germplasm with secure backups to prevent loss; (3) adequate documentation and characterization of the germplasm; (4) sufficient supplies of viable seeds to allow for distribution; and (5) quarantine facilities that make germplasm available in a timely manner. The steady decline in available funding has had an extremely negative impact on the ability of the NPGS to have a balanced program.

The above problems are just a few of the many that are plaguing the NPGS due to the lack of adequate funding. However, they are jeopardizing the security of the U.S. food and fiber system. As some plant breeders have stated, genetic diversity is the engine that drives plant breeding. Without new sources of genetic variation, plant breeders cannot make improvements. Without improvements, we will be unable to ensure the continued economic viability and security of our food and fiber system.

The NPGS is a fundamental, strategic resource that we cannot afford to jeopardize. Without a significant infusion of funds, the NPGS will not be able to ensure the preservation of important germplasm. Our very existence and posterity hinges on our ability to provide breeders with the blueprints and genetic codes necessary to ensure new, plentiful foods, fibers, consumer products, and drugs. If the NPGS is not funded at a sufficient level, we will have lost opportunities for biodiversity and, perhaps, lost the germplasm for a possible wonder drug or the cure for some dreaded disease. The consequences of not funding the NPGS adequately are severe. The NPGS is a good investment for taxpayers and for the American consumer.

We strongly urge you to provide an increase of \$20 million for the NPGS for fiscal year 2001. We recognize that this will be difficult and that there are many competing priorities for limited resources; however, we cannot afford to be complacent about the fundamental resources that underpin our entire future.

Thank you for the opportunity to present ASTA's views on the importance of the National Plant Germplasm System. We look forward to working with you to ensure that the NPGS is able to provide the germplasm necessary for U.S. agriculture to meet the demands and challenges of the 21st Century.

PREPARED STATEMENT OF THE ASTA CORN AND SORGHUM BASIC RESEARCH
COMMITTEE

SUMMARY

We are requesting \$500,000 be appropriated annually for enhancing corn germplasm.

- Corn is a key resource providing food, industrial uses, livestock feed, and export.
- Corn production in the U.S. is based on less than 5 percent of corn germplasm available in the world. Broadening the germplasm base would provide genes to improve yields and protect against new disease, insect and environmental stresses. Exotic germplasm would also be a source for changes in grain quality being demanded by export markets, industrial processors, and other end users.
- Most exotic germplasm is unadapted to growing conditions in the U.S. This proposal is a joint USDA/ARS, university, and industry effort to adapt this material, so that it can be used by commercial breeders in the development of new hybrids to meet the demands of the American consumer and our foreign markets.

- We greatly appreciate the \$500,000 previously appropriated for this research, beginning with the 1995 Federal budget. This funding is supporting the two main USDA/ARS locations involved in this research (Iowa and North Carolina), as well as USDA/ARS and university locations in Delaware, Illinois, Iowa, Missouri, Ohio, New York, Tennessee, Texas and Wisconsin. Industry is providing \$450,000 in-kind support annually for this effort.
- The additional appropriation of \$500,000 annually would enable the Iowa and North Carolina locations to purchase equipment and add staff necessary for carrying out this research. It would also provide funding for the increased germplasm evaluation and breeding necessary to test and enhance the exotic materials available.

BACKGROUND

Corn is the major crop on the cultivated land of the U.S.A. where approximately 75 million acres are planted each year. U.S. corn production, accounting for about half of the world's annual production, adds over \$16 billion of value to the American economy as a raw material. About 20 percent (\$3.2 billion) of this production is exported each year, thereby providing a positive contribution to the nation's trade balance. Approximately 17 percent of the yearly corn crop is industrially refined. A portion of the refined products is exported resulting in an additional \$1.4 billion in export. Through feeding livestock, the rest of the crop is processed into meat and dairy products that affect everyone in our society. Corn is a key resource within our country.

CONCERNS

All of this production is based on using less than 5 percent of the corn germplasm available in the world. Less than 1 percent of our commercial corn is of exotic (foreign) origin, and tropical exotic germplasm is only a fraction of that. This situation exists because private sector corn breeders have generally concentrated on genetically narrow based, or elite by elite, sources for their breeding efforts, since their use results in getting hybrids to the marketplace faster.

Traditionally, corn has been treated as a commodity. In recent years corn grain users and processors have become more interested in the quality characteristics of the grain itself and how this affects their business. Since much of the exotic germplasm has undergone selection for many indigenous uses (foods, beverages, etc.) by various cultures, it seems likely that new grain quality characteristics will be found in exotic germplasm rather than the narrow-based germplasm now used. A small increase in value to the grain, such as 10 cents per bushel, would increase its annual value by \$800 million for an eight billion bushel harvest.¹

Breeders must still be concerned with breeding for higher yields so that U.S. corn farmers can remain competitive. Tapping into the broader germplasm pool could provide new sources of genes for higher yield and other performance traits, such as disease and insect tolerance or improved stalk and root strength.

A further concern with a narrow genetic base is the potential for widespread disease or insect damage due to new diseases or insect species spreading into U.S. corn growing areas. It is more likely that resistance to these dangers would be found in genetically diverse exotic germplasm sources than in our breeding material. One major benefit would be reduced pesticide use. In addition to protection against diseases and insects, these exotic materials provide insurance for unforeseen climatic or environmental problems.

LAMP PROJECT

What would be the source of this exotic germplasm? Over the years, collections of corn have been made from farmers' fields and other sources all over the world, and are stored in various germplasm banks. In 1987, the Latin American Maize Project (LAMP) was initiated to evaluate these corn collections (accessions). It was a cooperative effort among 12 countries to identify accessions that might provide valuable source material for further improvement in hybrid and open-pollinated cultivars in the U.S.A. and other areas. Pioneer Hi-Bred International gave USDA/ARS \$1.5 million to fund the LAMP research.

Nearly 12,000 maize (corn) germplasm accessions were evaluated. In successive stages, the project identified the top 268 accessions. The environmental areas of ad-

¹ Salhuana, Pollak, Tiffany 1994. Public/Private Collaboration Proposed to Strengthen Quality and Production of U.S. Corn through Maize Germplasm Enhancement, Diversity Vol. 9, no. 4, 1993/Vol. 10, no. 1, 1994.

aptation for these 268 “elite” populations range from temperate to tropical, and are prime candidates for enhancing the U.S.A. corn germplasm base.

GERMPLASM ENHANCEMENT

Most of this germplasm is unadapted to growing conditions in the U.S. and requires genetic enhancement to make it adapted, or able to grow and mature in our environmental conditions. Enhancement basically means that these exotic materials will be bred with U.S. adapted materials and breeders will select progeny that carry the desired exotic traits and are also adapted to U.S. growing conditions. This will require a concerted long-term breeding approach by corn breeders at numerous locations (environments) throughout the U.S. Only after this process of enhancement will these exotic materials be ready to enter commercial corn breeding channels and be effectively utilized by a broad cross-section of the industry in the development of new hybrids for farmers and corn users.

The total process of enhancement is too large and long-term for public institutions and/or seed companies to accomplish individually. An ambitious task of this nature can only be completed through a coordinated and cooperative effort between the USDA/ARS, land-grant universities, and industry.

The Corn and Sorghum Basic Research Committee of the American Seed Trade Association has been concerned that enhancement of this exotic germplasm would proceed. The Committee consists of representatives from about 30 companies actively involved in the corn and sorghum seed industry, and at the committee's request, Dr. Linda Pollak, Research Geneticist, USDA/ARS, et al, developed a proposal for enhancing exotic germplasm starting with materials which will include the elite LAMP accessions as noted above. This proposal has developed into the U.S. GEM (Germplasm Enhancement of Maize) Project.

U.S. GEM PROJECT OUTLINE

Since this project serves a national need, the primary effort and direction has come from the USDA/ARS. Two permanent USDA/ARS locations are being used as primary sites for enhancement breeding and coordination. One is in Ames, Iowa, where the USDA/ARS currently conducts corn evaluation and enhancement efforts. Dr. Linda Pollak, Research Geneticist, is located there. Dr. Pollak was the Principal Investigator of the U.S.A. for LAMP, and is the lead scientist for this project.

The other permanent site is the USDA/ARS location in North Carolina. This site has responsibility for initial evaluation and conversion of the tropical materials. Tropical corn populations normally will not reach maturity in the Corn Belt, but will produce seed in North Carolina. After initial enhancement of the tropical materials in the South, they will be sent to Ames for further enhancement and testing in Corn Belt conditions. Dr. Marty Carson is in charge of this program.

A number of corn researchers at various land-grant universities and other ARS locations are also taking part in the enhancement and evaluation of this exotic germplasm. This cooperative effort is very important and serves not only as a source of improved germplasm but also provides excellent training for future plant scientists.

Industry is also involved. Due to the success of the GEM program, an initial group of 19 companies has increased to a total of 27 companies that have pledged research nursery and yield trial plots to be used in this breeding effort. This in-kind support is valued at \$450,000 per year.

An important component of the project is an annual meeting of all cooperators to evaluate progress and plan strategies. An information network has been established to keep everyone up-to-date. A U.S. GEM Technical Steering Group consisting of members from USDA/ARS, University, and Industry has been formed for guidance and administration of this cooperative effort.

This germplasm enhancement project is public and is open to all public sector institutions as well as private seed companies. Information will be freely available and publicly developed materials will remain in the public domain, accessible to all.

ACCOMPLISHMENTS IN 1996–1999

Following is a description of accomplishments and research conducted at various locations using 1996–1999 funding.

Ames, Iowa.—Priorities for the corn enhancement work at this location are overall project coordination, data analysis and management, management and release of enhanced germplasm, analysis of materials for value-added traits, and as one of the many breeding sites. To date, 186 hybrids from crosses with GEM breeding lines have beaten the average of commercial check hybrids in trials analyzed in Ames.

The laboratory is continuing to evaluate oil, starch, and protein in the exotic accessions and in the breeding populations made up of exotic materials crossed to proprietary corn belt inbreds. In results from 1996, a line from one breeding cross measured total protein of 16 percent (corn belt germplasm has 10 percent) and total oil level of 6 percent (corn belt is 4 percent). It is extremely unique to find increased levels for both of these traits in the same line, and it is potentially very useful for food and feed applications. In 1997, lines were identified with unique starch characteristics, which may be beneficial for human food products. In 1998, three lines were identified with high percent retrogradation, which may have applications as a new source of dietary fiber or as a dry lubricant. Other lines were found to exhibit certain potentially useful traits, such as low protein (5.1 percent), high protein (15.4 percent) and high starch content (73.6 percent). In 1999 five lines were found with improved starch quality (three for improved gelatinization and two for Peak Height Index) and several lines were identified with enhanced fatty acid content.

GEM's World Wide Web site opened on July 15, 1996. From this site cooperators can obtain the latest data from yield tests, disease and insect screening, and value-added trait research, as well as news and upcoming events.

Raleigh, North Carolina.—The focus of this location is twofold. One priority is to develop enhanced material adapted to the Southern U.S. corn growing conditions. The second is to be a stepping stone for adapting tropical material to Midwest conditions.

Breeding populations were tested for resistance to various leaf diseases and stalk rots. Selections were made for improved material with resistance to these diseases as well as for improved yield, standability, and adaptation to southern U.S. conditions. For example, in 1997 significant resistance to *Fusarium* ear rot was found in four GEM breeding populations. Resistance to *Aspergillus* ear rot was also found in two of these same four populations. Hybrids of about 55 advanced breeding lines developed from tropical by elite breeding populations yielded equal to or outyielded the mean of commercial check hybrids over two years. These lines are now candidates for release.

Other public cooperators conducted evaluations and are finding many positive results in 1999 as follows: Grain quality in Delaware and Ohio. Yield data accumulation in Georgia, North Carolina, Maryland, Tennessee, Kentucky, Missouri, Texas and Delaware. Starch quality and disease resistance in Illinois. *Fusarium* ear rot resistance in Iowa. Wet milling properties, starch functionality, and other value added grain traits in Iowa. Aflatoxin resistance, corn earworm tolerance and grain quality in Texas. Resistance to corn rootworm in Missouri. Resistance to anthracnose stalk rot in New York. Breeding in Tennessee. Evaluation of silage quality in Wisconsin.

Demonstration nurseries were planted at Iowa and North Carolina for viewing by cooperators. Fall field days were held at Iowa and North Carolina.

In 1999, private cooperators continued the breeding and adaptation of about 15 accessions following the protocol developed by the GEM Technical Steering Group. Companies increased their nursery and yield trial in-kind support by approximately 25 percent in 1996. In 1999, six additional private cooperators joined GEM and are providing in-kind support.

RESEARCH IN 2000

Research will continue at the various USDA/ARS, university, and company locations similar to 1999.

EFFECTS OF INCREASED FUNDING BEGINNING IN 2001

Appropriation of the additional \$500,000 annually would provide funds to increase research in the following ways:

Ames, Iowa.—The increase in the integrated field and laboratory experiments and breeding projects requires the addition of a field technician (GS-7). Continuation of the postdoctoral position for value added trait research (after a one year hiatus) would provide for the study of food technology aspects of the unique traits being discovered. A graduate research assistant would study the inheritance of these value added traits, developing invaluable information for the breeding effort. A database management system has been purchased, which needs additional programming to meet GEM needs. By nearly tripling the amount for public cooperators, it would greatly enhance the data gathering and adaptation breeding of these materials in the various States where these cooperators are located.

Raleigh, North Carolina.—This location has a number of equipment needs, such as a seed storage unit, because current facilities are filled to capacity and a minivan for transportation. A technician would be added to handle the expanded field work.

Current resources restrict testing and development work to relatively few breeding populations. With the increased funding, the number of breeding crosses could be increased, greatly speeding up the introduction of adapted GEM material into private and public breeding programs. Additional funding would provide for yield trial testing at more locations and more extensive disease and insect resistance screening, greatly increasing the precision in selecting materials that are high yielding and have high levels of pest resistance.

Other Public Cooperators.—The increase in funding for public cooperators (to \$266,250 per year in the third fiscal year) would allow for full evaluation and development of new breeding materials improved for productivity as well as disease and insect resistance and value-added traits. Most public cooperators are willing to participate, but cannot unless they have at least partial funding. There are approximately 30 public cooperators now in many States, and as the project develops we are likely to have more.

CONCLUSION

Corn hybrids in the U.S. have a very narrow genetic base, utilizing only a small percentage of all available corn germplasm. This greatly increases vulnerability to unforeseen pest problems, and may lead to an eventual yield cap. Exotic corn germplasm could provide genes for resistance to pest problems and for increased yields. These exotic materials may also contain quality traits to meet new market demands. This will help ensure the U.S. maintains its world leadership in providing the best raw materials to meet the demand for the production of meat, eggs, milk, and many other food and industrial uses.

The LAMP project identified the top 268 corn accessions from among 12,000 populations evaluated. The present proposal represents a joint USDA/ARS, land-grant university, and industry effort to enhance these and other exotic accessions so that they can enter commercial corn breeding programs. The result of this cooperation will be an increase in the productivity, quality, and marketability of hybrid corn in the U.S. and for export, benefiting the farmer, the feed and processing industries, and the consumer.

Therefore, the ASTA Corn and Sorghum Basic Research Committee hereby requests the 106th Congress of the United States to add funding of \$500,000 (in addition to the \$500,000 appropriated initially in 1995, for a total of \$1,000,000) annually for this corn germplasm enhancement project beginning with the 2001 Federal budget.

BUDGET SUMMARY

This is a summary of the operational and capital budgets for 2000, 2001, and 2002. The budget is divided into the Corn Belt Location and corresponds to Ames, Iowa (USDA-ARS) and the cooperators in the Corn Belt area. The Southern Location corresponds with Raleigh, North Carolina (USDA-ARS) and the cooperators in the States in the South. For a complete copy of the budget, please contact Dr. David Harper, Holden's Foundation Seeds LLC, Box 839, Williamsburg, IA 52361 or 319-668-1100.

Items	2000	2001	2002
Corn Belt Location:			
Board Reductions	\$20,200	\$20,900	\$21,500
Personnel	142,100	248,700	271,270
Office/Field	52,800	68,700	70,980
Capital Equipment	24,900	80,450	55,000
Specific Agreements for Public Cooperators ¹	60,000	181,250	181,250
Total for Corn Belt Location	300,000	600,000	600,000
Southern Location:			
Personnel	68,600	113,000	115,400
Indirect Costs	16,213	13,363	13,363
Office/Field	30,187	43,637	45,237
Capital Equipment	5,000	65,000	41,000
Specific Agreements for Public Cooperators ¹	30,000	65,000	85,000

Items	2000	2001	2002
Total for Southern Location	150,000	300,000	300,000
Summary:			
Corn Belt Location	300,000	600,000	600,000
Southern Location	150,000	300,000	300,000
USDA/ARS Overhead	50,000	100,000	100,000
Grand Total	500,000	1,000,000	1,000,000

¹Specific Agreements for Public Cooperators: Agreements for public cooperation can be made with universities and ARS scientists in many locations which could include the following States: Delaware, Ohio, Pennsylvania, Indiana, Illinois, Wisconsin, Kentucky, Missouri, New York, Iowa, Michigan, Minnesota, North Dakota, South Dakota, Nebraska, North Carolina, Mississippi, Georgia, Louisiana, Texas and Tennessee. Research at these locations would include selection for disease and insect resistance, evaluation for value added traits, and yield trials.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR NUTRITIONAL SCIENCES

The American Society for Nutritional Sciences (ASNS) is the principal professional organization of nutrition research scientists in the United States representing 3,000 members whose purpose is to develop and extend the knowledge and application of nutrition science. ASNS members include scientists involved in human as well as animal nutrition research. Our members hold positions in virtually every land grant and private institution engaged in nutrition-related research in the United States as well as industrial enterprises conducting nutrition and food related research.

ASNS wants to express gratitude for the work that this committee did last year, on both sides of the aisle, to help maintain competitively awarded agricultural research in the National Research Initiative Competitive Grants Program (NRICGP) against many other worthy competing programs. However, significant growth in fiscal year 2001 for the NRICGP is needed to help set the course for increased emphasis in the critically emerging areas such as genomics and genetics. While genomics is being studied under NIH and NSF funded grants, they have not addressed the areas of the genetic influence on nutrient requirements of individuals, nutrient gene interactions, and nutrient metabolism on the genetic basis of diseases in their intramural grants programs. These areas easily fit into the purview the of USDA's NRI mission. ASNS supports these and other key elements that will enhance cross-cutting areas of nutrition research having broad health outcomes.

The President's Budget for fiscal year 2001 calls for a net increase of \$31 million above fiscal year 2000 funding for the NRI. We strongly endorse this substantially needed investment, plus an additional \$73 million that would provide the NRICGP with \$203 million in fiscal year 2001.

We know there would be concerns from this Committee and the Congress about how the competitive grants program might absorb such a substantial increase and effectively manage any new competitive initiatives. At this time we offer some suggestions as to how USDA's CSREES may incorporate such an increase so that the funds are effectively managed for the best possible health research outcomes. ASNS encourages Congress to urge department officials to consider administering all ongoing and new initiatives through a centralized office. This allows new grant administrators to take advantage of the investment and experience of an established program. Our Society stresses that the NRICGP use the model of other federal agencies that have more than one review cycle per year. Two or three cycles per year would allow for timely resubmission and encourage institutions to provide bridging funds for quality programs. However, despite the potential for further advancement, the USDA research budget has actually decreased in constant dollars by nine percent in the last five years. Currently only 25 percent of qualified grants receive funding. Consequently, inadequate funding limits the productivity of researchers that the NRICGP is able to fund and deters researchers from spending valuable time writing additional grant proposals. Furthermore, NRICGP awards are small, averaging \$133,210 in fiscal year 1999, and short, averaging 2.3 years for a total average support of about \$60,000 each year. Though, according to a the Federation of American Societies for Experimental Biology (FASEB) Federal Funding Consensus Report for fiscal year 2001, it is important to note that the number of applications received in

fiscal year 1999 increased by 157 over fiscal year 1998 following an increased appropriation to the program's budget.¹

A recent report from the National Association State Universities and Land Grant Colleges (NASULGC) stated that research and development funding for space exploration, the environment, basic science research, and health research has increased in constant dollars from 23 to 58 percent over the last ten years. But during this same time period, the funding for agricultural research and extension programs, the lifeblood of our food supply system, has shrunk by eight percent in constant dollars. Base funds have eroded by 16 percent. These funds support the scientists and extension educators who can respond quickly and effectively to unexpected problems that arise for producers and consumers. The benefit is a food system that enables the consumer dollar and the welfare family's food stamps to purchase inexpensive, safe, and nutritious food. A food system that creates jobs, competes worldwide, and conserves its natural resources base.²

RESEARCH FUNDING MECHANISMS AND ISSUES:

Competitive Grants

A competitive system for allocating Government research funds is the most effective and efficient mechanism for focusing efforts on cutting edge research aimed at improving the health of the American people. Competitive grants provide the most effective, efficient and economic return to the public. ASNS strongly supports the competitive grants process as reflected in the National Research Initiative and believes that an open, merit and peer review process, applied as extensively as possible throughout the research system, is the best way to distribute research funds among qualified scientists.

Initiative for Future Agriculture and Food Systems (IFAFS)

IFAFS calls for priority mission areas to be addressed: food genome; food safety; food technology and human nutrition; new and alternative uses and production of agricultural commodities and products; agricultural biotechnology; and natural resource management. The Initiative also includes provisions that allow merit/peer review and lets those who benefit from agricultural research provide input about the priority setting process. ASNS supports this Initiative and urges members of this sub-committee make it a funding priority in fiscal year 2001.

National Needs Fellowship Grants Program

Another important area where funding has remained stagnant is the National Needs Fellowship of the Graduate Fellowship Program at the Higher Education Office of the USDA. This program fills an important need to help train the next generation of agricultural researchers. Despite its importance, funding for the program has seen a dramatic decline in recent years after peaking in 1996 at \$5 million. ASNS endorses \$5 million for the National Needs Program so that it may be restored to its previous funding levels. We also support the review and subsequent reorganization of USDA-sponsored graduate training.

Special Grants

ASNS strongly believes that the best research results come from research that is peer reviewed. That is why researchers funded by federal agencies, such as the NIH and the NSF, that award grants on merit have made such great progress. There is a potential danger that special grants and earmarked research funds from USDA may be awarded on the basis of politics rather than merit, priority or research need. Therefore, the perception might be that the integrity of the research system and agricultural science is undermined. Last year special grants were appropriated at nearly \$74 million even though the Administration's request for this year was less than half of that figure. We recognize that there is pressure to maintain these special grants. While special grants have their place to address emergency needs of national priority such as food safety, they may also be used to address research that is not deemed of the highest priority or merit. Thus, the proportion of special grants in comparison to the total research budget at USDA should be decreased.

THE NEED FOR NUTRITION-RELATED RESEARCH

The need for nutrition science and research is critical within the USDA. Nutrition and agricultural research are areas that impact the constituents of every congress-

¹ Federal Funding for Biomedical and Related Life Sciences Research Fiscal Year 2001, Federation of American Societies for Experimental Biology, 2000, p.15.

² Investments that Make a Difference, National Association of State Universities and Land-Grant Colleges, Fiscal Year 2000 Budget Proposal.

sional district in the nation. New technologies are demanded to reduce the likelihood of pathogen transmission by food, to improve the quality of processed foods, and to deliver greater nutritional value in foods. Additionally the economic impact on society in healthcare costs produced by advances in nutrition research is significant in the number of dollars saved by the American taxpayer. As health costs continue to rise, it is imperative that our medical practices take a preventive approach. This requires a thorough understanding of the role of nutrients in foods in preventing chronic illnesses such as heart disease, cancer and diabetes.

The USDA has a unique role in the area of nutrition research, particularly as it applies to human nutrition. For example, although there is a serious and obvious commitment to the funding of disease-related research within the National Institutes of Health, issues important to the basic mechanisms of nutrient function and the safety of the food supply have traditionally been the purview of USDA funded research. Most of the recent work on nutrient content and availability in various foods has come from USDA-NRI supported research. From a consumer perspective, it is this type of information that is often the most useful.

FOOD SECURITY AND BEHAVIORS

A 1994 Institute of Medicine Report stated that reducing foodborne illness will require research in all aspects of the food system, from production to consumption.³ For example, identifying the foods most involved in foodborne illnesses, characterizing new foodborne pathogens, and developing new monitoring protocols are some ways to detect pathogens or toxicants responsible for outbreaks and minimize their impacts. Studies are also needed to identify food behaviors and nutritional effects in relation to more vulnerable populations such as infants and the elderly. Also, knowing more about health protectants will enable individuals to maximize the nutrition and "healthfulness" of their food choices relative to the prevention of disease. The need also exists to better understand the biology and behavior of food choices. Here we also need to study consumption related to risk analysis which demands better data on food consumption.

BIOTECHNOLOGY AND NUTRITION

Increased interest in enhancing the nutritional quality of the food supply has sparked ways to design foods not just for disease prevention but also for health promotion. For example, opportunities exist to influence food habits and food choices, by using technology to enhance healthful foods.

Ultimately we will want to know what compositional changes in crop plants have the best nutritional value. There are many basic questions left unanswered on the role of diet in health and disease when it comes to phytonutrients in plants.

USDA is encouraged to collaborate with other federal agencies in the area of nutrition whenever possible. This objective naturally spans research done in both the USDA and NIH.

GENETICS AND NUTRITION

Studying genetic interactions will allow us to address several issues at once. For example, what intakes of nutrients are needed to achieve optimal health and minimal risk of various diseases associated with diet? Do requirements differ depending on genetics? How do genetics influence efficiency of metabolism and does this affect nutrient requirements? What are metabolic and health consequences of inadequate nutritional status, as affected by genetics? Many research opportunities exist in this area.

GENOMICS AND NUTRITION

ASNS supports a recent report from the Federation of American Societies for Experimental Biology that states, increased funding should bring an emphasis on all aspects of genomics. Such an initiative would significantly enhance existing programs within the NRI. One example might be functional genomics. ASNS has provided detailed scientific background about this kind of research to USDA program directors at a recent stakeholders meeting.

Research and resources devoted to unraveling the genomes of a few selected organisms have been expanding dramatically in recent years. While the administration of large-scale programs has been placed in agencies other than USDA, the power and long-term impact of a large-scale genome initiative directed toward agriculturally important organisms—including animals, plants, and microbes (plant, animal

³ Opportunities in the Nutrition and Food Sciences, Institute of Medicine, 1994, p. 111.

and human pathogens)—represents a major opportunity and fulfills an important need in agriculture.

USDA's NRICGP is well positioned to use genomic data to address programs in agriculturally important organisms. However, given its present budget—and even with the most optimistic incremental increases—the NRICGP currently lacks the resource depth to meet this challenge. Portions of our proposed increase would be wisely used in the critically important area of genomics.

ANIMAL WELFARE ACT

Research using animals has been crucial to virtually every advance in medicine in the past century. Agents for control of high blood pressure and the management of diabetes, vaccines for the control of poliomyelitis and mumps, development of artificial joints and heart-lung machines, and many more medical advances have depended on animal research.

USDA's Animal and Plant Health Inspection Service (APHIS) is charged by Congress to enforce the Animal Welfare Act (AWA). Under the AWA, USDA licenses dealers to buy and sell random-source animals to research facilities that are unable to obtain them from municipal pounds and shelters. This provides access to a critical supply of animals since animals bred specifically for research often lack characteristics needed by researchers studying health-related problems. Much of their work relies on older, larger, and genetically diverse animals.

ASNS recommends that Congress provide APHIS with adequate funding for enforcement of the Animal Welfare Act in fiscal year 2000 so that it can continue to ensure compliance with the AWA.

CONCLUSION

Agriculture is and will continue to be important to human health in terms of food that provides proper nutrition for healthier people. As the future challenges us with more complicated diseases, research must expand outside the traditional disciplines and approaches, such as the work that is being done in plant and animal genomics. New approaches must be implemented to address new societal concerns. For example, despite our hard efforts to plan healthy diets for school children much of this food is being wasted. Nutritionists are constantly challenged to develop nutrient-balanced meals that will encourage our children to choose more healthful foods. New demands to fit busy lifestyles is another example. Issues such as product convenience, uniformity of products, ease of preparation, "automatic" nutrient balancing, and packaging are all areas scientists must address. Research in areas of how our food is produced, pesticide usage, animal care and food handling issues also present demands to our scientists. These demands and opportunities must be answered in a way that sustains or enhances our quality of life. Although greater challenges lie ahead, agricultural research funding continues to have slow growth despite significant increases at other research agencies such as the NIH and NSF.

It is for these reasons that ASNS reiterates the following recommendations to the sub-committee:

- Increase funding for USDA's NRICGP from \$119 million to \$203 million, of which a portion should be allotted for a genomics initiative.
- ASNS recommends \$120 million for the Initiative for Future Agriculture and Food Systems in which human nutrition research remains a research priority.
- Provide an increase of \$5 million to the National Needs Fellowship Grants Program so that it may be restored to its previous funding levels.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR MICROBIOLOGY

FOOD AND DRUG ADMINISTRATION

The Food and Drug Administration (FDA) plays an essential role in protecting the nation's health. The Agency enters the 21st century with rapidly expanding responsibilities and an urgent need for more resources. The American Society for Microbiology (ASM), which represents over 42,000 members, believes the Administration's proposed FDA budget for fiscal year 2001 is a good first step toward providing increased support for the critical public health activities of the FDA. The nearly \$1.4 billion budget requested for FDA by the Administration represents an increase of 13 percent, or \$176 million over the fiscal year 2000 enacted level.

Providing an adequate budget for the FDA is essential because the nation's burgeoning medical and food research efforts will result in steadily increased numbers of products before the FDA for review. This review must be based on solid, state-of-the-art science, which requires financial resources and trained personnel. The fis-

cal year 2001 budget request recognizes the importance of FDA's traditional dual roles: that of ensuring the highest level of safety for already marketed products, and that of ensuring in a timely fashion the release of new products that benefit the American public.

FDA research should be recognized as an important component of the nation's overall biomedical research program and should receive increased attention and funding. Every FDA decision which influences public health must be based on current, highest quality research.

With its focus on the microbiological sciences, the ASM fully appreciates the complexity and critical nature of the FDA's efforts to manage health risks to humans and animals, to develop new scientific research within the Agency itself, and to interact effectively with the public, industry and academia alike. Several specific areas of the FDA mission are of particular interest to the ASM membership and demonstrate the need for additional resources: FDA research in the Center for Biologics Evaluation and Research (CBER) which enables FDA to respond to scientific and technological advances, vaccine safety, blood safety, gene therapy safety and diagnostics related to infectious diseases; FDA capacity to respond to food safety involving foodborne pathogens and antibiotic resistance acquired by pathogenic microorganisms and to reduce the number of deaths from medical errors; and FDA participation in U.S. bioterrorism preparedness to ensure an adequate program in this country.

FDA RESEARCH

The ASM strongly supports budgetary increases to improve FDA's science base. The FDA must be given the resources to keep pace with accelerating technology and to take advantage of scientific opportunities to best serve the American public.

Basic research by the FDA's Center for Biologics Evaluation and Research contributes to the Agency's ability to respond to escalating product market in a timely and knowledgeable manner. The ASM recommends adoption of the Administration's fiscal year 2001 budget request for increased support of CBER and its research efforts, at a time when the demands on the FDA's expertise are growing rapidly.

To ensure the fruits of the nation's biomedical research successes, the FDA will face complex, often unexpected, demands in this new century, as both science and public needs change and change again over time. We can predict challenges, such as continued safety of our blood supply and enlarging stockpiles of vaccines to counter potential bioterrorism. Others, such as still unknown microbial pathogens and expanding antibiotic resistance, can only be anticipated. Not only must the FDA have at hand the latest in known technology, it must consistently develop innovative ways to eliminate future threats to public health and remain able to adapt rapidly to ever new challenges.

In the past 20 years, expenditures in drug research have increased seven-fold, resulting in more and more potential products in need of science-based evaluation by the FDA. Although the FDA is not a basic research agency, it must be able to respond to constant changes in both its consumer constituency and the challenges it faces daily. Thus research is an important component of its broad based mission. In the face of a rapidly shifting research environment, the FDA, like all research agencies, must stay at the forefront of scientific knowledge, through both the efforts of its own scientists and the communication with others involved in safeguarding public safety. It must be able to recruit and retain high quality personnel capable of adapting to consumers' concerns, changes in the marketplace, the varied threats to public health, and new processing practices by the growing numbers of product producers. This enormous task mandates strong fiscal support from the Congress, sustained over time and into the future.

FOOD SAFETY AND ANTIBIOTIC RESISTANCE

The ASM commends the Congress' and the Administration's support in recent years of the national Food Safety Initiative, a collaborative program of the FDA, the Centers for Disease Control and Prevention, and the U.S. Department of Agriculture. The \$30 million requested by the Administration for this important initiative in fiscal year 2001 will support program goals already underway, including expansion of domestic food inspection, development of nationwide standards for on-farm and in-plant preventive controls, further research on molecular methods to rapidly identify foodborne pathogens, and completion of the National Antimicrobial Resistance Monitoring System.

The Food Safety Initiative is just one example of science-based success in the past year. In addition to the National Antimicrobial Resistance Monitoring System, two other national systems to assure food safety are now in place: FoodNet, a foodborne

disease tracking system, and PulseNet, a computerized database of bacterial DNA subtypes to help determine whether scattered disease outbreaks are due to a common food source. The FDA recently developed a method to detect as many as 13 foodborne pathogens in one suspected food sample. Several outbreaks of foodborne illness were shortened in the past year, in part through the efforts of the FDA and its partners in food safety.

Food production and consumption patterns have changed considerably in recent decades. New foodborne pathogens, more meals prepared and eaten away from the home, more complicated food processing methods multiply the possibilities of contamination. Some foodborne pathogens have become far more deadly in recent years, such as pathogenic *E. coli* and antibiotic resistant *Salmonella*. The local food market is now part of a global grocery store, a system of imported and exported foods that must be regulated by the FDA. And the populations most vulnerable to foodborne diseases, such as children and the elderly, have increased to account for as much as 25 percent of the U.S. population further complicating the FDA's mission as protector of public health.

MEDICAL ERRORS

As the nation's population ages and becomes more diverse, the health care system becomes more stressed, more susceptible to human and technological errors. This has been and continues to be a major area of concern to the FDA, as the Federal agency charged with product safety. A recent study by the Institute of Medicine estimated that nearly 100,000 Americans may be dying each year as a result of preventable medical errors. Part of this disturbing situation can be attributed to human error, part to an exploding array of drugs, medical devices, blood and other biological products used in health care settings.

The \$12.8 million requested to respond to preventable medical mistakes will help assure the safety of vaccines, therapeutic agents, blood products, medical devices and other tools used by the U.S. health care industry—an important step toward minimizing the number of deaths.

BIOTERRORISM

Unfortunately, the threat of a biological attack against American citizens must be taken seriously, and U.S. preparedness for an emergency response is essential. There is need to ensure expeditious development and licensure of new vaccines for smallpox, anthrax and other biological agents that might be weaponized. The ASM recommends that Congress provide the requested \$11.5 million to FDA to help counter bioterrorism and work, in collaboration with NIH, CDC, DOD, academia and private industry, to ensure the development of vaccines, diagnostics and therapeutics to be used in response to selected biological and chemical agents. The FDA needs resources to expeditiously review and approve new drugs, therapeutics, vaccines and anti-toxins against biological warfare agents in the interest of national security and public health.

CONCLUSION

Through its many and diverse responsibilities, the FDA provides the United States with not only an improved national health but a collective peace of mind. Much of its work is never recognized, as the FDA often works behind the scenes to benefit the American public. The Agency provides tangible results such as prevention of foodborne disease through systematic monitoring of production facilities and screening of the blood supply. FDA approval of the Hemophilus influenzae type B vaccine will save the United States an estimated \$150 to \$400 million annually in health care costs. The FDA is also targeting as a principal concern medical errors, which are estimated to cost as much as \$80 billion a year. FDA researchers contribute as well to the scientific knowledge base, thus enhancing new product development by industry and public research organizations, and helping the United States remain a world leader in new product development.

The ASM thanks the subcommittee for the opportunity to submit testimony and would be pleased to respond to any questions.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR MICROBIOLOGY

RESEARCH AND EDUCATION PROGRAMS

The U.S. agricultural system is one of the most productive and efficient in the world, due in part to past technological innovations. Agricultural research plays a

crucial role in promoting the nation's economic growth, improving environmental quality, and assuring innovative scientific research. Federal support for agricultural research is essential, in order to build the broad knowledge base needed to commercialize new and improved agricultural products and tools.

U.S. agriculture, however, continues to face an array of challenges, including the threats of new and emerging diseases, public concern about food safety and the agriculture industry's impact on the environment, not to mention an increasing global population. It is critical to increase the investment in research to respond to these challenges. We encourage Congress to build on the renewed focus on agricultural research in recent years, which will benefit not only U.S. agriculture but also the health and well being of every American citizen.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

The ASM strongly supports competitive peer reviewed research that is open to all the nation's scientists. The ASM urges the Subcommittee to support the President's request of \$150 million for the National Research Initiative Competitive Grants Program (NRI) within the Cooperative State Research, Education and Extension Service (CSREES), an increase of \$31 million over the fiscal year 2000 appropriation. The proposed increase will address important research areas in agriculture including food safety, plant and animal genetics, and pest and disease management.

The ASM is pleased to see the President's continued support for the Initiative for Future Agriculture and Food Systems (IFAFS). This competitive grants program differs from the NRI in that it provides \$120 million in fully offset mandatory funding for research and extension projects that are multi-disciplinary and applied in scope and target critical and emerging agriculture issues. ASM encourages the Congress to support this needed infusion of research money.

AGRICULTURAL RESEARCH SERVICE

The ASM supports the President's request to increase funding for the Agricultural Research Service (ARS) by 7.7 percent or \$64 million in fiscal year 2001. This increase will enable the ARS to support both ongoing and new initiatives in such areas as emerging and exotic diseases, invasive species, plant and animal genetics research, food safety, technologies for production and conversion of crops into biobased products and bioenergy, and research initiatives on soil, water and air quality.

U.S. agriculture is experiencing severe problems caused by new and reemerging infectious diseases in plants and animals, a threat which requires immediate attention. Changes in agricultural practices, population growth, climate, microbial evolution, animal migration, and international trade and travel are all factors in the threat of introducing new plant and animal diseases into the U.S. agriculture system. The lack of knowledge to effectively manage and control new and reemerging infectious disease often leads to serious consequences such as reduced crop yield and unacceptable quality. Billions of dollars are lost through trade embargoes, quarantines, and the destruction of agricultural fields to control the spread of disease. The President's budget requests \$23.2 million for ARS to address major threats to U.S. agriculture from exotic diseases, pests and invasive species. This increase includes \$10 million for expanding the diagnostic capabilities to prevent acts of chemical and biological terrorism against U.S. agricultural and food security systems. The increase will also provide additional funds to prevent and control emerging infectious and zoonotic diseases afflicting livestock and aquaculture. The ASM urges the Congress to provide the President's request for these activities.

BIOBASED PRODUCTS

The ASM supports the requested increase of \$14 million for research to accelerate the conversion of agricultural materials and feedstocks into biofuels, and enhance the advancement of valuable biobased products. Such scientific advancements in biobased product research allow for enhanced farm income, strengthened U.S. energy security, and environmental protection.

USDA FOOD SAFETY INITIATIVE

The ASM recommends that Congress provide additional funding to USDA of at least the \$5.7 million increase to expand food safety research in support of the President's Food Safety Initiative. New funding is essential for research on antibiotic resistant bacteria in poultry, swine and cattle; to control bacteria and pathogens carried by animals and transmitted to humans and to develop intervention

strategies used in HACCP to reduce the risk of pathogen infestation in meat and poultry, as well as implementation of the Shell Egg Action Plan.

USDA'S NATIONAL FOOD GENOME STRATEGY

The ASM is disappointed that no request has been made for genetic resources for microorganisms. Microbes are involved in all aspects of agriculture—from beneficial uses of microbes in food (i.e. yogurt, cheese, bread, beer and wine) to pest controls to the spread of disease in plants and animals and the contamination of the food supply. Studying the genomes of agricultural microbes could lead to the development of new technologies to provide improved foods and better pest control to protect the nation's crops, to reduce the incidence of plant and animal disease, and to ensure a safer food supply.

USDA ANIMAL AND PLANT HEALTH INSPECTION SERVICE

The ASM urges the Congress to provide the requested \$16 million, an increase of \$5 million, for the fiscal year 2001 appropriation for the Animal Care Unit within the Animal and Plant Health Inspection Service (APHIS), which is the regulatory body mandated to enforce laboratory animal care. This increase would maintain current activities, while allowing for increased inspections and improved follow-up to verify corrections of prospective violators. Additionally, APHIS would expand outreach efforts to the general public and AWA regulated facilities by increasing the amount of educational resources available, encourage participation at industry meetings, and allow the development of industry specific training for animal care and welfare.

Thank you for the opportunity to provide testimony on USDA programs. We would be pleased to respond to any questions.

PREPARED STATEMENT OF THE ASSOCIATION OF AMERICAN MEDICAL COLLEGES

The Association of American Medical Colleges (AAMC) is pleased to submit its views on the fiscal year 2001 appropriation for the Food and Drug Administration (FDA). The AAMC represents the nation's 125 accredited medical schools, some 400 major teaching hospitals and health systems, and 91 academic and professional societies representing over 75,000 faculty members. Our members and institutions educate and prepare physicians to meet evolving health needs, conduct research leading to the discovery of medical knowledge and the development of innovative treatments and therapies, and provide basic and specialized health care services. We believe that the FDA should be recognized as an important component of the nation's overall commitment to biomedical research and should receive similar attention and funding. The AAMC supports the administration's \$1.4 billion budget request for fiscal year 2001 as a good first step toward providing increased support for the agency's critical public health activities.

As the FDA enters the 21st century, the agency faces rapidly expanding responsibilities and an urgent need for more resources. The presence in the FDA of a vigorous, high-quality intramural research program provides the essential foundation for sound regulatory policy, and ensures that the FDA is, and will continue to be, well positioned to carry out its statutory responsibilities to protect, promote and enhance the health of the American people. Providing an adequate budget for the FDA is essential because the nation's burgeoning medical research efforts will result in steadily increased numbers of products for the FDA to review.

In the past 20 years, expenditures in drug research have increased seven-fold, resulting in more potential products in need of scientific-based evaluation. In the next several years, the FDA expects a continued increase in both the number and complexity of applications. To address properly the challenges of facilitating the development and use of traditional and novel pharmaceutical products, FDA research programs will be directed toward solving the scientific problems that impact regulation. FDA research is needed to address issues where there may be a significant lack of the information required for scientific decision-making. This includes data necessary for risk assessments, validation of methods, and standardization of products.

A strong FDA science capability is equally critical in understanding and managing risks associated with products that are already on the market. These reviews must be based on solid, state-of-the-art science, which requires financial resources and trained personnel. A strong and well-managed intramural research program provides the foundation for creating a climate of scientific communication and discovery within the FDA that enhances the ability of the agency to recruit and retain high-quality personnel. Internal research expertise enhances the agency's ability to seek

out and critically evaluate external scientific input, and creates a platform from which agency staff can productively interact with external scientific expertise from academia, industry and other Federal agencies as respected and knowledgeable colleagues.

In the face of a rapidly changing research environment, the FDA, like all research agencies, must stay at the forefront of scientific knowledge. Given the extraordinarily rapid pace of achievements in fundamental scientific disciplines, the intimate proximity and interaction of cutting-edge scientific research with review and regulatory activities is more important today than ever before. If the FDA is not in a state of scientific readiness when applications are received, then the agency must either delay regulatory decisions on important new products until we have adequate knowledge, or make very conservative decisions in order to err on the side of caution.

Through its many and diverse responsibilities, the FDA provides the nation with not only an improved national health but a collective peace of mind. Much of its work is never recognized, as the FDA often works behind the scenes to benefit the American public. The FDA's role in evaluating existing and novel drugs and devices must not be overlooked in the national efforts to increase funding for biomedical research. To keep pace with the increasing quantity and complexity of scientific progress, the FDA needs additional financial and human resources.

The fiscal year 2001 budget request recognizes the importance of research in FDA's traditional dual roles of premarket review and postmarket surveillance, which ensure the highest possible levels of safety for current products, and timely review and release of new products to benefit the American public. Once again, we ask you to consider carefully the Administration's \$1.4 billion fiscal year 2001 budget request for the FDA as critical first step toward providing increased support for the agency's public health activities. The AAMC thanks the subcommittee for this opportunity to comment on funding for the FDA's research efforts.

PREPARED STATEMENT OF THE ASSOCIATION OF RESEARCH DIRECTORS OF THE
HISTORICALLY BLACK 1890 LAND-GRANT UNIVERSITIES

Senator Thad Cochran, Chairman, and other distinguished members of the Committee, my name is Samuel L. Donald, Regional Research Director for the Association of Research Directors of the Historically Black 1890 Land-Grant Universities, including Tuskegee University (hereafter referred to as the 1890s). Mr. Chairman, I submit, on behalf of the 1890 community, this written testimony in support of the fiscal year 2001 Budget recommendations for the 1890s.

GENERAL INFORMATION

Mr. Chairman, today, the rich legacy of the land-grant tradition remains prominent on the campuses of the 1890s. These institutions are increasingly serving as economic instruments of the State and the nation. They have their extraordinary influence on the lives of all citizens including African Americans and other minority groups. While enduring inequities in State and Federal funding, the 1890s serve as exemplary role models; provide educational access to those who may otherwise be denied the opportunity to pursue a college education; and foster an unyielding commitment to academic excellence, social equality and the assurance of a decent future for all students including those from the lowest economic strata of the nation. These universities have been in the forefront of educating youth-at-risk, producing research vital to the quality of life and the environment, and addressing the social and economic needs of urban and rural communities. Teaching, research and extension remain prominent on the campuses of the 1890s.

ACCOMPLISHMENTS AND IMPACTS

Historically Public Black Colleges and Universities (HPBCUs) constitute some of the largest and most prestigious institutions of higher education in the nation. Among them, two of the largest are 1890 HPBCUs. Several of the 1890s offer doctoral degrees and/or professional degrees in engineering, food science, toxicology, environmental science, and other areas of national need. Three of the top five HPBCUs in the nation contributing to the production of African American doctorates are 1890s. Annually, six HPBCUs produce nearly 20 percent of all African American bachelor degree recipients in engineering and the 1890s graduate over 80 percent of all Black recipients of bachelor degrees in agricultural sciences. Tuskegee University alone has trained more than 80 percent of the nation's Black veterinarians.

The 1890s depend heavily on Federal support for sustaining their academic, research, and extension programs. These institutions contributions to science and other accomplishments are reasons for maintaining and expanding the Federal partnership. For the purposes of improved food quality and food safety, improved and sustained agriculture production, improved quality of life for rural people, etc., some of the more recent accomplishments of the 1890s are:

- Provided small farm clients with management and production techniques that led to new business opportunities.
- Responded to the changing demands in food and agricultural systems by listening and developing new approaches that meet clientele needs.
- Developed new invitro systems for enhancing root system development of pine and hardwood trees.
- Found that increased production of rapeseed will provide an efficient domestic source of erucic acid oil, reduce expensive imports of rapeseed oil, help control environmental pollution resulting from use of inorganic pesticides, and assist in the development of sustainable crop production.
- Found that N-methyl aspartate enhanced growth and reduced fat in swine and chickens.
- Encouraged (and assisted) small farmers to take advantage of niche markets to generate additional farm income.
- Provided educational resources to assist small farmers and limited resource families acquire jobs and better manage what they earn.
- Determined that lambs and kids produced on cowpeas are lean and low in fat and are preferred by consumers.
- Through research and outreach, provide small farmers with information about alternative enterprises that are environmental friendly.
- Developed a new vegetable-legume cropping system for small-scale farmers in the Southeast.
- Provide sound science as the basis for improving food quality.
- Determine that dietary omega-3 polyunsaturated fats have beneficial properties to change physical and biochemical processes to control blood pressure.
- Developed technology to improve goat meat and fiber production.
- Developed intensified “Farm Planning Program” for farmers to improve profitability from crops, livestock, and alternative farm enterprises.
- Conducted senior citizens conferences on consumer fraud, security, energy conservation, and modification of dwellings for handicapped use and access.

The above accomplishments had major impacts on improving (a) the quality of lives of people served and (b) the entrepreneurial skills and farming operations of farmers served. The bottom line is, due primarily to Federal appropriated dollars to the 1890s, many under-served clientele, customers and stakeholders have a “brighter” tomorrow.

BUDGET RECOMMENDATIONS

The 1890s support the fiscal year 2001 budget recommendations of the National Association of State Universities and Land-Grant Colleges (NASULGC) which emphasizes modest increased funding for the research, extension, and academic programs. Mr. Chairman, the 1890s urge the Committee to strongly support the NASULGC recommendations which includes the following for the 1890s:

Evans-Allen Research Program (\$36.197 Million).—The 1890s request a marginal increase in base funds for research. These funds will enhance the capacity of these institutions to become more competitive in the private sector and in domestic and international research endeavors designed to undergird the vitality of the nation’s agricultural enterprise. This support will enhance the ability of the 1890s to compete for grants and contracts in a wider variety of programs in the U.S. Department of Agriculture, other Federal agencies, and the private sector.

Capacity Building Grants Program (\$15 Million).—The Capacity Building Grants Program is making a major difference in the quality and quantity of teaching and research programs in food and agricultural sciences and technology on the campuses of the 1890s. Since the creation of this enormously important program, the 1890 leadership has strongly advocated a substantial and sustained increase in funding at more than \$25 million annually. This level of funding would allow these institutions to significantly improve the range and level of academic programs offered, enhance the performance and productivity of faculty in the sciences, and increase research opportunities for undergraduate and graduate students. However, consistent with NASULGC’s recommendation, the 1890s support the request of \$15 million.

1890 Facilities Grants Program (\$15 Million).—The 1890s unequivocally support the \$15 million facilities funding request in the NASULGC budget for renovation,

maintenance and overall improvement of the infrastructure on our campuses. The 1890s face nearly insurmountable barriers in attracting public and private support for enhancement of facilities. Although this level of funding will not fully address the critical facility needs of our institutions, it will complement existing efforts to make major improvements.

Extension Program (\$31.674 Million).—The 1890s support a modest increase in base funding requested by NASULGC for extension activities. This marginal increase will allow our institutions to sustain program activity at current levels and respond more efficiently to the growing demand for services in severely depressed and under-served communities.

Mr. Chairman, in addition to the NASULGC budget recommendations for the 1890s, support is sought for the following:

1890 Agricultural Biotechnology Research/Graduate Program Grants (\$8 Million).—A new initiative that is not in the NASULGC budget recommendations for the 1890s is a Research/Graduate Program, emphasizing biotechnology. Biotechnology is one of the major areas in which the 1890s are recognizing the importance of strengthening their role as a national resource in conducting research in biotechnology, biosafety and food security. The 1890s seek support to conduct basic and applied research in biotechnology and to engage in partnerships with national laboratories and biotech industries. Funds would be used to develop graduate programs that build and strengthen areas of specialization in food and agricultural sciences, biotechnology and related disciplines, to provide fellowships and assistantships for graduate students, summer research and professional development fellowships for graduate students, and research and professional development assistance for faculty. The budget request is a permanent line item of \$8,000,000 to be appropriated to the Agricultural Research Service of USDA, exclusively for 1890s.

CLOSING COMMENTS

Mr. Chairman, based on past accomplishments and visionary approach, the 1890s are positioning themselves to enter the 21st Century with a renewed commitment and capacity to implement their land-grant mission of teaching, research and extension. Full appropriations of the fiscal year 2001 budget recommendations as stated above will facilitate this and is vital to the 1890 Land-Grant Universities.

PREPARED STATEMENT OF THE BIOTECHNOLOGY INDUSTRY ORGANIZATION

The following is the statement of the Biotechnology Industry Organization (BIO) in support of increased funds for the U.S. Food and Drug Administration (FDA) in the fiscal year 2001 budget. BIO represents more than 900 biotechnology companies, academic institutions and State biotechnology centers in 47 States and 26 nations. BIO members are engaged in biotechnology research on medicines, diagnostics, agriculture, pollution control and industrial applications.

Our industry's goal is to develop products that will cure disease, improve the quality and quantity of the world's food supply, and clean up the environment. Our success in achieving those objectives is dependent upon an expert and productive FDA.

BIO supports increased funding for the FDA. In addition to our own advocacy efforts, we have joined together with organizations representing some of the other FDA-regulated industries to urge Congress to provide increased funds for fiscal year 2001 for the agency. Specifically, our coalition has called for an increase of at least 13 percent over last year. This is the amount included in the President's budget request absent the imposition of additional user fees. The text of our coalition's letter to the Chairman and Ranking Member of this subcommittee is attached.

Funding for the FDA will have a direct impact on the lives of millions of Americans. Important new biopharmaceuticals are being developed for a variety of diseases including cancers, Alzheimer's Disease, and diabetes. In 1992, industry and the FDA negotiated an innovative collaboration pursuant to which industry funds a portion of the FDA review program through user fees on prescription drugs and biologics.

However, the Federal appropriation for the FDA has remained relatively flat over the past several years. The result is that despite the revenues generated by user fees paid by our industry, the true operating budget of the agency has shrunk after inflation and federally-mandated pay raises for staff have been calculated.

In constant dollars, the agency has less money now than it had in 1993 for its activities not funded by user fees or earmarked programs such as tobacco and food safety. Therefore, while the agency has received a \$450 million increase in current

dollars since 1993, only \$91 million has been available for non-user fee, non-earmarked programs.

When the FDA Modernization Act (FDAMA) was enacted in 1997, both industry and the FDA agreed to implement programs that would accelerate the drug development process. In fact, FDAMA expressly recognizes that FDA should not only serve as a regulator, but also as an agency that provides assistance to biotechnology companies that are developing drugs and biologics.

Many of these new responsibilities are resource intensive and are not fully financed by user fees. For example, if FDA places a "clinical hold" on a research trial, it must respond in writing within 30 days of receipt of a written request to remove the hold and specify the reasons for its decision. In addition, the law requires FDA to meet with companies in an effort to reach agreement on the design and size of clinical trials on a drug or biological product.

The Congressional Budget Office has estimated that FDAMA implementation will cost \$41 million each year. Without sufficient funding, FDA reform cannot succeed. This will lead to development delays for important and cost effective new drugs, compromising an already stressed health care system. Moreover, review of some biologic products fall outside the user fee program. These applications will suffer serious delays without additional resources for the agency.

Our nation makes a huge investment in biomedical research. For example, a few years ago, Congress began the process of doubling the budget for the National Institutes of Health over a five year period. BIO supports these increases. However, for Americans to benefit from this investment, the FDA must be capable of reviewing and regulating the products that are ultimately developed from this research. Otherwise, potentially life saving drugs and other products will never reach the patients that need them. A recent survey of biotechnology, pharmaceutical and medical device firms confirms that the lack of highly skilled reviewers unduly delays product approval.

Over the past several years, the Clinton Administration and some in Congress seem to have adopted a strategy that assumes additional user fees will be enacted and paid by other regulated industries. Accordingly, the appropriations for the agency have been less than adequate. This occurred again in the President's fiscal year 2001 budget request that includes unauthorized user fees. BIO agrees that it is appropriate for industries to pay user fees. However, this issue should be debated independent of the appropriations process.

In addition to its existing commitments, the agency needs to have the resources to respond to new situations. For example, since the tragic death of Jesse Gelsinger, the FDA is considering new actions to increase oversight of gene therapy clinical trials. Some initiatives have already been announced and others are still being developed.

There are two reasons why it is critical that the FDA have the monies to perform these functions. First, we support FDA's initiatives because FDA oversight is critical to maintain public confidence in the safety of this new and promising research. Moreover, when the agency takes action to respond to pressing issues such as these, extra resources are needed so that other critical, longstanding agency priorities are not slowed.

An adequately funded FDA is also necessary for capital formation for our industry. Our investors need to know that products from biotechnology companies will get a timely and high-quality review from the agency. Increased funds are necessary to achieve this goal. In addition, when the overall appropriation for the agency is low or remains flat, critical infrastructure needs such as personnel, facilities, and equipment are left unmet. This hurts the overall performance of the agency.

The FDA plays a critical role for our nation. By providing science-based regulation, it helps speed the delivery of new, life saving products to the public, while ensuring that these products are safe. An investment in the FDA today will clearly pay large dividends in the future.

For more information about BIO's views on this issue, please call Michael Werner, Esq., Director of Federal Government Relations and Bioethics Counsel at (202)-857-0244 or mwerner@bio.org.

Thank you for your attention to this important matter.

PREPARED STATEMENT OF THE CALIFORNIA INDUSTRY AND GOVERNMENT CENTRAL
CALIFORNIA OZONE STUDY COALITION

Members of the Subcommittee: On behalf of the California Industry and Government Central California Ozone Study Coalition we are pleased to submit this state-

ment for the record in support of our fiscal year 2001 funding request of \$250,000 from CSREES for the Central California Ozone Study (CCOS).

Ozone and particulate matter standards in most of central California are frequently exceeded. In 2003, the U.S. Environmental Protection Agency (U.S. EPA) will require that California submit SIPs to for the recently promulgated, national, 8-hour ozone standard. It is expected that such SIPs will be required for the San Francisco Bay Area, the Sacramento Valley, the San Joaquin Valley, and the Mountain Counties Air Basins. Photochemical air quality modeling will be necessary to prepare SIPs that are acceptable to the U.S. EPA.

Central California Ozone Study (CCOS) is designed to enable central California to meet Clean Air Act requirements for ozone State Implementation Plans (SIPs) as well as advance fundamental science for use nationwide. The CCOS field measurement program will be conducted in the summer of 2000 in conjunction with the California Regional PM10/PM2.5 Air Quality Study (CRPAQS), a major study of the origin, nature and extent of excessive levels of fine particles in central California. CCOS includes an ozone field study, a deposition study, data analysis, modeling performance evaluations, and a retrospective look at previous SIP modeling. The CCOS study area extends over central and most of northern California. The goal of the CCOS is to better understand the nature of the ozone problem across the region, providing a strong scientific foundation for preparing the next round of State and Federal attainment plans. The study includes six main components:

- Developing the design of the field study (task already underway)
- Conducting an intensive field monitoring study, scheduled for June 1 to September 30, 2000
- Developing an emission inventory to support modeling
- Developing and evaluating a photochemical model for the region
- Designing and conducting a deposition field study
- Evaluating emission control strategies for the next ozone attainment plans

CCOS is directed by Policy and Technical Committees consisting of representatives from Federal, State and local governments, as well as private industry. These committees, which managed the San Joaquin Valley Ozone Study and are currently managing the California Regional Particulate Air Quality Study, are landmark examples of collaborative environmental management. The proven methods and established teamwork provide a solid foundation for CCOS. The sponsors of CCOS, representing state, local government and industry, have contributed approximately \$8.6 million for the field study. In addition, CCOS sponsors will provide \$4 million of in-kind support. The Policy Committee is continuing to seek additional funding (\$9.0 million) for a future deposition study, data analysis, and modeling. California is an ideal natural laboratory for studies that address federal, agriculture-related issues, given the scale and diversity of the various ground surfaces in the region (crops, woodlands, forests, urban and suburban areas).

For fiscal year 2001, our Coalition is seeking funding of \$250,000 through the U.S. Department of Agriculture (USDA) Cooperative State Research, Education, and Extension Service (CSREES). Domestic agriculture is facing increasing international competition. Costs of production and processing are becoming increasingly more critical. The identification of cost-effective options for addressing environmental options affecting agricultural costs will contribute significantly to the long-term health and economic stability of local agriculture. A CSREES grant is needed to address the issue of biomass burning and alternatives to open burning. Biomass burning is managed in order to minimize smoke impacts and avoid violations of ambient air quality standards. The air quality impacts of using biomass as a fuel source and as an alternative to open burning need to be addressed. CCOS will improve the ability to assess the impacts of biomass power plants.

There is a national need to address national data gaps and California should not bear the entire cost of the addressing these gaps. National data gaps include issues relating to the integration of particulate matter and ozone control strategies. The CCOS field study will take place concurrently with the California Regional Particulate Matter Study—previously jointly funded through Federal, State, local and private sector funds. Thus, CCOS is timed to enable leveraging of the efforts for the particulate matter study. Some equipment and personnel can serve dual functions so that CCOS is very cost-effective. From a technical standpoint, carrying out both studies concurrently is a unique opportunity to address the integration of particulate matter and ozone control efforts. CCOS will also be cost-effective since it builds on other successful efforts including the 1990 San Joaquin Valley Ozone Study. To effectively address these issues requires federal assistance and CCOS provides a mechanism by which California pays half the cost of work that the Federal Government should pursue.

Scientists at the University of Nevada, Desert Research Institute (DRI) are the principal investigators for CCOS. To expedite research studies related to biomass burning and smoke management for CCOS, it is requested that funds provided by CSREES be allocated directly to DRI.

We appreciate the Subcommittee's consideration of our request. Thank you very much.

PREPARED STATEMENT OF THE CITY OF GAINESVILLE, FLORIDA

Mr. Chairman: On behalf of the City of Gainesville, Florida, I appreciate the opportunity to present this written testimony to you today. The City of Gainesville is seeking federal funds in the fiscal year 2001 Agriculture, Rural Development, FDA and Related Agencies Appropriations bill to assist our efforts to protect the Florida Aquifer from stormwater runoff which starts out in Gainesville's Sweetwater Branch Basin.

Sweetwater Branch Project

The City of Gainesville is seeking \$1.5 million in funding assistance for a \$2 million stormwater management project intended to remove 90 percent or more of the sediment and debris from the Sweetwater Branch creek flow preventing those undesirable materials from entering the Paynes Prairie Preserve, thereby helping to insure and protect the Florida Aquifer as the major source of drinking water for the State of Florida.

The Sweetwater Branch basin contains approximately 1,710 acres, and is located mainly in the southeast central portion of the City of Gainesville. The outfall from this basin discharges into Paynes Prairie, a State-owned preserve and park system, where the creek flow is directed into the Alachua Sink. The Alachua Sink is a natural sinkhole that drains directly into the Florida aquifer.

The Florida Aquifer provides the majority of drinking water to Florida's residents and has a direct impact on the Florida Everglades. In addition, many domestic water wells are used to obtain water from surficial and intermediate aquifers in the Gainesville area.

The Sweetwater Branch drainage basin contains urban, commercial, industrial, and residential area stormwater runoff. Because the Sweetwater Branch runs through some of the oldest portions of Gainesville, most stormwater runoff is directly discharged into the Branch with very little flooding attenuation or pollution loading reduction. In addition, there is insufficient undeveloped land available to accommodate stormwater management facilities except for the area very near the Paynes Prairie outfall.

Pollution reduction of the Sweetwater Branch surface waters before entering the Paynes Prairie Preserve will assist in the re-establishment of the Preserve's natural aesthetics and re-establishment of the natural ecological systems of the Preserve, in addition to providing protection for a major source of drinking water. The runoff also has the potential to negatively impact threatened and endangered wildlife such as the American Bald Eagle, the Woodstork, the Florida Sandhill Crane and the Southeastern American Kestrel. In summary, the situation has created a concern amongst environmentalists, business leaders, and concerned citizens throughout the region that Paynes Prairie and the Florida Aquifer are being compromised.

With this in mind, the City of Gainesville, Alachua County, the Florida Department of Environmental Protection, the St. Johns River Water Management District, and local citizens are all seeking a comprehensive ecosystem management solution to the problem of stormwater runoff from downtown entering Sweetwater Branch, Paynes Prairie and the Alachua Sink.

The project devised by these groups would reduce or eliminate the sediment, debris, nutrients and general pollutants currently being discharged into Paynes Prairie and eventually the Florida aquifer from the Sweetwater Branch Creek.

Current projections are that the project would consist of the following three components:

- the purchase of undeveloped property in the vicinity of State Road 331 and Sweetwater Branch;
- the construction of maintainable sediment and debris removal systems; and
- the construction of maintainable nutrient removal systems.

Removing all pollutants at the discharge end of Sweetwater Branch would cost at least \$14–\$20 million. Smaller projects upstream of the Prairie have been initiated at the local level. Expenditures of about \$2 million are identified for three such smaller projects: (1) the Duck Pond, (2) the Baffle Box, and (3) the Downtown (a Brownfield Area) Stormwater Facility. These smaller projects are designed to deal

with specific subbasins and water quality issues. The current projects now planned utilizing local resources will only clean up parts of the basin. Considerable flow and accompanying pollution still will go through to the Prairie. An additional facility is needed to clean up the rest of the flow.

An in-depth engineering analysis of the creek system, property topography, associated wetlands, and other pertinent factors would be accomplished to determine the optimum and appropriate scope of property purchase and facilities construction. The City is prepared to pay some of the cost for this analysis, and has received a \$500,000 grant from the U.S. Environmental Protection Agency, but we are simply unable to bear the entire burden. As a result, we request that the Subcommittee appropriate \$1.5 million to assist our efforts.

The requested federal funds, if awarded, will be used by the City to secure the necessary property rights and to construct the facility. Once the project construction is complete, Gainesville's Stormwater Management Utility, a public utility, would provide the required annual operating and maintenance funding, and no further federal maintenance funds would be needed.

In closing, federal support is critical for this initiative. As a result, we respectfully request that the Subcommittee will give funding assistance for our project every consideration throughout the fiscal year 2001 appropriations process.

PREPARED STATEMENT OF THE COALITION TO PROMOTE U.S. AGRICULTURAL EXPORTS

As members of the Coalition to Promote U.S. Agricultural Exports, we commend the Chairman and members of the Subcommittee for their interest and support of U.S. agriculture and express our appreciation for this opportunity to share our views.

The Coalition to Promote U.S. Agricultural Exports is an ad hoc coalition of over 80 organizations, representing farmers and ranchers, cooperatives, small businesses, regional trade organizations, and the State Departments of Agriculture (see attached). We believe the U.S. must continue to have in place policies and programs that help maintain the ability of American agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition.

Farm income and agriculture's economic well-being depend heavily on exports, which account for one-third or more of domestic production, provide jobs for millions of Americans, and make a positive contribution to our nation's overall trade balance. Without aggressive action, however, U.S. agriculture exports are projected to remain below \$50 billion this year due to a combination of factors, including continued subsidized foreign competition and related artificial trade barriers. U.S. agriculture's trade surplus is also expected to remain around \$11.5 billion, down nearly 50 percent from 1996, with continued low commodity prices also forecast.

Also troubling is the erosion in the U.S. market share of global agricultural trade. In fact, this could culminate in the United States losing out to the European Union (EU) as the world's top agricultural exporter sometime this year. We believe that a major reason for this decline in market share lies in the more aggressive promotion expenditures of our foreign competitors.

According to a recent USDA study, the EU and other foreign competitors are outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion. In 1997, in addition to spending over \$7.2 billion in export subsidies, our leading foreign competitors spent a combined \$924 million on various activities to promote their exports of agricultural, forestry, and fishery products, including some \$365 million by the EU.

According to the most recent information by USDA, spending by these competitor countries on market promotion has increased by 35 percent, or nearly \$1 billion, in the past three years, while U.S. spending remained flat. Almost all of this increase has been directed to the high-value and consumer-ready product trade.

Information compiled by USDA also shows that such countries are spending over \$100 million just to promote sales of their products in the United States. In other words, they are spending more to promote their agricultural exports to the United States, than the U.S. is currently spending (\$90 million) to promote American-grown and produced commodities worldwide! And according to the most recent USDA numbers, for the first time ever, during fiscal year 1999 we imported almost \$1 billion more in agricultural products from the EU than we exported to them.

The USDA study noted above goes on to say that "because market promotion is a permitted "green box" activity under World Trade Organization (WTO) rules, with no limit on public or producer funding, it is increasingly seen as a centerpiece of a winning strategy in the future trade battleground. Many competitor countries have announced ambitious trade goals and are shaping export programs to target

promising growth markets and bring new companies into the export arena." European countries are expanding their promotional activities in Asia, Latin America, and Eastern Europe. Canada, Australia and New Zealand have also sharply bolstered their export promotion expenditures in recent years.

Clearly, as the EU and our other foreign competitors made clear in Seattle, they intend to continue to be aggressive in their export efforts. For this reason, we believe the Administration and Congress should immediately strengthen funding for MAP and other export programs, and ensure that such programs are fully and aggressively utilized. Since MAP was originally authorized, funding has been gradually reduced from a high of \$200 million to its current level of \$90 million—a reduction of more than 50 percent. Again, given what our foreign trade competitors are doing, we believe it's time to restore funding for this vitally important program up to its original level. American agriculture is the most competitive industry in the world, but it can not and should not be expected to compete alone against the treasuries of foreign governments.

In order to reverse the decline in funding over the past decade for a number of our agricultural export programs, the Coalition is strongly supporting legislation (S. 1983) introduced by Senators Murray (D-WA) and Craig (R-ID), et al. that would authorize no less than \$90 million and up to \$200 million per year for MAP. The bill would also provide a minimum of \$35 million for the Foreign Market Development (FMD) Cooperator Program for cost-share assistance to help boost U.S. agriculture exports. Further, it would allow up to 50 percent of available funds under the Export Enhancement Program (EEP) to be used for related market development and promotion activities.

Both MAP and FMD are administered on a cost-share basis with farmers and other participants required to contribute up to 50 percent of their own resources. These programs are one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition. By any measure, they have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, protect American jobs, and strengthen farm income. In addition to helping achieve these objectives, enactment of S. 1983 would provide needed flexibility to respond to changing market conditions and capitalize on potential new market opportunities. It would also send a powerful message to our foreign competitors and strengthen the U.S. negotiating position in future trade talks.

For all these reasons, we want to emphasize again the need to help strengthen the ability of U.S. agriculture to compete effectively in the global marketplace. As a nation, we can work to export our products, or we can export our jobs. USDA's export programs, such as MAP and FMD, are a key part of an overall trade strategy that is pro-growth, pro-trade and pro-job.

Again, as members of the Coalition to Promote U.S. Agricultural Exports, we appreciate very much this opportunity to share our views and we ask that this statement be included in the official hearing record.

PREPARED STATEMENT OF THE COLORADO RIVER BASIN SALINITY CONTROL FORUM

The Congress concluded that the Colorado River Basin Salinity Control Program should be implemented in the most cost-effective way and realizing that agricultural on-farm strategies were some of the most cost-effective strategies authorized a program for the Department of Agriculture. With the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), the Congress concluded that the Salinity Control Program could be most effectively implemented as one of the components of the Environmental Quality Incentives Program. Since the enactment of FAIRA, the Salinity Control Program has not been funded at a level adequate to ensure that water quality standards in the Colorado River, with respect to total dissolved solids (salinity), will be honored, nor is the funding sufficient to prevent salt loading from irrigated farms from impacting the quality of water delivered to Mexico under a minute of the International Boundary and Water Commission, United States and Mexico.

The Salinity Control Program has been subsumed into the EQIP program without the Secretary of Agriculture giving adequate recognition to the requirement in Section 202(c) in the Colorado River Basin Salinity Control Act to carry out salinity control measures. Water users hundreds of miles downstream are the beneficiaries of this water quality improvement program. Agriculturalists in the Upper Basin, however, see local benefits as well as downstream benefits and have submitted cost-effective proposals to the State Conservationists in Utah, Wyoming and Colorado.

Priority Area proposals for EQIP funding are ranked in each state under the direction of the NRCS State Conservationist. Existing ranking criteria, however, does not consider downstream benefits (particularly out of state benefits) when proposals are being evaluated.

After longstanding urgings from the states and directives from the Congress, the Department has concluded that this program is different than small watershed enhancement efforts common to the EQIP program. In this case, the watershed to be considered stretches more than 1200 miles from the river's headwater in the Rocky Mountains to the river's terminus in the Gulf of California in Mexico. The Department has now determined that this effort should receive a special fund designation and is moving to appoint a coordinator for this multi-state effort.

The Basin states were led to believe by Congressional staff that when the EQIP program was created, the \$200,000,000 annual Commodity Credit Corporation (CCC) borrowing authority given to the Secretary would ensure that through the year 2002 at least this amount of funding would be expended for the EQIP program. The Forum is very dismayed as this committee acted to reduce the funding for the current fiscal year to \$174,000,000. This level of funding is not adequate for this most important nationwide program and the Administration does not believe that it provides sufficient funds to implement National Priority Areas as allowed by Congress under FAIRA. The Forum urges that the funding for EQIP for fiscal year 2001 total \$325,000,000.

This last year, the Natural Resources Conservation Service (NRCS) earmarked funds to use in areas of special interest in the amount of about \$5.3 million. The states added about \$2 million in up-front cost-sharing and local farms, we estimate, contributed about another \$2.3 million. The plan for water quality control of the river prepared by the Forum, adopted by the states, and approved by EPA requires that the USDA portion of the effort to be funded at \$12 million. Hence, there is a shortfall from the federal side of \$6.7 million this last year. State and local cost-sharing is triggered by the federal appropriation. Hence, the entire effort is only at about 44 percent of what is needed. The USDA indicated that a more adequately funded EQIP program would result in more funds being allocated to the salinity control program. The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts in the cost-sharing fashion provided by the Congress. The agricultural producers in the Upper Basin are waiting for their applications to be considered so that they might also cost share in the program.

The Forum urges that this committee support the funding of \$325,000,000k from the CCC in fiscal year 2001 for EQIP. The Forum also requests that this Committee advise the Administration that \$12,000,000 of these funds be designated for the Colorado River Basin Salinity Control Program.

OVERVIEW

The Colorado River Basin Salinity Control Program was authorized by Congress in 1974. The Title I portion of the Colorado River Basin Salinity Control Act responded to commitments that the United States made, through a minute of the International Boundary and Water Commission, to Mexico with respect to the quality of water being delivered to Mexico below Imperial Dam. Title II of the Act established a program to respond to salinity control needs of Colorado River water users in the United States and to comply with the mandates of the then newly legislated Clean Water Act. Initially, the Secretary of the Interior and the Bureau of Reclamation were given the lead federal role by the Congress. This testimony is in support of funding for the Title II program.

After a decade of investigative and implementation efforts, the Basin states concluded that the Salinity Control Act needed to be amended. Congress revised the Act in 1984. That revision, while keeping the Department of the Interior as lead coordinator for Colorado River Basin salinity control efforts, also gave new salinity control responsibilities to the Department of Agriculture, and to a sister agency of the Bureau of Reclamation—the Bureau of Land Management. Congress has charged the Administration with implementing the most cost-effective program practicable (measured in dollars per ton of salt removed). It has been determined that the agricultural efforts are some of the most cost-effective opportunities.

Since Congressional mandates of nearly two decades ago, much has been learned about the impact of salts in the Colorado River system. The Bureau of Reclamation is now completing studies on the economic impact of these salts. Reclamation recognizes that the damages to United States' water users alone are hundreds of millions of dollars per year.

The Colorado River Basin Salinity Control Forum (Forum) is composed of gubernatorial appointees from Arizona, California, Colorado, Nevada, New Mexico, Utah

and Wyoming. The Forum has become the seven-state coordinating body for interfacing with federal agencies and Congress to support the implementation of a program necessary to control the salinity of the river system. In close cooperation with the Environmental Protection Agency (EPA) and under requirements of the Clean Water Act, every three years the Forum prepares a formal report analyzing the salinity of the Colorado River, anticipated future salinity, and the program necessary to keep the salinities at or below the levels measured in the river system in 1972.

In setting water quality standards for the Colorado River system, the salinity concentrations measured at Imperial, and below Parker, and Hoover Dams in 1972 have been identified as the numeric criteria. The plan necessary for controlling salinity has been captioned the "plan of implementation." The 1999 Review, Water Quality Standards for Salinity, Colorado River System, includes an updated plan of implementation. In order to eliminate the shortfall in salinity control resulting from inadequate federal funding for the last seven years for USDA, the Forum has determined that implementation of the salinity control program needs to be accelerated. The level of appropriation requested in this testimony is in keeping with the agreed to plan. If adequate funds are not appropriated, state and federal agencies involved are in agreement that the numeric criteria will be exceeded and damage from the high salt levels in the water will be widespread and very significant in the United States and Mexico.

STATE COST-SHARING AND TECHNICAL ASSISTANCE

The authorized cost sharing by the Basin states, as provided by FAIRA, was at first difficult to implement as attorneys for USDA concluded that the Basin states were authorized by FAIRA to cost share in the effort, but the Congress had not given USDA authority to receive the Basin states' funds. After almost a year of exploring every possible solution as to how the cost sharing was to occur, the states, in agreement with the Bureau of Reclamation, with state officials in Utah, Colorado and Wyoming and with NRCS State Conservationists in Utah, Colorado and Wyoming, agreed upon a parallel program wherein the states' cost sharing funds will be used. We are now in the fourth year of that program and, at this moment in time, this solution to how cost sharing can be implemented appears to be satisfactory.

With respect to the states' cost sharing funds, the Basin states felt that it was most essential that a portion of the program be associated with technical assistance and education activities in the field. Without this necessary support, there is no advanced planning, proposals are not well prepared, assertions in the proposals cannot be verified, implementation of contracts cannot be observed, and the most valuable partnering and education efforts cannot occur. Recognizing these values, the "parallel" state cost sharing program expends 40 percent of the funds available on these needed support activities. Initially, it was acknowledged that the federal portion of the salinity control program funded through EQIP was starved with respect to needed technical assistance and education support. The Forum is encouraged with the Administration's determination that 19 percent of the EQIP funds will be used for technical assistance. The Forum urges this Committee to appropriate adequate funds for these support activities rather than to direct NRCS to borrow these needed funds from the CCC.

PREPARED STATEMENT OF THE COLORADO RIVER BOARD OF CALIFORNIA

Your support and leadership are needed in securing adequate funding for the U.S. Department of Agriculture with respect to its on-farm Colorado River Basin salinity control program for fiscal year 2001. This program has been carried out through the Colorado River Basin Salinity Control Act, since it was enacted by Congress in 1974. With the enactment of the Federal Agricultural Improvement and Reform Act (FAIRA) in 1996, specific funding for salinity control projects in the Colorado River Basin were eliminated from the Federal budget, and aggregated into the newly created Department of Agriculture Environmental Quality Incentive Program (EQIP) as one of its program components. With that action, Congress concluded that the salinity control program could be more effectively implemented as one of the components of the EQIP. Prior to FAIRA, the Department of Agriculture had specific line item funding for salinity control projects as high as \$14.7 million, but in recent years the level of appropriations have been reduced to between \$3.4 and \$5.1 million which is inadequate to ensure that water quality standards in the Colorado River, with regards to salinity can be met. It has been estimated through previous Federal studies that Colorado River water users in the Lower Basin States' (Arizona, California, and Nevada) were suffering economic damages estimated to be in excess of

\$750 million per year in 1995 due to the salts in the River system. Most of that damage is occurring in California. The potential impact of failing to move forward with the plan of implementation for salinity control would be to permit these damages in the Lower Basin to reach an estimated \$1.25 billion annually by the year 2015.

The Colorado River Board of California (Colorado River Board) is the State agency charged with protecting California's interests and rights in the water and power resources of the Colorado River System. In this capacity, California along with the other Basin States through the Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin States' salinity control efforts, established numeric criteria, in June 1975, for salinity concentrations in the River. These criteria were established to lessen the future damages in the Lower Basin States as well as assist the United States in delivering water of adequate quality to Mexico in accordance with Minute 242 of the International Boundary and Water Commission. The goal of the Colorado River Basin salinity control program is to offset the effects of water resource development in the Colorado River basin after 1972 rather than to reduce the salinity of the River below levels that were caused by natural variations in river flows or human activities prior to 1972. To maintain these levels, the salinity control program must remove 1.48 million tons of salt loading from the River by year 2015. To date, only 721,000 tons of salt load reduction have been achieved. In the Forum's last report entitled 1999 Review, Water Quality Standards for Salinity, Colorado River System released in June 1999, the Forum found that additional salinity control measures were necessary to meet the implementation plan that had been adopted by the seven Colorado River Basin States and approved by the Environmental Protection Agency. Since implementation of the EQIP, Federal allocations by the Department of Agriculture have not equaled the Forum's identified funding needs for the Department of Agriculture's portion of the program. The Forum identified a "backlog" of salinity control measures which stands at 384,000 tons. This is in addition to future controls designed to lower the River's salt loading by 372,000 tons by 2015 in order to meet the established salinity standards. The Forum has presented testimony to Congress recommending that the salinity control efforts through EQIP be accelerated to continue to meet the salinity standards through 2015. It has developed a plan that recommends the removal of at least 87,000 tons per year of salt loading through 2005.

The President's proposed budget for fiscal year 2001 contains funding of \$325 million for implementation of EQIP, up \$125 million from the \$200 million Commodity Credit Corporation borrowing authority provided the Secretary of Agriculture by FAIRA per year. The Colorado River Board is pleased with the Administration's statement that it intends to expend \$325 million in fiscal year 2001 through EQIP. Of the amount to be appropriated for EQIP, the Colorado River Basin Salinity Control Forum, at its meeting in San Francisco, California, in October 1999, recommended a funding level of \$12.0 million for on-farm salinity control in the Colorado River Basin for fiscal year 2001 to maintain water quality consistent with the established standards. These Federal dollars, if earmarked, would be augmented by State cost sharing of 30 percent with an additional 30 percent provided by the agricultural producer with whom the Department of Agriculture contracts for implementation of salinity control measures. The Colorado River Board supports the recommendation of the Forum. The salinity control program has proven to be a very cost effective approach to help mitigate the impacts of higher salinity. Continued Federal funding of the program is essential.

In addition, the Colorado River Board recognizes that the Federal Government has made significant commitments to the Republic of Mexico and to the seven Colorado River Basin States with regard to the delivery of adequate quality water to Mexico. In order for those commitments to be honored, it is essential that in fiscal year 2001 and in future fiscal years, the Congress provide funds to the Department of Agriculture to allow it to continue providing needed technical support to the producers for addressing salinity control in the Basin.

The Colorado River is, and will continue to be, a major and vital water resource to the 17 million residents of southern California as well as throughout the Lower Colorado River Basin. As stated earlier, preservation of its quality through an effective salinity control program will avoid the additional economic damages to users of Colorado River water in California, Arizona, and Nevada.

The Colorado River Board greatly appreciates your support of the Federal/State Colorado River Basin Salinity Control Program and again asks for your assistance and leadership in securing adequate funding for this program.

PREPARED STATEMENT OF COLORADO STATE UNIVERSITY

Mr. Chairman, Members of the Subcommittee, my name is Judson M. Harper. I am Vice President for Research and Information Technology at Colorado State University, located in Fort Collins, Colorado. I appreciate this opportunity to submit my testimony for the record of proceedings on the fiscal year 2001 Department of Agriculture Budget. I would like to testify in support of the budget request for funds related to carbon sequestration mitigation strategies and take this opportunity to inform you of the ongoing work in this field being conducted by the Consortium on Agricultural Soils Mitigation of Greenhouse Gases.

The Consortium for Agricultural Soils Mitigation of Greenhouse Gases (CASMGs) includes Colorado State University, Texas A&M University, Iowa State University, the University of Nebraska, Kansas State University, Michigan State University, Montana State University, The Ohio State University and Battelle-Pacific Northwest National Laboratory. These institutions have been working individually and collectively for the past few years in the fields of soil carbon dynamics, soil-derived greenhouse gases, soil erosion, water quality and computer modeling, land resource data analysis, agricultural resource economics and integrated assessment.

The Administration's Budget for the Department of Agriculture proposes \$12 million for conservation technical assistance programs to develop accurate baseline soil carbon data and to determine the impacts of federal programs on soil carbon stocks across the country. An additional \$3 million is proposed to fund demonstration and research pilot projects to test various carbon sequestration mitigation strategies and monitoring mechanisms. We support these initiatives and feel prepared to partner with the federal government in reaching its objectives.

Concern has been mounting about the considerable buildup of carbon dioxide (CO₂) in the atmosphere. This atmospheric buildup has been greatly accelerated by industrialization and the burning of fossil fuels (coal, oil and natural gas). Crops and other plants remove carbon dioxide from the atmosphere and, following harvest their residue and roots remain in the soil for long periods. Carbon accumulation in soils can be greatly improved by various forms of conservation management, such as no-till and replanting with grasses. This carbon sequestration occurs because there is less soil disturbance and more carbon is added to the soil. Corollary benefits of carbon sequestration are increased soil fertility, reductions in erosion and increases in soil quality.

To help reduce carbon dioxide emissions, a new plan is emerging—sequester carbon in U.S. agricultural soils, which helps the soil and air and benefits the U.S. agricultural economy. It has been estimated that 20–40 percent of targeted emission reductions can be met by agricultural soil carbon sequestration. Under a private emission trading strategy, U.S. farmers, practicing appropriate conservation practices, could sell carbon “credits” to carbon emitters. Alternatively, government policies might be implemented to directly support farmers for implementing conservation management practices. Either strategy would help mitigate carbon dioxide rise while the needed long-term technical solutions are found for producing clean energy.

The goal of CASMGs is to provide the tools and information needed to successfully implement soil carbon sequestration programs intended to lower the accumulation of greenhouse gases in the atmosphere, while improving the soil and providing income and incentives to farmers. Specifically, the Consortium will:

- Produce national inventories of all major greenhouse gas fluxes from soils.
- Provide measurement and modeling tools for quantifying and verifying soil carbon sequestration rates to support carbon dioxide emission credit or trading schemes.
- Provide integrated assessment models to evaluate alternative national and global economic and policy strategies for carbon sequestration. These models will provide insights on the impacts of such programs on crop production potential, food security and environmental quality.
- Provide a standing capability to meet the short-term needs of Federal agencies, Congress and the White House, for information, data and analysis on issues relating to soil carbon sequestration and soil greenhouse gas emissions.
- Participate in the transfer to and adoption of technology by other countries for quantifying and verifying carbon sequestration rates.
- Provide information to each of the stakeholder groups: policymakers, agricultural sector, energy and transportation industries, the scientific community and the general public, through annual and special reports, scientific and trade journals, popular publications and an internet website.

The work of the Consortium will enhance the capacity to sequester carbon in agricultural soils and provide time for industry to develop and implement clean energy technologies. We are hopeful that this Committee will acknowledge the important

role that agricultural lands play in carbon emissions mitigation, as well as, the unique opportunity for farmers to earn monetary rewards for sound agricultural practices that not only sequester carbon, but also improve the quality of the soil.

PREPARED STATEMENT OF THE COSMETIC, TOILETRY, AND FRAGRANCE ASSOCIATION

The Cosmetic, Toiletry, and Fragrance Association (CTFA)¹ appreciates the opportunity to submit testimony regarding the fiscal year 2001 budget request for the Food and Drug Administration (FDA) and, in particular, to support an increase in funding for the Center for Food Safety and Applied Nutrition (CFSAN) and its Office of Cosmetics and Colors. The Administration's budget proposal maintains the funding for the Office of Cosmetics and Colors at the fiscal year 2000 level of approximately \$5.2 million. We are concerned that this continuation of current funding will have the effect of reducing the office's resources because inflationary and mandatory salary increases are not funded. We believe funding this office sufficiently to cover those automatic expenses is essential to preserve the integrity of this regulatory program, which ensures consumer confidence in the safety of cosmetic products.

CTFA member companies provide consumers with a wide array of safe cosmetic products, including makeup preparations, shampoos, deodorants, toothpastes, mouthwashes, perfumes, shaving creams, and skin lotions. These products promote personal hygiene, as well as helping people look and feel good. Virtually everyone in the U.S. uses cosmetic products on a regular basis. Thanks to the safety programs of the cosmetic industry, often with the cooperation and participation of the FDA, and the effectiveness of FDA's cosmetic-related activities, everyone can be confident that the products they use routinely are safe. The continued appropriate funding of the Office of Cosmetics and Colors is essential to maintain this level of assurance for this industry and our consumers.

A strong FDA cosmetics regulatory program is critically important for the continuing economic success of the \$25 billion cosmetic and personal care industry. Our industry counts on the FDA compliance function to deter the entry into the market of unscrupulous organizations, as well as to ensure that questionable products are quickly removed from the market. A vital FDA program maintains a level playing field for all companies in the marketplace, and for all products. An efficient program allows members of our industry to know what the regulatory requirements are, how they will apply, and that they will be enforced consistently, regardless of whether products are produced domestically or imported into the U.S.

The Office of Cosmetics and Colors has been, and remains, a national leader in setting and maintaining standards for the safety of cosmetic products and for their proper labeling. This national leadership means that consumers throughout the nation can trust that their safety is protected, regardless of where they purchase products. The effective functioning of the Office is essential so that States are encouraged to adopt national standards rather than setting individual, differing state requirements. The resulting patchwork of regulatory requirements would not only confuse consumers but also create impossible difficulties for an industry conducting business in interstate commerce.

The FDA also is recognized internationally as expert in cosmetic regulation, largely as a result of the effective functioning of the Office of Cosmetics and Colors. FDA's international leadership is necessary so that we, along with other industries, can continue to move toward the goal of international harmonization. This was identified by Congress as a priority for FDA in Section 410 of the FDA Modernization Act of 1997.

Finally, in addition to supporting sufficient and stable funding for the office of Cosmetics and Colors, we also wish to take this opportunity to express support for two specific initiatives for which the Administration has requested additional funding in fiscal year 2001. First, the Administration requests \$5 million for costs associated with the move of CFSAN to new headquarters facilities. Without these funds, this long anticipated and congressionally supported move will not be completed successfully. For years, CFSAN has occupied seriously outmoded facilities and coped with extreme difficulties in upgrading laboratory, computer, and telecommunications capacity. The funds requested in this budget will allow implementation of

¹CTFA is the national trade association representing the cosmetic and personal care product industry. Founded in 1894, CTFA has an active membership of almost 300 companies, which manufacture or distribute the vast majority of the finished cosmetic and personal care products marketed in the U.S. The Association also has approximately 300 associate members, which provide services, equipment, or supplies, such as raw materials and packaging components, to our active members.

a much improved system, which will greatly benefit both consumers and the regulated industry.

Second, the Administration requests \$20 million for new laboratory facilities in Los Angeles. The FDA field laboratory in Los Angeles is an unsafe workplace, and its equipment and instrumentation are obsolete and cannot perform the important product analysis and monitoring functions necessary to continue to ensure product safety. This laboratory is especially important to FDA's work in preventing the importation into the U.S. of unsafe foreign-made products. The Los Angeles facility is a principal laboratory for analysis of imported cosmetic products, and its effective functioning is critical to our industry's goal that every cosmetic and personal care product on the U.S. market meet our high standards, whether the product is made in the U.S. or imported.

CTFA thanks you for considering our views as you move forward with your deliberations on the fiscal year 2001 budget. If there is any way we may be of assistance to you, please call upon us.

PREPARED STATEMENT OF THE COUNCIL FOR AGRICULTURAL RESEARCH, EXTENSION
AND TEACHING

Thank you Mr. Chairman, I appreciate the opportunity to provide testimony in support of the Land Grant University System.

My name is Daniel M. Dooley, Chairman of the Council for Agricultural Research, Extension and Teaching, commonly called CARET. CARET is a national group of lay support persons working on behalf of the Land Grant University System. The CARET group was formed a number of years ago for the express purpose of enhancing national support and understanding of the important role played by the Land Grant Colleges in the food and agricultural production system, as well as the role of this system in enhancing the quality of life for all citizens of the nation.

I do not intend to take your time discussing all of the contributions that the Land Grant System has made to the food and agricultural production system. I do want you to know, however, that the Land Grant University System has been an essential ingredient to the success of American agriculture and the health of the American public.

Suffice it to say, that the Land Grant University System is very unique and has been a critical component to the long-term success of the agricultural community. It has provided technology and education enabling farmers and ranchers and other stewards of natural resources in this country to manage their productive resources in a way that is efficient and yields the greatest and most nutritious quality and quantity of food in the world. The Land Grant Universities' contribution to agriculture has had enormous impact upon our economy, our balance of trade, the quality of our work force and the health and quality of life of American citizens. Unfortunately, this system is sometimes taken for granted.

It is now time to make substantial new efforts to the further research and development of the agriculture and food production system. This committee must acknowledge the important contributions to be made by support for Section 401 of the Agricultural Research, Extension and Education Reform Act of 1998 (AREERA). It is imperative that the committee find a resolution of the dispute which has emerged among your colleagues in the House of Representatives. Unfortunately, the future health and well being of the agriculture and food production system and the consumers it serves, are at risk because of the internal squabbles about implementation of Section 401. I represent to you that, on behalf of CARET, resolution of this matter is the highest priority facing you.

Additionally, this testimony is principally to request support for the fiscal year 2001 budget recommendations of the National Association of State Universities and Land Grant Colleges (NASULGC) Board on Agriculture of \$1,095,229,000.00. These increases, in addition to support of Section 401 of the AREERA, are critical to advance the interests of the agricultural economy in the United States.

CARET and NASULGC do endorse and are pleased with the President's proposed budget increases for the Cooperative State Research, Education and Extension Service of the United States Department of Agriculture. However, we do feel that it is necessary to reallocate some of the proposed increases and to augment increases in other areas.

The budget recommendations that are being advanced by CARET on behalf of the Land Grant Universities are the result of a broad number of stakeholder meetings and receipt of substantial input from those that benefit from the research and education activities. Specifically, I want to address a few funding highlights that are

recommended by CARET. It is our recommendation that the following programs be increased by the amounts noted.

- Base formula funds for research and extension, \$50,000,000.00 increase
- National extension priorities (water quality, food safety, pesticide impact assessment program), \$20,000,000.00 increase
- Native American and Hispanic serving institution funding, \$9,000,000.00 increase
- 1890 institution facilities improvements, \$3,000,000.00 increase
- National research initiative, \$30,000,000.00 increase
- Integrated research extension and education, \$43,000,000.00 increase
- Extension and research initiatives—(RUPRI, farm safety, grazing lands), \$13,000,000.00 increase
- International Science and Education Grant Program, \$8,000,000.00 increase
- Investment in students, \$15,000,000.00 increase

Additionally, the CARET recommendations include a number of cross-cutting issues for fiscal year 2001. The cross-cutting issues include investing in minority serving colleges, supporting partnerships to address national issues at the local level, investing in students, and globalizing United States universities.

Targeted issues for fiscal year 2001 include investing in farmers and ranchers, investing in food safety, investing in nutrition, investing in the environment, investing in renewable resources, investing in children, youth and families, and investing in new markets in quality communities.

The proposed increases in competitive grants will make the research and education system more responsive to emerging issues that are facing American agriculture in a rapidly changing and globalizing economic environment. The augmentation of the competitive grant program is essential to provide a mechanism which enables major research institutions to develop technology necessary to compete in this environment.

It is the belief of CARET that these proposed budget recommendations will help equip American agriculture for the 21st century. It will facilitate the maintenance of our competitive edge throughout the broad range of the production, processing, distribution and retail system that moves commodities around the world. Further, CARET believes that these recommendations will enhance the health and welfare of the American consuming public.

I have attached a copy of the NASULGC Board on Agriculture Budget Recommendations to this presentation. Thank you very much for the opportunity to present this testimony in support of appropriations for the Land Grant University System.

PREPARED STATEMENT OF DEFENDERS OF WILDLIFE

On behalf of our nearly 400,000 members and supporters nationwide, Defenders of Wildlife thanks you for the opportunity to submit testimony on the fiscal year 2001 Agriculture Appropriations bill. Defenders is a national, non-profit organization focused on conserving wildlife, their habitats and the ecosystems on which they depend. Consequently, we have a very special interest in the U.S. Department of Agriculture's natural resource protection programs. These programs include the Conservation Reserve Program (CRP), the Conservation Reserve Enhancement Program (CREP), the Wetland Reserve Program (WRP), the Environmental Quality Incentives Program (EQIP), the Wildlife Habitat Improvement Program (WHIP), and the Farmland Protection Program (FPP). We also are very interested in the newly proposed Conservation Security Program (CSP) and its potential beneficial impacts on wildlife habitat and ecosystem quality.

Although much remains to be done to improve the effectiveness and efficiency of existing USDA resource conservation programs, we would like to voice our strong support for the Administration's budget request of \$125 million for the CRP, \$65 million for the FPP, \$50 million for the WHIP, and \$325 million for the EQIP. We also support the enrollment of an additional 210,000 acres in the WRP program. We believe that the newly proposed CSP is an exciting opportunity to combine natural resource and farm income improvement objectives and that the program should receive the full level of the Administration's budget request of \$600 million.

A major constraint to improving the effectiveness and efficiency of existing USDA conservation programs is the lack of adequate monitoring and evaluation of field level projects and their impacts on natural resource quality, especially native wildlife and their habitats. We believe that \$5 million should be allocated to defining and implementing a pilot monitoring program(s) over the next two years to evaluate conservation program impacts toward achieving improved native wildlife habitat,

water and air quality, and soil health. Defining and implementing a pilot monitoring program(s) would be a cooperative effort involving the President's Council on Environmental Quality (CEQ), the USDA, the Environmental Protection Agency, the United States Fish and Wildlife Service, the National Marine Fisheries Service, and the United States Geological Survey, with the CEQ serving as the lead agency. The experience from this pilot effort would be used to determine a longer term conservation program monitoring and evaluation program that would be implemented under new Farm Bill legislation in 2002.

Lastly, effective implementation of USDA conservation programs requires increased technical assistance at the field level. We therefore support the Administration's proposed budget increases for field-level technical assistance for the natural resource conservation programs that are implemented and administered by the Farm Services Agency and the Natural Resources Conservation Agency.

On behalf of Defenders of Wildlife, I thank you again for this opportunity to submit testimony.

PREPARED STATEMENT OF DEFENDERS OF WILDLIFE

On behalf of our nearly 400,000 members and supporters nationwide, Defenders of Wildlife thanks you for the opportunity to submit testimony on the fiscal year 2001 Agriculture Appropriations bill. Defenders is a national, non-profit organization focused on conserving wildlife, their habitat and the ecosystems on which they depend. Consequently, we have a very special interest in the U.S. Department of Agriculture's Wildlife Services (WS) program.

The WS program, formerly known as Animal Damage Control, was created in 1931 at a time when the U.S. sheep industry was at its zenith with 52 million head nationwide. Consequently, its primary function became protecting sheep from predators—primarily in the West. Since that time, the sheep industry—for a number of reasons—has experienced a nearly 70-year decline. Sheep production is now less than 15 percent of its 1930s level, with the total number of sheep today at just over 7 million. The 1999 lamb crop of 4.7 million was down 6 percent from 1998 to a new record low and the number of sheep producers as of January 2000 totaled 66,800, down from 3 percent from 1998 and 8 percent from 1997. Despite the serious decline in the number of sheep and sheep producers, a change in sheep population distribution and the emergence of other vertebrate pest threats to agriculture, WS continues to view the western sheep rancher as its primary “customer” and continues to allocate the bulk of its resources to livestock protection.

The WS operations budget appears as a single line item in the budget with seven main program categories to which federal funds can be allocated: livestock protection, human health and safety, forest/range, aquaculture, property, crops and natural resources. Figures 1 and 2 indicate how WS allocated its fiscal year 1998 direct federal appropriation by program category in each state. From this information it is clear that livestock protection receives a disproportionate share (46.3 percent) of the total operations budget while the 6 remaining program categories collectively share the remaining 54.7 percent. Of the amount spent on livestock protection, 95.1 percent was spent within the 17 western states.

By continuing to fund the livestock protection program at such disproportionate levels, WS ignores those with greater needs, such as non-western livestock producers. For example, Iowa ranks 10th in the nation for sheep production with 265,000 head, yet only received \$2,625 in federal livestock protection money for fiscal year 1998, resulting in a cost per head of just one cent. A much different scenario exists in the West. Contrasted with Nevada, which has only one-third the number of sheep that Iowa does, this western state receives 7.1 percent of the direct federal dollars that WS dedicates to livestock protection, resulting in a per head cost of \$7.57. And if we assume, as studies suggest, that on average only 10 percent of ranchers utilize WS, that means 35 ranchers in Nevada receive a government subsidy of over \$20,000 per year.

A further example of how WS ignores the needs of others faced with animal damage conflicts is evident when one analyzes WS' human health and safety program. Although it often touts this to be a major program, in fiscal year 1997, WS allocated just \$1.9 million of its direct federal appropriation to addressing human health and safety needs for all of the 50 states. The human health and safety program largely addresses the issue of bird-aircraft strikes at airports. According to a WS publication, the FAA estimates that birds and animals threaten human safety and cause \$200 million in damage each year to aircraft in the U.S. Indirect costs, such as flight delays, aircraft changes, and loss of revenues add immeasurably to direct costs. Contrast these figures with the direct federal funds allocated to Idaho and

Montana for livestock protection: \$906,103 and \$824,681 respectively, for livestock damages that reportedly totaled just \$2.5 million. Overall, in fiscal year 1997 (the last year for which WS collected information pertaining to the reported value of resources damaged) WS spent \$9.8 million in response to the reported \$7.7 million in livestock-related damages and spent just \$9.5 million to address the more than \$63 million in damages reported in the 6 other program categories.

Figures 1 and 2 also demonstrate how skewed the WS program is in terms of funding levels for eastern programs. Despite the fact that the 31 eastern United States contain 70 percent of the total U.S. population and that six of the top ten states in agricultural products sales, less than 27.5 percent of WS' direct federal appropriation is spent on programs in the East.

Another area where both WS and the Animal and Plant Animal Health Inspection Service have failed to address much more legitimate animal damage conflicts is in the control of invasive exotic species. Invasive exotic species are one of the gravest threats to American agriculture as well as to a variety of natural ecosystems. Based on data on agriculture, forestry and public health, it is estimated that invasive exotic species now cost the nation more than \$122 billion per year (Pimentel et al 1999). About 42 percent of the species on the federal Threatened or Endangered Species List are considered at risk primarily because of competition and predation by exotic species and according to a 1998 study, the affect of exotics on imperiled species is second only to habitat destruction among major threats to biodiversity. Despite the magnitude of the threat that invasive species pose to agriculture, WS currently focuses solely on one invasive species, the brown tree snake and incredibly, last year when the Administration proposed a \$1.8 million across the board reduction in WS' operations budget, WS proposed eliminating funding of this highly critical program in order to achieve the reduction. This is even more incredible considering that the Department of Defense funds the lion's share of the brown tree snake program.

One exotic species whose control is clearly within the domain of WS is the nutria, a rodent native to South American that was introduced in the United States in the late 19th century. An initial population of 20 nutria in Louisiana reached 20 million individuals within 25 years, and the rodent now has established populations in the coastal and freshwater marshlands of 15 other states. They have damaged 80,000 of Louisiana's three million acres of coastal marshlands, resulting in more than \$2.2 billion per year in lost value. Yet despite the tremendous economic losses resulting from nutria damage, WS spends virtually nothing on controlling this highly destructive species and when recently asked to assist with a pilot project at Blackwater National Wildlife Refuge in Maryland aimed at eradicating nutria from the area, WS claimed that there were no funds in their budget available for such assistance.

Clearly, forceful congressional direction is needed to ensure that WS reassesses how it determines its program priorities in the future. In order to provide this direction, we urge the Subcommittee to limit funds for livestock protection to no more than \$2.5 million, of which none can be spent on lethal control, and a redirection of funds toward programs that deal with the control of exotic species. Federal funds remaining for livestock protection would be sufficient to allow WS field personnel to provide technical assistance to ranchers with depredation problems.

The Subcommittee has received testimony submitted by Mr. James G. Butler, Chair of the National Wildlife Services Advisory Committee dated March 1, 2000. Although Mr. Butler's testimony was purportedly submitted on behalf of the advisory committee, it was neither reviewed nor approved by the advisory committee, on which a Defenders' employee resides. Thus, Mr. Butler's testimony speaks only for him, and Congress should be aware that not only was his testimony on behalf of the advisory committee ill-advised, but it also potentially violates federal law. As Mr. Butler is a sheep rancher residing within Texas, his views of the WS program are markedly different from those of Defenders and therefore should not be construed to represent Defenders' opinion. We will be pursuing this matter with WS administrators in the very near future.

Lastly, we would like to voice our strong support for the Administration's request for \$125 million for the Conservation Reserve Program, \$65 million for the Farmland Protection Program, \$50 million for the Wildlife Habitat Incentives Program, \$325 million for the Environmental Quality Incentives Program and \$600 million for a new Conservation Security Program. We also support the enrollment of an additional 210,000 acres in the Wetlands Reserve Program.

On behalf of Defenders of Wildlife, I thank you again for this opportunity to submit testimony.

PREPARED STATEMENT OF EASTER SEALS

Easter Seals appreciates the opportunity to report on the notable accomplishments of the USDA Cooperative State Research, Education, and Extension Service (CSREES) AgrAbility Program and recommend that funding for the AgrAbility Program be increased to \$4.6 million in fiscal year 2001.

The AgrAbility Program is an essential, unduplicated, hands-on resource for farmers, ranchers, and farmworkers with disabilities. It is the only USDA program dedicated exclusively to helping agricultural producers with disabilities. It demonstrates the value of public-private partnership by securing donations of funds, talent, and materials to magnify the impact of a modest federal investment. The fiscal year 2000 appropriation is \$3,055,000 (minus a 15 percent decrease in funds as part of efforts to cut discretionary spending) which funds 18 state programs.

Disability & Agriculture

Agricultural production is one of the nation's most hazardous occupations. Each year, approximately 200,000 people working in agriculture experience injuries that limit their ability to perform essential farm tasks. Tens of thousands more become disabled as a result of non-farm injuries, illnesses, other health conditions, and the aging process. Nationwide, approximately 500,000 agricultural workers have physical disabilities that prevent them from performing one or more essential farm tasks.

For many of these individuals, the presence of a disability jeopardizes their rural and agricultural futures. Rural isolation, a tradition of self-reliance, and gaps in rural service delivery systems frequently prevent agricultural workers with disabilities from taking advantage of growing expertise in modifying farm operations, adapting equipment, promoting farmstead accessibility, and using assistive technologies to safely accommodate disability in agricultural and rural settings. Yet, with some assistance, the majority of disabled agricultural workers can continue to earn their livelihoods in agriculture and participate fully in rural community life.

AgrAbility's Role and Record of Success

Since 1991, thirty-one states have been served by AgrAbility projects. AgrAbility currently has:

- Provided direct on-farm assistance to more than 4,700 farmers, ranchers, and farmworkers with disabilities and their families.
- Provided information and advice to more than 10,000 persons with disabilities employed in agriculture and related occupations.
- Educated more than 160,000 agricultural, rehabilitation, and rural health professionals on safely accommodating disability in agriculture.
- Recruited and trained more than 3,500 volunteers to assist agricultural producers with disabilities and their families.
- Reached approximately 8.4 million people through 3,800 exhibits, displays, and demonstrations to increase awareness of the challenges affecting and resources available to people with disabilities who work in agriculture.

The AgrAbility Program was established under the 1990 Farm Bill in response to the needs of farmers with disabilities. The Farm Bill authorizes the Secretary of Agriculture to make grants to Extension Services for conducting collaborative education and assistance programs for farmers with disabilities through state demonstration projects and related national training, technical assistance, and information dissemination. Easter Seals is proud to be a partner with Purdue University's Breaking New Ground Program to provide the national training and technical assistance portion of AgrAbility. Thousands of people in states with and without state AgrAbility projects are aided through this initiative.

AgrAbility combines the know-how of Extension Service and national disability organizations to provide people with disabilities working in agriculture the specialized services that they need to safely accommodate their disabilities in everyday farm operations. AgrAbility received strong bipartisan support during the 1998 reauthorization of the USDA research and education programs, and was extended through fiscal year 2004. The \$6 million authorization level for AgrAbility was continued.

Under the statute, state and multi-state AgrAbility projects engage Extension Service agents, disability experts, rural professionals, and volunteers in offering an array of services, including: identifying and referring farmers with disabilities; providing on-the-farm technical assistance for agricultural workers on adapting and using farm equipment, buildings, and tools; restructuring farm operations: providing agriculture-based education to prevent further injury and disability; and, upgrading the skills of Extension Service agents and other rural professionals to better promote success in agricultural production for people disabilities.

In 2000, USDA received an allocation from Congress of \$3,055,000. To meet the fiscal 2000 budget agreement of reducing discretionary spending by .38 percent, the Department reduced the AgrAbility funding by 15 percent. These funds support eighteen state projects in Colorado, Delaware, Illinois, Indiana, Iowa, Kentucky, Minnesota, Mississippi, Missouri, Nebraska, North Carolina, North Dakota, Pennsylvania, South Dakota, Tennessee, Texas, Utah, and Wisconsin.

AgrAbility provides customized assistance to farmers, ranchers, and farmworkers with disabilities and their families. The nature and degree of assistance depends on the individual's disability needs and agricultural operation. For example:

- Ron Brown from Edgar, Wisconsin, sought help from AgrAbility because a 1981 injury that limited the use of his arm and arthritis in his knees was making it increasingly difficult to accomplish the chores on his 40 to 50 head dairy farm. AgrAbility staff worked with Ron and enlisted the help of the state Division of Vocational Rehabilitation to create solutions to allow Ron to stay active in farming. AgrAbility staff recommended new types of equipment to minimize the stress on Ron's knees and arm. A John Deere "Gator" utility vehicle allows Ron to get around the farm easily, helping him herd cows, fix fences and do other chores. Ron did some of the modification work himself. The added extra steps and handrails he added to his tractors allow him to get on and off more easily and safely. Ron says that the partnership has helped make farming "a little better, and easier to do." Ron now travels the state supporting other farmers with disabilities.
- Rodney Lane of Harrison Valley, Pennsylvania has operated a farm in the Harrison Valley since 1979. He has a dairy herd and over 500 acres of crops. He lost his left arm below the elbow and part of three fingers on his right hand in a corn picker accident. He uses a prosthesis on his left arm when tending his cows. AgrAbility for Pennsylvanians worked with Vocational Rehabilitation to acquire a mixed ration wagon that eliminates the need for multiple trips to and from the grain bin and reduces the need for heavy lifting. Rodney has this to say about his modification, "Assistive technology has made things easier so that I can farm more self-sufficiently."
- Darwin Hoffmeister of Ackley, Iowa, lost four fingers and the use of his left arm in a combine accident five years ago. Although plenty of offers to take over his soybean and livestock operation came in after his accident, Darwin wanted to continue in farming. AgrAbility worked with him to change the ladder on his combine, put guardrails on his grain bin and provide him with adapted tools such as a magnetic hammer that allows for one-handed operation. In his own words, "farming is all I've ever done, and I wanted to prove that I could still do it."
- Louis Jones of Biddle, Kentucky, worked for Clarklands Thoroughbreds, a breeding farm, mowing lawns, grooming horses, and performing maintenance. After a spinal cord injury, he contacted AgrAbility staff who helped him explore the possibilities of starting a lawn care business. With AgrAbility's assistance, Louis found the right equipment and funding to start his new company. AgrAbility staff worked with Louis to modify equipment so he can access and maintain all of it. The horse farm where Louis worked will become one of his new clients.

Impact of Current Funding Levels

In the 1990 Farm Bill, a funding floor of \$150,000 per state was set to assure that the state programs were successfully implemented. However, because funding has not approached the \$6 million authorized level, state projects have been funded at only \$85,000 per state. In the 1998 reauthorization of the USDA research and education programs, the Committee reaffirmed a commitment to that \$150,000 per state floor. Easter Seals strongly supports full funding of state programs to assure that they continue to be effective for farmers with disabilities. Without a concurrent increase in appropriations, fully funding state projects at \$150,000 per state would result in a loss of almost half of the existing AgrAbility projects. The fiscal 2001 request of \$4.6 million would bring all current states up to the \$150,000 level and would allow eight currently unserved states to implement AgrAbility programs.

AgrAbility projects are underfunded relative to need and objective. At \$85,000 per state, only a few staff can be hired to provide state-wide education and assistance to farmers with disabilities, educate rural professionals, recruit volunteers, and work with rural businesses on disability-related issues. Rising demand for services and the great distances that must be traveled to reach farmers and ranchers severely strains even the most dedicated of AgrAbility's outstanding staff. The 15 percent rescission for fiscal 2000 has added to the stress faced by staff. State AgrAbility projects were asked to develop work plans for 2000 based on the original appropria-

tion of \$3,055,000, only to be asked to revise and resubmit them to accommodate the 15 percent rescission. Easter Seals fears that failure to invest adequately in this worthwhile program will ultimately cause it to falter.

One of the consequences of limited funding is that in every grant cycle, some states that have existing AgrAbility programs, and can demonstrate a legitimate need for services, are not renewed and forced to discontinue services to farmers with disabilities in that state and often have difficulty getting the access to the limited state and private funding sources that the federal seed money granted them. More than a dozen states have sought AgrAbility funding without success. Other states, including Louisiana, Michigan, New Hampshire, South Carolina, and Vermont, had USDA-funded AgrAbility projects in the past and seek to re-establish their programs. Each of these states can demonstrate significant unmet needs among farm and ranch families affected by disability that AgrAbility could potentially address. In the 1998–1999 grant cycle, projects in Ohio, New York, Idaho/Montana, and New Jersey ceased to receive federal support. The need for the program in these once-funded states is exemplified by the fact that last year the technical assistance telephone line operated by AgrAbility staff at Breaking New Ground Resource Center at Purdue University logged hundreds of calls for assistance from these nine states alone. Any loss of programs will greatly affect farmers with disabilities in states for whom AgrAbility is the primary resource through which they seek information and assistance.

The need for AgrAbility services has never been greater, and its accomplishments to date are remarkable by any standard. Easter Seals is proud to contribute to the ongoing success of the USDA–CSREES AgrAbility Program. Please support the allocation of at least \$4.6 million for AgrAbility in fiscal year 2001 to ensure that this valuable public-private partnership continues to serve rural Americans with disabilities and their families. Thank you for considering Easter Seals' views and recommendations.

PREPARED STATEMENT OF THE FDA–NIH COUNCIL

INTRODUCTION

The FDA–NIH Council appreciates the opportunity to submit testimony concerning the importance of a sustainable funding base for the Food and Drug Administration (FDA). This year President Clinton has proposed an impressive 13 percent increase for the Agency. The Council members are grateful for the Committee's support of the FDA and consideration of the Administration's proposal.

The FDA–NIH Council is a coalition of patient advocacy organizations, academic scientists, health professionals, and research-based industry organizations. These partners in the process of medical discovery and innovation have come together as a result of the shared concern about the complex challenges faced by the FDA in carrying out its regulatory responsibilities. The Council members recognize that new advances in research, innovations in technology, and additional resources for research make demands on the FDA that must be addressed.

There is no question that we are on the threshold of medical breakthroughs that were unthinkable just five years ago. We have built a successful discovery process in government, academia, and industry, attracted some of the best scientific minds, and initiated ground-breaking programs that have already yielded critical knowledge, and improved patient care and quality of life. The unprecedented increases at the National Institutes of Health (NIH) have led to significantly increased activity at the FDA relative to increased product development and clinical trials. Without the resources and necessary funding to support scientific expertise, we limit our ability to rapidly and cost-effectively translate that research and development into commercial products for health professionals and consumers. The FDA must be in a position to respond to the tremendous advances occurring in the public and private sectors.

Over the past five to eight years the FDA's appropriations have increased at a steady and minimal rate. However, trends in a wide variety of external factors have generated workloads and public expectations that are poorly matched with the FDA's capacity to respond in a timely and adequate manner. The Agency's growing responsibilities include Biotech alliances, direct-to-consumer prescription drug advertisement, new drug and biotech patents, food imports to the United States, transgenic crops, and Internet pharmacies, not to mention dietary supplements and generic drug approvals.

While an increasing proportion of the FDA's workforce is new product review staff, funded by user fees under the Prescription Drug User Fee Act (PDUFA), the

number of non-user fee funded full-time equivalent (FTE) positions has declined by more than 800 over the last eight years, which impacts on the Agency's ability to inspect, monitor, and address responsibilities outside PDUFA. In addition, FDA's statute specifies very precise time frames or frequencies for many review and inspection functions. Because most of these activities are very labor intensive, and grow over time, the FDA's ability to accomplish this work is often less than required by the statute.

The FDA-NIH Council supports the FDA's request which focuses on Assuring Safety through Strengthened Science. In the past twenty years, expenditures in drug research have increased seven-fold; the drug discovery process is being driven by major breakthroughs in both biotechnology and information technology; medical device technology has shifted from x-rays and CAT scans to also include robotics, miniaturization, and bio-materials; trade and the standards that guide it have become increasingly globalized; and consumers' purchasing cues have shifted from traditional print and electronic media to the Internet. An increase in the Agency's budget is necessary to bring the FDA into the 21st century with a strong, focused emphasis on managing risk, developing science within the Agency, and pursuing leveraging opportunities with industry and academia.

As a Coalition, we support the accomplishments of the FDA:

Prescription Drug User Fee Act (PDUFA).—In the premarket arena, as a result of PDUFA and the cooperation of the FDA and industry, drugs are now being reviewed expeditiously, allowing consumers to benefit from new and innovative safe and effective medical products on the market more rapidly. The FDA is currently on track to meet or exceed all performance commitments associated with PDUFA for fiscal year 2000.

Streamlining Premarket Activities.—The FDA has completed several reinvention efforts to streamline the premarket review process to accelerate review times for important new medical devices and animal drugs. These efforts have relied on the collaboration with health professionals and industry to assure public health and safety before and after market entry.

FDA Modernization Act (FDAMA).—The Agency has successfully been implementing FDAMA. The FDAMA Statutory Compliance Plan provides a strategic blueprint for the FDA's future direction, and identifies the gap between the Agency's current capacity, and the goals of statutory requirements and public expectations. Working in collaboration with the FDA, stakeholders have articulated the need to strengthen the science and analytical base of the Agency, and the need for improved communications, including maximizing the availability and clarity of information for consumers about new products and for industry about review processes.

The FDA-NIH Council strongly believes that the following items are essential for fiscal year 2001:

The FDA-NIH Council urges the Committee to do all that is possible to ensure that the FDA is provided the resources to carry out its mandates.—We recommend that the Committee support the Administration's request for \$1,391 million, and increase of \$176 million over the fiscal year 2000 enacted level. Program authority at this level would include the collection of authorized user fees for prescription drugs (\$149 million) and mammogram quality screening (\$15 million). The Council, and stakeholders in the research and innovation process—patients, health providers, researchers, and industry—agree how successful the user fee program has been in expediting the progress of research to consumer product.

The FDA-NIH Council recommends the FDA maintain a strong science base that keeps pace with accelerating technology.—With an explosion of new technologies, it is imperative the FDA maintain a level of expertise and remain current in science to fully understand the risks associated with new products. New mandates and appropriate prohibitions against resource shifting have eroded the funding for the Centers and base programs supported by the FDA. The Administration has proposed new initiatives and mandates without providing the full funding necessary to maintain the integrity of existing programs in the Agency, which has the potential to weaken the FDA.

The FDA-NIH Council strongly opposes the unauthorized user fees proposed by the Administration, as we have consistently in the past.—User fees should be used to speed and enhance the quality of the review by the FDA. We oppose the collection of unauthorized user fees for deficit reduction. Any user fee program should be authorized prior to implementation. The Council believes that the initiatives proposed by the Administration should undergo the same Congressional consideration that was provided to the Prescription Drug User Fee program.

The FDA-NIH Council understands the inherent difficulties in terms of weighing the available resources and supporting numerous worthy federal programs in light of the severe budget constraints which presently exist. However, we strongly believe

the functions of the FDA are too vital to the health and welfare of our citizens and urge your support for a strong increased appropriation to the Agency.

The FDA-NIH Council thanks the Committee for the opportunity to submit testimony. We appreciate the support of this Committee.

The members of the FDA-NIH Council are: the A-T's Children Project; Candlelighters Childhood Cancer Foundation; Allergy and Asthma Network—Mothers of Asthmatics, Inc.; Alliance for Aging Research; Schering-Plough Corporation; Albert B. Sabin Vaccine Foundation; Merck & Co., Inc; Pfizer, Inc.; American Veterinary Medical Association; Joint Council of Allergy, Asthma and Immunology; American Society of Tropical Medicine and Hygiene; American Academy of Pediatrics; National Multiple Sclerosis Society; Glaxo Wellcome, Inc.; Cystic Fibrosis Foundation; Bristol-Myers Squibb Company; Society of Toxicology; Research Society on Alcoholism; Theracom; Parkinson's Action Network; Academic Contract Research Organization; American Academy of Allergy, Asthma and Immunology; Bermuda Biological Station for Research; and the Cancer Research Foundation of America.

PREPARED STATEMENT OF THE FEDERATION OF AMERICAN SOCIETIES FOR
EXPERIMENTAL BIOLOGY

Mr. Chairman, Mr. Kohl, Members of the Subcommittee: The Federation of American Societies for Experimental Biology, FASEB, is the largest organization of life scientists in the United States. Founded in 1912, FASEB is comprised of 20 societies with a combined membership of more than 60,000 scientists, including investigators involved in a broad spectrum of agricultural research. Our member scientists hold positions at nearly every land grant and private institution engaged in nutrition-related research in the United States. Many more are pursuing agricultural questions through industrial and biotechnology activities. Their research projects span human and animal nutrition, plant science, animal physiology and reproduction.

Each year, FASEB brings together representatives of our member societies to review the life science research programs at various federal agencies. After considerable deliberation and debate, these scientists produce funding recommendations for each agency examined. This year's proposals are contained in a report released for this budget cycle.¹ It is on behalf of FASEB scientists that testimony to this subcommittee is submitted.

University research supported by the U.S. Department of Agriculture (USDA) throughout the country is critical to achieving the agricultural advances required to feed the world, reduce environmental pollution, provide safe foods, improve nutrition and enhance the competitive position of U.S. agriculture in the global marketplace. The USDA supports basic and applied research through its Research, Education and Extension (REE) budget and through its intramural research arm, the Agricultural Research Service. Half of the total REE budget supports the Cooperative State Research, Education and Extension Service (CSREES), which allocates resources for national and regional priorities through a variety of funding mechanisms. By providing a structure for USDA-university partnerships, CSREES sustains the university-based research and education system that is intrinsic to our agricultural success. Much of this support is disbursed through competitive grants programs, ensuring that funds are invested in the highest quality research projects.

The dramatic rise in the U.S. and world population will significantly increase the demand for food; greater investment in agricultural research today is essential to meeting this need in the future. USDA therefore must be involved in research aimed at creating environmentally sustainable development, rural medical delivery systems and improved technology for food processing, contributing to more effective and cost-efficient health care.² Several programs within USDA warrant increased support, in order to capitalize on their ability to address these challenges.

National Research Initiative Competitive Grants Program (NRICGP)

The National Research Initiative Competitive Grants Program (NRICGP) provides important scientific underpinnings to meet the pressing need for a safe and nutritious food supply. This competitive and highly productive merit-reviewed research program supports projects that lead to improved understanding as well as direct applications to enhance agricultural productivity, environmental quality and optimal human nutrition and food safety. Its vitality is crucial to the future of U.S. agriculture.

¹Federation of American Societies for Experimental Biology. 2000. Federal Funding for Biomedical and Related Life Science Research fiscal year 2001. <http://www.faseb.org>.

²Coalition on Funding Agricultural Research Missions. 1999. Invest Now for a New Century Bethesda, MD: Co-FARM.

Recent NRICGP-sponsored advances include:

- Improved understanding of the biochemical and genetic basis for plant resistance to cold, drought and salinity, providing the potential for the development of improved varieties of agricultural crops.
- Improved understanding of virulence mechanisms of plant pathogens.
- Enhanced understanding of the mechanism of bovine fertilization and early hormonal interactions between mother and fetus will lead to improved reproduction of livestock.
- Further understanding of the role of soybean lectin gene in plant development, which has direct applications to insect resistance and human nutrition.
- Improved understanding of the genetic regulation of oil production in plant seeds, which has direct application to the production of oils with improved industrial functionality as well as for production of oils with improved nutritional quality for human and animal consumption.
- Improved methods for detection of naturally occurring seafood toxins.
- New strategies for elimination of Salmonella from chickens.
- New insight into the role of dietary fat in regulating metabolism.
- New techniques using nonradioactive tracers to assess nutrient requirements based on rates of metabolic processes.
- Improved understanding of the metabolic basis for nutritional requirements at critical stages of development including pregnancy and infancy.
- The above examples represent only a subset of the NRICGP research portfolio.

One of the strengths of this program is its breadth and consequent ability to maximize research contributions across areas of agricultural need.

However, despite the potential for further advancement, the USDA research budget has actually decreased in constant dollars by nine percent in the last five years. In 1998, for example, only 25 percent of the qualified grant proposals were funded. As a result, high-quality projects were turned down, discouraging the nation's best scientists with the most meritorious ideas from competing for USDA funding. And, even at this modest funding level, the awarded budgets were reduced by an average of 30 percent. Consequently, the research capacity of the NRICGP program is underutilized and an effective competitive grants program is impeded. In accordance with this position, it is important to note that the number of applications received in fiscal year 1999 increased by 157 over fiscal year 1998 following an increased appropriation to the program's budget.³

Inadequate support limits both the number and the productivity of researchers that the NRICGP is able to fund. NRICGP awards are small, averaging about \$60,000 per year, and have a short duration, averaging 2.3 years. Researchers must therefore limit the scope of their work or spend valuable time writing additional grant proposals. Moreover, a congressionally mandated cap on indirect (facilities and administrative) costs for NRICGP grants deters many capable investigators from even seeking NRI grants. The 19 percent cap on these costs does not cover the real expenses associated with the research. These factors have led to more than a 20 percent reduction in proposals submitted since 1994.⁴

In addition to relieving the administrative constraints on NRICGP-sponsored research, support for areas of great opportunity should be augmented, including animal, plant and microbial genomes; improving human nutrition for optimal health; food safety; plant biochemistry; decreasing the environmental impact of animal pollutants; integrated agricultural systems; and infrastructure building. Funds now available for these areas of critical research are insufficient to allow them to reach their full potential.

Therefore, FASEB recommends:

- an appropriation of \$203 million in fiscal year 2001 for base funding of NRICGP. This would represent a first step toward the goal of attaining the originally authorized \$500 million for a program that has been chronically under-funded since its inception. This increase should not come at the expense of other CSREES programs.
- efforts be made within NRI to fund grants at the lengths and amounts recommended by peer-review panels. FASEB further urges Congress to increase the 19 percent cap on indirect (facilities and administrative) costs for NRI grants.

³U.S. Department of Agriculture. National Research Initiative Competitive Grants Program Annual Reports, fiscal year 1994 through fiscal year 1999 and personal communication, Sally Rocky, Deputy Administrator, Competitive Research Grants and Awards Management, Cooperative State Research, Education and Extension Service.

⁴Ibid.

- maintaining the NRI process for enhancing the funding of new investigators and encourages the NRI to expand the number of these awards.
 - continuing the policy of using funds from the NRI program to support young investigators for the President's Early Career Award for Scientists and Engineers.
 - USDA and NRI continue their successful collaboration with other federal agencies on issues such as the Plant Genome Project and the Food Safety Institute.
- Finally, FASEB applauds Congress for implementing increased accountability of formula-funded research programs and for directing 25 percent of funding into multi-disciplinary research and 25 percent into multi-state projects.

Initiative for Future Agriculture and Food Systems

A second issue that FASEB recommends Congress pursue is the expenditure of funds for the Initiative for Future Agriculture and Food Systems (henceforth referred to as 'the Initiative'). Two years ago, Congress authorized the Initiative to fund competitively awarded research grants to support large, multi-disciplinary, multi-center programs beyond the scope of the NRI. The program includes merit review and priority-setting provisions involving the relevant stakeholder groups.

Within the Initiative, FASEB recommends the creation of a new agricultural genomics program. The power and long-term impact of a large-scale genome initiative directed toward agriculturally important organisms represents a major opportunity and fulfills an important need in agriculture. The most efficient means to establish these new genomic databases is to integrate bioinformatics with large-scale sequencing efforts through the comparative mapping of genes in related organisms. NRICGP is well positioned to then support the resulting database research and to address problems presented in agriculturally significant organisms. FASEB further recommends that this program be coordinated with other USDA activities and with those at NSF, DOE, NIH and the private sector.

Similarly, FASEB recommends the initiation of an agricultural biotechnology/risk assessment program, within the Initiative, as food technology and nutrition and agricultural biotechnology are priority mission areas. USDA is the logical agency to provide leadership and research support for risk assessment to both consumers and the environment relative to genetically modified food products. Areas of emphasis should include identifying protective components of foods that reduce the risk of chronic diseases, investigating how individuals of varying genetic backgrounds respond to different intakes of those food components, bio-engineering of foods to provide increased amounts of nutrients or other components that are important to health and testing the effectiveness and safety of those modifications in animals and humans. Additionally, links between various food components and diseases such as cancer continue to be uncovered, including over 600 plant-derived chemicals with chemopreventive properties, such as antioxidants. Ultimately, as there are many basic questions left unanswered on the role of diet in health and disease, we will want to know what compositional changes in plants and animals provide the best nutritional value.

- FASEB endorses the Initiative for Future Agriculture and Food Systems and recommends full funding of \$120 million in fiscal year 2001.

Higher Education

Encouraging and educating the next generation of agricultural scientists is a fundamental prerequisite to sustaining our capability and success in agricultural research. The National Needs Graduate Fellowship Grants Program (NNFG) contributes to the training of outstanding researchers who can interact effectively with agricultural producers and consumers. Despite its importance, funding for the NNFG declined from \$5 million in fiscal year 1996 to \$3 million in fiscal year 1997 where it has remained.

- FASEB recommends that funding for the National Needs Fellowship Grants be restored to its previous level of \$5 million in fiscal year 2001.

In addition to the NNFG, the USDA supports innovation in teaching methods and materials through the Institution Challenge Grants program. The critical need to recruit and train the next generation of agriculture researchers necessitates that these two programs be supported at levels sufficient for them to accomplish their goals effectively.

- FASEB recommends that the Institution Challenge Grants be maintained at \$4.35 million in fiscal year 2001.

Use of Animals in Research

Research using animals has been crucial to most of the major medical advances of the past century. Reasonable guidelines concerning how animals are used in research provide safeguards and ensure public confidence. USDA's Animal and Plant

Health Inspection Service (APHIS) is charged by Congress with enforcing provisions of the Animal Welfare Act, and FASEB commends the USDA for its diligent enforcement efforts.

—FASEB recommends that Congress provide the Animal and Plant Health Inspection Service with continued support for Animal Welfare Act enforcement in fiscal year 2001.

In conclusion, agricultural research is crucial to sustaining the productivity of our farmers and livestock breeders, as well as to maintaining consumer confidence in the safety and nutritional value of American foods. As agricultural scientists address the challenges and opportunities in this new century, it is important that USDA programs have the resource capacity to support their progress. The growth and enhancement of the National Research Initiative Competitive Grants Program, the Initiative for Future Agriculture and Food Systems and increased support for the training of the next generation of agricultural scientists is therefore fundamental to ensuring that we are able to provide for our future needs.

PREPARED STATEMENT OF FLORIDA STATE UNIVERSITY

Mr. Chairman, I would like to thank you and the Members of the Subcommittee for this opportunity to present testimony before this Committee. I would like to take a moment to briefly acquaint you with Florida State University.

Florida State University is a comprehensive Research I university with a liberal arts base. The University's primary role is to serve as a center for advanced graduate and professional studies while emphasizing research and providing excellence in undergraduate programs. Faculty at FSU have been selected for their commitment to excellence in teaching, for their abilities to perform research and creative activities, and for their commitment to public service. Among the faculty are numerous recipients of national and international honors, including four Nobel laureates and eight members of the National Academy of Sciences. Our scientists and engineers do excellent research, and often they work closely with industry to commercialize the results of their research. Florida State ranks third this year among all U.S. universities in revenues generated from its patents and licenses, trailing only Columbia University and the entire University of California system. Having been designated as a Carnegie Research I University several years ago, Florida State University currently exceeds \$100 million per year in research expenditures. With no agricultural or medical school, few institutions can match our success.

Florida State attracts students from every county in Florida, every state in the nation, and more than 100 foreign countries. The University is committed to high admission standards that ensure quality in its student body, which currently includes some 192 National Merit and National Achievement scholars, as well as students with superior creative talent. We consistently rank in the top 25 among U.S. colleges and universities in attracting National Merit Scholars.

At Florida State University, we are very proud of our successes as well as our emerging reputation as one of the nation's top public universities.

Mr. Chairman, let me tell you about a project we are pursuing this year involving the development of sustainable marine aquaculture systems and sustainable marine aquaculture opportunities through distance learning.

The opportunity for the U.S. marine aquaculture industry to meet the increasing demand for seafood has never been greater than it is today. The majority of the world's marine aquaculture production takes place in coastal ponds or sea cages. In the U.S., aquaculture industry development has been inhibited by the high cost and limited availability of coastal lands, high production costs, restricted growing season and governmental regulations. In order for U.S. marine aquaculture production to expand and develop, innovative approaches to address the constraints being faced by the emerging aquaculture industry must be found.

Florida State University (FSU) and Harbor Branch Oceanographic Institution (HBOI) have formed a collaboration to design and develop improved energy and filtration treatment technologies for marine aquaculture. Expanding marine aquaculture opportunities to inland sites using species that can be adapted to freshwater, designing low-cost filtration systems for high density production, and designing low-cost energy efficient recirculating systems will provide solutions to several of the production and regulatory constraints faced by U.S. producers. If progress is made in these areas, there will be an increased opportunity for marine aquaculture to develop and expand.

There is an increasing global awareness of the need for sustainable marine aquaculture development. By the year 2025, global population is projected to be nearly 8.5 billion people, with a projected demand for seafood of 120 million metric tons

(MMT). Seafood fisheries reached carrying capacity more than ten years ago with a capture of 60 MMT, but demand for seafood has shown no signs of abating. The United Nations Food and Agriculture Organization (FAO) reported that by 1995, marine aquaculture accounted for only 26 percent of the total world harvest of food fish. In 1997, U.S. seafood imports increased both in volume and value, with shrimp topping the list at 278,600 metric tons valued at \$2.7 billion. Shrimp imports continue to be the second largest contributor to the U.S. trade deficit, and it is expected that finfish imports will follow the same scenario. There remains a great need for U.S. marine aquaculture production to fill this void and relieve some of the harvest pressure on natural stocks.

Competition for access to the now limited U.S. coastal land resources requires innovative approaches to develop and expand marine aquaculture into new environments. HBOI has work underway that suggests many saltwater species thrive in freshwater systems with the appropriate chemical makeup. Another issue is environmental protection of coastal waters and biosecurity to protect both wild and farmed aquatic resources from disease and exotic introductions, which necessitates the development of cost effective recirculating production systems. In many locations around the U.S., regulatory constraints already require the use of recirculating marine aquaculture systems. HBOI has designed an intensive recirculating, production system to culture marine finfish species in fresh or brackish water. The first component of this effort will involve the teaming of FSU's Department of Oceanography, the FSU/FAMU College of Engineering and HBOI to conduct parallel experiments to determine the optimal production parameters using hard freshwater in Florida. FSU's research on solar technologies will be utilized to design low-cost energy efficient recirculating systems for this effort as well. All of this work will expand U.S. marine aquaculture production of saltwater species into new locales, result in better utilization of land resources and reduce the demand for imported aquaculture products.

The second component of this collaborative effort will involve a continuation of the program initiated in fiscal year 2000 to facilitate cooperative research, education and public outreach programs focused on marine aquaculture. Educational materials are being developed for an outreach training program in the field of marine aquaculture through the use of distance learning technologies with funding provided in fiscal year 2000. We are requesting continued funding to develop aquaculture education and training programs and expand the program to reach new rural communities throughout Florida.

A number of other marine aquaculture business opportunities exist for rural communities throughout Florida, but their implementation requires that the training and technical support be provided in the home community. Through a combination of distance learning technology and satellite education and support hubs, we will provide marine aquaculture training, technical support and appropriate economic information to rural communities throughout Florida. As materials are being developed in the project, FSU and HBOI will work together with the local community colleges, economic development officials and extension specialists to develop a comprehensive dissemination network for this information.

The two collaborating institutions are seeking an appropriation of \$1.97 million in fiscal year 2001 to support the development of sustainable marine aquaculture systems. This effort includes a request of \$1.5 million from the USDA Agricultural Research Service to initiate the research component of this project, and the balance of \$470,000 to continue the distance education and training program from the USDA Cooperative State Research, Education and Extension Service.

Mr. Chairman, this is just one of many exciting activities going on at Florida State University that will make important contributions toward solving problems our nation faces today. Your support would be appreciated, and, again, thank you for the opportunity to present these views for your consideration.

PREPARED STATEMENT OF THE FRIENDS OF AGRICULTURAL RESEARCH-BELTSVILLE,
INC.

Mr. Chairman, and Members of the Subcommittee, thank you for this opportunity to present our statement supporting the Administration's funding request for the Department of Agriculture's Agricultural Research Service (ARS), and especially for the Agency's flagship research facility in Maryland, the Beltsville Agricultural Research Center (BARC). Our organization—the Friends of Agricultural Research-Beltsville—is dedicated to supporting and promoting the Center's agricultural research, outreach, and educational missions.

Mr. Chairman, public investments in agricultural research yield astonishing returns to American taxpayers. As the 20th Century dawned, an American farm produced only enough food for its residents and a handful of others. Yet a new USDA report, without factoring in our huge agricultural exports, notes that today American farms with \$10,000-plus in sales each produce enough food annually for 258 Americans. This astonishing success story traces directly to public research and outreach programs such as those of the Beltsville Agricultural Research Center, the world's most comprehensive agricultural research facility.

Highly regarded economists W.E. Huffman and R.E. Evenson have estimated the annual return on agricultural research to be between 135 and 170 per cent. Virginia Tech's George W. Norton puts the return on research in a long-term perspective. He notes that research may take several years to produce economic returns, but then it pays-off for a long, long time. Over a 15 to 20 year period, he estimates roughly a \$5 return for each research dollar spent.

Mr. Chairman, we would like to focus the remainder of our statement on three vitally important areas. All urgently need support. Without indicating priority order, we will discuss: Invasive Species; the Human Nutrition Research Initiative; and Modernization of the Beltsville Human Nutrition Research Center, Phase Two.

Invasive Species.—Invasive weeds—such as purple loosestrife, leafy spruce, Canada thistle, salt cedar, water hyacinth, and malaleuca—infest over 100 million acres in the United States at an estimated annual cost of \$36 billion in reduced crops, \$2 billion in reduced range yields, and \$100 million in aquatic weed control. Infested acreage is growing by 8 to 20 percent annually. Approximately half of our endangered and threatened plants are at risk to invasive species.

Invasive arthropods—insects such as whiteflies and the Russian wheat aphid—destroy \$14 billion worth of crops annually. The losses of mature hardwood and landscape trees to the Asian Longhorn Beetle are incalculable. Livestock and poultry producers must also contend with the threat of invasive arthropods. Records of introduced species that have plagued U.S. livestock include the stable fly, face fly, horn fly, sheep bot fly, northern cattle grub, common cattle grub, and sheep ked. An enormous number of nonindigenous insects, ticks, and mites that affect animals present the potential for becoming introduced and established in the United States. Losses to lawn and garden pests annually cost Americans another \$1.5 billion.

Beltsville scientists have pioneered applied and fundamental research in the detection and identification of invasive plants, insects, and pathogens as well chemical and biological control. The fiscal year 2001 budget proposes increased funding for invasive species research. We applaud this, for much basic and applied work remains to be done. Beltsville research in this vital area is underfunded, and at risk to losing its critical mass of highly qualified scientific expertise.

Human Nutrition Research Initiative.—Beltsville maintains several work areas that are fundamental to the mission of the Agricultural Research Service, indeed to the Department of Agriculture. They are, in a word, mission-critical. Yet, they are underfunded.

One area is the National Nutrient Database. This database contains vital information on the vitamin, mineral, and other nutrient content of U.S. foods. It is the foundation for food consumption tables used throughout the world. Closer to home, it supports the food consumption survey as well as the evaluation of such programs as Women, Infants, and Children (WIC) and school lunches. Moreover, it is the basis for most of the food-labeling content done by industry. Over time, the database has become outdated, failing to keep up with food processing changes, new foods, even new cuts of meat. Adequate funding is needed both to bring the database up-to-date and to maintain it. The closely related Continuing Survey of Food Intakes by Individuals needs support to improve its methodology and validation techniques.

Another area is the Food Composition Laboratory. This unit develops new analytical methods to measure food nutrient content—methods that are used widely by industry. These data go into the National Nutrient Database. We need better methods for measuring phytonutrients—a large complex group of food compounds, such as antioxidants and others—that have beneficial health effects. These complex compounds are hard to measure, and we urgently need to perfect simple, rapid, and accurate methods for accomplishing this.

A third area is Beltsville's exciting new research emphasis on Nutrition and Immunity—the relationship between nutritional status and disease immunity. A Beltsville scientist has shown that a person's nutritional status can affect whether a virus causes disease in that person. Beltsville also needs support to investigate mucosal (lining of the digestive tract) immunity. Beltsville plans to create and operate the only nationwide research program relating human nutrition to mucosal immunity.

Modernization of the Beltsville Human Nutrition Research Center.—We could hardly over-emphasize the importance of funding for the second phase for modernizing the Beltsville Human Nutrition Research Center. Congress appropriated Phase One funds in the fiscal year 2000 budget. Planning is on schedule to begin construction, and if everything goes as intended, there will be a groundbreaking in the fall. We need to keep momentum for this vital work going forward. Thus, Mr. Chairman, we strongly recommend approval of Phase Two funding as proposed in the Administration's budget.

Mr. Chairman, that concludes our statement. We again thank you and Members of the Subcommittee for your support and for the opportunity to present our testimony.

PREPARED STATEMENT OF FRIENDS OF THE NATIONAL ARBORETUM

Chairman Cochran and members of the Subcommittee, thank you for the opportunity to submit testimony in support of the U.S. National Arboretum on behalf of Friends of U.S. National Arboretum (FONA).

The President's budget contains a request for an increase of \$3,330,000 for the U.S. National Arboretum consisting of \$2.8 million to automate and replace lateral irrigation lines and \$530,000 for modernization of the existing heating, ventilating and air conditioning (HVAC) system in the current administration building. These are necessary core maintenance and improvement items, vital to the Arboretum and its 446 acres of plantings. The request is certainly supported by FONA.

These necessary maintenance items do not, however, address the need to advance the statutory educational function of the Arboretum and make it more visitor friendly through implementation of the new Master Plan, nor do they address the increased staffing needs of the Arboretum as hundreds of new visitors each year discover the wonders of this national treasure.

For fiscal year 2001, FONA respectfully requests \$110,000 for planning and design of the new Education and Visitors Center at the U.S. National Arboretum and \$3,000,000 for planning, design and construction of a new entrance off Bladensburg Road and the attendant widening and storm water control for existing roads at the National Arboretum. Both of these requests are consistent with the new Master Plan for the U.S. National Arboretum and compatible with funding requests by the U.S. National Arboretum.

Thanks to your Committee, and after some years of preparation, the schematic for the new Master Plan is now complete and the U.S. National Arboretum is poised to move into the twenty-first century and enhance its mission of horticultural education mandated by Congress.

The new Master Plan proposes, among other things, a new entrance to the National Arboretum off Bladensburg Road. The District of Columbia is currently preparing to rehabilitate Bladensburg Road with funds provided by Congress in TEA-21 and it is critical that the new entrance from Bladensburg Road into the Arboretum be coordinated with this project. The Department of Public Works of the District of Columbia has been very cooperative, and the \$3 Million requested coupled with the \$500,000 provided in fiscal year 2000 for engineering and design, would provide the funds the Arboretum estimates as necessary. Creation of the new entrance will also require widening of existing roads and provision for storm water management.

The \$110,000 request is for initial planning for the new Education and Visitors Center which is key to the core area of the Master Plan. This enhanced core area is the central feature making the U.S. National Arboretum a more attractive facility for visitors and enhancing its potential for horticultural education. Significant private funds are available to initiate a flowering tree walk which would tie together the various collections in the core area. The new Education and Visitors Center also presents other significant opportunities for private funding.

The foregoing requests for funds are also consistent with requests made by Representatives Bereuter, Goss, Petri, Dooley and Frelinghuysen to Secretary Glickman for fiscal year 2001 funding. We urge you to include this funding for fiscal year 2001 to enhance the U.S. National Arboretum's singular role as a source of horticultural education and as a national showcase for advances in horticulture.

FONA realizes that an enhanced U.S. National Arboretum envisioned by the Master Plan will require additional staff support. Already the Arboretum is attracting new visitors every year, placing a strain on the limited staff in place; there are now close to 7000 visitors for every one staff person. FONA is prepared to support additional staffing requested by the Arboretum and the Department of Agriculture to meet increased usage and visitation.

In an era when horticulture is the fastest growing segment of the agricultural industry, and public interest in horticulture and gardening is at an all time high, making the U.S. National Arboretum a renowned attraction for horticultural education—a “horticultural Smithsonian”—is well worth the effort and the investment.

Thank you for your continued support of the national treasure that is our U.S. National Arboretum.

PREPARED JOINT STATEMENT OF THE GENERIC PHARMACEUTICAL INDUSTRY ASSOCIATION, NATIONAL ASSOCIATION OF PHARMACEUTICAL MANUFACTURERS, AND NATIONAL PHARMACEUTICAL ALLIANCE

Mr. Chairman and Members of the Subcommittee, the Generic Pharmaceutical Industry Association (GPIA), National Association of Pharmaceutical Manufacturers (NAPM), and National Pharmaceutical Alliance (NPA) are pleased to have the opportunity to present these joint comments on the fiscal year 2001 budget request for the Food and Drug Administration (FDA). As part of a coalition of FDA-regulated industries, we support the Administration’s requested 13 percent increase in funding for fiscal year 2001. A letter expressing the coalition’s support, which was sent recently to this Subcommittee, is attached to our testimony.

As we begin the new millennium, it is imperative that this Subcommittee ensure that American consumers have continued access to safe, effective, and affordable pharmaceutical products. Promoting the availability of cost-effective drugs is the top priority for our members. GPIA, NAPM, and NPA are the three national trade associations representing manufacturers and distributors of finished multi-source generic pharmaceuticals, manufacturers and distributors of bulk active pharmaceutical chemicals, and suppliers of other goods and services to the generic drug industry. The associations’ combined membership encompasses virtually the entire U.S. generic pharmaceutical industry.

GENERIC DRUGS CONTINUE TO PROVIDE SIGNIFICANT HEALTH CARE COST SAVINGS

The generic drug industry addresses this Subcommittee with one voice to support FDA’s Office of Generic Drugs (OGD) and request that \$1.5 million in additional appropriations be allocated to OGD. This appropriation is critical to shore up OGD’s work of reviewing and approving generic drug applications, called abbreviated new drug applications (ANDAs).

Generic drugs continue to represent one of the most effective means of controlling healthcare costs in the U.S. Generic drug competition has saved the American consumer, taxpayer, and Federal and state governments billions of dollars since passage of the Hatch-Waxman Act in 1984. According to a July 1998 Congressional Budget Office study, consumers who bought generic drugs at retail pharmacies saved \$8–\$10 billion in 1994 alone.¹ Since the federal health program spends one out of every five health care dollars on prescription medicine,² lower-priced generic drugs save the U.S. government untold billions as well.³ These savings are possible because generic drugs typically enter the market at 25–30 percent below the brand price and, within two years, decline to 60–70 percent of the brand price.⁴ Access to this price discount is important for taxpayers and consumers, but is crucial for those seniors and the uninsured who have difficulty meeting their health care needs.

Despite the healthcare cost reductions that generic drugs have generated, the savings could be even greater if FDA took final action on generic drug applications within the statutorily required six months.⁵ Due in large part to the infusion of directed appropriations to OGD in 1998 and 1999, the agency has successfully focused

² Joseph McCafferty, Critical Condition, CFO, The Magazine for Senior Financial Executives, Jan. 1999, at 63.

³ FDA recognizes that generic drugs provide “substantial savings” to the Medicare and Medicaid programs in its Appropriations documents. HHS fiscal year 2001 Performance Plan, Fiscal Year 2000 Final Performance Plan, and Fiscal Year 1999 Performance Report for FDA, at 64.

⁴ CBO Report, “How Increased Competition from Generic Drugs has Affected Prices and Returns in the Pharmaceutical Industry” (July 1998), at Summary; “Economic Impact of GATT Patent Extension on Currently Marketed Drugs,” PRIME Institute, College of Pharmacy, University of Minnesota (Mar. 1995), at Executive Summary; SBC Warburg Dillon Read Inc., “Industry Report—Specialty Pharmaceuticals: Generic Drugs, May 20, 1998, at 22.

⁵ Under the law, FDA must take final action on generic drug applications within 180 days. 21 U.S.C. § 355(j)(5). In 1999, the median time to approval for ANDAs was 17.3 months—almost three times the length mandated by statute. HHS Fiscal Year 2001 Performance Plan, Fiscal Year 2000 Final Performance Plan, and Fiscal Year 1999 Performance Report for FDA, at 64.

on this mandate.⁶ Yet, under the present budget, FDA estimates that the improvement will stop—OGD's average review times for ANDAs actually will increase in 2000 and 2001,⁷ and much of the fiscal year 2000 appropriations will be consumed by inflationary costs.⁸ At the same time, an increase in future generic application submissions is almost guaranteed since, over the next five years, brand drugs with annual sales of \$25.5 billion will come "off patent," clearing the way for more generic applications.⁹ Therefore, this Subcommittee must continue its support for OGD, to ensure that the agency has adequate funding to approve safe and effective generic drugs promptly and efficiently.

THE GENERIC INDUSTRY REQUESTS DIRECT APPROPRIATIONS FOR FASTER GENERIC APPROVALS

GPIA, NAPM and NPA encourage the Subcommittee to continue its support for cost-effective pharmaceuticals by providing direct appropriations for OGD. These funds would enable OGD to progress further toward meeting the six month statutory period for final agency action on ANDAs, and address the backlog of ANDAs that remains at OGD. Specifically, we recommend that the Subcommittee take the following actions:

- Appropriate \$1.5 million directly for the Office of Generic Drugs, in addition to its fiscal year 2000 funding level;
- Continue to insist that FDA provide detailed and accurate information about agency expenditures specifically for, and by, OGD; and
- Include language in the fiscal year 2001 Agriculture Appropriations Bill to emphasize the Subcommittee's commitment to ensuring accelerated FDA review and approval times for cost-effective generic drugs.

These direct appropriations would assist OGD in reducing generic drug approval times through staff training and information technology upgrades, as described below.

WITH DIRECT APPROPRIATIONS, OGD CAN TRAIN STAFF AND ENHANCE EFFICIENCIES

Among the most pressing needs at OGD is one for appropriately trained staff members who can efficiently review generic drug applications. The modest increases in OGD's budget over the last three years have resulted in the addition of reviewers to the OGD staff. While these staff members are essential to handling OGD's ever increasing workload, their productivity can be improved. For example, 75 percent of OGD's microbiology reviewers have less than one year of experience at OGD, 50 percent of OGD's project managers are new, and 20 percent of the chemistry reviewers have less than one year on the job.¹⁰ These new reviewers would reach their potential much faster if given the opportunity and overtime pay to participate in the training programs that OGD used when funds were available.

WITH ADDITIONAL FUNDING, OGD CAN UPGRADE ITS INFORMATION TECHNOLOGY

Another immediate need in fiscal year 2001 is to augment OGD's information technology (IT) capability. An appropriation of \$1.5 million would enable OGD to purchase information technology hardware and software to expand and modernize several essential ANDA review programs. These IT programs include: (1) the electronic ANDA submissions program that is eliminating the need for volumes of burdensome paper documents; (2) the computerized tracking system that OGD project managers and generic companies rely on to evaluate the progress of applications; (3) ANDA review software; and (4) a new electronic filing system that is being developed for all offices within the Center for Drug Evaluation and Research.

⁶ OGD's median approval time for ANDAs has steadily decreased, from 19.6 months in 1997, to 18.7 months in 1998, and 17.3 months in 1999. HHS Fiscal Year 2001 Performance Plan, Fiscal Year 2000 Final Performance Plan, and Fiscal Year 1999 Performance Report for FDA, at 64.

⁷ HHS fiscal year 2001 FDA Justification of Estimates for Appropriations Committees, at 66.

⁸ FDA Allocates \$13.5 Mil. For Inspection Requirements In Fiscal Year 2001 Budget, F-D-C Reports, Inc., The Pink Sheet, Mar. 6, 2000, at 27 (quoting Commission Henney at a Feb. 29, 2000 House Appropriations Subcommittee hearing).

⁹ SBC Warburg Dillon Read LLC data, reported in Generics: Best Years to Come, MedAd News, Oct. 1999, at 1 (years 2000–2004).

¹⁰ Sporn Leaves OGD With Generic Integrity Rebuilt, Generic Line, Jan. 26, 2000, at 1–2 (quoting Doug Sporn, outgoing Director of OGD); OGD's Approvals Decrease As Drugs Coming Off Patent Increase, FDA Week, Feb. 4, 2000, at 2 (quoting Gary Buehler, incoming Director of OGD).

CONCLUSION

In sum, we request that Congress continue to guide FDA's priorities by allocating resources directly to OGD. As medical treatment becomes even more expensive and reliant on pharmaceuticals, it is important that generic drug applications move through the approval process as quickly as scientifically-sound reviews permit. Every day that a generic drug is delayed from entering the market, Americans pay millions of dollars more than necessary for their prescription drug products.

Finally, Mr. Chairman, we urge this Subcommittee to emphasize its support for cost-effective pharmaceuticals by including the following language in the fiscal year 2001 Agriculture Appropriations Bill:

"One of the most effective and immediate means to address the rising cost of prescription drugs is to ensure that the American consumer has timely access to more affordable generic medicines. In recent years, Congress has provided increased appropriations for the Office of Generic Drugs to hire more reviewers, reduce the backlog of generic drug applications, and accelerate generic drug approvals. Still, current approval times for generic drugs are three times the statutory limit. In an effort to further reduce approval times, the Committee has provided an increase above the amount available to the Office of Generic Drugs of \$1,500,000 to be used for employing and training staff, and for upgrading information technology systems that permit the electronic submission and review of generic drug applications."

Mr. Chairman, the members of GPIA, NAPM, and NPA would like to thank you and the Subcommittee for your time and attention concerning this critical aspect of FDA's fiscal year 2001 budget request. We look forward to continuing our work with you and members of the Subcommittee to bring safe, effective, and more affordable pharmaceuticals to the American public.

PREPARED STATEMENT OF THE HEALTH INDUSTRY MANUFACTURERS ASSOCIATION

The Health Industry Manufacturers Association (HIMA) and its members appreciate this opportunity to provide testimony on funding for FDA in fiscal year 2001.

HIMA represents more than 800 manufacturers developing and selling innovative medical technologies that save and improve lives and help reduce costs. HIMA member firms provide nearly 90 percent of the \$68 billion of health care technology products purchased annually in the United States, and nearly 50 percent of the \$159 billion purchased annually around the world.

This year's budget deliberations occur at a time when FDA and medical technology companies are entering a new era of rapid and dramatic breakthroughs. Fields such as information technology, genomics, nanotechnology and tissue engineering promise to produce exciting life-saving and life-improving breakthroughs in the coming decade.

FDA Commissioner Jane Henney, M.D., summed up the new era her agency faces in recent testimony before this subcommittee. Commenting on the dramatic advances in medical technology we will witness in the years ahead, Dr. Henney said: "New products entering the marketplace will change the face of health care and will help us lead longer, healthier lives. They will also bring enormous economic benefits, both in lessening the cost of health care and in returning profits on the investments that are being made in research."

Medical device and diagnostics manufacturers are investing heavily in research and development to bring these breakthroughs to fruition. A report scheduled for release later this week by the Lewin Group is expected to quantify the significant increases in R&D spending that medical technology companies have made over the last five years.

In making these heavy R&D investments, HIMA members are acutely aware of the challenges FDA faces in making these innovations available to patients in a timely manner.

FDA's premarket review responsibilities will become more complex and difficult as medical technology advances at an increasingly rapid pace. Many of tomorrow's breakthroughs will defy the traditional device/drug/biologic regulatory classifications. FDA faces a tremendous challenge in adapting to this change in a way that allows it to review new technologies and get them to patients in a timely manner.

Clearly, changes are needed soon in order not only to enable FDA to meet its statutory review times but to meet the goal the Administration set in its fiscal year 2001 budget request of beginning "the process of preparing FDA for a new age of rapid biomedical and pharmaceutical innovation." This new age is rapidly approaching, and the time to start preparing is now.

FDA NEEDS ADDITIONAL PREMARKET RESOURCES TO PREPARE FOR THE NEW AGE IN
MEDICAL TECHNOLOGY INNOVATION

This new era of biomedical breakthroughs is arriving at a time when the agency lacks the resources to meet even its current premarket review duties. In December 1998, FDA Senior Associate Commissioner Linda Suydam estimated that the agency is \$165 million short of what it actually needs to do its job. Last year's funding increase of \$7 million for device premarket reviews was an important step forward.

The inclusion in last year's budget of a specific line-item for device premarket review activities also was an important precedent. HIMA believes that FDA's device review program will continue to warrant specific attention in the budget as the agency prepares for the coming explosion in medical technology innovation.

HIMA believes FDA should have the resources it needs to meet its statutory time frames, both now and in the future. This means completing final actions for premarket approval applications for breakthrough products within 180 days and 510(k)s for incremental advances within 90 days.

The performance goals the Administration outlines for device premarket reviews in its fiscal year 2001 budget justification document move in the right direction. Yet they also show that FDA is still not meeting its statutory device review timeframes.

Because of the budget shortfall for premarket reviews, HIMA wholeheartedly supports the Administration's request for increased appropriations for the device program in fiscal year 2001. Specifically, the entire \$14 mil. sought by the Administration (\$7.7 mil. from appropriations and \$5.8 mil. from new user fees) should be allocated to FDA's device review program through direct appropriations. This funding is urgently needed to help FDA prepare for the coming revolution in medical technology.

While HIMA supports increased FDA funding through appropriations we believe that, absent authorizing legislation, the Administration's request for \$5.8 mil. in new device user fees should not be approved. Rather, this funding should be provided to FDA through direct appropriations targeted to device premarket reviews. We urge the Administration to use additional premarket funds to contract out portions of device reviews, especially those for which the agency lacks the scientific expertise. This is an important way that FDA can meet its goal of bolstering its science base.

HIMA believes the Subcommittee should consider providing FDA with the appropriations levels proposed in the Administration's budget for review of premarket applications. The funding needed for timely FDA premarket reviews is indeed a small investment in making the life-saving and life-improving fruits of research, both public and private, available to patients. Now is the time to make the necessary investments to ensure that patients have access to the latest medical innovations.

Finally, we point out the importance of FDA's biologics center; an important yet sometimes overlooked aspect of the agency's device review program. FDA's Center for Biologics Evaluation and Research also requires additional resources to meet its device review responsibilities. As the line between biologics and medical devices becomes increasingly blurred, it will become more important to ensure that FDA's Center for Biologics Evaluation and Research has adequate resources to do its job.

REGULATORY CHANGES ARE NEEDED TO PREPARE FDA FOR THE NEW AGE OF MEDICAL
TECHNOLOGY INNOVATION

HIMA further believes, however, that increased FDA funding for premarket reviews is only part of the answer to timely patient access to medical innovations. FDA also needs new and better ways of doing its job. In order to meet the coming biomedical revolution, the agency must be as innovative in its regulation of new technologies as researchers are in developing them.

FDA has shown a commitment to finding new approaches to getting its job done, and this commitment should be encouraged and expanded on. FDA has demonstrated this commitment through successfully implementing some key provisions of the FDA Modernization Act, such as exemption of additional devices from 510(k) premarket review. It also is reflected in the improvement in device review times that FDA has made over the past two years.

HIMA has been encouraged by FDA's recent work towards successful implementation of some other crucial FDAMA provisions. The agency's cooperative work with medical technology companies to implement the law's "least burdensome" premarket review provision is one example. We hope to work closely with the agency in completing implementation of other key provisions of the law such as the 510(k) third-party review program and the provision on early meetings with new product sponsors.

Instead of levying a user fee to increase participation in the third-party review program, HIMA believes that FDA can improve the program by expanding the types of devices eligible for outside review. Currently, the vast majority of the devices eligible for outside review are very simple products such as blood pressure cuffs and dental cement where FDA already has an excellent review record. It is interesting to note that the current third-party review program has been most successful for the more complex products such as diagnostic imaging systems for which more pre-market expertise is required.

FDA should expand the list of devices eligible for third-party review to add more complex devices so that the program is available to those product sponsors who could benefit most from it. HIMA is encouraged by the agency's recent willingness to expand the third-party review program and to consult with industry stakeholders in this effort.

Contracting out premarket review work to independent third parties and partnering with medical technology companies are two important ways that FDA can meet its goal of expanding its science base.

As FDA Commissioner Jane Henney stated in her recent testimony, the agency "must be able to anticipate and access the cutting-edge science that will be needed to regulate the products of future technology." HIMA strongly agrees that FDA must remain on the cutting edge of science, and believes that one useful way to achieve this goal is for FDA to make greater use of the expertise of the researchers who are advancing this science and applying it to medical technology breakthroughs.

As the pace of medical technology innovation quickens, it will become increasingly important for FDA to look to outside expertise to make sure the agency does not become an ever-tighter regulatory bottleneck.

Medical technology innovation comprises many specialized disciplines, and new fields of research continue to emerge. In addition to the third-party review program for 510(k)s, FDA should also consider contracting out for reviews of some high-tech devices to provide assistance in regulating dynamic and rapidly advancing medical technologies, rather than attempting to acquire internal expertise in every discipline.

FDA MUST MAKE WISE USE OF SCARCE RESOURCES TO PREPARE FOR THE NEW AGE OF MEDICAL TECHNOLOGY INNOVATION

As FDA's regulatory responsibilities become more complex in the coming years, it will be ever more important for it to spend its dollars where they have the greatest impact. This holds true for both device premarket reviews and postmarket activities.

HIMA applauds the steps FDA has taken in its device postmarket program to work more efficiently and effectively. Recent innovative and collaborative initiatives include pre-announced inspections of device facilities, taking steps to create a more open, interactive inspection process, and conducting a survey with industry on the inspection process. Steps such as these help FDA meet its postmarket responsibilities more effectively and efficiently.

Congress Should Consider Voluntary Reporting Methods on Medical Errors

FDA must be especially prudent in spending its resources in light of the broad scope of its regulatory programs, from ensuring food safety to helping reduce medical errors. The Institute of Medicine's recent report on medical errors, as well as a follow-up report by the government's interagency task force, highlight the important work FDA conducts in this area.

As you may know, medical technology manufacturers already have mandatory reporting of device-related adverse events, thus helping to reduce medical errors. In addition, the FDA is in the process of implementing a user facility "sentinel reporting" (also known as the MedSuN) system.

HIMA supports the work FDA is doing under its current statutory authority to gather adverse event reports from sentinel user facilities. This initiative has the potential to generate valuable information on medical errors, and to do so in a way that focuses on the quality rather than the quantity of information gathered.

As FDA implements the sentinel reporting program, it is critically important to make sure the agency is receiving high quality information that is useful to providers and manufacturers in reducing medical errors. It is important to make sure FDA is gathering useful information under its current program before expanding it to additional facilities.

John Eisenberg, M.D., Director of the Agency for Healthcare Research and Quality, stressed the importance of the need for high-quality data at an FDA Science Forum in mid-February, where he urged policy makers and stakeholders "not just to count [errors] but to make it count."

The pressing need to reduce medical errors is another important reason why timely FDA premarket reviews are so important. Many medical device companies are developing technologies that show great promise in reducing medical errors. These products, such as drug infusion monitoring and control systems need to be approved by FDA and brought to bear on the medical errors problem as quickly as possible.

Finally, as policy makers consider how the government can best help reduce medical errors, it is important to keep in mind device companies' long-standing focus on working closely with the health care community to find ways to reduce errors. A good example of this is in area of anesthesia care, where two medical device companies helped found the Anesthesia Patient Safety Foundation (APSF).

In 1984, anesthesiologists, medical equipment manufacturers and other health professionals formed the APSF to tackle the problem of anesthesia-related deaths and injuries. The group for the first time brought together the clinical community, manufacturers, government agencies and patients to address the problem.

The APSF brought about crucial changes in anesthesia practice and technology. For example, it encouraged the widespread adoption of oximeters and capnographs among anesthesiologists so that patients under anesthesia were monitored more effectively. As a result of APSF's work, the anesthesia mortality rate has dropped from an estimated two deaths in 10,000 cases to one in every 100,000 to 200,000 cases.

Although the recent focus has been heavily focused on mandatory reporting, voluntary partnerships between manufacturers, the clinical community, academia, and government agencies like the APSF should form a key component of policy makers' overall strategy for reducing medical errors.

CONCLUSION

HIMA urges this Subcommittee to help prepare the FDA for the coming era of biomedical innovation. To ready FDA for this era and ensure that patients enjoy timely access to the coming dramatic breakthrough in medicine, we must take several important steps:

—First, Congress must adequately fund FDA's device and biologics premarket review programs. HIMA supports an increase in appropriations of \$14 mil. for FDA device review activities. Additional resources will become even more critical in the coming years as dramatic new medical breakthroughs begin to arrive at FDA for review.

—Second, FDA needs new and innovative ways to meet its regulatory obligations. Congress should encourage the agency to strengthen and expand on steps the agency has recently taken in this direction. As FDA looks to strengthen its science base, it should find ways to make use of the existing science base outside the agency. Partnering with experts in the clinical, research, and manufacturing fields is one effective way to do this.

HIMA again thanks the committee for this opportunity to present our views and looks forward to working with you in helping prepare FDA for the coming revolution in biomedical innovation.

PREPARED STATEMENT OF THE ILLINOIS SOYBEAN ASSOCIATION

Mr. Chairman and distinguished members of the Agriculture, Rural Development, and Related Agencies Subcommittee: The Illinois Soybean Association, an organization of approximately 4,000 leading soybean producers, and the University of Illinois, a major land-grant institution, join in requesting that \$3.5 million in federal funds be authorized to establish a Soybean Disease Biotechnology Center within the National Soybean Research Laboratory at the University of Illinois. Among other goals for this initiative, we wish to foster well coordinated public and private research leading to safe, nutritious, healthy, affordable, and convenient soy products for consumers and sustainable competitive advantage for the U.S. and Illinois soy industries.

We will ask the Illinois Soybean Checkoff Board to contribute \$500,000 to help establish the Center. We will also ask them to entertain proposals from the Center for program support in the future. The University of Illinois will contribute core staff, space, general support services and facilities, and utilities and will operate and maintain the Center henceforth in support of soybean disease biotechnology research.

ROLE OF THE CENTER

The Soybean Disease Biotechnology Center will be the first line of defense against major soybean diseases that threaten the U.S. soybean industry, especially the soybean cyst nematode (SCN). It will provide outstanding research talent and state-of-the-art facilities, equipment, and support services for cutting-edge biotechnology research on major soybean diseases. The Center will bring the power of the new sciences of structural, comparative, and functional genomics and genetic transformation to bear on SCN and other current and potential disease threats, including major diseases not yet in the U.S., such as soybean rust.

Center researchers will identify and create new and improved mechanisms of disease escape, tolerance, and resistance. The aim is to protect the soybean crop and increase its profitability throughout the industry. Genetic disease control mechanisms in the germplasm and genetic stocks of the National Soybean Germplasm Collection, located at the University of Illinois, will be a unique, readily accessible resource for the Center. In addition, genetic mechanisms of escape, resistance, and tolerance in other species will be identified and transferred to the soybean. Accordingly, highly effective disease control genes can be used for "stacking" in soybean varieties. This will assure the realization of gains from other genetic improvements, such as unique quality traits.

SETTING FOR SOYBEAN DISEASE BIOTECHNOLOGY RESEARCH

Researchers in the Soybean Disease Biotechnology Center will use the support services of the University of Illinois' new Keck Center for Comparative and Functional Genomics, with its high throughput genetic sequencing, unequaled bioinformatics capabilities, and unique, one-of-a-kind genetic analysis tools. This will greatly facilitate evaluation of materials in the National Soybean Germplasm Collection. Researchers will also have ready access to the University of Illinois Biotechnology Center, which provides recombinant DNA and protein science services, immunological resources, flow cytometry, high capacity transgenic plant production, and cell and tissue culture, among other valuable support services.

There will be direct access to superb conventional greenhouse and controlled environment facilities in adjacent, connected structures. As part of this project, a biocontainment greenhouse will be constructed specifically to provide the levels of isolation and protection required for sophisticated disease biotechnology research. An elaborate system of research farms will be available for testing new developments in a wide range of soil, climatic, and socio-economic conditions.

The Center will complement and connect with the new St. Louis-headquartered Danforth Plant Science Center and participate in the Illinois-Missouri Biotechnology Alliance. As part of the program of the National Soybean Research Laboratory (NSRL), work at the Center will be strategically integrated with other public and private efforts to conceive, plan, and implement soybean production and marketing systems of the future. This will foster interdisciplinary and cross-functional efforts that speed development and adoption of new technology and gain competitive advantage for the U.S. soybean industry.

NSRL is a major interface between the soybean industry, as represented by state and national soybean organizations and checkoff boards, and university research and education programs. NSRL was initiated by a USDA special grant of \$5 million. NSRL is directed by a Chair Professor of Agricultural Strategy, the only so-named professorship in the nation. The Chair position was endowed by the soybean industry, which contributes \$40 to \$80 million annually to soybean research.

NSRL fosters strategic public/private alliances within the soybean industry and with other commodity-based industries. It achieves extraordinary levels of communication, coordination, and integration of publicly and privately financed research and educational programs across the nation. As developer of STRATSOY, the most sophisticated and useful commodity website, NSRL provided the soybean industry with a powerful tool for uniting its far-flung checkoff-funded programs, disseminating information, eliminating redundancy, sharpening strategic focus, and increasing the return on both public and private investment in soy research.

Its association with the NSRL will assure that research in the Soybean Disease Biotechnology Center will fully complement and benefit from other soy research programs across the nation and world. It will assure that the results of fundamental soybean disease biotechnology research are quickly translated into practical technology, useful information, and sustainable competitive advantage for the industry. The NSRL mission of increasing the volume of profitable, sustainable business in the soy industry will become the mission of the Soybean Disease Biotechnology Center.

This is an excellent time to establish the proposed Center because the University of Illinois is ramping up its Postgenomic Biotechnology Program. A multi-million investment of state funds will provide new biotechnology positions in functional genomics, bioinformatics, developmental biology, microanalytic systems, and cellular and molecular bioengineering. This will enhance the effort to fill new positions in plant disease biotechnology with outstanding scientist/educators who already have established impressive track records. The Center will also benefit from the investment of Illinois in an expanded University of Illinois business incubator and research park to assure rapid commercialization of promising new technologies from the University's research program.

GOALS OF THE CENTER

The Soybean Disease Biotechnology Center will:

- Provide a superb setting for cutting-edge soybean disease biotechnology research.
- Foster and support the very best soybean disease biotechnology research team in the world.
- Assure that effective soybean disease escape, resistance, and tolerance genes are available for "stacking" in top U.S. soybean varieties.
- Eliminate the soybean cyst nematode as a major threat to the U.S. soybean industry and prevent harm from introduction of foreign disease organisms.
- Enable molecular soybean pathology research through which the Illinois and U.S. soybean industries will achieve and maintain preeminence in global and domestic markets for soybeans and soybean products.
- Enable the U.S. soy industry to capture proprietary benefits from soybean biotechnology research and other research conducted all over the world.
- Enhance the global and strategic significance of the National Soybean Research Laboratory and empower its scientists, thus maximizing its benefits for the nation.

SUMMARY

We request that \$3.5 million be authorized to establish a Soybean Disease Biotechnology Center within the National Soybean Research Laboratory at the University of Illinois. These funds, complemented by state funds and industry contributions, will be used to staff, equip, house, and operate the center, and launch and sustain its programs.

PREPARED STATEMENT OF IMPERIAL COUNTY, CALIFORNIA

Mr. Chairman, we appreciate this opportunity to acquaint you with the important research and biological control efforts underway by Federal, State, regional, County and local entities to combat and effectively control, not only the persistent whitefly and pink bollworm, but also threats by newly introduced exotic species.

In the last twelve months, Imperial County and other areas of the Southwestern United States have experienced the introduction of four new exotic pests; the pink hibiscus mealybug; giant salvinia, an aquatic weed; the citrus leafminer; and the red gum lerp psyllid. Also, we are on the fringe of an infestation of the glassy-winged sharpshooter/Pierce's disease complex. Even though the glassywinged sharpshooter has not reached Imperial County, the potential threat to our small, but prosperous grape industry is very high.

The following testimony will focus on funding for the United States Department of Agriculture (USDA) Animal and Plant Health Inspection Service (APHIS) (specifically, the Methods Development Lab and the Plant Protection Centers) and the Agricultural Research Service (ARS) for fiscal year 2001.

FUNDING FOR SILVERLEAF WHITEFLY (BEMISIA AGENTIFOLII)

The silverleaf whitefly (SLW) remains a serious national pest problem, resulting in conservatively estimated crop losses exceeding \$500 million a year in the United States. Economic losses from the silverleaf whitefly have involved cotton and a wide range of ornamentals, melons and vegetable crops.

The need for an effective SLW biological control program is paramount. While chemicals continue to provide a short term solution to the problem, the threat of insecticide resistance and the importance of an effective management program cannot be overemphasized.

We are continuing an aggressive pursuit of IPM methodology using biological control, natural predators, and plant pathogens coupled with intensive weed control

and crop sanitation. In addition, we are using fewer chemical applications and less toxic pesticides. These IPM technologies are designed to comply with the Clinton administration's 1993 policy statement of utilizing IPM practices on 70 percent of United States farmland by the year 2000.

In the Imperial Valley, the USDA has made numerous augmentative releases of exotic parasitoids in the refugia and commercial fields to assess their effectiveness against the silverleaf whitefly. Four of these exotic species have become established and have been recovered up to six miles away from the original release sites. The USDA APHIS PPQ Methods Development Unit has also begun an extensive multivariate analysis to assess the effect of the surrounding crops and chemical usage on SLW and their parasites and also the effect of the parasites on the SLW populations.

We cannot overemphasize the importance of the five-year Silverleaf Whitefly National Research, Action, and Technology Transfer Plan (1997-2001). This plan defines the continuing need for a highly coordinated and cooperative program, including long term goals and objectives, and provides technology transfer to the scientific community, legislators, regulators, the agricultural industry, and the public. This is the all-important vehicle by which the agricultural community will directly benefit from the significant SLW research which the five-year plan has yielded. Long-term economically, socially, and environmentally acceptable management systems are being developed from the extensive knowledge base developed to provide a more complete understanding of whitefly biology, ecology, and host plant interactions. This plan is designed to provide a smooth transition of this research into the field. We urge you to fund the Technology Transfer, New Research and Action Plan at no less than \$5.8 million for ARS and \$1.85 million for APHIS.

FUNDING FOR PINK HIBISCUS MEALYBUG (*MACONEFFICOCCLUS HIRSUTUS*)

During the late fall of 1999, the pink hibiscus mealybug (PHM) was detected in Imperial County. This was the first detection recorded in the continental United States. This mealybug, present in the Caribbean since the mid 1990's, was first expected to arrive in Florida. How it came to appear in Imperial County is still a mystery. However, there is a great potential for this pest to cause serious economic damage to agriculture in Imperial County and the southwest.

There are international quarantines imposed against several types of fresh market produce which are reported to harbor this pest. These quarantines could have a serious impact on our ability to export fresh produce to the Pacific Rim.

Following the detection of this pest in Imperial County, it was found across the border in the Mexicali Valley of Mexico. With the rapid assistance of USDA-APHIS, a survey and public outreach program was undertaken in a very expeditious manner. I must state my praise for APHIS' quick reaction to this pest.

At the same time, a leading USDA scientist in the Caribbean responded rapidly with exotic biological control organisms. These parasitic wasps have been very successful in containing PHM in the Caribbean. This scientist not only put on workshops, but also released several thousand parasites on both sides of the border. Subsequent to that, a second shipment of parasites arrived and were released by biologists from Imperial County and the California Department of Food and Agriculture.

Imperial County, in conjunction with the California Department of Food and Agriculture and the APHIS Methods Development Center, has established a rearing facility for these PHM parasites in Imperial County. We hope to be able to produce and release enough parasites to keep this potentially harmful pest below significant economic levels in Imperial County, surrounding regions and Mexico.

Because of the numerous parties involved, including the USDA-APHIS and ARS, the University of California, the California Department of Food and Agriculture (CDFA), and the Imperial County Agricultural Commissioner's Office, this project requires a significant amount of coordination to avoid overlap and duplication of project activities. We are requesting \$50,000 to fund a Project Coordinator, which would provide a single point of contact to which all involved parties could report. The Project Coordinator would also synchronize the efforts of all agencies and would provide public outreach and education.

FUNDING FOR THE CITRUS LEAFMINER (*PHYLLOCNISTIS CITRELLA*)

This pest was found but a few weeks ago during a routine inspection of a local retail nursery. The citrus leafminer is considered a serious pest and is currently found in Florida and Texas. Follow up surveys of the surrounding areas verified that the pest was also present in a large commercial orchard in the Mexicali-San Luis Valley of Mexico and several backyard locations in southern Imperial County.

The large areas in which this pest was found made it impossible to undertake eradication, especially since it has been reported to be present in Arizona.

In cooperation with the nursery owner where the initial find was made, the young, heavily infested citrus trees were destroyed. The mature trees on the property were stripped of foliage showing signs of leafminer infestation and the cuttings destroyed.

Since this pest spends almost all of its life inside the leaf, conventional pesticides are not effective. The most successful method of control for this pest are biocontrol agents. There are several indigenous parasitic wasps that are effective against this pest. Also, there is a very voracious exotic parasite that requires importation from Australia. This parasite has been reported to be up to 90 percent effective. Again, we are faced with the necessity of having to locally rear parasites in sufficient numbers for release to provide adequate control and to help reduce the economic impact this pest could have on our citrus industry. We are requesting \$50,000 to expedite the foreign exploration, importation, and evaluation of exotic parasites to combat this pest.

FUNDING FOR GIANT SALVINIA (SALVINIA MOLESTA)

Giant salvinia is an exotic aquatic weed that was recently discovered in an agricultural drain of the Palo Verde Irrigation District, the lower portion of the Colorado River (on both the California and Arizona sides of the river) and a large portion of the Imperial Irrigation District canal system. This plant, if left uncontrolled, has the potential to completely clog the waterways currently infested, thereby severely restricting the flow of water. The potential negative economic impact this could have is manifold, but the primary impact is increased maintenance costs to keep the waterways free and flowing.

This weed is currently under eradication. The involved agencies are using two strategies to eradicate this pest. First, an herbicide is used to reduce the surface size of giant salvinia mats; then, a weed-eating beetle is used to complete the task.

Releasing these predacious beetles on salvinia is not only time consuming, but could take several years to accomplish. A facility will be required to rear these beetles over a large period of time. This weed is also found in Texas and Arkansas. We are requesting \$50,000 for expanded and expedited survey, detection, and eradication activities.

It seems as though the desert southwest has become the revolving door for the introduction of exotic pests. It also appears, particularly in light of the recent actions caused by the Food Quality Protection Act, that the most logical method by which to combat these pests is through the introduction of biocontrol agents. The vast majority of these biocontrol agents are small parasites and predators. In order for us to rapidly attack and continue to do battle with these exotic pests, we must have the ability to take known biological control agents which have been released from quarantine and evaluated by either the University of California or the APHIS Plant Protection Centers, and mass rear them locally for release.

As a result of the increased biocontrol activity caused by all of these exotic pests, we are requesting \$100,000 to fund a feasibility study which would identify the resources, partners, and personnel necessary to establish a mass rearing facility for biological control agents, possibly at the Brawley Research Center. The facility would not compete with the biocontrol quarantine facility at either the University of California (UCR) or other USDA facilities, but rather would act cooperatively with them to mass rear parasites which they have evaluated and released from quarantine.

FUNDING FOR RED GUM LERP PSYLLID (GLYCASPIS BRIMBLECOMVEI) AND GLASSY-WINGED SHARPSHOOTER (HOMALADISCA COAGULATA)

There are currently no known biocontrol agents for either red gum lerp psyllid or glassy-winged sharpshooter. A world-wide search is currently being conducted and if effective parasites or predators are found, having a mass rearing facility available would expedite the rearing and release of these agents.

FUNDING FOR PINK BOLLWORM (PECTINOPHORA GOSSYPIELLA)

Pink bollworm has been an exotic pest of cotton for several years. It is singularly responsible for the decline of cotton acreage not only in the southwestern United States, but northwestern Mexico. Costs to control this pest using conventional methods have risen dramatically and that, in combination with declining cotton markets, has made it impossible to continue to grow this crop in an economical manner. Through the efforts of the USDA APHIS Methods Development Lab, the University of California and the California and Arizona Cotton Growers, a bi-national strategy

was developed which would eventually lead to the eradication of the pink bollworm from the cotton growing regions of the United States.

Even though the Arizona cotton growers have temporarily put their participation in the project on hold, the cotton growers in the upper Rio Grande/Trans-Pecos area and their counterparts on the Mexican side of the Rio Grande River have embraced the project with sincere enthusiasm.

Research needs to continue on such soft technologies as the autocidal biocontrol agent currently being developed by APHIS Methods Development and the University of California at Riverside. This particular agent holds great promise by becoming the biocontrol agent that could replace transgenic "Bt" cotton in the continuing effort to eradicate pink bollworm.

\$2.6 million dollars is needed for APHIS-PPQ and Methods Development to achieve the important objectives of promoting strategies for region-wide eradication of PBW in California, Arizona and northwest Mexico, as well as continuing to keep this voracious and economically devastating pest out of the prime cotton producing areas of California's San Joaquin Valley. This technology would also help cotton farmers comply with the reduced use of pesticides as required by the Food Quality Protection Act. Ultimately hundreds of thousands of pounds of pesticides could be eliminated from the environment if the pink bollworm was eradicated from the southwestern United States and northwestern Mexico.

SUMMARY OF FUNDING REQUESTS

Continuation of funding for the Silverleaf Whitefly National Research, Action and Technology Transfer Plan: \$5.8 million for ARS and \$1.85 million for APHIS.

Funding for pink hibiscus mealybug joint county-state-federal-binational coordination: \$50,000.

Funding for citrus leafminer for foreign exploration, importation and evaluation of exotic parasites: \$50,000.

Funding for giant salvinia for survey, detection and eradication activities in California and Arizona: \$50,000.

Funding for identifying resources, partners and personnel necessary to establish mass rearing Biological Control Center for desert southwest which is an invasive species corridor for exotic pests: \$100,000.

Funding for the APHIS-PPQ Methods Development dealing with pink bollworm in California, Arizona and northwest Mexico and prevention in San Joaquin Valleys: \$2.6 million.

PREPARED STATEMENT OF THE INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

NATURAL RESOURCE CONSERVATION SERVICE (NRCS)

The Natural Resource Conservation Service has immense responsibilities for implementing the conservation provisions of the 1985 Food Security Act (FSA), the 1990 Food, Agriculture, Conservation and Trade (FACT) Act, and the Federal Agricultural Improvement and Reform (FAIR) Act of 1996.

Technical Assistance.—The USDA publication "Geography of Hope" identifies that the need for general Conservation Technical Assistance for America's private landowner will continue to increase to 2002 and beyond. An fiscal year 1999 workload analysis indicated the need for an additional \$300 million for technical assistance. The Association applauds and supports the \$86.4 million requested increase in Conservation Operations as a move in the right direction but recognizes a yet unbudgeted shortfall of an additional \$250 million. The Association enthusiastically supports the increase of 1,843 staff years for more field staff to provide technical assistance required for existing programs as well as the Administration's proposed new initiatives.

In addition to increasing general (non-programmatic) technical assistance, increased technical assistance funds are needed to implement increasingly popular provisions of the 1996 FAIR Act. The budget for the Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP) all include the customary 19 percent to 20 percent for technical assistance. The Association strongly supports this level of funding provided to ensure that optimum agriculture and natural resource benefits will accrue from these programs. Not obvious in the list of programs that provided adequate levels of technical assistance is the Environmental Quality Incentives Program (EQIP). The proposed fiscal year 2001 budget raises EQIP from \$174 million to \$325 million, which the Association applauds. It is not clear, however, that additional funds are available

to provide the required technical assistance to a field level program with such a large increase. Some Programs (CRP, WRP, CFO and FPP) have a technical assistance cap set by Section 11 of the CCC Charter Act at the 1995 spending level. No such constraint exists on EQIP. The Association therefore strongly urges the designation of the customary 19 percent for technical assistance on EQIP. The Association further recommends raising the Section 11 cap on CCC funds to \$95 million, which are the funds necessary to provide technical assistance for CCC funded programs at the 2001 level.

Increasingly, state fish and wildlife agencies are contributing staff time to help NRCS field offices service landowner participation in USDA conservation programs including WHIP, CRP, WRP and EQIP. The Association strongly encourages the Administration to consider sharing technical assistance funds, allocated for these programs, with state agency partners.

Conservation Security Program (CSP).—This new program initiative is intended to support and secure the environmental benefits that all Americans enjoy—clean air and water, reduced erosion, improved wildlife habitat and sustainable soil. The Association strongly supports the concept of the proposed CSP as well as the budget item of \$510 million for financial assistance to landowners plus \$90 million for technical support. Especially notable is the mandatory allocation of an approximate 17 percent of total funding to technical assistance.

Wetland Determination.—We believe the need for wetland determination, certification, and mapping is great and urge NRCS to proceed as soon as possible, under the guidance of the FAIR Act of 1996. The Association urges expeditious completion of the wetland determinations required to implement the Swampbuster provisions of the 1985 FSA, 1990 FACT Act, and the 1996 FAIR Act as well as the FAIR Act directed interagency cooperation whereby NRCS assumed responsibility for wetland designation for Section 404 (Clean Water Act) purposes on farmland, including tree farms, rangelands, native pasture, and other private lands used to produce or support the production of livestock. The Association and individual states wish to continue to work with NRCS to help achieve these goals.

Public Law 566.—The Association generally supports the small watershed (Public Law 566) projects. That support is based upon continued emphasis on updated watershed planning and management. Such efforts could utilize and expand upon existing Public Law 566 plans examined in light of present day issues of wetland protection, water quality enhancement and fish and wildlife habitat. The greatest potential for these programs is for land treatment measures that retain the water on the land, improve infiltration, improve water quantity and quality, and provide fish and wildlife habitat. Structural and non-structural land treatment activities require state and local matching funds to leverage greater conservation benefits for each federal dollar spent while promoting valuable partnerships among states, local agencies, and other organizations.

National Buffer Initiative.—NRCS has implemented this initiative in cooperation with industry and other partners. The Association is pleased to be a sponsor of this innovative approach. The National Academy of Sciences has found that buffer strips can reduce off-field pollution by 70 percent, thus also contributing to meeting non-point source remediation goals under the Clean Water Act. Unfortunately, the level of sign-up by producers remains very low. NRCS has committed special emphasis and a major effort to use the buffer strip practices covered by the continuous CRP sign-up in a more targeted fashion. Unlike the large or whole field CRP retirements, buffer strips will require extensive outreach plus the much more attractive rental rates than now proposed. The Association supports the allocation of the additional \$125 million specifically for new incentives, increased outreach and more attractive rental rates to increase participation in the various buffer practices. In addition, a review and evaluation of why sign-up is low and how it can be improved is strongly recommended.

Forest Incentive Program (FIP).—The Forest Incentive Programs (FIP) has multiple resource values for fish, forests, wildlife, clean water and erosion control. The Association opposes the NRCS proposed intention to zero out FIP funding and strongly recommends that the fiscal year 1999 level of \$16.325 million be restored in the fiscal year 2001 budget.

Capped Programs.—The Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP) and Farmland Protection Program (FPP) have all reached or are near authorized acreage or appropriation caps. In addition, funding levels for the Environmental Quality Incentives Program (EQIP) has not been sufficient to meet landowner interest or needs. We believe that due to the overwhelming success, customer acceptance and public benefits of these programs, they should be reauthorized. Therefore, we applaud the Administration's Farm Safety Net proposal to provide additional support to farmers through funding WRP at \$286 million, EQIP at

\$325 million, WHIP at \$50 million and FPP at \$65 million. The Association also applauds the efforts of the Administration to raise the cap on the Conservation Reserve Program (CRP) to 40 million acres.

FARM SERVICE AGENCY (FSA)

An adequately funded budget for the FSA is essential to implement those conservation related programs and provisions under FSA administration and/or in cooperation with NRCS as a result of passage of the Federal Agricultural Improvement and Reform (FAIR) Act of 1996. The Association strongly advocates that the budget include sufficient personnel funding to service a very active program and strongly believes that the past erosion of personnel has been inconsistent with program needs. The Association applauds the Administration's proposed personnel levels but also sees the need for an additional 600 staff years of temporary assistance.

FSA programs have tremendous quantifiable impacts on natural resources, and yield substantial public as well as private benefits. Building on the provisions of the 1985 FSA, the 1990 FACT Act, and the 1996 FAIR Act, the Association wants to ensure that each program accomplishes the broadest possible range of natural resource objectives, and encourages close cooperation between FSA, NRCS and the State Technical Committees in implementing the 1996 FAIR Act.

Conservation Security Program.—This new program initiative is intended to support and secure the environmental benefits that all American's enjoy—clean air and water, reduced erosion, improved wildlife habitat and sustainable soil. The Association strongly supports the concept of the proposed CSP as well as the budget item of \$510 million for financial assistance to landowners plus \$90 million for technical support. Especially notable is the mandatory allocation of an approximate 17 percent of total funding to technical assistance.

Flood Risk Reduction Program.—We believe this program has great potential to mesh with the Army Corp of Engineers Rivers Ecosystem Restoration and Flood Hazard Mitigation Project which is a part of the President's Clean Water Initiative. In addition, this program has excellent potential to secure floodplain restoration through easement purchase, to the benefit of the landowner, and as an alternative to expensive and recurring repair of frequently flooded land. We urge FSA to prepare regulations and budget for implementation and make every effort to ensure that language used in its easements and agreements provide a streamlined basis for appropriate administration and are user-friendly. The Association is disappointed that no budget is requested and urges that a start-up budget of \$30 million be initiated to assist in the President's Clean Water initiative.

Conservation Reserve Program.—The continued administration of CRP under the guidelines of the 1996 FAIR Act is a very significant and valuable commitment of USDA and the FSA. The Association applauds FSA efforts to fund and extend CRP contracts for the multiple benefits that accrue to the public as well as the landowner. The Association is especially pleased to note the commitment to raise the authorized ceiling to 40 million acres. The Association provides special thanks to FSA for the continuous CRP sign-up of high value environmental practices and applauds the additional \$125 million in new incentives to increase landowner participation as well as ensure that practices incorporate fish and wildlife needs along with soil and water considerations.

The commitment of FSA to provide high wildlife benefits in CRP contracts has been obvious since the advent of the Environmental Benefits Index (EBI) in the 15th sign-up. The Association applauds FSA in those efforts with their special emphasis on native grasses, endangered species and enlightened pine planting. Management/maintenance strategies are essential to ensure continuation of soil, water and wildlife benefits throughout the life of the CRP contract. However, the "up-to-\$5/acre" maintenance payment tends to be viewed by many landowners as additional rental payment, whether maintenance practices are performed or not. The Association encourages FSA to convert the annual maintenance fee to cost-share on an as-needed basis to ensure soil, water and wildlife objectives reflected in the EBI are realized as well as to ensure wise use of public funding for CRP.

WILDLIFE SERVICES (APHIS)

The President's fiscal year 2001 proposed budget for the APHIS Wildlife Services Operations is \$28,684,000 and reflects a \$2,711,000 decrease from the fiscal year 2000 level. For Methods Development, the proposed budget is \$10,525,000, a \$168,000 increase from the fiscal year 2000 level. For Aquaculture, the proposed budget is \$576,000, a decrease of \$190,000 from the fiscal year 2000 level. The Association is seriously concerned about reductions to Wildlife Service's budget.

Wildlife Services (WS) a unit of APHIS, is the Federal agency responsible for controlling wildlife damage to agriculture, aquaculture, forest, range and other natural resources; for protecting public health and safety through the control of wildlife-borne diseases; and wildlife control at airports. Its control activities are based on the principles of wildlife management and integrated damage management and are carried out cooperatively with State fish and wildlife agencies. Most APHIS WS operational work is cost shared between the Federal WS program, State and county governments, agricultural producers, and other cooperators.

The cooperation and support of the agricultural community are essential to maintaining wildlife populations because much of the Nation's wildlife exists on private agricultural lands. A progressive wildlife damage management program which reduces the adverse impact of wildlife populations is necessary to maintain the support of the agrarian community and to counter increasing pressures for indemnity due to wildlife damage.

Since Congress transferred the WS program to USDA in 1986, the Association has worked closely with this program on numerous issues critical to the State fish and wildlife agencies including those related to migratory bird and endangered species. The Association commends the WS program for its professionalism and continuing effort to be attuned to the changing public values for the Nation's wildlife, while remaining responsive to the emerging wildlife problems.

The Association is concerned with the Administration's proposed reduction in both the WS operations program and the aquaculture program for fiscal year 2001. The Administration is requesting that cooperating entities assume an ever larger share of the costs for WS services at a time when cooperators are already paying at least 50 percent of the costs if not more. Many wildlife populations such as predators, waterfowl, fish-eating birds, deer, and beavers are at all-time highs. Wildlife conflicts and requests for assistance are also at record numbers, and State wildlife agencies and the public look to WS for leadership and professional expertise in dealing with these conflicts.

The Association requests the WS budget be restored to at least the fiscal year 2000 level for the Operations and Aquaculture line items. WS can be progressive, responsible and successful only if adequately funded and staffed. Of additional concern is the near level funding proposal for Methods Development. Although the fiscal year 2001 budget contains a \$168,000 increase, all but \$8,000 of this is for increased pay costs. Many of the current control tools such as traps and other restraining devices are becoming less acceptable to the public and are actually being prohibited in many States because of public referendums. The only source of new methods is through research. We commend Congress for recognizing the need to relocate the WS research facility from Denver to Ft. Collins, Colorado. Hopefully, the research center will be completed within the next year. However, increased operating and maintenance costs will then exceed \$1 million which is not provided for in the general appropriation. The Association requests an increase of at least \$2.3 million to the Methods Development line item to adequately continue nonlethal methods research and address the increased operating and maintenance costs, with \$300,000 being dedicated for expansion of commercial trap testing in cooperation with the IAFWA and the State Fish and Wildlife Agencies to help meet and carry out U.S. international understandings to improve animal welfare in state regulated wildlife trapping programs.

The Association recognizes the importance of aircraft to WS for both predator control and the distribution of oral vaccine baits for rabies control projects and we commend Congress for providing \$1.2 million in fiscal year 2000 to WS to continue implementing improved safety procedures for their aerial operations. However, no increased funding was proposed in the fiscal year 2001 budget to continue this effort, and the Association recommends that an additional \$1.9 million be provided to fully implement the safety recommendations contained in the aerial safety report.

The Association is concerned with recent attempts by various organizations and individuals in the past several years to significantly reduce WS's funding for predator control activities in the western United States. The Association opposes any attempts to reduce the WS budget through any broad scale or across-the-board funding cuts for the program or my efforts to reprogram funds from within. As our wildlife continues to flourish the States need a strong federal partner in animal damage research and management and it is to WS that we look for credible, science-based solutions.

The Association is pleased with the accomplishments of the Berryman Institute at the Utah State University in Logan, Utah. However, we would like to see the Institute enhance its capabilities to conduct social science research, expand continuing education programs, and start a new high quality scientific journal for wildlife damage management that would be patterned after other established journals.

To reach these new goals, the Association supports an increase of the funding to the Berryman Institute by an additional \$300,000.

The Association commends Congress for increasing the funding in Montana in fiscal year 2000 by \$250,000 to deal with the increasing wolf-related conflicts. However, wolf conflicts are also increasing in Minnesota, Wyoming, and Idaho, and the Association requests an additional \$300,000 to deal with these problems in those States as well.

The Association recommends that Congress make \$750,000 available in fiscal year 2001 to allow WS to continue to implement the new Management Information Reporting System. The implementation began 2 years ago and will occur over a 5-year period at a total cost of \$6–\$8 million. The new system will allow WS to provide specific information on resources protected, damage levels, trend information, and data on measurements and outcomes now required by the Government Performance and Results Act.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES) U.S.
DEPARTMENT OF AGRICULTURE

The Association recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant, positive changes in attitudes and implementation of new technologies by private landowners, managers, community decision-makers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES-Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move towards a more sustainable society. However, in the President's fiscal year 2001 budget, we see virtually no emphasis on natural resources research and education directed toward helping these clientele. In fact, the total number of farmers based on recent statistics is just slightly over one million, yet the great majority of CSREES' budget is devoted to production agriculture with only \$3.192 million budgeted for the Renewable Resources Extension Act to assist the over ten million private landowners and managers who own and manage most of the nation's natural resource base. The Association is seriously concerned that this amount is infinitesimal and totally inadequate in the CSREES proposed fiscal year 2000 budget of \$948.01 million.

IAFWA strongly recommends that the Renewable Resources Extension Act be funded at a minimum level of \$15 million in fiscal year 2001. The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperative partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to \$15 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991–1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. It is important to note that RREA has been reauthorized through 2002. It was originally authorized at \$15 million annually; however, even though it has been proven to be effective in leveraging cooperative state and local funding, it has never been funded at a level beyond \$3.4 million. An increase to \$15 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decision-making and management on an additional 35 million acres while increasing productivity and revenue by \$200 million.

The Association strongly endorses the increase of McIntire-Stennis Forestry Research funds from \$21.93 million to \$25 million. The Association feels that it is essential to the future of all aspects of forest resource management on non-industrial private forestlands. With the rapid reduction in timber harvests from public lands, especially in the west, small private forest ownerships are being depended on for playing an increasing role in providing the nation's overall timber supply. This is creating a situation where in many areas of the country timber harvest is exceeding growth of timber stock on private lands. These forestlands play a critical role in providing watershed protection, wildlife habitat, recreational opportunities and environmental quality in both rural and urban communities. There is a significant need to provide more focus on improved management of small forest ownerships since they

are the key to substantial forest resource management in the future. Currently there are over 10 million private landowners, many of whom have yet to realize the need to both manage and sustain these forests and related natural resource benefits for both their and society's future. Success in this arena of providing improved management and sustainability of these forest resources depends on enhancing research directed towards these ownerships through the McIntire-Stennis Research program.

The Association notes with satisfaction and support that funding for water quality integrated programs was increased in the President's 2001 budget by \$3.2 million. We are concerned, however, that there is no line item budget for water quality specific to educational programs under Smith-Lever in Extension activities. The Association recommends a minimum of \$3.5 million in Extension programs to focus on water quality education targeted at agricultural producers and other private landowners and managers. We believe that such program efforts are urgently needed now to help these landowners learn how to prevent and/or reduce water quality degradation from known sources which are seriously affecting fisheries and wildlife resources, human health, and environmental quality of rural and urban communities.

Finally, the Association is further aware of one particular program contained within the Cooperative States Research, Education, and Extension Service that is of high priority to several states. The U.S. Marine Shrimp Farming Program is an integrated multi-state research program at work in the states of Mississippi, Hawaii, Massachusetts, Texas, Arizona, and South Carolina. The goal of this program is to significantly expand the domestic shrimp farming industry, thereby reducing pressure on wild shrimp stocks and helping to offset the annual \$2.5 billion trade deficit. The Association urges the Congress to increase the Appropriation in fiscal year 2001 from \$3.354 million to \$5 million for fiscal year 2001.

PREPARED STATEMENT OF THE IZAAK WALTON LEAGUE OF AMERICA

On behalf of the Izaak Walton League of America and our 50,000 members and supporters nationwide, I am writing to provide testimony for the record regarding the fiscal year 2001 Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations Bill. The League has a 78-year history of supporting sustainable agriculture and sound conservation of our nation's natural resources. Most of our 335 chapters are located in rural areas and a great many of our members farm as a way of life. Accordingly, our organization takes a keen interest in the funding levels provided for natural resource conservation programs administered by the U.S. Department of Agriculture.

The subcommittee has, as always, a daunting challenge in allocating federal dollars among a variety of agencies and many worthwhile programs. At the same time, we strongly believe that the federal programs highlighted below are especially deserving of increased funding levels:

- Wildlife Habitat Improvement Program (WHIP)*.—The WHIP program, authorized under the 1996 Farm Bill, provides cost-sharing assistance to producers who voluntarily undertake efforts to restore and maintain habitat for fish and wildlife on their land. Unfortunately, the tremendous potential benefits from this program have been substantially unrealized due to lack of funding. We fully support the administration's requested funding level of \$50 million and strongly urge the subcommittee to make this funding available in fiscal year 2001.
- Environmental Quality Incentives Program (EQIP)*.—EQIP provides technical, educational and financial assistance to farmers and ranchers seeking to minimize and mitigate adverse ecological impacts associated with their present agricultural practices, such as controlling soil erosion or reducing runoff of animal wastes into streams. Many producers want to be better stewards of the land and simply need sound advice and assistance to implement the necessary changes in their operations. The League supports the requested increase of \$151 million over fiscal year 2000 enacted levels and encourages the subcommittee to appropriate \$325 million for EQIP.
- Farmland Protection Program (FPP)*.—Conversion of agricultural lands into commercial or residential developments is a significant and growing problem throughout the nation. The FPP is designed to arrest this problem by providing matching funds to state, local and tribal governments to permanently protect agricultural lands. We firmly believe that at least \$65 million in fiscal year 2001 is needed to help preserve agricultural production capacity, open space, family farms and viable rural communities.
- Wetlands Reserve Program (WRP)*.—Wetlands are one of the most important ecosystem types that exist in the U.S., providing essential habitat to an incred-

ibly wide variety of fish and wildlife species. Unfortunately, half of the wetlands in the lower 48 states have been lost, much of it to conversion to cropland. WRP provides payments to landowners that voluntarily retire converted wetlands from production, restore wetland characteristics and protect it through long-term or permanent easements. The League urges the subcommittee to provide at least \$286.1 million for WRP in fiscal year 2001 and supports eliminating the current enrollment cap of 975,000 acres in order to allow up to 210,000 additional acres to be enrolled in fiscal year 2001.

—*Conservation Reserve Program (CRP)*.—The CRP is undoubtedly one of the most successful conservation programs ever conceived. By paying farmers to retire highly erodible or other environmentally sensitive land from production for 10 years, CRP has significantly reduced soil erosion, improved water quality and provided critical wildlife habitat to a variety of game and non-game species. The League fully supports the administration's requested funding level of \$126.7 million for CRP and other reimbursements, as well as increasing the current enrollment cap by 3.6 million acres (40 million acres in total).

The stewardship of our natural resources, protection of environmental quality and the preservation of the family farming and ranching community within the fabric of American society not only provides incalculable benefits for the current generation, but also insures for the prosperous future of generations yet to come. We firmly believe that these funding levels are not only realistic, but also vital to the success of accomplishing these important objectives.

In closing, I wish to thank you for your thoughtful consideration of these views. As the appropriations process moves forward, the League looks forward to working with you and your staff to insure conservation of the nation's natural resources and preservation of our outdoor heritage. If you have any questions or require additional information, please contact me at (301) 548-0150, ext. 225.

PREPARED STATEMENT OF THE JOSLIN DIABETES CENTER

INTRODUCTION

Mr. Chairman, thank you for this opportunity to submit a statement for the public witness hearing record. The subject of this short statement is the continued funding in fiscal year 2001 for the Diabetes Project in the Extension Service of CREES. We have developed a plan for fiscal year 2001 that will require \$975,000. This includes costs of Federal Administration, participation expenses of the states of Washington and Hawaii, and the personnel, equipment and associated costs of Joslin Diabetes Center within the total cost of the program.

Fiscal year 2000 background

I would like to express Joslin Diabetes Center's sincere appreciation to you and your colleagues for your leadership in the fiscal year 1999 and fiscal year 2000 appropriations process in providing \$550,000 for each year toward the Diabetes Project. We know you faced difficult decisions concerning funding priorities. We feel that your allocation of these funds indicates that you share the vision of the growing community role and organizational flexibility of the Extension Service in the 21st Century.

Joslin and Extension personnel are implementing the fiscal year 1999 program. Extension Service officials characterized the concept as a "win-win" program during the first meeting. Extension Service officials continue to embrace the concept of utilizing components of Extension's national partnership infrastructure for a pilot program with Joslin. The National Diabetes Education Program (NDEP), a joint program of the Centers for Disease Control (CDC) and the National Institutes of Health (NIH), both part of the Department of Health and Human Services, are also involved as components of this project. Extension officials recognized that Joslin's non-invasive screening proposal, based on components of the Joslin Vision Network (JVN), brought an important new facet to the NDEP and services to the rural health population. The addition of the Joslin pilot program is of particular importance in providing this new technology to minority rural residents, who suffer a much higher incidence rate than the national average.

We have signed a Memorandum of Understanding with the Federal Extension Service upon which to base the full-scale program. We have submitted a plan of action for year two and are incorporating some alterations suggested by both States and the Federal Extension personnel. When the revised plan is completed and approved by Washington Federal Extension, we will deploy the equipment for screening for diabetic retinopathy.

Fiscal year 2001 plan

For fiscal year 2001, the mission and objectives for the state pilot program remain the same as for fiscal year 1999 and fiscal year 2000. We are just now implementing the first year of activities, due to the relatively late obligation dates of the USDA/Extension grant process. We did not receive fiscal year 1999 funding until October 1999. We are planning to process fiscal year 2000 funds shortly, and accomplish all tasks before October 1, 2000.

The following will be accomplished by October 1, 2000:

- Training of Washington and Hawaii Extension personnel in equipment use will have taken place;
- deployment of the diabetes non-invasive screening portion of the project will be completed;
- educational materials will have been circulated for the specific target populations of Washington and Hawaii;
- coordination with the NDEP and local and State health officials to handle referrals will have been established; and
- preliminary baseline comparisons will have been completed for the first year's operational phase.

The evaluation of the two-year performance, compared with baseline data, will yield the results of the introduction of the advanced technology and the advanced medical care and prevention techniques that are the subject of this project. When similar testimony is provided to the Committee next year, we hope to have preliminary findings to report to you on this investment in American rural health and the cooperative partnership between the Extension Service and Joslin Diabetes Center.

Mr. Chairman, this concludes my brief statement. We are submitting a detailed budget for the fiscal year 2001 funds of \$975,000 we are seeking to the Extension Service for their review. If you or the Committee have any questions concerning this project, we would be pleased to meet and discuss the details.

Mr. Chairman, thank you again for your efforts in fiscal year 2000. The Extension Service and Joslin Diabetes Center appreciate your confidence in our capabilities and your focus on the improvement of the quality of life in rural America. We respectfully request continued funding of \$975,000 in fiscal year 2001 to fully demonstrate the benefits and potential national returns that can be derived from this pilot project.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

The Metropolitan Water District of Southern California (MWD) appreciates the opportunity to submit testimony regarding the U.S. Department of Agriculture's (USDA) fiscal year 2001 budget, for the Hearing on Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations. MWD is a public agency created in 1928 to meet supplemental water demands of those people living in what is now portions of a six-county region of southern California. Today, the region served by MWD includes 16 million people living on the coastal plain between Ventura and the international boundary with Mexico. It is an area larger than the State of Connecticut and, if it were a separate nation, would rank in the top ten economies of the world.

Included in our region are more than 225 cities and unincorporated areas in the counties of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura. We provide more than half the water consumed in our 5,200-square-mile service area. MWD's water supplies come from the Colorado River via the district's Colorado River Aqueduct and from northern California via the State Water Project's California Aqueduct.

INTRODUCTION

MWD continues to favor USDA implementation of conservation programs, and is especially encouraged by the new actions identified in the recently released Clean Water Action Plan. The Clean Water Action Plan fosters integration of efforts by USDA, the U.S. Environmental Protection Agency, and other federal agencies to improve water quality. MWD firmly believes that inter-agency coordination along with cooperative conservation programs, that are incentive-based and facilitate the development of partnerships are critical to addressing natural resources concerns, such as water quality degradation, wetlands loss and wildlife habitat destruction. It is vital that Congress provide USDA with the funding necessary to successfully carry out its commitment to natural resources conservation.

Our testimony focuses on USDA's conservation programs that are of major importance to MWD. In particular, MWD urges your full support for funding for USDA's Environmental Quality Incentives Program (EQIP). Full funding for this program is essential for achieving Colorado River Basin salinity control objectives through the implementation of salinity control measures as part of EQIP. In addition, MWD requests your full support for the Wildlife Habitat Incentives Program, Conservation Reserve Program, and Wetlands Reserve Program. Sufficient federal funding for these USDA programs is necessary to achieve wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and in California's Sacramento/San Joaquin Bay-Delta (Bay-Delta) estuary.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The Environmental Quality Incentives Program provides cost-sharing and incentive payments, technical assistance and educational assistance to farmers and ranchers for the implementation of structural practices (e.g., animal waste management facilities, filterstrips) and land management practices (e.g., nutrient management, grazing management) that address the most serious threats to soil, water and related natural resources. EQIP is to be carried out in a manner that maximizes environmental benefits per dollar expended. This assistance is focused in conservation priority areas identified by the Natural Resources Conservation Service's State Conservationists, in conjunction with state technical committees and Farm Service Agency personnel. MWD does have some concern with respect to this aspect of EQIP. Beginning with the first full year of EQIP funding in 1997, USDA's participation in the Colorado River Basin Salinity Control Program has significantly diminished. The mechanism by which funding has been allocated by USDA to date inherently overlooks projects for which benefits are interstate and international in nature. Clearly, Colorado River salinity control has benefits that are not merely local in nature, but continue downstream and EQIP as it is currently administered by USDA does not adequately fund national priorities. MWD supports the recommendation of the Colorado River Basin Salinity Control Forum as a way to remedy this situation. In Public Law 104-127, Congress amended the Colorado River Basin Salinity Control Act to direct the Secretary of Agriculture to carry out salinity control measures in the Colorado River Basin as part of EQIP. Sufficient federal funding for implementation of EQIP is critical in order to achieve Colorado River Basin salinity control objectives as well as source water quality protection and ecosystem restoration objectives in the Bay-Delta estuary and watersheds tributary to the Bay-Delta.

The Colorado River is a large component of Southern California's regional water supply and its relatively high salinity causes significant economic impacts on water customers in MWD's service area, as well as throughout the Lower Colorado River Basin. MWD and the Bureau of Reclamation completed a Salinity Management Study for Southern California in June 1999. The first phase of the study (completed in February 1997) concluded that the high salinity from the Colorado River causes significant impacts to residential, industrial and agricultural water users. Furthermore, high salinity adversely affects the region's progressive water recycling programs, and is contributing to an adverse salt buildup through infiltration into Southern California's irreplaceable groundwater basins. In April 1999, Metropolitan's Board of Directors authorized implementation of a comprehensive Action Plan to carry out Metropolitan's policy for management of salinity. The Action Plan focuses on reducing salinity concentrations in Southern California's water supplies through collaborative actions with pertinent agencies, recognizing that an effective solution requires a regional commitment. Metropolitan, the Association of Groundwater Agencies, the Southern California Association of Publicly Owned Treatment Works, and the WaterReuse Association of California have executed a Memorandum of Understanding agreeing to the formation of a Salinity Management Coalition. Based on a 1988 study, Reclamation estimated that water users in the Lower Basin were experiencing in excess of \$750 million in annual impacts from salinity levels in the river in 1995, and that impacts would progressively increase with continued agricultural and urban development upstream of California's points of diversion. As part of the Salinity Management Study, the economic impacts have been refined for MWD's service area and have been submitted to Reclamation for its use in updating its Lower Basin estimate. Droughts will cause spikes in salinity levels that will be highly disruptive to Southern California water management and commerce. The Salinity Control Program has proven to be a very cost-effective approach to help to mitigate the impacts of higher salinity. Adequate federal funding of the program is essential.

The Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin states' salinity control efforts, issued

its 1999 Review, Water Quality Standards for Salinity, Colorado River System (1999 Review) in June of 1999. The 1999 Review found that additional salinity control was necessary with normal water supply conditions beginning in 1994 to meet the numeric criteria in the water quality standards adopted by the seven Colorado River Basin states and the U.S. Environmental Protection Agency. For the last seven years (1994–2000), funding for USDA's salinity control program has not equaled the Forum-identified funding need for the portion of the program the Federal Government has the responsibility to implement. It is essential that implementation of Colorado River Basin salinity control efforts through EQIP be accelerated to permit the numeric criteria to be met again under average annual long-term water supply conditions, making up the shortfall. The Basin states and farmers stand ready to pay their share of the implementation costs of EQIP.

The President's proposed fiscal year 2001 budget contains program funding of \$350 million for implementation of EQIP through financing provided by the Commodity Credit Corporation. MWD supports this level of EQIP funding. The Forum has determined that allocation of \$12 million in EQIP funds in fiscal year 2001 is needed for on-farm measures to control Colorado River salinity. This level of funding is necessary to meet the salinity control activities schedule to maintain the state adopted and federally approved water quality standards.

MWD also supports the proposed level of funding for Conservation Technical Assistance (CTA) included within the Natural Resources Conservation Service's (NRCS) Conservation Operations Program. Conservation technical assistance provides the foundation for implementation of EQIP and other conservation programs. We are pleased that the CTA budget includes \$87 million in funding to assist Animal Feeding Operations (AFO) in reducing their water quality impacts. AFOs are a potential source of *Cryptosporidium*, a pathogen that is only partially removed by conventional drinking water treatment technology. Minimizing loadings at the source is important to ensure safe and healthy drinking water supplies.

MWD urges you and your Subcommittee to support full funding for EQIP and NRCS CTA as requested in the President's fiscal year 2001 budget for USDA, with the specific designation of EQIP funds to the Salinity Control Program. MWD also recommends that the Colorado River Basin be designated as a national priority area for salinity control.

WILDLIFE HABITAT INCENTIVES PROGRAM

The Wildlife Habitat Incentives Program (WHIP) is a voluntary program, providing technical assistance and cost-sharing, to help landowners develop habitat on their properties that will support wetland wildlife, upland wildlife, threatened and endangered species, fisheries, and other types of wildlife. WHIP offers an opportunity to encourage development of improved wildlife habitat on eligible lands by providing assistance to landowners who wish to integrate wildlife considerations into the overall management of their operations.

WHIP cost-sharing assistance could be utilized to support ongoing interim conservation efforts both in the Bay-Delta estuary and for the Lower Colorado River Multi-Species Conservation Program. The CALFED Bay-Delta Program is a cooperative effort among state and federal agencies and the public to develop a long-term, comprehensive solution to ecosystem and water supply problems in the Bay-Delta. One of the main objectives of the CALFED Bay-Delta Program is to improve and increase aquatic, wetland and riparian habitats so that they can support sustainable populations of wildlife species, by implementing a system-wide ecosystem restoration approach. WHIP could benefit this program by providing cost-share assistance for the development of wildlife habitat on private lands in the Bay-Delta watershed.

The Lower Colorado River Multi-Species Conservation Program (LCR MSCP) is a broad-based partnership of state, federal and private entities in Arizona, California, and Nevada. Participants include water, hydroelectric power and wildlife resource management agencies, Tribal governments, and environmental organizations with interests in the Lower Colorado River. The LCR MSCP is focusing on the conservation of over 70 threatened, endangered and sensitive species and their habitats. WHIP would allow the combination of federal cost-sharing dollars and voluntary agricultural land-use practices to enhance habitat for listed and sensitive species of interest in the Lower Colorado River. This could be a valuable vehicle for gaining further agricultural support for conservation efforts and the goals of the LCR MSCP.

The President's budget requests \$50 million for WHIP for fiscal year 2001. MWD recommends that you and your Subcommittee support continued funding of WHIP at the level requested in the President's fiscal year 2001 budget for USDA.

CONSERVATION RESERVE PROGRAM

Continued support for the Conservation Reserve Program (CRP) is necessary in order to build on the past successes of this USDA conservation program. Under the CRP, incentive payments are provided to producers to remove highly erodible and other environmentally sensitive land from production. This program helps protect the quality of drinking water supplies and facilitates ecosystem restoration efforts by reducing soil erosion, improving water quality, protecting wildlife habitats, and achieving other natural resource conservation measures. The Conservation Reserve Enhancement Program and National Conservation Buffer Initiative will further encourage enrollment of high environmental-value acreage. We are pleased that the fiscal year 2001 budget provides financial incentives of up to \$125 million annually for producers who enroll in CRP continuous signup programs such as these.

Enrollment of eligible agricultural lands that are located in the Bay-Delta estuary and tributary watersheds in the CRP, could provide water quality improvement benefits for this important source of drinking water. We note, however, that the method which determines the rental rate for CRP enrollments effectively precludes the enrollment of much irrigated agricultural land and land with high value crops. As a result, states in the arid west do not benefit from the CRP in proportion to their contribution to agricultural production. While MWD urges you and your Subcommittee to support the President's budget request for the CRP of \$1.742 billion for fiscal year 2001, we also strongly request that you review the method for rental rate determination.

WETLANDS RESERVE PROGRAM

The Wetlands Reserve Program (WRP), first authorized in 1990, is a voluntary program providing incentives to landowners for the restoration and protection of wetlands with long-term or permanent easements. Wetlands restoration provides important water quality improvement and wildlife habitat restoration benefits that are important to the Bay-Delta estuary. MWD urges you and your Subcommittee to support appropriation of \$286 million for the WRP in fiscal year 2001, as requested in the President's budget. We further support the removal of the acreage cap and the proposal to enroll 250,000 acres annually.

CONCLUSION

Thank you for your consideration of our testimony. We believe our comments emphasize the importance of continued funding for USDA's agricultural conservation programs. The USDA's conservation programs are critical for achieving Colorado River Basin salinity control objectives, as well as broader wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and the Bay-Delta estuary.

PREPARED STATEMENT OF THE MINOR CROP FARMER ALLIANCE

The Minor Crop Farmer Alliance (MCFA) is a coalition of individual firms and organizations representing agricultural producers who grow and market minor-use agricultural commodities or utilize minor-use materials. MCFA was organized in 1991 to address industry concerns about pesticide manufacturers' voluntary cancellation of agricultural pesticides and the accelerating loss of important crop protection tools. MCFA's primary focus today is implementation of the Food Quality Protection Act (FQPA). Over 100 organizations representing the majority of our nation's fruit and vegetable producers support MCFA's efforts.

INTRODUCTION

The U.S. Environmental Protection Agency's (EPA) implementation of FQPA may result in the phase-out of many of the most important pesticides used in the minor-use industry. Those industries provide the majority of fruits and vegetables consumed in the United States. The minor-use industry is gravely concerned that EPA will unnecessarily cancel pesticides that are essential for the production of those crops. It is imperative that adequate research and pest management programs be made available to lessen the potential devastating impact of FQPA implementation.

USDA has a critical role in the implementation of FQPA. It provides input to EPA in the development of policies, the conduct of risk assessments, and the impact of EPA's decisions on agriculture, including the minor-use community. It is vital to the long-term well-being of this nation's agricultural industry that USDA meet the chal-

lenges presented by FQPA, and that it fully participate in the FQPA implementation program.

MCFA appreciates the opportunity to comment on the U.S. Department of Agriculture's (USDA) appropriations for fiscal year 2001. Our testimony focuses on USDA programs that are involved in the FQPA implementation process, including, but not limited to, providing critical data for fair and reasonable assessment of pesticides and conducting important research that is needed to develop alternative pest management strategies.

SPECIFIC FUNDING REQUEST

MCFA strongly supports full funding for the following programs intended to facilitate fair FQPA implementation, and to offset its anticipated negative impact on minor-use industries.

- \$14 million for the Pesticide Data Program (PDP) administered by the Agricultural Marketing Service;
- \$3.2 million for the National Agricultural Statistics Service pesticide-usage surveys;
- \$2.6 million for the Office of Pest Management Policy administered by the Agricultural Research Service;
- \$12.2 million for the Integrated Pest Management Research Grant Program administered by the Cooperative State Research, Extension and Education Service (CSREES); and
- \$18 million for the Pesticide Impact Assessment Program, Crops at Risk and Risk Avoidance and Mitigation Program also administered by CSREES.

Members of the Minor Crop Farmer Alliance include the following organizations and firms:

A Duda & Sons, Alger Farms, American Dehydrated Onion & Garlic, American Farm Bureau Federation, American Mosquito Control Association, American Nursery and Landscape Association, American Seed Association, Atlantic County Board of Agriculture, Brewster Heights Packing, California Ag Issues Forum, California Avocado Commission, California Canning Peach Association, California Cherry Advisory Board, California Citrus Mutual, California Citrus Quality Council, California Cut Flower Commission, California Farm Bureau Federation, California Fig Advisory Board, California Grape & Tree Fruit League, California Pistachio Commission, California Prune Board, California Seed Association, California Strawberry Commission, California Tree Fruit Agreement, Cherry Marketing Institute, Consumer Produce Company, Cranberry Institute, D'Arrigo Brothers, DeBruyn Produce Company, Del Monte Foods, Diamond Produce, Dried Fruit Association of California, Florida Citrus Mutual, Florida Citrus Packers, Florida Farm Bureau Federation, Florida Nurserymen & Growers Association, Florida Fruit & Vegetable Association, Frank Capurra & Sons, Fresh Produce & Floral Council, Grower Shipper Vegetable Association of Central California, Hillsborough County Farm Bureau (Florida), Holden Wallace, Inc., Idaho Potato Commission, Interstate Fruit & Vegetable Company, Lee County Mosquito Control District, Major Farms, McManus-Wyatt-Hidalgo Produce Marketing Company, Merrill Farms, Michigan Asparagus and Plum Advisory Board, Michigan Celery Promotion Cooperative, Inc., Michigan Farm Bureau, Michigan Onion Committee, Michigan Vegetable Council, National Christmas Tree Association, National Council of Farmer Cooperatives, National Food Processors Association, National Onion Association, National Potato Council, National Watermelon Association, New York State Vegetable Growers Association, North American Strawberry Growers Association, North Central Washington Fieldman's Association, Northwest Food Processors Association, Northwest Horticultural Council, Ocean Mist Farms, Ocean Spray, Ohio Fruit Growers Society, Ohio Vegetable & Potato Growers Association, Oregon Raspberry & Blackberry Commission, Ostrom Farms, Pacific Coast Canned Pear Service, Pacific Seedmen's Association, Processed Tomato Foundation, Pear Advisory Board, Pear Bureau Northwest, Produce Marketing Association, R.C. Farms, Rio Grande Okra Sales, Inc., Rio Queen, Inc., Robert Ruiz, Inc., Roses Inc., Society of American Florists, SoilServ, Inc., South Carolina Tomato Growers Association, Starr Produce Company, Tanimura & Antle, Inc., Texas Citrus Mutual, Texas Nursery & Landscape Association, Texas Produce Association, Texas Vegetable Association, Tree Top, Inc., U.S. Apple Association, U.S. Canola Association, U.S. Hop Industry Plant Protection Committee, United Fresh Fruit and Vegetable Association, USA Dry Pea & Lentil Council, Val Verde Vegetable Company, Valley Fruit & Vegetable Company, Virginia Farm Bureau Federation, Washington Hop Commission, Washington State Horticultural Association, Washington State Potato Commission, Western Growers Association, Western Washington Farm

Crops, Wiesehan Farms, Inc., Wild Blueberry Commission of Maine, Wisconsin Ginseng Growers Association, and Yakima Pomological Club.

PREPARED STATEMENT OF MISSISSIPPI STATE UNIVERSITY

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to submit this testimony on behalf of the Coalition of EPSCoR States¹ regarding the U.S. Department of Agriculture Experimental Program to Stimulate Competitive Research (USDA EPSCoR). USDA EPSCoR is extremely important to agricultural research in the state of Mississippi and in our nation. I appreciate the opportunity to submit this testimony.

I would also like to extend my appreciation to you, Mr. Chairman, for your strong support of USDA EPSCoR. This important program is having a significant impact in Mississippi and in the other USDA EPSCoR states. Your support and the support of this Subcommittee have been absolutely crucial in establishing and maintaining this important program. Mr. Chairman, those of us committed to improving Mississippi's research and development capability deeply appreciate your support and your effort. Thank you for your fine work representing Mississippi in the United States Senate.

Seven federal agencies have EPSCoR or EPSCoR-like programs, including USDA. EPSCoR works to improve our country's science and technology capability by funding activities of talented researchers in states that have historically not received significant federal R&D funding. USDA EPSCoR was established in fiscal year 1992 with a goal of increasing the amount of agricultural research at academic institutions within states that have received limited competitive funding from USDA.

The Mississippi EPSCoR program began in 1988 with the naming of the state EPSCoR Committee by the Governor. Mississippi EPSCoR obtained its first funding in 1989 from USDA EPSCoR's sister program in the National Science Foundation. Since that time, EPSCoR has had an enormously positive impact within the state and at the four research institutions and their affiliates.

Because of the multi-institutional framework of EPSCoR and of the commitment of the state EPSCoR Committee to creating a critical mass of scientists and engineers around specific issues as well as a more fully developed statewide infrastructure, Mississippi EPSCoR has produced a stronger, more competitive research community and closer working relationships among the institutions that participate in the federal EPSCoR programs: Jackson State University, Mississippi State University, the University of Mississippi, the University of Southern Mississippi, and the University of Mississippi Medical Center.

Mr. Chairman, USDA EPSCoR is helping to improve the quality and competitiveness of agriculture research in Mississippi. Since the program was established in 1992, a number of Mississippi researchers have received USDA EPSCoR Strengthening Awards. These investigators have been located at Mississippi State University, the University of Mississippi Medical Center, and the University of Southern Mississippi.

Important examples of Mississippi's research include studies in such areas as: kenaf processing, which is a potential economic opportunity for rural states; rapid detection of E coli, an important factor in food safety; and disease mechanisms in channel catfish, which impacts a significant cash crop across the southern part of the country. These projects and many, many others address issues important to rural states and to the rest of the nation. USDA EPSCoR allows researchers across our country to contribute to our economy and our agricultural research knowledge base.

USDA EPSCoR states are those whose funding ranks no higher than the 40th percentile of all states, based on a three year rolling average, but excluding strengthening set-aside funds. For fiscal year 2000, the following states are eligible: Alaska, Arkansas, Connecticut, Delaware, Hawaii, Idaho, Kentucky, Maine, Mississippi, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Carolina, South Dakota, Vermont, West Virginia, Wyoming, and the Commonwealth of Puerto Rico. Let me stress that EPSCoR relies on rigorous merit review in order to ensure that it funds only high-quality research.

USDA makes four types of competitive awards through USDA EPSCoR: Research Career Enhancement Awards, Equipment Grants, Seed Grants, and Strengthening Standard Research Project Awards. Proposals must be related to the program prior-

¹Alabama, Alaska, Arkansas, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, North Dakota, Oklahoma, Puerto Rico, South Carolina, South Dakota, Vermont, West Virginia, and Wyoming.

ities of the National Research Initiative Competitive Grants Program, which address critical issues facing agriculture today.

- Research Career Enhancement Awards help faculty enhance their research capabilities by funding sabbatical leaves. Applicants may not have received a NRICGP competitive research grant within the past five years.
- Equipment Grants strengthen the research capacity of institutions in USDA EPSCoR states. The grant cannot exceed 50 percent of the cost of the equipment, or \$50,000, whichever is less. The principal investigator for this grant is responsible for securing non-Federal matching funds.
- Seed Grants enable researchers to collect preliminary data in preparation for applying for a standard research grant. Seed Grant awards are limited to a total cost of \$75,000, including indirect costs, for two years and are non-renewable. Applicants must indicate how the research will enhance future competitiveness in applying for standard research grants.
- Strengthening Standard Research Project Awards fund standard research projects of investigators who have not received a NRICGP grant within the past five years.

Through USDA EPSCoR, Mississippi and the other USDA EPSCoR States contribute more effectively to our nation's science and technology capability, and help provide our country with needed, high-quality, peer-reviewed research. This program allows all regions of our country to contribute to our nation's science and technology capability while allowing flexibility to meet regional research needs. USDA EPSCoR is a sound investment of taxpayer dollars.

Mr. Chairman, the Subcommittee has for several years directed USDA to set aside 10 percent of USDA NRICGP funds for USDA EPSCoR. Those funds have provided significant opportunity and significant success in Mississippi and the other EPSCoR states. I request that the Subcommittee once again include report language directing USDA to set aside 10 percent of its NRI competitive grant funds in fiscal year 2001 for an EPSCoR program. These funds will allow the EPSCoR states to continue providing for the agricultural research needs of rural America and of our nation.

I thank the Subcommittee for the opportunity to submit this testimony.

PREPARED STATEMENT OF THE NATIONAL AGRICULTURAL AVIATION ASSOCIATION

The National Agricultural Aviation Association requests that the Subcommittee on Agriculture, Rural Development, Food and Drug Administration and Related Agencies of the Senate Appropriations Committee include a line item of \$1.3 million in its fiscal year 2001 Agricultural Spending Bill for the USDA—Agricultural Research Service's (ARS) Aerial Application Technology Program in College Station, Texas. This program is of tremendous value to agriculture and the environment.

Aerial application is a vital service for America's farmers enabling them to produce a safe, abundant and affordable supply of food and fiber for the nation and the world. Aerial application accounts for about 25 percent of crop protection spray applications and nearly 100 percent of forest protection applications. It also is used to protect human health from the spread of airborne viruses and disease. Furthermore, aerial application permits large areas to be covered rapidly, thus ensuring timely and effective applications. When soil conditions and crop foliage prohibit the use of ground machines, aerial application is the only feasible method of treating crops.

The Aerial Application Technology Program at College Station Texas is nationally recognized for conducting innovative research to make aerial application more efficient, effective and precise. Technologies have been developed at the facility that significantly mitigates spray drift and enables less crop protection product to be used more effectively. The continued implementation of environmental safeguards in which the agricultural industry must comply, coupled with the necessity of aerial application for American agriculture, underscores the need to augment the efforts of the USDA—ARS Aerial Application Technology Program where research supporting this balance is conducted. The \$1.3 million line-item in the fiscal year 2001 Agricultural Spending Bill will ensure that valuable aerial application technology research continue at the ARS College Station, Texas facility.

Increased research funding for the Aerial Application Technology Program is supported by a large and diverse coalition of agricultural groups that recognize the important role the Program plays in safely and effectively contributing to our nation's agricultural producers. These groups include the Agricultural Retailers Association, the American Crop Protection Association, the American Farm Bureau Federation, the American Sugarbeet Growers Association, the National Association of Wheat

Growers, the National Corn Growers Association, the United Fresh Fruit and Vegetable Association, and the U.S.A. Rice Federation.

We appreciate your consideration of this important issue.

PREPARED STATEMENT OF THE NATIONAL ALLIANCE FOR FOOD SAFETY

Thank you, Chairman Cochran and members of the Agriculture Appropriations Subcommittee for the opportunity to share with you information about the National Alliance for Food Safety. My name is Lonnie King and I am the chairman of the NAFS.

Food safety issues present us with complex and difficult challenges—shifting demographics, growing susceptible populations, changing production systems, new emerging pathogens, changes in the nature of foods, increasing importation of foods, and shifting dietary preferences. All these challenges have combined to inextricably change the landscape for both our food system and our food safety system.

In an effort to address the difficult and complex issues of ensuring a safe food supply, different strategies, alliances and essentially different ways of working will be needed to produce sustainable progress and useful results. Based on this national need, the concept of a broad-based, integrated partnership for research and education arose in the form of the NAFS.

The National Alliance for Food Safety—A Partnership for the Science of Safe Food—was established for the purpose of creating research and education programs that address issues and problems in food safety. The activities of the NAFS are oriented toward enhancement of public health and prevention of foodborne illness in response to the emergence of food safety as a prominent area of concern for the American public in recent years.

Twenty-five universities have joined with the Agricultural Research Service to comprise NAFS so that the organization may make the most efficient use of available resources. The work of the NAFS pursues this mission: to continually improve the safety of our food supply to ensure the public's health and to enhance our national and international food systems.

The NAFS represents a collective of over 500 researchers and scientists who offer an unprecedented portfolio of products, services, and expertise in research and educational programs. The NAFS also represents a new operative built on the philosophy of creative collaboration. This collaboration is enhanced through the many disciplines and areas of expertise of the scientists. In addition, the diversity of the Alliance's member institutions is a unique and compelling strength. This diversity enables researchers to compare and contrast a wide variety of production systems and climatic and environmental conditions across the U.S.

The partnering institutions strongly believe that together we will: help formulate and focus on the top research priorities; prevent duplication of effort; form synergies through multidisciplinary and cross-university food safety teams and centers of expertise; and, align our outstanding and substantial resources, facilities, and intellect toward a national, integrated research and educational blueprint directed at the assurance of a safe food supply. Finally, the NAFS will also assure the highest applicability of its activities to resolving critical food safety problems of greatest national need and delivering products, services, and information of the highest scientific merit.

The NAFS membership stretches from coast to coast. Its member universities are Clemson University, Cornell University, Georgetown University, Iowa State University, Kansas State University, Michigan State University, Mississippi State University, North Carolina State University, North Dakota State University, Pennsylvania State University, Purdue University, Texas A&M University, University of Arkansas, University of California-Davis, University of Florida, University of Georgia, University of Idaho, University of Illinois, University of Maryland-College Park, University of Maryland-Eastern Shore, University of Nebraska, University of Tennessee, University of Wisconsin, Virginia Tech University and Washington State University. These universities have bound themselves together with the Agricultural Research Service around the common goal of ensuring the safest possible food supply for the consumer.

The member universities bring to the NAFS a strong base of scientific expertise in food safety with several components. The members use their respective components to form the basis for collaborations with their counterparts at other universities and at ARS. The geographical diversity of the NAFS members provides for a mix of climatic conditions, soil and vegetation types and farm and handling practices representative of the whole nation.

The role of the NAFS is to use its capacity to foster strong working partnerships to deal with food safety issues. No single research and education establishment in the nation has the intellectual capacity nor the infrastructure to address the problem in its entirety. Working as partners, the members of NAFS can bring sophisticated problem-solving research activity to food safety questions unmatched by any other entity.

The NAFS has begun its work with the recent request for proposals from its members. The Agricultural Research Service received a fiscal year 2000 appropriation increase for cooperative research with NAFS member institutions for food safety research on *E. coli* O157:H7 and *Listeria monocytogenes*. Collaboration among NAFS and ARS scientists was a requirement for all successful proposals. Strong encouragement was given toward the submission of proposals of collaborations among multiple NAFS members and ARS scientists.

The NAFS looks to the long term for opportunities to use its capabilities. Its research strengths center on several commodities: muscle foods, minimally processed foods, fruits, vegetables, dairy products, cereals and grains, aquaculture, seafood and egg products. NAFS members' expertise is in disciplines including epidemiology, toxicology, risk assessment, microbiology, virology, medicine, clinical research and health outcomes.

Research priorities for NAFS include isolation and detection methodology, surveillance, emerging pathogens, traceback of hazards, risk analysis and modeling, rapid methods of pathogen detection, antimicrobial resistance, methods of pathogen reduction, intervention strategies, mechanisms of pathogenicity and food toxicology.

The goal of NAFS is to initiate food safety projects assuring the highest applicability to food safety problems and being of the highest scientific merit. The specific goals and objectives of the NAFS are to:

- Meet the emerging food safety needs of industry in the areas of food production, processing, transportation, retail and food service;
- Address global issues in food safety related to the international marketing of U.S. agricultural products and enhance the safety of foods imported into the United States;
- Develop prevention and intervention strategies that will facilitate the continued production of healthy animals and safe plant-derived foodstuffs;
- Conduct research to enhance the safety of food products in the food service and retail environment, including market distribution;
- Communicate with the public regarding food safety research and implementation of technology for food products from production through the marketing chain to the consumer;
- Develop a framework for improving risk assessment and risk management information communication through a combination of resources including health, medical and epidemiological research programs;
- Increase our understanding of pathogens in the environment and food, including their prevalence, survival and adaptability under various conditions, and emergence of virulent strains;
- Address issues such as the role of food animals in the development of antibiotic resistant human pathogens.

NAFS is now functioning with the support of funds made available last year through ARS. Collaborators from several NAFS universities and ARS are responding to calls for new research initiatives. This support from Congress has been a vital first step in the life of NAFS. NAFS respectfully requests continued support from Congress so that it may expand its work to cover the many areas listed above.

The National Alliance for Food Safety requests \$5 million for fiscal year 2001. We strongly urge the Congress to approve this step toward the maturity of NAFS as a research organization as NAFS pursues its mission.

The NAFS contains the necessary elements to avoid duplications of effort and to encourage well-organized teamwork. The Agricultural Research Service, working as a full partner, promises to be a valuable asset toward the success of NAFS. The members believe that their collaborations will result in a credible response to the congressional call for greater cooperation and elimination of redundancy in scientific research. The NAFS, with one of the most potent arrays of research institutions assembled toward achievement of a common goal, pledges continued careful and credible use of food-safety research funds allocated to the academic and government agency sectors.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF STATE UNIVERSITY AND
LAND-GRANT COLLEGES

INTRODUCTION

From Alaska to Puerto Rico, scientists, educators and extension personnel in 106 Land-Grant colleges and universities across America have a unique partnership with the Department of Agriculture's Cooperative State Research, Education and Extension Service (USDA/CSREES). This partnership makes it possible to address critical national issues at the local level. We are requesting an increase of \$191 million over fiscal year 2000. Below is a table highlight the increased areas.

[In millions of dollars]

<i>Funding highlights</i>	
Base formula funds (Research and Extension)	50
National Extension Priorities	20
Native American and Hispanic Serving Institution funding	9
1890 Institution Facilities Improvements	3
National Research Initiative	30
Integrated Research, Extension, Education	43
International Science and Education Grant Program	8
Extension and Research Initiatives	13
Investment in Students	15
<hr/>	
Total proposed increases over fiscal year 2000	191

With this investment, Land-Grant Institutions will be given the foundation to continue to make great strides in research and deliver important information from this research to the public. The following is divided into three sections. First, I describe the initiatives the Land-Grant System would like to continued from fiscal year 2000 not included in the above table. Second, I detail our goals within USDA/CSREES as reflected in the table. Finally, I explain the issue areas that cross across two or more federal agencies that the land-grant community needs funding in order to become full partners in ongoing projects which are also reflected in the above table.

INITIATIVES

Initiative For Future Agriculture And Food Systems

We envision a dynamic future agricultural science program to grow from the seed of this "New Initiative" into an exciting new "National Institutes of Agricultural Science model." This new approach will focus the nation's important scientific research, education and outreach into a unified architecture, similar to that performed by the NIH for the important human medical and other health related sciences. Currently, this funding is being used for research, extension or education grants to address critical emerging agricultural issues related to future food production, environmental protection, farm income and for activities carried out under the Alternative Agricultural Research and Commercialization Act of 1990. Priority is given to projects that are multi-state, multi-institutional, or multidisciplinary and to projects that integrate agricultural research, extension and education. Funds are awarded competitively to address priority mission areas related to food genome, food safety, food technology, human nutrition, new alternative uses and production of agricultural commodities and products, agricultural biotechnology, and natural resource management, including precision agriculture. We support continuation of this program in fiscal year 2001 at last year's level.

Fund For Rural America

No one can ignore the economic realities found in rural America today. The Fund for Rural America includes a component that provides for integrated research, education and extension to address the most pressing issues of rural America. The fund unites the many rural development efforts of the department into one strategy aimed at addressing the most pressing needs in rural America and improving the quality of life for these citizens. This research and extension component of the program helps communities use science to solve real world rural challenges—from conservation to hunger to farm profitability. We support continuation of this program in fiscal year 2001 at last year's level.

Investing in farmers and ranchers

As discussed in the earlier section on "Supporting partnerships to address national issues at the local level," there is a great need to invest in research and extension to assist all farmers and ranchers as they struggle through difficult economic times. Small and medium size farmers are facing some special challenges. Currently about 92 percent of American farms and ranches are classified as small or mid-sized with gross annual sales of less than \$250,000. These operations account for approximately 34 percent of agricultural production. Small and mid-sized operations support small communities, local businesses, and produce innovations for agricultural enterprises. We cannot allow these operations to fail. There is a real need for risk management education and options as decision-making tools for farmers, ranchers, and their families. Annual one-time support payments must be replaced with programs to develop longer-term planning and management skills. Efforts are underway to strengthen Extension's ability to provide risk management education to farmers and ranchers searching for answers during this farm crisis. In addition, we propose the Food and Agricultural Policy Research Institute (FAPRI) and its consortium of related universities, be established as a Policy Research Center as envisioned under Section 224 of the Agricultural Research, Extension, and Education Reform Act of 1998 and Section 807 of the FAIR Act. FAPRI delivers a product, which is used regularly on a national basis and provides Congress and other decision makers with high quality, carefully reviewed, objective policy analysis.

Investing in Food Safety

In the U.S., 6.5 million cases of food-borne illness are reported each year, but the government estimates that there may be more than 33 million actual cases. The annual domestic cost of food-borne illness is estimated at \$23 billion. Safe food depends upon broad-based understanding of the causes of food-borne illness, paths to prevention, and commitment to preventive practices employed by producers, processors, handlers and consumers. Better methods for analyzing available data and addressing any uncertainty among the public is critically needed. Research examining risk assessment, new emerging diseases, safety of food imports, new processing techniques, research on the actual causes and prevention of food-borne illnesses as well as education on how to handle food will not only save lives, but also save money. We support sustained funding to identify the critical points of food contamination through targeted research, extension, and education programs.

Investing in Nutrition

Capacity to learn and to contribute to society is traced directly to the quality of health and nutrition from prenatal status through adulthood. Assuring a healthy, well-nourished population required continuing efforts toward development of quality research information on nutrient function for maintenance of optimal health, understanding the availability and bio-availability of food for all population groups, especially those at greater risk for nutrition-related diseases, e.g., infants, elderly, new immigrant groups. Using foods to treat diseases is a major component of an active and progressive nutrition research program. Nutrition education incorporating this research is also needed. This education should include knowledge of how to secure foods to provide adequate nutrition to families with a commitment to dietary guidelines. Therefore, we support sustained funding for the Expanded Food and Nutrition Education Program.

Investing in the Environment

EPA and USDA have recently developed a draft, "Unified National Strategy for Animal Feeding Operations." In addition, federal legislation such as the Clean Water Act, state legislation and other administrative actions have addressed the issue of agricultural waste. There is an urgency to develop science-based practices and educational programs that address waste management challenges. Funding that allows universities to identify alternative technologies and practices for pesticide management, address water quality and soil nutrient management, and develop models of improved livestock waste management is vital and allows the Land-Grant University System, working with USDA and EPA, to make significant contributions.

Investing in Renewable Resources

Between five million and ten million private timberland owners turn to the Land-Grant University System as their main source for education information. With the loss of cutting rights in the West, private forest landowners will be under tremendous pressure to produce forest products for houses, furniture, paper, ect. These are products Americans use daily and the demand increases steadily. Today, ten percent

more timber is cut than grown. Education is needed to get landowners, particularly private landowners, to replant and protect their timber. The number of forest landowners increases each year; thus, the need for educational services increases. In order to protect our land and timber supply, we support significant increases to the Renewable Resources Extension Act.

Also, research and extension education is needed on grazing and pasturelands to fully utilize their renewable resources. Each year we rely on over 600 million acres of grazing and pastureland to provide 57 percent of the feed energy for the nation's single largest agricultural economic sector, livestock. Reduced cost of production is imperative for this industry to survive and compete. Fragmentation of once contiguous tracts of grazing and pasturelands, especially near urban and suburban settings, has increased the level of human disturbance; thus, amplifying the need for scientific solutions to biological, physical, and social issues.

Investing in Children, Youth and Families

The strength of much of American agriculture depends upon the family and associated community life. Major changes in the structure of agriculture (including consolidations of concentration) are threatening the community systems that support families and make rural life attractive. The viability of American agriculture requires investment in those systems that sustain quality family life. These systems include viable communities, schools, medical services, childcare, technology and jobs, to name a few. The Cooperative Extension Service programs in Land-Grant Universities deliver community-based programs that are designed to help children and their families solve many of their own problems. Highly successful programs address parenting skills, building family strengths, community leadership development, health and nutrition education, workforce education, positive youth development and more. Strong continuing support of successful programs as well as new innovations are needed.

Investing in New Markets and Quality Communities

Many Americans in both rural and urban communities continue to be significantly poorer, less healthy, and much more likely to suffer from the multiple challenges inherent in persistent economic, social, institutional, and equity capital in most rural communities and many urban centers. CSREES research, education and extension programs seek to enhance the quality of life in under-served communities through education and training (Quality Knowledge), research and development (Quality Information) and extension and outreach (Quality Place-Based Solutions to Local Real-World Challenges). Our goal is to build a bridge between rural and urban citizens and bring all Americans into the economic mainstream. To further the rural mission, the Land-Grant System proposes that the Rural Policy Research Institute (RUPRI) be funded as the National Rural Policy Research Institute through a new CSREES budget line item. This would provide RUPRI with the ongoing infrastructure to sustain and expand core operations and rural policy research capabilities. In addition, we propose an increase in funding to the four Regional Rural Development Centers throughout the country. These centers provide much needed research and education to decision makers in rural communities. Their services can address the changing economic infrastructure in rural America and facilitate leadership development programs for community leaders and elected officials that will help these public leaders address the difficult issues facing rural communities. Similarly, a major new investment is needed to address the economic and social infrastructure issues specific to impoverished urban and suburban populations to empower them to enter the mainstream of American life. Model research and extension programs currently addressing these urban problems need enhancement and replication across the nation.

CROSSCUTTING ISSUES

Investing in the 1890 and 1994 Land-Grant Institutions and other minority serving colleges

The 1890 and 1994 Land-Grant Universities, together with the Hispanic-Serving Institutions, comprise a unique and rich asset. These institutions with their multicultural depth enrich the research, extension and education programs of the Department. The focus on these institutions at this time is crucial. A primary goal of the Department is to improve minority access to USDA programs. Strengthening minority serving institutions and making them equal partners in the Land-Grant System are the key elements to accomplishing this goal. These universities need a significant boost in infrastructure investment to fully participate and compete for research, extension and education funding. Therefore, we are proposing a significant

increase in the appropriate funding mechanisms relevant to each group of these institutions.

Supporting partnerships to address national issues at the local level

The research, education and outreach that the Land-Grant System provides, should be an essential part of our response to the farm crisis. Emergency relief can help farmers in the short run, but in the long run, the diversity of our farm sector cannot survive without strong and unbiased research and development, produced and disseminated in a way that is accessible to producers on an unbiased basis. There are five areas in which the Land-Grant System can help farmers, ranchers and forest land owners succeed globally in the new century. These areas are: small farm competitiveness; marketing skills and technology; new product development; risk management education; and natural resource management. We strongly support increases in base funding for the Land-Grant System to continue and expand efforts to support farmers and ranchers.

Investing in students

The changing structure of American agriculture in a global economy, the major and rapid advances in genomics and biotechnology, shortages of skilled labor, and the growing economic gap between small and mid-sized farms and large corporate entities require important changes in education for those who produce and process food and fiber. Funding must be available to enable universities to broaden their curricula; promote faculty development; strengthen student research projects; and increase the number of new scholars, including minority graduate students, recruited in the food and agricultural sciences. Investing in higher education allows universities to build the human capacity to carry agricultural science in the next century.

Globalizing U.S. university agricultural teaching, research, and extension programs

Global forces are rapidly transforming U.S. agriculture. Several evident forms of this transformation are: (1) regional and world trade agreements which broaden access to U.S. food and fiber products to emerging and developing markets and which broaden access of agricultural products from other nations to U.S. markets; (2) global environmental changes which impact directly on production processes in the U.S.; (3) multinational investments in agricultural production in the U.S. and other nations; (4) the growing U.S. international agricultural labor force; and (5) the need to research and insure the safety of food, both domestic and imported. U.S. universities must teach agribusiness and producers of today and tomorrow to adjust to rapidly changing product, financial, and labor markets. They must access the best of new technologies and practices whatever their origin. This will require continued updating of international dimensions of teaching, research and extension programming.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF UNIVERSITY FISHERIES
AND WILDLIFE PROGRAMS

The National Association of University Fisheries And Wildlife Programs (NAUFWP) provides this statement on the proposed fiscal year 2001 appropriations for the Cooperative State Research, Education and Extension Service (CSREES), U.S. Department of Agriculture.

Fifty-four universities dealing with natural resources share membership in the NAUFWP. They seek to advance the science and practice of fisheries and wildlife ecology and management, and enhance public understanding and multiple benefits from natural resources.

The NAUFWP recognizes that the research, education and extension programs of CSREES and its Land Grant University partners initiate positive changes in attitudes, and stimulate constructive actions to implement new technologies and ecologically sound approaches and practices by private landowners, resource managers, community decision-makers, and other members of the public. Accumulated experiences show that investments of funds and time yield significant benefits to individuals, the States and the nation by building and sustaining a more viable and productive natural resource base, and a competitive and profitable agriculture.

The pressing challenge is to have the CSREES/Land Grant System, with its credibility and delivery system, reach a larger portion of the 10 million or more private landowners and managers who control more than two-thirds of the U.S. lands, or approximately 1.35 billion acres. Regrettably the proposed fiscal year 2001 budget for CSREES is far from adequate to help landowners and managers move toward achieving sustainable uses of the resource base. Only about 4 percent of the pro-

posed fiscal year 2001 budget of \$972,395,000 supports research and extension activities pertaining to forests, rangelands, fish and wildlife. This funding level is inadequate to respond to the public's concerns and demands to enhance stewardship and management of natural resources. Much greater investments and emphasis on proper uses of natural resources are needed to achieve a more sustainable society, thereby avoiding costly restoration.

To strengthen essential efforts of CSREES, the NAUFWP strongly recommends that the following three priority adjustments and four additional adjustments be made in the proposed fiscal year 2001 budget.

Priority 1.—That the Renewable Resources Extension Act (RREA) be funded at \$15.0 million in fiscal year 2001. Demands for outreach services exceed currently funded capabilities (about \$3.1 million). RREA funds, apportioned to the State Extension Services, effectively leverage cooperating partnerships at four to one. This proposed increase to \$15.0 million would permit the Extension System to respond to more informational needs of private landowners, and thereby accomplish the goals and objectives outlined in its 1991–1995 Report To The Congress. Needs for expanded outreach services are greater than ever, as landownerships become increasingly fragmented, as new and established landowners request more information, and as the general public demands natural resources be managed more carefully. The proposed increase to \$15.0 million would enable the Extension Service to build its capabilities to assist more than 500,000 private landowners yearly to improve decision making and management on an additional estimated 35 million acres. Among the landowners and managers requiring assistance are the more than 10 million private, county and tribal landowners holding forestlands. Currently only a small percentage have a forest management plan.

Priority 2.—That Smith-Lever 3 (b) & (c) funding be increased by 5 percent to a level of \$290,000,000, with the increase allocated to strengthening the Natural Resources And Environmental Management (NREM) base program. NAUFWP appreciates that 3 (b) & (c) base programs provide block grant type funds for Land Grant Universities to provide essential educational outreach based on local assessments of needs. The proposed increase in funds would enable NREM programs to develop a more realistic level of expertise at State and local levels to address resource and environmental issues directly affecting farmers, as well as other landowners, in rural and urban communities nationwide. Expressed needs for program expansion include such issues as forest management, wetlands maintenance and restoration, responses for declining and endangered species, and human/wildlife interactions. Likewise, urban and community forestry and other natural resource education efforts need strengthening, as called for in the 1990 FACT Act, to achieve sustainability of these critical resources. The proposed increase, targeted appropriately, would also help producers better understand and implement conservation provisions of the Farm Acts. It could also help strengthen the limited natural resources staff in CSREES, as well as at the Land Grant Universities, including the Black and Tribal institutions.

The Congress should direct the State Cooperative Extension Services to partner with the State Fish And Wildlife Agencies, and other appropriate State and Federal agencies, conservation organizations and relevant private groups to meet demands for services. Extension 4–H Youth natural resource programs and projects continue to expand, with more than 1,350,000 young people presently enrolled, and needs are increasing for additional technical assistance nationwide.

Priority 3.—That the water quality integrated activity be given at least 10 percent more funds than proposed for fiscal year 2001 (\$16,204,000) to help correct the numerous and serious water quality situations in the U.S. and assist in preventing additional situations from developing. Only through the CSREES integrated research and extension water quality program can connections between agricultural practices and outbreaks of harmful algal blooms be understood and managed more effectively. Approaches are required to correct and prevent massive fish kills, human health problems and significant economic losses to the seafood industry.

Priority 4.—That the Rangeland Research Grants (RRG) be restored to \$500,000 in the fiscal year 2001 budget. No funds were provided in budgets for fiscal year 1998, 1999, 2000 and 2001. This is a major weakness in CSREES's budget. More than one-half of the U.S. land area is rangeland. Elimination of the only Federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted in the past decade. Continued funding is needed to focus on wildlife issues on rangelands. They will be some of the more critical rangeland research problems in the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners accelerate adoption of habitat conservation

and management recommendations for rangelands and forests. Only through such efforts can degraded rangelands and associated riparian areas be restored.

Priority 5.—That an appropriate portion of the total proposed increased appropriation for Pest Management be dedicated to educational programs to prevent and control vertebrate pests in urban and rural communities. Agricultural producers and other private landowners and managers in many States have identified their needs to respond to their most significant problems, frequently involving vertebrate pests. Information and technical assistance are required. Targeting Pest Management funds for vertebrate pest research and educational programs would effectively advance the knowledge and capability of landowners and managers to significantly reduce the losses in these problem situations.

Priority 6.—That Hatch funds be increased 11 percent to \$200,000,000 and McIntire-Stennis funds be increased 14 percent to \$25,000,000. Flat funding, as proposed for fiscal year 2001 for both Hatch and McIntire-Stennis, will not permit CSREES and the Land Grant Universities to provide services to the more than 10 million private landowners and managers. This assistance is needed to help them address their natural resource issues, which frequently also are concerns expressed by the general public. Greater cooperative research and extension efforts are required to address the erosion and degradation of the nation's natural resource base. The natural resource base and all of its functions and services must be conserved if agriculture productivity is to be sustained.

Priority 7.—That the proposed increase in funds for the National Research Initiative competitive grants, especially those for natural resources and the environment, be granted. As stated above, greater efforts are required to address the erosion and degradation of the nation's resource base.

In summary, the NAUFWP recommends that the following actions be taken on CSREES's proposed fiscal year 2001 budget:

- Fund the RREA program at \$15.0 million.
- Increase the Smith-Lever 3 (b) & (c) base funds to \$290,000,000.
- Provide at least a 10 percent increase for the water quality integrated activity.
- Restore \$500,000 for Rangeland Research Grants.
- Designate an appropriate portion of the increased funds for Pest Management to bolster research and education to address vertebrate pest control and prevention in urban and rural communities.
- Increase Hatch funds to \$200,000,000 and McIntire-Stennis funds to \$25,000,000.
- Provide the proposed increase in funds for the National Research Initiative competitive grants, especially those for natural resources and the environment.

Please include this statement in the official record on the fiscal year 2001 appropriations for CSREES, Department of Agriculture. Your positive response will be appreciated.

PREPARED STATEMENT OF THE NATIONAL CONGRESS OF AMERICAN INDIANS

INTRODUCTION

Good morning Chairman Cochran, Vice-Chairman Bumpers and distinguished members of the Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies. Thank you for the opportunity to present testimony regarding the President's Budget Request for fiscal year 2001 Indian programs and services. My name is Susan Masten. I am President of the National Congress of American Indians (NCAI) and Chair of the Yurok Tribe of Northern California.

The member tribal governments of NCAI are encouraged about this year's budget process. For the first time in a generation, the President has proposed a significant increase in the budget for programs that assist Indian people and Indian tribes. If preserved through the appropriations process, more than \$1.2 billion more will be provided to Indian programs. This commitment will better serve Indian communities and take a big step toward honoring the Federal Government's treaty and trust obligations to Indian nations. The news is out in Indian Country: this year the President is committed to meeting the acute needs in our communities. We are going to work very hard to ensure that Congress shares that commitment.

The last time the Federal Government enacted an increase of a similar scope to the President's fiscal year 2001 proposal, was in the mid-1970's, as a part of President Nixon's Tribal Self-Determination policy. Self-Determination has been and continues to be the most successful Federal policy toward Indian Nations ever in the history of the country. Under this policy, tribal governments have local control over programs and decision making on their reservations and have been able to fulfill

needs and solve problems far more quickly and efficiently than through “top-down” Federal programs. Through experience with Self-Determination, a generation of financially astute and fiscally responsible tribal government leadership has learned to function as better managers and service providers in all manner of tribal government functioning and tribal business development.

NCAI urges Congress to increase the investment in Indian programs and tribal government infrastructure. We believe that the President’s fiscal year 2001 budget request has taken a positive step in that direction. The following testimony provides NCAI’s viewpoint on sections of the budget that are most critical to tribal governments in the Department of Agriculture.

DEPARTMENT OF AGRICULTURE

Being the most rural of any minority group, American Indians residing on reservations are for the most part, geographically isolated, resource-limited, and the least likely of any farm group to receive loans from the United States. Of the some 55 million acres of Indian lands, 47 million acres are used for the production of crops, livestock, or both. Those individual operators and farming tribes who produce these resources are in need of capital, more efficient administration of existing Federal programs, and technical assistance. This need extends to every farming tribe, even those who may have an abundance of other natural resources.

Programs Assisting Native Americans

While the President’s proposed fiscal year 2001 budget request for the Department of Agriculture is decreased overall by eight percent from fiscal year 2000, the President’s funding request for Native American programs is increased by \$90 million from fiscal year 2000, for a total of \$784 million. NCAI greatly supports this request for increased funding, as it would: further the success of the numerous American Indian tribes engaged in cultivation of agricultural and community development; assure economic stability on Indian lands; and, facilitate the development of agri-business to help overcome economic, infrastructure, resource and geographic challenges, characteristic of Indian reservations.

The commitment of the USDA to adequately fund line item programs that apply specifically to tribes and to programs that benefit tribes indirectly are both essential in order to enhance economic self-sufficiency through rural development and rural based economies, and is further strengthened and safeguarded by the specific education initiatives of tribal colleges.

Native American Specific Programs

Extension Indian Reservations Program

Since 1990, the Extension Indian Reservation Program, authorized under the Food, Agriculture, Conservation and Trade Act, has been providing many services to Indian Country on issues ranging from crop and animal production practices to farm business management. It also has provided extension agents, employees of the State Cooperative Extension System, to work with tribal advisory committees in developing educational programs in agriculture or agriculture-related youth programs that respond to tribal priorities. Unfortunately, since funding began in 1990, the Extension Indian Reservation program has remained at \$1.7 million, allowing support for about 26 projects in 15 States. For fiscal year 2001, the President has requested \$5 million, an increase of \$3.3 million from the fiscal year 2000 level. NCAI strongly supports this increase for fiscal year 2001 in order for the program to hire additional extension agents on Indian reservations and to assist tribal governments in promoting productive and efficient land use on their reservations.

Rural Development Native American Programs

For fiscal year 2001, the President has requested \$48.7 million, an increase of \$36.7 million over the fiscal year 2000 enacted level for the Rural Development Native American Programs. Included in this request is funding specifically earmarked for: Water and Waste Disposal Direct Loans and Grants; Community Facility Loans and Grants; Rural Business Enterprise Grants; Rural Business Opportunity Grants; and, Intermediary Relending Program Loans.

NCAI supports the funding request to the Rural Development Native American programs as it would provide more loans and grants to tribal governments to construct and improve their water and wastewater systems, construct community facilities such as health clinics and child care centers, and diversify and expand economic opportunities within their communities. These funds would also provide an appropriate step in advancing tribal economic development and the achievement of stable and self-sustaining reservation economies.

Specifically, NCAI supports the following:

- Water and Waste Disposal Direct Loans and Grants—the fiscal year 2001 budget request is \$29.7 million, an increase of \$17.7 million from fiscal year 2000. These loans and grants will assist tribes in meeting the substantial need to improve the quality of drinking water systems and waste water disposal facilities on their reservations.
- Community Facility Loans and Grants—for fiscal year 2001, the President has requested \$8 million for this new initiative which would provide grants to tribes for infrastructure development.
- Rural Business Enterprise Grants—for fiscal year 2001, the President has requested \$6 million that would provide grants for reservation small business.
- Rural Business Opportunity Grants—for fiscal year 2001, the President has requested \$1 million for Rural Business Enterprise Grants, as seed monies for start-up businesses on reservations.
- Intermediary Relending Program Loans—for fiscal year 2001, the President has requested \$4 million for this new program which will provide loans for small business start up and expansion at considerably lower interest rates than market rate.

Food Distribution Program on Indian Reservations

The Food Distribution Program on Indian Reservations (FDPIR) greatly benefits many Native Americans who live on and off Indian reservations. This program is administered by the Food & Nutrition Service (FNS), an agency of the U.S. Department of Agriculture, in cooperation with 98 Indian tribal organizations and six State agencies. The fiscal year 2001 budget for the FDPIR is \$76.5 million, an increase of \$1.5 million over the fiscal year 2000 enacted level. Although insignificant, this increase is crucial in order to provide commodity foods to low-income households, including the elderly Native American, living on reservations, and to Native American families residing in designated areas near reservations. Many Native Americans actually participate in the FDPIR, rather than the Food Stamp Program because of rural isolation and the lack of easy access to food stores. NCAI supports the appropriate funding increases to the FNS budget.

Proposed Expansion of Empowerment Zones

The proposed expansion of Empowerment Zones (EZs) will expand the wage credits and tax incentives, as well as facilitate a new round of urban EZs. These EZs will extend and improve economic growth in the thirty-one existing urban and rural EZs that are administered by the Department of Housing and Urban Development (HUD) and USDA, and support the proposed third round of ten new EZs to be designated in 2001. The total cost of these proposals will be \$4.4 billion over ten years. NCAI supports the much needed expansion of EZs as it will provide economically depressed rural areas and communities, such as Indian communities, with real opportunities to create jobs, develop and enhance their communities, and diversify markets.

CONCLUSION

Mr. Chairman, we urge the Congress to fulfill its fiduciary duty to American Indians and Alaska Natives and to uphold the trust responsibility, as well as preserve the Government-to-Government relationship with tribal governments, which includes the fulfillment of health, education and welfare needs of all Indian tribes in the United States. This responsibility should never be compromised or diminished because of any Congressional agenda or party platform. Tribes throughout the nation relinquished their lands as well as their rights to liberty and property in exchange for this trust responsibility. The President's fiscal year 2001 budget request acknowledges the fiduciary duty owed to tribes. We ask that the Congress maintain the Federal trust responsibility to Indian Country and continue to aid tribes on our journey toward self-sufficiency. Thank you for allowing me to present for the record the National Congress of American Indians' comments regarding the President's fiscal year 2001 budget request for the Department of Agriculture.

PREPARED STATEMENT OF THE NATIONAL CONSORTIUM FOR RURAL GEOSPATIAL
INNOVATIONS

As your subcommittee prepares the fiscal year 2000 Agriculture, Rural Development and Related Agencies appropriations, we are requesting that you provide \$2 million to support the Geographic System Information Program (GISP). We appreciate the support your subcommittee has provided our Program in the past. This

Program has received funding from the Research and Education account of USDA's Cooperative State, Research, Education, and Extension Service (CSREES).

The National Consortium for Rural Geospatial Innovations (RGIS) is a group of eight university and non-profit sites distributed across the U.S. With the support of the Geographic System Information Program, RGIS sites assist state, tribal, regional and local governments and non-and-for-profit organizations in implementing advanced geospatial information technologies. The last decade has seen an explosion of computer-based technologies for the creation and management and distribution of information about natural resources, property records, infrastructure, transportation, and other land use arenas. These technologies include geographic information systems (GIS), remote sensing image processing, global positioning systems (GPS) and other related information technologies. RGIS uses a variety of approaches to make these technologies understandable, affordable and useful.

The mission of RGIS is to eliminate the digital divide facing rural America by promoting the transfer of geospatial technologies by:

- Providing geospatial tools, technologies, and training to empower local governments, organizations, and citizens to understand and participate in decisions that affect their economy, quality of life, and environment;
- Educating and training a cadre of people to apply geospatial technologies to rural issues;
- Supporting the development of appropriate local land information systems, as well as linkage to and cooperation with regional, state, and national land information systems.
- The goal of the program is to improve the quality of life, environmental health, and economic competitiveness in rural communities.

RGIS members have proved that geospatial technologies are efficient and cost-effective tools to improve local decision-making and local governmental processes. RGIS members have enabled local communities to develop better information, which has allowed local communities to make better decisions on a variety of issues including farmland preservation, emergency services, watershed management, land records modernization, and environmental protection. Continued funding of the Program will allow the organization to continue these benefits and leverage other resources to improve the quality of life in rural America and insure these communities have access to cutting-edge technologies.

This past year two new Chesapeake sites were added and supported by the Program. These sites brought the following strengths to the Consortium:

- Wilkes University and Kings College in Pennsylvania brings expertise in how to implement geospatial technologies among rural local governments and engineering mapping skills for comprehensive watershed planning.
- Pennsylvania State University brings expertise in how to apply geospatial technologies to assess agricultural quality for rural land use planning and management and spatial analytic methods for assessing the environment.

This past year the other existing six sites contributed the following outcomes:

- University of Wisconsin-Madison continues its extensive set of geospatial outreach training programs, including hands-on land use planning and management program for county and town level planners. Selection by the Federal Geographic Data Committee (FGDC) Community Demonstration Program has provided an opportunity to assist local citizen planners access new land use planning and management tools.
- University of North Dakota continues to respond to the expanding interest in geospatial technology by local governments. One of the most rewarding developments has been the assistance provided to the City of Grand Forks in the aftermath of the 1997 devastating flooding of the Red River.
- University of Arkansas continues to provide local, state and national leadership. Examples include providing geospatial expertise to the Arkansas Land Records Modernization Board, GIS training camps for local high schools, and assisting the NRCS develop the capacity to transfer soils and orthophotography information over the Web.
- Central Washington University continues to support the modernization of irrigation records used by water management boards to insure equitable distribution of hydraulic resources and continues to assist tribal and local rural communities assess the role and use of geospatial technologies.
- South Georgia Regional Development Center continues to assist local governments modernize land record systems such as parcel records for various applications including economic development and infrastructure management.
- Southwestern Indian Polytechnic Institute (SIPI) in its inaugural Program year started a program to assist tribal communities utilize GIS and GPS technologies for agricultural and local land management applications. Also SIPI hosted a sat-

elite distance education geospatial program for 29 tribal colleges across the U.S. Each RGIS Program Site participated by providing a 15 minute technical segment to the 2 hr. satellite program.

Thank you for your consideration of this request. If you have any questions, please contact us at your convenience.

PREPARED STATEMENT OF THE NATIONAL COOPERATIVE BUSINESS ASSOCIATION

USDA RURAL COOPERATIVE DEVELOPMENT GRANTS

Mr. Chairman, members of the committee, we appreciate the opportunity to present testimony as you prepare to consider appropriations for the Department of Agriculture for fiscal year 2001. I would like to discuss the Rural Cooperative Development Grants program. I urge you to appropriate \$10 million for this valuable program that is offering real solutions to the daunting challenges being faced in rural America.

The National Cooperative Business Association (NCBA) is proud of its role in assisting the creation of a network of rural cooperative development centers across the country. We know that Congress is equally as proud of its role in fostering a cooperative business development support network throughout rural America. Congress and this Administration recognize the vital role that cooperatives play in providing jobs, increasing incomes and reducing expenses for millions of rural Americans. NCBA is now also proud to be a member of CooperationWorks, a network of cooperative development centers and national partners dedicated to enhancing the capacity of centers and promoting co-op solutions to rural America's economic challenges.

The Grants for Rural Cooperative Development program was originally authorized by section 2347 of the 1990 farm bill as a program of Grants for Technology Transfer and Cooperative Development. In fiscal year 1993, this committee began to provide funding for the program, and report language over the years has indicated your strong support for the concept of using this funding for the purpose of creating a network of centers for rural cooperative business development. While the centers offer technical assistance, information and other resources for cooperative business formation, their network provides a vital support system for the centers to continue operating.

NCBA's members, along with other supporters of cooperatives around the nation, joined together as the National Rural Cooperative Development Task Force to advocate for support for a national network of centers and to develop the linkages among the centers and between the centers and local partners to sustain the network's development. NCBA is now working with these regional centers that provide vital technical assistance and support for the development of cooperative enterprises in rural America.

In 1996, Congress demonstrated its strong commitment to the centers approach when it passed the FAIR Act, also known as the 1996 farm bill. The program is now called Grants for Rural Cooperative Development in section 747(c)(4) of Public Law 104-127. The program focuses on supporting "nonprofit institutions for the purpose of enabling the institutions to establish and operate centers for rural cooperative development." It is authorized to provide funding at \$50 million per year. The revised statutory language defines the goals of these centers as "facilitat[ing] the creation of jobs in rural areas through the development of new rural cooperatives, value added processing, and rural businesses."

With the support of funding received from the program over the past few years, the rural cooperative development centers have demonstrated quantifiable results. CooperationWorks centers have established more than 50 value-added cooperatives serving in excess of 5,000 members. These centers have created or saved 16,500 jobs in the communities they serve. They have assisted more than 400 local communities and organizations. The centers have raised the quality of technical assistance being provided on cooperative development, they have developed significant information-sharing capability among their network and created the first report of best practices in the field of cooperative development.

This coming year, centers will be involved in replicating successes they have achieved and breaking new ground in areas where cooperative development is needed. As the farm crisis continues into another year, centers are working with farmers to get more of the consumer dollar and diversify their sources of revenue. Co-op development centers provide the necessary technical assistance to help farmers form value-added cooperatives. These cooperatives allow, as USDA Secretary Glickman has said, the tomato farmers to own the ketchup plant. Centers are helping farmers diversify their sources of revenue by assisting in the formation of forestry coopera-

tives. These co-ops are enabling farmers to turn unproductive woodlots on their property into another crop that provide income year after year.

Other cooperative development projects include the formation of new consumer-owned energy purchasing cooperatives, child care cooperatives, and cooperative housing projects. New energy cooperatives are giving consumers the power to negotiate better prices on a broad range of energy products and services. Child care cooperatives provide former welfare recipients and other low-income people the opportunity to reduce the cost of child care and give them control over how their child care facilities are operated. Cooperative housing gives seniors and others in rural areas the chance to save money on their housing and live in safe communities.

The President's budget includes \$6 million for this program. This is a significant increase in funding from prior years, demonstrating the Administration's acknowledgement of the value of this program. USDA's National Commission on Small Farms recently recommended that this program be funded at \$20 million annually. The Commission's report calls the program "one of the few that supports rural cooperative development at the grassroots level." The program is authorized to be funded at \$50 million annually.

We urge this committee to do what over 130 organizations from around the country are urging Congress and the Administration to do: increase funding for this valuable program. Mr. Chairman, I ask that the letter signed by those organizations be included in the record of this hearing along with my testimony.

NCBA is a national membership association representing cooperatives—over 120 million Americans and 47,000 businesses ranging in size from small buying clubs to businesses included in the Fortune 500. NCBA's membership includes cooperatives in the fields of housing, health care, finance, insurance, child care, agricultural marketing and supply, rural utilities and consumer goods and services. NCBA brings its members together to create business opportunities and to develop, advance and to protect cooperative enterprise.

INCREASE FUNDING FOR RURAL COOPERATIVE DEVELOPMENT GRANTS

We, the undersigned organizations, urge Congress and the Administration to increase funding for the Rural Cooperative Development Grants program at USDA. The program has helped build capacity in a few rural cooperative development centers at its annual funding level. This program could be a driving force in federal efforts to spark an economic revitalization in rural America, but only if further funds are provided to meet the need. The program is authorized to be funded at \$50 million annually.

USDA's National Commission on Small Farms recommended that this program "be increased by \$10 million annually up to \$20 million." The Commission's report calls the program "one of the few that supports rural cooperative development at the grassroots level."

While dramatically changing economic forces are challenging rural Americans, this type of program is giving them the tools to shape their own future. We ask for your commitment to growing this program to serve all of rural America.

PREPARED STATEMENT OF THE NATIONAL CORN GROWERS ASSOCIATION

The National Corn Growers Association (NCGA) appreciates the opportunity to provide the Subcommittee with our recommendations for fiscal year 2001 appropriations for key programs administered by the U.S. Department of Agriculture. The NCGA represents 30,000 corn growers in 48 states and the association's mission is to create and increase opportunities for corn growers in a changing world and to enhance corn utilization and profitability.

The NCGA, strongly, urges the Subcommittee to:

- Increase the ARS plant, animal, and microbial genomics programs by, at least, the \$4.7 million requested in the Administration's budget;
- Increase funding for the National Plant Germplasm System by \$20 million; and
- Provide funding for the Initiative for Future Agriculture and Food Systems.

While many federal agricultural programs are important to the nation's corn growers, NCGA believes that the future of the corn industry is written in corn's genetic code and that plant genomics will give us the fundamental information necessary to revolutionize American agriculture. Plant genomics research advances our understanding of the structure, organization and function of plant genomes.

Since 1996, funding for plant genomics has been the number one appropriations issue for the NCGA. The Plant Genome Initiative (PGI), a multi-agency program focused on structural and functional genomics, will help scientists, geneticists, and plant breeders identify and utilize genes (from corn and other plants) that control important traits, such as nutritional value, stress tolerance, and resistance to pests. In a recently published report, the Interagency Working Group on Plant Genomes, estimated that \$500 million, over three years (fiscal year 2000–2002) was needed for the National PGI. While the NSF will provide a significant level of funding for the PGI, USDA must increase its plant genomics funding, substantially, if we are to meet the minimum level of need. Further, USDA must begin a concerted effort in animal and microbial genomics.

For the fiscal year 2001 agricultural appropriations bill, the NCGA supports the Administration's budget request for an increase of \$4.7 million for plant, animal, microbial, and insect genomics at the Agricultural Research Service (ARS). We believe, however, that this amount should be increased, substantially, to ensure that the ARS has sufficient resources to participate fully in the advances in genomics research. The NCGA, also, urges the Subcommittee to provide funding for the Initiative for Future Agriculture and Food Systems so that a major portion of the funds will be used for a comprehensive plant, animal, and microbial genomics competitive grants program that is coordinated with the ARS, NSF, and DOE.

To take full advantage of the plant genomics revolution, diverse plant germplasm must be available for crop breeders to develop the varieties necessary to meet the changing circumstances and needs of the future. The USDA National Plant Germplasm System (NPGS)—

- Acquires germplasm;
- Develops and documents information on the germplasm;
- Preserves and distributes germplasm upon request; and
- Maintains quarantine facilities for testing imported germplasm.

Funding for the NPGS has declined by more than 14 percent, in constant dollars, since 1992, while demands on the system have increased. The NSF-funded plant genome research program will increase, tremendously, the amount of genetic stocks for the NPGS to manage. For example, one maize grant will generate, at least, 50,000 new maize genetic stocks, doubling the size of the NPGS maize stock center. Comparable situations will exist for several other economically important crops as well. Without a significant increase in funding, the NPGS will not be able to manage current stocks, much less the increased stocks that are being generated through genomics research.

The NPGS must obtain a significant increase in funding over the next few years to ensure that diverse genetic resources are available to provide growers with hybrids and varieties that will address the challenges of the future. It is critical that these resources be maintained at the public level for continued accessibility to all scientists and breeders. The NCGA believes that the NPGS is a fundamental, strategic resource. The NCGA urges the Subcommittee to provide a \$20 million increase for the National Plant Germplasm System.

Advances in basic plant science that result from a vigorous plant genomics program and a strong, viable National Plant Germplasm System will allow us to create new hybrids and varieties that will—

- Improve human and animal health;
- Reduce medical costs due to more nutritious, healthier, food for individuals;
- Reduce worldwide malnutrition through higher yielding and more nutritious crops;
- Reduce environmental problems for crop and livestock growers;
- Expand plant-based renewable resources for chemicals and energy; and
- Allow growers to get more income from the market and reduce grower reliance on Federal farm programs.

The National Plant Genome Initiative and the National Plant Germplasm System are critical to the long-term viability of U.S. agriculture. The NCGA, strongly, urges Congress to provide increased funding for plant, animal, and microbial genomics research and to provide an increase of \$20 million for the National Plant Germplasm

System to ensure that our growers have the tools to meet the challenges and demands of the 21st century.

Thank you for your consideration of our views.

PREPARED STATEMENT OF THE NATIONAL COUNCIL OF FARMER COOPERATIVES

The National Council of Farmer Cooperatives (NCFC) appreciates this opportunity to share its views regarding the fiscal year 2001 agriculture appropriations bill, and respectfully requests this statement be made a part of the official hearing record.

OVERVIEW OF NCFC

NCFC is a national trade association representing nearly 100 regional marketing, supply and credit cooperatives, and state councils. Included among these regional cooperatives are over 3,500 local cooperatives whose farmer-owners represent a majority of America's nearly 2 million individual farmers. These farmer-owned cooperative businesses are engaged in virtually every facet of agriculture. This includes handling, processing, marketing and exporting of U.S.-produced agricultural commodities and related products; the manufacture, distribution and sale of farm supplies; and the providing of credit and related financial services, including export financing for and on behalf of their farmer owners.

IMPORTANCE OF FARMER COOPERATIVES

For farmers, such cooperative self-help efforts provide the opportunity to reduce risks, capitalize on market opportunities and earn a greater return on their productivity and investment. Earnings derived from such business are returned to the cooperative's farmer owners on a patronage basis, which also helps contribute to local and regional economic activity as well as the national economy. Another important contribution is reflected in the fact these farmer-owned cooperative businesses also employ nearly 300,000 people (full and part-time) with a combined payroll of approximately \$6.8 billion. Many of these jobs are in rural areas where employment opportunities are sometimes limited.

NEED FOR PUBLIC POLICIES THAT PROMOTE COOPERATIVE SELF-HELP EFFORTS

Current economic conditions, together with the rapid changes taking place throughout the global economy, underscore the need for policies and programs to strengthen the ability of farmers to join together in cooperative self-help efforts to: (1) better manage the risks and uncertainty inherent in production agriculture; (2) capitalize on new market opportunities, including moving more into value-added production and processing; and (3) compete more successfully in a global marketplace still characterized by subsidized foreign competition. Such initiatives would help maintain and create needed jobs in communities throughout rural America.

SUPPORT FOR USDA'S RURAL BUSINESS-COOPERATIVE SERVICE

We urge that funding and staffing be strengthened for USDA's Cooperative Services unit within the Rural Business-Cooperative Service (RBS) to ensure that it is fully able to carry out its historical mission as mandated by Congress in support of farmer cooperatives. It should be noted that funding for such programs is currently included in amounts made available for salaries and expenses in the RBS mission area. Providing specific funding for programs administered by Cooperative Services for research, education and technical assistance in support of farmer cooperatives would enhance program continuity and promote longer term planning.

Specifically, we recommend that not less than \$5 million be made available to RBS's Cooperative Services unit for carrying out such programs relating to farmer cooperatives. Funding for cooperative research agreements should also be strengthened with the objective of further assisting farmers in joining together in cooperative self-help efforts. Such action would encourage and promote research, education and technical assistance that would benefit farmers and their cooperatives.

COMMODITY PURCHASE PROGRAMS AND FARMER COOPERATIVES

We also want to express our strong support for maintaining both the statutory provisions and report language included in the fiscal year 2000 agriculture appropriations bill to ensure that farmer cooperatives are fully eligible to participate in USDA's commodity purchase programs. Such programs serve two important purposes. One, they help meet the food and nutrition needs of consumers. Two, they

provide an important market outlet for farmers, especially during periods of surplus production, thereby helping strengthen farm income and promoting orderly marketing.

However, under previous guidelines established by USDA, this important market was eliminated for many farmers choosing to cooperatively market their products. The provision in the fiscal year 2000 agriculture appropriations bill addresses this by clearly providing that farmer cooperatives are fully eligible to participate in such programs for and on behalf of their farmer owners.

In doing so, it preserves an important market outlet for many farmers, promotes orderly marketing, encourages cooperative self-help efforts, and helps maintain and strengthen farm income—since proceeds from the sale of commodities and related products are returned to the cooperatives' farmer owners as patronage income. It also serves to increase the potential quantity and quality of commodities and related products available for purchase and use under such programs, and provides for more competitive bidding among participants. Finally, it helps contribute to stronger rural communities where farmer cooperatives and their farmer owners are located.

CROP INSURANCE/RISK MANAGEMENT

We continue to urge support for policies and programs that provide an expanded role and opportunity for farmers through their cooperatives and associations to join together to purchase or obtain crop insurance on a more affordable and competitive basis. We believe such action would also help encourage program participation, improve the current delivery system, strengthen private sector involvement, and further encourage cooperative self-help efforts. In support of such action, we believe USDA should be encouraged to provide for full and effective participation by farmer cooperatives for the benefit of their farmer members.

EXPORT PROGRAMS

We strongly urge support for USDA's export programs, including the Market Access Program (MAP) and Foreign Market Development (FMD) Cooperator Program, and we endorse the recommendations of the Coalition to Promote U.S. Agricultural Exports of which NCFCA is a member. Such programs have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, countering subsidized foreign competition, protecting American jobs and strengthening farm income.

Programs such as MAP and FMD have also helped encourage and strengthen the ability of farmers to join together in cooperative efforts to promote their products in overseas markets and improve their income. Administered on a cost-share basis, they remain one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition.

According to a USDA study, the European Union (EU) and other foreign competitors are now outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion. The same study shows that such countries are spending over \$100 million just to promote sales of their products in the United States. In other words, they are spending more to promote agricultural exports to the United States, than the U.S. is currently spending (\$90 million) to promote American agricultural exports worldwide! Equally alarming, USDA now reports that based on 1999 figures, the U.S. for the first time has become a net importer of agriculture products with regard to the European Union.

Clearly, aggressive action is needed. We urge support for increased funding for MAP and other export programs, and ensuring that such programs are fully and aggressively utilized. Since MAP was originally authorized, funding has been gradually reduced from a high of \$200 million to its current level of \$90 million—a reduction of more than 50 percent. Again, given what our foreign trade competitors are doing, we believe it's time to restore funding for this vitally important program up to its original level.

We also urge continued funding for other related USDA export programs, including the Export Enhancement Program (EEP), Dairy Export Incentive Program (DEIP), GSM Export Credit Guarantee Program, and Public Law 480. All of these programs continue to be essential to help encourage U.S. agriculture exports, counter subsidized foreign competition, protect American jobs, and strengthen farm income.

AGRICULTURAL RESEARCH

Another important area of emphasis when it comes to enhancing the global competitiveness of farmer cooperatives and American agriculture is research. It is equally important to help ensure that farmer cooperatives and American agriculture can continue to help provide consumers at home and abroad with a dependable supply of safe, high quality food and fiber at reasonable prices, while meeting important environmental and food safety objectives.

This includes recognition of the need to help farmers, their cooperatives, and others engaged in agriculture meet the goals and requirements of such statutes as the Food Quality Protection Act (FQPA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA) and the Clean Air Act (CAA), among others. To help meet these challenges, we believe every effort should be made to maintain and strengthen the highly successful public-private partnership involving USDA, the land grant universities and colleges, and the private sector. This includes providing needed funding at the federal level through USDA and ensuring that such funding helps achieve the important objectives outlined above.

CONSERVATION/EQIP

We strongly support continued funding for the Conservation Reserve Program (CRP), as well as restoring funding for the Environmental Quality Incentives Program (EQIP), as recommended in the Administration's budget. Such programs are necessary to help achieve and maximize water quality and other environmental benefits.

The CRP and EQIP programs in particular are critical to empowering farmers to continue voluntary efforts to respond to societal expectations and demands with regard to water quality and help protect our natural resource base.

Adequate funding for the Natural Resource Conservation Service (NRCS) technical assistance capability is critical to farmers and cooperatives working to address water quality and other conservation and environmental challenges.

CROP PROTECTION/PESTICIDE PROGRAMS

The Administration's budget request includes funds for Integrated Pest Management (IPM) programs and IR-4 program to collect and analyze data on pesticide residues through the Pesticide Data Program (PDP). We endorse the views of: (1) the Food Quality Protection Act-Implementation Working Group (FQPA-IWG) of which NCFC is a steering committee member, and (2) the Minor Crop Farmer Alliance (MCFA) of which NCFC is an executive committee member. USDA's role in this process is critical if FQPA is to be implemented as intended by Congress.

We believe USDA is uniquely qualified to (a) gather and provide data to the EPA regarding pesticide use and dietary consumption patterns, and (b) to provide information about crop protection needs and efficacious and affordable alternatives. USDA has statutory obligations to carry out regarding minor use pesticides pursuant to FQPA, including establishment of a minor use office to facilitate grower efforts to provide information needed to maintain or develop label uses.

Clearly, USDA has an essential role to play in working with EPA regarding implementation of FQPA to ensure that food and agricultural policy considerations are taken into account. For these reasons, we strongly urge that adequate funding be provided to ensure that it has the necessary resources to carry out such responsibilities.

MEAT INSPECTION/USER FEES

We continue to be opposed to user fees relating to Food Safety and Inspection Service (FSIS) for meat inspection. Such inspection programs provide important public benefits relating to food safety and quality and should continue to be publicly funded. The imposition of new user fees, to the extent that such fees could not be passed on to consumers, would impose an additional cost burden on farmer cooperatives and their farmer members, and reduce farm income. Again, in recognition of the public benefits of such programs and the need to maintain confidence in the safety and quality of such products, the federal government should maintain its historic role.

CONCLUSION

Mr. Chairman, on behalf of NCFC and its members, we want to again thank you for the opportunity to share our views with regard to the fiscal year 2001 agriculture appropriations bill. We also wish to take this opportunity to express our ap-

preciation to you and the members of the Subcommittee for your interest and support of farmer cooperatives and American agriculture.

PREPARED STATEMENT OF THE NATIONAL COMMODITY SUPPLEMENTAL FOOD
PROGRAM ASSOCIATION

Mr. Chairman and subcommittee members, I am Barb Packett, President of the National Commodity Supplemental Food Program (CSFP) Association. Our Association of state and local CSFP operators work diligently with the Department of Agriculture Food, Nutrition, and Consumer Service to insure a quality supplemental nutrition assistance commodity food package program for senior men and women, and mothers, infants, and children. The program, which was authorized in 1969, serves 436,000 individuals every month in 24 states and the District of Columbia.

This 30 year old CSFP program stands as testimony to the power of partnerships between community-based organizations, private industry and government agencies. The CSFP offers a unique combination of advantages unparalleled by any other food assistance program:

- The CSFP specifically targets our nation's most vulnerable populations: the very young and the very old.
- The CSFP provides a monthly selection of foods specifically tailored to the nutritional needs of the population we serve. Each eligible participant in the program is guaranteed [by law] a certain level of nutritional assistance every month.
- The CSFP purchases foods at wholesale prices, which amounts to one-third the cost it would be to provide the same supplemental nutrients at retail voucher cost. The average food package cost for fiscal year 2000 is \$15.71 and retail would be at least \$55.
- The CSFP involves the entire community in the problems of hunger and poverty. Thousands of volunteers as well as many private companies donate money, equipment, and most importantly time to deliver food to homebound seniors. These volunteers not only bring food but companionship and other assistance to seniors who might have no other source of support.
- For these historical reasons I would like to submit the National CSFP Association legislative issues and a report of our 1999 survey of monthly volunteer labor hours to support our requests.

Chairman Cochran, the committee has consistently been helpful with funding support for our very prudent way of providing nutritional supplements to the seniors and mothers and children. Please help us continue.

COMMODITY SUPPLEMENTAL FOOD PROGRAM (CSFP) LEGISLATIVE ISSUES FISCAL YEAR
2001

Position.—The CSFP Association recommends an appropriation of \$110 million for FFY 2001. This would increase the budget figure of \$93.3 million. The increase is necessary for:

- Additional caseload requests
- Adjustment for state/local funding

Justification.—CSFP is a very effective food delivery system. According to USDA-FNS the average cost of a food package is \$16. The average retail value of those foods distributed by grassroots community organizations is \$50–\$60. Our 1999 survey of monthly volunteer labor hours shows we have at least \$641,312 a month donated to stretch support funding for the program.

- Expansion requests and restoration requests for caseload total 37,488 more than fiscal year 2000. This will support existing programs and the five new states of Mississippi, Montana, Ohio, Texas and Vermont.
- The President's budget includes \$7 million in food inventory for program support. The mix of food inventory and funds would effectively reduce state/local support funds by \$1.4 million (–7 percent) due to computation on funds not total program assets.

Position.—With the aging of America, CSFP should be an integral part of USDA Senior Nutrition Policy. This is the most cost-effective way to provide the nutrient rich foods low-income seniors are lacking.

Justification.—The advantages of CSFP include:

- The food package for seniors is nutritionally balanced.
- Supplemental nutrition is proven to reduce public health care costs.
- Nutrition education and health referrals are provided.
- Food is distributed through community and faith based organizations, familiar to many seniors.

- Seniors resist participation in programs such as food stamps, but readily access commodity programs.
- CSFP requires a means test that assures participants are truly needy.
- Actual food is provided to those who need it most.
- CSFP supports United States farmers.
- Program operators utilize volunteers and other in-kind donations to reach homebound seniors.
- The retail value of each food package is approximately \$55.00 while the USDA blended cost per food package is \$15.71.

NATIONAL COMMODITY SUPPLEMENTAL FOOD PROGRAM (CSFP) SURVEY—1999 MONTHLY VOLUNTEER LABOR DATA

State	Fixed Sites	Participants	Mobile Sites	Participants	Volunteer Sites	Participants	Volunteer Hours	Dollar Value	Square Miles

¹ Figures are approximate; taken from Spring/Summer 1999, in a survey conducted by the National CSFP Association. (figures are from 1998).

² Reservation.

FIXED SITE: Foods are warehoused and participants travel to the site and take food packages back to their homes. Distributed to participants by paid staff.

MOBILE SITE: Distribution where foods are transported to a facility (not warehoused) and distributed to participants by paid staff.

VOLUNTEER SITE: Location where distribution of prepacked foods is performed by volunteer groups or individuals.

PREPARED STATEMENT OF THE NATIONAL FISHERIES INSTITUTE

As the subcommittee begins its consideration of the Administration's budget submission and fiscal year 2001 appropriations, the National Fisheries Institute (NFI) would like to take this opportunity to share with you our priorities and concerns regarding the budget proposal for the Food and Drug Administration (FDA). The NFI is the nation's leading trade association for the fish and seafood industry. Our members represent all aspects of the fish and seafood industry: harvesters, aquaculturalists, processors, importers, exporters, food service operators, and restaurants. The NFI appreciates your consideration of these requests.

FOOD AND DRUG ADMINISTRATION

Consolidating Seafood Inspections

The fiscal year 2001 FDA budget proposes for the second year in a row that \$13 million in user fees be collected by transferring the Department of Commerce (USDC) Voluntary Seafood Inspection Program to the FDA as a Performance-Based Organization. The NFI opposes this transfer. We feel it is inappropriate to combine the voluntary marketing and quality assurance program of the USDC with the mandatory seafood HACCP program at the FDA. As suggested by the National Academy of Sciences, such a combination could create conflicts of interest that would undermine the objectivity and credibility of FDA's seafood HACCP program. The NFI is particularly concerned about the proposal to "cross-deputize" voluntary inspectors as HACCP inspectors. If the FDA needs FTEs to adequately staff its mandatory inspection program, it should seek the funding for them. The NFI pioneered seafood HACCP and cannot support any proposal that would weaken this program. We urge you to oppose this proposal.

Improving FDA's Infrastructure

The NFI strongly supports the proposal for \$43 million over two years (including \$20 million in fiscal year 2001) to replace the dilapidated Los Angeles regional laboratory facility. Expected benefits from construction of the new Los Angeles laboratory include providing a much safer location and a vastly improved working environment for FDA and partnering state laboratory personnel, having a concentration of scientific talent available which will permit better management of the analytical workload and will provide significant improvement in operational efficiency. Also, better analytical coverage will be provided during emergencies. Additional benefits include a more efficient use of costly analytical equipment and better-equipped laboratories in a state-of-the-art facility, resulting in improved turn-around time and sampling efficiency. The existing facility which processes 23 percent of the FDA's food analyses each year, has exceeded its limitations and is currently unable to provide these services in a timely and efficient manner. The NFI urges the subcommittee to full fund this budget proposal.

At the same time, we are concerned about the ongoing degradation of services from the FDA's seafood laboratory in Seattle, WA. The FDA must have an adequate research capability to provide scientific data and information necessary to implement its inspection program based on sound science. This lab provides extremely valuable analytical services to the fish and seafood industry. Staff and funding cuts have undermined the capability of this facility to deliver scientific information on emerging food safety questions. We urge the subcommittee to direct the FDA to maintain the services of the Seattle seafood laboratory.

User Fees

The NFI strongly opposes the proposal to impose user fees on food additive petitions (\$8.4 million) and food export certifications (\$5.3 million). With regard to food additive petitions, these petitions are required in order to protect public health from potentially dangerous or otherwise inappropriate food additives. The primary beneficiary is the public. In addition, a perceived conflict of interest could arise if consumers thought the industry was paying the FDA to approve food additives. With regard to export certificates, our trading partners, most notably the European Union, rely on FDA's export certifications as an objective and credible verification of the safety of exported food products. Imposing a User Fee on this system could undermine their confidence in the independence of the certifications, hurting our fish and seafood exports that already trail seafood imports by \$5 billion per year. We urge you to oppose these proposals.

Equivalency Agreements

More than 60 percent of the more than 4 billion pounds of seafood consumed by Americans is imported. Under the current FDA HACCP program, importers must

demonstrate HACCP compliance by their foreign suppliers. NFI member companies strive to acquire verification documentation and other assurances that their imports have been processed under HACCP systems. The FDA further assures compliance with port-of-entry sampling. However, this sampling and testing system is reactive and subject to resource limitations. One way to substantially improve our confidence in the food safety inspection systems of our foreign suppliers is throughout the establishment of agreements between the FDA and our major trading partners. The fiscal year 2000 FDA budget proposal indicated that the FDA was working to improve the safety and sanitation of imported seafood by establishing equivalency agreements to ensure that exporting countries have seafood inspection systems equivalent to those of the U.S. The FDA's equivalency program is consistent with provisions of the General Agreement on Tariffs and Trade (GATT) where participating countries agreed to accept products made under equivalent systems. In fiscal year 2000, the FDA was to have reviewed submissions from numerous countries and the European Union. In addition, the FDA was to visit 6 countries, including Australia, Canada, Chile, Iceland, New Zealand, and the E.U.

Despite the rhetorical commitment to equivalency agreements, not a single agreement has been signed. We urge the subcommittee to direct the FDA to prioritize equivalency agreements.

Compliance Visits

The FDA conducts HACCP compliance visits to key nations that supply fish and seafood to the United States. The visits allow the FDA to evaluate the capabilities of government inspection programs and individual processing plants to meet U.S. HACCP requirements. These visits augment the verification efforts of the U.S. seafood importing community and help ensure that overall safety of imported fish and seafood products. In addition, the information gathered during these visits can be used to improve port of entry inspection by targeting risk entries. Despite recent increases in the number of countries inspected by the FDA, we feel additional visits are warranted. We urge the subcommittee to direct the FDA to continue to increase the number of compliance visits it is conducting on an annual basis.

USDA—AGRICULTURAL RESEARCH SERVICE

The NFI is deeply concerned about a proposed \$2.5 million cut to the aquaculture/fish farming research being conducted at ARS research stations in Alabama, Connecticut, Hawaii, Idaho, Mississippi, and West Virginia. The proposed cuts are in the areas of fish health management (such as vaccine development), registration of drugs and chemicals to combat serious diseases, least-cost fish feed formulations, genetic fish stock improvements, catfish, and cool and cold water fish production technology.

The ARS has done much to focus research programs over the last decade and provide needed research results to the aquaculture community. With world population continuing to grow, and wild harvest of fish and seafood reaching its maximum potential, aquaculture will play an increasingly important role in providing lost-cost, healthful protein to all peoples. Without a strong commitment to aquaculture research and development, the United States will find other nations taking the leadership role in aquaculture development. We urge the subcommittee to oppose these cuts. The NFI appreciates the opportunity to submit these requests with regard to the fiscal year 2001 FDA budget. Thank you for your consideration of these requests.

PREPARED STATEMENT OF THE NATIONAL FOOD PROCESSORS ASSOCIATION

Mr. Chairman, my name is John Cady, Chairman and CEO of the National Food Processors Association (NFPA), and today I am submitting testimony on behalf of NFPA. NFPA is the nation's largest food trade association representing a \$460 billion industry that includes an estimated 20,000 manufacturing facilities and employees over 1.5 million Americans. With three laboratory centers, NFPA is the leading authority on scientific and public policy issues involving food science and safety for the food industry. For more than 90 years, the food industry has relied on NFPA for government and regulatory affairs representation, scientific research, technical services, education, communications, and crisis management.

NFPA was formed at a time when it was necessary to enhance public confidence in food safety, and we are proud of our contributions to further enhancing the safety of our nation's food supply. NFPA enjoys many partnerships with federal and state food safety regulatory authorities, and we are committed to ensuring that these

same authorities are well equipped to protect public health and instill confidence among consumers about the safety of the food products they consume.

NFPA is particularly supportive of providing an adequate level of funding for the Food and Drug Administration (FDA) and the Department of Agriculture's Food Safety and Inspection Service (FSIS). While several federal agencies have responsibility for food safety and quality programs, the FDA and FSIS share the primary responsibility for food regulation.

USER FEES

The President's fiscal year 2001 Budget proposes new user fees—more appropriately described as regulatory taxes—which require food companies to pay for the privilege of being regulated. The fiscal year 2001 request proposes nearly \$550 million in such user fees—\$530 million for the FSIS and \$13 million for the FDA's food regulation program. NFPA appreciates that the Committee repeatedly has rejected these proposals in past Administration budget requests, and recommends again that funding of food safety and regulation programs should be borne through appropriated funds.

Proposed user fees on the food industry are hidden taxes whose costs would be borne both by producers and eventually consumers in higher food prices. Furthermore, funding regulatory programs through taxes raised from the industry would only serve to undermine public confidence in the independent judgment of either FDA or the FSIS. We urge the Committee to reject these user fee proposals.

FOOD SAFETY INITIATIVE

NFPA appreciates the continued emphasis that Congress has placed on food safety through its funding for the Food Safety Initiative for FDA, USDA, and the Centers for Disease Control (CDC) in fiscal years fiscal year 1998 through 2000. The fiscal year 2001 request represents the fourth year of the Initiative, and we endorse most aspects of the Initiative's request, particularly those areas that emphasize research, risk assessment, education and surveillance. We request, however, that the Committee remain vigilant in its oversight to ensure that appropriated funds for food safety programs are deployed in a manner commensurate with relative food safety risks.

FOOD AND DRUG ADMINISTRATION'S FOOD REGULATORY PROGRAMS

NFPA supports the requested level of funding for FDA's food regulation activities, but recommends, to the extent funds are provided that priority be given to those areas of research, risk assessment, education and surveillance. Such priority setting will ensure that limited resources will be targeted toward foodborne illness problems that pose the greatest risks. In addition, we support FDA's infrastructure request for funding to administer the transfer of the Center for Food Safety and Applied Nutrition (CFSAN) to College Park, Maryland and to construct a new regional laboratory in Los Angeles, California.

We also urge the Committee to protect funding for food science base activities at CFSAN. While CFSAN has benefited from funding increases in recent years, much of these increases have been absorbed by a combination of dedicated funding for regulatory initiatives, and staff salary increases and cost-of-living adjustments. This "crowding out" effect appears to have contributed to a slow, but steady, erosion in FDA's ability to preserve its food science base. The continued decline of FDA's scientific base can only imperil FDA's long-term capabilities to respond rapidly and authoritatively to emerging scientific and policy challenges that grow increasingly complex. We urge the Committee to explore with FDA opportunities to support the integrity of CFSAN's scientific capabilities.

FURTHER REFORMS NEEDED AT FOOD SAFETY AND INSPECTION SERVICE

NFPA supports adequate resources for the FSIS, but is concerned with reports of personnel management practices that have led to inspector shortages and resulting plant slowdowns or work stoppages in meat and poultry establishments. We urge the Committee to review this problem to ensure the availability of inspection personnel via either additional resources or management reforms, including alternative inspection procedures.

NFPA supports the transition to a HACCP-based inspection system, but notes that FSIS pledges to remove inspection regulations that are inconsistent with HACCP have not been fully realized. We urge the Committee to ensure that unnecessary layers of regulation are promptly removed to speed HACCP implementation.

NFPA notes with approval the announced plan of FSIS to move toward daily, unscheduled processing inspection in 2001. NFPA agrees that daily, unscheduled processing inspection can free up appropriated funds to address inspection shortages or other, greater relative food safety risks. NFPA believes, however, that without arbitrary requirements for frequency of inspection, unscheduled inspection in processing establishments could yield even greater benefits. NFPA urges the Committee to direct FSIS to explore methods of further maximizing this flexible approach.

NFPA also recognizes the lead role that FSIS plays in overseeing the work of the U.S. Manager for Codex Alimentarius. NFPA strongly supports the fiscal year 2001 requested increase of \$1 million for FSIS Codex activities, and requests the Committee to providing an even higher level of funding for this important function. Codex remains a critically important forum for ensuring United States leadership in international food safety activities.

CONCLUSION

In conclusion, NFPA is grateful for the important funding oversight that the Committee provides to ensure the integrity of U.S. food safety regulation. The food industry endeavors to produce the safest and highest quality food products in the world. As a result, NFPA understands that adequate funding for our nation's food safety regulators through direct appropriations is fundamental to good public health, and to maintaining the confidence of consumers in the safety of the food supply. NFPA appreciates the opportunity to submit testimony on the President's fiscal year 2001 food safety budget request.

PREPARED STATEMENT OF THE NATIONAL GRAIN AND FEED ASSOCIATION

Chairman Cochran, Senator Kohl, and members of the subcommittee, the NGFA is grateful for this opportunity to submit testimony on Government aid to producers during this time of low commodity prices.

The National Grain and Feed Association (NGFA) consists of more than 1,000 grain, feed, processing and grain-related companies that operate 5,000 facilities that store, handle, merchandise, mill, process and export more than two-thirds of all U.S. grains and oilseeds. About 70 percent of NGFA members are small businesses—country elevators and feed mills. Also affiliated with the NGFA are 37 State and regional agribusiness associations.

PRICES ARE LOW, BUT NOW IS NOT THE TIME TO MOVE BACKWARDS

As everyone knows, prices for farm commodities are low, and according to recent baseline estimates released by the USDA and others, are likely to see only slow increases over the next two years, barring significant weather and crop production problems. This situation has resulted in calls for a return to the failed policies of the past as a way of artificially increasing crop prices. It is our opinion that the results of such a decision would be disruptive to the long-term prospects of the rural economy. Short-term blips in the market caused by recession or depression in large country economies or in major sections of the world can cause economic adjustment challenges, but should not form the basis for major shifts in policy direction. Instead of going backwards, and losing the progress the U.S. has made in recapturing its market share, Congress should search for new ways of increasing producer competitiveness and security through innovative, flexible farm policy.

AN EXPANDED CONSERVATION RESERVE PROGRAM IS COUNTER-PRODUCTIVE

On numerous occasions Government officials have told American producers that the key to future prosperity was through exports, and making inroads into rapidly developing overseas markets. The FAIR Act of 1996 was a strong step toward restructuring American agriculture to better compete in this new environment. One of the major changes the Act wrought was ending annual acreage-reduction programs such as the ARP, and shifting the focus of the Conservation Reserve Program (CRP) from supply control to conservation and environmental purposes. USDA leadership has been outspoken on this point, with Secretary Glickman stating on numerous occasions that the CRP would not be used by this administration for supply control purposes.

In its fiscal year 2001 budget request, however, the administration has reversed course by supporting an increase in the CRP's statutory acreage cap to 40 million acres. In addition, several bills are pending before the Agriculture Committees in Congress that would increase the cap. Unfortunately, the goal of this activity seems to be to once again use the CRP as a supply control tool in response to low com-

modity prices. We believe such a dramatic policy shift will result in longterm harm to the rural economy for the following reasons:

- Acreage idling in the U.S. has consistently failed to raise commodity prices for producers over any appreciable length of time;
- Acreage idling results in increased foreign production acreage; and
- Increased foreign production results in reduced market share for U.S. producers at a time when global consumption is increasing.

Thus, acreage idling tends to both diminish farm income prospects earned through commercial markets and increases farmers' dependence on Government for more subsidies.

World commodity consumption will continue to grow

There has been a sharp increase in global consumption of commodities over the past twenty years. The following table shows the percentage of growth in global grain and oilseed consumption:

Growth in Consumption, 1980-1999

	<i>Percent</i>
Rice	+ 40
Wheat	+ 32
Feed grains	+ 19
Oilseeds	+ 94

This trend is expected to continue. Most agricultural forecasts call for a steady growth in grain, oilseed and meat consumption. With world population expected to near 10 billion people by the year 2050, global expansion in food markets over the long term is readily predictable. Over the next ten years, global consumption of foodstuffs will rise as developing nations in Asia and Latin America experience strong economic growth. Improving personal income and affluence will result in increasing demands for more and better quality foods, markets that American producers can take full advantage of. They can't, however, compete for these markets if they are hamstrung by an artificial reduction in their production capacity.

Acreage idling fails to increase commodity prices

The following analysis uses a 5-year average of grains and oilseeds acreage in millions of hectares around the 1980 (1978-1992) and the 1990 (1988-1992) crop years. It was during the time between these crop years that the U.S. acreage-idling programs were at their peaks.

	U.S. hectares	Non-U.S. hectares	World hectares
1978-1982	106,691	741,011	847,702
1988-1992	92,027	757,375	849,202
Change	- 14,664	+ 16,364	+ 1,700
Percent	(- 14)	(+ 2.2)

Acreage Idling Price Impact:

Corn	1980=\$3.10 pb
	1990=\$2.35 pb
Wheat	1980=\$4.00 pb
	1990=\$3.00 pb
Soybeans	1980=\$7.60 pb
	1990=\$5.90 pb

This is only one example of how the past policy of idling large tracts of productive farmland did nothing to increase prices. In fact, it cost U.S. farmers valuable revenue as foreign producers easily filled the void.

Acreage idling increases foreign production acres

Overall, world production acreage has increased to take advantage of the growth in consumption. Following the ineffective and misguided embargo of grain and food trade with the former Soviet Union, the U.S. chose a policy regime of high loan rates and heavy reliance on acreage idling. From 1980 to 1995, the period of heaviest idling, the U.S. shrank its production base while other nations more than replaced the acreage that the U.S. unilaterally gave up:

Grains and Oilseeds Acreage Changes, 1980-1995

[In millions of acres]

U.S.	- 33
Foreign	+ 49

Foreign production of grains continued to grow; world consumption continued to grow; the only economic factor that shrank was U.S. acreage and our ability to compete for growing markets. Consequently, U.S. market share of global grains and oilseeds markets declined precipitously from nearly 27 percent to less than 21 percent. The U.S. gave up tremendous market share during this period of heavy acreage idling.

There is another adverse effect of increasing the CRP: the Government essentially becomes another competitor against farm operators for productive land. If land in a certain area is rented by the Government, the rate that the CRP payments for that land are set at become a de facto price floor for rent prices of non-CRP land in the area. As one producer from Washington State recently told Secretary Glickman, "Farmers, especially young farmers, cant compete with the CRP lease rate. You're forcing young farmers off the land!" An expansive CRP would further tighten already thin farming margins.

As stated above, one of the most important provisions of the FAIR Act was to shift the focus of the CRP toward environmental and conservation purposes. A return to expanded use of CRP for supply control purposes will have a predictable and disastrous effect on long-term market growth and farm income prospects.

CROP INSURANCE, RISK MANAGEMENT, AND GOVERNMENT'S ROLE

Instead of acreage idling, Congress should continue to examine alternative means of aiding producers during times of low prices. One alternative is crop insurance, and Congress has been debating this issue for over a year. While crop insurance is a vital piece of the risk management puzzle, we would urge Government to keep the following points in mind:

- Crop insurance, cash forward contracts, futures/options and agricultural trade options all are useful (or potentially useful) products. But none of these products, standing alone, is a "complete" risk-management tool; each should be evaluated by the farmer on its merits and whether it benefits individual operations. To encourage the private sector to make more risk-management tools available to farmers, Government should ensure that policies support all these tools. One policy change that should be pursued quickly is to establish a reasonable regulatory framework for agricultural trade options to permit that tool to come into more common usage.
- Government should carefully consider what practical limits should be placed on the subsidization of crop insurance. Excessive subsidies for crop insurance can lead to: (1) excessive commodity supplies causing depressed prices (a recent study indicates excess supplies of 3 percent may be created by the current subsidy structure); (2) disincentives for using other, more efficient, tools for risk management; (3) distortions in market signals guiding farmers' production/marketing decisions; and (4) programs favoring certain types of farmers and regions of the country. If properly limited and structured, crop insurance subsidies can lead to prudent use of production and yield risk-management tools that will also further encourage sound marketing and pricing strategies for crops. [See also item #5 of this section.]
- The Government should exercise extreme caution in subsidizing price-insurance tools particularly price insurance tools that replicate or offer similar features to existing futures-based or cash-based products. There is a substantial risk that Government subsidization of insurance-type products could "crowd out" non-subsidized market-based products, resulting in less efficient markets, excessive taxpayer expenses and ultimately rewarding poor management practices. Options traded on futures exchanges, by providing price protection for a fixed premium, function much like insurance and subsidization of competitive products is counter-productive.
- The Government should consider a more neutral system of incentives for risk management to enhance accessibility of risk-management alternatives to more farmers. There is no single set of risk-management tools that are "right" for the farmer. In some cases, crop insurance "works" for the farmer; in other cases the farmer is better off to self-insure. As for forward contracting, the farmer may be more comfortable using certain forms of contracts over others.

The role of Government should be to encourage farmers' use of tools that are of greatest value to his/her individual operation. To avoid creating distorted in-

centives in the marketplace directed at certain categories of risk-management tools, one policy concept would be to permit current crop insurance subsidies to be “portable.” For example, if the producer evaluated the subsidized crop insurance product and decided it was not a prudent investment, a portability feature would permit the farmer to take the subsidy embedded in the insurance and apply it to the investment cost of other risk-management tools. Such portability could be applied to all or a portion of the embedded subsidy. The ultimate goal would be to enhance accessibility and make more affordable a wide variety of risk-management tools. In this regard, the NGFA is supportive of the concept of “multi-option” risk management incorporated in S. 1666.

—Government policies should be designed to encourage farmers to begin marketing earlier in the production cycle. The longer a producer delays selling or actively pursuing a marketing plan, the fewer days remain in which a favorable pricing opportunity may occur. Producers realistically can market a single crop over a span of two or more years, starting a year or more prior to harvest. Among policies that would encourage earlier marketing are: (1) Purchasing crop insurance that can provide the assurance of minimum yields; and (2) A viable program of agricultural trade options, which would provide an early pricing opportunity while permitting the farmer the option to “walk-away” (not deliver) on contract in the event of crop failure or another event. Examples of policies that discourage early marketing are: (1) subsidization of on-farm storage, which tends to lead to a “wait-and-see” marketing strategy; (2) extended loan programs, which provide a longer “tail” to the marketing period but also may take away from early season strategies because the producer knows he/she has the opportunity to extend the marketing period; and (3) farmer-owned reserve programs, which function largely like a long-term extended loan program. Such programs also tend to build overall stock levels that overhang the market and depress farm prices for long periods.

As the debate continues over how best to support producers during stressful economic times, we would urge Congress to craft policies that provide improved support without creating marketplace distortion.

PREPARED STATEMENT OF THE NATIONAL POTATO COUNCIL

My name is Todd Michael. I am a potato farmer from Ohio and current Vice President, Legislative/Government Affairs for the National Potato Council (NPC). On behalf of the NPC, we thank you for your attention to the needs of our potato growers.

The NPC is the only trade association representing commercial growers in 50 states. Our growers produce both seed potatoes and potatoes for consumption in a variety of forms. Annual production in 1997 was 465,800,000 cwt with a farm value of \$2,402,000,000. Total value is substantially increased through processing. The potato crop clearly has a positive impact on the U.S. economy.

The potato is the most popular of all vegetables grown and consumed in the United States and one of the most popular in the world. Annual per capita consumption was 142.1 pounds in 1997 up from 107 pounds in 1962 and is increasing due to the advent of new products and heightened public awareness of the potato’s excellent nutritional value. Potatoes are considered a stable consumer commodity and an integral, delicious component of the American diet.

The National Potato Council’s fiscal year 2001 appropriations priorities are as follows:

Cooperative State Research Education and Extension Service (CSREES)

Special Grant Program.—The NPC urges that \$1.5 million be appropriated for the special research grant program. The Congress increased the level in fiscal year 2000 by \$50,000 to \$1.35 million. However, that increase was lost due to the across-the-board cuts.

The NPC also urges that the Congress, once again, include report Committee language as follows:

“Potato research.—The Committee expects the Department to ensure that funds provided to CSREES for potato research are utilized for varietal development testing. Further, these funds are to be awarded competitively after review by the Potato Industry Working Group.”

Agricultural Research Service (ARS)—Facilities

Prosser, Washington.—Oppose the Administration's fiscal year 2001 budget request that \$191,000 for potato research be terminated and assure that full amount appropriated by the Congress in fiscal year 2000 is utilized by the ARS at Prosser.

Orono, Maine.—Oppose the Administration's fiscal year 2001 budget request that \$230,000 for potato research be terminated and assure that the full amount appropriated in fiscal year 2000 is utilized by the ARS at Orono. Support the Administration's fiscal year 2001 budget request for an increase of \$300,000 for Integrated Sciences for Ecological Challenges.

Beltsville, Maryland.—Improving the nutritional value of potatoes is a high priority of the NPC. Research should be initiated at the Beltsville Vegetable Laboratory that combines traditional breeding and plant biotechnology to increase the nutritional value of the potato and add value to the crop. Estimated cost would be \$300,000 for fiscal year 2001.

Albany, California.—Dr. William Belknap in Albany has been funded by ARS, with the support of the NPC, to develop genetic constructs for potato transformation that will be publicly available without patent restrictions on their use. His laboratory should serve as a source of reagents for use by ARS scientists and others who work in the public sector. Estimated cost of providing this service is an additional \$100,000 in fiscal year 2001 for Dr. Belknap's base budget.

Fort Collins, Colorado.—Support the budget request for \$300,000 for the Soil, Plant, Nutrient Research Program to conduct research to enhance water and soil quality with precision conservation farming.

Aberdeen, Idaho.—Appropriate \$3 million for the construction of an advanced molecular genetics laboratory at the National Small Grains Germplasm Research Facility. This facility is needed to assure the continuation of advanced molecular genetics research for potatoes and small grains.

Committee Report Language.—The NPC urges that the Congress once again add Committee report language urging the ARS to work with the NPC on how overall research funds can best be utilized for grower priorities.

Yakima Agricultural Research Laboratory, Wapato, Washington: "Potato research at the Yakima Agricultural Research Laboratory. The Committee expects the Department to ensure that funds provided to the Yakima Agricultural Research Laboratory for potato research are fully utilized for potato research equivalent to 2.15 F.T.E. of Research Entomologist effort, as directed by the ARS National Program Staff. These 2.15 F.T.E. are to be distributed among a maximum of four Research Entomologists. Further, this research is to be conducted without dependence on, but may be supplemented by, local extramural financial support."

Plant Protection and Quarantine Service (APHIS-USDA)

The NPC urges that the Congress appropriate \$580,000 for the Golden Nematode Quarantine Program, which amount is the fiscal year 2001 budget request. The National Potato Council also supports the appropriation of \$100 million for the Agriculture Quarantine Inspection (AQI) user fee account, and the fiscal year 2001 budget request for AQI appropriated funds, for sanitary/phytosanitary (SPS) management and for pest surveillance and detection.

FQPA Funding

Finally, the NPC also supports the Administration's budget request for funds to meet the data requirements of the new Food Quality Protection Act, (FQPA). The NPC has devoted considerable time and resources to the evaluation of pesticides required by the FQPA. However, it is essential that the USDA have adequate resources to assist in this effort. Otherwise, given the tight time frame for these assessments, the EPA will rely on default assumptions in the absence of actual data.

PREPARED STATEMENT OF THE NATIONAL RURAL TELECOM ASSOCIATION

SUMMARY OF TESTIMONY REQUESTS

Project involved

—Telecommunications lending programs administered by the Rural Utilities Service of the U.S. Department of Agriculture

Actions proposed

—Supporting loan levels for fiscal year 2001 in the same amounts as those contained in the fiscal year 2000 Agriculture Appropriations Act which are the same levels as those requested in the President's budget for fiscal year 2001 for

- hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs and the associated subsidy to fund those programs at the existing level.
- Supporting funding in the amount of \$25 million in loan and grant authority designated for distance learning and telemedicine purposes and the \$2 million in direct loans and grants for a pilot program to finance broadband transmission and local dial-up Internet service in rural areas as requested in the President's budget.
 - Supporting an extension of the language removing the 7 percent interest rate ceiling on cost-of-money loans.
 - Supporting continuation of the restriction on retirement of Rural Telephone Bank class A stock at the level contained in the fiscal year 2000 Agriculture Appropriations Act and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund.
 - Opposing the proposal contained in the budget to transfer funds from the unobligated balances of the liquidating account of the Rural Telephone Bank for the bank's administrative expenses and loan subsidy costs.

Mr. Chairman, Members of the Committee: My name is John F. O'Neal. I am General Counsel of the National Rural Telecom Association. NRTA is comprised primarily of commercial telephone companies which borrow their capital needs from the Rural Utilities Service of the U.S. Department of Agriculture (RUS) to furnish and improve telephone service in rural areas. Approximately 1000, or 71 percent of the nation's local telephone systems borrow from RUS. About three-fourths of these are commercial telephone companies. RUS borrowers serve almost 6 million subscribers in 46 states and employ over 22,000 people. In accepting loan funds, borrowers assume an obligation under the act to serve the widest practical number of rural users within their service area.

PROGRAM BACKGROUND

Rural telephone systems have an ongoing need for long-term, fixed rate capital at affordable interest rates. Since 1949, that capital has been provided through telecommunications lending programs administered by the Rural Utilities Service and its predecessor, the Rural Electrification Administration (REA).

RUS loans are made exclusively for capital improvements and loan funds are segregated from borrower operating revenues. Loans are not made to fund operating revenues or profits of the borrower system. There is a proscription in the Act against loans which would duplicate existing facilities providing adequate service and state authority to regulate telephone service is expressly preserved under the Rural Electrification Act.

Rural telephone systems operate at a severe geographical handicap when compared with other telephone companies. While almost 6 million rural telephone subscribers receive telephone service from RUS borrower systems, they account for only four percent of total U.S. subscribers. On the other hand, borrower service territories total 37 percent of the land area—nearly 1½ million squares miles. RUS borrowers average about six subscribers per mile of telephone line and have an average of more than 1,000 route miles of lines in their systems.

Because of low-density and the inherent high cost of serving these areas, Congress made long-term, fixed rate loans available at reasonable rates of interest to assure that rural telephone subscribers, the ultimate beneficiaries of these programs, have comparable telephone service with their urban counterparts at affordable subscriber rates. This principle is especially valid today as the United States endeavors to deploy telecommunications "information superhighway" technology and as customers and regulators constantly demand improved and enhanced services.

At the same time, the underlying statutory authority which governs the current program has undergone significant change. In 1993, telecommunications lending was refocused toward facilities modernization. Much of the subsidy cost has been eliminated from the program. The subsidy that remains has been targeted to the highest cost, lowest density systems. Other loans are made at Treasury's cost-of-money or greater.

We are proud to state once again for the record that there has never been a default in the RUS/REA telephone program! All loans have been repaid in accordance with their terms with interest!

NEED FOR RUS TELECOMMUNICATIONS LENDING CONTINUES

The need for rural telecommunications lending is great today, possibly even greater than in the past. Technological advances make it imperative that rural telephone companies upgrade their systems to keep pace with improvements and provide the latest available technology to their subscribers.

These rapid technological changes and federal policies of competition and deregulation in the telephone industry, as evidenced by passage of the “Telecommunications Act of 1996”, underscore the continuing need for targeted assistance to rural areas. The inherently higher costs to serve these areas have not abated. Regulatory trends encouraging competition among telephone systems increase pressures to shift more costs onto rural ratepayers. Interstate subscriber line charges continue to shift substantial costs to local exchange customers. Pressures to recover more and more of the higher costs of rural service from rural customers to foster urban competitive responses will further burden rural consumers.

1996 TELECOMMUNICATIONS ACT EFFECT ON RURAL AMERICA

Congress passed the Telecommunications Act of 1996 as the culmination of more than a decade of debating national telecommunications policy and balancing many diverse needs and interests. The 1996 Act responded to a number of rural needs and differences with a series of safeguards to ensure that rates, services and network development in rural America will be reasonably comparable to urban telecommunications opportunities.

The process of implementing the new law continues to raise troubling uncertainties and concerns about whether the FCC and the states will honor the balance Congress achieved in its policy, as regulators (a) radically revise the mechanisms for preserving and advancing “universal service,” (b) adjust the cost recovery responsibilities and allocations of authority between federal and state regulation, (c) effectuate the Act’s somewhat different urban and rural ground rules for how new companies and incumbent universal service providers connect their networks and compensate each other and (d) peel back layers of regulation developed over a century. So far, the FCC has been overzealous in expanding the Act’s market-opening provisions to give new entrants a regulatory head start and advantage at the expense of the Act’s rural development and universal service provisions. The FCC is trying to usurp the role of competition by dictating a whole new—and wholly inadequate—way to measure the costs of modern, nationwide telecommunications access to information. The FCC needs to reorder the sequence of its proceedings to ensure that rural Americans are not denied the ongoing network development and new services the Act requires. Rural telephone systems with universal service obligations must not be thwarted in their efforts to upgrade and provide rates and services reasonably comparable to urban offerings. The FCC must not falter in delivery on these national policies either during or after the difficult process of implementing the law. Congress and the courts must carefully supervise the FCC’s implementation to achieve the rural access to information and an evolving modern public network intended by Congress, as well as the benefits of deregulation and genuine competition.

EXPANDED CONGRESSIONAL MANDATES FOR RURAL TELECOMMUNICATIONS

Considerable loan demand is being generated because of additional mandates for enhanced rural telecommunications standards contained in the authorizing legislation enacted in 1993 by Congress in Public Law 103–129.

These mandates coupled with the need for stable financing sources to meet the infrastructure demands envisioned for rural areas by the 1996 telecommunications act amply demonstrate the continuing need for this important program at the following levels:

5 percent Hardship Loans	\$75,000,000
Cost-of-Money Loans	300,000,000
Guaranteed Loans	120,000,000
Rural Telephone Bank Loans	175,000,000
 Total	 670,000,000

These are the levels established in the fiscal year 2000 appropriations act for the hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs and are the same levels as those requested in the President’s budget. We believe that the needs of this program balanced with the minimal cost to the taxpayer argue for its continuation at enacted levels given the fact that it provides funding for the neediest borrower systems serving the highest cost areas.

SPECIFIC ADDITIONAL REQUESTS

Continue the Removal of the 7 percent Cap on Cost-of-Money Loans

Again this year we are supporting removal of the 7 percent ceiling on cost-of-money loans even though long-term Treasury rates are currently below this level. This Committee included language in the fiscal year 1996 act to permit borrower

interest rates on cost-of-money loans to exceed the 7 percent per year interest rate ceiling contained in the authorizing act. The language has been continued in subsequent acts. We support an extension of this provision in the fiscal year 2001 bill.

Continue the Restriction on Retirement of Class A Government Stock in the Rural Telephone Bank (RTB) and also Continue the Prohibition Against Transfer of RTB Funds to the General Fund and Require the Payment of Interest

The Committee should continue the restriction on retirement of the amount of class A stock by the Rural Telephone Bank in fiscal year 2001. The Bank is currently in the process of retiring the government's stock as required under current law. We believe that this process which began in fiscal year 1996 should continue to be an orderly one as contemplated by the retirement schedule enacted five years ago and continued in last year's bill to retire no more than 5 percent of the total class A stock in one year. We also urge the Committee to continue the prohibition against the transfer of any unobligated balance in the bank's liquidating account which is in excess of current requirements to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private Class B and C stockholders of the Rural Telephone Bank have a vested ownership interest in the assets of the bank including its funds and their rights should be protected. Previous appropriations acts (fiscal year 1997 through 2000) have recognized the ownership rights of the private class B and C stockholders of the bank by prohibiting a similar transfer of the bank's excess unobligated balances which otherwise would have been required under the federal credit reform act.

Reject Budget Proposal to Transfer Funds from RTB Liquidating Account for Subsidy and Administrative Costs

In this same vein, we are also opposed to the proposal contained in the President's budget again this year that the subsidy cost associated with Rural Telephone Bank loans be funded by a transfer from the unobligated balances of the bank's liquidating account rather than by a traditional appropriation from the general fund of the Treasury which has been the funding mechanism utilized for the bank since enactment of the federal credit reform act in 1990. Requiring the bank to fund the subsidy cost of its loans would dilute the interests of the bank's stockholders. By definition, the bank's unobligated balances are not exclusively federal funds but are subject to the respective ownership interests of all the stockholders of the bank. This cost is more properly funded through a regular appropriation from the general fund of the Treasury.

The President's budget also proposes that the bank assume responsibility for its administrative costs also by a transfer of funds from the unobligated balances of the bank's liquidating account rather than through an appropriation from the general fund of the Treasury. This recommendation is contrary to the specific language of Sec. 403(b) of the RTB enabling act.

The budget language acknowledges that neither proposal would result in budgetary savings. Both proposals were specifically rejected again last year by this Committee. No new justification for these recommendations is contained in the budget. Both proposals would require consideration by the authorizing committees and enactment of new authorizing legislation as a prerequisite to an appropriation. As of this date, no such legislation has been transmitted by the Administration or is under consideration before the authorizing committees.

Loans and Grants for Telemedicine, Distance Learning and Internet Access

The President's budget requests \$25 million in loan and grant authority for fiscal year 2001 specifically devoted to telemedicine and distance learning purposes. Loans are made at the government's cost-of-money. The purpose is to accelerate deployment of telemedicine and distance learning technologies in rural areas through the use of telecommunications, computer networks, and related advanced technologies by students, teachers, medical professionals, and rural residents. We believe this program is particularly important. Continuing to target funds in this manner spurs deployment of this important new technology which is vital for the survival of rural schools, hospitals and the rural communities they serve. At the same time, we believe the level proposed strikes a cost effective balance for the taxpayer.

We are also supporting the \$2 million requested in the President's budget for a pilot program of loans and grants to finance broadband transmission and local dial-up access to the Internet in rural areas.

CONCLUSION

Thank you for the opportunity to present the association's views concerning this vital program. The telecommunications lending programs of RUS continue to work

effectively and accomplish the objectives established by Congress at a minimal cost to the taxpayer.

PREPARED STATEMENT OF THE NATIONAL TELEPHONE COOPERATIVE ASSOCIATION

SUMMARY

The information age continues to evolve at lightening speed, permeating every element of our existence. No longer a luxury at all, today, access to advanced, affordable, communications infrastructure and services, by every American, is an absolute necessity. Indeed, federal, state, and local executives, legislators, and regulators, as well as the general public, are demanding nothing less.

The small rural incumbent local exchange carrier (ILEC) segment of the communications industry has responded to these demands with outstanding vigor, providing perhaps the most exceptional telecommunications services of anywhere in the nation. It has done so through both a deep commitment to community and by having access to the affordable financing that is available via the Rural Utilities Service (RUS) Telecommunications Loan Program.

For over 50 years, NTCA's small rural ILEC members, in partnership with the RUS, have fulfilled the joint statutory mission of both providing and improving rural telecommunications service, with distinction. With the RUS appropriately funded, they will be able to continue that mission. Therefore, NTCA recommends full funding for all accounts of the RUS Telecommunications Loan Program and its related community development program. Additionally, NTCA recommends that language be included in the fiscal year 2001 appropriations package which will protect the program, and particularly the Rural Telephone Bank (RTB), from frivolous or premature actions intended to redirect their course.

BACKGROUND

NTCA is a national trade association representing more than 500 small, rural, cooperative and commercial incumbent local exchange carriers (ILECs) located throughout the nation. These locally owned and operated ILECs provide local exchange service to more than 5 million rural Americans. Through the 50 year history of the RUS Telecommunications Loan Program, more than 80 percent of NTCA's member systems have been able to utilize the federal program to one degree or another.

NTCA's members, like most of the country's independent ILEC's, evolved to serve high cost rural areas of the nation that were overlooked by the industry's giants as unprofitable. And there can be no doubt regarding the high cost of such markets. Consider that the combined service area's of these ILECs constitutes approximately 40 percent of the nation's geographic area, yet the more than 5 million subscribers served in this territory account for little more than 4 percent of the nation's total access lines. On average, RUS borrowers have approximately 6 subscribers per mile of infrastructure line, compared with 130 for the larger urban-oriented, non-RUS financed systems. This results in an average plant investment per subscriber that for RUS borrowers is 38 percent higher than for most other systems.

Congress recognized the unique financing dilemma confronting America's small rural ILECs as early as 1949. It was in that year that it amended the Rural Electrification Act (RE Act) to create the Rural Electrification Administration (REA) Telephone Loan Program, today known as the RUS Telecommunications Loan Program. Through the years Congress has periodically amended the RE Act to ensure that original mission—to furnish and improve rural telephone service—was met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the RUS was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. In 1993, Congress established a fourth program lending facet, the Treasury Cost of Money account.

RUS HELPS MEET INFRASTRUCTURE DEMANDS

While the RUS has helped the subscribers of NTCA's member systems receive service that is comparable or superior to that available anywhere in the nation, their work is far from complete. As federal policies such as the Telecommunications Act of 1996 continue to evolve, the high costs associated with providing modern telecommunications services in rural areas will not diminish. Four years into the implementation of the 1996 Act, the Federal Communications Commission's (FCC's) interpretation of the statute, and several court decisions, have held little regard for congressional intent particularly with respect to universal service which is so vital to

small rural ILECs. Consequently, the ongoing need for the well defined, understood, time-tested RUS Telecommunications Loan Program is even greater.

For example, RUS telecommunications lending has stimulated billions of dollars in private capital investment in rural communications infrastructure. In recent years, on average, less than \$10 million in federal subsidy generated \$670 million in federal loans and loan guarantees. For every \$1 in federal funds that were invested in rural communications infrastructure, \$4.50 in private funds were invested.

The RUS is also making a difference in our rural schools, libraries, and hospitals. Since 1993, the RUS Distance Learning and Telemedicine Grant and Loan program has funded approximately 350 projects throughout the nation for interactive technology in rural schools, libraries, hospitals, and health clinics. To date, approximately 704 rural schools and education centers have gained access to improved educational resources through the information superhighway by sharing limited teaching resources and gaining access to libraries, training centers, vocational schools and other institutions located throughout the country. This program has provided unprecedented educational opportunities for rural students and enhanced health care for rural residents.

In addition, two other RUS related programs are making a difference in rural America. Formerly under the RUS, and known as the Zero Interest Loan and Grant Program, the Rural Economic Development Grants Program and the Rural Economic Development Loans Program are now managed by the Rural Business Cooperative Service. The two programs provide funds for the purpose of promoting rural economic development and job creation projects, including funding for project feasibility studies, start-up costs, incubator projects and other expenses tied to rural development.

NTCA’S APPROPRIATIONS RECOMMENDATIONS

Fully Fund The RUS Telecommunications Loan Program.—Increasing demand for expanded telecommunications services and infrastructure upgrades indicates a continuing strong need for stable loan levels at the authorizations established by the Rural Electrification Loan Restructuring Act of 1993. NTCA is supporting loan levels for fiscal year 2001 in the same amounts as those contained in the fiscal year 2000 Agriculture Appropriations Act, which are the same levels as those requested in the President’s budget for fiscal year 2001.

Hardship Account	\$75,000,000
Treasury-rate Account	300,000,000
Guaranteed Account	120,000,000
Rural Telephone Bank Account	175,000,000
 Total	 670,000,000

Extend Removal Of The Interest Rate Cap On Treasury-Rate Loans.—NTCA is also requesting that Congress again include language removing the 7 percent interest rate cap on Treasury-rate loans. This provision has been included in recent appropriations measures to prevent the potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized lending levels.

Prohibit The Transfer Of Unobligated Balances Of The RTB Liquidating Account.—NTCA also recommends that Congress continue the prohibition against the transfer of any unobligated balances of the Rural Telephone Bank liquidating account to the general fund of the Treasury. This language has routinely been included in annual appropriations measures since the enactment of the Federal Credit Reform Act (FCRA), Public Law 101–508, that allows such sweeping to potentially occur. Restatement of this language will again ensure that the RTB’s private class B & class C stockholder are not stripped of the value of their statutorily mandated investment in the Bank.

Prohibit RTB From Self Funding Subsidy And Administrative Costs.—The Administration’s fiscal year 2001 budget proposal suggests funding the RTB’s loan subsidies and administrative expenses out of unobligated balances in the bank’s liquidating account rather than out of the general fund of the Treasury as is required by the RE Act. NTCA urges Congress to reject this proposal, as it has in the past, for the following basic reasons: (1) such action would require amendment of the RE Act, (2) the proposal appears to be in conflict with the intent of the FCRA, (3) the proposal will not result in federal budgetary savings, (4) it is unnecessary to the determination of whether the bank could operate independently, and thus would amount to wasting the resources of the bank which could be put to better use upon its complete privatization.

Rural Telephone Bank Privatization.—Under the President's fiscal year 2001 budget proposal, the RTB is proposed to "become a Performance Based Organization (PBO) to establish its financial and operational independence prior to its being privatized within ten years." At this time, it is difficult to support, or evaluate any privatization proposal without first obtaining an answer to the critical question of who owns the assets of the bank at any given time during the privatization period, which is already underway at a minimal statutory pace. Without a definitive and official determination of this central issue, it is not possible to formulate an informed position regarding privatization of the bank.

NTCA believes any privatization plan should be well conceived before implementation. At the very least, privatization should proceed in an orderly fashion with a full accounting of the various financial and legal implications involved. Congress, RTB Stockholders, and the rural telecommunications industry deserve the benefit of having RTB privatization reviewed thoroughly, and not in the vacuum of the budgetary process. In addition to having a high concentration of RTB stockholders as members, NTCA itself is a RTB stockholder. The RTB's portfolio is currently valued at well over \$2 billion and consequently it continues to play a critical role in the modernization of rural telecommunications infrastructure throughout the United States. For these reasons, the RTB's future will continue to be closely monitored, and protected, by NTCA and its members. Furthermore, NTCA urges Congress to refrain from commencing such deliberations without the asset question answered, or in an effort to simply respond to the administration's budget suggestion.

Continue RUS Distance Learning and Telemedicine Loan and Grant Program.—The RUS Distance Learning and Telemedicine Loan and Grant program has proven to be an indispensable tool for rural development. In this regard, NTCA urges Congress to provide adequate funding for this critical program. NTCA supports the recommendations for this program that are contained in the president's budget proposal. NTCA also supports the \$2 million in direct loans and grants for a pilot program to finance broadband transmission and local dial-up Internet service in rural areas as requested in the President's budget.

Preserve RBCS Rural Development Grant and Loan Programs.—Likewise, NTCA has witnessed the good these programs have done for rural communities. NTCA requests adequate subsidy to support the current \$15 million loan program.

Deploy NOAA Radio Weather Warning System in unserved or under-served Rural Areas.—Rural areas traditionally do not have the same access to reliable weather radio warning systems as more urban and populated cities. Too often, lives are unnecessarily lost due to the lack of knowledge and proper warning of an impending hurricane or tornado. Therefore, NTCA is requesting adequate subsidy to support a \$5 million loan program to facilitate a partnership between rural utilities possessing commercial tower space and the national weather service.

CONCLUSION

The RUS Telecommunications Loan Program bears a proud 50-year record of commitment, service, and achievement to rural America. Never in its entire history has the program lost even a dollar to abuse or default—an unparalleled feat for any government-sponsored lending program. Clearly such a successful program should remain in place to guarantee rural Americans have the opportunity to play a leading role in the information age. After all, an operational and advanced rural segment of the nation's telecommunications infrastructure is critical to truly ensuring that the national objective of universal telecommunications service is fulfilled. Please help us accomplish that objective.

PREPARED STATEMENT OF THE NATIONAL TREASURY EMPLOYEES UNION

Chairman Cochran, Ranking Member Kohl, and distinguished Members of the Subcommittee, my name is Colleen Kelley, and I am the National President of the National Treasury Employees Union. The NTEU represents more than 155,000 Federal employees, including those who work at the Food and Drug Administration. I appreciate this opportunity to present testimony to you today on behalf of the men and women who help ensure our foods, drugs, cosmetics, medical devices, and thousands of other consumer products are safe. The actions of this subcommittee directly affect their lives and the livelihoods of every American.

American consumers rightfully depend on their food to be free of bacteria or other food borne diseases. They demand that we find cures for terminal cancer and other deadly diseases. And they expect that consumer products, such as mouthwash, toothpaste, or any other commonly used product imported into the U.S. will not prove to be fatal.

Day in and day out, FDA's scientists, doctors, veterinarians, and support personnel are working to ensure the safety of the American people. From the most basic, but very important, task of educating children about how to handle meats properly to avoid bacteria, to approving new drugs to treat diabetes or depression, FDA employees are working to protect and improve the health of the American people.

Let me share with you a couple of examples of the outstanding work of our FDA employees. One of the most important duties of the FDA field laboratories is to directly respond to local consumer complaints regarding FDA regulated products. Recently a chemist working at the FDA laboratory located in Denver, Colorado helped prevent the death of a man who had gotten violently ill while drinking a soda. This FDA chemist analyzed the soda and found it to be contaminated with barium nitrate. This deadly chemical came from a sparkler, which had been put into the soda. If this deadly chemical had not been accurately identified in a timely manner, the man probably would have died. However, thanks to the analysis and accurate identification of the poisoning by the FDA chemist in Denver, the patient's doctor was able to save the patient by knowing to treat him for barium poisoning.

At our laboratories in San Francisco, Los Angeles, Baltimore, and other laboratories located at or near our nation's ports, FDA microbiologists and investigators work with Customs officials to quickly test and identify harmful foods which are trying to be imported. When the FDA microbiologists determine that the foods pose a risk to American consumers the foods are sent back to where they originated.

In Rockville, Maryland, FDA chemists and scientists are quickly developing and approving safe and effective drugs to help find cures for cancer, AIDS, Alzheimer's, and autism. They're working on drugs to help ease the pain of heart burn and treat depression.

On any given day at an FDA laboratory in Missouri or California, FDA scientists could be analyzing over-the-counter drugs for cyanide contamination, examining baby food products for added glass fragments, or analyzing wine for poisonous ethylene glycol contamination.

These are only a mere sampling of the day-to-day activities being performed by the dedicated men and women who work at the FDA. And these are only a few examples of why we need to increase the resources for this agency.

I am pleased that the President has requested a 14.5 percent increase in funding for the FDA for fiscal year 2001. We cannot expect the FDA to continue to carry out its mission and protect the public health, without the staffing and resources necessary to do the job. In particular, I support FDA's request for increased staffing in a number of critical areas, such as the food safety initiative, verifying the safety of domestic and imported products, cracking down on illegal Internet drug outlets, and improving the efficiency and timeliness of the user fee program. These programs, as well as countless others within FDA need additional staff to address the demands of protecting and improving the health of the American public.

The FDA needs increased staffing in order to increase surveillance and inspections of food: food that originates in this country, and food that is imported. And the FDA needs more staff to address the increasing demands to shorten the amount of time it takes to test drugs, ensure their safety, and make them available to patients.

I also want to bring to your attention some concerns I have about the FDA budget. As you know, the FDA is in the midst of a consolidation of its laboratories, which are currently located in key locations across the country. I share the agency's views that we need to significantly improve the quality of FDA's laboratory infrastructure. However, I do not believe that closing certain existing laboratories will necessarily improve FDA operations and capabilities. Our nation cannot afford to lose the knowledge and experience of these scientists who have worked for many years in the FDA field laboratories. However, if any laboratories are closed in the future, I would urge this subcommittee to work to ensure that the FDA minimizes the impact on the current FDA employees who would be affected, and the impact on FDA operations in general.

In addition, I have serious concerns about proposals that have been considered both in Congress and internally at the FDA which would contract out work currently being performed by FDA employees. There is an inherent conflict of interest when a company seeking approval for a drug or food product is the same company granting the approval. I do not believe the American public is prepared to entrust private companies, most of which are driven by profit, to ensure the safety and effectiveness of their drugs and food.

I believe that the FDA fiscal year 2001 budget request is a good first step, but I believe that the level of funding requested by the FDA should be viewed as a floor, not a ceiling. As the number and complexity of drugs, food products and other FDA

regulated goods in the marketplace continues to increase, it is critical that the Congress provide additional funding for staffing at the FDA. While I believe that funding should be used to make technological improvements to FDA laboratories and equipment, I am sure you will agree with me that technology alone cannot possibly address the demands the agency now faces.

I would like to thank the Subcommittee again for the opportunity for our Union to present its views on the budget for fiscal year 2001. As you continue your subcommittee's deliberations, I hope you will give special consideration to FDA's dedicated workforce, a team of public servants who have committed themselves to ensuring safe foods, drugs, and medical devices for the American people.

PREPARED STATEMENT OF THE NATIONAL UTILITY CONTRACTORS ASSOCIATION

Mr. Chairman and Members of the Subcommittee, my name is Angelo Di Paolo. I am President of the National Utility Contractors Association (NUCA) and President of Di Paolo Company in Glenview, Illinois. I see firsthand everyday the dire water and wastewater infrastructure needs our country faces, so I sincerely appreciate your interest in preventing public health and environmental disasters in rural communities by adequately funding the U.S. Department of Agriculture (USDA) Rural Utilities Service (RUS) Water and Waste Disposal infrastructure program for fiscal 2001.

FISCAL 2001 RECOMMENDATION

On behalf of NUCA's nearly 2,000 members and the citizens of rural America who endure daily life without the basic wastewater infrastructure that ensures clean drinking water and appropriate disposal of waste, I respectfully request that the Subcommittee appropriate a minimum of \$700 million in budget authority for the RUS Water and Waste Disposal Program. Further, I respectfully ask that Congress allow the RUS to determine the most appropriate allocation of the budget authority to loans and grants as it is in the best position to target the grants toward the very poor while providing loans for the relatively more well-healed communities.

RURAL WATER AND WASTE DISPOSAL NEEDS AND THE RUS CURE

Imagine waking up, sleepily walking into the bathroom, turning the shower faucet, and being greeted by stinky, murky water. Imagine being unable to quench your thirst because only unfiltered water comes to your house. Comparatively speaking, these are mild pictures of the horrible circumstances that almost a million rural residents endure daily. These Americans do not have potable water or effective waste disposal systems. Moreover, the citizens facing these problems are those least able to afford bottled water services. Generally, the affected families live below the poverty level, \$16,700. So even if they aren't drinking contaminated water, they have no choice but to wash and cook with it. Ironically, in the town serving as the namesake for Deer Park bottled water, the locals were drinking unfiltered water from shallow wells until the RUS funded a \$1.7 million water system in 1998. RUS Water and Waste Disposal loan and grant programs provide such funds for small communities with 10,000 or fewer residents that cannot secure reasonable financing for drinking water and wastewater infrastructure improvements. The majority of the residents are low-income and cannot afford even the smallest ratepayer increases, increases that would be certainties with other infrastructure funding sources. Currently, there is a \$3.8 billion backlog of applications from needy communities that simply cannot afford to build their infrastructure through other funding sources. At this time last year, the backlog was only \$3.2 billion. Today, communities must wait an average of approximately three years from the start of an application process to the time that RUS commits funds. During the three-year wait, children and the elderly continue to be exposed to waterborne diseases that have life-long or terminal effects on their health. No State is immune from this problem. According to the USDA's recent best estimates, at least 260,000 American homes still do not have complete plumbing. Another 715,000 homes have critical problems with drinking water quality, quantity, and availability. At least 1.1 million homes have inadequate wastewater disposal systems that threaten human and environmental health. The U.S. Environmental Protection Agency (EPA) estimated in 1997 that some 15 million households use private wells and another 1 million homes rely on untreated water sources that include cisterns and water hauled from springs, rivers, and lakes. In 1996, the EPA estimated that small communities with 10,000 or fewer residents face more than \$13.8 billion in capital costs over the next two decades for sewage collection and treatment works. That figure does not include an es-

timation of septic system needs. These figures are considered by most within EPA to be conservative estimates. Regardless how you look at the needs, a \$700 million investment would be worth every penny. Despite their inability to afford other funding sources, the communities historically do not default on RUS loans. Year after year, the USDA maintains an unrivaled loan delinquency rate of just over one percent and a long-term loss rate of one-tenth of one percent on the wastewater loan program.

CONCLUSION

We, the members of NUCA, urge you to fund the RUS Water and Waste Disposal loans and grants program at a minimum \$700 million for fiscal 2001. Thank you for considering our recommendation.

PREPARED STATEMENT OF THE NATIONAL WATERSHED COALITION

Mr. Chairman and Members of the Subcommittee: The National Watershed Coalition (NWC) is pleased to present this testimony in support of some of the most beneficial water resource conservation programs ever developed in the United States. The Coalition recognizes full well the need to use our tax dollars wisely. That makes the work of this Subcommittee very important. It also makes it imperative that the federal programs that are continued are those that provide real benefit to society, and are not programs that would be nice to have if funds were unlimited. We believe that the Small Watershed Program (Public Law 83-566) and the Flood Prevention Operations Program (Public Law 78-534) are examples of those rare programs that address our nation's vital natural resources which are critical to our very survival, do so in a way that provide benefits in excess of costs, and are programs that serve as models for the way all federal programs should work.

The National Watershed Coalition is an alliance of national, regional, state and local organizations that have a common interest in advocating the use of the watershed when dealing with natural resource issues. We also support the use of total resource management principles in planning. We are advocates of both the Small Watershed Program and the Flood Prevention Operations Program administered by USDA's Natural Resources Conservation Service (NRCS). These resource protection programs deserve much higher priority than they have had in the recent past. Even in difficult financial times, and we keep hearing we are in a period of budget surpluses, their revitalization would pay dividends in monetary and other benefits, and jobs! The disastrous 1993 Midwest floods and the floods in Texas in the fall of 1998 should have taught us something. If one examines the Report of the 1994 Interagency Floodplain Management Review Committee that studied the 1993 Midwest flood event, we see that flood damages were significantly reduced in areas where Public Law 566 projects were installed. The requests for disaster assistance were also less.

The watershed as the logical unit for dealing with natural resource problems has long been recognized. Public Law 566 offers a complete watershed management approach, and should have a prominent place in our current federal policy emphasizing watersheds and total resource management based planning. Proper watershed management improves water quality. Why should the federal government be involved with these watershed programs?

- They are programs whose objectives are the sustaining of our nation's precious natural resources for generations to come.
- They are not federal, but federally assisted, locally sponsored and owned. They do not represent the continued growth of the federal government.
- They are locally initiated and driven. Decisions are made by people affected, and respect private property rights.
- They share costs between the federal government and local people. Local sponsors pay between 30-40 percent of the total costs of Public Law 566 projects.
- They produce net benefits to society. The most recent program evaluation demonstrated the actual ratio of benefits to costs was approximately 2.2:1. The actual adjusted economic benefits exceeded the planned benefits by 34 percent. How many other federal programs do so well?
- They consider and enhance environmental values. Projects are subject to the discipline of being planned following the National Environmental Policy Act (NEPA), and the federal "Principles and Guidelines" for land and water projects. That is public scrutiny!
- They are flexible programs that can adapt to changing needs and priorities. Objectives that can be addressed are flood damage reduction, watershed protection (erosion and sediment control), water quality improvement, rural water supply,

water conservation, fish and wildlife habitat improvement, recreation, irrigation and water management, etc. That is flexibility emphasizing multiple use.

—They are programs that encourage all citizens to participate.

—They can address the needs of low income and minority communities.

—And best of all—they are programs the people like!

The National Watershed Coalition is concerned with the recent Congressional lack of support for these watershed programs, with the exception of the recent watershed rehabilitation efforts, and we hope the outcome of the fiscal year 2001 appropriations process will enable this vital work to continue and expand as we seek to preserve, protect and better manage our nation's water and land resources. Every State in the United States has benefited from the Small Watershed Program.

In order to continue this high priority work in partnership with states and local governments, the Coalition recommends a fiscal year 2001 funding level of \$250 million for Watersheds and Flood Prevention Operations, Public Law 83-566 and Public Law 78-534. We recommend that \$30 million of this amount be for Public Law 78-534 projects. For some years now, the federal budget has eliminated the separate line items for the Public Law 534 and Public Law 566 watershed projects, and just lumped a total figure under Public Law 566 with a note that some amount "may be available" for Public Law 534 projects. This is an entirely unsatisfactory way of doing business. Public Law 534 still exists in law; it has not been repealed. It should be funded as a separate program. The current situation really penalizes both Public Law 534 and 566, as 534 has no funds at the outset, and in order to provide a little something to the Public Law 534 watershed projects, NRCS has to take some money from the Public Law 566 accounts which are already very underfunded. Please restore funding for Public Law 534 watershed projects to \$30 million in fiscal year 2001. We also recommend that watershed surveys and planning be funded at \$25 million, which represents the true need.

We would also suggest that \$55 million be used for structural rehabilitation and replacement, in accordance with H.R. 728 recently introduced in the 106th Congress by Representatives Frank Lucas and Wes Watkins of Oklahoma, and S. 1762 introduced in the Senate by Senators Paul Coverdell of GA, and Blanche Lincoln of AR, and that another \$5 million be available for a thorough assessment of rehabilitation needs. The recognition of watershed rehabilitation as a national priority is gaining support throughout the countryside.

We recognize that Congress may be thinking of lesser amounts for these programs, but we believe we are not doing our job of helping you recognize the true need if we continually recommend the federal share of these needed funds be less. We would hope that everyone understand that these funds are only a part of the total that are committed to this vital purpose. The local project sponsors in these "federally assisted" endeavors have a tremendous investment also. We also suggest that the Emergency Watershed Program (EWP) be provided with \$20 million to allow the NRCS to provide rapid response in time of natural disaster. Our recommendations are considerably different from those proposed by the Administration for the fiscal year 2001 budget. Congress increasingly talks of wanting to fund those investments in our nation's infrastructure that will sustain us in the future. Yet this and past Administration's budgets have regularly cut funding for some of the best of these programs. This makes absolutely no sense! We continue to read that we are in a period of budget surpluses, almost as if the federal coffers were overflowing with cash, yet there is next to nothing for watershed protection and improvement. Our Gross Domestic Product has risen for over 93 straight months, unemployment is low, the stock market has risen to new highs, and we can't seem to invest and re-invest in our vital watershed infrastructure. That is simply unconscionable. Isn't water quality and watershed management a priority?

The issue of the current condition of those improvements constructed over the last fifty years with these watershed programs is a matter of great concern. Many of the nearly 10,500 dams that NRCS assisted sponsors build throughout the United States no longer meet current dam safety standards largely as a result of development, and need to be upgraded to current standards. A USDA study published in 1991 estimated that in the next ten years, \$590 million would be needed to protect the installed works. Of that amount, \$100 million would come from local sponsors as their operation and maintenance contributions. NRCS also conducted a more recent survey, which indicated the current national needs were about \$540 million. That is the reason we are recommending starting with \$60 million (\$55 million for rehabilitation work and \$5 million to start a more precise assessment of needs) for the work necessary to protect these installed structures, and commend Oklahoma Representatives Lucas and Watkins for their leadership in introducing H.R. 728, the Small Watershed Rehabilitation Amendments of 1999, and Sens. Coverdell and Lincoln for introducing S. 1762, the Small Watershed Rehabilitation Act in the Senate.

Watershed project sponsors throughout the U.S. appreciate their leadership on this vital issue. If we don't start to pay attention to our rural infrastructure needs, the ultimate cost to society will only increase, and project benefits will be lost. This is a serious national issue.

In addition to offering our thoughts on needed conservation program budget levels, we would like to express our great concern with the way in which the Administration's budget proposes to change the watershed program funding in fiscal year 2001. We will address each "account" in some detail as to the adverse impacts we see.

WATERSHED AND FLOOD PREVENTION OPERATIONS

The Administration proposes \$83,423,000, a decrease of \$16,010,000 from the grossly inadequate funding of fiscal year 1999. They talk of their concern for the environment, but it is not reflected in their budget proposals. This account needs \$250 million!

Of the funds proposed under the Public Law 566 authority, no funds are specifically suggested for the Public Law 534 projects, only \$8 million is available from the Public Law 566 account for Public Law 534 projects, a decrease of \$7 million—or 47 percent—from fiscal year 1999. This is unacceptable.

No funding is proposed to address the aging watershed infrastructure problem which poses great risk to human health, safety and quality of life, and which we discussed earlier. We suggest \$60 million is needed in fiscal year 2001. Pass H.R. 728 & S. 1762!

The Administration's budget mentions that "up to \$4,170,000" of their proposed watershed and flood prevention budget amounts might be used for "the cost of loans for rehabilitation of upstream watershed dams." This is entirely unsatisfactory! Rehabilitation needs and a way to approach them are adequately addressed in the two bills working their way through Congress (H.R. 728 and S. 1762). They should be cost-share programs as the Bills propose, and not loan programs. Watershed project sponsors do not need federal loans; they need their federal partner to pay their agreed-to share of the work put on the landscape by the partnership. The Administration's budget proposal would again penalize the ongoing national watershed programs by taking away money sorely needed to complete ongoing projects.

WATERSHED SURVEYS AND PLANNING

The Administration proposes \$10,368,000 for these vital planning activities, and we believe \$25 million is a more realistic figure considering the need. There are many potential projects and project sponsors in every state wanting watershed planning assistance, and that assistance is not available. And this at a time when our federal government is encouraging the watershed approach and local leadership. Here we have the ideal partnership cost-share program that encourages local leadership, and the federal share of the funds is not there.

EMERGENCY WATERSHED PROTECTION PROGRAM.

The Administration proposes no funds to maintain readiness to deal with emergencies caused by natural disasters, or maintain any technical staff capacity. This makes no sense! We suggest that \$20 million be put into this account to provide rapid early response, and then deal with total disaster needs for each incident with supplemental appropriations as in the past.

The Administration's budget also uses language that appears a bit deceiving. They say that "\$2 million is proposed to provide technical assistance to communities for disaster mitigation planning," and "\$3 million is proposed to provide technical and financial assistance to communities to implement disaster mitigation plans." None of this is new and the NRCS has been providing this assistance from their various budget accounts for years.

There are a number of suggestions we would like to make concerning this very important legislation, that we will be making to other committees and they have budget implications. We believe the objectives of this legislation should be expanded to include more non-structural water quality practices, allow the law to provide assistance in developing rural water supplies (without water there is no rural development) and eliminate the current requirement that mandates that twenty percent (20 percent) of the total projects benefits be "directly related to agriculture" which can be very subjective and has the unintended effect of penalizing poor, small, rural communities, many of which are minority communities.

The Coalition appreciates the opportunity to offer these comments regarding fiscal year 2001 funding for the water resource programs administered by the Natural Resources Conservation Service. With the "downsizing" the NRCS has experienced, we

would be remiss if we did not again express some concern as to their ability to provide adequate technical support in these watershed program areas. NRCS technical staff has been significantly reduced and budget constraints have not allowed that expertise to be replaced. Traditional fields of engineering and economics are but two examples. We see many states where the capability to support their responsibilities in these program areas is seriously diminished. This is a disturbing trend that needs to be halted. This downsizing has a very serious effect on state and local conservation programs. Local Watershed and Conservation Districts and the NRCS combine to make a very effective delivery system for providing the technical assistance to local people—farmers, ranchers and rural communities—in applying needed conservation practices. But that delivery system is currently very strained! Many states and local units of government also have complementary programs that provide financial assistance to land owners and operators for installing measures that reduce erosion, improve water quality, and maintain environmental quality. The NRCS provides, through agreement with the USDA Secretary of Agriculture, “on the land” technical assistance for applying these measures. The delivery system currently is in place, and by downsizing NRCS we are eroding the most effective and efficient coordinated means of working with local people to solve environmental problems ever developed. Our system and its ability to produce food and fiber is the envy of the entire world. In our view, these programs are the most important in terms of national priorities.

We are also disappointed that the subcommittee has a practice of not accepting oral testimony from organizations such as the National Watershed Coalition. When we were allowed to make an oral presentation in the House, we were able to talk to subcommittee members who could ask us questions. It was a chance for them to actually talk with people doing the work on the land. That personal contact in both houses is now missing, and it would be easy to think that our written testimony may not be seriously considered. We hope you will reconsider this practice in future years, and again allow oral testimony.

The Coalition pledges its full support to you as you continue your most important work. Our Executive Director/Watershed Programs Specialist Mr. John W. Peterson, who has over forty years experience in natural resource watershed conservation, is located in the Washington, DC area, and would be pleased to serve as a resource as needed. John’s email address is jwpeterson@erols.com.

Thank you for allowing the National Watershed Coalition (NWC) this opportunity.

PREPARED STATEMENT OF THE NATURE CONSERVANCY

Mr. Chairman, and members of the Committee, I appreciate the opportunity to submit this testimony for the record on fiscal year 2001 appropriations for the Natural Resources Conservation Service (NRCS) and for the Animal and Plant Health Inspection Service (APHIS).

The Nature Conservancy is an international, non-profit organization dedicated to the conservation of biological diversity. Our mission is to preserve the plants, animals and natural communities that represent the diversity of life on Earth by protecting the lands and waters they need to survive. The Conservancy has over a million individual members and over 1,500 corporate sponsors. We currently have programs in all 50 states and in 20 nations. To date our organization has protected more than 11 million acres in the 50 states and Canada, and has helped local partner organizations preserve millions of acres overseas. The Conservancy itself owns more than 1,600 preserves—the largest private system of nature sanctuaries in the world. Three concepts have been fundamental to our success: sound science; strong partnerships with public and private landowners; and tangible results at local places.

The Conservancy is deeply committed to working with agricultural producers to conserve biodiversity on private lands. We currently work with local landowners at approximately 75 sites across the country to implement conservation on the ground, and plan to increase this number to 500 sites within the next decade. Conservation programs administered by NRCS are highly popular with producers because they provide voluntary tools to manage landscapes and reduce the need for regulatory compliance. The programs also serve as an important additional source of income for economically distressed producers.

RECOMMENDATIONS

The Conservancy recommends:

—The appropriations committee to fund the enrollment of a total of 150,000 acres in the Wetland Reserve Program (WRP) for fiscal year 2001, should the author-

- izing committee not approve new acres for enrollment in the program. We also urge the committee not to target WRP to offset other expenditures.
- EQIP funding of \$300 million for fiscal year 2001. We also urge the committee not to target EQIP to offset other expenditures.
 - Full support of the President's budget request for \$747 million in appropriations to the conservation operations account for NRCS. This appropriation principally supports the agency's basic conservation program, called conservation technical assistance.
 - Full support of the President's budget request for \$10.5 million for APHIS to enhance its capability to fight invasive species as called for by the recently signed Executive Order.

WETLAND RESERVE PROGRAM (WRP)

The agriculture conservation program most important to the Conservancy is the WRP. This program makes a sizeable amount of money available to producers who enroll in the program after having concluded that the best economic return on their land would be from the receipt of program dollars rather than from crop or livestock production. Because wetlands provide excellent habitat for wildlife, the program serves the Conservancy's mission of habitat conservation, and at the same time provides farmers who elect to enroll in the WRP with the opportunity to generate income by renting WRP acres to hunting groups.

The Conservancy strongly supports WRP because it is the only program administered by the U.S. Department of Agriculture that at least in part buys permanent protection for resource values on private lands. These values include: (1) conservation of wildlife habitat, (2) purification of groundwater runoff and, (3) regulation of the flow of water in watershed systems by storing surface and groundwater. Permanent protection of environmentally significant resources is the best investment of public conservation dollars. In these times of economic distress for many producers, making financial options available for producers that also results in conservation benefits for the general public is good public policy.

The 1996 Farm Bill authorized the enrollment of 975,000 acres for WRP. Only 40,000 of these acres remain to be enrolled in fiscal year 2001. The Conservancy recommends that the appropriations committee fund a WRP enrollment level of 150,000 acres in fiscal year 2001, should the authorizing committee not approve new acres for the program. Should the authorizing committee approve additional acres, we ask the appropriations committee not to use the WRP account to offset other expenditures.

ENVIRONMENTAL QUALITY INCENTIVE PROGRAM (EQIP)

The Conservancy seeks a \$100 million increase in funding for EQIP for fiscal year 2001, for a total of \$300 million. In addition, we urge the committee not to target EQIP to offset other expenditures. The agricultural conservation community recognizes the significant contribution made by farm runoff to the impairment of our nation's watersheds. An important strategy for addressing this problem must be voluntary farm runoff abatement measures, such as that provided by the EQIP program. The increased funding recommended will begin to help animal feeding operators in financial distress deal with regulatory pressure to keep water clean.

CONSERVATION TECHNICAL ASSISTANCE

Agricultural production depends on the conservation of the soil and water resource base. NRCS and the Conservancy both know that conservation will succeed ultimately only to the extent that it also serves the need of producers to engage in economically viable farming. NRCS has a relationship of trust with private landowners that is unusual among federal agencies. It takes a non-regulatory, voluntary approach to conservation. The voluntary conservation programs administered by NRCS, along and the Conservation Reserve Program administered by the Farm Service Agency, provide farmers with highly effective tools for conserving soil and water resources.

NRCS provides conservation technical assistance through their district conservationists, who give free advice to producers interested in managing the natural resources on their land. In addition, district conservationists provide a number of products requested by producers. These include conservation management systems for a variety of land types, irrigation water management plans, animal waste management plans, program eligibility determinations, wetland creation or restoration plans, conservation education, and long-term strategic resource planning to individuals and communities.

Congress appropriated \$661 million for the agency in fiscal year 2000. The current demand for these services approximately doubles NRCS' ability to provide them. The Conservancy believes that if NRCS is not funded at a level sufficient to provide these services, the resource base on private lands will be impaired and biodiversity will be put at greater risk. In particular, NRCS will have difficulty providing technical assistance in support of the Wetland Reserve Program (WRP) and the Conservation Reserve Program (CRP) in the absence of full funding of the conservation technical assistance account.

A comprehensive clean water policy at the federal level must include funding for the tools that enable producers to implement voluntarily conservation practices and regulatory activities. An increase in appropriations for conservation technical assistance is needed this year in particular because of the increased requirements for animal feeding operators to change practices that affect water quality. For all of these reasons, we ask the Committee to give full support to the President's request of \$747 million for NRCS conservation operations.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The President signed an executive order in February 1999 that directs the federal government to make a concentrated and coordinated effort to fight invasive species. The 2001 budget request for APHIS reflects this heightened attention in two accounts which are of greatest importance to the Conservancy. First, the President requested an increase of \$1.7 million for the noxious weed account within the area of pest and disease management. This amount would be used by APHIS to begin developing a national rapid assessment and response system for invasive plants. Rapid detection of new invasions may be the most effective means for managing the presence of invasive plants on our lands.

Second, the President requested \$8.8 million to fund a new account for invasive species. These funds would be used to gain a better understanding of the pathways through which invasive plants spread through the United States; to collect baseline data on the presence of invasive plants, and to further develop eradication and/or management programs; and, to conduct public education. These activities are critical to successfully fighting the invasive species that are destroying the biological and economic value of our natural and grazing lands.

We appreciate the support that you have shown for agriculture conservation through the years, and appreciate this opportunity to present a written statement to your committee. The Conservancy looks forward to working with you on these issues in this and future agriculture appropriations bills.

PREPARE STATEMENT OF THE NEW MEXICO INTERSTATE STREAM COMMISSION

SUMMARY

This Statement is submitted in support of appropriations for the Department of Agriculture's Colorado River Basin salinity control program. The salinity control program has not been funded at the level necessary to control salinity with respect to water quality standards of the basin states. Also, this failure to provide adequate funding negatively impacts the quality of water delivered to Mexico pursuant to Minute 242 of the International Boundary and Water Commission. Funding for the Environmental Quality Incentives Program (EQIP), from which the Department of Agriculture funds the salinity program, has been insufficient to fund needed salinity control measures. I urge that the administration's recommended funding of \$325,000,000 be appropriated for EQIP, with at least \$12,000,000 designated to the Colorado River Basin salinity control program.

STATEMENT

The Colorado River Basin salinity control program was authorized by Congress in the Colorado River Basin Salinity Control Act of 1974. The Act was amended by Congress in 1984 to give new responsibilities to the Department of Agriculture. The seven Colorado River Basin states, in response to the Clean Water Act of 1972, formed the Colorado River Basin Salinity Control Forum. Comprised of gubernatorial appointees from the seven Basin states, the Forum was created to provide for interstate cooperation in response to the Clean Water Act, and to provide the states with information necessary to comply with Sections 303 (a) and (b) of the Act. The Forum has become the primary means for the seven Basin states to coordinate with federal agencies and Congress to support the implementation of the salinity control program.

Many of the most cost-effective projects undertaken by the salinity control program have occurred since implementation of Department of Agriculture's authorization for the program. The Bureau of Reclamation is currently completing studies on the economic impacts of the salinity of the Colorado River in the United States. Reclamation's study indicates that damages in the United States may soon be approaching \$1 billion per year. It is essential to the cost-effectiveness of the salinity control program that Department of Agriculture salinity control projects be funded for timely implementation to protect the quality of Colorado River Basin water delivered to the Lower Basin States and Mexico.

However, with the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), the Congress concluded that the salinity control program could be most effectively implemented as one of the components of the Environmental Quality Incentives Program. Since the enactment of FAIRA, the salinity control program has not been funded at a level adequate to ensure that water quality standards in the Colorado River, with respect to total dissolved solids (salinity), will be honored, nor is the funding sufficient to prevent salt loading from irrigated agriculture in the Upper Colorado River Basin from impacting the quality of water delivered to Mexico under Minute No. 242 of the International Boundary and Water Commission, United States and Mexico.

The salinity control program has been subsumed by the EQIP program without the Secretary of Agriculture giving adequate recognition to the requirement in Section 202 (c) in the Colorado River Basin Salinity Control Act to carry out salinity control measures. Water users hundreds of miles downstream are the beneficiaries of this water quality protection and improvement program. Irrigated agriculture in the Upper Basin sees local benefits as well as the downstream benefits and have submitted cost-effective proposals to the State Conservationists in Utah, Wyoming and Colorado. Priority Area proposals for EQIP funding are ranked in each state under the direction of the NRCS State Conservationist. Existing ranking criteria, however, does not consider downstream benefits (particularly out of state benefits) when proposals are being evaluated.

The Department of Agriculture, following protracted urging by the Basin states, has concluded as a result that the salinity control program is different than the small watershed approach of the EQIP program. The watershed for the salinity control program stretches almost 1200 miles, from the headwaters of the river through the salt-laden soils of the Upper Basin to the river's termination at the Gulf of California in Mexico.

The Basin states were led to believe by Congressional staff that when the EQIP program was created, the \$200,000,000 annual Commodity Credit Corporation (CCC) borrowing authority given to the Secretary would ensure that through the year 2002 at least the requested amount of funding would be expended for the EQIP program. The Basin states, including New Mexico, have been very dismayed that funding for EQIP was reduced to \$174,000,000 last year. This level of funding is not adequate for this most important nationwide program and the Administration does not believe that it provides sufficient funds to implement National Priority Areas as allowed by Congress under FAIRA. The Forum urges that the funding for EQIP for fiscal year 2001 total \$325,000,000.

The Natural Resources Conservation Service (NRCS) earmarked funds to use in areas of special interest in the amount of about \$5.3 million last year. The states added about \$2 million in up-front cost-sharing and local farms contributed about \$2.3 million. The plan for salinity control of the water quality of the river, prepared and adopted by the Basin states, shows that the USDA portion of the effort must be funded at \$12 million per year in order to comply with water quality standards and offset significant salinity damages in the United States.

State and local cost-sharing is triggered by the federal appropriation. The entire effort last year was funded at only about 44 percent of program needs. The requested funding of \$12 million for fiscal year 2001 will continue to be needed each year for at least the next few fiscal years. The Department of Agriculture indicated that a more adequately funded EQIP program would result in more funds being allocated to the salinity program. The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts in the cost-sharing fashion provided by the Congress. The agricultural producers in the Upper Basin are waiting for their applications to be considered so that they might also cost share in the program. The Department of Agriculture projects have proven to be the most cost-effective component of the salinity control program. However, Administration and Congressional funding support has dramatically declined despite increasing damages from the salinity of the Colorado River.

I urge the Congress to appropriate \$325,000,000 from the CCC in fiscal year 2001 for EQIP. Also, I request that Congress advise the Administration that \$12,000,000

of the appropriation is to be designated for the Colorado River Basin salinity control program.

Finally, I request that adequate funds as requested by the Administration be appropriated for technical assistance and education activities at the local level, rather than requiring the NRCS to borrow funds from CCC for the direly needed support functions.

PREPARED STATEMENT OF THE NORTHWEST INDIAN FISHERIES COMMISSION

Mr. Chairman and Members of the Committee, I am Billy Frank, Jr., Chairman of the Northwest Indian Fisheries Commission (NWIFC), and on behalf of the twenty-Western Washington member Tribes, I submit this request for appropriations to support the research, sanitation and marketing of Tribal shellfish products. We request the following:

- \$500,000 to support commercial harvests costs which will assist the tribes in fulfilling the demands for their shellfish products in both domestically and abroad;
- \$1,000,000 to support water and pollution sampling, sampling and research for paralytic shellfish poisoning and coordination of research projects with State agencies; and,
- 1,000,000 to support data gathering at the reservation level for the conduct of shellfish population surveys and estimates.

TREATY SHELLFISH RIGHTS

As with salmon, the tribes' guarantees to harvest shellfish lie within a series of treaties signed with representatives of the Federal Government in the mid-1850s. In exchange for the peaceful settlement of what is today most of Western Washington, the tribes reserved the right to continue to harvest finfish and shellfish at their usual and accustomed grounds and stations. The tribes were specifically excluded from harvesting shellfish from areas "staked or cultivated" by non-Indian citizens. Soon after they were signed, the treaties were forgotten or ignored.

The declining salmon resource in the Pacific Northwest negates the legacy Indian people in Western Washington have lived by for thousands of years. We were taught to care for the land and take from it only what we needed and to use all that we took.

We depended on the gifts of nature for food, trade, culture and survival. We knew when the tide was out, it was time to set the table because we live in the land of plenty; a paradise complete. Yet, because of the loss of salmon habitat which is attributable to overwhelming growth in human population, a major pacific coastal salmon recovery effort ensues. Our Shellfish resource is our major remaining fishery.

At least ninety types of shellfish have been traditionally harvested by the Tribes in Western Washington and across the continent Indian people have called us the fishing Tribes because of our rich history of harvesting and caring for finfish and shellfish. Our shellfish was abundant and constituted a principal resource of export, as well as provided food to the Indians and the settlers which greatly reduced the living expenses. Shellfish harvesting subsidized our income when we were unable to support our families from the finfish revenues only.

Then came civilization, Tribal beaches were sold by the State to non-Indians, and the waters were polluted and contaminated which greatly impacted the resource. And today, at a time when efforts are underway to restore the Pacific Coastal Salmon, Western Washington Tribal fishers are unemployed because there are no salmon. We ask this Committee to help us to restore our shellfish harvesting which will enable us to participate in the shellfish trade industry once again.

Assist the tribes in fulfilling the demands for their shellfish products, \$500,000

Shellfish harvested by members of Western Washington's Indian tribes is highly sought after throughout the United States and the Far East. We request \$500,000 which will assist Tribes in promoting our shellfish products, in both domestic and international markets. We are now at a point in time when telecommunicating is both cost effective and timely when marketing products. Tribal fishers are not capable of supporting such an effort individually, but, could collectively benefit if such a network could be developed through the Northwest Indian Fisheries Commission and the Northwest Indian College in Bellingham, Washington. This institution is capable of providing the technology needed to implement such a marketing program for Tribal shellfish products.

Water and Pollution Sampling, Sampling and Research for paralytic shellfish poisoning and coordination of research projects with State agencies, \$1,000,000

Shellfish growing areas are routinely surveyed for current or potential pollution impacts and are classified based on the results of frequent survey information. No shellfish harvest is conducted on beaches that have not been certified by the tribes and the Washington Department of Health. Growing areas are regularly monitored for water quality status and naturally-occurring biotoxins to protect the public health.

However, both Tribal and non-Indian fisheries have been threatened due to the lack of understanding about the nature of biotoxins, especially in subtidal geoduck clams. Research targeted to better understand the nature of biotoxins could prevent unnecessary illness and death that may result from consuming toxic shellfish, and could prevent unnecessary closure of tribal and non-Indian fisheries.

Data gathering at the reservation level for the conduct of shellfish population surveys and estimates, \$1,000,000

Very little data and technical information exists for many of the Tribal fisheries now being jointly managed by State and Tribal managers. This is particularly true for many free-swimming and deep-water species. This lack of information can not only impact fisheries and the resource as a whole, but makes it difficult to assess 50/50 treaty sharing arrangements. Additionally, intertidal assessment methodologies differ between State and tribal programs, and can lead to conflicts in management planning.

Existing data systems must be enhanced for catch reporting, population assessment and to assist enhancement efforts. Research on methodology for population assessment and techniques also is critical to effective management.

Onsite beach surveys are required to identify harvestable populations of shellfish. Regular monitoring of beaches also is necessary to ensure the beaches remain safe for harvest. Additional and more accurate population survey and health certification data is needed to maintain these fisheries and open new harvest areas. This information will help protect current and future resources and provide additional harvest opportunities.

TRIBAL SHELLFISH RESOURCE

Shellfish have been a mainstay of western Washington's Indian tribes for thousand of years. Clams, crab, oysters, shrimp, and many other species were readily available year 'round. The relative ease with which large amount could be harvested, cured, and stored for later consumption made shellfish an important source of nutrition—second only in importance to salmon.

Shellfish remain important for subsistence, economic, and ceremonial purposes. With the rapid decline of many salmon stocks, due to habitat loss from western Washington's unrelenting growth in the human population, shellfish harvesting has become a major factor in tribal economies.

The tribes have used shellfish in trade with the non-Indian population since the first white settlers came into the region a century and a half ago. Newspaper accounts from the earliest days of the Washington Territory tell of Indians selling or trading fresh shellfish with settlers. Shellfish harvested by members of western Washington's Indian tribes is highly sought after throughout the United States and the Far East. Tribal representatives have gone on trade missions to China and other Pacific Rim nations where Pacific Northwest shellfish—particularly geoduck—is in great demand. Trade with the Far East is growing in importance as the tribes struggle to achieve financial security through a natural resources-based economy.

As with salmon, the tribes' guarantees to harvest shellfish lie within a series of treaties signed with representatives of the Federal Government in the mid-1850s. Language pertaining to tribal shellfish harvesting included this section:

“The right of taking fish at usual and accustomed grounds and stations is further secured to said Indians, in common with all citizens of the United States; and of erecting temporary houses for the purposes of curing; together with the privilege of hunting and gathering roots and berries on open and unclaimed lands. Provided, however, that they not take shell-fish from any beds staked or cultivated by citizens.”

Treaty With the S'Klallam, Jan. 26, 1855

In exchange for the peaceful settlement of what is today most of western Washington, the tribes reserved the right to continue to harvest finfish and shellfish at all of their usual and accustomed grounds and stations. The tribes were specifically excluded from harvesting shellfish from areas “staked or cultivated” by non-Indian citizens.

Soon after they were signed, the treaties were forgotten or ignored. The influx of non-Indian settlers into western Washington continued to grow with each passing year, and the tribes were slowly excluded from their traditional shellfish and finfish harvest areas.

Tribal efforts to have the Federal Government's treaty promises kept began in the first years of the 20th Century when the United States Supreme Court ruled in *U.S. v. Winans* that where a treaty reserves the right to fish at all usual and accustomed places, a State may not preclude tribal access to those places.

Sixty years later, the tribes were again preparing for battle in court. After many years of harassment, beatings and arrests for exercising their treaty-reserved rights, western Washington tribes took the State of Washington to Federal court to have their rights legally re-affirmed. In 1974, U.S. District Court Judge George Boldt ruled that the tribes had reserved the right to half of the harvestable salmon and steelhead in western Washington.

The "Boldt Decision," which was upheld by the U.S. Supreme Court, also re-established the tribes as co-managers of the salmon and steelhead resources in western Washington.

As a result of this ruling, the tribes became responsible for establishing fishing seasons, setting harvest limits, and enforcing tribal fishing regulations. Professional biological staffs, enforcement officers, and managerial staff were assembled to ensure orderly, biologically-sound fisheries.

Beginning in the late 1970s, tribal and State staff have worked together to develop comprehensive fisheries that ensure harvest opportunity for Indian and non-Indian alike, and also preserve the resource for generations to come.

It was within this new atmosphere of cooperative management that the tribes sought to restore their treaty-reserved rights to manage and harvest shellfish from all usual and accustomed areas. Talks with their State counterparts began in the mid-1980s, but were unsuccessful. The tribes filed suit in Federal court in May 1989 to have their shellfish harvest rights restored.

The filing of the lawsuit brought about years of additional negotiations between the tribes and the State. Despite many serious attempts at reaching a negotiated settlement, the issue went to trial in May 1994.

In 1994, district court Judge Edward Rafeedie upheld the right of the treaty tribes to harvest 50 percent of all shellfish species in their Usual and Accustomed fishing areas. Judge Rafeedie also ordered a shellfish Management Implementation Plan that governs tribal/state co-management activities.

After a number of appeals, the U.S. 9th Circuit Court of Appeals let stand Rafeedie's ruling in 1998. Finally, June 1999, the U.S. Supreme Court denied review of the District court ruling, effectively confirming the treaty shellfish harvest right. Thank you.

PREPARED STATEMENT OF THE OCEANIC INSTITUTE
ARS AQUACULTURE FEEDS AND NUTRITION PROGRAM

The overall goal of the program is to advance feeds technologies to enhance global competitiveness of U.S. feeds, agricultural ingredients used in feeds, and aquaculture products. The program is managed by the Oceanic Institute (OI), a world leader in feeds and nutrition technology. It technically supports and assists the aquaculture and aquafeed manufacturing sector and associated industries, including feed ingredient suppliers and exporters. The program conducts basic as well as applied research that focuses on developing and disseminating new and improved aquatic feeds and associated feeding technologies. These strategies are designed to be economically viable and environmentally compatible with the sustainable development of the aquaculture sector.

Aquatic feeds and feeding generally represent the largest single operating cost item (typically between 25 to 50 percent) of the total running expenses of most intensive and semi-intensive finfish and crustacean farming operations. Although the U.S. currently ranks first in terms of the global production of industrially manufactured animal feeds, its domestic aquaculture sector is still emerging and modest compared to the terrestrial livestock production sector, with the total compound aquafeed production accounting for about 4 percent of total global aquafeed production in 1998. However, the global production of aquaculture feeds depends heavily on agricultural exports from the U.S. With the aquaculture sector currently representing the fastest growing segment of U.S. and global agriculture (surpassing in value most domestic fruit, vegetable, and nut crops), the potential for increased

aquaculture and therefore aquafeed production in the U.S. and globally using U.S. agricultural ingredients is considerable.

The program's recent achievements include the following: (1) demonstrating the technical feasibility of using lower cost shrimp aquafeeds in advanced biosecure, zero-water exchange culture systems; (2) improved processing methods for overall improvement in growth rates, feed conversion efficiencies and water quality; (3) development of improved shrimp feed formulations which take into account the dietary nutrient requirements of the cultured shrimp and that of the living microbial community within warmwater aquaculture systems; (4) development of improved feed processing techniques, including ingredient particle size reduction, mixing, pelleting, and extrusion processing, for increasing feed nutrient digestibility and availability, with consequent improvements in shrimp growth and reduced feed wastage and pollution; (5) development of improved analytical techniques for the measurement of nutrients in feed ingredients and finished feeds, including the successful publication of an analytical procedures manual for aquaculture feeds and feed ingredients for the American Feed Industry Association; and (6) increased use of U.S. feed ingredient sources (i.e., such as soybean meal, corn gluten meal, animal byproduct meals from the animal rendering industry, grains—wheat, corn) as sources of high grade dietary protein and energy for use within aquafeeds, and thereby minimizing imports in the form of fishmeal, fish oil, and other nutrient inputs.

Some of the program's research highlights in the past year have included the development of new feed formulations and feeding regimes that enabled the production of market size shrimp in only eight weeks (as opposed to the normal 12–16 weeks), with average weekly growth rates in excess of two grams per week. The program demonstrated the particular importance of improved feed and water management and the use of optimum dietary feeding regimes to elicit maximum growth and feed efficiency.

The program has recently assumed a critical role in the development of a new technology package which offers the U.S. substantial worldwide competitive advantage in the domestic farming of marine shrimp. The emerging zero-exchange biosecure marine shrimp production systems are fully dependent upon new and novel feed formulations, ingredients, and feeding methods. The systems will permit the U.S. to compete in the world market with systems that provide for protection from disease and full compatibility with the natural environment and also are less expensive. The aquaculture feeds program has already identified "key" feed fundamentals which allow the exploitation and integration of genetically improved and disease free shrimp stocks, virus free production methods, and zero environmental impact. It is clear that these advanced production systems are dependent on new feeds technology and feeding methods.

The Oceanic Institute has added world-class scientists to its program staff including nutritionists, feed processing technologists, microbiologists and computer modelers. Solid science, first class facilities and close interactions with genetic and health programs are coming together for major technology advances to benefit the United States. The OI model has been recently adopted by government agencies in parallel fresh water aquaculture efforts. An Industry Liaison Committee (composed of experts representing the various sectors of the aquatic feed manufacturing and shrimp farming industries, including commercial feed producers, feed equipment manufacturers, animal nutrition specialists, and commercial shrimp farmers within the U.S.) supported by the Agriculture Research Service, has given full endorsement to the program in its recent review.

We ask for your continuing support of this aggressive, highly productive and model research and development program.

PREPARED STATEMENT OF THE ORGANIZATION FOR THE PROMOTION AND
ADVANCEMENT OF SMALL TELECOMMUNICATIONS COMPANIES

SUMMARY OF REQUEST

The Organization for the Promotion and Advancement of Small Telecommunications Companies (OPASTCO) seeks the Subcommittee's support for fiscal year 2001 loan levels for the telecommunications loans program and Rural Telephone Bank (RTB) program administered by the Rural Utilities Service (RUS) in the following amounts:

[In millions of dollars]	
5 percent hardship loans	\$75
Treasury rate loans	300

guaranteed loans 120
 RTB loans 175

In addition, OPASTCO requests the following action by the Subcommittee: (1) removal of the statutory 7 percent cap on Treasury rate loans for fiscal year 2001; (2) a prohibition on the transfer of unobligated RTB funds to the general fund of the Treasury; (3) opposition to the Administration’s proposal to fund the RTB’s loan subsidies and administrative expenses from the bank’s liquidating account; and (4) funding of the distance learning and telemedicine grant and loan program at sufficient levels, including funding for the Administration’s proposed pilot program to finance broadband transmission and local dial-up Internet service.

GENERAL

OPASTCO is a national trade association of more than 500 independently owned and operated telecommunications carriers serving rural areas of the United States. Its members, which include both commercial companies and cooperatives, together serve over 2.5 million customers in 42 states. Over half of OPASTCO’s members are RUS or RTB borrowers.

Perhaps at no time since the inception of the RUS (formerly the REA) has the telecommunications program been so vital to the future of rural America. The telecommunications industry is at a crossroads, both in terms of technology and public policy. Advances in telecommunications technology in recent years will deliver on the promise of a new “information age.” The Federal Communication Commission’s (FCC) implementation of the landmark Telecommunications Act of 1996, as well as modernization resulting from prior statutory changes to RUS’s lending program, will expedite this transformation. However, without continued RUS and RTB support, rural telephone companies will be hard pressed to build the infrastructure necessary to bring their communities into this new age, creating a bifurcated society of information “haves” and “have-nots.”

Contrary to the belief of some critics, RUS’s job is not finished. Actually, in a sense, it has just begun. We have entered a time when advanced services and technology—such as broadband fiber optics, high-speed packet and digital switching equipment, and digital subscriber line technology—are an expected and needed part of a customer’s telecommunications service. Unfortunately, the inherently higher costs of upgrading rural networks, both for voice and data communications, has not abated. Rural telecommunications continues to be more capital intensive and involves fewer paying customers than its urban counterpart. RUS borrowers average only 6.3 subscribers per route mile versus 130 subscribers per route mile for large local exchange carriers. In order for rural telephone companies to modernize their networks and provide their customers with advanced services at reasonable rates, they must have access to reliable low-cost financing.

The relative isolation of rural areas increases the value of telecommunications services for these citizens. Telecommunications enables applications such as distance learning, telemedicine, and high-speed Internet connectivity that can alleviate or eliminate some rural disadvantages. Telecommunications can also make rural areas attractive for some businesses and result in revitalization of the rural economy. For example, businesses such as telemarketing and tourism can thrive in rural areas, and telecommuting can become a realistic employment option.

While it has been said many times before, it bears repeating that the RUS telecommunications loans and RTB programs are not grant programs. The funds loaned by RUS are used to leverage substantial private capital, creating public/private partnerships. For a very small cost, the government is encouraging tremendous amounts of private investment in rural telecommunications infrastructure.

Most importantly, the programs are tremendously successful. Borrowers actually build the infrastructure and the government gets paid back with interest. There has never been a default in the history of the telecommunications lending programs.

THE TELECOMMUNICATIONS ACT OF 1996 HAS HEIGHTENED THE NEED FOR THE TELECOMMUNICATIONS LOANS AND RTB PROGRAMS

The FCC’s implementation of the Telecommunications Act of 1996 will only increase rural telephone companies’ need for RUS assistance in the future. The forward-looking Act defines universal service as an evolving level of telecommunications services that the FCC must establish periodically, taking into account advances in telecommunications and information technologies and services. This year, the FCC is expected to convene a Federal-State Joint Board to revisit the universal service definition, as the Act anticipates. While the competitive environment engendered by the 1996 Act may offer the means of meeting this evolving definition in urban areas, rural and high cost areas have less potential for economically sound

competitive alternatives. RUS has an essential role to play in the implementation of the law, as it will compliment new funding mechanisms established by the FCC and enable rural America to move closer to achieving the federally mandated goal of rural/urban service and rate comparability.

At present, considerable regulatory uncertainty exists for rural telephone companies as several critical FCC proceedings implementing the 1996 Act remain unresolved. These include fundamental changes to the universal service and access charge systems and the procedures incumbent carriers use to separate their costs between the Federal and state jurisdictions. In addition, uncertainty exists as to whether rural incumbent carriers will be able to recover the costs of the extensive additional regulatory obligations and potential broadband deployment demands placed on them. If these outstanding issues are resolved in a piecemeal fashion and/or with a strong bias toward new entrants, rural incumbent carriers with universal service obligations could be hampered in their ability to modernize their networks and provide quality, affordable service to all of their customers. Managed sequencing and coordination of existing proceedings is necessary if the Commission is to preserve Congress's public policy goals of affordable rates and access to an evolving telecommunications network for all Americans. Equally important is for Congress to monitor the FCC's implementation of the Act to ensure that all of its goals—including universal service, an even playing field for competition, and deregulation—are realized in rural areas.

A \$75 MILLION LOAN LEVEL SHOULD BE MAINTAINED FOR THE 5 PERCENT HARDSHIP
LOAN PROGRAM

One of the most vital components of RUS's telecommunications loans program is the 5 percent hardship loan program. These loans are referred to as hardship loans for good reason: They provide below-Treasury rate financing to telephone companies serving some of the most sparsely populated, highest cost areas in the country. The commitment these companies have to providing modern telecommunications service to everyone in their communities has made our nation's policy of universal service a reality and, in many cases, would not have been possible without RUS's hardship loan program. Companies applying for hardship loans must meet a stringent set of eligibility requirements and the projects to be financed are rated on a point system to ensure that the loans are targeted to the most needy and deserving. For fiscal year 2001, the government subsidy needed to support a \$75 million loan level is under \$7.8 million. Given the necessity of this indispensable program, it is critical that the loan level be maintained at \$75 million for fiscal year 2001.

REMOVAL OF THE 7 PERCENT CAP ON TREASURY RATE LOANS SHOULD BE CONTINUED

With regard to RUS's Treasury rate loan program, OPASTCO supports the removal of the 7 percent ceiling on these loans for fiscal year 2001. This Subcommittee appropriately supported language in the fiscal year 1996 Agriculture Appropriations Act to permit Treasury rate loans to exceed the 7 percent per year ceiling contained in the authorizing act. The language has been continued in each subsequent year. Were long-term interest rates to exceed 7 percent, adequate subsidy would not be available to support the Treasury rate loan program at the authorized levels. Accordingly, OPASTCO supports the continuation of this language in the fiscal year 2001 appropriations bill in order to prevent potential disruption to this important program.

THE PROHIBITION ON THE TRANSFER OF ANY UNOBLIGATED BALANCE OF THE RTB LIQUIDATING ACCOUNT TO THE TREASURY AND REQUIRING THE PAYMENT OF INTEREST ON THESE FUNDS SHOULD BE CONTINUED

OPASTCO urges the Subcommittee to reinstate the language introduced in the fiscal year 1997 Agriculture Appropriations Act, and continued in the years following, prohibiting the transfer of any unobligated balance of the RTB liquidating account to the Treasury or the Federal Financing Bank which is in excess of current requirements and requiring the payment of interest on these funds. As a condition of borrowing, the statutory language establishing the RTB requires telephone companies to purchase Class B stock in the bank. Once all loans are completely repaid, a borrower may then convert its Class B stock into Class C stock. Thus, all current and former borrowers maintain an ownership interest in the RTB. As with stockholders of any concern, these owners have rights which may not be abrogated. The Subcommittee's inclusion of the aforementioned language into the fiscal year 2001 appropriations bill will ensure that RTB borrowers are not stripped of the value of this required investment.

THE ADMINISTRATION'S PROPOSAL TO FUND THE RTB'S LOAN SUBSIDIES AND ADMINISTRATIVE EXPENSES FROM THE BANK'S LIQUIDATING ACCOUNT SHOULD BE REJECTED

As it's done the past two years, the Subcommittee should once again reject the Administration's proposal to fund the RTB's subsidy budget authority and administrative expenses through the bank's liquidating account balances. The Administration's proposal is inappropriate on both legal and policy grounds. Statutorily, the Rural Electrification Act provides for the RTB's use of facilities and services of employees of the Department of Agriculture, without cost to the RTB, until such time as the bank is privatized. The proposal also appears inconsistent with the bifurcated structure of the RTB under the Federal Credit Reform Act of 1990 which does not permit funds in the liquidating account to finance new loans. From a public policy standpoint, unobligated balances of the liquidating account have been targeted to support the privatization of the RTB and use of these funds for other purposes would only serve to dilute the value of the bank for all stockholders. Finally, paying for the RTB's administrative expenses and subsidy through the liquidating account offers no budgetary savings. For these reasons, OPASTCO is opposed to the Administration's proposal and urges the Subcommittee to continue to fund the RTB through the general fund of the Treasury.

THE DISTANCE LEARNING AND TELEMEDICINE PROGRAM SHOULD CONTINUE TO BE FUNDED AT ADEQUATE LEVELS

In addition to RUS's telecommunications loans and RTB programs, OPASTCO supports adequate funding of the distance learning and telemedicine grant and loan program. This sensible investment allows rural students to gain access to advanced classes which will help them prepare for college and jobs of the future. Also, rural residents will gain access to quality health care services without traveling great distances to urban hospitals. Loans are made at the government's cost-of-money, which should help to meet demand for the program in the most cost effective way. In addition, OPASTCO supports the Administration's inclusion of a pilot program to finance installation of broadband transmission capacity and to provide local dial-up Internet service to rural areas. In light of the Telecommunications Act's requirement that schools, health care providers, and libraries have access to advanced telecommunications services, and that rural areas have access to advanced services that are comparable to those provided in urban areas, sufficient targeted funding for these purposes is essential in fiscal year 2001.

CONCLUSION

The development of the nationwide telecommunications network into an information superhighway, as envisioned by policymakers, will help rural America survive and prosper in any market—whether local, regional, national, or global. However, without the availability of low-cost RUS funds, building the information superhighway in communities that are isolated and thinly populated will be untenable. By supporting the RUS telecommunications programs at the requested levels, the Subcommittee will be making a significant contribution to the future of rural America at a negligible cost to the taxpayer.

PREPARED STATEMENT OF THE PHARMACEUTICAL RESEARCH AND MANUFACTURERS OF AMERICA

Mr. Chairman and Members of the Subcommittee: On behalf of the Pharmaceutical Research and Manufacturers of America (PhRMA), I present recommendations on the fiscal year 2000 budget request submitted by the Administration for the Food and Drug Administration, for inclusion in the Subcommittee hearing record. PhRMA represents the country's leading research-based pharmaceutical and biotechnology companies, which are devoted to investing more than \$24 billion annually in discovering and developing new medicines. PhRMA companies are leading the search for new cures and treatments.

We recognize the difficulties confronting the Subcommittee in meeting overall domestic spending caps affecting programs under your jurisdiction, under the 1997 budget agreement. We also recognize that pressures on appropriators to ensure an appropriate level of U.S. defense spending is likely to be even greater in light of the recent military activity with NATO. Decisions about which domestic programs to maintain or increase thus will be even more difficult. We urge you, however, to remember that many of the fruits of biomedical research are brought to the bedsides of patients through the research and development of new pharmaceuticals and through actions by the FDA to bring those safe and effective medicines to patients

as soon as possible. To achieve this translation of medical research into better health for our citizens requires a commitment to appropriate funding for FDA.

That is why PhRMA fully supports the Administration's fiscal year 2000 request for budget authority specifically for direct federal appropriations of \$1.016 billion (excluding rental payments of \$95 million) for FDA salaries and expenses. This account is the major and essential component of FDA's resources, and the budget request represents a \$128 million increase over the appropriations enacted by Congress for the current fiscal year under Public Law 105-227.

This level of funding is particularly important under the "trigger" provisions of the 1997 FDA Modernization Act (FDAMA) if the pharmaceutical industry is to continue to be required to pay the user fees that have enabled FDA to make new life-saving, cost effective medicines available to patients much more quickly. The trigger provisions require that general fund appropriations for all FDA salaries and expenses must equal or exceed the fiscal year 1997 appropriation level (excluding user fees), as adjusted for inflation or changes in discretionary budget authority for overall domestic spending, beginning after fiscal year 1997.

As FDA Commissioner Jane E. Henney, M.D., noted in her recent prepared testimony before your Subcommittee, FDA's dedication to the health and safety of the American people is well established. It is America's most important consumer protection agency. The FDA regulates products that account for one-quarter of all consumer spending and that comprise about \$1 trillion in sales—including foods, medical and radiological devices, medicines, animal drugs, and cosmetics. These are goods that Americans expect to be safe and reliable.

However, Congress has imposed increasing responsibilities on FDA's staff during the past decade—most recently, under FDAMA and the Animal Drug Availability Act. For example, FDAMA requires that FDA inspect establishments that make drugs and devices every two years. But between 1990 and 1998, the number of firms subject to inspections reportedly rose from 89,000 to 114,000—a 28 percent increase.

In addition, the agency has had to respond quickly to an increasing variety of new public health issues, such as ensuring the safety of food and the nation's blood supply. For these reasons, it is of critical importance that FDA be able to retain and recruit highly qualified staff.

The research-based pharmaceutical and biotechnology industries are particularly concerned that FDA be able to continue to meet highly important performance goals, mutually agreed upon in an historic compact between FDA, Congress and industry. The agreement was first reached in 1992 in the Prescription Drug User Fee Act (PDUFA) and was confirmed in 1997 under FDAMA as PDUFA II. The total FDA "program" request for salaries and expenses in fiscal year 2000 includes authorized appropriations of over \$145 million for PDUFA II user fees—an increase of some \$13 million over the current fiscal year, to add staff to handle vitally important drug reviews. During fiscal year 1998-2002, pharmaceutical companies will pay over \$550 million in user fees under FDAMA, so FDA can continue to reduce both review and overall drug development times. As FDA Commissioner Henney has testified: "PDUFA is among the most successful agency programs in history. Within its first five years of implementation, the increased resources provided by PDUFA to hire additional review staff has resulted in cutting the average review times for new drugs, without compromising the high standards that FDA has traditionally applied in weighing the risks and benefits of new drugs and thereby in determining their safety and effectiveness."

Under PDUFA, the pharmaceutical industry and FDA are continuing to work to serve a common client—the patient. The industry is working to develop new and better drugs, FDA is striving to improve the drug development and review process.

The critical importance of this partnership, in cooperation with Congress, in delivering new medicines to patients as soon as possible cannot be overemphasized. The 30 new drugs and 9 new biologics approved by FDA in 1998 are to treat diseases that affect 180 million patients and that cost more than \$400 billion a year. New treatments include medicines for patients suffering from AIDS, cancer, including breast cancer, cardiovascular disease, Crohn's disease, tuberculosis, rheumatoid arthritis, depression, Parkinson's disease, erectile dysfunction, and the first vaccines to prevent Lyme disease and retrovirus infection.

The prescription drug user fee program—which must be sharply distinguished from proposals for general purpose user fees—is based on three key principles:

- User fees must supplement FDA appropriations, not substitute for them.
- User fees must be targeted to the review and approval of innovative prescription medicines and their supplemental indications, and are not to be used for general agency activities.
- User fees must be applied to meet specific performance goals, agreed upon by FDA, to ensure the timely review and approval of new drugs.

Before user fees, FDA review times averaged about 30 months. But the 30 drugs approved in 1998 were reviewed in an average of 11.7 months slightly better than the 12-month goal specified in PDUFA II. FDA also exceeded the fiscal year 1998 goal to review 90 percent of all standard new drug and biologic applications within 12 months, by completing 100 percent of the reviews within this timeframe.

The prescription drug user fees collected in fiscal year 2000 will enable FDA to continue to meet its PDUFA II performance goals, including:

- Review and act upon 90 percent of standard original NDA and PLA/BLA submissions filed during fiscal year 2000 within 12 months of receipt, and review and act on 50 percent within 10 months of receipt.
- Review and act on 90 percent of priority original drug NDA and biotechnology BLA submissions filed during fiscal year 2000 within six months of receipt.
- Review and act on 90 percent of standard drug efficacy supplements filed during fiscal year 2000 within 12 months of receipt, and review and act on 50 percent within 10 months of receipt.
- Review and act on 90 percent of priority drug efficacy supplements filed during fiscal year 2000 within six months of receipt.

What this means is that FDA can continue to build on its record of helping patients to obtain new medicines more than a year and a half sooner than they did before user fees were enacted, while maintaining its high standards of safety and effectiveness.

In addition, FDAMA contains important provisions that facilitate access by patients to experimental drugs; give FDA more flexibility in determining effectiveness; expand access by doctors to peer-reviewed medical information; and encourage the development and testing of medicines for children.

The U.S. system of new drug approvals is the most rigorous in the world. On average, a company invests about \$500 million and takes about 12–15 years to discover and develop a new drug. Only five in 5,000 compounds that enter preclinical testing make it to human testing. And only one of these five is approved for use by patients.

R&D investment by research-based pharmaceutical firms continues to break records. In 1999, pharmaceutical companies will invest \$24 billion to discover and develop important new medicines. That figure represents a 14.1 percent increase over last year's record setting R&D spending. And no industry devotes a higher percentage of sales to R&D—20.8 percent—than the research-based pharmaceutical industry.

However, the pharmaceutical industry's ever increasing R&D investment, and FDA's determined efforts to improve the drug development and review process, will be nullified if adequately increased baseline appropriations for all of the agency's programs are not provided.

For these reasons, PhRMA strongly urges that Congress appropriate \$1.016 billion (exclusive of rental payments) in fiscal year 2000 for FDA salaries and expenses, as requested by the Administration, to ensure that the agency can fulfill its vital responsibilities to promote and protect the health and safety of the American people.

PREPARED STATEMENT OF THE PREDATOR CONSERVATION ALLIANCE

I am writing you regarding appropriations of federal funds for the U.S. Department of Agriculture "Wildlife Services" program (formerly called, "Animal Damage Control"). I am writing on behalf of Predator Conservation Alliance, a non-profit conservation organization based in Bozeman, Montana. We urge you and the other members of the Subcommittee to cut \$10 million from Wildlife Service's "livestock protection" program, which is almost entirely comprised of lethal predator control in the western United States.

The federal Wildlife Services program has received much public scrutiny and criticism for its livestock protection program, which primarily involves killing coyotes, mountain lions and other predators. The problem with the USDA's Wildlife Services program is that public money is being spent to kill publicly owned wildlife, often on public lands, for the benefit of a small percentage of private livestock producers, who are neither required to change their management practices to reduce livestock/predator conflicts nor directly pay for this government "service." Of the federal funds Congress allocates to Wildlife Services, we find that the majority goes to the western states, and the majority of that is spent on killing predators.

Our analysis of Wildlife Service's own data on its expenditures and kill figures from fiscal year 1998 (the most recent data available to the public) reveals the following problems:

- Despite a Clinton Administration policy that federal dollars should fund no more than half of Wildlife Services' state office expenditures, this is violated in 10 of the 17 western states;
- Western livestock producers, including individuals and organizations, contributed less than 17 percent in direct payments for livestock protection, and less than 29 percent when indirect payments to county governments (typically due to a "head" tax on livestock) are included;
- Livestock protection—which is almost exclusively lethal predator control—accounts for three-fifths (61 percent) of Wildlife Services' western state office expenditures, and about the same percentage of the (63 percent) of its western state office expenditures of federally appropriated funds;
- Over the past several years, Wildlife Services' western state office expenditures to kill predators has exceeded reported livestock losses to predators in those states by more than three times!

Predator Project considers the Clinton Administration's recent proposal to reduce Wildlife Services' operational budget for fiscal year 2001 by \$2.8 million a step in the right direction. However, we urge Congress to further reduce Wildlife Services' budget by \$10 million, by eliminating federal appropriations for the lethal predator control work conducted through the Wildlife Services' "livestock protection" program. For fiscal year 1998 (the most recent years for which figures are available) Wildlife Services state offices spent \$9.58 million of federally appropriated funds on livestock protection. We propose a \$10 million cut in Wildlife Services' annual federal appropriations to eliminate this aspect of the Wildlife Services program. It is important to note that this total comprises the amount spent by state offices only. Additional federally appropriated funds are spent by the western and national Wildlife Services offices to manage lethal predator control work; these funds will be unaffected by this cut, and will therefore be available to provide technical assistance to livestock producers, targeted lethal predator control, and other Wildlife Services activities in the western 17 states. Eastern Wildlife Services activities, which largely assist landowners in managing their own wildlife problems, would be unaffected by this reduction.

Predator Conservation Alliance is not alone in suggesting that Congress end the wildlife control program. In January, an unusual coalition of taxpayer and environmental groups released "Green Scissors 2000—Cutting Wasteful and Environmentally Harmful Spending" (see attached). Wildlife Services was one of 77 programs which the report recommended be cut, because the program is "preying on taxpayers." According to the report, not only is the program harmful and costly, it does not even work: "This program kills hundreds of thousands of wild animals, but has not significantly reduced livestock losses due to predators." In addition, Wildlife Services' livestock protection activities benefit western ranchers to the exclusion of most eastern ranchers. In fact, data recently obtained by the New Mexico-based group New West Research reveal that only a small percentage of western ranchers use Wildlife Services.

A final good reason for cutting the predator control component of Wildlife Services' budget is that this program is outdated and no longer supported by the majority of Americans. Our nation spends millions of dollars each year to aid wildlife, and the killing of wildlife by Wildlife Services directly contravenes these efforts.

We look forward to working with you to reduce the Federal Government's operations and budget on this issue.

PREPARED STATEMENT OF THE RED RIVER VALLEY ASSOCIATION

Mr. Chairman and members of the Committee. I am Wayne Dowd, and I am pleased to represent the Red River Valley Association as its President. Our organization was founded in 1925 with the express purpose of uniting the citizens of Arkansas, Louisiana, Oklahoma and Texas to develop the land and water resources of the Red River Basin.

As an organization that knows the value of our precious water resources we support the most beneficial water and land conservation programs administered through the Natural Resources Conservation Service (NRCS). We understand how important a balanced budget is to our nation; however, we cannot sacrifice what has been accomplished. The NRCS programs are a model of how conservation programs should be administered and our testimony will address the needs of the nation as well as our region. We believe strongly that the whole, national program must be preserved.

We appreciate that the fiscal year 2001 President's budget increases the NRCS overall funding; however, some programs are NOT adequately funded, to the det-

rimment of the agency and our citizens. The increases are earmarked for grants, financial assistance and other non-federal personnel items. The effect is a decrease of funds for direct technical assistance.

We would like to address several of the programs affected by the President's fiscal year 2001 budget proposal. Failure to fund these initiatives would reduce assistance to those who need it.

Conservation Operations Budget.—This has been in steady decline in real dollars over the past several years. This has apparently happened partly as a result of dollars being diverted from Conservation Operations to fund new programs, especially the increases in financial assistance for conservation. We appreciate the increase for Conservation Technical Assistance to \$653,805,000; however, this falls short of what is required. We request that \$900 million be appropriated for Conservation Technical Assistance.

Conservation Technical Assistance is the foundation of technical support for conservation to the private users and owners of land in the United States. The President's Clean Water Action Plan and the Unified Strategy for Animal Feeding Operations will rely heavily on the technical assistance provided through NRCS's Conservation Operations Program. However, the Administration's proposal is to increase CCC programs such as WRP, EQIP, CRP and the newly proposed CSP. The problem is that personnel funded from these programs can only provide technical assistance for those enrolled in these cost share programs leaving a large percent of the agricultural community without technical assistance. We recommend that funding for all technical assistance should be placed in 'Conservation Technical Assistance' and allow NRCS to perform their mission of implementing these programs and providing assistance to everyone, including those not fortunate enough to be selected to participate in cost share programs..

With increases to EPA's manpower and decreases to NRCS you are emphasizing enforcement and reducing assistance. This is the wrong way to go. We encourage you to change this trend and allow our agricultural community to have access to technology for better conservation than be harassed by the constant threat of penalties for non-compliance.

Section 11 Caps.—Another factor which has seriously reduced the ability of NRCS to meet the considerable demands for its technical assistance is the limitation on funding which can be provided to NRCS due to the Section 11 cap on transfer of funds from the Community Credit Corporation (CCC). The CCC provides the funding for NRCS technical assistance for several programs including EQIP and CRP. Currently, this cap prevents NRCS from covering its staff costs for these crucial programs. We support the lifting of the Section 11 cap which was established before EQIP, CRP and WRP were created.

Watershed and Flood Prevention Operations (Public Laws 566 & 534).—More than 10,400 individual structures have been installed nationally. They have contributed greatly to conservation, environmental protection and enhancement, economic development and the social well being of our communities. More than half of these structures are over 30 years old and several hundred are approaching their 50 year planned life.

Today you hear alot about the watershed approach to resource management. These programs offer a complete watershed management approach and should continue for the following reasons:

- They protect people and communities from flooding.
- Their objectives and functions sustain our nation's natural resources for future operations.
- They are only federally assisted and do not grow the federal government.
- Initiatives and decisions are driven by the communities.
- They are cost shared.
- They follow NEPA guidelines and enhance the environment.
- They often address the need of low income and minority communities.
- The benefit to cost ratio of this program has been evaluated to be 2.2:1.

What other federal programs can claim such success?

There is no doubt of the value of this program. The cost of losing this infrastructure exceeds the cost to reinvest in our existing watersheds. Without repairing and upgrading the safety of existing structures we will miss the opportunity to keep our communities alive and prosperous. It would be irresponsible to dismantle a program that has demonstrated such great return and is wanted by our citizens.

We fully support H.R. 728, introduced in the 106th Congress by Representative Frank Lucas (R-OK) and Representative Wes Watkins (R-OK) as well as S. 1762 introduced by Senator Blanche Lincoln (D-AR); both from the Red River Valley Region. This is a crucial bill to address a serious problem.

In addition to the needs for reinvesting in existing infrastructure there are many new projects which are awaiting funds to be built. The present level, outlined in the budget, of \$43.4 million is not adequate. We strongly recommend that a funding level of \$250 million be dedicated to Flood Prevention; Public Law 534, \$30 million, and Watershed Operations Public Law 566, \$220 million. This is more realistic and compares to the programs appropriated in the years prior to 1997. At the proposed funding level it would take over 30 years to complete just the identified projects, with no attention given to rehabilitation needs.

Emergency Watershed Protection Program.—This program comes under Watershed and Flood Prevention Operations, but is a separate line item. This has been a zero budget item; however, there will always be emergency needs.

As our land use expands, to include sensitive environmental ecosystems, major weather events will have an adverse impact requiring NRCS to assist under this program; therefore it should be funded up front. It is important for NRCS to be prepared for a rapid response. With funds available they can react immediately to an emergency when it occurs.

We request that a minimum of \$20 million be appropriated for this program in the fiscal year 2001 budget and that these funds are not taken from elsewhere in the NRCS budget.

Conservation Reserve Program (CRP).—This program, administered by Farm Services Agency, impacts NRCS the most. NRCS conducts and is reimbursed for the technical assistance of this program.

We agree with the President's initiative to increase the enrollment cap and request that, as a minimum, the CRP cap be increased to 45 million acres. This is an extremely beneficial program to our nation and should not be allowed to expire. It provides a safety net to those farmers trying to make a living on the marginal lands most suited for this program.

Watershed Survey and Planning.—This was budgeted by the President at \$10.4 million and is an extremely important community program. NRCS has used this to become a facilitator for the different community interest groups, state and federal agencies.

As our municipalities expand the water resource issue tend to be neglected until a serious problem occurs. Proper planning and cooperative efforts, through this program, can prevent problems and insure the water resource issues are met. We request that this program be funded at a level of \$25 million.

Forestry Incentives Program.—The President's budget has no funding for this program. Congress transferred this program to NRCS from the Farm Service Agency as a restructuring in the Federal Agricultural Improvement and Reform Act of 1996. Forestry on small, privately owned lands is recognized as a farming activity. NRCS is the best agency to administer this program which assists farmers in production agriculture. It is more than just a timber production program. Forests are the most effective land users as they relate to water quality, non point source pollution, air quality, greenhouse gas reduction and wildlife habitat.

We request Congress fund the Forestry Incentives Program at a level of \$6.5 million for fiscal year 2001.

Environmental Quality Incentives Program (EQIP).—Requests for assistance through the EQIP program have been overwhelming. The resulting requests far exceed the available funds and is an additional workload on NRCS's delivery system. Additionally, adequate funding for technical assistance must be provided to implement the program at a minimum of 19 percent of the total program.

The \$325 million proposed by the President for the EQIP program is an adequate budget for fiscal year 2001; and the technical assistance for this program budgeted at \$61.750 million meets the 19 percent level.

Wetlands Reserve Program (WRP).—This is a very popular and important program. It serves as a safety net to those farmers trying to make a living on these marginal lands. It also addresses conservation needs from water quality to global warming.

We agree with the President's request to raise the cap 560,000 acres over two years. We strongly recommend that this program be supported at this level. This will allow the program to continue until fiscal year 2002 when a reauthorization for the program can be made.

Red Bayou Irrigation "Demonstration Project".—Recent findings in the Natural Resources Inventory (NRI) have concluded that irrigated agriculture is moving from western states to the east. A prime example of this is the interest to irrigate along the Red River in Arkansas and Louisiana. The drought conditions being experienced has accelerated the efforts of different regions to form irrigation districts and start the process to install systems. The farmers along Red Bayou, Caddo Parish, Louisiana, have been very aggressive in their attempts to become operational. We re-

quest that this project be 'earmarked' as a demonstration project to be used as a model throughout the Red River Valley. NRCS was requested to determine the cost for this irrigation system and we request maximum federal participation for funding of this endeavor.

Over 70 percent of our land is in private ownership. This is important to understanding the need for NRCS programs and technical assistance. Their presence is vital to ensuring sound technical standards are met in our conservation programs. These programs not only address agricultural production, but sound natural resource management. Without these programs and NRCS properly staffed to implement them many owners of our private lands will not apply conservation measures needed to sustain our natural resources for future generations.

The administration has proposed 'new' Clean Water Initiative, but why do they ignore the agency that has a proven record for implementing conservation watershed programs? Congress must decide: will NRCS continue to provide the leadership within the communities to build upon the partnerships already established? The President's proposal does not provide for that leadership and so it is up to Congress to insure NRCS is properly funded and staffed to provide the needed help to our taxpayers for conservation programs. This can be accomplished simply by Funding Conservation Technical Assistance at \$900 million and eliminating the Section 11 Caps.

All these programs apply to the citizens in the Red River Valley and we are concerned for the future. The RRVA is dedicated to work toward the programs which will benefit our citizens and provide for high quality of life standards. We therefore request that you appropriate the required funding levels within the individual programs to insure our nation's conservation needs are met.

I thank you for the opportunity to present this testimony on behalf of the members of the Red River Valley Association and we pledge our support to assist you in the appropriation process

Grant Disclosure.—The Red River Valley Association has not received any federal grant, subgrant or contract during the current fiscal year or either of the two previous fiscal years.

REGIONAL AQUACULTURE CENTERS

PREPARED STATEMENT OF LESTER W. MYERS, SOUTHERN REGIONAL AQUACULTURE CENTER

Mr. Chairman and Members of the Subcommittee, I thank you for the opportunity to provide testimony in support of the USDA-CSREES Regional Aquaculture Centers. My name is Lester Myers. I own and operate a catfish farm near Inverness, Mississippi, and am President and General Manager of Delta Western, Inc., Indianola, Mississippi, the largest catfish feed mill in the United States.

Over the last 20 years, aquaculture has become an important part of United States agriculture. Production of channel catfish, the largest sector of domestic aquaculture, has increased more than 30 percent in the last 10 years—a growth rate matched by very few industries. Farm-raised channel catfish now makes up a remarkably large proportion of domestic seafood consumption and, on a value basis, catfish ranks fourth in the United States, behind only shrimp, salmon, and crabs. Further, a significant portion of the salmon consumed by Americans also derives from aquaculture.

As the catch from wild fisheries continues to decline, with no end in sight, the shortfall in seafood production must be met by increased aquaculture production. However, continued expansion and profitability of the aquaculture industry will depend on development of new technology to reduce production costs and make production more competitive in the global market. For the past several years, I have been actively involved with the Southern Regional Aquaculture Center as Chairman of the Industry Advisory Council, and I feel that the Regional Aquaculture Center program is essential to help meet the need for technology development. Already, results from the Regional Center projects are having a significant impact on domestic aquaculture. I would like to illustrate that point with the results of one project that I am very familiar with through my role as General Manager of a catfish feed mill.

Feeds represent about half the cost of raising fish in aquaculture, so advances in feed formulation and feeding practices can have a great impact on profitability. The recently completed project "Improving Production Efficiency of Warmwater Aquaculture Species through Nutrition" was one of the most successful projects developed through the Southern Regional Aquaculture Center. Scientists from nine states—Alabama, Arkansas, Georgia, Kentucky, Louisiana, Mississippi, North Carolina,

Tennessee, and Texas—cooperated on the project. These researchers, worked collaboratively to identify the most cost-effective levels of vitamin and protein supplementation in feeds. Their work resulted in improved feed formulations and feeding practices that have saved the catfish, baitfish, and striped bass industries millions of dollars a year. For example, in the catfish industry alone, feed costs have been reduced \$2–\$4 a ton as a direct result of work on this project. Assuming overall feed use of 600,000 tons per year in the catfish industry, cost savings average \$1.8 million annually—over three times the amount spent on this project over its 3-year duration.

The project mentioned above is just one of many projects supported through the Regional Center program that return economic benefits many times the amount invested. This funding efficiency is the result of the decentralized structure of the Regional Centers and the unique cooperative process used to develop research projects.

In summary, representatives of the U.S. aquaculture industry are convinced that the Regional Aquaculture Center programs are highly valuable and productive. Additional new research findings will help insure future success for aquaculture production in the United States. The authorized level of funding for the five Regional Aquaculture Centers is \$7.5 million annually. Despite an outstanding performance record and an organizational structure that has become a model for collaborative research in agriculture, funding for the Regional Center program has remained level at half the authorized level of funding, or \$4.0 million per year (\$800,000 for each of the five Regions). This has resulted in a steady erosion of actual operating funds, at the very time when industry expansion calls for greater investment in research and development. I respectfully request that you recommend the full authorized level of \$7.5 million for the existing five Centers to support these extraordinarily important and effective programs.

On behalf of the U.S. aquaculture industry, I thank you for the opportunity to present testimony in support of the Regional Aquaculture Centers, and express my sincere appreciation for the support you have provided in previous years. Again, I would like to emphasize that significant benefits have already been provided from work conducted by these Centers and additional funding is urgently needed by our industry.

PREPARED STATEMENT OF RAMSEY REIMERS, TROPICAL AND SUBTROPICAL REGIONAL
AQUACULTURE CENTER

Mr. Chairman and Members of the Subcommittee: Thank you for allowing me the opportunity to submit testimony on behalf of the Regional Aquaculture Centers and the Center for Tropical and Subtropical Aquaculture.

Robert Reimers Enterprises, Inc. has been involved in various aquaculture projects for the last 15 years. Until two years ago, we were the only private sector company involved in aquaculture in the Republic of the Marshall Islands.

To date, we have experimented with a wide range of aquaculture products including Corals, Giant Clams, Sponges, Sea Cucumbers, Trochus Shell, Moi (Threadfin Shad), Shrimp and Black Pearl Oysters. We have invested over \$1,000,000 in these ventures and our aquaculture facility is the largest of its kind in Micronesia.

The investments we have made to date are now experiencing a financial return. Our Giant Clam Farm is now cash flow positive and the Black Pearl Oyster project shows tremendous potential. These projects represent two of the very few export products that our country produces, bringing in foreign exchange dollars and providing employment for our local residents.

We can say, unequivocally, that a large portion of our success to date is due to our relationship with the Center for Tropical and Subtropical Aquaculture (CTSA) and their direct involvement in our programs.

CTSA provides a critical link between the scientific community and farm operators through the Aquaculture Extension/Development project which operates in our region. Intensive extension services were provided to us in Giant Clam, Coral, Moi and Black Pearl Oyster culture. Without the hands on demonstrations and the frequent research bulletins provided, we would not have had the ability or courage to enter these industries. Just as important is the constant encouragement and moral support that we receive from all levels of CTSA personnel. For companies pioneering aquaculture ventures in third world countries such as ours, this level of support was absolutely essential.

In addition to the Extension/Development services, CTSA provides an opportunity to directly learn from others in our industry. The annual Industry Advisory Council meeting is one example. For those living in the more remote locations of the Pacific, this meeting provides an especially valued opportunity to meet with other aquaculture professionals, to discuss problems related to our regional industry develop-

ment, to hear of new products and techniques, and to make synergistic business contacts.

CTSA works hard at its mission to develop the aquaculture industry and potential in its region. The management of CTSA makes a concerted effort to listen to industry and respond to industry issues. This is most refreshing coming from what many may view as an obscure research facility. CTSA conducts the research that we, the industry and investors, want to have done. CTSA research helps streamline our processes and will ensure the economic success and continued growth of our projects for as long as it is in existence.

It is our hope that with this testimony, your esteemed offices will consider continued and expanded support for this valuable agency, the Center for Tropical and Subtropical Aquaculture.

PREPARED STATEMENT OF CARTER NEWELL, NORTHEASTERN REGIONAL AQUACULTURE CENTER

Mr. Chairman and members of the Subcommittee: I am Carter Newell of Great Eastern Mussel Farms and Pemaquid Oyster Company, two shellfish aquaculture companies located in mid-coast Maine. I am the immediate past Board Chair of the Maine Aquaculture Innovation Center, and I also sit on a marine advisory panel for the newly-formed Maine Technology Institute. I have been active in commercial aquaculture in my state for twenty-five years.

Although most aquaculture in Maine is conducted in the ocean, our finfish and shellfish growers have much in common with land-based farmers, especially those who rear livestock. We have many similar problems and concerns. It is understandable therefore that we often look to the United States Department of Agriculture (USDA) for assistance. In Maine we believe that USDA, with its research, extension, and commercialization experience has much to offer our growing aquaculture industry.

We connect with USDA through the Northeastern Regional Aquaculture Center (NRAC) which has its office in Massachusetts near New Bedford. Each of the twelve northeastern-most states and the District of Columbia are represented on the NRAC Board of Directors. Through their NRAC affiliation, land grant universities and state trade associations are able to keep up to date with USDA's activities relating to aquaculture industry development.

Recently, the U.S. Department of Commerce (DOC), has taken an increased interest in aquaculture, particularly marine culture. The National Sea Grant College Program, a DOC agency has been involved in NRAC from the beginning. Therefore it can be said that NRAC provides a bridge between Federal agencies, as well as a bridge between the Federal Government and aquaculture in the states.

The recently completed National Census of Aquaculture, based on 1998 data, shows that Maine overall has the fourth largest aquaculture industry in the United States, behind Florida, Mississippi, and Arkansas. However, when it comes to mariculture (ocean aquaculture) Maine is the top producer in the United States. The value of Maine's Atlantic salmon, oyster, and mussel harvests this year is expected to exceed \$67 million at the farm gate. This makes aquaculture an important force for economic development in my state.

I am personally involved in an initiative designed to increase one segment of aquaculture in Maine. Four years ago, as Chair of the Maine Aquaculture Innovation Center, I established a "Mussel Working Group" tasked with the responsibility of investigating whether mussel "suspension culture" (from rafts or longlines) could work in Maine. Public interest in this project has been encouraging. We now have over 80 people (many are capture fishermen) who are actively following the progress of our investigations regarding the suspension culture of mussels. Ten rafts of varying designs are now in place.

Suspension techniques, long utilized in European waters, and off Prince Edward Island in Canada, seem to show promise. But we still face a number of serious obstacles, and this is where an organization like NRAC can play an important role. Let me give you an example.

We are learning that bird predation—mostly from eider ducks, threatens the success of mussel rafts. We need to comprehensively focus on ways to keep waterfowl away from the rafts, through the use of acoustical devices or protective netting. Now, Maine has sources to which a commercial farm can go for sponsorship of aquacultural research, but usually, state agencies require match funding. Here is where the RACs can make a real difference.

In the past, NRAC has assisted industry by bringing people together, sponsoring research on environmental, disease, and marketing topics, and effectively communicating the outcome of research of interest to industry. With additional annual ap-

ropriations from the Congress, NRAC could do much more in the area of applied commercial research. Support from USDA could be matched with support from state sources, academia and industry. Working together, these partners could concentrate their efforts on the obstacles that currently prevent entrepreneurs from making major leaps forward.

You are all aware, I believe, that aquaculture does not fit neatly into one department of the Federal government. At last count, some fourteen Federal agencies are involved in one way or another with our fledgling industry.

Imagine how this situation confounds the young businessperson trying to establish an aquafarm. Right now, the Northeastern Regional Aquaculture Center is the best place for an interested person to go and obtain Federal information concerning fish farming. By linking with NRAC, the prospective fish farmer can identify people who can provide assistance and training, can obtain fact sheets and easy to read reports on completed and ongoing research. The "information clearing house" function alone should justify continued Congressional support of the RACs.

As the industry becomes more sophisticated, its members will realize that the RACs can play a greater role. We ask that your subcommittee give the RACs the resources they need to realize their full potential.

Thank you for your attention to these remarks.

PREPARED STATEMENT OF MYRON KLOUBEC, MIDWEST REGIONAL AQUACULTURE
CENTER

Thank you Mr. Chairman and Members of the Subcommittee for allowing me the opportunity to submit testimony on behalf of the Regional Aquaculture Center Program. Kloubec Fish Farms is one of the Midwest's largest fish producing operations with hatchery, fingerling ponds, and indoor food fish facilities. Originally conceived by my father as a hobby in 1976, it was later developed by myself into a permanent alternative agriculture business in 1981. The business has had considerable success supplying a wide variety of fingerling stock into numerous recreational areas, including regional farm ponds, state and county parks, and private lakes. Since 1981 Kloubec Fish Farms has evolved into a wholesale and retail distributor of quality fish for sale nationwide, and has spread into international markets. My farm has expanded from four ponds and three species in 1976, to over 50 ponds and 14 species currently covering 50 acres. Consisting of spawning labs and a hatchery, Kloubec Fish Farms has become Iowa's largest privately owned and operated fish farm. The operation now has 2 employees. Given the necessary financial and operational inducements I think that my aquaculture operation is an example of what can be done in today's agriculture.

Aquaculture is a young and developing industry, especially here in the Midwest. As with any new agricultural enterprise, we have had to produce new products that consumers wanted as well as obtain the necessary financing to allow our operation to keep growing. At the same time regulations associated with aquaculture have not always been that conducive to the private sector. I personally see a bright future for aquaculture in the U.S. as long the following occurs: (1) increasing research and technology transfer activities in aquaculture, (2) reduce the over-regulation of aquaculture (state and federal), and (3) provide more access to financing for aquaculture ventures. One way in which Congress can influence these factors is to fully fund the \$7.5 million authorization for the Regional Aquaculture Centers; Congress has never fully funded the Centers. If the fully authorized amount is not appropriated, then they should at least be funded at the level they have received over the last few years which is \$4.0 million. The savings in increased taxes resulting from less imports and more domestic production in aquaculture will help to produce a sound economy for this county. Thank you.

PREPARED STATEMENT OF THE SANTA CLARA VALLEY WATER DISTRICT

SUMMARY

The statement urges the Committee to support adequate funding for the Public Law 566 program in the Administration's budget to provide \$1 million for the Llagas Creek Project and \$6 million for the Lower Silver Creek Project.

BACKGROUND

The Public Law 566 Watershed Protection and Flood Prevention Program has provided funding for flood prevention projects that have benefitted communities and agricultural interests throughout the United States. Beginning in 1954, the Santa Clara Valley Water District (District) has participated in the program with three

projects in Santa Clara County: Llagas Creek Project, Lower Silver Creek Project, and Upper Penitencia Creek Project. The passage of the federal 1990 Farm Bill, however, halted the Natural Resources Conservation Service watershed plan for Upper Penitencia Creek. Despite the project's high benefit-to-cost ratio of 1.7 to 1.0, the U.S. Department of Agriculture would not approve the project under the Farm Bill because the agricultural benefits are less than the prescribed 20 percent.

PROJECT SYNOPSIS

Public Law 566 projects in Santa Clara County have been significantly delayed in recent years because of the program's limited funding. This drawn-out schedule has caused a significant hardship for the communities. For example, in Morgan Hill, where residents have been waiting since 1954 for project completion, severe flood damages were sustained in 1997 and 1998 from Llagas Creek.

Llagas Creek Project

The Llagas Creek Project is located in the southern Santa Clara County and serves the communities of Gilroy, San Martin, and Morgan Hill. Llagas Creek has flooded in 1937, 1955, 1958, 1962, 1963, 1969, 1982, 1986, 1996, 1997, and 1998. In the areas of Morgan Hill and San Martin, where protection is proposed, flood damages of \$150,000 were sustained in 1997 and \$200,000 in 1998. However, in both years, the floods did not damage Gilroy, which was protected by the completed portion of the Llagas Creek Project.

The proposed project will protect more than 1,100 homes, 500 commercial and industrial buildings, and 1,300 agricultural acres from a 1 percent flood.

The Llagas Creek Project has not been funded for the last four years by the Natural Resources Conservation Service. The legal transfer of construction authority and program funding from the U.S. Department of Agriculture to the U.S. Army Corps of Engineers (Corps) was completed under the Water Resources Development Act of 1999 (Section 501).

Lower Silver Creek Project

The Lower Silver Creek Project is located in eastern Santa Clara County, within the boundaries of the city of San Jose. The creek has flooded in 1952, 1955, 1958, 1967, 1982, 1983, and 1986. The proposed project on Lower Silver Creek will primarily protect a residential area in eastern San Jose. Approximately 1,400 buildings are located in this flood prone area. Due to curtailment of Public Law 566 federal funding, the District is working with the Natural Resources Conservation Service on a reimbursement agreement to design and build the Lower Silver Creek Project.

FISCAL YEAR 2000 FUNDING

The level of Natural Resources Conservation Service funding for the fiscal year 2000 Public Law 566 program did not provide funds for the Lower Silver Creek Project. \$250,000 was appropriated for Llagas Creek in the Corps budget.

FISCAL YEAR 2001 FUNDING RECOMMENDATION

Based on the need to provide critical flood protection for Santa Clara County, it is requested that the Congressional Committee support adequate funding for the Public Law 566 program in the Administration's fiscal year 2001 budget to provide \$1 million for the Llagas Creek Project and \$6 million for the Lower Silver Creek Project.

PREPARED STATEMENT OF THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe of Florida is pleased to submit this statement regarding the fiscal year 2001 budget for the Natural Resources Conservation Service (NRCS) in the Department of Agriculture. The Tribe asks that Congress provide \$903.8 million for NRCS's Conservation Operations-01 Partnership; this request exceeds the administration's budget request for fiscal Year 2001 by \$250 million. The Seminole Tribe's agricultural enterprises and environmental programs benefit from the technical assistance the NRCS provides through its Conservation Operations Partnership. Recently, the Tribe has been working closely with the Florida State Conservationists on a number of 1996 Farm Bill programs and anticipates increased technical assistance needs in the coming fiscal year.

THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe lives in the Florida Everglades. The Big Cypress Reservation is located in the western basins, directly north of the Big Cypress National Preserve. The Everglades provide many Seminole Tribal members with their livelihood. Our traditional Seminole cultural, religious, and recreational activities, as well as commercial endeavors, are dependent on a healthy Everglades ecosystem. In fact, the Tribe's identity is so closely linked to the land that Tribal members believe that if the land dies, so will the Tribe.

During the Seminole Wars of the 19th Century, our Tribe found protection in the hostile Everglades. But for this harsh environment filled with sawgrass and alligators, the Seminole Tribe of Florida would not exist today. Once in the Everglades, we learned how to use the natural system for support without harm to the environment that sustained us. For example, our native dwelling, the chickee, is made of cypress logs and palmetto fronds and protects its inhabitants from the sun and rain, while allowing maximum circulation for cooling. When a chickee has outlived its useful life, the cypress and palmetto return to the earth to nourish the soil.

In response to social challenges within the Tribe, we looked to our Tribal elders for guidance. Our elders taught us to look to the land, for when the land was ill, the Tribe would soon be ill as well. When we looked at the land, we saw the Everglades in decline and recognized that we had to help mitigate the impacts of man on this natural system. At the same time, we acknowledged that this land must sustain our people, and thereby our culture. The clear message we heard from our elders and the land was that we must design a way of life to preserve the land and the Tribe. Tribal members must be able to work and sustain themselves. We need to protect the land and the animals, but we must also protect our Tribal farmers and ranchers.

Recognizing the needs of our land and our people, the Tribe, along with our consultants, designed a plan to mitigate the harm to the land and water systems within the Reservation while ensuring a sustainable future for the Seminole Tribe of Florida. The restoration plan will allow Tribal members to continue their farming and ranching activities while improving water quality and restoring natural hydroperiod to large portions of the native lands on the Reservation and ultimately, positively effecting the Big Cypress National Preserve and Everglades National Park.

The Seminole Tribe's project addresses the environmental degradation wrought by decades of federal flood control construction and polluted urban and agricultural runoff. The interrupted sheet flow and hydroperiod have stressed native species and encouraged the spread of exotic species. Nutrient-laden runoff has supported the rapid spread of cattails, which choke out the periphyton algae mat and sawgrass necessary for the success of the wet/dry cycle that supports the wildlife of the Everglades.

The Seminole Tribe designed an Everglades Restoration project to allow the Tribe to sustain ourselves while reducing impacts on the Everglades. The Seminole Tribe is committed to improving the water quality and flows on the Big Cypress Reservation. We have already committed significant resources to the design of this project and to our water quality data collection and monitoring system. We are willing to continue our efforts and to commit more resources, for our cultural survival is at stake.

In addition to addressing the ecosystem concerns related to the Big Cypress Reservation, the Tribe has been actively involved in the development of the ecosystem-wide restoration plan. The Tribe, as an active member of both the Governor's Commission for a Sustainable South Florida and the South Florida Ecosystem Restoration Task Force and Working Group, has worked cooperatively with our neighbors to design a sustainable future for all of South Florida.

SEMINOLE TRIBE EVERGLADES RESTORATION INITIATIVE

The Tribe has developed a conceptual water conservation plan that will enable us to meet new water quality standards essential to the cleanup of our part of the South Florida ecosystem and to plan for the storage and conveyance of our water rights. We have also designed, with the assistance of the NRCS, the Tribe's best management practices program. We continue to use available funds to further the design and planning work necessary to implement our Everglades Restoration Initiative.

The Tribe's Everglades Restoration Initiative is designed to mitigate the degradation the Everglades has suffered through decades of flood control projects and urban and agricultural use and ultimately to restore the nation's largest wetlands to a healthy state. Our Everglades Restoration Initiative will enable the Tribe:

- to collect and monitor data to establish a baseline and to evaluate performance of the overall system design;
- to design and construct surface water management systems to remove phosphorus, convey and store irrigation water, improve flood control, and rehydrate the Big Cypress National Preserve;
- to commit to the long-term operation and maintenance of new water management systems; and
- to design and implement comprehensive best management practices for the Big Cypress Reservation.

This project will enable the Tribe to meet proposed numeric target for low phosphorus concentrations that is being used for design purposes by state and federal authorities. It will also provide an important public benefit: a new system to convey excess water from the western basins to the Big Cypress National Preserve, where water is vitally needed for rehydration and restoration of lands within the Preserve.

CONCLUSION

Everglades restoration is a well-recognized national priority. Through its assistance to the Tribe, NRCS has provided valuable technical assistance to date. Beginning in fiscal year 1999, NRCS has provided programmatic support through EQIP and WRP, which is anticipated to continue. The Tribe also anticipates additional programmatic assistance through the implementation of a portion of the Tribe's water conservation plan through the small watershed program as authorized through Public Law 83-566. None of the joint objectives of the Tribe and the NRCS can be accomplished, however, without sufficient funding of the Florida Conservationist's technical assistance budget.

The Seminole Tribe is ready, willing, and able to begin work immediately. Doing so will require substantial commitments from the Tribe, including the dedication of over 9,000 acres of land for water management improvements. However, if the Tribe is to move forward with its contribution to the restoration of the South Florida ecosystem, a substantially higher level of federal financial assistance will be needed as well.

The Tribe has demonstrated its economic commitment to the Everglades Restoration effort; the Tribe is asking the federal government to also participate in that effort. This effort benefits not just the Seminole Tribe, but all Floridians who depend on a reliable supply of clean, fresh water flowing out of the Everglades, and all Americans whose lives are enriched by this unique national treasure.

Thank you for the opportunity to present the request of the Seminole Tribe of Florida. The Tribe will provide additional information upon request.

PREPARED STATEMENT OF THE SOCIETY OF AMERICAN FORESTERS

Mr. Chairman, I am William H. Banzhaf. I am the Executive Vice-President of the Society of American Foresters (SAF). The more than 17,500 members of the Society constitute the scientific and educational association representing the profession of forestry in the United States. SAF's primary objective is to advance the science, technology, education, and practice of professional forestry for the benefit of society. We are ethically bound to advocate and practice land management consistent with ecologically sound principles.

I am especially pleased to be here today to comment on the fiscal year 2001 budget for the Department of Interior and Related Agencies. I wish to thank the subcommittee for its continued support of professional forestry, and its continued support of our priorities. I thank the Chair for the opportunity to testify on these important issues.

The public policy activities of SAF are grounded in scientific knowledge and professional judgment. From this perspective we review proposed budgets for forestry and related natural resource programs to determine their adequacy to meet stated objectives and public needs.

THE USDA FOREST SERVICE

Forest Inventory and Analysis

Of all Forest Service programs, the Forest Inventory and Analysis (FIA) is our top funding priority for fiscal year 2001. The Agriculture Research, Extension, and Education Reform Act of 1998 demonstrated how strongly Congress supports an improved FIA program. The Forest Service has developed a strategic plan for the program, a plan that we believe strongly responds to Congress' intent, and the recommendations of a blue ribbon panel designed specifically to evaluate the progress

of the program and make recommendations for its improvement. The plan calls for an \$8 million increase per year through 2003 to fully implement the program. Full implementation ought to be our goal.

We are extremely concerned that the Administration does not truly support this important program. The President's budget proposal provides no new money for the FIA program. We do believe the Agency itself is committed to the program. This is evidenced by a Memorandum of Understanding (MOU) between the National Association of State Foresters and Chief Dombeck on February 15, 2000. This MOU commits the Forest Service to fully implementing the strategic plan, which would elevate the role of FIA within the Forest Service and hopefully, increase future funding requests from the Administration. The MOU also encourages states to make financial and other contributions toward fully implementing the FIA program, which is absolutely necessary to make it a success.

In the past, we have discussed a problem with internal funding within the Forest Service. Essentially the National Forest System (NFS) was not making an appropriate contribution to the FIA program that collects inventory data on NFS lands. Chief Dombeck has shown real leadership in improving this problem, and we are pleased that the Forest Service will allocate funding to assure that all NFS lands are inventoried as outlined in the FIA Strategic Plan.

The Forest Inventory and Analysis program provides accurate, comparable data across all forestlands in the United States. Local governments, journalists, environmental groups and private citizens, in addition to forestry professionals in every employer category, need and use this information. Understanding the condition of the nation's forests is critical for appropriate planning and sustainable management. We believe the subcommittee has recognized the importance of this program in the past, and will continue to do so in the future.

Moving toward the new annualized inventories and increasing the range of data collected will create new demand for this important program. In order to support these endeavors, we encourage the subcommittee to continue to support increased funding for this critical program.

Cooperative Fire Protection Programs

We also strongly support funding for the Cooperative Fire Protection programs. Uncontrolled wildland fires pose a tremendous threat to the lives, property, and natural resources across the country. Conditions are particularly hazardous in the wildland-urban interface, a zone where human development intermingles with forests and grasslands. In order to secure firefighter safety, minimize property damage, and resource loss, cooperative approaches must be effective. Firefighters must receive the training, information, and equipment necessary to safely carry out their responsibilities.

Wildfire does not respect political boundaries. Effective wildfire response requires a coordinated interagency effort. Frequently, federal land managers call upon state and volunteer firefighters nationwide to assist in coping with wildland fires, and to provide assistance to carry out prescribed burns and fuel reduction programs.

There are two components of the Cooperative Fire Protection programs: the State Fire Assistance program and the Volunteer Fire Assistance program. The State Fire Assistance program provides state forestry agencies with assistance in delivering a coordinated wildfire response and in complying with national safety and training standards allowing state and local crews to be deployed to federal fires and other emergency or disaster situations. The program also assists states with hazard assessments, fuel treatment projects, and public education efforts.

State forestry agencies administer the Volunteer Fire Assistance program through grants and other assistance to local fire departments for training and equipment. The program's main focus is on rural and urban interface communities that need assistance in meeting both existing and expanded fire suppression responsibilities. The Volunteer Fire Assistance program is another strong cost share program that helps rural firefighters secure the latest training and equipment. Rural communities fight forest fires, and without this program they would not have the appropriate resources. This funding is critical because these communities have seen a significant decline in receipts from national forest and BLM revenue sharing programs. Resources are scarce in rural America.

Cooperative Fire Protection programs are critical to both forest health and the safety of our communities. We ask the subcommittee to consider strong funding levels for these programs.

Addressing the Ecological Infrastructure Backlog

Much has been said about the backlog issues associated with the national forests. Whether it is forest health, deteriorating forest roads, endangered species, salmon

habitat, recreation facilities, hazardous fuels, or any number of other issues, it is clear that the national forests desperately need attention. The Forest Service must address its ecological infrastructure backlog. Ecological infrastructures are those mechanisms that allow forest and other natural systems to function properly. Any one component of a system that is not functioning properly has the potential to impact other parts of the system. This is not always the case, but clearly there are examples in the national forests. Humans manipulate these processes sometimes acting as an equalizer, sometimes doing more damage. The key is allowing professional natural resource managers to put the infrastructure back in place.

The Agency is attempting to deal with all the ecological infrastructure needs. They have mapped areas of forest health risk across the nation. They are addressing a very serious problem with the National Forest System road network. They are addressing wildland/urban interface issues. The most frustrating thing about all of these efforts is the estimated costs associated with addressing them. The Forest Service believes it will cost \$8.6 billion to address the road backlog it faces. The Congressional Research Service believes it will cost \$3.9 billion to completely address the hazardous fuels buildup on the National Forest System. These figures do not include other ecological infrastructure issues that plague the National Forest System, such as the costs associated with restoring salmon habitat, enhancement of endangered species habitat, or a host of other problems. While these figures are astronomical and beyond what Congress can realistically fund, the Forest Service will receive money to address some of these problems and one problem should not be favored over the other by the Congress or the Administration. Forest Service managers on the ground know where critical problems exist, they know how to address them, and they have the wherewithal to get the job done. The Forest Service should continue to develop plans and tools like the forest health risk maps, which Congress can study and consider. We believe this helps Congress, in their oversight role, fund backlogged work with confidence that the work will be completed. The Forest Service needs a reliable multi-year source of funding to address these issues, and the ability to set the priorities at the local level. The Agency also needs adequate and appropriate staff to carry out these activities.

We appreciate the efforts the Forest Service has made to respond to repeated criticisms regarding accountability. We note that one of their responses has been to collapse numerous line items in the National Forests System Account to three. We do not support this initiative. Collapsing the line items reduces one's ability to understand where the Forest Service priorities lie. We do support the Forest Service's efforts to detail performance measures, and we believe this process will improve over time.

America's Forested Landscape

It is important that the Forest Service and the federal government strengthen their commitment to state and local forestry agencies and the 10 million nonindustrial private forestland owners of this nation. The Forest Service has a unique partnership with the state forestry organizations, a partnership that has the opportunity to improve the health of our nation's forests through technical assistance, inventory and monitoring, and protection from fires, insects, and disease on the 543 million acres of non-federal forests. Due to limited funding, the State and Private Forestry programs have yet to fully meet their potential, however, SAF supports these programs and hopes Congress will as well.

We are concerned about the status of private forestland in this nation. State, county, private, and industrial lands are increasingly producing forest-related goods and services. The most dramatic change on these lands is the shift in production of timber. Approximately 94 percent of all timber produced in the U.S. is produced on non-federal lands. The volume of timber from national forests has decreased dramatically, from 12.7 billion board feet (bbf) to 3.4 bbf, over the past 12 years. Such reductions shift the burden of producing wood fiber to state and private lands in order to meet the nation's increasing demand for forest products. The federal government has some responsibility to protect and enhance the sustainable flow of forest products from state and private lands precisely because of the substantial decrease in production on Forest Service lands. We are seeing examples of increasing urban sprawl, forest fragmentation, and more importantly large managed private forests sold as smaller parcels to individual owners reducing overall land management opportunities. As a nation we have decided that forests, both public and private, are important for economic, environmental, human health, and spiritual reasons. We express the importance and value of our forest resources through a variety of mechanisms, including legislation. Many federal statutes, including the Endangered Species Act, the Clean Water Act, the Clean Air Act and others, have a regulatory impact on the management of private lands. Other statutes, the Cooperative

Forestry Assistance Act of 1978, and the 1990 Farm Bill Forestry Title, for example, take a cooperative, incentive based approach to non-federal forests. These acts recognize the need for state, federal, and local cooperation to achieve resource benefits across the landscape, and they use a non-regulatory, incentive-based approach to achieve them. This cooperative approach is vital on issues that cross ownership boundaries, such as watersheds, forest insects and disease, and particularly wildfire.

Adequate funding is essential if the program is to reach non-industrial private landowners, only about 10 percent of whom have written management plans for their land. Even worse, the majority of timber sales on private lands go forward without the benefit of professional forestry advice. While this may seem like merely a problem of poor business practices, we in the forestry profession view it as a serious threat to the long-term sustainability of the nation's forest resources. Private land has public value. That is why we actively support programs that increase the amount of forestry advice available to non-industrial private forest landowners. In addition to private sector consulting and industry efforts, extension programs, and other mechanisms, we believe the State and Private forestry programs can help both public and private sector foresters meet these challenges.

Maintaining and Enhancing Forest and Rangeland Research

There has been a general clamor for increased funding for forestry research since the publication of the 1990 RPA program report, which identified improving scientific knowledge about natural resources as a high priority. The National Research Council's (NRC) 1990 report, *Forestry Research: A Mandate for Change*, found the knowledge required for sound forest management policies inadequate. The 1997 NRC report entitled *Forested Landscapes in Perspective*, which focused on the needs of non-industrial private landowners, continued to report that information needs were not being met. There are ongoing efforts studying the question of the adequacy of forestry research, and they all come to the same conclusion: current forestry research efforts are inadequate.

SAF is concerned about the relatively stagnant Forest Service research budget of the last few years, but have been encouraged by recent modest increases, and we thank the Committee for that support. These appropriations, however, represent a significant decline in constant dollars and have led to the unavoidable loss of not only administrators but scientists with significant expertise in highly specialized areas.

Natural resource management issues are more complex today than they ever have been in the past. To find solutions we need interdisciplinary research in the biological, physical, and social sciences. The Agency has done a good job, and could do more, to reduce overhead and put more research dollars to work in direct research projects. But if we continue to lose scientists and research dollars, we believe complex issues are unlikely to be resolved, and the future of the Forest Service research program will be in jeopardy. With recognition of this disturbing trend, we encourage the Committee to increase the appropriation for Forest Service Research above the President's request. We have presented separate testimony on this issue, and we thank the Committee for its continued interest in the need for forestry research.

The Bureau of Land Management

The fiscal year 1998 Interior and Related Agency Appropriation Act (Public Law 105-83) included language that expanded the use of the Bureau of Land Management's Forest Ecosystem Health and Recovery Fund (FEHRF), allowing the BLM to expand silvicultural treatments to improve forest ecosystem health. Funds from this account are used to support Public Domain forest management efforts, including reforestation, thinning, salvage timber sales and other fuel reduction activities including prescribed fire. The expanded authority for the FEHRF, combined with increased funding for prescribed burning, will provide BLM managers with the tools to improve forest and wildlife habitat on BLM lands. And again, we thank the Committee for developing this change in authority.

In spite of the funding available under the FEHRF to implement ecosystem health projects, the BLM lacks the on-the-ground personnel, within the Public Domain, necessary to plan and implement these important activities. Since 1981, the BLM Forestry Management program has experienced an inflation-adjusted 65 percent budget decrease, whereas the entire Management of Lands and Resources budget has experienced only a 10 percent decrease over the same time period. With this in mind, we do support the modest increase of about \$2.8 million requested in the President's budget to complete on-the-ground forest management projects. However, we firmly believe the BLM needs to increase its forest management expertise in order to take full advantage of the FEHRF and effectively shift to a focus on forest restoration. Therefore, we support an increase in funding and congressional direc-

tion for additional forestry personnel to plan and administer forest health improvement activities under the BLM Forestry Management program.

In conclusion, we strongly support Forest Service research, in particular Forest Inventory and Analysis, and the Cooperative Fire Protection programs, and state and private programs. We also support the BLM's Forest Ecosystem Health and Recovery Fund and the effort to restore the Public Domain forests. Thank you, Mr. Chairman for the opportunity to share our views with you and the subcommittee today.

ABOUT THE SOCIETY

The Society of American Foresters, with about 18,000 members, is the national organization that represents all segments of the forestry profession in the United States. It includes public and private practitioners, researchers, administrators, educators, and forestry students. The Society was established in 1900 by Gifford Pinchot and six other pioneer foresters.

The mission of the Society of American Foresters is to advance the science, education, technology, and practice of forestry; to enhance the competency of its members; to establish professional excellence; and to use the knowledge, skills, and conservation ethic of the profession to ensure the continued health and use of forest ecosystems and the present and future availability of forest resources to benefit society.

The Society is the accreditation authority for professional forestry education in the United States. The Society publishes the *Journal of Forestry*; the quarterlies, *Forest Science*, *Southern Journal of Applied Forestry*, *Northern Journal of Applied Forestry*, and *Western Journal of Applied Forestry*; *The Forestry Source*; and the annual *Proceedings of the Society of American Foresters national convention*.

PREPARED STATEMENT OF THE SOCIETY FOR ANIMAL PROTECTIVE LEGISLATION

We greatly appreciate the support this Subcommittee has provided to these programs of the U.S. Department of Agriculture and respectfully request the following modest appropriations and oversight to ensure that the laws passed by Congress are being carried out effectively.

A \$15.175 MILLION APPROPRIATION IS NEEDED FOR APHIS/ANIMAL CARE'S ENFORCEMENT OF THE ANIMAL WELFARE ACT

An unprecedented coalition of organizations has joined together seeking adequate funds for enforcement of the Animal Welfare Act (AWA). The Coalition includes national groups such as the American Veterinary Medical Association, the American Zoo and Aquarium Association, the National Association for Biomedical Research and the Society for Animal Protective Legislation, as well as grassroots organizations from across the country. This represents a unique meeting of the minds between the regulated community and the animal welfare community, who recognize the desperate need for increased funding for this vital program.

The Animal Welfare Act is the chief federal law for the protection of animals. The USDA seeks compliance with its minimum standards for the care and treatment of animals during transportation and at the more than 10,000 sites of dealers, research, testing and teaching facilities, zoos, circuses, carriers (airlines, motor freight lines and other shipping businesses) and handlers (ground freight handlers).

Forty-five percent of the facilities that are inspected are found to be noncompliant. Facilities with serious deficiencies require reinspections to ensure that corrective action is taken. Our review of inspection reports shows a widespread inability of inspectors to make the needed reinspections; the only reason they are unable to reinspect is a lack of sufficient funds.

In 1966 the Laboratory Animal Welfare Act (later renamed the Animal Welfare Act) was adopted in an effort to prevent the sale of lost or stolen pets into research. Nevertheless, this has continued to be a serious problem. In an attempt to address this problem, in the mid-1990s, Animal Care instituted a policy of conducting quarterly inspections of random source dealers. Since stepping up its enforcement in this area (which has come at the expense of inspections conducted elsewhere), USDA has revoked 11 dealer licenses and imposed over \$500,000 in fines. The number of random source (USDA licensed Class B) dealers supplying dogs and cats to research has dropped from 104 to 32.

This example illustrates the value of frequent, unannounced inspections of licensees and registrants. Increasing the number of inspections will significantly improve compliance with the law.

Limited resources could be better utilized if Congress prohibited the supply of dogs and cats by Class B dealers altogether. It is not feasible for AC to expend the tremendous effort necessary to track the sources on each random source dog and cat. As a result, AC is unable to provide an assurance that each dog and cat from these dealers is not a lost or stolen pet. There is no need for continued reliance on Class B dealers because there are other sources for the dogs and cats needed for research purposes including breeders. Report language from the Subcommittee could offer support for H.R. 453, the Pet Safety and Protection Act, which would end the supply of dogs and cats to research facilities by random source dealers. Adoption of this legislation would reduce USDA's regulatory burden, while permitting experimentation to continue unhindered. The 1985 amendment to the AWA mandates at least one inspection per year of all registered research facilities. A vigorous inspection program is vital to maintaining public confidence in the quality of research and ensuring the humane treatment of research animals. With the need to evaluate performance, as well as engineering, standards, each inspection is extremely time-consuming and labor intensive.

Increased funding will permit AC to hire and equip more inspectors, whose numbers have declined from a high of 88 to a current low of only 64. AC will be able to increase its searches for unlicensed/unregistered facilities, an important effort because failure to obtain licensure or registration is a widespread problem with many entities purposefully evading AC and the requirements of the AWA. The area most frequently ignored for lack of sufficient funds has been inspection of airlines. Increased funding will permit AC to conduct an adequate number of inspections of airlines in an effort to protect against the injury, loss or death of animals being transported by air and to help meet the requirements of the recently adopted Federal Aviation Administration amendment for safe transport of animals by air.

A \$1 MILLION LINE ITEM APPROPRIATION IS NEEDED FOR THE ANIMAL WELFARE INFORMATION CENTER LOCATED AT THE NATIONAL AGRICULTURAL LIBRARY

The Animal Welfare Information Center (AWIC) was established by the 1985 amendment to the Animal Welfare Act, the Improved Standards for Laboratory Animals Act, to serve as a clearinghouse and educational resource of information on alleviating or reducing pain and distress in experimental animals (including anesthetic and analgesic procedures), reducing the number of animals who must be used for research and identifying alternatives to the use of animals for specific research projects.

Animal Care is seeking to maximize compliance with the Animal Welfare Act, and the AWIC is the single most important resource for educating research facility personnel on their responsibilities under this law. There are more than 1,200 registered research facilities nationwide, and the services of the AWIC are available to all individuals at these institutions.

The AWIC staff, four full-time professionals, one technician and two part-time professionals, respond to requests for information on topics covered by the Animal Welfare Act including alternatives to painful procedures, unproved methodologies, training, environmental enrichment for nonhuman primates, and checking for unintended duplication. The staff conduct training, present at meetings, exhibit at conferences, produce documents, maintain a website and work on special projects.

The AWIC website (<http://www.nal.usda.gov/awic>) receives approximately 30,000 hits per month. According to AltaVista, there are links to the AWIC site by approximately 765 pages. Annually the AWIC staff fills more than 18,000 requests for specific publications and has provided reference services in response to more than 1,900 requests.

The AWIC has not received an increase in appropriations during its 14 years, restricting the services it is able to provide. Though a number of documents are in the final stages of preparation, there are insufficient funds to provide print and electronic versions of them all. These documents include an updated listing of animal-related audiovisuals in the National Agricultural Library collection, two issues of the Animal Welfare Information Center Bulletin, a database on swine (who are being used in increasing numbers) as an animal model, an information resource on the use of fish, amphibia, reptiles, cephalopods, and insects in research, and processing a series of data sets on anesthetics, analgesics, and tranquilizers into searchable files on the AWIC website.

Funds are urgently needed to permit the AWIC staff to develop a training program to help Institutional Animal Care and Use Committees best fulfill their responsibilities under the Animal Welfare Act. The increased costs of personnel, publishing, journals and books, computer hardware and software, travel and exhibiting have all increased dramatically since 1986 when the AWIC was first funded.

§500 THOUSAND FOR ENFORCEMENT OF THE HORSE PROTECTION ACT

It has been thirty years since the Horse Protection Act was adopted by Congress, yet soring of Tennessee Walking Horses continues to be a widespread problem. Soring is defined by APHIS as “the application of any chemical or mechanical agent used on any limb of a horse or any practice inflicted upon the horse that can be expected to cause it physical pain or distress when moving.” Horses are sored to produce an exaggerated gait.

The most effective method of reducing the showing of horses who have been sored is to have Animal Care (AC) inspectors present at the shows. AC has been restricted to attending less than 6 percent of horse shows because of extreme shortage of funds. Unless sufficient funding is provided to enable AC to attend more events, the industry will continue to defy the law with impunity.

Lack of financial support has made it necessary for Animal Care to rely heavily on the industry to assume responsibility for enforcement of the law. This is the same industry that has turned a blind eye to compliance with the law since 1970! “Designated Qualified Persons” (DQPs) are the “inspectors” from industry who are supposed to assist AC in identifying sore horses and pursuing action against the individuals who are responsible. The history of the DQPs reveals their failure to achieve the level of enforcement of the unbiased, well-trained, professional inspectors who work for AC. In fiscal year 1997 (the most recent year for which such information is available), the rate at which DQPs turned down horses for soring was 1.42 percent. The turndown rate more than doubled to 3.57 percent when government inspectors were present to oversee the activities of the DQPs.

An increase in appropriations to \$500,000 would permit AC to attend a greater percentage of horse shows, thereby ensuring significantly stronger compliance with the Horse Protection Act.

CONGRESS NEEDS TO PROVIDE INCREASED OVERSIGHT OF WILDLIFE SERVICES OPERATIONS AND RESEARCH

Mammals

Wildlife Services (WS) has been involved in an extremely effective oral rabies vaccine program. Use of treated baits has been successful in curbing the spread of rabies. Unfortunately, the Administration has suggested a reduction in this funding. Resources should be maximized to address the rabies threat before it spreads to additional states. We encourage that full funding be restored for this vital effort.

Wildlife Services (WS) needs to utilize a variety of tools for management of wildlife under its purview. However, it is essential that these tools are effective and publicly acceptable.

WS needs to begin a phase out of use of steel jaw leghold traps. Leghold traps slam shut with bone-crushing force on the limbs of their victims, tearing ligaments and tendons, severing toes and causing excruciating pain. These traps, opposed by the vast majority of Americans, have been condemned as “inhumane” by the American Veterinary Medical Association, the American Animal Hospital Association and the World Veterinary Association.

On December 11, 1997, the United States Government reached an “Understanding” with the European Union in which the U.S. agreed to phase out use of “conventional steel-jawed leghold restraining traps.” WS has the responsibility of complying with the U.S. obligation by ending its use of these barbaric devices.

WS should begin by immediately prohibiting use of leghold traps for 3 species for which there is extensive documentation that effective, publicly acceptable, less cruel alternatives exist. These species are raccoon, beaver and opossum. While we believe that this policy should extend to all species, there is no justification for refusing to implement this modest step in alleviating unnecessary animal suffering at once.

WS should pursue no further testing of leghold traps as this would be an extremely wasteful and cruel use of taxpayer money. Previously, funds designated for trap research were merely passed on to a nongovernmental organization to utilize as it saw fit, without involvement from WS. If funds are allocated for trap testing, WS should conduct the research since the agency has the appropriate technical expertise.

Further, WS should adopt a policy of checking all restraining traps within a 24-hour period. A wealth of scientific studies documents the fact that the longer an animal is in a restraining trap, the greater the injury. For this reason, the majority of states have a daily trap check requirement. Animals should not be subjected to long-drawn out pain because of a failure to assume the responsibility of carefully checking traps every day. This policy will help reduce the trauma experienced by non-target animals, too, ensuring that more of these animals will be able to be released alive.

Birds

WS is expected to approve the poisoning of two million blackbirds with DRC 1339 which takes one to three days to kill the birds by uremic poisoning. We urge this distinguished Subcommittee to eliminate funding for this empty gesture to appease the growers of sunflower seeds which the birds eat during their spring migration.

The poison is a cruel and basically ineffective means of attempting to control blackbird numbers since there are over 35 million blackbirds in this portion of the flyway! WS' specious claim that no other birds are harmed by the poison is patently incredible. The American taxpayer is certainly harmed by being forced to contribute to this cruel boondoggle.

WS is developing a fertility control substance, which could be genuinely effective in reducing blackbird numbers. We urge the Subcommittee to encourage this sensible effort by WS and cut the useless funding for painful poison application. We agree with the National Audubon Society demand for an immediate end to the project.

PREPARED STATEMENT OF THE STATE OF ILLINOIS

As you begin to formulate your appropriations and funding priorities for fiscal year 2001, I respectfully urge you to consider the following items for inclusion in the upcoming agriculture appropriations bill. Each request is followed by a brief description of the project. These projects and funding requests are of particular importance to the State of Illinois and I hope you will be able to include them in this legislation. In addition, I am grateful for all of the assistance that you have been able to provide to the State of Illinois—your efforts are greatly appreciated and provide many benefits throughout the state.

NATURAL RESOURCES AND ENVIRONMENT

Illinois River Basin Restoration Program, "Illinois River 2020"—Farm Bill Components

The Illinois River Basin Restoration Program is a comprehensive proposal of authorizations and appropriations that will address the serious threats to the Illinois River and its tributaries and implement Illinois' goals for the restoration, enhancement, and conservation for the Illinois River and its 55 county watershed. The Illinois River Basin Restoration Program is a two-tiered approach to provide a voluntary, incentives-based program that restores and protects the Illinois river hydrology and water quality, addresses urban non-point source issues, farmland protection and open space, land treatment for stormwater, and best management practices for upland areas that drain into the river and its tributaries.

The following natural resources and environment requests relate directly to the Illinois River Preservation Initiative:

Environmental Quality Incentives Program (EQIP)

Request. Fully fund the Environmental Quality Incentives Program (EQIP) at its authorized level of \$200 million nationally and increase Illinois' share to \$9 Million.

Description. Illinois only received \$2.4 million in EQIP dollars in 1998 and in 1999, respectively. In 1999, over 160 landowners could not participate in the program because there was a shortfall of \$1.8 million for projects. An additional \$4.5 was needed in 1999 to fund new EQIP priority areas that were denied because of insufficient funds.

Farmland Protection Program (FPP)

Request. Dedicate \$10 million in fiscal year 2001 and fiscal year 2002 in the FPP for the Illinois River Basin.

Description. The FPP provides matching funds (up to 50 percent of the fair-market value) to state, local and Tribal governments to permanently protect farmland threatened by development from urban and suburban sprawl, through the purchase of easements that preserve the land for farm use.

Wildlife Habitat Incentives Program (WHIP)

Request. Dedicate \$1 million in both fiscal years 2001 and fiscal year 2002 to the Wildlife Habitat Incentives Program (WHIP) for the Illinois River Basin.

Description. WHIP offers cost-share assistance for up to 75 percent of the habitat restoration expenses and technical assistance for farmers, ranchers and other landowners who wish to implement wildlife habitat practices. Eligible practices include native grass restoration, riparian area restoration, and aquatic habitat establishment.

Conservation Reserve Program (CRP)

Request. Dedicate 400,000 acres of Conservation Reserve Program acres to the Illinois River Basin for fiscal year 2001 and fiscal year 2002.

Description. The CRP provides farmers with technical and financial assistance, including annual rental payments, in exchange for removing environmentally sensitive land from production and implementing conservation practices such as wildlife habitat restoration and field windbreaks. This expansion of acreage would bring an estimated \$909 million in new federal funding to Illinois for restoration over 15 years of the CRP contract lifetime.

Wetlands Reserve Program (WRP)

Request. Dedicate 10,000 acres of Wetland Reserve Program to the Illinois River Basin for permanent easements.

Description. The WRP offers technical and financial assistance to farmers who wish to restore and protect agricultural wetlands. The USDA provides up to 100 percent of the wetland restoration costs and up to 100 percent of the fair market agricultural value of the land in return for permanent or 30-year easements or wetlands restoration cost-share agreements. The allotment of this acreage would bring an estimated \$11 million in new federal funding to Illinois for wetland restorations.

Other natural resources and environment requests include the following:

Trees Forever Illinois Buffer Initiative (Illinois Department of Agriculture)

Request. Annual commitment of \$200,000 over five years for the "Trees Forever Buffer Initiative."

Description. Agriculture and rural America continue to face various water quality issues including but not limited to surface water quality and TMDLs, Gulf Hypoxia, nutrient management planning and many others. The Trees Forever Illinois Buffer Initiative is a project targeted at the establishment of demonstration projects across the state, which will highlight the benefits of various types of vegetative buffers. Projects will include streamside buffer plants of trees, shrubs and grasses; streambank stabilization demonstrations; stream channel enhancements; constructed wetlands; livestock facility border plantings and various combinations. The purpose of the project is to bring together various state, federal, and local groups which may already be promoting components of these practices and apply them to specific whole farm or whole resource needs.

Mahomet Aquifer Consortium

Request. \$10 million for an extensive study of the Mahomet Aquifer in Central Illinois.

Description. The Mahomet Aquifer Consortium is proposing a study of the Mahomet Aquifer in Central Illinois. The Study will identify and resolve water quality and quantity issues, help ensure a water supply for the future, optimize future water costs, and promote planned economic development for the communities affected by the aquifer. The project is broken down into 2 phases with phase one taking 3 years and an estimated cost of \$4 million dollars. Phase two will cost \$6 million and take 6 years to complete.

FOOD NUTRITION AND CONSUMER SERVICES

Request. A total of \$405 million to Illinois for the following domestic food programs:

—*National School Lunch Program.*—Full funding of this program will translate into \$329.7 million for Illinois. There are currently 1,864,271 students enrolled.

—*School Breakfast Program.*—Full funding of this program will mean \$22.2 million for Illinois. There are currently 1,022,966 students enrolled.

—*Child and Adult Care Food Program.*—Full funding of this program will mean \$46 million for Illinois. There are currently 114,819 students participating.

—*Summer Food Service Program.*—Full funding of this program will mean \$5.0 million for Illinois. There is currently a daily average of 118,200 students attending.

—*Special Milk Program.*—Full funding of this program will mean \$2.1 million for Illinois. There is currently a daily average of 161,876 students attending.

Description. Every Illinois student needs a strong foundation for learning. Thousands of children come to school already at risk of academic failure and we must break that cycle. These nutrition programs serve a vital role in supporting student educational programs and it is critical that they be funded at the highest possible levels.

AGRICULTURAL RESEARCH, EDUCATION AND ECONOMICS

National Corn to Ethanol Research Pilot Plant

Request. \$14 million for a National Corn to Ethanol Research Pilot Plant (NCERPP).

Description. The State of Illinois has appropriated \$6 million for construction of the NCERPP at Southern Illinois University at Edwardsville. The total cost of constructing the project is estimated at \$20 million. The cost of operating the facility will be borne by industry and university research conducted at the plant. A total of \$14 million is needed, and no federal funds were appropriated for this in fiscal year 2000.

Center for Alternative Agriculture Crops and Products (Southern Illinois University)

Request. \$1.95 million for the Center for Alternative Agriculture Crops and Products at SIU-Carbondale.

Description. This center synergizes various corporations, agencies, and regional universities of the heartland and mid-south to explore alternative income crops and products for Southern Illinois, Illinois, and the entire region. Emphasis would be on increased farm income and increased rural development through added production, processing, and employment. The plan calls for \$1.95 million for renovation and expansion of a 13,000-sq. foot building on SIU-Carbondale campus.

Southern Illinois University / University of Illinois Agriculture Outreach Center

Request. \$2.5 million for a joint SIU/U of I agriculture outreach center.

Description. Located on the Carbondale, IL Campus, University of Illinois Extension Service and SIU College of Agriculture Agribusiness Economics Department will partner to serve Southern Illinois constituents via on-site classroom instruction, digital television delivery, and web-based access. Building 103 on the Carbondale campus would be renovated, expanded, and rewired. Estimated cost is \$1.8 million.

Plant and Alternative Crop Training Center-Belleville, IL

Request. \$2.5 million for a Plant and Alternative Crop Training Center at Southern Illinois University Belleville Research Station.

Description. Project seeks to add a 10,000-sq. ft. facility for university and industrial training on the SIU Belleville Research Station site near the Mid-America airport. The facility would allow agricultural industries of the Metro-East (St. Louis) area to have access to an indoor multimedia training/meeting facility. This plan allows for synergy with Donald Danforth Plant Science Center shared use of land and 1,200-sq. ft. of wet-laboratory space. Construction cost is estimated to be \$2.5 million.

Soybean Genomics Lab at Southern Illinois University

Request. \$189,000 for the Soybean Genomics Lab at SIU.

Description. Expand the current laboratory at Southern Illinois University to accommodate four added faculty researchers in soybean genomics and transformation.

Peoria Research Lab Invasive Species Biological Control Center (through Agriculture Research Service.)

Request. \$4–8 million to establish an Invasive Species Biological Control Center.

Description. The U.S. is facing an unprecedented need to develop viable strategies for management of invasive species. Biological control is a fundamental management strategy that can be used to manage invasive pests both before and after introduction. The Midwest has become a focal point for invasive species introductions due to its location at the heart of the Great Lakes Region and as home to major international shipping and air transportation systems. We propose that developing a coordinated administrative structure and facility to enhance invasive species management and biological control activities in the region should be a joint priority of USDA and state partners.

Agriculture Research Service—Greenhouse Facility at University of Illinois

Request. \$4 million for the University of Illinois for construction of a state-of-the-art greenhouse facility.

Description. The State of Illinois seeks to construct a state-of-the-art greenhouse facility that will support research associated with the Maize (corn) Genetics Stocks Collection and the National Soybean Germplasm. Collection at the University of Illinois. (The University received \$400,000 in planning funds in fiscal year 2000 for this project.)

Agriculture Research Service—Laboratory in Peoria

Request. \$4 million for the ARS Laboratory in Peoria

Description. The State of Illinois supports funding for improvements and renovation to the ARS laboratory in Peoria. (\$1.8 million was appropriated for fiscal year 2000 for this purpose.)

Soybean Disease Biotechnology Research Center

Request. \$3.5 million for the National Soybean Research Laboratory (NSRL) at the University of Illinois.

Description. Fiscal year 2001 request is \$3.5 million. To be established within the National Soybean Research Laboratory (NSRL) at the University of Illinois, the Center will be the first line of defense against major soybean diseases that threaten the most important "biofactory" of new foods and uses in the future, namely, the soybean crop. Scientists in the Center will employ cutting edge biotechnology research to provide soybeans with new and improved mechanisms of escape from, tolerance of, and resistance to major pathogens, including soybean cyst nematode (SCN) and other soy diseases that threaten the profitability of the soybean industry. The Center will draw on the 17,000 lines in the National Soybean Germplasm Collection at the NSRL and apply the power of structural, comparative, and functional genomics and genetic transformation. The Illinois soybean industry will provide funds to help establish the Center and support its research program.

Illinois-Missouri Biotechnology Alliance

Request. \$3 million in funding for the Illinois-Missouri Biotechnology Alliance.

Description. The State of Illinois supports funding for the Illinois-Missouri Biotechnology Alliance to continue research at the Universities of Illinois and Missouri on biotechnology. Congress appropriated \$1.184 million in funds for this project in fiscal year 2000.

Postharvest Antimicrobial Resistance

Request. Support funding for Agriculture Research Service's Postharvest Antimicrobial Resistance food safety research project at the Peoria Lab.

Description. Congress appropriated \$400,000 for this project in fiscal year 2000.

Aflatoxin Research at the University of Illinois

Request. \$130,000 for Aflatoxin Research at the University of Illinois.

Description. The State of Illinois requests funds to continue aflatoxin research at the University of Illinois.

FARM AND FOREIGN AGRICULTURAL SERVICES

Warehouse Examination Agreements (Illinois Department of Agriculture)

Request. \$400,000 to cost-share additional expense of warehouse examinations.

Description. Prior to 1985, federal policies dictated that commodities would be isolated from market prices and forces until prices rose to specified levels. As a result, large inventories and Government owned commodities and commodities pledged as collateral for price support loans accumulated and the facilities in which these commodities were stored had to be examined to adequately protect the Commodity Credit Corporation's (CCC) interests. This led to CCC relying heavily on cooperative agreement because the volume of workload associated with these high stock levels did not make it feasible for CCC to hire and train a workforce that would be adequate to conduct all the necessary examinations. USDA terminated this program in 1997. Illinois' storage share and federal reimbursements were: In 1993/4, 7.78 million bushels of grain stored—\$364,920 reimbursed; in 1994/5, 7.87 million bushels—\$364,820 reimbursed, in 1995/6, 8.04 million bushels of grain—\$379,487 reimbursed. Given the fact that today USDA is estimating that 70 percent and 80 percent respectively of Illinois's 1999 corn and soybean crops are presently committed in LDP's or CCC loans, the Department is asking USDA to again cost share the additional expense of warehouse examinations.

FOOD SAFETY AND INSPECTION SERVICE

Quality Assurance Pilot Certification Program for Small Meat Processors

Request. \$200,000 per year over three years for a Quality Assurance Pilot Certification Program for small meat processors.

Description. This Pilot Program is an effort by the Illinois Department of Agriculture to establish a Quality Assurance Certification Program for small meat and poultry slaughter and processing plants. Under this certification program, the Department will contract with food safety experts to provide education and HACCP compliance training to plant management and employees. After completion of the project, material can be used by other states.

National Center for Food Safety and Technology

Request. \$3 million for the National Center for and Technology

Description. The State of Illinois seeks continuation of the \$3 million received by the Illinois Institute of Technology (IIT) for its National Center for & Technology through the fiscal year 2000 Agriculture Appropriations bill. The Center needs the funding to continue its progress in fighting the growing incidence of food borne illness. The NCFST has been fighting food borne illness for over a decade. It is a unique collaboration between government, academia and the food industry that develops manufacturing methods to detect and prevent contamination of foods. The NCFST's partners are the U.S. Food & Drug Administration, IIT and almost 70 members of the food industry.

IIT Center for Safe Food for Small Businesses

Request. The State of Illinois supports the Illinois Institute of Technology's request for \$3 million in federal support.

Description. This Center provides direct technical assistance to small and medium sized food manufacturers to assure both safe products for public consumption and improve the companies competitiveness. IIT will be requesting continuation of federal funding for the overall National Center for Food Safety & Technology. The State of Illinois will provide \$1 million in fiscal 2001 for this project.

National Food Testing Center at the University of Illinois

Request. \$25 million to create a state of the art National Food Testing Center at the University of Illinois.

Description. To create a state-of-the-art facility for conducting safety and efficacy research on new, improved, and functional foods, including health-related, genetically enhanced foods. The National Food Testing Center will support and expedite the most important experiments on foods, that is, tests to assure that they are safe and effective. Through these experiments, hundreds of new and improved foods and related products will be tested and approved for human use, resulting in greatly improved human health, quality of life, and longevity. This will enable the U.S. to capture proprietary benefits from its investment in agricultural and biomedical research. In addition, consumers of these products will be fully confident that these products will be safe and effective.

RURAL DEVELOPMENT

Pork Producers' Producer-Owned Cooperative Initiative

Request. Support funding for the capitalization of pork producers' producer-owned cooperatives.

Description. The National Pork Producers are asking for \$200 million for grants to develop, establish, and assist in the capitalization of producer-owned cooperatives. These will facilitate slaughtering, processing, distribution, and marketing of livestock and livestock products. They believe that producer-owned, value-added marketing cooperatives provide the best tools for the future and will allow independent pork producers to stay in business.

Belvidere-Boone County, Illinois New Uses Ag-Tech District

Request. \$400,000 annually five years for the Belvidere-Boone County, Illinois New Uses Ag-Tech District

Description. The New Uses Economy from bio-based products is poised for growth as public and private sectors begin to shift their research and development away from petroleum-based products. In order to leverage local, state and private investment and to continue the development of the project, federal funding of \$400,000 per year is necessary for the next five years to undertake the following: (1) Continuation of the discovery process including the definition of the New Uses Economy and the definition of a Green Zone Program; (2) Expansion of partnerships with the private sector, universities, and the State; (3) Development of the Ag-Tech Park including master planning and site development; and, (4) Pursue continued funding through private corporations, foundations, and state and federal grants.

MARKET DEVELOPMENT PROGRAMS

Market Access Program

Request. Fully fund market development programs.

Description. The Market Access Program (MAP) uses funds from the U.S. Department of Agriculture's (USDA) Commodity Credit Corporation (CCC) to help U.S. producers, exporters, private companies, and other trade organizations finance promotional activities for U.S. agricultural products. Each year, MAP activities help

launch and expand sales of a wide variety of U.S. agricultural, fish, and forest products overseas.

Farmers benefit from MAP as the primary suppliers of commodities. All regions of the country benefit from the program's employment and economic effects from expanded agricultural export markets. In 1997, agricultural exports totaled \$57.3 billion, generating about 974,000 full-time American jobs, including 562,000 non-farm sector jobs.

More than one million Americans now have jobs that depend on U.S. agricultural exports. USDA economists calculate that each dollar earned from agricultural exports stimulates another \$1.32 in business activity for the economy.

Since 1985, the Market Access Program and its predecessors, the Targeted Export Assistance Program (TEA) and the Market Promotion Program (MPP), have helped boost agricultural exports, resulting in a positive agricultural trade surplus of \$12.5 billion in fiscal year 1999, and contributing billions of dollars more in increased economic activity and additional tax revenues.

Agriculture Structure Center (University of Illinois)

Request. \$320,000 for an Agriculture Structure Center in Illinois.

Description. The start of the new millennium finds farmers dealing with a lot of stress. In addition to 12 year lows in corn prices, 27 year lows in soybean prices and 50 year lows in hog prices, tremendous concern lies in the rapid consolidation of farms and the businesses that serve them. In the United States, essentially five companies control most of the field seed business, four to five companies control most of the meat packing business, twenty to twenty-five companies control most of the chicken business and ten companies control half of the food retailing business. Within ten years, thirty beef cattle feeding and fifty hog-producing businesses will finish 50 percent or more of all beef cattle and hogs. This rapidly changing structure has led many in production agriculture to wonder if there will be a role in the future for independent producers. Existing public and private institutions are not well situated at this time to provide answers to these producers on how they can remain relevant and competitive in a highly integrated, global business.

Institute for Value Added and Alternative Agriculture Products at Southern Illinois University

Request. \$175,000 for an Institute for Value Added and Alternative Agriculture at Southern Illinois University.

Description. One method of improving the economic condition of the agricultural sector is to increase the value of the products that are sold and to create a greater demand for existing or new food or agricultural products which can be produced in Illinois. If more feed grains, as well as other agricultural produce, were processed before they leave the state, it would not only increase the value of the product being exported, but also provide tremendous employment opportunities and industrial growth. An institute for value added and alternative agricultural products would contribute to economic growth through research and development of new and/or improved products. The proposed institute would be a focal point for agricultural commodity groups and agricultural related industries. The university is in a unique position to support such an institute with a well established College of Agriculture with current programs in food and nutrition, animal and plant science, agricultural economics, as well as faculty in other colleges with interests in marketing, genetics, bioengineering and economic development.

FOOD AND DRUG ADMINISTRATION

Clinical Pharmacology Program

Request. \$3 million for fiscal year 2001 for the FDA's Clinical Pharmacology Program.

Description. The existing clinical pharmacology program offers many benefits-development of new drugs, training in pharmacology, important research, resource for the local and regional communities, and maintaining the U.S. as a world leader in drug development and research. Some of the research projects that clinical pharmacology programs have been involved in are: AIDS, diabetes, heart attacks, lupus, and kidney disease. Despite an authorization of \$3 million in fiscal year 2000, the program only received an appropriation of \$500,000. Congress first authorized the clinical pharmacology program in 1991. Up to \$1.9 million annually in funds was authorized for FDA to set up clinical pharmacology programs at several medical schools throughout the U.S. An FDA peer review panel established the program at four universities: U of I College of Medicine in Peoria, Meharry Medical College in Tennessee, Mayo Clinic in Minnesota, and the State University of New York in Buf-

falo. IN 1998, the program was reauthorized in the FDA Modernization Act until 2002 at \$3 million per year.

ANIMAL PLANT HEALTH INSPECTION SERVICE (APHIS)

National Food Animal Institute (Illinois Department of Agriculture)

Request. Three-year commitment of \$1 million annually for a National Food Animal Institute in Illinois.

Description. The Institute would be established by the Illinois Department of Agriculture to review research through peer review and to publish and disseminate unbiased information about all the aspects of the food animal industry. It would maintain comprehensive information systems for the improvement and enhancement of the food animal industry for use by the public, government agencies, and other interested parties. The Institute must fulfill its purpose with unbiased integrity.

Pseudorabies Swine Slaughter

Request. Support full funding for Animal Plant and Health Inspection Service (APHIS). Funds from APHIS would be used to institute a pseudorabies swine slaughter surveillance collection point at Johnsonville Packing, Momence, IL.

Description. Currently, Illinois is struggling to acquire an adequate number of slaughter surveillance samples to maintain the compliance established by the National Program Standards. In 1998, first point testing was conducted at the end of the year to achieve the required numbers. It has been established that slaughter surveillance of cull sows and boars is the superior method of determining the PRV status in herds at the grassroots level. Funds from APHIS are critical toward the establishment of a pseudorabies swine slaughter surveillance collection point in Illinois.

Swine Producer Laboratory Testing

Request. Support a one-time appropriation from Animal Plant and Health Inspection Service (APHIS) for \$100,000 to defray the cost for swine producers conducting laboratory testing necessary to diagnose or maintain the health of their swine herds.

Description. With the current low prices for hogs, many producers are either foregoing diagnostic or preventative health measures in an effort to obtain some profit from their animals. Maintaining a healthy swine herd helps the producer produce his product in a more efficient manner. Providing this assistance would insure that animals that are unhealthful and diseased would have access to proper diagnosis and eliminate potential disease situations arising in the herd and possible spread within the swine industry. In 1997, Illinois produced 1.82 billion pounds of pork, placing it fourth in U.S. hog production. The number of hog producers in Illinois continues to drop: 8,800 hog farms in 1996; 7,500 hog farms in 1997; and 7,000 hog farms in 1998.

APHIS-Gypsy Moth "Slow the Spread" Program

Request. Support fiscal year 2001 spending levels to provide Illinois with an estimated \$200,000 for the APFUS program.

Description. The Illinois Department of Agriculture, under authorities provided in the Insect Pest and Plant Disease Act, annually cooperates with APHIS and various units of local and county government to identify and control the Gypsy Moth in Illinois. The annual program includes both the identification of gypsy moth infestations as well as a treatment control program. In the past, no funding has been transferred between agencies. In the trapping (identification) program, APHIS has concentrated on the Chicago Metropolitan area and the Illinois Department of Agriculture has worked in the balance of the state. Once an area is identified as being in need of a treatment control, the APHIS has provided the biological pesticide, the local unit of government has provided funding for the applicator and the Illinois Department of Agriculture has provided overall project oversight and coordination. In fiscal year 1999, the APHIS provided funding to states for an expansion of the trapping (identification) program to attempt to further reduce the spread of the insect.

Johne's Disease Pilot Program (Illinois Department of Agriculture)

Request. Support a three-year commitment from the Animal Plant and Health Inspection Service (APHIS) for \$200,000 for the purpose of establishing a Johne's Disease pilot program.

Description. Johne's disease is a wasting disease of cattle, sheep, goats and cervidae. This disease is contracted through direct contact with infected animals, which are generally infected at a young age, but may not exhibit signs of the disease until they are four or five years of age. Johne's disease is characterized by weight loss, severe diarrhea, depression, and poor performance. There is no cure for Johne's

disease. It has been estimated that economic losses can amount to \$227 per cow. A recent National Animal Health Monitoring System (NAHMS) sampling of Illinois dairy cows, indicated a prevalence of at least 10 percent in the cull cows from the dairy herds tested. Illinois would like to start a pilot program that could be used as a model for the U.S.

Renewables Bioprocessing Research Program (University of Illinois)

Request. \$20 million for the Renewables Bioprocessing Research Program (RBRP) at the University of Illinois.

Description. The Renewables Bioprocessing Research Program (RBRP) is an effort by the University in collaboration with other agencies and institutions to provide "plant to product" research information for the production and processing of corn, soybeans, and wheat. Objectives of the RBRP program are: (1) Establish an interdisciplinary collaborative research effort in the production and development of new food and industrial products from corn, soybeans, and wheat coproducts; (2) Establish an interdisciplinary collaborative research effort to improve the overall efficiency of converting renewable corn, soybean and wheat coproducts into saleable products; (3) Enhance the development of small-scale laboratory procedures to accurately predict the genetic capabilities of different genotypes, phenotypes, and varieties to make desired end use products; and, (4) Provide commercial companies with a single integrated program of contract research.

National Facility for USDA Animal Health

Request. Support USDA's efforts to fund a national facility for Animal Health in Ames, Iowa.

Description. This new facility would replace the National Animal Disease Center (NADC), the National Veterinary Services laboratory (NVSL), and the Center for Veterinary Biologics (CVB). All of these units are in substandard facilities, except for one building at the NADC that is new and few APHIS buildings that will be renovated to fit in the new plan. The three laboratories, especially NADC, are national and international in that they have the capability address a broad spectrum of major livestock diseases in BL-2, BL-3, and BL-3 Ag (containment facilities.) Improving competitiveness in the world market, enhancing our nation's livestock industries, and protecting against emerging diseases more than ever depends on maintaining disease-free animals and ensuring that systems are in place to respond to disease outbreaks. Healthy livestock are fundamental to a safe food supply for the American public.

National Coolwater Broodfish Center, SIU

Request. The State of Illinois and Southern Illinois University request \$250,000 per year for this project.

Description. SIU seeks funding of \$250,000/year from USDA to establish a center than can expand the aquaculture industry in Illinois. The goal of this concept is to develop a center to domesticate suitable strains of coolwater fish species that will allow the farm belt to become a greater participant in the aquaculture industry. Currently, most aquaculture occurs with warm water fish (catfish) in the south and coldwater fish (trout and salmon) in the north. There is a lack of domesticated species suitable for aquaculture use in the middle latitudes in the U.S. The impact of this project extends to a vast area beyond. The proposed center would take advantage of the existing on-campus strength present at the Fisheries and Illinois Aquaculture Center, and would:

- Domesticate suitable strains of coolwater species for commercial foodfish production.
- Selectively breed coolwater fishes for desirable traits (e.g., rapid growth, improved dress-out percents, and disease resistance).
- Maintain genetic histories of coolwater broodfishes.
- Provide selectively bred coolwater broodfishes to commercial producers throughout all coolwater regions of the U.S.A.

Land Use Impacts and Water Quality Research

Request. \$450,000 for Land Use Impacts and Water Quality Research at Southern Illinois University (SIU)

Description. Building on 8 years of collaborative research focusing on basic and applied research concerning groundwater, agricultural chemicals, and the impacts of natural disasters on groundwater, soils, and diversity, this proposal focuses on the impacts of land use on water quality. Changes in land use due to urbanization, growth of large animal feed lots, and agricultural practices impact water quality, flow, and management. SIU will organize and manage a research program to provide a scientifically valid basis upon which to base management and regulatory deci-

sions on land use and water resources. \$350,000 was included for this project in fiscal year 2000 Agriculture Appropriation Bill.

Should you need additional information, please do not hesitate to contact Bobby Thomson in my Washington, DC office at (202) 624-7772. Thank you for your consideration of these requests and for your leadership on this most important legislation.

PREPARED STATEMENT OF THE STATE OF WYOMING

This testimony supports fiscal year 2001 expenditures for the Department of Agriculture's Environmental Quality Incentives Program (EQIP) in the amount of \$350,000,000 and requests that \$12,000,000 be designated for the Colorado River Salinity Control Program.

This testimony supports fiscal year 2001 appropriations for the Department of Agriculture's Environmental Quality Incentives Program (EQIP) to carry out Colorado River salinity control activities. The State of Wyoming is a member State of the Colorado River Basin Salinity Control Forum (Forum), a seven-State organization created by the Governors of the Colorado River Basin States. The Forum's Executive Director, Jack Barnett, will submit separate testimony in support of this requested appropriation and the State of Wyoming has participated in the development of, and concurs with the statements made in, the Forum's testimony to this Subcommittee.

Wyoming is also represented on the Colorado River Basin Salinity Control Advisory Council, which was created by the 1974 Colorado River Basin Salinity Control Act (Public Law 93-320). Like the Forum, the Advisory Council is composed of gubernatorial representatives of the seven Colorado River Basin States and serves as a liaison between the seven States and the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). It advises these Federal officials and the involved agencies on the progress of efforts to control the salinity of the Colorado River and annually makes funding recommendations, including the amount believed necessary to be expended by the USDA for its on-farm Colorado River Salinity Control (CRSC) Program. Our testimony makes those funding requests that are contained within the Advisory Council's written program funding recommendations.

The Plan of Implementation and the numeric water quality criteria set for three Lower Colorado River stations constitute the State-adopted, EPA-approved, water quality standards for salinity the Colorado River. Jointly developed and revised each three years by the States and involved Federal agencies, the Plan of Implementation is being carried out to ensure continuing compliance with the numeric water quality criteria for salinity.

During its October 1999 meeting, the Advisory Council recommended that at least \$17,500,000 be expended by the Department of Agriculture for cost-sharing to implement salinity reduction practices (funds that are matched with individual contractor's cost-share funds) in fiscal year 2001, plus sufficient funds for administration, technical information and education, to assure that the Program's progress of removing salt and preventing additional salt loading into the Colorado River system stays on the schedule set forth within the Plan of Implementation.

Should a lesser funding level be provided for this important basin-wide water quality program, the progress (as measured in tons of salt prevented from entering the Colorado River system) achieved by the USDA component of the multi-agency, State and Federal Colorado River Basin Salinity Control Program will fall far short of meeting the rate of salinity control determined to be determined necessary to assure compliance with the basin-wide standards for salinity in the Colorado River. Failure to maintain the standards' numeric criteria could result in the imposition of state-line water quality standards (as opposed to the successful basin-wide approach that has been in place since 1975) and impair the Colorado River Basin States' ability to develop their Compact-apportioned water supplies. Further, it is unmistakable that funding shortfalls will result in significantly higher costs to implement the same level of salinity control through the CRSC Program in future years.

The Federal Agriculture Improvement and Reform Act of 1996 (Public Law 104-127) provided for the CRSC Program to continue in the future—as a component part of the Environmental Quality Incentives Program (EQIP). We view the inclusion of the Salinity Control Program in EQIP as a Federal recognition of commitment to complying with the Colorado River salinity water quality standards. The Secretary of Agriculture has a vital role in meeting that commitment. We urge the Subcommittee to remind the Secretary of Agriculture of his obligations under that Federal commitment as he makes decisions about national conservation priority areas

and priority resource concerns. The intention of Public Law 104-127 is that the nation's agricultural programs be "locally led and driven" and we agree with that approach. Since the enactment of that law, however, the Salinity Control Program has not been funded at a level adequate to ensure that the water quality standards for salinity in the Colorado River can be maintained at or below the numeric criteria levels specified in the standard.

The Colorado River Basin States have urged the U.S. Department of Agriculture to designate the Colorado River Salinity Control Program as a national conservation priority area as provided for in the USDA's promulgated regulations for the EQIP. Although numerous requests have been made for this designation, USDA's responses have justified the lack of national conservation priority area designations by pointing to the lack of adequate EQIP funding. An authorization of \$350,000,000 for EQIP funding in fiscal year 2001—an additional \$150,000,000 above the \$200,000,000 level minimum specified in Public Law 104-127—is both appropriate and needed.

I accordingly request that this committee support the borrowing of \$350,000,000 from the Commodity Credit Corporation (CCC) in fiscal year 2001 for the EQIP Program, and that the Congress advise the Administration to designate \$12,000,000 of the EQIP funding for the Colorado River Basin Salinity Control Program. Thank you for the opportunity to submit this testimony.

PREPARED STATEMENT OF TEXAS A&M UNIVERSITY

Mr. Chairman and members of the Committee, I am Ed Hiler, Vice Chancellor for Agriculture and Life Sciences in the Texas A&M University system. I appreciate the opportunity to appear before you today, to describe a few exciting research projects we have underway, and to ask for your support for continued federal funding. New technology is the life blood of American agriculture. With the 1996 Farm Bill and resulting phase down in federal farm programs, it is imperative that research continues providing a technological underpinning for agriculture. Today, I will describe several examples of how we can provide this underpinning.

DESIGNING FRUITS, VEGETABLES AND OTHER FOOD PLANTS FOR PREVENTION OF LIFE-THREATENING DISEASES

To identify plant "phytochemicals" that prevent disease and enhance those compounds in fruits, vegetables, and other food plants that promote human health. Objectives seek to reduce the risk of, to slow, and/or to prevent diseases such as cancer, heart disease, stroke, and atherosclerosis. Consumers, health care providers, farmers, and government will benefit from the production, consumption, and health effects of producing and consuming these improved plants. We are requesting increased funding for this important continuing project at \$2,000,000 for fiscal year 2001.

EFFICIENT IRRIGATION FOR WATER CONSERVATION IN THE RIO GRANDE BASIN

Recent drought conditions in the border region of the Rio Grande Basin highlight the importance of ample water resources for the region's economy and environment. More efficient agricultural and urban irrigation systems can conserve large amounts of water that can be used for other purposes. The objective of this two-state initiative is to increase the efficiency of agricultural and urban landscape irrigation and encourage development of efficient water markets in the basin. We are requesting funding for this project at \$3,250,000 for fiscal year 2001.

ANIMAL FIBER RESEARCH

Appropriations are sought to conduct wool, mohair and cashmere research that will stabilize and increase the profitability of the sheep, Angora, and cashmere goat industries in the United States and Texas while providing U.S. consumers with high quality animal fibers at internationally competitive prices. In this three-state initiative, emphasis will be placed on the development and expanded use of objective fiber measurements in the areas of nutrition, management, selection, harvesting, and marketing. We are requesting funding for this project at \$300,000 for fiscal year 2001.

FARM-LEVEL IMPACTS OF AGRICULTURAL POLICY

Funds are needed to conduct agricultural policy research that directly supports congressional committees involved in setting agricultural policy. This two-state research activity emphasizes the regional and farm-level effects of alternative agricul-

tural policies on crop producers. Monitoring performance at the farm level continues to be particularly critical as government explores its role in providing an income safety net for American agriculture. We are requesting funding for this project at \$500,000 for fiscal year 2001.

LIVESTOCK AND DAIRY POLICY ANALYSIS

Funds are needed to allow Texas A&M University and Cornell University to conduct agricultural policy research on the livestock and dairy industries that will assist congressional committees in developing new legislation for agricultural programs. Legislative options will be analyzed to determine policy impacts on various sectors of the agricultural economy, markets and land prices. Monitoring the performance of the dairy sector at the farm level will be particularly critical at a time of regulatory dairy policy reform mandated by the 1996 Farm Bill and government roles in providing an income safety net for American agriculture. We are requesting funding for this project at \$625,000 for fiscal year 2001.

CENTER FOR NORTH AMERICAN STUDIES

This two-state funding initiative, which has received continual support from Congress since fiscal year 1994, would continue and expand the programs of the Center for North American Studies headquartered in The Texas A&M University System. The Center provides leadership for the promotion of stronger agricultural relationships among Canada, Mexico and the United States through cooperative study, research, policy analysis and training. We are requesting funding for this project at \$300,000 for fiscal year 2001.

CONSORTIUM FOR AGRICULTURAL SOILS MITIGATION OF GREENHOUSE GASES (CASMGs)

A consortium of eight Land Grant universities, USDA agencies, and a private-public research laboratory seeks funds to develop and verify scientifically defensible methods to measure and estimate the effects of soil conservation and crop management practices on carbon sequestration in agricultural soils. The consortium will also assess the economic and environmental consequences of programs designed to sequester atmospheric carbon dioxide in agricultural soils. We are requesting funding of \$5,000,000 from USDA for this project for fiscal year 2001.

SHRIMP AQUACULTURE RESEARCH

Federal support is needed to maintain continued funding for ongoing efforts and to expand programs of the U.S. Marine Shrimp Farming Program (USMSFP). This program, currently funded by the USDA/Cooperative State Research, Extension and Education Service (CSREES) through the Oceanic Institute in Hawaii and the Gulf Coast Research Laboratory Consortium as based in the Texas Agricultural Experiment Station and The Texas A&M University System Agriculture Program. We are requesting funding for this project at \$5,000,000 for fiscal year 2001.

INTERNATIONAL GOAT RESEARCH AT PRAIRIE VIEW A&M UNIVERSITY

Congressional funds are sought to continue the effort supporting dairy and meat goat research at the International Goat Research Center at Prairie View A&M University, a member of The Texas A&M University System. We are requesting funding for this project at \$750,000 for fiscal year 2001.

NEW PRODUCTS FROM RANGELANDS AT TEXAS A&M UNIVERSITY-KINGSVILLE

Congressional funds are sought to continue research efforts to support the commercialization of new industrial and food crops from native plants—such as cacti and mesquite—from arid lands, greatly benefitting Americans who live in the southwestern United States. We are requesting funding for this project at \$120,000 for fiscal year 2001.

SOUTHERN PLAINS COTTON RESEARCH AND EDUCATION CONSORTIUM

The cotton industry in the Southern Plains is under unprecedented stress from declining prices due to strong global competition, improved boll weevil management, and increased cotton acreage in the southeastern U. S. An agricultural research and education consortium composed of Texas Tech University, the Texas Agricultural Experiment Station, the Texas Agricultural Extension Service, and USDA Agricultural Research Service has been formed to address these challenges in the Southern Plains. The consortium proposes to initiate a five-year, \$27.5 million program to increase profits of Southern Plains cotton farmers and processors. The effort will ac-

comply its goal by developing and disseminating improved cotton germplasm, crop management practices, pest control programs, textile processing technologies, and marketing programs. We are requesting funding for this project at \$5,500,000 for fiscal year 2001.

AGRICULTURE AND THE ENVIRONMENT—LANDSCAPE ISSUES

The focus of the Texas Institute for Applied Environmental Research is on agriculture and the environment. Funding for this initiative will be used to continue development of (1) conceptual approaches that can be used to resolve environmental problems in agriculture while maintaining the competitiveness of the industry, (2) modeling tools that analyze policy alternatives to determine their effectiveness in achieving environmental objectives and their economic impacts on the targeted industry, and (3) implications of smart growth initiatives on production agriculture. We are requesting funding for this project from USDA at \$750,000 for fiscal year 2001.

PROTECTING U.S. AGRICULTURE FROM BIO-TERRORISM & EXOTIC BIO-INVADERS

An integrated system for protecting U.S. agriculture and its food supply against the threat of bioterrorism is recognized as an increasingly high priority addition to similar systems for protecting humans and cyberspace. The system will also work for natural or accidental outbreaks of animal and plant disease resulting from introduction of exotic bio-agents. The proposed agricultural bio-security system will include a surveillance network utilizing GPS and satellite imaging technology, field and laboratory based diagnostic capacity deploying DNA-chip technology to identify and characterize bio-agents, and a geo-referenced information system for predicting and tracking the spread of bio-agent after introduction. The system will include means to support intervention and mitigation following attack. The system will be developed in partnership with the USDA's Agricultural Research Service, other universities, and the private sector. We are requesting funding for this project at \$5,000,000 for fiscal year 2001.

CENTER FOR FOOD SCIENCE AND ENGINEERING

Appropriations are requested to construct and equip a 125,000 sq. ft. facility at College Station, Texas to house: USDA-Agricultural Research Service food safety programs and the Texas A&M University Institute of Food Science and Engineering. Dedicated incubator space will be provided for entrepreneurs seeking to break into food manufacturing. We are requesting funding for this project at \$30,000,000 for fiscal year 2001.

ECONOMICALLY & ENVIRONMENTALLY SOUND RICE PRODUCTION AND MANAGEMENT IN THE U.S.

Privately held rice lands provide several societal and ecological benefits. Rice has an annual impact of about \$13 billion on the economy of the U.S., and represents the economic, social, and environmental underpinning of major sections of the Gulf Coast. Rice production in these soils provides several environmental benefits, including wildlife habitats, water filtration through wetlands, and flood protection. Federal support is needed to identify and place values on ecological services provided by rice production and to design and evaluate technologies and policies that increase these public benefits while improving the industry's economic viability. We are requesting funding from USDA for this project at \$1,000,000 for fiscal year 2001.

INCREASING FOOD SAFETY THROUGH ADVANCED MOLECULAR TECHNOLOGIES

Appropriations are sought to develop and test the application of advanced molecular technologies for enhancing the safety of the nation's supply of meats, fruits, and vegetables. Foods contaminated with animal wastes and other sources of bacterial pathogens annually cause millions of illnesses and thousands of deaths. New and rapidly advancing molecular technologies promise to make possible the early and economical tracking and investigation of such pathogens. This will significantly increase our ability to determine sources of outbreaks and to anticipate the effects of food production and processing practices on the ability of these organisms to cause disease. The Texas and Iowa Agricultural Experiment Stations and Texas Tech University propose cooperative public-private research needed to put such technologies in place throughout the nation and the world. We are requesting funding for this project at \$1,250,000 for fiscal year 2001.

NATURAL FIBERS MARKETS AND POLICY ANALYSIS

Scientists at Texas Tech University and Texas A&M will determine, monitor and continuously assess the status of the U.S. natural fiber (cotton, mohair and wool) industries within the context of the U.S. and world natural and synthetic fiber markets. It will periodically evaluate the impacts of proposed, anticipated and potential policy, trade and macroeconomic changes/trends in both the U.S. and abroad, on the U.S. natural fiber and textiles markets. The program will anticipate shifts in the levels of competitive advantage of U.S. industries and the resulting capital/resource flows that might result from changing economic and policy environments. These types of analyses are particularly important in light of the current debate about the role that the U.S. government should play in the agricultural sector/markets, and about the costs and benefits of global trade liberalization. We are requesting funding for this project at \$550,000 for fiscal year 2001.

RISK MANAGEMENT SAFETY NET

Increased volatility of commodity prices and dissatisfaction with crop insurance as a policy tool have heightened interest in the role of government in providing a safety net for U.S. agriculture. This initiative would support analyses of alternative safety net proposals as a risk management tool for production agriculture as a substitute for conventional farm programs. We are requesting funding for this project at \$500,000 for fiscal year 2001.

STRENGTHENING OUR CAPACITY TO CARE: COMMUNITY SUPPORT FOR YOUTH AND FAMILIES

This initiative will provide a comprehensive youth and family development program designed to strengthen and enhance local community educational programming in youth life skills, community service, workforce preparation, character education, fathering support and parenting education. The goal of this initiative will result in the empowerment of families and increased ability of youth to be successful contributing members of society. We are requesting funding for this project at \$2,500,000 for fiscal year 2001.

IMPROVED STRESS TOLERANCE OF CORN FOR THE SOUTHERN GREAT PLAINS AND DEVELOPING COUNTRIES

Farmers and consumers in many parts of the world would benefit from corn hybrids that combine high yield potential (like those developed in the United States and Europe) with the stress tolerance found in certain tropical and subtropical varieties. Working in close cooperation over the past several years, the Texas A&M University System (TAMUS), Texas Tech University (TTU), and the International Maize and Wheat Research Center (CIMMYT) have demonstrated the feasibility of introducing genes for stress tolerance into germplasm with high yield potential. These three partner institutions propose a five-year, \$7.5 million effort to introduce multiple and complementary genes for drought, heat, nutrient, disease, and insect tolerance (from tropical and subtropical germplasm) into high-yielding germplasm adapted to the Southern High Plains and tropical/subtropical environments. The anticipated result of this effort are hybrids with yield potentials equal to the best commercially available materials and no more than half the sensitivity of current materials to moderate and severe drought, heat, nutrient, disease, and insect stresses. We are requesting USDA funding for this project at \$500,000 for fiscal year 2001.

CENTER FOR HISPANIC FAMILY STUDIES

This initiative from Texas A&M University-Kingsville will provide leadership for teaching and research about the Hispanic family in the United States, including life span analysis ranging from infant studies to gerontology. Child care, nutritional and educational services will be offered to the studied population. We are requesting funding for this project at \$3,300,000 for fiscal year 2001.

THE BORDERLANDS: HUMAN IMPACTS ON AVIAN COMMUNITY DYNAMICS

Texas A&M University-Kingsville seeks appropriation to examine the immediate and future impacts that a growing human population in southern Texas/northern Mexico borderlands is having (and will have) on the diverse avian communities that share this region. The evaluation of the effects of invasive species, urbanization, environmental contaminants, and agricultural practices have on avian ecology, such as changes in reproduction, mortality, resource allocation, and the temporal and spatial distribution of species will benefit our understanding of how to better man-

age this rich resource now and in the future. We are requesting funding for this project at \$1,660,000 for fiscal year 2001.

ENHANCING AGRICULTURAL PRODUCTION IN SALINE REGIONS

Congressional appropriations are sought to conduct research into methods of increasing terrestrial and aquatic agricultural production in regions with shortages of fresh water but abundant supplies of saline water. Technology developed as a result of this research effort will be transferred to the private sector for commercialization. Texas A&M University-Kingsville requests funding for this project at \$320,000 for fiscal year 2001.

EMERGING HEALTH & TRADE ISSUES IMPACTING NATIONAL CATTLE INDUSTRIES: JOHNE'S DISEASE

Develop modern methods for detecting and preventing Johne's Disease of cattle to improve animal health, enhance production efficiency and eliminate disruption of vital interstate and international trade. We are requesting funding for this project at \$2,000,000 for fiscal year 2001.

A FUNGAL GENOME INTERNET

The Fungal Genome Internet (FGI) will integrate fungal genome research at institutions in Georgia, Louisiana, New Mexico, North Carolina, Oklahoma, and Texas. The long term objective of the FGI is to use the information derived from fungal genomes to enhance the beneficial aspects of fungi and to control their negative impact on our society. The FGI will be an academic focal point for the functional analysis, including bioinformatics and transcriptional profiling, of three important fungal genomes. The FGI will also coordinate functional genomics activities in other academic and industrial labs. At Texas A&M University, the FGI will be a joint effort with the Departments of Biology, Plant Pathology and Microbiology, Biochemistry and Biophysics and the Crop Biotechnology Center. Texas A&M University requests funding for this project at \$3,000,000 for fiscal year 2001.

NEW FOOD AND ANIMAL WASTE COMPOSTING TECHNOLOGY—A NATIONAL OUTREACH/ TECHNOLOGY TRANSFER INITIATIVE

New "in-vessel" composting technology has been developed at Texas A&M University-Commerce that will rapidly decompose, stabilize and sanitize food residuals, animal wastes and animal mortalities. Funding of this three-year initiative will (1) provide demonstration and implementation programs in strategic, visible national production centers, (2) facilitate and coordinate linkages between waste stream generators and end product users, and (3) focus efforts of the existing Center for Rural Water Studies toward value-added processing and utilization of noxious food and animal wastes. Texas A&M University-Commerce requests funding for this project at \$1,000,000 for fiscal year 2001.

REDUCING AMMONIA EMISSIONS FROM FEEDLOTS

Ammonia emitted from feedlot surfaces combines with combustion byproducts to produce minute particulate matter (dust) that is of significant environmental and health concern to the United States Environmental Protection Agency (EPA). The purpose of this initiative is to develop scientific and engineering methods for reducing ammonia emissions from feedlots and thereby reducing health and environmental problems. West Texas A&M University requests funding for this project at \$1,500,000 for fiscal year 2001.

FOOD SAFETY AND WATER QUALITY

Reducing levels of food-safety-related-pathogens in live animals is a potential means of increasing food safety. The purpose of this initiative is to characterize the role of water as a vehicle for food-safety-related-pathogens in feedlot cattle in the Texas High Plains. West Texas A&M University requests funding for this project at \$1,000,000 for fiscal year 2001.

PREPARED STATEMENT OF THE U.S. APPLE ASSOCIATION

The U.S. Apple Association (USApple) appreciates the opportunity to provide this testimony on behalf of our nation's apple industry.

Our testimony will focus on the following three areas: the Market Access Program (MAP); Food Quality Protection Act (FQPA) implementation; and Agricultural Research Service (ARS) funding.

USApple is the national trade association representing all segments of the apple industry. Members include 36 state apple associations representing the 9,000 apple growers throughout the country as well as more than 450 individual firms involved in the apple business. Our mission is to provide the means for all segments of the U.S. apple industry to join in appropriate collective efforts to profitably produce and market apples and apple products.

MARKET ACCESS PROGRAM (MAP)

USApple strongly supports increasing the annual appropriation for MAP from \$90 million to \$200 million.

All segments of the U.S. apple industry benefit directly from the use of export promotion funds, which increase export demand. In fiscal year 1999, the apple industry received \$3 million in MAP export-development funds. These funds are matched by grower funds, and are used to promote apples in more than 20 countries throughout the world. Since 1987, when the apple industry first utilized MAP funds, apple exports have increased by 88 percent.

The U.S. apple industry faces keen competition around the globe from competitors who receive significant government funds for generic promotions. The governments of our foreign competitors spend approximately \$500 million on export promotion and market development. It has become increasingly difficult for U.S. exporters to compete with European and Chinese producers who receive massive government assistance. Increased funding for this critical program will assist U.S. apple producers to better compete, and revive export demand in countries recently hit by adverse economic conditions.

FOOD QUALITY PROTECTION ACT (FQPA) APPROPRIATIONS

USApple strongly supports full funding for the following programs intended to facilitate fair FQPA implementation, and to offset its anticipated negative impact on apple growers.

Specifically, USApple supports the U.S. Department of Agriculture's following budget requests.

- \$14 million for the Pesticide Data Program, administered by the Agricultural Marketing Service;
- \$3.2 million for the National Agricultural Statistics Service pesticide-usage surveys;
- \$2.6 million for the Office of Pest Management Policy administered by the Agricultural Research Service;
- \$12.2 million for the Integrated Pest Management Research Grant Program administered by the Cooperative State Research, Extension and Education Service (CSREES);
- \$18 million for the Pesticide Impact Assessment Program, Crops at Risk and Risk Avoidance and Mitigation Program also administered by CSREES.

(ARS) TEMPERATE FRUIT FLY RESEARCH POSITION—YAKIMA, WASHINGTON

USApple requests the appropriation of \$300,000 to fill a critical position at the USDA-ARS laboratory in Yakima, Washington to conduct research of temperate fruit flies, a major pest of apples.

FQPA implementation is expected to significantly reduce the number of pesticides currently available to growers for the control of pests such as cherry fruit fly and apple maggot. Left unchecked, these temperate fruit flies can be devastating. Research is critically needed to develop alternative pest controls should growers lose access to presently-available crop protection tools as a result of FQPA implementation.

Congress appropriated \$300,000 last fiscal year for this critical position. We request that the committee appropriates \$300,000 for this position in fiscal year 2001.

(ARS) POST HARVEST QUALITY RESEARCH POSITION—EAST LANSING, MICHIGAN

USApple requests that the committee direct USDA to provide continued funding for postharvest quality research at the ARS laboratory in East Lansing, Michigan.

This facility is conducting research that is critical to the future economic recovery of the apple industry. Using a series of new sensing technologies, researchers at the East Lansing facility are developing techniques that would allow apple packers to measure the sugar content and firmness of each apple before it is shipped to con-

sumers. Research has shown that consumers will increase purchases of high quality products that consistently meet their expectations. We believe consumers will eat more apples if this technology is fully developed and employed, by our industry.

However, the administration is proposing to terminate the East Lansing research program effective Sept. 30, 2000. We request that the committee direct USDA to continue funding for this critical research.

Thank you for this opportunity to present this testimony on behalf of USApple and the U.S. apple industry.

PREPARED STATEMENT OF THE UNITED STATES TELECOM ASSOCIATION

SUMMARY OF REQUEST

Project Involved.—Telecommunications Loan Programs Administered by the Rural Utilities Service of the U.S. Department of Agriculture.

Actions Proposed.—Supporting RUS loan levels and the associated funding subsidy for the hardship, cost of money, Rural Telephone Bank and loan guarantee programs in fiscal year 2001 in the same amount as loan levels specified in the fiscal year 2000 Agriculture Appropriations Act which are the same levels as those requested in the President's budget for fiscal year 2001. Also supporting an extension of the language removing the 7 percent interest rate cap on cost of money loans. Also supporting continuation of the restriction on the retirement of class A Rural Telephone Bank stock in fiscal year 2001 at the level contained in the fiscal year 2000 Agriculture Appropriations Act and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Supporting funding in the amount of \$25 million in loan and grant authority designated for distance learning and telemedicine purposes. Also supporting \$2 million in direct loans and grants for a pilot program to finance broadband transmission and local dial up Internet service in rural areas as requested in the President's budget. Opposing the President's budget proposal to transfer funds from the unobligated balances of the liquidating account of the Rural Telephone Bank for the Bank's administrative expenses and loan subsidy costs.

The United States Telecom Association (USTA) represents over 1,000 local telephone companies that provide over 95 percent of the access lines in the United States. USTA members range from large public-held corporations to small family-owned companies as well as cooperatives owned by their customers. I am Roy Neel, President and CEO of USTA. I submit this testimony in the interests of the members of USTA and their subscribers.

USTA members firmly believe that the targeted assistance offered by a strong RUS telecommunications loan program remains essential in order to maintain a healthy and growing rural telecommunications industry that contributes to the provision of universal telephone service. We appreciate the strong support this committee has provided for the telecommunications program since its inception in 1949 and look forward to a vigorous program for the future.

A CHANGING INDUSTRY

As Congress recognized through passage of the Telecommunications Act of 1996, telecommunications in the United States is in the midst of the most significant changes any industry has ever undergone. Both the technological underpinnings and the regulatory atmosphere are dramatically different and changing at an extraordinarily rapid pace. Without system upgrades, rural customers will be left out of the emerging information revolution.

The need has never been greater for the technology employed by RUS borrower rural telecommunications companies to continue to be modernized. In addition to upgrading switching capability to allow new services to be extended to rural subscribers, it is crucially important that rural areas be included in the nationwide drive for greater bandwidth capacity. In order to provide higher speed data services, such as Digital Subscriber Line (DSL) connections to the Internet, outside plant must be modernized in addition to new electronics being placed in switching offices. With current technology, DSL services cannot be provided to customers located on lines more than three miles from the switching office. Rural areas have a significant percentage of relatively long loops and are therefore particularly difficult to serve with these higher speed connections. Rural telecommunications companies are doing their best to restructure their networks to shorten loops so that DSL may be provided, but this is not an inexpensive proposition and may not be totally justified by market conditions. However, these services are important for rural economic development, distance learning and telemedicine. RUS-provided financial incentives for

additional investment encourage rural telecommunications companies to build facilities which allow advanced services to be provided. The economic externalities measured in terms of economic development and human development more than justify this investment in the future by the federal government.

Greater bandwidth and switching capabilities are crucial infrastructure elements which will allow rural businesses, schools and health care facilities to take advantage of the other programs available to them as end users. The money spent on having the most modern and sophisticated equipment available at the premises of the business, school or clinic is wasted if the local telecommunications company cannot afford to build facilities that quickly transport and switch the large amounts of data that these entities generate. RUS funding enhances the synergies among the FCC and RUS programs targeted at improving rural education and health care through telecommunications.

The RUS program provides needed incentives to help offset regulatory uncertainties related to universal service support, interstate access revenues and interconnection rules with a reliable source of fairly priced, fixed-rate long term capital. After all, RUS is a voluntary program designed to provide incentives for local telecommunications companies to build the facilities essential to economic growth.

RUS endures because it is a brilliantly conceived public-private partnership in which the borrowers are the conduits for benefits from the federal government to flow to rural telephone customers, the true beneficiaries of the RUS program. In fact, the GAO recently observed in a Congressional hearing that if there were no RUS telecommunications program, today's Congress would invent one. The government's contribution is leveraged by the equity, technical expertise and dedication of local telecommunications companies.

IMPACT OF CREDIT REFORM ON THE RURAL TELEPHONE BANK

Contrary to the intent of Congress, the interpretation of credit reform by the Office of Management and Budget (OMB) has significantly affected the operation of the Rural Telephone Bank (RTB). One of the most damaging impacts of OMB's interpretation of the credit reform law is to essentially cleave the RTB into two banks—a liquidating account bank which is responsible for pre-credit reform loans, and a financing account bank which is responsible for post credit reform loans. USTA has protested this arrangement since it began, since it prevents the relending of borrower repayments to fund new loans in direct contravention of Sec. 409 of the Bank's enabling act. This, in turn, forces the RTB to borrow unnecessarily from the Treasury to fund new loans. It also permits funds to build up in the liquidating account that were generated by GAO-documented interest rate overcharges, instead of those funds being returned through relending to the same universe of borrowers that initially generated them.

In the fiscal year 2001 budget proposal, the Administration proposes, despite its recognition that these are equity funds belonging to stockholders, to take monies from the liquidating account and fund the loan subsidy for new loans as well as the RUS administrative expenses allocated to the RTB. This is in direct conflict with an existing provision of law, Sec. 403(b) of the Rural Telephone Bank Act (Public Law 92-12). That provision states “. . . in order to perform its responsibilities under this title, the telephone bank may partially or jointly utilize the facilities and the services of employees of the Rural Electrification Administration or of any other agency of the Department of Agriculture, without cost to the telephone bank”. (Emphasis added)

Instead of using the repayments into the liquidating account to fund the expenses of the RTB (contrary to the Rural Electrification Act) or to fund the loan subsidy, neither of which would result in any budget savings, OMB should adhere to Sec. 409 of the Rural Electrification Act and allow those repayments to be used to fund new RTB loans. It is ironic that in the same budget proposal that purports to have the RTB act more like a private bank, OMB continues to maintain the artificial split of the bank's resources which prevents it from acting as would a private bank—relending repayments.

RUS TELEPHONE PROGRAM PROCEDURES

Under the leadership of Acting RUS Administrator Chris McLean and Assistant Administrator for Telephone, Roberta Purcell, significant steps have been made in streamlining the policies and procedures of the RUS telecommunications loan program. RUS should be commended for the progress it has made and continue to reduce regulation and improve service delivery, within the context of the government's interest in security for these rural telecommunications infrastructure improvement loans.

RECOMMENDATIONS

Continuation of the loan levels and necessary associated subsidy amounts for the RUS telephone loan programs that were recommended by this committee and signed into law for fiscal year 2000 would maintain our members' ability to serve the nation's telecommunications needs, maintain universal service and bring advanced telecommunications services to rural America.

For a number of years, through the appropriations process, Congress has eliminated the seven percent "cap" placed on the insured cost-of-money loan program. The elimination of the cap should continue. If long term Treasury interest rates exceeded the 7 percent ceiling contained in the authorizing act, adequate subsidy would not be available to support the program at the authorized level. This would be extremely disruptive and hinder the program from accomplishing its statutory goals. Accordingly, USTA supports continuation of the elimination of the seven percent cap on cost-of-money insured loans in fiscal year 2001.

The restriction on the retirement of the amount of class A stock by the Rural Telephone Bank, adopted in fiscal 1997, should be continued. The Bank is currently retiring Class A stock in an orderly, measured manner as current law requires. This should continue. The Committee should also continue to protect the legitimate ownership interests of the Class B and C stockholders in the Bank's assets by continuing to prohibit a "sweep" of those funds into the general fund.

Recommended Loan Levels.

USTA recommends telephone loan program loan levels for fiscal year 2001 as follows:

	[In millions of dollars]	
RUS Insured Hardship Loans (5 percent)		\$75
RUS Insured Cost-of-Money Loans		300
Rural Telephone Bank (RTB) Loans		175
Loan Guarantees		120
		670
Total		

Distance Learning and Telemedicine

USTA strongly supports the loan and grant proposal and recommends its funding for fiscal year 2001 at the levels proposed in the Administration's budget submission, that is, \$25 million for loans and grants. This program is a perfect complement to the traditional RUS telecommunications loan programs. For distance learning and telemedicine to become a reality, schools and hospitals need training and equipment. Similarly, local telecommunications companies need modern infrastructure to connect these facilities to the telecommunications network.

Even though our members do not benefit directly, USTA also supports the \$2 million requested in the President's budget for a pilot program of loans and grants to finance broadband transmission and local dial up access to the Internet in rural areas. RUS was founded on the notion that rural Americans should have no lesser service, facilities and prices for telephone service as those living in more densely populated, lower cost areas. As we move into the Information Age, in which increases in productivity, economic development, education and medicine can greatly benefit from the tremendous potential of the Internet, it is a continuation of the historic of the historic mission of RUS to support the extension of vital new services to rural America.

CONCLUSION

Our members take pleasure and pride in reminding the Subcommittee that the RUS telecommunications program continues its perfect record of no defaults in over a half century of existence. RUS telecommunications borrowers take deadly seriously their obligations to their government, their nation and their subscribers. They will continue to invest in our rural communities, use government loan funds carefully and judiciously and do their best to assure the continued affordability of telecommunications services in rural America. Our members have confidence that the Subcommittee will continue to recognize the importance of assuring a strong and effective RUS Telecommunications Program through authorization of adequate loan levels.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Mr. Chairman and distinguished members of the Agriculture, Rural Development, and Related Agencies Subcommittee: We are pleased to provide this updated testimony on behalf of the federally-funded project entitled "Studies to Reduce the Aflatoxin Problem in Corn" being carried out in the University of Illinois Crop Sciences Department by Professors J.M. Widholm and D.G. White, in cooperation with scientists in other institutions and agencies. Professors White and Widholm provided the technical information in this report. We wish to thank you, Mr. Cochran and others on the Committee, for appropriating \$1,249,000 to date for this important research. We continued to make progress on the project during the past year. We request an fiscal year 2001 allocation of \$180,000 so that we can move closer to achieving the goals of the project.

THE AFLATOXIN PROBLEM AND OUR STRATEGY TO SOLVE IT

Because of its toxicity and carcinogenicity (causes cancer), aflatoxin in corn grain is a very serious problem. When the causal fungus, *Aspergillus flavus*, is present on the grain, the toxin is often present also. Aflatoxin problems occur primarily in years and areas of moisture stress, which means their occurrence is relatively unpredictable. According to our studies of sixty-five widely grown commercial corn hybrids, including yellow dent corn, white corn, and food-grade white and yellow corn, there is little or no resistance to *A. flavus* in commonly grown hybrids.

The toxin can form in the maturing grain before harvest and in stored grain if the moisture levels are too high. Due to the danger posed by aflatoxin, levels of the toxic compound are closely monitored in corn grain. If levels of aflatoxin are too high in a given sample, the grain represented by the sample cannot be sold in interstate commerce. There is a significant monitoring cost, but it is small relative to other costs incurred by aflatoxin.

It is estimated that in any given year 5 to 30 percent of the nation's corn crop experiences severe moisture stress. Direct yield and quality losses caused by aflatoxin are at least \$500 million annually. That loss accrues to producers. In addition, there are harmful health, social, and economic effects of aflatoxin when it is present in corn-based food products. Aflatoxin is one of the most carcinogenic of naturally occurring compounds. It is very detrimental to the health of humans or animals that ingest it. For these reasons, it is important to eliminate aflatoxin from corn grain. That is the mission of this project.

The strategy of the project is to: (1) through field tests, identify resistant germplasm in existing collections, (2) using tissue culture techniques, evaluate and select corn cultures that inhibit *A. flavus* growth and/or aflatoxin production, (3) regenerate promising plants for greenhouse and field evaluation, and (4) using recombinant DNA techniques, introduce into corn antifungal genes encoding enzymes such as chitinase and B-glucanase, which may impart resistance to *A. flavus*.

PROGRESS REPORT AND LOOK TO THE FUTURE

Previous and current conventional breeding and selection approaches

Since 1991 we screened thousands of corn inbred lines, some of which already existed in various collections and some of which we derived from existing material. We discovered an additional 21 lines since last year for a total of 32 with high levels of resistance to *Aspergillus* ear rot and to the production of aflatoxin. We concentrated on sources of resistance that can be used to improve inbred lines B73 and Mo17, from which most important commercially used inbred lines are derived.

In inheritance studies, we found that resistance genes have both additive and dominant affects. It is desirable for resistance genes to be dominant, so that when resistant and susceptible lines are crossed, the resulting hybrids will be as resistant as the resistant parent. Some of the resistance genes discovered are strongly dominant. Much of the effort was concentrated on inbred line Tex 6, developed at the University of Illinois by selecting from a southern white corn population that has high levels of resistance to southern corn leaf blight. So far, Tex 6 is the best source of resistance produced in this project.

Tex 6 confers extremely high levels of aflatoxin resistance when crossed with most of the inbreds that are important in the cornbelt. Inheritance studies indicate that the resistance in Tex 6 is controlled by just a few genes, which is very desirable. The fewer the genes controlling a trait, the easier it is to transfer that trait to otherwise desirable lines and the faster the trait can be introduced into widely used material using the common backcrossing approach.

A major milestone was reached when, using Tex 6 and other experimental lines and the backcrossing approach, we were able to transfer effective aflatoxin resist-

ance into commercially used inbreds related to both B73 and Mo17. In 1995, 1996, and 1999 yield trials, hybrids with some of these new aflatoxin resistance inbreds as one parent yielded as well as popular commercial hybrids. This breakthrough paves the way for private firms to introduce resistance to *A. flavus* and aflatoxin into their best lines.

The most important development in corn production in recent years was the introduction of practical high oil corn hybrids by Dupont and Pfister Hybrids, using materials developed at the University of Illinois. Unfortunately, high oil hybrids, which are produced by the so-called Topcross™ method, are more susceptible to *Aspergillus* ear rot and aflatoxin production than are normal hybrids of the same pedigree with a normal pollinator. Fortunately, high oil top crosses that involve some of the sources of resistance developed in this aflatoxin project are equal in resistance to normal resistant hybrids. Thus, this project is providing the mechanism to assure that the enormous potential of high oil corn is not reduced by aflatoxin.

Past, current, and future biotechnology research on aflatoxin

Four years ago, we used Restriction Fragment Length Polymorphism (RFLP) markers to identify those chromosome regions associated with specific genes for aflatoxin resistance. We found that some genes confer resistance to the fungal disease organism (*A. flavus*) that causes ear rot. Some do not confer resistance to the fungal organism but do inhibit its production of aflatoxin. Some genes do both.

A cooperator, Professor Gary Payne of North Carolina State University, identified a specific protein from seed of inbred Tex 6 that inhibits aflatoxin production in culture but has very little effect on growth of the fungus. He identified another protein that inhibits the growth of the fungus. Apparently there are corn genes that code for each of these proteins. Among other advantages of this finding, corn breeders will be able to use marker-assisted selection, a molecular selection technique, which should greatly speed the process of screening and selecting high-yield, aflatoxin-resistant lines of corn.

This year we completed work with inbred line C12, which has good levels of resistance and also makes a protein that blocks some, but not all, aflatoxin synthesis. If we can enhance the production of these blocking proteins and transfer the gene or genes that code for them into otherwise productive corn hybrids, several advantages will accrue. Since fewer genes will have to be transferred, less time will be required to incorporate desirable aflatoxin-reducing genes into commercially important hybrids. Also, the fungus will be less likely to develop ways to defeat the resistance mechanism.

Once these genetically controlled resistance mechanisms are fully understood, the resistance genes can be transferred to other crops, such as peanuts, that also have aflatoxin problems. Contrary to some previous indications, corn lines identified in this project that are resistant to *A. flavus* apparently are not consistently resistant to *Fusarium moniliforme*, which produces fumonisin, another highly toxic and carcinogenic mycotoxin. There is direct evidence that fumonisin causes cancer and birth defects in humans, not just in laboratory animals. We believe that some of the emphasis on this project should shift to fumonisin, which may turn out to be a bigger problem than aflatoxin. Fumonisin is produced by a common fungal disease of corn.

Biotechnology breakthrough

We experienced a major breakthrough during early fiscal year 1998 with the successful introduction of antifungal genes bean chitinase and B-1,3-glucanase into corn cells, both alone and in combination. The particle gun was used to accomplish this transformation. The transformed cells were regenerated into plants and were self-pollinated to obtain plants that are homozygous for the antifungal genes. Subsequently, we demonstrated by several different methods that the introduced genes are stable, are passed to progeny in normal reproduction, and are expressed in seeds of the transformed plants. In other species, these particular genes are expressed as enzymes that break down cell walls of invading fungi, thus preventing or reducing fungal diseases.

During tests in fiscal year 2000, some of the transformed plants showed resistance, although none were as resistant as Tex 6. We found that Tex 6, which confers the highest level of natural fungal resistance, has high levels of natural chitinase in its tissues. This is a different chitinase, however, than the one we introduced by recombinant DNA techniques. During the past year, several new plants were transformed with aflatoxin resistance genes. They are being evaluated for resistance in the greenhouse and field.

Plans for fiscal year 2001

In fiscal year 2001, we will continue to look for unique aflatoxin resistance mechanisms in the corn germplasm. We will seek to enhance natural resistance to *A. flavus* through conventional breeding techniques and will conduct further research aimed at increasing the resistance of high oil corn hybrids to the pathogen. We will also continue to evaluate plants transformed with resistance genes from corn and other species. We expect recent advances in the science of functional genomics to be useful in this project. Among other goals, we would like to develop additional genetic techniques that simplify the process of screening the thousands of lines of corn germplasm. Also, it will be very important to determine if a combination of chitinases confer greater and more lasting resistance than only one.

Cooperation

We continue to have good cooperation with other institutions and USDA-ARS. Several sources of resistance we discovered and several resistant lines derived from them were shown to be resistant in field studies conducted by cooperators in Mississippi and south Texas. Professor Gary Payne of North Carolina State University continues to make valuable contributions to the project. Several private firms have shown interest in our aflatoxin resistant lines. So far, they have just been observing the material and comparing it with materials they already have. Reports on the new material are generally positive.

Progress in moving the resistance genes to commercial lines is inhibited by a legal problem that confronts those who market seed. Increasingly, growers are inclined to sue companies when plants grown from seeds that are advertised as resistant to a disease have some level of damage. There is still enough uncertainty and variability with aflatoxin resistance genes that companies are reluctant to advertise the resistance trait. If companies cannot advertise the trait, they cannot differentiate their product from that of competitors. If they cannot differentiate their product, they cannot recover the costs of research required to introduce the trait. To the extent we can develop stable and predictable aflatoxin resistance in this project, we can help to overcome the barriers to adoption of an important technology.

SUMMARY

We believe this project is making excellent progress toward the desired outcome of reducing or eliminating aflatoxin as a serious problem in corn production and use. To summarize project results to date, we identified several corn lines that are resistant to the organism (*Aspergillus flavus*) that causes ear rot and produces aflatoxin. We also discovered lines that inhibit aflatoxin production without inhibiting fungal growth. This increases the possibility of inducing aflatoxin resistance that does not decrease with time.

We learned how aflatoxin resistance is inherited when crosses are made. We have sources of resistance that are effective when used in either the northern or southern corn belt. We developed practical tissue culture tests and DNA analysis techniques to identify resistant germplasm. We found that high oil corn hybrids are more susceptible to aflatoxin-producing organisms than normal hybrids, but that resistance sources developed in this project can be used to produce resistant high oil corn. The project continues to generate important papers in scientific journals. The papers provide valuable information on both practical and basic science issues associated with aflatoxin.

In a landmark achievement, we introduced antifungal genes bean chitinase and B-1,3-gluconase from other organisms into corn cells and successfully regenerated plants that have these genes. We found that the introduced genes are stable, passed to progeny during normal reproduction, and expressed in seeds. We still need to screen more germplasm for resistance sources. Natural resistance genes tend to work for a while and then become less effective as the pests evolve new virulence mechanisms. We still have to broaden the base of inbred lines that will be used to introduce aflatoxin resistance into commercial varieties grown in the major corn growing regions of the nation.

Our goal is to insert new resistance genes that can be moved rapidly into commercially used inbreds and that are effective in reducing and eliminating other mycotoxins as well.

REQUEST

We respectfully request an allocation of \$180,000 in federal funds for fiscal year 2001 to continue this important project. This amount will allow us to maintain the momentum and productivity of this innovative aflatoxin research program and capitalize on the progress made to date.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Mr. Chairman and Distinguished Members of the Agriculture, Rural Development, and Related Agencies Subcommittee:

Request

We request \$3.5 million to create a unique integrated animal waste and odor management research program (AWORP). This program will focus on technology for reducing, modifying, recycling, and utilizing waste streams from livestock production and eliminating associated air, water, and soil quality problems.

Need

The AWORP is essential if the U.S. is to:

- Sustain economically, socially, and environmentally viable livestock production operations in the central U.S.
- Capture value added to feed grains by livestock production
- Compete effectively in vast emerging markets for animal protein products,
- Recover and recycle nutrients used in production of feed grains, principally corn and soybeans that are fed to livestock
- Provide healthy working conditions for swine industry workers
- Preserve safe and attractive environments in the vicinity of U.S. livestock operations, and
- Provide adequate protein at reasonable prices for U.S. citizenry and other consumers around the world.

Background

Livestock production in the U.S. permits consumers around the world to enrich their diets with high quality protein in many forms. Adequate levels of animal protein characterize healthy populations in affluent nations. Inadequate levels are characteristic of poor, undeveloped nations and unhealthy people.

Currently, livestock production in the U.S. is threatened by fears concerning its environmental impact. Aerial emissions such as odor, particulates, and gases from livestock operations are already major concerns. A new area of concern is biological emissions, including microorganisms, their associated toxins, and ammonia. These emissions are potentially detrimental to the health and wellbeing of humans and animals who breathe or otherwise ingest them. Workers and animals within livestock production facilities are most likely to be affected.

The nutrients in animal wastes are valuable if they can be retained in production animals or recycled through crop and natural ecosystems. It is very undesirable, from health, aesthetic, environmental, and economic standpoints, for nutrients to end up in rivers, lakes, or aquifers that provide water for humans or animals.

Environmental problems related to livestock production are solvable. However, the complex interrelationships among variables influencing nutrient/contaminant production and flow through the system dictate that several factors must be managed simultaneously, in an integrated systems approach.

Therefore, to improve waste and odor management, these factors must be researched simultaneously, using a systems research approach. Existing research programs tend to focus on only one factor at a time and do not reflect conditions caused by multifactor interactions in complex livestock/cropping systems. AWORP will be conducted within a research infrastructure and with research protocols that correct deficiencies in present animal waste research programs and facilities.

Objectives

AWORP will produce practical technology and information that enables livestock producers to: reduce production of waste and odor in livestock operations; reduce waste and odor emissions from production facilities, reduce indoor levels of waste and odor components that cause human and animal health problems, rapidly and efficiently collect animal manure, treat manure to preserve plant nutrients and prepare for safe utilization, recycle manure, its constituent nutrients, and water in economically, socially, and environmentally acceptable ways, improve health, safety, and working conditions for livestock production workers, and make livestock production compatible with neighboring individuals and communities.

Features

AWORP will utilize a flexible array of integrated components required for a systems approach to waste and odor research:

- Pilot-scale swine and cattle production facilities for investigating the interactive effects of facilities design and operation, dietary and health management prac-

tices, and animal management techniques on manure and nutrient output and efficiency of manure collection.

- Pilot-scale manure handling, processing, and storage capabilities to evaluate a wide range of current and emerging technologies for waste management, nutrient preservation, emissions control, and odor elimination.
- Well instrumented fields for use in comparing strategies for capturing the nutrient output from livestock systems and in measuring the short- and long-term effects of manure applications on soil, water, and air quality.

Location and alliances

AWORP will be headquartered at the University of Illinois at Urbana-Champaign (UIUC). It will be a powerful mechanism for resolving critically important livestock waste and odor problems and an important contribution to a huge national effort involving state, federal, and private cooperation and investment.

Among several other related assets, the UIUC currently has a large, multidisciplinary research program on swine odor and waste management, which is funded at over \$1 million per year in state and private funds overseen by the Council on Food and Agriculture Research (C-FAR). This C-FAR Strategic Research Initiative (SRI) is characterized by an unprecedented level of stakeholder involvement in priority setting, funding, and accountability.

The initiative includes extensive atmospheric measurements, atmospheric chemistry studies, and studies of human health effects in cooperation with the Illinois Natural History Survey, Department of Atmospheric Sciences, and other units at the University of Illinois and with the National Farm Medicine Center in Marshfield, WI, which has an Animal Environmental Physiology Laboratory (AEPL) with experience in measuring ammonia and particulate emissions from livestock facilities.

Budget and Summary

We request \$3.5 million in federal funds to mount AWORP. These funds, complemented by significant state and private investments, will be used to staff, equip, house, and operate AWORP, and launch and sustain its projects. The University of Illinois will contribute the core staff (estimated cost, \$300,000 annually) and a strategically located field site (estimated value, \$150,000). The University will operate and maintain AWORP facilities (estimated cost, \$500,000 annually).

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Mr. Chairman and distinguished members of the Agriculture, Rural Development, and Related Agencies subcommittee:

We request that \$4 million in federal funds be appropriated in fiscal year 2001 to construct a state-of-the-art greenhouse facility at the University of Illinois. Detailed planning is underway, supported by the \$400,000 which was appropriated in fiscal year 2000. We thank you and the Subcommittee for your past support. This facility will support research associated with the Maize (corn) Genetics Stocks Collection and the National Soybean Germplasm Collection. These collections are maintained at the University of Illinois by the United States Department of Agriculture—Agricultural Research Service (USDA-ARS). As a partner in this endeavor, the University of Illinois agrees to provide and prepare the site, provide utility connections, and operate and maintain the facility in support of the collections and for related research programs.

NEED

Currently, University of Illinois greenhouses are used to support the collections, but they are so heavily used by both state and federal scientists that not enough space is available to support the collections adequately, nor is the space designed properly for support of the collections. The new greenhouse facility will significantly enhance the rate at which state and USDA scientists can identify and evaluate useful plant genes and incorporate them into new and improved plant varieties, tailored to the needs and opportunities of American agriculture.

To make effective use of conventional breeding and selection techniques and powerful new biotechnology approaches, scientists need excellent greenhouse facilities. Properly designed and efficiently operated greenhouses permit scientists to grow and maintain plants year round regardless of weather; perform experiments and evaluations requiring extraordinary levels of environmental control; and protect and reproduce valuable plants that are too fragile to survive in the natural environment. Genetically engineered plants being regenerated from single cells or small pieces of

tissue are often fragile and need the protection of growth chambers and greenhouses.

The Maize Genetics Stocks Collection and the National Soybean Germplasm Collection are unique and extremely valuable collections. Scientists all over the world request samples from among more than 70,000 lines of corn maintained in the Maize Collection. They use these samples to study corn genetics and basic molecular genetics. Likewise, all soybean breeders, both private and public, can draw on 18,000 lines of soybeans in the National Soybean Germplasm Collection for materials to serve as sources of genes that impart new and improved characteristics to soybeans.

Through negotiations spearheaded and financed by the Illinois and Iowa Agricultural Experiment Stations, Illinois and Iowa soybean checkoff boards, and USDA-ARS, the soybean collection has recently been enriched with over 2,000 new lines of soybeans from the geniplasm collection of the People's Republic of China, which maintains the largest collection in the world. This expansion of the collection will generate an even greater need for greenhouse space. The contributions from China are scheduled to continue at the rate of 500 new lines or more every two years. Evaluations to date indicate that there are many important quality and disease-resistance genes in the Chinese material that are not found in material already in the U.S. collection.

The corn and soybean collections are the repositories for quantity and quality characteristics that will characterize and sustain the U.S. corn and soybean industries into the future. The future of these industries is, indeed, written in genetic code. The collections are unique in the nation and are absolutely essential to continued improvement of these two important crop species. The scientists directly associated with the collections are constantly collecting, classifying, evaluating, multiplying, and distributing new materials. In addition they continue to maintain and evaluate the materials already in the collection. The biotechnology revolution is providing many powerful new techniques for evaluating the collection and is stimulating scientists to use the collections much more than before.

From time to time, because seed in the collections will only remain viable for five to ten years in storage, these materials must be grown to produce new seed. Many of the materials are not adapted to the outdoor environment of Illinois or they are too valuable to risk losing them to weather or other unpredictable events in the field. Thus greenhouses are essential to the maintenance of the collections. They are also essential to the performance of many other kinds of experiments involved in corn and soybean genetic improvement.

The work of evaluating and using the collections continues to be a major area of cooperation between the USDA-ARS and the University of Illinois. While samples are available to scientists all over the world, University of Illinois scientists and graduate students and their genetics and plant breeding programs benefit considerably from their proximity to the collections and their direct access to the USDA-ARS people who maintain the collections. USDA-ARS scientists, in turn, benefit greatly from being located in this great institution, with its vast and diverse physical and intellectual resources.

To illustrate the value of the University/USDA relationship, a Korean soybean land race obtained in an AID-financed University program and placed in the National Soybean Germplasm Collection, was discovered by a University of Illinois scientist to be the only line in the collection, perhaps the only soybean line in the world, that lacks the Kunitz trypsin inhibitor, which must be removed from soybeans by processing in order for them to be useful. The resulting introduction of Kunitz-free soybeans by the University and USDA-ARS is a very important contribution to the industry.

IMPLEMENTING THE PROJECT

The proposed greenhouse complex will be created by constructing four greenhouse bays adjacent to and integrated with the Turner Hall greenhouse complex at the University of Illinois. The bays will be attached to the Turner Hall greenhouse service corridor, thus providing ready access to the rest of a very large greenhouse complex, its basement, and several adjoining laboratory and office buildings of the University of Illinois College of Agriculture, Consumer, and Environmental Sciences, including facilities in which the contingent of USDA-ARS scientists are housed.

The four greenhouse bays will provide 10,000 net assignable square feet (nasf) of modern standard greenhouse space. This will meet current and anticipated greenhouse space needs for maintaining and expanding the collections. Basement space under these greenhouse sections will be used for additional cold storage for the Maize Genetics Stocks Collection, for laboratory space to support the nematology re-

search program, and for unfinished space for future expansion as program needs develop.

The integration of the facility with the existing greenhouse facilities will provide significant economies of scale and scope, simplify connection to existing utilities, and facilitate sharing of greenhouse equipment and support services.

SUMMARY AND BUDGET

We request \$4.0 million in federal funds in fiscal year 2001 to offset the costs of constructing the proposed greenhouse complex. As a partner in this nationally important effort, the University of Illinois agrees to provide land and utility connections, prepare the site, and pay the cost of operating and maintaining the facility henceforth. Site preparation and utility connections are estimated to cost \$200,000. Annual operating and maintenance costs are estimated at \$100,000.

PREPARED STATEMENT OF THE LOVELACE RESPIRATORY RESEARCH INSTITUTE AND THE UNIVERSITY OF MIAMI

Mr. Chairman and Member of the Subcommittee: We appreciate the opportunity to present jointly our testimony on behalf of the Lovelace Respiratory Research Institute (LRRRI) in New Mexico and the University of Miami School of Medicine (UMSM) in Florida for our proposed Minority Health Tobacco Research Center (MHTRC).

INTRODUCTION

Nicotine is a drug. It is a highly addictive drug that is unregulated. It is also a drug that appears to have profound inhibitory effects on the mammalian immune system. The delivery system of choice for this drug is the cigarette. There is no doubt that the use of tobacco products causes untold human injury and suffering. What is less well studied is the effect of secondary smoke (and by inference the delivery of nicotine to non-smokers) on the health of family members and co-workers of addicted users of these products. We propose the establishment of a center designed to study the physiology and behavioral medicine of secondary smoke combining the unique capabilities of two leading complementary research institutions, the University of Miami School of Medicine and its Drug Abuse Research Center in Florida and the Lovelace Respiratory Research Institute in New Mexico.

Extensive experience in health research at UMSM in minority substance abuse and minority health will be linked to the world class physiology, cell and molecular biology and toxicology expertise present at LRRRI to model the role of secondary smoke on the biology of the individual using cellular and rodent models followed by studies of family members of smokers. Medical and behavioral interventions will then be developed based on the resulting data.

Although prohibited from regulating tobacco products as it does other drugs by court action, the FDA does have an obligation to study the effects of these drugs on the public health of the nation. By supporting the Minority Health Tobacco Research Center, the FDA will be contributing to the knowledge base of the scientific community on the effect of secondary smoke and low dose nicotine exposure on minority health.

THE NEED FOR THE MINORITY HEALTH TOBACCO RESEARCH CENTER

The MHTRC as a joint project will be devoted to the reduction of health risks associated with addiction to tobacco and other harmful substances. Approximately 20 percent of all deaths are associated with tobacco smoking. Tobacco kills more people than murder, AIDS, suicide, illicit drug use and automobile accidents combined. The medical consequences of tobacco addiction include the three leading causes of death: cardiovascular disease, cancer and cerebrovascular disease. Its related medical costs are astronomical. For example, in Florida in 1996, tobacco-related Medicaid payouts were estimated to be \$264 million and \$365 million.

Tragically, the use of tobacco is also the most preventable cause of disease and death. We now know that nicotine is at least as addictive as cocaine or heroin. Recent studies even suggest that nicotine interacts with other drugs of abuse, that it reinforces craving and increases intake of cocaine and other drugs. However, nicotine is a special case of addiction because tobacco is legally sold and its use is not prohibited among adults. In spite of the evidence that nicotine is an addictive drug, which affects the brain in the same way that illicit substances such as opiates and cocaine do, nicotine dependence has not been considered substance abuse.

The need to focus on the minority population is particularly significant given the underutilization of the health system by the population. This disturbing fact is documented in a recent study produced by the Commonwealth Fund and published on February 18, 2000. The report discovered that Hispanics account for an alarming one-quarter of the nation's 44 million uninsured people. Hispanics are twice as likely as the general population to go without coverage. The number of uninsured Hispanics more than doubled to 11.2 million from 1987 to 1998. (bkb@cmwf.org)

LRRRI AND UMSM ARE UNIQUELY QUALIFIED TO ADDRESS TOBACCO AND HARMFUL
SUBSTANCE ADDICTION

UMSM researchers have significant expertise and experience in many relevant areas including: substance abuse, evaluation research, community research, behavioral medicine, disease prevention, treatment of tobacco-related disease, basic science research, epidemiology, and public health. The University's Tobacco Research Evaluation and Coordinating Center (RECC) has been responsible for the evaluation of Florida's Tobacco Pilot Program. Other strengths in the area of biomedical research and treatment include pediatric oncology and the Bachelor Children's Research Center, the Pediatric Environmental Respiratory Center, as well as the proposed Minority Health Tobacco Research Center (MHTRC)

LRRRI has undertaken some of the leading studies of animal models of smoking and the role of nicotine in immune function. It is one of the few research organizations capable of undertaking complex inhalation exposure protocols with appropriate animal models that predict human physiological responses. LRRRI will undertake experimental protocols investigating the role of second hand smoke on neonates and other adults. These models determine the precise immunological defects that result from these exposures. This data will then be compared to the cellular immune function of newborns, older children, and family members of minority subjects in Miami and New Mexico.

FOCUS ON MINORITY POPULATIONS

The proposed MHTRC will be devoted to the study of unrecognized health risks associated with addiction to tobacco products, predominantly in minority populations. This group may be uniquely susceptible to immune suppression, increased fetal HIV transmission, increased respiratory inflammation and infection, synergistic negative health effects with other abused substances and impaired immunological function of non-smoking family members exposed at home or in utero.

The MHTRC will address the culturally relevant behaviors that underlie tobacco use in human populations. The importance of the MHTRC lies in its bridging the use of animal models to the study of disease in people and the subsequent formulation and testing of medical and behavioral interventions to improve or eliminate the negative health consequences associated with tobacco use. Of further interest is the opportunity to compare two different Hispanic populations that differ in genetics and cultural characteristics (Mexican and Hispanic in New Mexico and Cuban in Florida) as well as characterizing African-American and Caucasian populations. Creating the MHTRC represents a unique opportunity to build upon the rich diversity of Florida's population, the commitment of the UMSM to the community and its experience with behavioral intervention, particularly related to tobacco use and substance abuse. Florida is an ideal location for the proposed MHTRC, being a bellwether state for social, demographic and epidemiological changes that the rest of the nation is currently facing or will face in the near future. Our extensive experience working with traditionally hard-to-reach populations such as minority substance abuser will ensure that the interventions developed will be culturally and linguistically appropriate and acceptable. UMSM also has the means for rapid dissemination of effective prevention and intervention within the minority communities through an already developed community health care coalition.

The goals of the MHTRC are to:

- Identify risk behaviors which lead to tobacco use and substance abuse.
- Reduce the incidence and prevalence of tobacco use and that of other addictive substances.
- Reduce the development of and suffering from disease associated with tobacco and other addictive substances through research and interventions in the basic sciences, clinical medicine and epidemiological research.
- Reduce exposure to environmental tobacco smoke.
- Develop, test and apply science-based community interventions to achieve these goals. We know that intervention with effective prenatal programs saves a tremendous amount of money that otherwise would be spent on healthcare after

birth. The same can be said for early detection of breast cancer through the screening of over 30,000 medically underserved women which has demonstrated that early detection and intervention saves dollars as well as lives. As is true for cancer, we already possess a great deal of knowledge that could be used to develop interventions and prevention strategies for addiction to tobacco and other harmful substances. Applying this knowledge could effect savings of billions of dollars for state, local and national governments. Equally important, the quality of life will be improved for individuals, families and their communities as well as society at large. It is becoming ever more apparent that we, as a society, cannot afford to ignore prevention and early intervention strategies since crises management is far too costly in terms of quality of life and unnecessary expenditures of dollars.

By achieving our stated goals, the MHTRC will be in a perfect position to:

- Improve quality of life,
- Decrease morbidity and mortality,
- Increase survival and,
- Significantly decrease health care expenditures by applying effective prevention and intervention.

For fiscal year 2001, we seek \$4 million (\$2 million for each institution) for this joint New Mexico-Florida initiative by the LRRI and UMSM. We feel strongly that the unique challenges you face have never been greater than at this point in history, but there has also never been a greater opportunity to apply science-based solutions to the riddle of addiction and greatly improving public health by eliminating or reducing its negative health consequences.

We hope, Mr. Chairman, that you and your colleagues on the Subcommittee will find it possible to support this important initiative.

PREPARED STATEMENT OF THE UNIVERSITY OF SOUTHERN MISSISSIPPI

Mr. Chairman, distinguished Members of the Subcommittee, I would like to thank you for this opportunity to provide testimony describing ongoing research and commercializing efforts of The University of Southern Mississippi (USM) and the Mississippi Polymer Institute. I am very grateful to the Subcommittee for its leadership and the continued support of the Institute and its work. This testimony will include an update on the progress of the Institute since my testimony of approximately one year ago. During the past year, our efforts have focused principally on two commercialization thrusts. One effort involves our novel, agricultural-based inventions in emulsion polymerizations, and the other is to produce and commercialize a viable, formaldehyde-free, soybean derived adhesive for a variety of composite board materials, i.e., particleboard or oriented strand board (OSB). During the past year, we have continued to exploit the opportunities offered by these novel materials and continue to be optimistic about their commercial fate. I will discuss the two inventions separately in order to offer more clarity. In the case of castor, lesquerella, or soy oil, we have designed and synthesized novel monomers or polymer building blocks that offer state-of-the-art technology. For instance, the attributes of the technology includes the ability to produce odor free, solvent free, non-polluting latex coatings. This represents best-available-technology for the production of solvent free latex coatings. The success of the technology depends on the use of agricultural materials as a building block of emulsion derived polymers offering a new opportunity for ag derived materials as a raw material in the polymer industry. By contrast, contemporary latex coatings contain 1,500 grams and more of air pollutants or volatile organic content (VOC) per gallon. Moreover, this novel technology, if practiced, would allow governmental regulatory agencies to tighten the restrictions on volatile organic content (VOC) emissions of applied coatings without harm to the coatings industry. I intend to share details of this novel and patented technology with the Environmental Protection Agency so that they can, if they wish, make an independent evaluation to confirm its suitability and efficacy. Much of the fundamental scientific principles regarding its mode of action have been confirmed, yet additional data must be collected. Specifically, we have identified one specific area in which it can be used, i.e., emulsion polymerizations. However, there are other fields of specialization where it could be very valuable and these opportunities must be evaluated. In particular, we believe this technology can be employed in light industrial and original equipment manufacture (OEM) industrial coatings as well as architectural coatings, and confirmation of these concepts is a priority in future work. The second and critically important objective is to secure manufacturing facilities for commercial production of the new material(s). Thus, we are currently in negotiations with parties who have expressed interest in manufacturing the novel ag based monomer(s).

It is imperative that a manufacturing facility be secured during the 1999–2000 period if this technology is to be successful. For instance, we have provided samples to our industrial partners from samples prepared in our laboratory. However, requests for the novel material are far too great to continue the practice of laboratory synthesis and thus we must move to an industrial type synthesis. In fact, one industrial client has expressed interest in placing orders for the monomer in the third or fourth quarter of 2000.

Furthermore, the uniqueness of this technology has been confirmed in industry, and at least one participating polymer manufacturing firm is sampling polymers manufactured via this novel technology. Therefore, we believe that the time when industrial firms will seek production quantities of the novel monomer is drawing closer, and we must be prepared to meet their needs. This is indeed an exciting time as we see the fruition of your support, and our efforts coming to the conclusion we both desire—the commercial production and sale of novel ag based materials to the polymer industry.

In yet another of our novel ag based technologies, we have developed formaldehyde-free adhesives for use in the composites industry, specifically for particleboard and oriented strand board. The new adhesives are composed of more than 98 percent agricultural products and are comparable in properties with traditional formaldehyde adhesives. Formaldehyde emissions are regulated as formaldehyde is considered a potential cancer producing agent. Consequently, there is a move afoot to remove formaldehyde from articles of commerce.

In 1983, the Mississippi Legislature authorized the Polymer Institute at USM to work closely with emerging industries and other existing polymer-related industries to assist with research, problem-solving, and commercializing efforts. During the past year, seventeen new polymer-related industries have located in Mississippi. In particular, during the past four years Sunbeam-Oster, Dickten and Masch, Wellman, and Kohler have constructed facilities approaching a cost of \$1.4 billion and each has commented on polymer science and engineering as a significant factor in their decision to locate near to The University of Southern Mississippi and the Mississippi Polymer Institute.

The Institute provides industry and government with applied or focused research, development support, and other commercializing assistance. This effort complements existing strong ties with industry and government involving exchange of information and improved employment opportunities for USM graduates. Most importantly, through basic and applied research coupled with developmental and commercializing efforts of the Institute, the Department of Polymer Science continues to address national needs of high priority.

The focus of my work is commercialization of alternative agricultural crops in the polymer industry. This approach offers an array of opportunities for agriculture as the polymer industry is the largest segment of the chemical products industry in the world, and heretofore has been highly dependent upon petroleum utilization. However, my efforts are directed to the development of agricultural derived materials that will improve our nation's environment and reduce our dependence on imported petroleum. As farm products meet the industrial needs of the American society, rural America is the benefactor. Heretofore, this movement to utilize alternative agricultural products as industrial raw materials has received some attention but much less than opportunities warrant. Your decisions are crucial to the accomplishment of these goals as funding from this Subcommittee has enabled us to implement and maintain an active group of university-based polymer scientists whose energies are devoted to commercializing alternative crops. We are most grateful to you for this support and ask for your continued commitment.

The faculty, the University, and the State of Mississippi are strongly supportive of the Mississippi Polymer Institute and its close ties with industry. Most faculty maintain at least one industrial contract as an important part of extramural research efforts.

Polymers, which include fibers, plastics, composites, coatings, adhesives, inks, and elastomers, play a key role in the materials industry. They are used in a wide range of industries including textiles, aerospace, automotive, packaging, construction, medical prosthesis, and health care. In the aerospace and automotive applications, reduced weight and high strength make them increasingly important as fuel savers. Their non-metallic character and design potentials support their use for many national defense purposes. Moreover, select polymers are possible substitutes for so-called strategic materials, some of which come from potentially unreliable sources.

As a polymer scientist, I am intrigued by the vast opportunities offered by American agriculture. As a professor, however, I continue to be disappointed that few of our science and business students receive training in the polymer-agricultural discipline as it offers enormous potential. The University of Southern Mississippi and

the Mississippi Polymer Institute are attempting to make a difference by showing others what can be accomplished if appropriate time, energy, and resources are devoted to the understanding of ag based products.

I became involved in the polymer field 36 years ago and since that time, have watched its evolution where almost each new product utilization offered the opportunity for many more. Although polymer science as a discipline has experienced expansion and a degree of public acceptance, alternative agricultural materials are an under-utilized national treasure for the polymer industry. Moreover, there is less acceptance of petroleum derived materials today than ever before and consequently the timing is ideal for agricultural materials to make significant inroads as environmentally friendly, biodegradable, and renewable raw materials. These agricultural materials have always been available for our use, yet society for many reasons, has not recognized their potential. The following examples are included and represent opportunities other than those already described which supports this tenet:

- A waterborne, waterproofer has been designed and formulated with the help of several natural products. The material functions as a waterproofer yet is carried in water. However, after application to the intended substrate, typically wood or cementous products, the material becomes hydrophobic and highly water resistant. We have collected two and one-half years of exposure data on this product with excellent success. It is currently being marketed via Southern Chemical Formulators of Mobile, AL. The distribution of this material has been slowed as the result of a fire at Southern Chemical Formulators that destroyed production facilities. We will make additional contacts with industrial firms this year who would be possible distributorship candidates.
- A new, multi-functional polymer additive was designed, synthesized, tested, and submitted to the patent office. The patent office has approved the issuance of a patent entitled, "Novel Multi-Functional Surface Active Agents, Syntheses and Applications Thereof," U.S. patent no. 5,807,922, September 15, 1998. The product is currently being evaluated by the Hanson Company as a potential commercial product. It is a highly efficient, multi-faceted additive that functions as a dispersant, a defoamer, an adhesion promoter, a gloss enhancer, and corrosion inhibiting species. It is derived from an agricultural raw material and is very novel in its performance and applications. We will utilize this technology in the synthesis of our own emulsion polymers and test them for property improvements and thus commercial viability.
- We have exploited the potential of lesquerella, a crop that produces a triglyceride similar to castor oil. Several high performance products have been prepared and include polyesters, stains, foams, pressure sensitive adhesives, and 100 percent solid ultraviolet (UV) coatings. This technology was highlighted at the AARC/NASDA meeting in Washington, DC. We are developing a cooperative relationship with Alcorn State University, Lorman, MS to grow and thus evaluate the agronomics of lesquerella as a new crop for Southeastern U.S. region.
- Novel open cell foams have been designed and prepared from lesquerella and/or castor oil. They are of high quality and can substitute for foams used extensively in industrial settings. Moreover, this ag based foam technology will be exploited during the coming year as a potential weed deterrent and mulch. The idea is to apply a layer of foam around crops to retard, if not stop, weed intrusion and their associated competition for food and water.

U.S. agriculture has made the transition from the farm fields to the kitchen tables, but America's industrial community continues to be frightfully slow in adopting ag based industrial materials. Let us aggressively pursue this opportunity and in doing so:

- Intensify U.S. efforts to commercialize alternative crops and dramatically reduce atmospheric volatile organic content emissions. The result will be much cleaner air for all Americans.
- Reduce U.S. reliance on imported petroleum.
- Maintain a healthy and prosperous farm economy.
- Foster new cooperative opportunities between American farmers and American industry.

Mr. Chairman, your leadership and support are deeply appreciated by the entire University of Southern Mississippi community. While I can greatly appreciate the financial restraints facing your Subcommittee, I feel confident that further support of the Mississippi Polymer Institute will continue dividends of increasing commercialization opportunities of agricultural materials in American industry. Advances in polymer research are crucial to food, transportation, housing, and defense industries. Our work has clearly established the value of ag products as industrial raw materials and we must move it from the laboratories to the industrial manufac-

turing sector. Only then can the U.S. enjoy a cleaner and safer environment which these technologies offer, as well as new jobs, and expanded opportunities for the U.S. farmer. We are most grateful for the support you have provided in the past. The funding you have provided has allowed the laboratory work to be conducted, yet we are at the crossroads of commercialization and additional funds are needed to take this technology from the laboratory to the manufacturing facilities. Moreover, past funding has been essentially level with some slight increases. Our current circumstance finds us in dire need of additional resources to take these technologies to the market place and to continue our developments of other exciting technologies. Thus, we respectfully request \$1.5 million in federal funding to exploit the potentials of commercializing alternative agricultural materials and to continue our initiatives. Thank you Mr. Chairman and Members of the Subcommittee for your support and consideration.

Mr. Chairman, I have included with this testimony written descriptions of our most advanced technology based on castor and/or lesquerella oils. I am told that 30,000 acres of castor beans are being planted in Texas, and I have herein already described our efforts to accelerate the adoption of lesquerella as a new industrial crop. The presentations are presented in the "lay" and "technical" fashion in an effort to meet the needs of the non-scientist as well as the highly technical professional, respectively.

PREPARED STATEMENT OF THE UPPER MISSISSIPPI RIVER BASIN ASSOCIATION

The Upper Mississippi River Basin Association (UMRBA) is the organization created 19 years ago by the Governors of Illinois, Iowa, Minnesota, Missouri, and Wisconsin to serve as a forum for coordinating the five states' river-related programs and policies and for collaborating with federal agencies on regional water resource issues. As such, the UMRBA has an interest in the budget for the U.S. Department of Agriculture's conservation programs and technical assistance.

Of particular importance to the UMRBA is funding for the Conservation Reserve Program (CRP), Wetlands Reserve Program (WRP), and Environmental Quality Incentives Program (EQIP). Taken together, these three Commodity Credit Corporation-funded programs provide an invaluable means for the USDA to work with landowners, local conservation districts, and the states to ensure that agricultural productivity is maintained while protecting the nation's soil and water resources. As stewards of some of the nation's most productive agricultural lands and important water resources, the five states of the Upper Mississippi River Basin believe these programs are vital. Strong farmer interest and state support demonstrate the region's commitment to the objectives of these programs. In 1998, state, local, and private entities matched every dollar of NRCS investment in the five states with an additional \$0.80.

The President's fiscal year 2001 budget proposal includes a \$1.3 billion Farm Conservation Initiative, a combination of new legislative and funding proposals with important potential implications for the USDA's core conservation programs. Funding for the CRP would be increased modestly to \$1.742 billion and the CRP acreage cap would be raised by 3.6 million acres to 40 million acres. The UMRBA would welcome such an adjustment to the CRP cap and also supports efforts to ensure that future CRP enrollments target the best opportunities to improve water quality and habitat values. Only 40,000 acres will remain next year under the current WRP acreage cap. The UMRBA supports legislation to increase the cap to permit enrollment of 250,000 acres per year in the WRP from 2001 to 2005. In order to realize the potential benefits of such an increase in the acreage cap, it is of course essential to provide the funds necessary to support additional enrollments. The Administration has proposed increasing WRP funding to \$286 million in 2001.

The CRP and WRP have been extremely effective in helping Midwest farmers to protect land and water resources by curtailing production on some of their most sensitive land. And there are certainly many more opportunities to make good use of the CRP and WRP in the region. However, it is also essential to support sound conservation practices on the far greater amount of land that remains in production. EQIP is the USDA's largest and most effective means of assisting farmers and ranchers to implement conservation practices on land currently in production. The President is proposing legislation to increase the authorized CCC funding to EQIP by \$625 million over five years. Such an increase would provide significant benefits to our region's farmers and natural resources. Under the Administration's plan, a portion of these increased funds would assist animal feedlot operators to implement conservation practices. Various incidents throughout the country have clearly dem-

onstrated the need for such assistance, which can help balance the new dynamics of livestock production with the need to protect soil and water resources.

The President is also proposing a new, \$600 million Conservation Security Program (CSP), to be administered by the NRCS. The CSP would provide assistance to farmers and ranchers who implement various conservation practices. The UMRBA states are keenly aware of the need for more resources to support practices such as conservation tillage and buffer strips. However, it is not clear whether additional resources should be directed to existing programs such as EQIP or to a newly established CSP.

The UMRBA does remain concerned with the adequacy of funding and staffing levels in the NRCS' conservation operations account. The technical assistance funded through conservation operations provides the foundation for the USDA's voluntary conservation planning. The Administration has proposed an increase of \$86 million in conservation technical assistance funding for fiscal year 2001. However, a large part of this increase would be dedicated to specific programs and initiatives outside of the USDA's core conservation programs. As a result, NRCS field staff will likely continue to have difficulty providing the timely, comprehensive technical assistance that farmers need if they are to participate effectively in the USDA's conservation programs. A 1998 National Workload Analysis indicated that the NRCS needed as many as 4,000 employees at the field level in the Midwest. At the time, actual field staff in the region numbered fewer than 2,500. The UMRBA urges Congress to ensure that the NRCS has both the staff and funding necessary to deliver its conservation programs effectively.

The Midwest and indeed much of the nation will face significant challenges in the future as dams built under the Public Law 534 and Public Law 566 programs age. More than 200 floodwater dams in the NRCS' Midwest Region will reach the end of their design life within 10 years. Many of these structures must be rehabilitated if they are to continue to function safely and effectively. The UMRBA encourages Congress to provide USDA with the authority and funding it needs to serve as an effective federal partner in addressing these needs.

The five states of the UMRBA acknowledge that our region faces enormous soil and water conservation needs and limited public and private resources to address those needs. In this context, it is imperative that NRCS work with the states, conservation districts, and farmers to identify and target the most pressing problems. Coordination and communication with the states is particularly critical to success in addressing the interstate resource challenges faced on the Upper Mississippi River. Success in addressing such complex, large-scale issues will not come quickly. It will require long-range thinking and commitment over time from all levels of government and from farmers. The states look to both Congress and the Administration to join them in providing such leadership.

PREPARED STATEMENT OF THE USA RICE FEDERATION

The U.S.A. Rice Federation wishes to express our opposition to the recommendations of the Administration for reductions in the appropriation for fiscal year 2001 for the Department of Agriculture for two items that are of importance to the rice industry. We are seeking funding for these two items at last year's levels. In addition, we support the requested funding levels for the White River Irrigation Demonstration Project and the Bayou Meto Project.

The U.S.A. Rice Federation is the nation's largest rice association, representing all segments of the U.S. rice industry. The Federation's charter members are the U.S.A. Rice Council, U.S. Rice Producers' Group and the Rice Millers' Association. Through these organizations, Federation membership encompasses U.S. rice producers who grow 80 percent of America's rice crop; farmer-owned cooperatives and privately owned mills comprising virtually all of the U.S. rice milling industry, with members in Arkansas, California, Florida, Louisiana, Mississippi, Missouri, and Texas; and a wide range of allied businesses in these and other states. The diversity and scope of this association permits it to provide a view common to all aspects of the industry, and to the vast majority of its participants.

The first item of concern to the industry relates to the funding of the Dale Bumpers National Rice Research Center at Stuttgart, Arkansas. This Center is the only one of its kind in the United States. It was established with the view of making U.S. produced rice more competitive in the global market through research for improved yields, a superior grain quality, pest resistance and stress tolerance. It has just recently commenced operations with emphasis on genome research that would focus on rice genetics. The results of the genome research would be of benefit not only for rice but also for other crops as well.

The Administration has proposed a major reduction in funding of this Center. The Administration has proposed for fiscal year 2001 a reduction in the current appropriation of \$5,336,700 to \$4,502,500 by terminating two projects and reducing the appropriation for rice research by \$382,500 and for aquaculture by \$457,700. The reduction for rice research would seriously impair the genome research efforts of the Center, and unduly impair the objectives for which the Center was established.

The other appropriation item on which we wish to comment is the appropriation for wildlife services operation contained in the budget for APHIS. The Administration has proposed a cut of \$2 million in this appropriation by reducing the appropriation from \$31 million to \$29 million in fiscal year 2001. One of the activities carried out by this appropriation is work on efforts to control blackbird populations which are a scourge of the rice industry, particularly in Louisiana, and Texas. The appropriation is used to apply bait that has been treated with a chemical, DRC 13329, as well as conducting baiting studies and studies on new chemicals that may be used as repellants for blackbirds. The appropriation from the Department of Agriculture supplements funds generated by producers in these states under their rice research and promotion legislation. The industry depends on this appropriation to aid in its efforts to control damage to the crops caused by the tremendous number of blackbirds that descend on the fields each spring.

We also support the requested funding levels of \$22.7 million for the White River Irrigation Demonstration Project and \$9.5 million for the Bayou Meto Project in Arkansas.

We wish to thank you for your help to the rice industry in the past and encourage you to continue your support for this industry.

Please include this statement in the record of the hearing and make copies available to the members of the Subcommittee.

PREPARED STATEMENT OF THE WILDLIFE MANAGEMENT INSTITUTE

Mr. Chairman, I am Ronald R. Helinski, Conservation Policy Specialist for the Wildlife Management Institute. Established in 1911, the Institute is staffed by professional wildlife scientists and managers. Its purpose is to promote the restoration and improved management of wildlife in North America. I am submitting testimony for the Subcommittee on Agriculture, Rural Development and Related Agencies—Senate Committee on Appropriations for:

NATURAL RESOURCES CONSERVATION SERVICE

Conservation Operations-Technical Assistance (TA).—The President's budget request is for \$86.431 million taking into consideration an increase of FTE's amounting to 1,843. WMI supports additional needed Technical Assistance (TA) both via funding and through the use of innovative delivery mechanisms. WMI submits that there are other ways to deliver TA, primarily through partnerships. Over the past several years, Congress has emphasized the need for a balanced budget. NRCS FTE's over that time period have been status quo. During that time, NRCS had to find new ways to provide services to its constituent base (landowners, farmers, and ranchers). Through NRCS's innovative spirit, more partnerships than ever before occurred. They effectively leveraged monies enabling them to continue to offer services to landowners. These partnerships bloomed into cooperative ventures with state fish and wildlife agencies to address needed expertise and assistance with Farm Bill programs. In many instances through the use of MOA's NRCS match dollar for dollar with state fish and wildlife organizations to hire needed FTE's to facilitate fish and wildlife TA to landowners. This innovation enabled NRCS to: 1) obtain needed expertise where they lacked it and 2) were able to increase FTE's on the ground providing needed TA. The continuation of this management style will provide more actual dollars to landowners via established Farm Bill programs (financial assistance) without taking away from TA funding. Partnerships with state fish and wildlife agencies and conservation NGO's are paying off and should be continued—it provides flexibility and needed services in a time of fiscal responsibility. An example of how this process works can be found in the states of: AR, MO, KY, TX, NC, GA, CO and WY.

With Farm Bill program demand ratios of 3:1 for WRP, 3:1 for WHIP, 2:1 for CRP and 4:1 for EQIP its not just about staffing needs but financial assistance too. Increased monies are needed to facilitate the demand. It's a true limiting factor for the demand far exceeds the available dollars available. With an increase in TA dollars being used in a partnership effort with state fish and wildlife agencies and/or conservation NGO's more services will be delivered on the ground thus meeting constituent demand.

There also is an increasing need to properly evaluate applications of Farm Bill programs on the ground. The above mentioned partnerships are a means to an end. Follow up with landowners has been hit or miss based on NRCS field priorities and current priority workloads. State fish and wildlife agencies and conservation NGO's would help supplement on site visits and offer a more umbrella approach to follow up visits. Properly evaluating implementation of Farm Bill programs on the ground will reinforce conservation connections and help catch problems in their early stages, thus saving money in the long run.

Programs-Wetland Reserve Program (WRP).—WMI is in support of increasing acreage to the 250,000 enrollment level in fiscal year 2001. With the national ratio of eligible offered acres to enrolled acres being 5:1 there is a need to expand the popular WRP program to meet national conservation goals. This program returns long-term benefits to both farmers and the American public.

Wildlife Habitat Improvement Program (WHIP).—WMI supports an increase in funding for this very successful program. With a 3:1 demand to approved contract ratio, \$50 million (12.5 for TA/37.5 for financial assistance) is far below the needed amount to meet constituent desires. As a result of the zeroing out of this program in fiscal year 2000 the pent up demand will be high. WMI supports a \$100 million allocation annually for this program. As mentioned above, through the leveraging of TA funds, more monies can be made available for direct financial assistance—we recommend \$87.5 million for landowners.

Conservation Security Program (CSP).—WMI applauds the recognition of strengthening conservation efforts on private land. With the focus on family farms and specific attention to private grazing lands, orchards, vineyards and other non-program crops, needed niches are now being addressed. "Thinking about the land itself as our most valuable commodity" is, as stated by Secretary Glickman, necessary for long term conservation needs. To that end, WMI supports this \$600,000 million program with these caveats: (1) by complimenting other Farm Bill programs CSP will support the coequal status of soil, water, and wildlife and (2) that evaluation mechanisms be established to monitor RESULTS from the investment of those monies.

Forest Incentives Program (FIP).—Zeroing out this program is a mistake. In most cases wildlife has benefitted from landowner use of available FIP funds. This is especially true when it comes to utilizing the management technique of forest stand improvement. WMI recommends that this program allow cost sharing for the use of prescribed fire on non-industrial, private lands. By doing this you will help encourage aggressive fuels management as well as assist with the development of needed understory and successional forest stage development for such wildlife species as bobwhite quail, woodcock and a variety of other bird and mammal species. Thus you will be promoting forest health, reduce unwanted wildfire risk, and improve wildlife habitat. To accomplish the above WMI recommends funding FIP at a \$25 million level.

FARM SERVICES AGENCY

Conservation Program Initiative (CPI).—WMI supports the increase from 36.4 million to 40 million acres in fiscal year 2001. The Conservation Reserve Program (CRP) is a voluntary and incentive-based program that have turned millions of acres of marginal cropland into vital wildlife habitat. These programs also help stem soil erosion, help agricultural producers meet the requirements of a variety of environmental laws and regulations. CRP also helps producers remain economically viable in an era of low commodity prices through program payments and increased opportunity for income from hunting, fishing and other recreational activities.

We also support the bonuses of \$125 million each year in fiscal year 2001 and 2002 for continuous CRP sign ups.

Supplementary Income Assistance Payments budgeted at 2.464 billion needs to include conservation compliance as part of the delivery mechanism to landowners. Accountability for the use of public funds to constituents concerning improvements to water, soil and wildlife is a must.

Technical Assistance (TA).—WMI recommends leveraging some of the \$52 million available with state fish and wildlife agencies and conservation NGO's to assist NRCS with TA delivery to landowners. In these times of balanced budgets, emphasis has been on streamlining government. Efficiency and becoming more effective are the rallying calls of those in Congress. With that in mind, WMI suggests that there are other ways to deliver TA to this nation's private landowners. We suggest going the route of developed partnerships with state fish and wildlife agencies and conservation NGO's. Through the use of MOA's NRCS can match dollars with the above partners to expand TA as well as offer more monies to Farm Bill program

participants. MOA's currently in effect in AR, MO, KY, TX, NC, GA, and WY are a model of how such leveraging can occur.

Wildlife Services, Animal and Plant Health Inspection Service (APHIS).—WMI recommends that the President's Budget for APHIS Wildlife Services (WS) be increased by \$1.0 million from \$28.7 million to \$29.7 million. This increase should be earmarked for the increased cost of maintenance and operations of the National Wildlife Research Center. WMI accepts the President's Budget request (a reduction of \$2.7 million and \$190,000 respectively) for the Operations and Aquaculture line items, provided that program cuts are only made in states that do not meet a 1:1 cost share match.

The WS program is a complex array of state and local partnerships that contribute financially to the overall program. These partnerships cooperate to control wildlife damage to agriculture, aquaculture, forest, range and other natural resources, and to protect public health and safety through control of wildlife-borne diseases and wildlife hazards at airports. The funding and support level should be governed by the cooperative agreements in place with the respective state agencies and be subject to the agreed to 50/50 cost share policy.

Providing a no net loss of funding for Methods Development is vital to continue the ongoing work of finding alternatives to existing control methods. New technology is the only answer to resolving the controversies surrounding some of the current control methods. Without the \$1 million increase, the program would be required to cut research efforts in order to pay for the increased maintenance for the research facility.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES) U.S.
DEPARTMENT OF AGRICULTURE

The Wildlife Management Institute (WMI) recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant, positive changes in attitudes and implementation of new technologies by private landowners, managers, community decision makers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES-Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move toward a more sustainable society. However, in the President's fiscal year 2001 budget, we see virtually no emphasis on natural resources research and education directed toward helping these clientele. In short, only about four percent of CSREES' proposed budget of \$972,395,000 supports research and extension activities pertinent to the nation's forest and range lands and associated wildlife and fisheries resources. This amount is infinitesimal and needs to be significantly increased.

PURPOSE

The Institute recommends that the fiscal year 2001 budget for CSREES should redirect funding to accomplish the following goals:

WMI recommends that the Renewable Resources Extension Act be funded at a minimum level of \$15.0 million in fiscal year 2001.—The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperating partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to \$15.0 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991–1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. An increase to \$15.0 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decision making and management on an additional 35 million acres while increasing productivity and revenue by \$200 million.

WMI recommends that Smith-Lever 3(b)&(c) funding be increased five percent to \$290,000,000, and that the increase be allocated to the Natural Resources and Environmental Management (NREM) base program.—WMI appreciates that Smith-Lever 3(b)&(c) base programs provide "Block Grant" type funds for land grant universities to provide essential educational outreach based on local need assessments. The re-

quested increase will enable NREM programs to develop a critical mass of expertise at the State and local levels to address natural resource and environmental issues that are directly affecting small landowners and farmers in both rural and urban communities nationwide. Expanding Extension public issues education programs on such issues as forest health, wetlands, endangered species, and human/wildlife interactions, as well as strengthening programs in urban and community forestry and environmental education as called for in the 1990 FACT Act is essential to the sustainability of these critical resources. Such an increase, targeted appropriately, would help producers better understand and implement the changes in the 1995 Farm Bill's Conservation Provisions and those conservation issues that are expected in the next Farm Bill. Moreover, we are concerned about declining natural resources staff in CSREES as well as at the Nation's Land Grant Universities including the predominantly Black and Tribal Institutions.

WMI encourages continuation of close cooperation between State Cooperative Extension Services and their State Fish and Wildlife agencies, as well as other appropriate State and Federal agencies and conservation organizations. Extension 4-H Youth natural resource program and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation. Increased Smith-Lever funds targeted appropriately will enable CSREES to carry out its environmental education and NREM National Strategic Plan obligations nationwide.

WMI recommends restoration of the Rangeland Research Grants \$500,000 budget for fiscal year 2001.—The Institute is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program were zeroed out in the President's 1998 budget and totally ignored in the fiscal year 1999, 2000, and 2001 budgets. Over one half of the land area of the United States is rangeland; and elimination of the only federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more critical rangeland research problems over the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners improve the adoption of forests and rangelands ecosystem management and the conservation of biodiversity on an ecoregion level.

WMI recommends that an appropriate portion of the total increased appropriation for Pest Management should be dedicated to educational programs for prevention and control of vertebrate pests in urban and rural communities.—WMI notes significant increases in the President's budget for Pest Management research and extension programs with no opportunity for addressing vertebrate pests. Yet, vertebrate pests have been identified in many States as posing the most significant problems that agricultural producers and other private landowners and managers need educational assistance with. The targeting of Pest Management funds for vertebrate pest research and educational programs would effectively advance the knowledge and capability of landowners and managers to significantly reduce the losses caused by these problem species.

WMI recommends that the Hatch funds be increased eleven percent to \$200,000,000, and McIntire-Stennis funds fourteen percent to \$25,000,000 and, if necessary, the increase be redirected from the proposed addition to NRI funding.—WMI is pleased that the Administration proposes an increase in basic research identified under the National Research Initiative (NRI) as Natural Resources and the Environment. However, what is proposed in the current version of the President's Budget does not address natural resource issues that the Natural Resource Community, the public, and the over 10 million private landowners are vitally concerned about. The Institute is extremely disappointed in the Goal 4 "Greater Harmony between Agriculture and the Environment" which is the only one of the 6 CSREES Strategic Goals that even purports to address natural resources. There is no mention of research or extension programs to address the erosion of the nation's natural resource base except that alluded to by the Integrated Research and Extension Water Quality Program. The others are totally focused on agriculture production. The nation's agricultural base cannot be sustained if its natural resource base is not sustained.

SUMMARY

The Wildlife Management Institute, based on the above considerations, recommends the following for the fiscal year 2001 budget of CSREES:

—The RREA budget be increased to \$15.0 million;

- Smith-Lever 3(b)&(c) base program funding be increased to \$290,000,000;
- Rangeland Research grants be restored at \$500,000 level;
- A portion of the Pest Management and related increase be targeted to provide increased research and education programs to address vertebrate pest prevention and control; and
- McIntire-Stennis and Hatch Act funding be increased to \$200,000,000 and \$25,000,000 respectively.
