**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2002**

WEDNESDAY, APRIL 25, 2001

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 1:35 p.m. in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Bond, Craig, Kohl, Harkin, Dorgan, Durbin, and Johnson.

DEPARTMENT OF AGRICULTURE

OFFICE OF THE SECRETARY

STATEMENT OF HON. ANN M. VENEMAN, SECRETARY OF AGRICULTURE

ACCOMPANIED BY:

**KEITH COLLINS, CHIEF ECONOMIST
STEPHEN B. DEWHURST, BUDGET OFFICER**

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The committee will please come to order. It is my pleasure to convene in our first hearing of the year, and to welcome to the subcommittee having jurisdiction over the Department of Agriculture and Related Agencies budget for fiscal year 2002 the new Secretary of Agriculture, Ann Veneman. We appreciate the cooperation of you and your staff in our review of the President's budget that has been submitted to the Congress for its consideration.

We notice that you have accompanying you today Keith Collins, the Department's chief economist, and Stephen Dewhurst, who is the budget officer for the Department. I have had an opportunity to review your prepared statement, which I appreciate your submitting to the committee, and an outline of the President's budget request for the Department of Agriculture and the other agencies that come within the jurisdiction of this committee.

I think there is a compliment that is deserved at this point, and that is that in this submission there is a proposal to increase funding to cover mandatory pay increases, and to continue essential investments in technology that are important to the effective and efficient operations of all agencies of the Department.

The budget maintains staffing levels for essential agency functions, and it also requests resources to support nutrition assistance programs to protect the safety of our Nation's food supply, to support agriculture trade initiatives, to deal with emerging pest and other challenges to agriculture and our food supply. Most of these proposed increases are offset by proposed reductions in some ongoing programs and other congressionally mandated additions to the budget.

We know we have some new challenges that are being faced by this Department, and your statement touches on them. Bovine Spongiform Encephalopathy, better known as mad cow disease or BSE, and the recent outbreak of foot and mouth disease in Europe, which poses threats not only there but probably around the world, requiring new initiatives and vigilance and efforts to make sure that those problems don't occur here.

We look forward to discussing that with you as we review the Department's budget today, and we encourage you to provide us with whatever additional comments you think would be helpful to our understanding of this budget request.

I am happy now to yield to our distinguished Ranking Member, my good friend from Wisconsin, Senator Kohl.

STATEMENT OF SENATOR HERB KOHL

Senator KOHL. I thank you so much, Senator Cochran. It is good to join you and all members of the subcommittee as we begin work on the agriculture appropriations bill for fiscal 2002. I would also like to recognize our two newest members, Senators Johnson and Craig.

Secretary Veneman, I especially want to welcome you, along with Mr. Collins and Mr. Dewhurst. It is good to have all of you here, and I look forward to your comments. Every year, it seems, we talk about the current crisis facing American agriculture. Unfortunately, this year is no different. Commodity prices remain at historic lows. Devastating animal disease is loose in the world and threatens our shores, recurring drought has again gripped the south and, as we speak, flood waters continue to consume farmland in Wisconsin and throughout other Midwestern States, and this is only April.

The President's proposed USDA budget provides \$72 billion in appropriations for fiscal year 2002. That is a reduction of \$563 million from last year's appropriated level, without even counting emergency funds enacted last year. Of the total proposed, \$14.1 billion is discretionary spending. While the President has claimed to hold overall spending to a 4.4 percent increase, it appears that USDA programs have been held to a lower position of importance within Government than other areas. This is a fact I find troubling, given the wide range of issues now facing the rural sector.

While I agree that meaningful income tax relief is very important, farm income tax relief presumes that there is farm income to be taxed, and an estate tax relief may benefit a handful of individual farmers but would have very limited effect on the overall farm sector.

On the other hand, the programs funded by this subcommittee, such as research, conservation, marketing and others, do provide

all farmers with tools that can help raise farm income and help farmers withstand the misfortunes of nature and disrupted markets. A 4.4 percent increase would be modest indeed, and a reduction would be disturbing.

I note the Secretary's commitment to open markets and the need to tear down trade barriers. I applaud that commitment and hope it applies equally to domestic as well as foreign markets. Today in this country, a regional market barrier has been built that puts Wisconsin and other States' dairy products at great risk. This is an unacceptable situation, and I fully expect the USDA to support all U.S. agriculture and work to tear down all trade barriers, foreign and domestic.

The President's budget also provides \$36.6 billion for USDA nutrition programs, the largest single area of spending in the USDA budget. These important programs provide a safety net for the most vulnerable children and adults and, while most of them involve mandatory spending, it is important to remember that they are subject to appropriations and the scrutiny of this subcommittee. Whether the issue is the nutritional quality of a school lunch or the level of WIC participation, this subcommittee is charged with the responsibility to ensure that every American shall have access to a healthy meal.

So Mr. Chairman, I thank you for your leadership and your assistance. I look forward to working with you and all members of the subcommittee this year as we review the President's budget and set priorities based on the real needs of rural America.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Kohl.

Senator Bond.

STATEMENT OF SENATOR CHRISTOPHER "KIT" S. BOND

Senator BOND. Thank you very much, Mr. Chairman, and Secretary Veneman, it is a pleasure to welcome you to the subcommittee. One of the most important ingredients of being a good Secretary of Agriculture is timing, and with prices now in the tank you have got a real opportunity to be the true heroine for agriculture if they just turn around, so the Secretaries may or may not have an ability to impact farm income, but unfortunately you always take the blame, and so there is opportunity and there is hope ahead.

The critical ingredient to success, however, is a willingness to use your position forcefully as an advocate for farmers, and that will mean keeping your eye and a hammer on other agencies who don't always have the best interests of farmers at heart, and keeping your eye on our friends at OMB who are sometimes accused, fairly enough, I would say, of knowing the cost of everything and the value of nothing. A lot of people have a high regard for your understanding of and commitment to trade expansion, and yesterday you and I discussed the promise that plant biotechnology holds in improving human health, the environment, diversifying ag uses, and improving production for the hungry in the world.

U.S. Agency for International Development had a group of scientists from Kenya, South Africa, Uganda and elsewhere in town yesterday to discuss the critical need to make new technology avail-

able to the poor, the sick, and the hungry in impoverished regions of Africa. It is clear to me that, while the wealthy, well-fed in Europe want a technology-free zone in Europe, the impoverished, hungry people in Africa are anxious to have the benefits that science can bring to them.

I have also taken a number of trips to Southeast Asia. They are particularly interested in trade and technology, and I hear more and more people say that, while we don't want to ignore Europe entirely, time will be spent much better on focusing on Asia, Latin America, and Africa, where our markets may be the most productive. If Europe wants to be isolated and cultivate more hysteria and nonsense than farmland, then we ought to look at regions that value science more than politics.

I do have one parochial issue. It is a favored farmer and environment-friendly program called Agroforestry. This subcommittee has funded research for a number of years, and while I know you will be a strong supporter of Agroforestry and its multiple benefits for farmers and the environment, for cleaning of the waters of our Nation, it is identified in the budget for a rescission.

Now, we go through this exercise every year with OMB, but since I have a better understanding of what may be your priorities and perhaps the President's than OMB does, I am certainly going to urge the chairman and the Ranking Member to reject the proposal for a rescission.

Finally, while you are in great demand, I do want to call your attention to an invitation you have received to attend the World Agriculture Forum taking place May 20 through 22 in St. Louis, Missouri. There will be a number of world leaders, including heads of State, deputies, ministers of agriculture chief executive officers, scientists, farmers, and others, and I hope you can look at that invitation and see if you will take advantage of that opportunity.

Since I have imposed upon the goodwill of the chairman and the Ranking Member and the committee members, I will extend to all of you an invitation to join us in St. Louis to talk about agriculture and world trade in agriculture May 20 through 22.

Thank you.

Senator COCHRAN. Thank you, Senator Bond. In recognizing Senators alternatively, one side of the aisle to the other, in the order in which they attended the hearing, I would now recognize Senator Johnson for any opening statement he may have.

STATEMENT OF SENATOR TIM JOHNSON

Senator JOHNSON. Well, thank you, Mr. Chairman, and Senator Kohl, I appreciate this opportunity to serve on the Appropriations Committee, on the Agricultural Subcommittee in particular. I look forward to working with the leadership of the committee and all members. This is of immense importance to my home State of South Dakota and, I think, to the Nation at large.

As a new member, I will focus a lot of my time to learning and listening, but I do very much appreciate this opportunity to participate in this hearing. I want to welcome Secretary Veneman to this hearing as well. Ms. Veneman is known as a Californian, but we in South Dakota claim some credit as well, as her Dutch ancestors homesteaded in Charles Mix County in South Dakota. There are

not a lot of peaches being raised in South Dakota, as there are in California, but we are proud to have that claim to Ms. Veneman's heritage.

I look forward to the testimony today on a range of issues. Obviously, tax relief is a matter of significant importance to us all, but it is also important that it be balanced with the needs to address other key priorities in this Nation, among them, agriculture and rural America, food safety, rural development, conservation, and other high priorities that I think people, rural and urban alike, share a concern for.

I am somewhat concerned about the reductions in conservation efforts at USDA, and I look forward to your testimony in that regard, as well as I am concerned about funding levels for our anti-trust and concentration efforts at USDA.

One area that I have a parochial concern as well, although not entirely just for South Dakota, has to do with the status of our CRP wetlands six-State pilot project, which has had bipartisan support, would utilize the CRP in a fashion which would address some of our wetlands controversies we have had in the prairie pothole region in particular. The rule has not yet been published, and it is imminent. Our farmers across the six States of the Northern Plains are looking forward to that as an additional tool.

PREPARED STATEMENT

It is a proposal that was put together by a group of some 30-plus rural and agricultural organizations in South Dakota as part of an out-of-court settlement. Any time you can get the Sierra Club, the Farm Bureau, and the Farmer's Union all to agree on a conservation initiative of this sort, I think we ought to move forward with it, and it is my hope that we can work with the Secretary to get those proposals published in the very near future.

So again, I welcome the Secretary to the committee, and look forward to my participation on this subcommittee.

Senator COCHRAN. Thank you, Senator Johnson.

[The statement follows:]

PREPARED STATEMENT OF SENATOR TIM JOHNSON

Thank you Chairman Cochran, Ranking Member Kohl and members of the subcommittee, it is an honor to participate in my first appropriations subcommittee hearing on agriculture. I am pleased by the reception that my colleagues on this panel have extended to me, and I look forward to working with all of you to complete work on a thoughtful, balanced budget for the United States Department of Agriculture (USDA), and the many important programs under the jurisdiction of this subcommittee.

I also thank Secretary Ann Veneman for offering testimony on USDA's proposed budget for fiscal year 2002, and I look forward to working with her to assure this subcommittee provides the investments necessary to keep rural America strong, now and into the future. Madam Secretary, I enjoyed meeting with you in January—prior to your confirmation by the Senate Agriculture Committee—and I expect to follow-up with you today on some of the issues and priorities we discussed at that time. Mr. Chairman, I want to make a special note at this point that while Senator Feinstein may take great pride in the fact that our new Secretary of Agriculture is indeed from a California peach-growing region, I am proud that Secretary Veneman has South Dakota ties too. In fact, her Dutch ancestors homesteaded in Charles Mix County near Platte, South Dakota. That was a long time ago, and there's not much peach growing in Charles Mix County, but nonetheless, we're proud of her connection to our South Dakota. Finally Madam Secretary, I again in-

vite you back to your ancestral State, where we can discuss issues of importance to South Dakota's farm families and rural communities.

Regarding USDA's budget proposal for fiscal year 2002, I appreciate the President's desire to fund national priorities in a restrained way so as to provide significant tax relief to America's working families. I too am on record in support of a significant tax cut. Yet, we must address the budget and tax cut in a balanced fashion, assuring efforts are made to pay down the federal debt and fund key programs—such as agriculture, conservation, rural development, and food safety just to name a few—which are essential to the well-being of our country.

In an initial analysis, USDA's proposed budget adequately addresses some of our agricultural, trading, and food safety priorities. Yet, I believe it fails to make some specific and significant investments in a secure farm safety net, conservation programs, efforts to restore marketplace competition, and rural development.

Moreover, despite the fact that over 20 major farm and commodity groups in the country—from Farm Bureau to Farmers Union, and including cattlemen, pork producers, corn, wheat, dairy, soybeans, cotton, rice, sugar producers, and others—have asked for increased support for a new farm bill and additional emergency aid for farmers and ranchers at levels similar to that of last year, the proposed USDA budget includes no support for a new farm bill or room for emergency aid—save the so-called contingency reserve. We will discuss this specific issue in greater detail at next week's subcommittee hearing on the farm economy and assistance for farmers and ranchers. Yet, our past experience of enacting multi-billion ad hoc emergency bills, while ignoring even modest changes to the farm bill, has proven costly to taxpayers, unpredictable for farmers, and not sustainable nor responsible in terms of long-term policy. That said, I am disappointed that USDA's budget does not include funding for a new farm bill that will ensure economic security for family farmers, ranchers, and rural communities now and into the future. I look forward to working with you, Madam Secretary, and the members of this subcommittee to help develop an adequate disaster bill for 2001 and sustainable new farm bill.

I am specifically concerned about the cuts or elimination of funds in fiscal year 2002 for important conservation programs such as the Wetlands Reserve Program, the Wildlife Habitat Incentives Program, and the Emergency Conservation Program. Farmers, other landowners, and society as a whole continue to desire more options to ensue the proper stewardship of our nation's soil and water resources. With agricultural conservation programs oversubscribed by nearly six times the available funding, this is clearly the wrong direction to take with conservation funding, and I plan to work in the subcommittee to secure funds that promote greater use of conservation programs instead of cutting or eliminating them altogether.

Madam Secretary, we have visited about a new pilot program I pushed last year to enroll farmed wetlands in the continuous Conservation Reserve Program (CRP)—which was enacted with some help from Senators Harkin, Kohl, Cochran, and Daschle. This two year pilot program was created by farmers and conservationists in South Dakota, and it would permit up to 500,000 acres of farmed wetlands to be enrolled under CRP in six states of the Prairie Pothole Region. Unfortunately, the rule to begin the process for farmers to sign-up for the program has yet to be published in the Federal Register. While the severe and wet weather in South Dakota and other reaches of the country have delayed planting decisions and inadvertently could permit some to enroll in this program, further procrastination on the finalization of this rule will only hurt the chances for this program to succeed. I urge you to work with the appropriate agencies within USDA to ensure the rule for this CRP-wetlands pilot project is published in the Federal Register and that sign-up commence as soon as possible.

On the other hand, I wish to thank you Madam Secretary for the steps you've taken within USDA to prevent outbreak of diseases such as Bovine Spongiform Encephalopathy (BSE) or "mad cow" disease and Foot and Mouth Disease (FMD) in the United States. Only three states raise a more sizable calf crop than that reared by South Dakota's cattle ranchers. Livestock production and processing contributes over \$3 billion to South Dakota's economy each year. An outbreak of either disease would have crippling consequences for the hard-working families raising cattle, sheep, and hogs in South Dakota. Under your leadership, USDA currently enforces a ban on the import of ruminant animals and animal products (primarily beef-based) into this country, and you've taken steps to ban the import of all animal and animal products from the European Union (EU), in response to the spread of FMD. Moreover, under the leadership of Chairman Cochran, the fiscal year 2001 Agriculture Appropriations bill provided USDA with \$85 million for preventative animal health monitoring and surveillance operations in the U.S.

In the context of the appropriations process, I believe this subcommittee may need to plan to provide additional funding both in fiscal year 2002—and potentially accel-

erated funding this year—for APHIS, the Food and Drug Administration (FDA), and other appropriate federal agencies that must work to prevent FMD and BSE outbreaks in the U.S. I have already met with FDA officials to discuss these issues, and look forward to Secretary Veneman's views today.

I am pleased that USDA's budget request for fiscal year 2002 increases funding for disease prevention. In fact, you seek to increase the Animal and Plant Health Inspection Service (APHIS) budget by \$174 million from fiscal year 2001, up to an \$849 million total for fiscal year 2002.

This should authorize additional resources to increase inspection personnel that protect against animal and plant diseases like FMD at major U.S. ports of entry. Specifically, USDA can hire approximately 350 additional personnel at critical ports and international airports to protect against pests and diseases. I am equally pleased with your requested \$13 million in additional program support to strengthen the Agriculture Quarantine Inspection Program (AQI), which helps protect the U.S. against animal diseases like FMD and BSE. Finally, in regards to increases in Agricultural Research Service (ARS) efforts to prevent diseases, I support your request for an increase of \$5 million for BSE-related research.

In addition to greater investment in USDA disease prevention efforts, I have encouraged my Senate colleagues and you, Madam Secretary, to consider S. 280, my bipartisan legislation calling for beef, pork, and lamb country-of-origin labeling. This bill, the Consumer Right to Know Act of 2001, ensures that consumers have knowledge about the true origin of the meat they feed their families. The legislation provides consumers with the confidence that meat products labeled as originating from the U.S. are, in fact, from animals born, raised, and slaughtered in the U.S.

While I would not suggest that my bill is necessary from a food safety standpoint (because the majority of current live animal and meat imports meet U.S. inspection and safety standards), I would assert that my legislation would empower consumers to make informed choices about meat products. Furthermore, I would observe that the pure standard in my bill for defining a meat product as being from the U.S. would reward domestic producers for their herd health and production practices, capitalize upon current USDA and FDA safeguards, and help prevent unwarranted consumer fear about U.S. meat.

We cannot underestimate the need to be very vigilant about the health of domestic livestock herds and the safety of domestically produced meat. I look forward to working with both of you to ensure Congress takes the appropriate measures this year to deal with FMD and BSE prevention, surveillance, monitoring, and control operations.

Rural Development (RD) initiatives provide incentives for the creation and expansion of value-added agricultural ventures in South Dakota, and help furnish critical infrastructure and telecommunications support to rural areas of our country. I am concerned by the \$2.5 billion cut to RD programs within USDA's budget. Because rural America depends upon a diverse economic engine to run smoothly, I am hopeful this subcommittee will work to restore funding to some of the key RD programs this year.

In concern to investments in Cooperative State Research Extension and Education Services (CSREES), the partnership between USDA and our land-grant university system is one of the most important investments we can make to ensure a strong rural America. In South Dakota, South Dakota State University (SDSU) and the Cooperative Extension Service are efficiently and effectively capitalizing upon the federal CSREES funds allocated to them to invest in educational opportunities for young people, to ensure a dependable food supply, to foster economic development, and to promote sustainable agricultural production while protecting our soil and water resources all at the same time. While USDA's proposed (CSREES) budget maintains formula funds at \$544 million—imperative to SDSU because these funds comprise thirty-eight percent of our extension service budget—I will be supporting an increase of \$200 million in the CSREES budget to invest in student learning, a dependable food supply, rural community economic development, and sustainable agricultural production.

This increase is necessary to build upon the success stories told time and time again in South Dakota and across the country, and I'd like to cite just two of many examples in my State.

In South Dakota, these formula funds allow for a program entitled "Putting Youth Back in Sports" that teaches sportsmanship, honesty, and fairness to young people involved in athletics and other extra-curricular activities. This innovative program also addresses the role parents and other adults play in serving as responsible role models, therefore "Putting Youth Back in Sports" works with parents, teachers, coaches, and others to ensure everyone knows how to be a "good sport." As a result,

nearly 10,000 people in South Dakota completed this program last year, and SDSU has been invited to bring the program to Penn State.

Additionally, CSREES funds allowed SDSU to establish a Standardized Performance Analysis (SPA), a record keeping analysis for cow-calf ranchers in South Dakota. This SPA permits individual ranchers to calculate operational costs on a per-cow and per-calf basis, and as a result, identify a specific break-even value allowing ranchers to take steps to reduce costs and increase potential profit-making opportunity.

These and many other innovative programs benefit from CSREES funds, which promote projects in South Dakota that serve its citizens through an educational process that helps them improve their lives by applying unbiased, scientific knowledge focused on needs and issues. That is why I will support an increase for fiscal year 2002. Thank you Mr. Chairman, this concludes my opening statement but I look forward to addressing Secretary Veneman with some questions in relation to these and other matters.

STATEMENT OF SENATOR LARRY E. CRAIG

Senator COCHRAN. Senator Craig.

Senator CRAIG. Mr. Chairman, thank you very much. Secretary Veneman, thank you for being with us today. I look forward to your testimony. I read your prepared remarks. You have just returned from Quebec and I have just returned from Brussels. You engaged Brazil and Argentina in discussions dealing with their extended agricultural capabilities, and I engaged Fran Krischler, the EU's agriculture minister.

Out of those two conversations, I suspect we in this country have got to decide where we're going to go with agriculture as it relates to what our public policy will be in the near and the long term. We are going to start looking at that soon, and I would suggest that we will find it extremely difficult to continue to simply serve an agriculture policy, which means write a check to every producer and make it larger every year so that they can balance the books. That will not continue to work, and somehow we have got to wrestle our way out of that.

I think that Senator Dorgan and I had a rather interesting awakening a few years ago when, as cochairs of the WTO Caucus, we engaged a fellow by the name of Pascal Lame, and after we had roughed him up for a bit he looked us all in the eye and chuckled a bit, and he says, you do not understand us, do you. We in Europe have decided to protect the pastoral beauty of our agricultural landscape, and therefore we will provide for our farmers and we will pay them directly for that purpose. We believe it is good social policy in Europe, so the only thing that you have left for us to debate is the subsidy that we may or may not do as it relates to moving product into the world market.

In other words, he said, hands off our domestic policy. We have made our decision. I think that is changing now in the EU as new countries come in and those countries come with a large agricultural portfolio.

At the same time, it is without question going to be demanding of us to look into our crystal balls and decide how we are going to deal with agricultural policy in this country as it relates to a producer-producer relationship, and certainly the well-being of our country and our consumers. I don't have an answer to that, and my guess is you probably don't, either, but maybe collectively in the next year we will work that out.

In the meantime, we need to continue a level of support for agriculture that at this time is at or below break-even, depending on the specific commodity, few of them above that line, and all of that extremely important to individuals within the industry itself, but collectively to our States and to our country.

I look forward to your testimony. More importantly, I look forward to working with you in the long-term as we wrestle through these issues.

Thank you.

Senator COCHRAN. Thank you, Senator Craig.

Senator Dorgan.

STATEMENT OF SENATOR BYRON L. DORGAN

Senator DORGAN. Mr. Chairman, thank you very much, and again, Mr. Chairman, thank you for convening this hearing. Madam Secretary, thank you for being here, and welcome.

Abraham Lincoln created what is now the U.S. Department of Agriculture, with nine employees back in the early 1860's. I understand we now have more than 97,000 employees, including the forest service, some 35,000 plus in the forest service. My feeling is, the only reason to have a Department of Agriculture is to preserve the network of family farms in this country.

I would prefer to use the term family farmer than just, quote, agriculture, unquote, because I think corporate America would farm America from coast to coast, given their own interests. I am interested in preserving the network of family producers in this country, and if we are not about doing that, then as far as I am concerned we probably could shut down USDA. If we want to do that, let us have an operational statement that our goal is to create, or rather to preserve, a network of family producers in this country on rural lands.

My colleague from Missouri mentioned timing, and certainly timing is important. There is an old story about a Cherokee Indian chief who said, the success of a rain dance depends a lot on timing. I suspect that is true, and it is certainly true, perhaps, with the stewardship of the Secretary of Agriculture. It is also true that initiative is critically important. The question for us is, do we have good intentions, number 1, and number 2, are we pursuing good policy?

Our family farmers are in some very serious trouble, and have been for some long while. The current farm program was written when the price of wheat was over \$5 a bushel. It collapsed quickly, and every single year we have had to play catch-up with some emergency help.

Last week, I was in Stanley, North Dakota. A young high school boy who had written me a letter came up and introduced himself and asked if I remembered him. I said I did. He wrote me a plaintive letter saying, I live on the farm with my family. He said, my dad can feed 180 people, and he can't feed his family. I told him that, I remember that letter. That is not a letter someone would easily forget. But he was describing the difficulty of trying to operate a family farm when prices for that which they produce are so far below their cost of production.

This budget that we're talking about is far short of what is needed. It is not reflective of what we need. We need to write a new farm program, and then we need to fund a countercyclical program in the farm program that will help family farmers when times are tough.

We also need to target that help. I do not want to see stories on television about the millions and millions of dollars we give to the largest producers in America. That does not make any sense. Corporate agrifactors will do just fine, thank you. They have got plenty of financial strength to do so.

But I look forward to working with you on a range of these issues. I would say I support expanded trade, but I do not think we are going to trade our way out of this problem. I support tax incentives that are well-constructed, but I think my colleague, Senator Kohl, said it correctly. The fact is, the tax breaks are not going to help a whole lot if you do not have income, especially income tax breaks do not help much if you do not have income. We need to work together and find a way to decide whether we have, as an operational statement for describing the purpose of USDA, that we want to preserve a network of family farms in this country's future.

If we do that, if we decide that is a goal, then let us work together to make that happen with a farm program that finally works. If not, maybe we ought to close the doors down there and save some money.

PREPARED STATEMENT

I do not mean to end this on a down note. I think there is plenty of hope if we work together, and if we are willing to find the resources to try to preserve our family farmers. It is not the case that they are like the little old diner that is left behind when the interstate came through and all that is left is some nostalgia about what was the part of our culture. They are an important part of this country and an important part of its future, but they will not be around unless we take affirmative action and the right initiatives and the right policy courses.

Mr. Chairman, thank you very much.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BYRON L. DORGAN

Mr. Chairman, today this Subcommittee begins to officially scrutinize the United States Department of Agriculture budget that the President released a couple of weeks ago. Quite frankly, I am very disappointed that the President has targeted the Agriculture budget for some of the largest spending cuts in his overall budget—cuts that we all know are mainly necessary to pay for his massive tax cut. All of us involved in Agriculture recognize the bleak economic climate in rural America. We can all agree that this segment of the national economy did not fare all that well in the last decade.

Commodity prices collapsed four years ago and have remained stagnant ever since. Repeated weather disasters have ravaged the nation from coast to coast. Even now, the upper Midwest river systems are flooding while news reports tell us daily about water shortages and drought in Florida and the Western United States. Few would deny that family farmers and those whose businesses are dependent on them in rural America continue to face tough economic circumstances right now, and are in no shape to be neglected by USDA.

Put bluntly, the conditions—low prices and adverse weather—that warranted three emergency farm assistance packages totaling \$25 billion these past three years are still in place. USDA's Chief Economist recently stated that net cash farm

income for 2001 will plummet \$4 billion below the average of the 1990's if no emergency help is enacted.

Despite this fact, the Administration has proposed a budget for USDA that drastically curtails expenditures. Tax relief for farmers is touted as a benefit that will more than compensate agriculture for this neglect.

However, to have a tax problem requires income, and most American farmers are suffering from a lack of income. Tax breaks are not a replacement for sound farm policy. To be more specific, collectively since 1980, deductible farm expense has exceeded farm income which means that the nation's farmers as a whole had a net taxable "loss" for the 20 year period. Recent tax records show that seventy-three per cent of farm sole proprietors either reported a farm loss or have no federal income tax liability. To say that farmers ought to blindly support the Administration's fiscal year 2002 USDA budget proposal because they have a "stake" in the overall budget objectives of the President—mainly his tax cut—is stretching things just a bit.

The Administration has proposed deep cuts in conservation and foreign food aid budgets. The program levels for rural development and research will also be significantly reduced under the Administration's recommendation. They remain silent about any need for emergency assistance for family farmers should commodity prices remain stagnant at these collapsed levels or weather disasters continue to plague the countryside.

USDA's proposed budget is naive in that it proposes to ignore the economic realities of rural America. Economic forecasts for agriculture remain bleak for the 2001 growing season and beyond due to the continuation of collapsed commodity prices, while input costs—most notably fuel and fertilizer—skyrocket. If we fail to offer adequate support for agriculture, massive farm failures will surely occur. Such failures would cripple rural America's economy and could further dampen the general economy, something we must prevent during this time of national economic uncertainty.

I am confident my colleagues will agree with me and that this Subcommittee will address the inadequacies of the Administration's proposed USDA budget for fiscal year 2002.

STATEMENT OF SENATOR RICHARD J. DURBIN

Senator COCHRAN. Senator Durbin.

Senator DURBIN. Thank you, Mr. Chairman, Senator Kohl, and my colleagues. Secretary Veneman, welcome to the hearing. I am glad to see you are joined by two stalwarts, Mr. Collins, who has served as an economist for a long time—I have known him since my days in the house—and Steve Dewhurst, who I think started in the early Grover Cleveland administration—

Senator DURBIN.—He has continued on with distinction every single year. You are lucky to have to two of them by your side.

Madam Secretary, I would like to follow through with a comment as well about the emergency situation we face. We have faced emergency assistance for farmers for the last several years that has literally meant whether or not those farmers survive or not. In Illinois and across the farm belt the Federal payments have accounted for half the net farm income. The farmers literally would not have survived without it.

Now, on top of that, Mother Nature has thrown us another challenge with the flooding in the Midwest. I was on the phone a few minutes ago with Joe Allbaugh of FEMA who is on his way to Illinois. Over 28,000 acres have been flooded now, and will be affected in terms of crop planting.

I would like to issue a personal invitation to you, Madam Secretary, if you would consider it, to come to Illinois and come to the flooded areas to meet with the farmers and farm families. There are some important questions they would like to ask of you, of the administration, concerning their future. They took a look, or at least their farm organizations have taken a look at the proposed budget and are concerned as to whether or not there has been a

sufficient amount of money set aside for emergency purposes. There is an inadequate amount from where I am sitting, but perhaps there is another view of this. We would like to offer you the opportunity to come and speak to that.

Second, I would like to say that I noted in many of the introductory comments here how often the issue of food safety has come up. It is interesting, in a country with the safest food supply in the world, that we want to do better, and we are conscious of challenges that other countries and other people are facing.

I have introduced three pieces of legislation. I would like to ask your Department to review and see if you might support. One of them relates to the whole question of the food that is being imported into this country, the National Food Security and Safety Act, to strengthen our national defenses against mad cow disease and related threats. It uses sound science, and I hope good common sense, to make our borders more secure, improve our surveillance activities, and remove from the food supply for humans any animals, some animal-derived materials that could potentially spread mad cow disease.

I am also working on the Genetically Engineered Foods Act. I noticed last night, perhaps you saw it, Frontline had a program relative to this whole issue of biotech, which is extremely controversial. Senator Bond has been a leader in speaking out on this, as others have. We want to make certain that we have the safest food supply and use the best science to not only feed America, but to feed the world.

Finally, I would like to commend to you a position that was taken by President Bush during his campaign but not by the Democratic candidates. It was a position that I have been espousing for some time, and it addresses the fact that we currently have Federal food safety fragmented in 12 different Federal agencies with 35 different laws and 28 different House and Senate subcommittees with jurisdiction and oversight. Is it any wonder that we have conflicting, overlapping, and oftentimes amusing contradictions in the law when it comes to the safety of our food?

This administration I think can make history by finally bringing together all of the different food safety aspects of the Federal Government into one scientifically driven agency that will combine the mission of food safety so that people across America and around the world know that we are absolutely doing our very best. I have been working on this for several years, and I would be anxious to work with you on that in the future.

PREPARED STATEMENT

The last point I will make is this. It is more global. After our visit to Africa a little over a year ago, I came back absolutely overwhelmed with what I had seen with the AIDS epidemic, and I am heartened by comments from my colleagues like Senator Frist and others, Senator Lugar, who believe, as I do, that with the largesse in the United States we have an opportunity and an obligation to try to help those in other countries who are braving this type of epidemic and other health problems. I hope that we can find ways to work together to expand our assistance in this area.

I thank you for joining us.

[The statement follows:]

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

Chairman Cochran, thank you for holding this important hearing today. I look forward to working with you, Senator Kohl, and my Subcommittee colleagues on the fiscal year 2002 (fiscal year 2002) Agriculture Appropriations bill.

Mr. Chairman, I would like to welcome USDA Secretary Ann Veneman to the hearing this afternoon. Although she may be a new secretary, she is not new to USDA or to agricultural issues. I enjoyed working with her during her stint as Deputy Secretary in the early 1990s. Madam Secretary, I look forward to working with you and the team you're assembling at the Department. I'm certainly familiar with the gentlemen you've brought with you today, Chief Economist Keith Collins and Budget Officer Steve Dewhurst. I always enjoy their budget insights.

I would like to take a few minutes this afternoon to talk about some very important issues that affect the Department and my home state of Illinois.

First, I've noticed that the Department's fiscal year 2002 budget contains no emergency funding. The Administration is relying on its proposed National Emergency Reserve Fund or Contingency Reserve Fund—neither of which exist at this time—to provide farmers with federal assistance.

The proposed Emergency Reserve Fund would only be given \$5.6 billion in fiscal year 2002 to respond to all types of disasters, including floods, earthquakes, hurricanes, droughts, and the kinds of emergency payments farmers will need. While I am open to efforts to prepare for unexpected emergencies, the continuing farm slump is different. We know the need. Congress has appropriated more than \$5.6 billion for farm assistance alone in each of the years since the farm economy's downturn began.

As for offering the Contingency Reserve Fund as an option for funding, this approach pits farm aid against Medicare, Social Security and defense spending needs. I wonder, how is relying on these reserve funds, which compete with other national needs, a responsible method for ensuring our farmers get the support they desperately need?

I raise this point because as we speak, western Illinois and eastern Iowa residents are battling another Mississippi River flood. The Illinois Department of Agriculture tells me that many farmers have canceled orders for inputs such as fertilizer and chemicals and are delaying the planting of crops in anticipation of possible flood damage to their property. Record crests are expected today and the FEMA director will travel to the Quad Cities on Thursday to assess the damage. Already, 28,600 acres of cropland in ten Illinois counties have been affected, according Illinois Emergency Management Agency.

And just like we can't accurately predict floods, other natural disasters or poor crop conditions could emerge through the planting season and into fall harvest throwing our agricultural economy for yet another loop. We need to be prepared.

Congress has provided approximately \$25 billion in emergency agriculture aid since 1998. Farm groups have requested up to a \$12 billion increase in the agriculture budget for fiscal year 2002 in anticipation of another year of depressed commodity prices and higher input costs. The Senate passed an amendment to the budget resolution that would allow for \$9 billion in additional emergency agricultural assistance this fiscal year. I supported that measure.

My colleagues will not be shocked to learn that government payments in 2000 made up nearly half of net farm income. The USDA predicts that without government payments, farm income will fall in 2001 to \$4.1 billion. A recent study by the University of Illinois shows that Illinois farm income is up slightly in 2000, but that government payments still account for 21 percent of gross farm returns. In fact, many families have to go off the farm to earn money to pay for simple living expenses and income and Social Security taxes.

Having said that, I think it's important for all of us to realize that the 1996 Farm Bill was not written in stone. It can and should be changed. I believe we must start now by reforming Freedom to Farm because clearly it has failed to meet the most basic needs of producers. Restoring the farm safety net, targeting payments to farmers in need, and ensuring that livestock producers are not left behind should be the first steps.

We must also work to both open and broaden markets for American agricultural products and find appropriate alternative uses. More specifically, I hope that my colleagues in Congress, and in the Bush Administration, will make every effort to expand the role of ethanol in the reformulated gasoline program. Knowing what we know about MTBE, this should be a top priority. I believe expanding ethanol's role

is a win for our farmers, a win for the environment, and a win for the rural economy.

We have a great deal to do and a very short year in which to accomplish these initiatives for rural America and our farm families. It's time for Congress to roll up its sleeves and get to work.

Now, I'd like to mention food safety.

Our country has been blessed with one of the safest and most abundant food supplies in the world. We have the science and know-how to make it even safer. And as the public learns of global threats to diseases like mad cow and foot and mouth and new, unfamiliar technologies—like genetically engineered crops and animals—we need to make sure that public confidence in food safety remains high.

I recently announced that I will soon introduce the National Food Security and Safety Act to strengthen our national defenses against mad cow disease and related threats. This bill will apply sound science and good common sense to make our borders more secure, improve our surveillance activities, and remove from the food supply for humans and animals some animal-derived materials that could potentially spread mad cow. We'll also get these same materials out of non-food items, like cosmetics and medicines.

I also plan to reintroduce the Genetically Engineered Foods Act. While I strongly support biotechnology, I've seen farmers in Illinois and throughout the country get hurt by some grave mistakes made by others. We must be able to better assure farmers of an available market for biotech crops, and assure consumers of the safety and effective oversight of this new technology. My bill will accomplish both these goals.

All food safety threats—whether salmonella or mad cow—are made more difficult to manage by our highly fractured food safety system. Currently, federal oversight for food safety is fragmented with at least 12 different federal agencies, 35 different laws governing food safety, and 28 House and Senate subcommittees with food safety oversight. With overlapping jurisdictions and scattered responsibilities, federal agencies often lack accountability on food safety-related issues.

For that reason, I will also be reintroducing the Safe Food Act. This legislation would unite food safety and inspection activities in a single agency with a clear mission to protect the public health. While the details of a new structure need to be developed in an open, participatory process, one of the best things we can do to protect the public health and save lives is unite federal food safety activities in one agency.

I want to work with you and others in the Administration to design and implement a more streamlined system to strengthen food safety and better protect public health. I hope the Department will continue to explore this idea and work with me on ensuring that our food supply is the safest in the world.

Secretary Veneman, as you may know, the Department has been working in Chicago and the surrounding suburbs to help eradicate the Asian Longhorned Beetle. The City of Chicago and the State of Illinois have been battling these pests for over three years now. Both APHIS and the Forest Service have been invaluable partners in this effort. I'm pleased to see that the Department's Budget includes more than \$49 million for efforts to fight Beetles in Illinois and New York.

I hope the Department will continue to work with the Illinois Delegation on the innovative Illinois Rivers 2020 program, a federal-state initiative designed to restore and enhance the Illinois River Basin.

Allow me to touch briefly on Africa. As you probably know, I was in Africa in January of last year and had an opportunity to see U.S. food aid programs in action. I was impressed and heartened by direct feeding programs as well as programs that sell U.S. food products at low cost to finance development projects. But I was overwhelmed by the impact of AIDS on Africa—particularly by the millions of children being left orphaned by the epidemic and the devastating impact on African countries' economies.

I believe U.S. food aid could be used to target communities heavily affected by AIDS. Last year, I supported a provision that passed in the final bill to use \$25 million-worth of surplus commodities in the 416(b) program for food aid, or to be monetized for development projects, for communities heavily impacted by AIDS. I would like to know what progress USDA has made in disbursing these funds and what kind of projects PVOs and the World Food Programme suggested. I would like to get the Department's views on the potential for U.S. food aid being used more broadly to help those children, families, and communities affected by AIDS in Africa and elsewhere in the world.

Finally, Madam Secretary, I have asked in the past that the Department specifically request funding to implement the U.S. Action Plan on Food Security. I'm very interested in how you think the United States can meet the commitments we made

to reduce world hunger at the 1996 World Food Summit. So far, our action plans have appeared to be only a list of the programs we already have, but we have not made much progress toward the goal of cutting in half the number of undernourished people by 2015.

Mr. Chairman, again thank you for the opportunity to raise these issues.

Senator COCHRAN. Thank you, Senator. Madam Secretary, our Ranking Member is not going to be able to return to the committee after we go vote—we have a vote that has now begun on the Senate floor—so I am going to recognize him for the purpose of asking a couple of questions, which I hope you can answer; Then we can take a break and go vote, and we will come back and resume our hearing and hear your statement and have additional questions.

Senator Kohl.

FOOT AND MOUTH DISEASE

Senator KOHL. Thank you, Mr. Chairman, for your courtesies.

Madam Secretary, I appreciate your comments on the steps necessary to avoid an outbreak on foot and mouth disease or similar animal diseases in our country. If an outbreak were to occur in my State, which relies on the dairy industry, the consequences would be absolutely devastating, as I pointed out in my April 7th letter to you. In that letter, I also mentioned a troubling story on this subject that appeared in Wisconsin State Journal on April 4 which reported shortfalls in the inspection procedure at U.S. points of entry, so Madam Secretary, have you had a chance to review that story, and would you please respond to the concerns it raises, and if a confirmed outbreak of foot and mouth disease were to occur in this country what USDA procedures are in place for disease containment?

Secretary VENEMAN. Thank you, Senator. As you probably know, foot and mouth disease has taken up a considerable amount of time for us in the Department of Agriculture since we assumed office, with the outbreak that occurred in the U.K. and continues to show new cases every day.

We have been watching this issue very, very closely, and taking considerable action with regard to foot and mouth disease. Initially we suspended the imports of products from any foot and mouth disease country as well as all of the EU, following the outbreak in Europe.

We have strengthened the number of inspectors that we have at ports of entry. We have increased our inspection at airports. We have increased public service announcements. We have increased the number of personnel at ports and airports. We have added about \$32 million from our AQI user fees to add inspectors toward this effort, so overall we have been continually reviewing the programs that we have for exclusion.

In addition, we are looking at all of the issues that we have with regard to preparedness should an outbreak occur, and that means working interagency with other agencies to make sure that we are totally prepared in the unfortunate event that we might get an outbreak.

We have strengthened our relationship with the States and the State veterinarians to ensure that all of our programs are working in coordination. We have taken a number of steps with regard to

constantly retooling our programs, looking into how we can strengthen them, because we know how devastating this disease can be to the United States, whether it is in your State, the dairy States, in my home State of California, or around the country, or to all of the livestock herds we currently have in so many parts of the country today.

This would impact seriously on almost every State, and so we are very cognizant of the importance of our vigilance.

As I said, if we did confirm an outbreak we would hope that it could be contained and eradicated very quickly, and we are constantly reviewing our systems to make sure we are working together with our States and all of the resources that we have in the U.S. to ensure that we could act quickly, and in the unfortunate event that we got it, to eradicate it quickly.

Senator KOHL. I would just ask one other question and submit the others for the record, as well as a letter from Senator Wellstone.

[The letter follows:]

LETTER FROM SENATOR PAUL D. WELLSTONE

APRIL 23, 2001.

Hon. HERB KOHL,
Ranking Member, Subcommittee on Agriculture, Rural Development and Related Agencies, U.S. Senate, Washington, DC 20510.

Dear HERB: I understand your Committee is hearing testimony from Secretary Veneman this week regarding the fiscal year 2002 Budget. As you know recent flooding has ravaged a number of Minnesota communities. I would appreciate your informing the Secretary of the current situation in Minnesota as it relates to agriculture.

Continued extremely wet conditions over the weekend of April 22nd have made planting conditions quite difficult. Approximately 5 to 8 inches of snow fell in central Minnesota, and over 4 inches of rain fell covering much of central and southeast portions of the state. Prior to this weekend's precipitation, the following state-wide estimates were provided by the Minnesota Farm Service Agency (FSA): \$1 million in structure damage (farm buildings, bins, storage facilities, etc.) and 8,000 acres of Conservation Reserve Program flooded out.

Minnesota FSA estimates that approximately 1.5 million acres of farm land have been flooded. Additionally 10 million acres are saturated, with no capacity to absorb any more moisture. The largest portion of the 11.5 million flooded and saturated cropland are along the Minnesota and Mississippi Rivers. The current cold and wet conditions increase the risk of another occurrence of the perennial scab and blight that affect small grains.

Furthermore FSA predicts delays in planting will result in a marked shift from corn to soybeans, due to a shorter growing season for soybeans. Minnesota already has seen an approximate 35 percent shift from traditional corn acres to soybean acres for this crop year because of favorable loan rates for soybeans. These projected shifts have already depressed the soybean market.

Thank you for your assistance on this matter. As additional information becomes available I will keep the Committee informed.

Sincerely,

PAUL D. WELLSTONE.

CRANBERRY INDUSTRY

Senator KOHL. Madam Secretary, the cranberry industry continues to face record low prices and problems related to oversupply. Wisconsin is the leading cranberry producing area in the country. The current crisis has devastated producers in my State. Currently, I know that you are reviewing a Cranberry Marketing Committee proposal for volume reduction to stabilize market conditions this year. Since it is obviously important that planning decisions be con-

cluded soon, can you provide a timetable by which you will have made a decision on this matter?

Secretary VENEMAN. Well, Senator, I am aware of this issue and the fact that there are industry proposals. The industry is not exactly united on this issue. We are looking at the issue. We hope to have a decision very soon. I understand very clearly the need to act with some urgency on this issue, and the fact that we have to have a timely decision. We will address this issue within a matter of days.

Senator KOHL. I thank you so much, and I thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Kohl. The committee will stand in recess. We will go over and vote on the legislation on the floor, and we will reconvene within a few minutes.

The committee will please come to order. I am pleased to continue our hearing. I apologize for having to suspend while we went over and voted on the legislation on the floor of the Senate.

We are pleased to have before the committee today Secretary Ann Veneman, Secretary of Agriculture. We have had opening statements from our committee members and a couple of questions from the Ranking Member. Madam Secretary, we are pleased to receive your statement at this time, and we will have a few questions following your statement. Your written statement is being included in full in the record, so we encourage you to make whatever summary comments you think would be helpful to us.

SECRETARY VENEMAN'S ORAL REMARKS

Secretary VENEMAN. Thank you, Mr. Chairman, and I was going to say members of the committee, but I will just say Mr. Chairman for now. It is an honor for me to appear before you today to discuss our 2002 budget for the Department of Agriculture, and as was indicated early on, I am lucky to have the two gentlemen with me, both of whom are long-time employees of the Department. Steve Dewhurst, our budget officer, and Keith Collins, our chief economist. I am going to make a relatively brief statement, and then we will all be available to respond to questions, and I appreciate you taking my full statement for the record.

I want to begin by thanking this committee for its support of USDA programs and for the long history of effective cooperation between the committee and the Department. I enjoyed a productive relationship with this committee when I was Deputy Secretary in the early nineties, and I want to preserve and strengthen that relationship in the future. I look forward to working with you, Mr. Chairman and all the members of the committee toward that objective.

As you know, the details of the President's budget proposals were released on April 9th. For the activities within the jurisdiction of this committee, the Department is requesting appropriations for the year 2002 which total \$72 billion, an increase of \$883 million for the Department's ongoing programs. It is important to note that in 2001 there was more than \$4 billion appropriated for emergencies. This budget does not include approximately \$3 billion of that spending appropriated for the Department, because it was

mostly one-time emergency spending where the missions have been completed.

By any measure, this is a responsible, yet restrained budget. It meets the President's objectives of slowing the growth of Federal spending, funding urgent national priorities, achieving historic levels of debt reduction, and providing tax relief. Farmers and other beneficiaries of USDA programs all have a stake in these objectives.

As you know, the Department is responsible for a very diverse set of programs. It is always difficult to find the appropriate balance for funding them. Nevertheless, we have tried very hard to provide adequate funding for the most urgent issues facing American agriculture, and we look forward to working with the committee as it proceeds through the year 2002 budget process.

However, I do want to emphasize that in order to get growth of spending under control, it is important that the levels that we are recommending to you today be supported. This budget was developed to include sufficient funding to carry out key priorities, including:

- First making sure we have the funding and legal authorities we need to strengthen our agricultural quarantine inspection activities and combat pest and disease infestations;

- Provide overseas marketing intelligence and technical expertise needed to support agricultural trade;

- Implement the new Agricultural Risk Protection Act so the farmers will have the benefits of improved crop insurance as soon as possible;

- Provide adequate funding for our food safety activities, particularly the meat and poultry inspection workforce of the Food Safety Inspection Service;

- Support our food assistance programs at levels consistent with the anticipated need for these programs;

- Provide adequate funding for the Department's rural developments activities, with particular emphasis on water and sewer facilities, rural housing, and efforts to improve access of rural areas to technology, particularly the Internet;

- Provide continued support to landowners, farmers, and ranchers through the Department's conservation programs, and redirect USDA research into important new areas.

With your permission, I would like to briefly make some additional comments on a couple of the areas that I just mentioned. As you know, there has been much attention this year devoted to issues such as foot and mouth disease and bovine spongiform encephalopathy, BSE, particularly given the heightened concerns about the situation in Europe. Preventing the introduction of these diseases into the U.S. is the best way of dealing with these threats.

I have said many times that pests and animal disease prevention and eradication programs are the very infrastructure to protect production agriculture. For 2002, we are requesting an increase of \$174 million in appropriations for APHIS programs which will allow us to continue emergency programs underway in 2001.

Specifically, we are requesting almost a 40-percent increase over the 2000 levels for the agricultural quarantine inspection, or AQI program, in order to increase the level of inspections along U.S.

borders and ports of entry. In order to provide more inspection resources at borders and ports of entry as soon as possible, I have authorized use of an additional \$32 million of AQI user fees for 2 years, beginning in fiscal year 2001.

Using these two sources of additional funding, we will be able to increase staffing in the AQI program by over 900 by the end of 2002, more than 35 percent higher than 2000. We have also taken a number of other actions in response to the outbreak of foot and mouth disease abroad. We have tightened regulations to prohibit shipments of livestock products from high-risk countries, strengthened Federal, State, and industry coordination, implemented education campaigns, and dispatched U.S. experts to provide technical assistance overseas.

All of these measures have been taken to reduce risk, and we continue to review and examine all existing programs to ensure this Department has all the necessary means to (1) prevent the possible entry of foot and mouth disease, and (2) ensure that if we ever faced an emergency, that we will have the resources and capabilities to quickly contain and eradicate.

Concerning BSE, we are proposing a research initiative for the Agricultural Research Service to determine the nature and transmission of the disease, and to develop improved detection and diagnostic tools. Early detection of the disease before symptoms appear is a priority, both to eradicate the disease and prevent hazardous products from entering the food chain.

Concerning food safety, this budget does not propose any new user fees for meat, poultry, or egg inspection. However, it does request additional funding to support a workforce sufficient to meet industry demand for inspection services so that there is no disruption in slaughter plant operations due to a lack of inspectors. Our goal is to make sure the food supply is safe, and to protect it from the variety of hazards that pose a threat. In that regard, we are also currently conducting a review of our food safety programs to ensure regulations and programs are meeting the goals of protecting consumers.

We believe this budget carries out the President's commitment to expand markets for American agricultural products. I have personally spent a lot of my time over the years dealing with trade matters, and I want to make sure the Department is well-equipped to do the job in this area. In this regard, I would like to emphasize the importance of funding our request to bolster the Department's capability to address technical trade issues and to strengthen our market intelligence capabilities at our overseas posts.

In addition, we are proposing funding for our credit, market development, and export enhancement programs at or above 2001 levels. We also will be aggressively pursuing international negotiations to reduce trade barriers and open markets for our farmers and ranchers.

Finally, I would mention a couple of points on the farm assistance side. Farmers have been through some tough economic times in the past several years, and there is continuing uncertainty about the future. We are closely monitoring the crop and market conditions and if additional assistance is needed we will work with the Congress to determine the nature and extent of that assistance.

There has been an extremely heavy workload in our county office service centers assisting farmers. We expect the heavy workload to continue into 2002, although with some moderation. In order to deal with providing adequate assistance to farmers, we will need greater funding for the salaries and expenses in the Farm Service Agency.

As noted in the budget request, we have proposed some additional funding to properly implement the reformed crop insurance programs authorized by Congress last year. As well, additional funding is included to assure that farmers have access to the credit they may need to carry out their farming operations.

PREPARED STATEMENT

With that, Mr. Chairman, I will conclude my statement. I am looking forward to working closely with the committee on the year 2002 budget. I know that one of the first things we can do to help the committee is to make sure you have all the information that you need to proceed to make decisions about the budget. You have received our budget justifications and other supporting material. If there is additional information that you need, please do not hesitate to let us know.

Now, we would be glad to respond to any questions.

[The statement follows:]

PREPARED STATEMENT OF ANN M. VENEMAN

Mr. Chairman, Members of the Committee, it is an honor for me to appear before you to discuss the fiscal year 2002 budget for the Department of Agriculture. I have with me today our Chief Economist, Keith Collins, and our Budget Officer, Steve Dewhurst.

I want to begin by thanking this Committee for its support of USDA programs and for the long history of effective cooperation between this Committee and the Department in support of American agriculture. The Department had a strong relationship with this Committee when I was Deputy Secretary in the early 1990's. I want to preserve and strengthen that relationship in the future. I look forward to working with you, Mr. Chairman, and all the Members of the Committee toward that objective.

As you know, the details of the President's Budget Proposals were released on April 9th. For the activities within the jurisdiction of this Committee, the Department is requesting appropriations in 2002 which total \$72.7 billion. This is a reduction of \$3.3 billion from the levels enacted by the Congress in 2001. However, it is important to remember that the 2001 figure includes over \$4 billion in emergency appropriations. When this factor is considered, the actual budget for the Department's on-going programs reflects an increase in 2002 of \$883 million.

By any measure, this is a restrained budget.

In developing the 2002 budget, the objectives of the President were to slow the growth of Federal spending, fund urgent national priorities, achieve historic levels of debt reduction and provide tax relief. Farmers and other beneficiaries of USDA programs all have a stake in these objectives. Farmers especially will benefit from the elimination of the estate tax and from the proposed establishment of tax-deferred risk management accounts.

Restraint of Federal spending is important. Federal spending has grown substantially in recent years. Left unchecked, Federal spending would far exceed the Budget Enforcement Act baseline over the next 10 years. USDA has contributed to this growth of Federal spending. Now, we must contribute to budget restraint.

Restraining the budget is not easy. The Committee is aware that USDA has one of the most diverse sets of programs in the Government. Developing a budget for this Department always involves difficult questions of finding the appropriate balance among all of these programs within a reasonable budget figure.

We have tried very hard to provide adequate funding for the most urgent issues facing the constituents of the Department. I realize that there are some reductions proposed in this budget which will cause concern. We are more than happy to dis-

cuss those matters and to work cooperatively with the Committee as we proceed through the 2002 budget process. However, I want to emphasize that we share the President's commitment to assuring that the total USDA budget does not exceed the levels recommended to you today.

As we developed this budget, I focused my attention on a number of key concerns. Specifically, I wanted to be sure that this budget had the necessary resources to:

- Provide the overseas market intelligence and technical expertise we need to support agricultural trade;
- Implement the new Agricultural Risk Protection Act of 2000 so that farmers will have the benefits of improved crop insurance as soon as possible;
- Make sure we have the funding and legal authorities we need to strengthen our agricultural quarantine inspection activities and combat pest and disease infestations;
- Provide adequate funding for our food safety activities, particularly the meat and poultry inspection workforce of the Food Safety and Inspection Service (FSIS);
- Support our food assistance programs at levels consistent with the anticipated need for those programs;
- Provide adequate funding for the Department's rural development activities, with particular emphasis on water and sewer facilities; rural housing; and efforts to improve the access of rural areas to technology, particularly the internet;
- Provide continuing support to landowners, farmers, and ranchers through the Department's conservation programs; and
- Redirect USDA research into important, new areas.

With your permission, I will now provide an overview of how I believe this budget responds to each of these important needs.

FARM AND FOREIGN AGRICULTURAL SERVICES

As you know, farmers have been through some tough economic times in the past several years, and there is continuing uncertainty about the future. Although the situation has improved for some commodities, there is continued weakness in certain sectors of the farm economy. The Department will be closely monitoring crop and market conditions over the coming months. If additional assistance is needed, we will work with the Congress to determine the nature and extent of that assistance. The President's overall budget includes a contingency reserve which could be used for this purpose. In the meantime, there are a number of specific proposals in this budget which I would commend to the Committee's attention.

The Administration has established an ambitious trade expansion agenda. USDA will be a full and active participant in that effort. The reasons for doing so are clear. With more than 95 percent of the world's population living outside the United States, the future prosperity of the American farm sector depends upon reducing trade barriers and increasing access to new markets in the expanding global economy.

USDA's trade expansion efforts will involve a coordinated Department-wide effort. One of the highest priorities will be international trade negotiations that provide the opportunity to achieve further reductions in trade-distorting agricultural policies, ensure fairer competition in global markets, and open new markets for our farmers and ranchers.

As the Committee is aware, multilateral negotiations to further liberalize agricultural trading practices are already underway under the auspices of the World Trade Organization. The United States has offered a set of ambitious proposals for the negotiations that provide for the elimination of export subsidies, improved market access through reduced tariffs and increased quotas, reform of state trading enterprises, tighter rules on trade-distorting domestic support, and facilitation of trade in the products of new technologies. The Department will be working closely with the Office of the U.S. Trade Representative to secure an agreement which incorporates those objectives.

Negotiations also are underway to achieve a Free Trade Area of the Americas by 2005. For agriculture, the objectives of the negotiations include eliminating export subsidies that affect trade in the Hemisphere, identifying other trade-distorting practices in order to bring them under greater discipline, and ensuring that sanitary and phytosanitary measures are based on science and conform with Uruguay Round principles. Latin America and the Caribbean region are expected to be among the most promising growth markets for U.S. agricultural products in the coming years, and we need to ensure that American agriculture has maximum access to those markets.

In addition to negotiating new agreements, the Department will be working hard to ensure that our trading partners comply fully with existing trade agreements and do not institute technical barriers to trade that run counter to the spirit of those agreements. Technical trade issues, such as those related to food safety and biotechnology, are among the fastest growing and most sensitive issues affecting agricultural trade today. It is critical that regulatory actions taken by our trading partners do not impede U.S. exports and that they comply with Uruguay Round trade disciplines. It is also important for the United States to participate actively in the international organizations that set the technical standards that govern agricultural trade.

The Foreign Agricultural Service (FAS) is the Department's lead agency in implementing many of our international programs and activities. For 2002, the budget provides appropriated funding of \$126 million for FAS. This is an increase of \$6.4 million above the 2001 level. This additional funding is provided to bolster FAS' capabilities to address technical trade issues and to strengthen FAS' market intelligence capabilities at its overseas posts. The emergence of increasingly complex trade policy and food security issues in recent years has led to a dramatic increase in workload at the agency's overseas offices. Meeting these priority workload demands in addition to regular commodity reporting, marketing, and representation duties has overwhelmed FAS in a number of key locations. We will be focusing our efforts on 14 important markets around the world where opportunities to expand U.S. agricultural exports appear to be the greatest.

Beyond these specific proposals, the budget also includes adequate funding for our export promotion and market development programs. The sustained effort of these programs is needed if we are to benefit from the market opportunities which become available. The Department's Foreign Market Development (Cooperator) Program, the Market Access Program, and the Quality Samples Program are estimated at \$120 million in the budget, the same level as 2001. The Department's Export Guarantee Programs are estimated at \$3.9 billion, an increase of more than \$100 million above the current estimate for 2001. Finally, funding for the Export Enhancement Program is estimated at \$478 million which is the maximum level authorized by statute and the same as 2001; and funding for the Dairy Export Incentive Program is estimated at \$42 million, slightly above the current estimate for 2001.

The budget includes a commitment to take a further look at the Department's foreign food assistance programs to be sure they are effective in achieving their objectives. The study has not yet been designed, but I believe it is in everyone's interest to make sure that these programs will meet the Nation's needs for the foreseeable future. For instance, we want to ensure that these programs significantly benefit farmers, target necessary humanitarian feeding needs and avoid adverse commercial impacts.

The budget for this Mission Area also includes other important proposals. Full funding is included for implementation of the reformed crop insurance programs authorized by the Congress last year. The budget includes increases of \$250 million in mandatory spending to finance the additional subsidies involved in this program and \$9 million in discretionary spending to provide the administrative money required by the Risk Management Agency to be sure this program is properly implemented.

With respect to the Farm Service Agency (FSA) salaries and expenses activities, the 2002 budget proposal will support about 5,900 Federal staff years and 11,500 non-Federal county staff years, including about 2,000 temporary county staff years. The heavy county office workload resulting from the weakened farm economy of the past few years is expected to continue into 2002, although with some moderation. The 2002 budget proposes to increase FSA salaries and expenses funding by almost \$120 million, the largest salaries and expense budget increase in USDA. As a result, FSA temporary staffing will be maintained at about twice the levels of the pre-crisis period of 1996-1998.

We have also budgeted almost \$4 billion in farm credit programs to assure that farmers have access when necessary to Federally-supported operating, ownership, and emergency credit. This action alone requires an increase of \$68 million in the discretionary budget.

MARKETING AND REGULATORY PROGRAMS

Critical issues of pest and disease control are the primary responsibility of the APHIS. For APHIS' salaries and expenses, we are requesting a \$174 million increase over 2001. Outbreaks of bovine spongiform encephalopathy (BSE) or "mad cow disease" and foot-and-mouth disease (FMD) in the European Union and other countries underscore the need to protect our borders from animal and plant threats.

Preventing the introduction of these devastating pests and diseases is the most cost-effective approach to deal with such threats. As a result, the APHIS budget provides increased funding for the Agricultural Quarantine Inspection (AQI) program along U.S. borders and ports of entry. Funding for the AQI program in 2002 will be almost 40 percent higher than 2000 and authorized staffing will be increased over 900 staff years—more than 35 percent higher than 2000. Part of this increase results from the additional \$8.4 million requested for the taxpayer supported inspection activities at the Canadian and Mexican borders. Another part of the increase results from my recent authorization to expand the user fee supported inspection services by \$32 million through 2002. These activities will increase inspection personnel to protect against animal and plant diseases, such as, foot-and-mouth, at major U.S. ports of entry.

In the face of threats from FMD and BSE, USDA has increased its vigilance to prevent such diseases from entering the United States. Live ruminants and their products were already prohibited from all EU countries due to risks associated with BSE. With the outbreak of FMD there, USDA has temporarily restricted the importation of live swine and swine products from the EU as well. This action is in addition to our standing restrictions on specified imports from other countries that have FMD. USDA has also intensified scrutiny and inspections at ports of entry, enhanced anti-smuggling operations, engaged in a public education campaign to raise travelers' awareness, enhanced communication with States and the livestock industry, and furthered our emergency preparedness. Finally, I asked a top California State veterinarian to come to USDA to assist APHIS in our FMD exclusionary planning activities.

With respect to pest and disease outbreaks, the 2002 budget requests appropriations to continue funding for several eradication programs that had been started with funds transferred from Commodity Credit Corporation (CCC). These continuing activities can no longer be considered "emergencies." These appropriations will fund eradication of 9 pest and disease outbreaks, including Mediterranean fruit fly, citrus canker, Asian Long-horned Beetle, and bovine tuberculosis. For any new emergency pest and disease outbreak, we are requesting continuation of our legal authority to use CCC funding.

I would also direct the Committee's attention to other important proposals in this area. For instance, the budget for the Grain Inspection, Packers and Stockyards Administration (GIPSA) includes \$1.2 million to facilitate U.S. grain exports by helping resolve recurring international grain quality issues and by enabling GIPSA certification laboratories to meet revised international certification standards.

The budget for the Agricultural Marketing Service includes an increase of \$4 million to develop the agency's capability to test bio-engineered fruits, vegetables, nuts, and seeds to support labeling programs aimed at differentiating bio-engineered commodities from conventional commodities. Also, the budget includes an increase of \$1 million to expand the agency's involvement in international standard setting activities to ensure that U.S. interests are represented during the development of agricultural standards that have an impact on export opportunities for U.S. producers.

FOOD SAFETY

Ensuring the safety of the food we eat is vital to American agriculture and consumers. There is no question that USDA must and will carry out its duties to protect the food supply from the variety of hazards that threaten its safety.

Unlike some recent budgets, this budget does not propose user fees for meat, poultry, and egg inspection. Instead, we are requesting appropriations of \$716 million, an increase of \$21 million over the 2001 level. The budget includes an increase for pay and benefits that is necessary to support FSIS workforce, including approximately 7,600 meat and poultry inspectors. The agency estimates that this level of inspectors is necessary to meet industry demand for inspection services without disruption.

The 2002 budget for FSIS also includes an increase to improve the agency's capability to detect residues in meat products being exported to the EU. This will comply with EU requirements and protect these exports.

The 2002 budget also includes an increase to review foreign inspection systems to assure they meet U.S. requirements. The requested increase will enable FSIS to strengthen efforts to conduct follow-up investigations of foreign systems found to have problems meeting U.S. requirements. The increase will also enable FSIS to increase the number of on-site audits of countries requesting initial certification to export to the United States.

FOOD, NUTRITION, AND CONSUMER SERVICES

The budget includes \$36.6 billion for the Department's nutrition assistance programs. This is about 50 percent of the total appropriations we are requesting from this Committee.

The Food Stamp Program is funded at \$21 billion. This includes funds to cover an anticipated food cost increase of 3 percent and an estimated additional increase of 800,000 participants. These figures are consistent with the overall economic projections in the President's budget. In addition, \$1 billion is requested for a contingency reserve. While use of the reserve is not anticipated, it would be available in the event that unforeseen economic changes would increase demand for the program.

The Child Nutrition Programs are budgeted under current law at \$10.1 billion, about \$550 million more than the 2001 estimate. This estimate is based on increased participation and an adjustment for the Consumer Price Index for Food Away From Home. The Department will continue to work with the States to improve the nutritional quality of school meals and to help strengthen program integrity.

For the Special Supplemental Program for Women, Infants, and Children (WIC), the budget requests \$4.1 billion, an increase of \$94 million over the 2001 appropriations, which will support a monthly average of 7.25 million participants, the same level expected in 2001. Funds are included to continue efforts to implement electronic benefit transfer (EBT) for WIC. EBT is expected to improve efficiency not only at the grocery checkout, but also within WIC clinics where the cards can greatly simplify identification and clerical tasks. The budget also funds the Farmers' Market Nutrition Program at \$20 million, the same as the 2001 level.

NATURAL RESOURCES AND ENVIRONMENT

The 2002 budget request in the conservation area recognizes the importance the public has placed on natural resource concerns, as well as the need to protect the conservation partnership that has evolved over the years between the Department and conservation districts and farmers.

For the Natural Resources Conservation Service, the budget requests \$927 million in appropriated funding. This includes \$678 million for conservation technical assistance (CTA) which represents the foundation of the Department's conservation partnership. The CTA request includes an increase of \$44 million for technical support of the Conservation Reserve Program (CRP). This is necessary because the 1996 Farm Bill imposed significant restrictions on the availability of CCC funds to support services such as conservation technical assistance for the CRP. Any funds not needed for this purpose will be available to support other high priority on-going conservation activities, such as waste management plans for animal feeding operations.

RURAL DEVELOPMENT

The 2002 budget will allow USDA to continue to play a significant role in the development of Rural America. The 2002 budget requests \$2.4 billion in budget authority to finance \$12.4 billion in rural development loans and grants.

The 2002 budget supports almost \$5 billion in loans and grants for rural utilities, including \$2.6 billion in loans for electric generation and transmission facilities, \$500 million in loans for telecommunication systems, over \$300 million for distance learning and medical link facilities, and \$1.4 billion in loans and grants for water and waste disposal systems.

The 2002 budget also includes a proposal to provide permanent authority for financing broadband transmission and local dial-up Internet service in rural areas. The 2001 Agriculture Appropriations Act authorized a pilot program that would support \$100 million in loans and \$2 million in grants for these services. These levels would be maintained in 2002. This program will narrow the gap in access for rural areas to the digital world of telecommunications.

The 2002 budget supports almost \$5.8 billion in loans and grants for rural housing. About \$4.2 billion of this amount is for loans for single-family housing, and will provide home-ownership opportunities for an estimated 56,000 rural families.

Rental assistance payments would be increased from \$679 million in 2001 to \$694 million in 2002. These payments are used to reduce the rents of the low-income occupants of USDA financed rental projects. The beneficiaries of this program have an average income below \$8,000. USDA maintains a portfolio of projects with about 430,000 units of housing for low-income families. This multifamily portfolio has an outstanding indebtedness of approximately \$12 billion. Rental assistance payments

serve the dual purpose of protecting USDA's investment in these projects, while keeping rents affordable for very low income families.

The budget supports a total of \$1.1 billion for rural business and cooperative programs. The biggest program in this area is our guaranteed loan program for business and industrial development. Subsidy costs for this program are rising largely because defaults are higher than expected. For this reason, the 2002 budget proposes that the fee charged for these loans be increased from 2 percent to 3.25 percent. This increased fee is consistent with what other lenders are charging and will permit us to provide a \$1 billion business and industry (B&I) guaranteed program.

The 2002 budget also discontinues funding for direct B&I loans. Direct loans were first introduced in 1997. Since then, demand has never reached the authorized loan level of \$50 million. Further, the subsidy rate has increased dramatically due to increased defaults. This indicates that the program is not achieving its goal to provide long-term, stable jobs in rural America.

RESEARCH, EDUCATION, AND ECONOMICS

To maintain and strengthen U.S. farmers' current competitive advantage in world markets will require investments in new technology. To meet these needs within a restrained budget, we must take a hard look at priorities.

The 2002 budget for this Mission Area totals \$2.1 billion including mandatory research grants. This is a reduction of 7 percent from 2001, but about the same level as provided in 2000. There are increases for selected programs and to cover pay costs. Proposed reductions are limited to earmarked projects and facility construction.

The 2002 research budget for the Agricultural Research Service is \$916 million, an increase of 2 percent above 2001. The budget includes \$15 million for work on bio-based products and bioenergy to overcome technical barriers to low-cost biomass conversion, \$12 million for additional work to prevent and control exotic diseases and pests with special emphasis on BSE, \$7.5 million to support work on biotechnology, including the development of databases and tools to store, analyze, and interpret genomics data for plants, animals, and microbes.

The 2002 budget request for the Department's extramural grants programs is nearly \$1 billion, a reduction of 12 percent from 2001 due almost entirely to discontinuing earmarked projects. Formula-based programs to the land grant university system are continued at the 2001 level. The \$544 million requested for these programs represents over one-half of the Cooperative State Research, Education, and Extension Service budget for 2002. The budget also proposes to maintain funding for the competitive National Research Initiative at the 2001 level of \$106 million and the Initiative for Future Agriculture and Food Systems at \$120 million.

DEPARTMENTAL MANAGEMENT

The Departmental staff offices provide leadership, coordination, and support for all administrative and policy functions of the Department. These offices are vital to USDA's success in providing effective customer service and efficient program delivery. Salaries and benefits often comprise 90 percent or more of these offices' budgets, leaving little flexibility to reduce other expenditures when salary costs increase. Thus, the 2002 budget proposes additional funding to cover pay costs, enabling these offices to maintain staffing levels needed to provide oversight and coordination for management initiatives and activities within the Department. The primary objective is to make the Department an efficient, effective, and discrimination-free organization that delivers the best return on the taxpayers' investments. In this area, we will be focusing on:

- Implementing a civil rights policy that affirms that discrimination will not be tolerated and that complaints will be resolved on a timely basis.
- Completing installation of the common computing environment in USDA local offices so that customers will have the ability to access information and download and file program applications and other forms electronically by the summer of 2002.
- Strengthening information security to safeguard the delivery of services over the Internet while protecting USDA information systems from costly hacker attacks.
- Implementing modern management systems to provide timely and reliable information on USDA's finances, people, and purchases.
- Continuing the renovation of the 70-year-old South Building in USDA's Washington complex to address safety and health hazards and enable access to modern technology.

The budget also includes \$71 million to maintain staffing levels for the Office of Inspector General (OIG). Public health and safety issues will continue to be a priority for OIG audits and investigations.

That concludes my statement. I am looking forward to working closely with the Committee on the 2002 budget so that we can better serve those who rely on USDA programs and services.

FOOT AND MOUTH DISEASE

Senator COCHRAN. Thank you very much, Madam Secretary. I think you have given a good overview of the budget request of the administration and emphasized a number of areas of concern in the general public's mind, and also here in the Congress. One, of course, that is at the top of the list, the foot and mouth disease issue. Recently I was reading in one of our major daily newspapers a story about the administration's assessment of the threat in terms of whether it was likely or not likely that we would see an outbreak of foot and mouth disease here in the U.S., and the headline said, administration fears outbreak is likely. I read the article and couldn't find anybody in there quoted as saying that. As a matter of fact, those who were quoted and who had statements attributed to them from the Department of Agriculture were saying that it was not likely. If you had had to write that headline, given the information that you have, would you have said that it's likely or not likely?

Secretary VENEMAN. I would not have said that it is likely. As I said in my statement, Mr. Chairman, we are doing everything that we can to assure that we protect against getting the disease, but at the same time, we are doing everything we can to make sure that in the event that we were to get any kind of outbreak, that we would be prepared to quickly respond and eradicate so that we would not have the situation, hopefully, that we have all seen in the U.K.

BUDGET REVISION

Senator COCHRAN. I know that the budget contains requests for research dollars at Plum Island, the New York facility that I think has the major responsibility for research in this area. Is the budget submission going to be revised in any way, given the instances of changes or new discoveries that are being made that would require more funds for any of the projects and programs that would deal with this problem?

Secretary VENEMAN. Well, as I indicated in my statement, we have added \$32 million to help us hire additional people to work at the ports, inspectors and so forth. That money has come from our user fee account. It will not require an additional appropriation.

In addition, we are continually reviewing our programs and looking at whether or not we need additional resources. If it is determined, we will come back to the committee to discuss those needs.

Senator COCHRAN. I think I can assure you for the committee that we would be responsive and quickly move to act on any supplemental request if you feel that that should be included. I know that we are going to have a supplemental submitted that will include the Department of Defense, and there may be other priority

areas for funding consideration. I think we would move quickly to include whatever is needed and justified.

FOOD SAFETY

In another area, food safety, the inspection of our own domestically produced processed foods, there has been a good deal of attention paid in recent years. Senator Durbin in his comments talked about the fact that more consolidation and streamlining needs to be done in this area, but in connection with the funding of the new programs that rely on emerging technologies to discover contamination in foodstuff that is processed here in our country. Do you think the budget that is submitted contains enough funding to guarantee that we will continue to have the safest and most wholesome food supply in the world?

Secretary VENEMAN. First I would simply start out by saying that we are very committed to the issue of food safety in the Department of Agriculture, and we take our responsibility in that regard very seriously.

As you know, we have the oversight responsibility for meat and poultry inspection in the USDA. A number of other food safety authorities are contained in the FDA. We have fully funded the projected number of inspectors that we believe will be needed over fiscal year 2002, and we have done that without proposing any user fees to do it, so we do believe that the Food Safety and Inspection Service is important, and will be funded at levels which will support it.

I might ask Steve Dewhurst to give you a little more specificity on the budget for FSIS.

Mr. DEWHURST. With respect to food safety, we spend about \$90 million a year in the Agricultural Research Service in the food safety area. We spend about \$35 million a year through the Cooperative State Research, Education, and Extension Service with the university system in food safety, and we are spending an increasing amount now, up to about \$6 million a year, in the Agricultural Marketing Service in testing products for residue and for contaminants. The overall food safety activities of the Department are funded in this budget in ways that do not reduce them from the prior year. It is a very substantial commitment.

There is an increase in the FSIS budget of about \$20 million. A large part of that is for the protection of the inspection workforce, but there is some money in the FSIS budget to improve their technical capability to identify residues in the meat supply. They have a scientific laboratory that will be upgraded in this budget.

Senator COCHRAN. Almost invariably, when we report a bill from this subcommittee and from the full committee to the floor of the Senate, there is a temptation for Senators to want to add money for all the good-sounding things, and food safety is one of them. We invariably see amendments well-argued to add money. That was one reason I wanted to ask the question, to be sure that we have in the bill sufficient funds to take care of the challenges and problems in this area. I do not think any Senator wants to undercut this program, or to underfund this program.

FOOD ASSISTANCE PROGRAMS

There is a similar concern in food and nutrition programs, too. We want to be sure that we fully fund the programs to feed those who are unable to provide for their own nutrition needs. I am talking about food for everything from the breakfast and lunch programs in our schools, to the food stamp program and the women and infants feeding program, all of which are very important. I notice in your statement you point out that \$36.6 billion is requested for funding those programs, and it reflects nearly half of the total amount requested in this entire bill, so I want to ask that question about those programs as well.

Are your requests adequate to take care of the anticipated needs in that program? You do have almost like a mandatory program, obligations to pay what somebody is entitled to under the food stamp program, so are you satisfied with the estimates, that this budget is based upon sound estimates of expected needs?

Secretary VENEMAN. I think they are based upon the estimates that have been traditionally used to determine food stamp needs, and we have fully funded what we anticipated the levels will be needed for food stamps. That is on the mandatory side of the budget. The WIC budget, which is on the discretionary side of the budget, shows an increase of \$94 million, for a total of \$4.1 billion, and we believe, that that will be adequate to fund the number of WIC desired participants for the fiscal year.

DISASTER ASSISTANCE

Senator COCHRAN. Last year, Congress ordered disaster assistance payments and economic loss payments made to distressed farmers because of drought conditions and other weather-related problems that production agriculture faced last year. We were late with some of those programs in that the regulations under which the funds were disbursed were late being drafted.

This was before you came into office, so it is not your fault, but the purpose of my inquiry right now is, have we gotten to the point now where we see the funds that have been appropriated by Congress for this purpose are being paid to farmers? Are there any further hangups or problems that we need to address in a supplemental way to deal with last year's declared emergencies?

Secretary VENEMAN. Senator, when we came to the Department there were a number of these regulations yet to be completed. As far as I know, I think we had all of those regulations completed within about 60 days. Most of the programs now that were authorized then, the payments are now in the process of being made under these programs.

Mr. DEWHURST. We made about \$3½ billion in payments against those programs and, of course, the key program, the crop loss payment program, was not capped in the legislation, so we can use whatever money is necessary to make those payments so we should be able to cover the needs in that area.

Secretary VENEMAN. Keith Collins has one additional point.

Mr. COLLINS. There is one program left that we are still working on, and that is the one that would pay farmers for quality losses as a result of last year. That is a very difficult one, because we

have to spend a fair amount of time figuring out what a quality loss is. That is the last of 15 or so major programs that the Farm Service Agency has to get out.

Senator COCHRAN. Of the moneys appropriated by Congress to be paid out, how much did we appropriate that has not been paid out? Do you know what that number is, and do you recommend a rescission or a deferment?

Mr. DEWHURST. Senator, direct assistance to farmers, the estimate was \$3,542 million. That was an estimate. We have paid about \$3½ billion so far. We have additional authority to put out additional money if we get valid claims under the crop loss disaster program, so essentially we can meet the need, and we have implemented the entire program.

Senator COCHRAN. Thank you.

Senator CRAIG.

Senator CRAIG. Thank you, Mr. Chairman.

POTATO WART

Secretary Veneman, I understand a letter has gone to the Canadians in relation to potato wart.

Secretary VENEMAN. Yes, Senator. Over the last several weeks we have been dealing with the Canadians on the issue of potato wart and the fact that it was found on Prince Edward Island.

There has been a lot of debate back and forth about what kind of measures would provide the level of protection that is needed to make sure that this disease does not spread from Prince Edward Island and the place where it was found to other parts of Canada and, indeed, into the U.S. Our scientists have been negotiating with Canada for a number of weeks on this issue.

We had our team of scientists come back together over the last week or 10 days and look at additional ways in which we might provide the level of protection we would need for potatoes to move off of Prince Edward Island to ensure that the risk of moving that disease was as small as possible. As a result of discussions that were held yesterday, the scientists have come to terms on an agreement that would allow movement from Prince Edward Island subject to meeting very stringent standards on cleanliness.

As you know, this disease is carried in the soil. Subject to the cleaning of the potatoes to stringent standards there would be allowance for these potatoes to move into other areas of Canada. In addition, potatoes for table use only could be moved into the United States if they are washed and what is called desprouted. We have discussed this with a number of scientists. They are satisfied that it provides the level of protection, and there will be a joint exchange of letters between the two countries finally resolving this issue for the 2000 year crop.

Senator CRAIG. So at least the scientists are jointly agreeing. The Canadians have not yet accepted, or is that joint agreement, that action an acceptance?

Secretary VENEMAN. The final documents are in the process of being drawn up as we speak. They may be completed by now.

EXPEDITED APPROVAL OF REQUESTS

Senator CRAIG. On March 7, the Idaho delegation submitted to you a request for the expedited approval of conservation reserve program, emergency haying, and grazing. The reason for that is severalfold. As you know, we are in a drought environment in the intermountain West as we speak, or the Pacific Northwest. That, coupled with about 1.3 million acres of land in Idaho that burned last year in the worst fire season ever, of which about 69,000 acres was private grazing, and of which about 37,000 acres cannot be grazed in 2001.

It is also true of a substantial number of public acres that can now not be grazed this year because of last year's fires. In addition, 227,000 acres of that land burned about—almost 200,000 cannot be grazed.

We believe that the emergency flexibility is necessary. We have got livestock men and women who are now ready to turn their cattle out onto the range, and some of them have no range to return to. We would hope that we could get your look at that right quickly and get a response to that request.

Secretary VENEMAN. We will expedite the review of this request. I know that there have been a number of emergency situations around the country where our FSA people in the field are reviewing requests, looking at the damage, and we will be looking at the emergency programs that might be applicable.

CHINA IMPORTATION OF POTATOES

Senator CRAIG. Last year also, I guess it was August 1, APHIS announced China was open to the importation of potatoes. I found it quite interesting that Alaska, a great potato-producing State, along with Washington and Oregon, were the only three States recognized. Idaho for some reason did not find its way onto that list. We would suggest that we do grow a few more potatoes in Idaho than they do in the Mattanuska Valley of Alaska, and so therefore it would be appropriate that we might appear on that list. We hope you would review that.

Secretary VENEMAN. We certainly will, Senator.

Senator CRAIG. Thank you much. My requests are simple ones.

Senator COCHRAN. Senator Durbin.

Senator DURBIN. Thanks, Mr. Chairman.

ENVIRONMENTAL PROTECTION AND CONSERVATION

Madam Secretary, I have noted in the budget in several areas relating to environmental protection and conservation that you are proposing to eliminate some programs that have been around for a while—the wetland reserve program, wildlife habitat incentives program, the environmental quality incentives program, and conservation reserve program. Senator Harkin I am sure will follow through on this.

Senator HARKIN. Do you want my chart?

Senator DURBIN. Thanks, Senator Harkin, for bringing our chart.

I would like to ask, Madam Secretary, at a time when farmers certainly across the Midwest are facing extreme difficulties in making a living, to the point where they are relying on the Federal

Government for more than half of their income, do we not run the risk, if we eliminate these environmental protection and conservation programs, that we will be giving at least a tacit approval to farmers planting land or using land that frankly is not in the best long-term interest of America?

These conservation programs I think are especially important when the economy is in a very difficult time for our farmers. Do we not run the risk, without these programs, of creating incentives, the wrong incentives for farmers to plant fragile land?

Secretary VENEMAN. Senator, first of all I would say that we take our environmental responsibilities in the Department very seriously, and we have a number of programs that assist farmers that are very beneficial to, as you say, protecting the land, because the farmers certainly have a vested interest in protecting the resources upon which they rely to produce their products.

A number of these programs that have been discussed—and I have been asked this question several times—have reached their authorized levels for funding under the last farm bill. We do not have any additional acres to enroll. I will ask Mr. Dewhurst to address the specifics of the budget for the programs that you mentioned.

Mr. DEWHURST. In the wetlands reserve program, the statutory limit on acreage is 1,075,000 acres. There was an increase approved by the Congress for this fiscal year to get to that number, and that additional acreage of 100,000 acres will be signed up this year. At that point we will be against the acreage limit, and so there is no authority in current law to add more acres.

In the wildlife habitat incentives program and the farmland protection program, there were cumulative funding limits in the farm bill for those programs, and we are against those limits.

In the conservation reserve program we have approximately 33 million acres in that program. We have a current statutory cap of 36½ million acres for that program. The budget assumes that we will have an additional sign-up in fiscal year 2002 to add those acres to the CRP program, and there is appropriated money requested in the budget for the Natural Resources Conservation Service to be sure that they can provide the technical assistance and support of that CRP sign-up, but beyond that, of course, there is no authority and therefore there is no proposal in the outyears.

Senator DURBIN. I thank you, and I thank you, Madam Secretary. I would have thought that it would have been sound policy for the administration to come forward and acknowledge the limits on authority, but also the backlog of applications on all of these programs that indicate a genuine interest by farmers and producers across America to set land aside that might otherwise cause environmental damage.

Instead what we have seen is kind of a closing of the door. Basically saying this is the end of the program as we see it. I will not dwell on that. If you would like to respond, I would be happy to allow it at this point, and then I would like to ask another question.

Secretary VENEMAN. Senator, I would not say it is a closing of the door. It is certainly a recognition of what the limits are, but secondly it is a recognition that we are going to be looking at—and

I say we, meaning the administration and the Congress are going to be looking at the farm bill for the year 2002. I have had discussions with many groups, with many people in Congress, there is a great interest in making sure that we address many of the environmental programs, that we look at new ways, new kinds of programs in the environmental areas, and we certainly look forward to working with you to look at new opportunities in that regard. Senator DURBIN. Thank you.

FOOD SAFETY

On the issue of food safety, I want to commend your decision on April 5. I do not know the background, and perhaps this is your first chance publicly to explain it. When you came to the testing of salmonella contamination for ground beef in the school lunch program, there was a posting on the USDA web site on March 30 to indicate that there would be an end to zero tolerance testing for salmonella in ground beef used in the school lunch program.

That sent a shock wave across the country, because people were very concerned that we might be compromising the safety of food for our children, some of the most vulnerable in our society, and there was really no explanation for it. I commend you again for announcing that you reversed the decision. I think at the time someone said it was made at a lower level and it never reached your office. Could you comment about how such an important decision could be made at that level, and what is your approach going to be when it comes to these issues of food safety in the school lunch program and other areas of jurisdiction?

Secretary VENEMAN. Well, as I said earlier, Senator, we take food safety issues very seriously. This issue is difficult to understand, because most people believe that it would have been a regulation. This actually was a contract standard for purchases of product for school lunch, and the contract standards were drawn up in the Agricultural Marketing Service rather than in the food safety or the nutrition areas. It was in the Agricultural Marketing Service, and they were looking at a different approach to the standard, which would have measured for a number of the microbiological indicators of salmonella but not the test result for salmonella itself.

I was unaware of that decision at the time it was posted on the web. When I was made aware of it we pulled it back and went back to the old contract. We are now reviewing that.

One of the other issues, of course, was that it did not have concurrence of all the parties who were interested in this issue, and so we pulled that back and we are now working with all of the interested parties to determine whether or not there is a common ground with regard to this issue that will provide a complete level of protection for our schoolchildren. This again was a contract standard. That is why it was done at the level of this.

Senator DURBIN. I do not want to jump ahead, but are you saying that the basic policy decision is still in play and still being considered that the Department may reach the same conclusion, or a slightly different conclusion? What is your hope in terms of outcome here?

Secretary VENEMAN. Well, what is being looked at is the overall contract standard for purchases of ground beef—making sure that

the contract standard has the greatest amount of protection that we can ask for in terms of a contract. We are looking at what fast food restaurants do in terms of what they demand, in terms of their suppliers, and we are looking as the customer of the product, and so we want to make sure that our contract standard is consistent with what we need to do, and what will provide the level of protection that we need for our children.

Senator DURBIN. Can families across this country be confident that when this is over that the standard we will use for ground beef and other food in the school lunch program will be at least as safe, if not safer, as that used by commercial entities across this country?

Secretary VENEMAN. Yes.

STARLINK

Senator DURBIN. Let me ask you about the biotech area. When it comes to StarLink, for example, I made an inquiry of the agencies that are involved in StarLink and was surprised to find a real lack of coordination. The USDA, the Food and Drug Administration, the EPA, all clear a biotech crop like StarLink, and I think you understand the contamination of StarLink has caused a great deal of economic loss and concern across America. I would like to ask you if you would consider, early in your administrations, looking to a coordination when it comes to this type of biotech product. I sense that there just is not enough communication, and I am fearful if we do not understand the implications of this, either from an economic or scientific perspective.

Secretary VENEMAN. Senator, I think that is a very important issue, and I agree with you. When I was in the Department in the late eighties, early nineties, the issue of biotech at that time was just how we were going to regulate it within the U.S. Government. At that time, there was very coordinated approach with FDA, EPA, and the USDA in terms of setting up the regulatory structure under which agricultural biotechnology would be regulated.

Since I have been back in the administration, of course, the StarLink issue has continued to be fairly significant. As you know, we had the issue of trying to get the seed out of the system for this year, and USDA agreed to purchase the seed that was in the hands of various distributors, but I will tell you that we also are increasing coordination all the time among these three agencies and among other agencies as well that have an interest, because so many of these issues now impact trade and other issues.

We have had, actually this week, a Cabinet-level coordinating meeting on these biotechnology issues and how we are going to move forward and work together on them, but I can assure you that we in the administration are working very closely together, recognizing that we need a very strong, coordinated system to deal with these issues.

GLOBAL FEEDING INITIATIVE

Senator DURBIN. Mr. Chairman, I would like to make two last comments and yield to my colleagues. I have worked with former Senators McGovern and Dole and my colleagues Senators Harkin and Leahy and Lugar and others on the feeding program, the inter-

national feeding program. The last administration by administrative decision moved money into this option that we could send some foodstuffs abroad, particularly for children, really focused on countries of greatest need, such as those that have been ravaged by the AIDS epidemic. We are going to be introducing formal legislation next week as a group on the Hill here, and I sincerely hope you will take a good look at this. I hope the administration can support this bipartisan effort.

WIC FUNDING

The last point that I will make, and then, of course, any closing comment I will leave to the Secretary. When it comes to WIC funding I have a concern. The concern is, although there is an increase in WIC funding in your budget, if we take the unemployment figures that have been projected by the administration for this year and look back to the history of the program as to the number of people who enroll in the program with that level of unemployment, then the amount of money that you are suggesting we appropriate this year will be inadequate.

For example, in 1998, when unemployment was at the same level as the administration is projecting for the year 2002, WIC participation averaged 7.37 million per month. As I understand it, your budget projects that only 7.2445 million women, infants, and children can be served with the current budget.

I would hope you will keep a close eye on this, because if we do not make a quick recovery and see higher unemployment, I think the demands in this program will grow, and we certainly want to make sure the nutritional needs of children and pregnant women are taken care of.

Secretary VENEMAN. We do—Senator, I do believe WIC is a very important program. I was surprised during my briefings yesterday to learn that almost 50 percent of the children born in this country have some kind of WIC assistance.

GLOBAL FEEDING INITIATIVE

As to the global feeding initiative, we have allocated \$300 million this year as a pilot program for that initiative. I am looking forward to meeting next week, I think, with Senator McGovern to further discuss this issue.

Senator DURBIN. Thank you very much. Thanks, Mr. Chairman.

Senator COCHRAN. Senator Dorgan.

Senator DORGAN. Thank you, Mr. Chairman, very much.

TRADE SANCTIONS

Again, Madam Secretary, welcome. Let me ask a number of questions in some policy areas. Number 1, you devoted a fair amount of your presentation to the issue of trade, opening foreign markets and so on. As you know, I have spent a great deal of time and in fact on this subcommittee offered amendments that became the subject of substantial controversy dealing with sanctions against other countries. That includes sanctions with respect to food and medicine. I am wondering if you have any information about this

administration's inclination of lifting especially food and medicine sanctions dealing with all countries, including Cuba.

Secretary VENEMAN. Senator, as you know, this administration has supported no new unilateral sanctions. I do not anticipate that the sanctions with regard to Cuba would be lifted at this point unless there was some kind of change in the structure of the Government there.

Senator DORGAN. But those of us in Congress will attempt to remove the impediment that was created last year in our legislative initiative. That impediment makes it appear as if there will be an opportunity to sell some food into the Cuban market, whereas, in fact, we will not be selling food into the Cuban market. My question is, for those of us who are attempting to remove that restriction, will the administration be supportive, or will it be opposing us?

Secretary VENEMAN. I have not talked recently with people to know exactly what the administration position is, but I can certainly reiterate that the position has been that they do not support any new unilateral sanctions.

Senator DORGAN. I understand. Would you make some inquiries and get back to me to let me know what we might expect.

Secretary VENEMAN. Certainly.

Senator DORGAN. I think it is immoral for this country, and I feel that with respect to any administration, to use food and medicine as weapons in the use of sanctions. I think it is not the right thing for this country, and it does not matter what other country we are talking about, it is not an endorsement of a foreign leader whose policies we have great problems with, or a foreign leader we may very well disrespect.

It has to do with sick, hungry, and poor people. When we impose sanctions that include food and medicine, especially food, we take aim at a dictator some place, and we end up hitting poor people, sick people, and hungry people, and we have to stop it. We know enough now to stop it.

So I am going to attempt once again to remove that roadblock, and I would hope for your support and the administration's support.

AGRICULTURAL RESEARCH

Let me ask a question or two about the issue of agricultural research. One of the top scientists at North Dakota State University told me on several occasions that we have had in recent years the fusarium head blight which is called scab. We have had the worst crop disease in a century in our State. The result is, we have had to rely on a robust amount of agricultural research at our research institutions to try to respond to it.

As you know, the President's budget calls for a cut of close to \$190 million in research related to education programs, which would result in curtailing or eliminating some of these programs and projects that are very important in agricultural research. Can you speak to that for a moment? It seems to me that this is ill-advised, and can you tell me some of the administration's thinking in the preparation of a budget that would cut that amount of money for research?

Secretary VENEMAN. The primary cuts in the research budget, as I understand it, are mandates that were put in the budget, and not proposed by the administration. I think it has been traditionally the way that the administration has proposed budgets, is that they have not put in those mandates, and I think those are the major cuts.

Senator DORGAN. Might I ask also your judgment about agricultural research? Would you not agree that at a time when we are trying to battle some pretty significant crop diseases, that we would want to maintain a robust agricultural research function?

Secretary VENEMAN. Absolutely. I think research is very important, and I think it is particularly important in the areas you are bringing up. Pest and disease prevention and eradication is very important, as we have talked about, the animal diseases we tend to deal with since we have been here. Crop diseases and pests are significant issues for American agriculture.

As I said in my opening statement, pest and disease prevention and eradication really are the infrastructure of what protects our agriculture in this country, and we need the research to support that.

I also think that we need to be targeting our research to address issues such as food safety, to address issues such as environmental issues that agriculture is facing, to look at new technologies, new uses, and alternative uses for agricultural products. So certainly research is important. In terms of biotechnology as well, we were talking earlier about some of the biotech issues, and so research in all of those areas are ones where we think our priority should be.

QUALITY LOSS PROGRAM

Senator DORGAN. Let me ask on the quality loss program which I helped create along with my colleagues on this subcommittee. This is the one area of help for family farmers that is not yet available and the payments for that have not yet gone out. Can you give us a timetable for that? When do you expect the quality loss program will be ready to provide some help to family farmers?

Secretary VENEMAN. I am going to have Mr. Collins address some of the issues on that program.

Mr. COLLINS. I regret I cannot give you a timetable as I sit here.

Senator DORGAN. Mr. Collins, I cannot hear you.

Mr. COLLINS. I regret that I cannot give you a timetable as I sit here at the moment. We continue to work on that. It is difficult, because we have to establish how we measure quality and what the benchmark of quality is. That is what the producer would have produced otherwise, but we are working on that very diligently. We have a team from all over the country that is working on that.

Senator DORGAN. But you can narrow it down. I mean, is it a week, a month, a year? I assume it is not a year.

Mr. COLLINS. It will not be a year.

Senator DORGAN. Are we within days or weeks of having this completed so that some payments can go out to farmers?

Mr. COLLINS. I cannot tell you the answer to that. It is certainly something that is the highest priority we have at the moment. It is the last of these 15 or so programs that we have been putting together.

Senator DORGAN. But somebody must have some notion. Are we within weeks, or is it going to be months? What is the objective?

Mr. COLLINS. As soon as possible, in the near term.

Senator DORGAN. But you are a trained economist.

Mr. COLLINS. I am, but I am not, unfortunately, writing this reg.

Senator DORGAN. But somebody is, and I am not trying to be confrontational, but somebody needs to give me some notion. Is this going to be within a month or so? What can farmers expect here? We have got a lot of them that are almost flat on their back, and they are into spring planting. The lenders do not have the foggiest notion what is going to happen this year with respect to a farm price support program.

Mr. COLLINS. I will tell you there are a number of particular problems with this that we are still working on, and I hope that we will finish them very shortly. One, for example, is hay. Hay is probably going to be the biggest commodity we deal with under this quality loss program. Hay has not been part of our crop disaster programs frequently in the past, and so we have got a lot of pioneering work to do here. I am not trying to equivocate. I am just telling you that we are working on this as diligently as we can. We understand the needs of American producers and we are going to get this out absolutely as soon as possible.

Senator DORGAN. Secretary Veneman, any comment on that?

Secretary VENEMAN. What I have been told is similar to what Mr. Collins has said. There have been some difficult issues with regard to this particular program. Because it is a pioneer program, we have never really dealt with this kind of calculation before, and it is not an easy thing to do. I would be happy to have our staff come and brief your staff on some of the issues we are encountering, if you would like that.

Senator DORGAN. Let me just say to you, I understand this is not a program without difficulty. I am just trying to get a sense on behalf of our producers out there what your goal might be in trying to sift through all of these difficulties.

Secretary VENEMAN. Our goal would have been to have it out within the 60 days that we got most of the other regs out, but because we cannot—our folks have not been able to work out the calculation on this. It has not been an easy one, and I frankly have not been given any timetable.

Mr. COLLINS. I would also mention, there is software development problems. I understand what you would like, Mr. Dorgan. We would like to be able to tell you. The problem is, if I tell you next week and we do not meet next week, then it creates a lot of difficulties.

Senator DORGAN. I understand why you are hedging, and you understand why I am asking, so we have reached a perfect balance here.

We actually have both studied economics, have we not?

Mr. COLLINS. Well then, we are very clear with one another.

Senator DORGAN. If I might, Mr. Chairman, do I have another moment to ask another question?

Senator COCHRAN. No more economic questions.

You go ahead.

Senator DORGAN. Let me quote Mr. Collins in testimony he provided recently. He said, a strong rebound—is it okay to quote an economist?

FARM PROGRAMS EMERGENCY FUNDING

Senator DORGAN. He said, a strong rebound in farm prices and income from the marketplace for major crops appears unlikely, at least over the next couple of years, in the absence of major global shortfall in crop production, and then he went on.

Given that testimony, I would ask Secretary Veneman, would it not be preferable to acknowledge now that we may have to provide some emergency funding in the farm program, rather than take the position well, let us just wait and see?

The problem is, all the farmers in this country, the family farmers who are relying on a farm program to help them through tough times and through collapsed prices are now going into spring planting after they have been to the bank. Neither they nor their banker have the foggiest idea what kind of assistance might be available this year outside of the Freedom to Farm bill, which in itself, as you know, is going to call for decreasing payments.

So would it not be better, given Mr. Collins' testimony that it is unlikely that we are going to see strength in the marketplace, would it not be better just to say to the farmers, look, the Secretary and the administration understand we are going to have to do something to provide some countercyclical help this year in the form of emergency help?

Secretary VENEMAN. Senator, this is an issue or a question we have certainly gotten many times and, as you know, when the President addressed the Congress, he set aside nearly \$1 trillion for emergencies, a savings account for the Government to deal with emergencies, and one of the emergencies he articulated that might be eligible for that savings account, that special, almost trillion-dollar fund, was agriculture.

As you know, the Congress has not really dealt with these emergency situations until August or September after they see what the crop looks like, after they see what the emergency really is, what the disasters are, and then the Congress has dealt with that.

The administration, because of the uncertainties of what the situation may be, what the emergency may be, has not at this point in time proposed any additional funding, but again, that nearly trillion-dollar reserve is available, and agriculture is one of the issues that will be considered as a part of that.

Senator DORGAN. That is an understandable position. I understand the rationale for making that judgment and saying what you said. But then, is it not also understandable for you to say, although we will not make that decision today, we want to send a signal to farmers across this country that if we have a tough crop, if we have collapsed prices through this fall, this administration stands prepared to work with Congress to develop an emergency fund and an emergency program?

The reason I ask that is, you have indicated in your speech recently there is no assurance of Federal help in the future, and that creates the uncertainty out there that people are concerned about. I am just wondering if there is a contingency fund, in fact- and

there is some dispute about whether that is not medicare trust funds, but if there is, in fact, a contingency fund, would you say to farmers today that if things remain as they are, prices are continued low, and we have the problems that we expect and Mr. Collins predicts, that the administration stands ready to work with the Congress on emergency help for farmers this year?

Secretary VENEMAN. Yes, and I think I said that I believe that there is certainly a good likelihood that we will see additional emergency assistance this year, and we certainly would stand ready to work with the Congress in that regard once we determine what the needs and the emergencies are.

Senator DORGAN. And be supportive of that?

Secretary VENEMAN. Yes.

Senator DORGAN. As I indicated when I made my opening statement, you have assumed a challenging job in challenging times. You and I could spend a lot of time, but I will not continue further, except to make one additional comment. There are a number of things where we would have disagreements.

RURAL TELEPHONE BANK

For example, the rural telephone bank, zeroing out that program I think is a mistake. Those of us who come from rural America and understand the need to avoid having a digital divide, and the need to especially have rural telephone companies play a significant role in the development of advanced telecommunications services all across the country know that we are going to need to rely on the rural telephone bank program. We are going to have to try to add back—I mean, I do not want to zero that out, so there are areas of disagreement.

I think we can have a discussion about them as we go along, and I would say, as I said when I started, my main concern here is family farms. Those families are living out there trying to make a go of it. This country will lose something very important if we do not get a program to help family farmers through tough times. The current farm program does not work. We have demonstrated that year after year, unfortunately, with emergency needs.

But, I hope to work with the chairman who, in the time that I have been on this subcommittee, has done an excellent job. He has worked with us as we go into conference to help provide some emergency help and has recognized what is going on in this country. We hope to be able to work with you to do that, Mr. Chairman.

Thank you very much.

Senator COCHRAN. Thank you, Senator Dorgan. I appreciate your kind comments, and I look forward to working with you and all the other members of this subcommittee to craft a bill that we can present to the full committee that will reflect the legitimate needs of production agriculture, and also reflects our concern for carrying out the responsibilities of law in a lot of other areas. We have mentioned a good many of them today.

Madam Secretary, my impression is that you are off to an excellent start as Secretary of Agriculture, and I commend you for the good job you are doing and the way you are going about trying to identify problems and find the right solutions and be a real leader in the Department of Agriculture.

I want to also let you know that you made the newspaper back in Jackson, Mississippi, today. This is your photograph, and it is a story that was released by the Delta Council up in Cleveland, Mississippi, saying that you would be the speaker at the group's annual meeting on May 24. That is really good judgment.

Secretary VENEMAN. As I recall, Senator, you made that request at my confirmation hearing.

Senator COCHRAN. It is very unique how this works out.

I hope you enjoy your trip to Mississippi and all goes well. I am sure it will.

Secretary VENEMAN. And I am taking my assistant, Hunt Shipman, with me.

Senator COCHRAN. Then you will not need a map of the local roadways if you have him along.

ADDITIONAL COMMITTEE QUESTIONS

There may be additional questions that will be submitted to the Secretary from members of the subcommittee, and we hope you will be able to respond to them in a reasonable time. Thanks again for participating and cooperating with our committee.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

ANIMAL PLANT HEALTH AND INSPECTION SERVICE (APHIS)

Question. What is the projected need for predator control funding for fiscal year 2002 for wolf activities in Wyoming, Idaho, and Montana? What is the projected need in Minnesota, Michigan, and Wisconsin?

Answer. The U.S. Fish and Wildlife Services—(FWS) gray wolf reintroduction in Wyoming (Yellowstone National Park) and Idaho has been so successful that wolf populations have expanded beyond original introduction site boundaries. From an original reintroduction of 66 wolves in 1995 and 1996, the FWS now estimates there are between 360–405 wolves in these two States. In addition, naturally occurring wolf populations in Montana have grown from an estimated 25–50 wolves in the early 1990s, to approximately 80 to 100 wolves today according to the FWS. In total, FWS estimates there are approximately 440–505 wolves in the Northern Rocky Mountain area and that the total number of wolves will triple in the next several years. APHIS received \$1,000,000 in fiscal year 2001 for predator/wolf control in Idaho, Montana, and Wyoming which we allocated equally among the three States. We are evaluating the impact of these expanding wolf populations and our ability to provide adequate service with the increased funding.

The Minnesota wolf population has steadily increased from approximately 1,200 wolves in 1979, found only in the remote northeastern parts of the State, to approximately 2,600 wolves now. This population increase has caused a significant southern expansion with a contiguous range now covering approximately 40 percent of the State. Wisconsin began to monitor the wolf populations in 1979, with an initial report of 25 animals. In the late 1980s, this population began to steadily increase and there are approximately 250 wolves now. In 1995, wolf discoveries occurred in areas south of the northern Wisconsin region. As wolves began to occupy northern Wisconsin, individual wolf observations occurred in the Upper Peninsula of Michigan. The FWS now estimates that approximately 200 wolves inhabit the Upper Peninsula. With such a large and ever expanding natural population of gray wolves, we have been addressing wolf impacts in Minnesota since the mid 1970s. The population growth and expanding range have resulted in wolves moving into Wisconsin and Michigan.

Question. What is the amount of funding in the baseline and the President's fiscal year 2002 budget request for the protection of sunflowers and rice from blackbirds?

Answer. The President's fiscal year 2002 budget request contains the following funding levels to protect sunflowers and rice from blackbirds (which are amounts

that the Congress appropriated in the form of directives in previous years): in fiscal year 1989, APHIS received \$368,000 for blackbird control in North Dakota and South Dakota; in fiscal year 1994, APHIS received \$50,000 for blackbird control in Arkansas, \$50,000 for blackbird control in Illinois, and \$120,000 for controlling blackbird damage to rice in Louisiana. APHIS commits these funds to Congressionally directed activities, such as the cattail management program in the Dakotas and to protect sprouting rice in Louisiana.

Question. APHIS has asked for comments on its notice in the Federal Register for protection of sunflowers from Red-Winged Blackbirds in North Dakota, South Dakota, and Minnesota. Should APHIS determine that lethal and non-lethal techniques will be used to control blackbirds, will the funding requested in the fiscal year 2002 budget suffice?

Answer. APHIS is evaluating the need to manage blackbird damage for the protection of sunflower crops. As part of that evaluation, APHIS personnel are conducting an environmental analysis of proposed actions which may include lethal control methods, non-lethal control methods, or a combination of both. Because of the range of issues that the public has raised through the public participation process, APHIS has decided to develop an environmental impact statement (EIS) to thoroughly analyze the issues and any proposed alternatives for managing the blackbird damage.

Question. As the budget for inspection has increased for animal welfare, has the agency seen an increased need for funding for enforcement and prosecution? If yes, at what amount does the fiscal year 2002 President's request fund enforcement and prosecution?

Answer. The increases in funding for Animal Care over the past couple of years and the resulting increase in the number of Animal Care Inspectors in the field will correlate with a need for more enforcement and prosecution. Fiscal year 2002, the President's request would fund enforcement and prosecution at \$6,601,000, an increase of \$352,000 over fiscal year 2001.

Question. Please provide information on the pilot project which was funded as a result of the provision in the fiscal year 2001 agriculture appropriations act which required a pilot project on development of non-lethal wildlife predation control methods in four states associated with livestock operations.

Answer. The Minnesota wolf population has steadily increased from approximately 1,200 wolves in 1979, found only in the remote northeastern parts of the State, to approximately 2,600 wolves now. This population increase has caused a significant southern expansion with a contiguous range now covering approximately 40 percent of the State. Wisconsin began to monitor for wolf populations in 1979, with an initial report of 25 animals. In the late 1980s, this population began to steadily increase and there are approximately 250 wolves now. In 1995, wolf discoveries occurred in areas south of the northern Wisconsin region. As wolves began to occupy northern Wisconsin, individual wolf observations occurred in the Upper Peninsula of Michigan. The U.S. Fish and Wildlife Service (FWS) now estimates that approximately 200 wolves inhabit the Upper Peninsula. With this expanding natural population of gray wolves, we have been addressing wolf impacts in Minnesota since the mid 1970s. The population growth and expanding range have resulted in wolves moving into Wisconsin and Michigan. As the wolf population increases, so does the number of depredation incidents against livestock. We project our responses to wolf complaints in Minnesota, Wisconsin, and Michigan will reach 289 during fiscal year 2001, a 26 percent increase since fiscal year 1999.

The FWS gray wolf reintroduction in Wyoming (Yellowstone National Park) and Idaho has been so successful that wolf populations have expanded beyond original introduction site boundaries. From an original reintroduction of 66 wolves in 1995 and 1996, the FWS now estimates there are between 360–405 wolves in these two States. In addition, naturally occurring wolf populations in Montana have grown from an estimated 25–50 wolves in the early 1990s, to approximately 80 to 100 wolves today according to the FWS. In total, FWS estimates there are 440–505 wolves in the Northern Rocky Mountain area and that the total number of wolves will triple in the next several years. APHIS—responsibility has increased significantly as a result of the wolf recovery efforts in Wyoming, Idaho, and Montana. We project our responses to wolf complaints in these States will reach 244 during fiscal year 2001, a 116 percent increase since fiscal year 1999. APHIS received \$1,000,000 in fiscal year 2001 for predator/wolf control in Idaho, Montana, and Wyoming which was allocated equally among the three States. We are evaluating the impact of these expanding wolf populations and our ability to provide adequate service with the increased funding.

Question. Please update the subcommittee on the status of the construction of the bison quarantine facility and the Environmental Impact Statement (EIS) that will be implemented by the National Park Service.

Answer. During calendar year 2000, APHIS, along with several other Federal Agencies, were involved in negotiations with the State of Montana to finalize a long term management plan for bison. The Record of Decision (RoD) on the EIS for bison management was released in December 2000. Since completion of the ROD, program officials have begun implementing the long term bison management plan. Among other items, the bison management plan includes increasing monitoring and surveillance of cattle in the area. Although the plan does not address the immediate need for a bison quarantine facility, it does allow for the consideration of this facility, if needed, at a later date. In the interim, program officials are using an APHIS funded and Montana operated capture facility in Horse Butte for the capture and sampling of bison.

While the plan is not intended to be a brucellosis eradication plan, it is intended to be a plan for the management of bison in the Greater Yellowstone Area (GYA) to prevent transmission of brucellosis from bison to cattle. Our next step will be working with the other Agencies to develop a plan for eliminating brucellosis from the bison and elk populations of the GYA.

Question. Please provide the amount requested (by line item) in the fiscal year 2002 President's budget for Foot and Mouth Disease.

Answer. APHIS has requested \$3,839,000 under the Foreign Animal Disease/Foot-and-Mouth Disease line item for fiscal year 2002. This request is for ongoing cooperative programs in Colombia, Mexico, and Panama.

Question. Please provide an update on the Texas and Michigan problems with bovine tuberculosis. What does the fiscal year 2002 President's budget request contain to address bovine tuberculosis (by line item)?

Answer. Of the 10 dairy herds currently located in the El Paso milkshed area, 2 are infected with tuberculosis. Most of these 10 herds have had recurring infections over the years. Only one herd has remained infection free. Recent studies have demonstrated a high probability that the recurrent infections in El Paso are linked to the high prevalence of tuberculosis in the dairies located near Juarez, Mexico. To address this problem, along with several others such as infection in wildlife, the Secretary of Agriculture declared an emergency in October 2000 and transferred \$54 million from the Commodity Credit Corporation (CCC). Congress appropriated an additional \$6 million towards this effort in the fiscal year 2001 Miscellaneous Appropriations Act. These funds will allow the Agency to implement a comprehensive bovine tuberculosis eradication plan which will include eliminating infected and high risk dairy herds in the El Paso milkshed area. By eliminating these herds, APHIS will create a buffer zone in the El Paso area to protect the U.S. cattle population. APHIS expects to begin eliminating these herds in August 2001. These funds have also allowed APHIS to address bovine tuberculosis in Michigan's wildlife population including enhanced surveillance in wildlife and domestic livestock, and depopulation. To date, close to 444,000 bison, cattle, and goats in Michigan have been tested for bovine tuberculosis. Twenty-seven of these animals (from 13 herds) were found to be disease positive. Of the 13 herds, 11 were depopulated and 2 are on the "test and remove plan". In the fiscal year 2002 President's Budget request, APHIS requests \$18.6 million to continue this effort.

Question. Has the new Administration revisited the Clinton Administration's recommended guidelines for the use of lost income compensation to control and eradicate emergency outbreaks of pests and diseases? Has the new administration solicited input from the authorizing committees, state government officials, and experts in academia and the private sector as recommended by the Chairman of the House Agricultural Appropriations?

Answer. We are reviewing the issue now and intend to work with the Office of Management and Budget to determine an appropriate position. Once we finish that review, we will share the position with the appropriate Members and Committees of the Congress.

Question. What amount does the President's fiscal year 2002 budget request contain for the National Poultry Improvement Plan (NPIP) for the National Veterinary Services Laboratories?

Answer. The President's fiscal year 2002 budget request contains \$744,000 for the National Poultry Improvement Plan (NPIP), of which \$497,000 is for diagnostic support at the National Veterinary Services Laboratory.

FOOD SAFETY AND INSPECTION SERVICE (FSIS)

Question. What level of funding will be spent on ratite and squab inspection in fiscal year 2001 and how much is budgeted for these activities for fiscal year 2002?

Answer. FSIS received \$2.5 million in its fiscal year 2001 appropriation to conduct mandatory ratite and squab inspection. The Agency implemented regulations governing this activity on April 26, 2001; mandatory inspection of both species commenced on that date. Costs associated with the development of the mandatory inspection regulation, and with inspection implementation itself, are estimated to be \$2.5 million in 2001 and 2002.

Question. Does the fiscal year 2002 budget request earmark FSIS dollars for the in-distribution program? How much?

Answer. The 2002 budget does not earmark dollars for an in-distribution program.

Question. What is the new Administration's philosophy regarding testing for E.coli 0157:H7 at the retail level? Does the Bush Administration plan to continue to test at the retail level or will it increase testing more in the distribution chain? Would more testing during the distribution help to discover the contaminated product sooner?

Answer. The Food Safety and Inspection Service plans to reassess its E. coli O157:H7 testing program. While this review is ongoing, the administration does not plan to make any changes in the current testing program and will wait for the results to determine how best to proceed on a scientifically sound basis.

Question. Does the new administration at the agency plan to work with the meat industry and retailers to minimize the risk of E.coli 0157:H7? If yes, how will the agency proceed?

Answer. Yes, we plan to work with all stakeholders to minimize the risk of E. coli O157:H7 and all pathogens found in meat and poultry. Industry has made several suggestions on changes that could be made to the Pathogen Reduction/HACCP rule as well changes to microbiological testing. Some of their suggestions will be discussed at the upcoming National Advisory Committee for Meat and Poultry Inspection in early June.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

Question. Why is there an undistributed amount of funding, \$2,776,188, for the Forestry Incentives Program for 2001?

Answer. The \$2,776,188 represents the carryover amount from the fiscal year 2000 Forestry Incentives Program activities. All monies have since been released to the states and no reserve is retained at the national level.

FARM SERVICE AGENCY (FSA)

Question. The President's fiscal year 2002 budget request proposes \$3 million for the state mediation program. The budget justification notes mention that 2 more states will be approved for participation in 2001. Which states are going to be approved? How much funding is needed to approve all of the pending applications?

Answer. Six states have either submitted or indicated that they would be submitting an application for certification. They are California, Colorado, Maine, New York, Mississippi and Tennessee. California was recently approved to participate in this program and decisions on approving the additional applications will be made soon.

The pending applications can be approved without additional funding. If they are approved, funding for fiscal year 2002 could be prorated.

AGRICULTURAL MARKETING SERVICE (AMS)

Question. Please update the committee on the implementation of the Microbiological Data Program (MDP). Are microbiologists involved in sampling, testing?

Answer. The Agricultural Marketing Service (AMS) has been involved in a number of activities in preparation for implementing the Microbiological Data Program (MDP). I have asked AMS to provide a status of their activities for the record.

[The information follows:]

AMS has established the infrastructure to implement MDP. AMS completed cooperative agreements with the ten participating States. These agreements delineate the responsibilities of AMS and the participating States regarding sampling, testing, reporting requirements, and quality assurance. The agreements, totaling \$4 million are with the agriculture departments of California, Colorado, Florida, Maryland, Michigan, New York, Ohio, Texas, Washington, Wisconsin, and the California Department of Pesticide Regulation (for sampling). All states will be testing samples

except for Maryland (samples shipped to Ohio) and Texas (samples shipped to AMS Eastern Laboratory).

The work plan for fiscal year 2001 was completed in cooperation with the Food and Drug Administration (FDA)/Center for Food Safety and Applied Nutrition (CFSAN) and the Centers for Disease Control (CDC). The plan requires the quantitative determination of *Escherichia coli*, as an indicator organism and the identification of *Salmonella* spp. The sampling design is based on the statistically reliable parameters employed by AMS' Pesticide Data Program (PDP). The number of source samples to be collected is based on State populations, ranging from 14 source samples in California to 2 in Wisconsin and Colorado, for a maximum of 62 source samples per month per commodity. Each source sample consists of 3 sub-samples. Samples are all collected within a state on the same day to create a testing set that meets the appropriate quality control requirements. The probability of selecting a site for sampling in a State is based on the volume of product at the site and was developed using the expertise of the National Agricultural Statistics Service. This sampling method will enable data users to make national inferences based on the data. All samples are collected aseptically, based on random selection at terminal markets and major distribution centers.

The system for sample collection and testing practices was placed in effect April 16 with collections of leaf and romaine lettuce as separate commodities. Domestic and imported tomatoes were added on May 1 and celery is scheduled for August 2001. The commodities were chosen for inclusion into MDP based on national consumption data in consultation with FDA and CDC. Standard Operating Procedures (SOP protocols) were developed for sampling, testing, and data reporting and are being tested during the first several weeks of sample collection. A final system should be in place by June. A proficiency testing system is also under development, slated for implementation later this fiscal year. A data system to handle electronic information transfer similar to the system in effect for PDP is under development, with segments to be developed by contract. An interim system for data transfer is in effect until a combined comprehensive PDP-MDP system is completed with state-of-the-art software design.

AMS established agreements with the Agricultural Research Service and Pennsylvania State University for serotyping of isolates and antibiotic resistance profiling as part of the baseline and research objectives of the Program.

AMS has four microbiologists assigned to handle SOP development and technical aspects of the program. In addition, the eight states engaged in daily testing activities have trained microbiologists and have developed expertise in microbial and pathogen determinations. AMS is also using the PDP sampling infrastructure and data transfer expertise in order to have consistent operation of both programs with the respective participating states.

Question. As part of the MDP, the Subcommittee understands that the data from this program will be made available to state public health agencies for food safety decision-making purposes. However, any premature or incorrect announcement by a public health official regarding microbiological information can prove to be a major setback to public health and economically harmful to the impacted industries. Has this issue been considered and what safeguards are in place in respect to this issue?

Answer. The Agricultural Marketing Service (AMS) has held discussions with the Food and Drug Administration (FDA) and participating States. The States will adhere to their current internal guidelines concerning actions regarding the confirmed determination of a pathogen. From the present testing requirements, this implies the determination of *Salmonella*. The FDA has requested data at three-month intervals for information purposes. These safeguards should avoid premature actions regarding pathogen determinations.

Question. Industry has applied to AMS for a petition to create a certification labeling program for "USA BEEF". When will this petition be accepted so that consumers will be able to purchase beef labeled "USA BEEF"?

Answer. At about the same time that industry groups petitioned the Department to create a process-verified program, "Beef: Made in the USA", a conference committee report was issued accompanying the Agricultural Appropriations Act of 2000. The conference committee report directs the Department to determine the best terms to use on labels to inform consumers that the beef products are U.S. products. The report stated that the lack of clarity regarding the definition of the terms "U.S. cattle" and "U.S. fresh beef products", hinders the ability of U.S. producers, who raise and handle cattle from birth to slaughter, to promote their products. At this time, an advanced notice of a proposed rulemaking is under consideration by the Department for addressing these issues. In light of these developments, the Department informed the industry coalition that sent the petition that the petition will not be addressed until the issues raised by Congress are addressed.

FOOD STAMP PROGRAM

Question. A USDA report dated January 2001, regarding the Food Stamp Program's Electronic Benefits Transfer (EBT) system, indicates that forty-one states, the District of Columbia, and Puerto Rico have operational food stamp EBT systems, and that thirty-nine of those systems are operating statewide. What is the current status of the nine states which had not completed the implementation of an EBT system as of the date of this report?

Answer. EBT is a high priority for the Department. EBT is expected to improve the efficiency of the program and help identify and control fraud. Thirteen State agencies (11 States, 2 Territories) did not have contracts for Statewide EBT implementation as of the last status report. These were California, Delaware, Guam, Indiana, Iowa, Maine, Mississippi, Montana, Nebraska, Nevada, Virginia, the Virgin Islands, and West Virginia. Although without Statewide EBT contracts, California and Iowa have EBT operations in limited areas.

Currently, Indiana, Nevada, and Virginia have approved contracts with Citicorp. Indiana began its pilot May 1, 2001. Nevada and Virginia are scheduled to begin pilot operations in October 2001. The remaining States/Territories—California, Guam, Iowa, Maine, Mississippi, Montana, Nebraska, the Virgin Islands, and West Virginia—are in some stage of planning or procurement for Statewide systems. However, there is a wide range of activity among these States and some are not likely to meet the October 2002 deadline unless they work aggressively to secure a contract for EBT implementation.

Delaware selected E-Funds as its EBT contractor but broke off negotiations when prices were significantly above the Federal cost cap. Delaware subsequently has asked for a waiver from the EBT mandate, citing excessive costs associated with EBT as the reason.

Question. Will all states have an operating EBT system by October 2002, as mandated by Welfare Reform?

Answer. EBT implementation is a high priority for the Department. The Food and Nutrition Service (FNS) continues to work towards the goal of Nationwide EBT by the October 2002 mandate and in particular, we are working with States that have obstacles to EBT implementation. However, State agencies without a contractual agreement in place very soon will have difficulties meeting the October 2002 deadline.

Delaware selected E-Funds as its EBT contractor but broke off negotiations when prices were significantly above the Federal cost cap. Delaware subsequently has asked for a waiver from the EBT mandate, citing excessive costs associated with EBT as the reason.

Other State problems include the lack of staff resources, budget constraints, insufficient infrastructure, the lack of technical expertise, competing priorities, and the sheer lack of time to complete implementation by October 2002.

Question. One projected benefit of the EBT system is the decreased possibility of fraud within the Food Stamp Program. An Associated Press article dated April 10, 2001, revealed that a New York food stamp recipient discovered an additional \$221,382 in her food stamp benefits account after making a purchase with her EBT card. What has been done recently to fight error and fraud within the entire Food Stamp Program, and specifically the EBT system?

Answer. The instance you cite of the overpaid recipient was, upon investigation, found to be an error in the retailer's point-of-sale device which caused an incorrect balance to print on the receipt. The incorrect amount was shown as a cash benefit to the recipient, not a food stamp benefit. Since then, steps have been taken to correct the error, however, at no time did the recipient actually have this amount in her account.

Overall, EBT has contributed to reducing fraud by creating an audit trail which helps pinpoint illegal transactions. It also allows recipients as well as retailers to be identified and sanctioned for trafficking violations using the transaction data. EBT States continue to expand their use of the data and to refine the techniques associated with analysis of transaction data.

In addition to these advantages of EBT, we continue to assist States in reducing the causes of overpayment and underpayment error, including identifying "best practices" by low error States. We are also expanding our use of the existing databases to identify and remove prisoners, deceased persons, and cases of duplicate participation from the rolls, and to follow up with sanctions and recoupment of overpayments, as necessary. Another tool in the collection of overpayments is the Treasury Offset Program (TOP), which is responsible for a growing percentage of total collections by intercepting tax refunds and other payments otherwise due the overpaid individual

Question. On December 27, 2000, the Food and Nutrition Service placed in the Federal Register a notice of availability of research grants to improve Food Stamp Program Access through Partnerships and New Technology. These competitively awarded grants would be 100 percent funded by the Federal Government with no matching requirement. How many of these grants have been awarded?

Answer. Fourteen grants have been awarded, totaling \$3.6 million.

Question. What have been the findings of the research projects funded by these grants?

Answer. As the program has only recently been initiated, it is too soon to report findings. However, grant recipients are required to submit periodic progress reports, and at the end of the two year grant period, final reports will be submitted assessing the impact of the grant projects.

Question. Does the Department support continued funding for these research grants?

Answer. The Department's 2002 request includes the base funding from which these grants were funded in 2001. A decision on how best to utilize these funds will be determined following the enactment of our appropriations for 2002, and will take into consideration the success of these activities to date, and other potential activities.

CHILD NUTRITION PROGRAMS

Question. The President's Budget suggests an increase of \$2,000,000 to enhance integrity in the National School Lunch Program (NSLP). How would this funding be used to enhance the integrity of the NSLP?

Answer. The \$2,000,000 requested would be used to improve the integrity of the NSLP by exploring potential improvements to the process used by schools and school districts to certify students for free and reduced price meals. FNS is seeking ways to provide these benefits to needy children without providing them to non-needy children, and doing so in a manner that is manageable for schools operating the NSLP.

FNS is operating a number of pilot projects designed to test alternative approaches to the existing NSLP application and verification process. The agency's current plan is to use a significant portion of the requested funding to collect information on income from a sample of parents whose children are in pilot schools, along with a sample of parents whose children are not in pilot schools, in order to provide an independent source of income data to compare to the application process. While this remains, in our judgment, the best option for using this funding to enhance NSLP integrity, USDA intends to continue to gather information from the pilots and other sources on this important issue. Our ongoing work with State officials and other Federal agencies continues to reveal new opportunities for system improvement. By the time of final appropriation, it may be more appropriate to focus these resources on activities that begin to address the issue operationally.

Question. What is the estimated cost of each activity?

Answer. The proposed income data collection analysis and reporting described above would cost roughly \$1.5 million, but could range as high as \$2.0 million. As noted previously, we intend to reassess our efforts as the pilot projects and other information-gathering continues, and consider using these funds for promising strategies to improve operations, as appropriate.

Question. The School Breakfast Pilot Program is now fully funded. Please provide the Subcommittee with an update on this pilot program.

Answer. Work on the pilot is progressing well. The six participating school districts were announced on May 15, 2000. Elementary schools within each school district were paired and randomly assigned to the control (regular School Breakfast Program) or treatment (universal-free breakfast program) group. Seventy control and 73 treatment school units are participating in this project.

Implementation of the universal-free breakfast program began in School Year 2000-2001. Five of the six selected school districts began implementation at the start of the school year; the sixth began implementing the universal-free breakfast program at the end of October, 2000.

The evaluation contractor, Abt Associates, Inc. a Cambridge, Massachusetts research firm, was competitively selected to conduct the evaluation, and the contract was awarded on June 26, 2000. Abt is currently collecting first-year implementation data in the six school districts. Data is being collected on about 30 students from each school for a total of 4,290 students. Student outcome measures include achievement test scores, cognitive performance scores, classroom behavior, attendance and dietary intakes. Program operations data, including implementation methods and operating costs, are also being collected.

Administrative data will be collected during School Years 2001–2002 and 2002–2003. Follow-up implementation data will also be collected during the third year of implementation (School Year 2002–2003). An interim project report will be available in Summer 2002, and the final report in Summer 2004.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN
(WIC)

Question. On December 11 of last year, President Clinton issued a memorandum on improving immunization rates for children at risk. In that memorandum, agencies were directed to “include a standardized procedure as part of the WIC certification process to evaluate the immunization status of every child applying for WIC services using a documented immunization history.” While the WIC program has served an appropriate role in child immunization screening and referral, a policy that might make WIC certification contingent on immunizations or require WIC clinics to evaluate and be held accountable for every participating child’s immunization status could prove too burdensome and impose potential troubling liability issues on WIC caseworkers. What is the status of USDA’s efforts to implement this Presidential directive?

Answer. As directed by the Executive Memorandum, USDA is working with the Centers for Disease Control and Prevention (CDC) to ensure that the actions outlined in the Presidential directive are taken in a manner “consistent with the mission” of each agency. A partnership consisting of USDA, CDC, the National Association of WIC Directors, American Academy of Pediatrics (AAP), Association of State and Territorial Health Officials, Association of Immunization Managers, and Every Child By Two is providing guidance and assistance to implement current and future WIC immunization linkages to meet the directives of the Executive Memorandum.

A draft policy memorandum, written in collaboration with partners, was distributed to partners and State WIC agencies for comment in February 2001. The policy memorandum outlined procedures for immunization screening and referral in the WIC Program, as directed by the Executive Memorandum. In response to comments, the policy memorandum is being redrafted and will be issued in June 2001. The policy memorandum makes it clear that (1) WIC certification is not contingent on immunization status or the attainment of immunization records, and (2) as an adjunct to health services, the WIC Program’s role in immunization screening and referral is to support existing funded immunization activities. Increased WIC involvement in immunization screening and referral should not result in reduced efforts or costs incurred for immunization services and programs that have primary responsibility in this area.

The policy memorandum includes a minimum screening protocol, developed in conjunction with CDC and AAP, specifically for use in WIC Programs where children are not screened and referred for immunizations by other means. The purpose of the minimum screening protocol is to identify children who may be at risk for under immunization. It is not meant to fully assess a child’s immunization status, but allows WIC to effectively fulfill its role as an adjunct to health care by ensuring that children who are at risk are referred for appropriate care. In State or local areas with documented vaccination coverage rates 90 percent or greater in WIC children by 24 months of age, there will be no requirement to implement the procedures set forth in the policy memorandum.

Through a “Dear Colleague” letter to its State immunization program grantees, CDC will ensure that Immunization Programs coordinate with WIC to provide the following: cooperative planning and budgeting that supports WIC screening and referral; adequate and appropriate referral information and networks; training of WIC staff; and other activities necessary to ensure that a comprehensive screening and referral system is in place that supplements WIC’s limited role and responsibility in this area.

Question. What is the status of the Department’s efforts to seek reimbursement from other agencies for health care services provided through the WIC program?

Answer. A partnership consisting of USDA, Centers for Disease Control and Prevention, National Association of WIC Directors, American Academy of Pediatrics, Association of State and Territorial Health Officials, Association of Immunization Managers, and Every Child By Two is finalizing a National strategic plan to improve immunization coverage rates of children participating in WIC. One of the goals of the strategic plan is to obtain adequate funding and/or reimbursement for WIC immunization activities so that WIC funds and staff time available for nutrition services are not reduced.

The Food and Nutrition Service (FNS) issued a WIC Cost Allocation Guide in November 1999 as a resource for WIC State and local staff. The guide describes accept-

able methods to ensure that a State or local agency's WIC Program grant or subgrant is only charged for WIC's fair share of allowable costs.

Question. The fiscal year 2002 budget requests continued funding for WIC electronic benefit transfer (EBT) systems. What is the status of WIC EBT efforts? What has been accomplished with the additional funding provided for this purpose for fiscal year 2001?

Answer. Currently, there are 14 WIC State agencies at various stages of planning, developing, and implementing EBT systems. This includes 1 State agency that has nearly completed statewide roll-out, 3 States with operational EBT pilot systems, 2 States preparing to launch pilots before the end of 2001, 2 States preparing to launch pilots in 2002, and 6 States preparing to launch pilots in 2003. Fiscal year 2001 funds for WIC EBT will be used for up-front development costs, and will be awarded through a competitive grant proposal and evaluation process to WIC State agencies that have made significant progress toward implementing EBT systems.

Question. What is the status of the draft proposed rule on the WIC food prescription (package)?

Answer. The Department has drafted and entered into clearance a proposed rule addressing changes in the WIC food packages. The rule is currently awaiting review by policy officials of the Bush Administration.

Question. What is the status of the scientific examination of the WIC food prescription anticipated to be undertaken under the auspices of USDA's Western Human Nutrition Research Center?

Answer. Further work on this project was suspended pending policy review by the Bush administration. Before continuing the study, the new team needs to determine the extent to which the study can and will fill the scientific gaps. We will be taking a look at this when we are fully staffed.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE FEDERAL
ADMINISTRATION AND SPECIAL RESEARCH GRANTS

Question. Please provide a description of the research that has been funded under the Federal administration/special research grant.

Answer. Sent to the Senate under separate cover.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research. (For extension activities: What is the national, regional, or local need for this project?)

Answer. Sent to the Senate under separate cover.

Question. What was the original goal of the research and what has been accomplished to date? (For extension activities: What was the original goal of this program and what has been accomplished to date?)

Answer. Sent to the Senate under separate cover.

Question. How long has this work been underway, and how much has been appropriated, by fiscal year through fiscal year 2001, for this work?

Answer. Sent to the Senate under separate cover.

Question. What is the source and amount of non-Federal funds provided, by fiscal year?

Answer. Sent to the Senate under separate cover.

Question. Where is the work being carried out?

Answer. Sent to the Senate under separate cover.

Question. What was the anticipated completion date of the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Sent to the Senate under separate cover.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Sent to the Senate under separate cover.

COOPERATIVE STATE, RESEARCH, EDUCATION, AND EXTENSION SERVICE SUSTAINABLE
AGRICULTURE RESEARCH

Question. For fiscal year 2002, the Congress provided increased funding for sustainable agriculture to focus on organic farming to serve an expanding and increasingly active constituency of producers and consumers. Can you give the Committee an update on this new initiative?

Answer. The increase in fiscal year 2001 funding over fiscal year 2000 for the Sustainable Agriculture Research and Education, SARE, program has been used for a range of high-priority projects in accordance with the guidance from the Senate appropriations report, which stated, in response to the targeting of the SARE increase to organic agriculture in the fiscal year 2001 President's Budget:

“Increased funds provided for sustainable agriculture research and education should include, but in no way be limited to, projects on organic agriculture. While organic production practices are included under the umbrella of sustainable agriculture, it is critical that funding increases be directed also to research on broader sustainable agriculture production systems and practices. The Committee also directs the Department to allocate a portion of funding increases to on-farm demonstration and producer-research projects.”

The increased funds are being used to support some projects in organic agriculture, particularly in the SARE southern region, which established organic agriculture as one of five priority areas for fiscal year 2001 competitive grants, and which held a region-wide training conference on organic agriculture for Extension and other agricultural professionals. Competitive grant projects in other regions that could not have been supported, had fiscal year 2001 funding not increased, include several on crop and market diversification in both field crops and specialty crops, sustainable production of crops including cotton and tomatoes, several projects in the Pacific Islands, and a project to encourage farmer-directed research and networking.

Increased support of on-farm, producer-led research is taking place not only through the last project noted above, but also through increased allocations toward producer grants in each region, either in fiscal year 2001 or planned for fiscal year 2002. In addition, the SARE Northeast region is allocating SARE Professional Development Program—Extension—funds to increasing the interaction of Extension and other agricultural professionals with producers engaged in SARE-sponsored on-farm research, and the SARE Southern region is piloting a program of on-farm research grants targeted at Extension agents and other agency and private-non-profit personnel who work closely with farmers in on-farm research.

Other uses of the increased Extension funds in the SARE Professional Development Program include a partnership with the Extension Indian Reservation Program to enhance sustainable agriculture professional development with Native American communities, and competitive grant projects on a range of professional development topics ranging from assisting private landowners with resource-conserving management practices, to producing and marketing ethnic and specialty vegetables. Additional resources are also being targeted to enhance program evaluation.

NATIVE AMERICAN INSTITUTIONS ENDOWMENT FUND

Question. Beginning in fiscal year 2001, 1994 Institutions were given the authority to use funds available from the Native American Institutions Endowment Fund to support facility infrastructure. How many of the 1994 Institutions have elected to use these funds for facility requirements?

Answer. The Conference Report states, “For the Native American Institutions Endowment Fund authorized by Public Law 103–382 (7 U.S.C. 301 note), \$7,100,100: Provided, That hereafter, any distribution of the adjusted income from the Native American Institutions Endowment Fund is authorized to be used for facility renovation, repair, construction, and maintenance, in addition to other authorized purposes.” The 1994 Institutions have expressed strong interest in using the adjusted income from the Native American Institutions Endowment Fund for facility requirements. The fiscal year 2001 adjusted income from the Endowment Fund will not be available until late in the year. Thus, these funds will be available for facility requirements after the end of fiscal year 2001 and beyond.

1890 LAND-GRANT INSTITUTIONS

Question. Provide a list, by 1890 Institution, of the renovation and construction projects funded in fiscal year 1999 and fiscal year 2000, the funds provided for each, and the amount required in future years to complete the project.

Answer. Awards are made for the acquisition and improvement of agricultural and food sciences facilities and equipment, including libraries, so that the 1890 land-grant institutions and Tuskegee University may participate fully in the production of human capital in the food and agricultural sciences. These activities are ongoing and are proposed in a five-year plan of work. The table below indicates the past, current and proposed appropriations to complete activities under the current five-year plan of work.

[The information follows:]

1890 FACILITIES

| | Fiscal year— | | | | | Total |
|--|--------------|-----------|------------|------------|------------|-------------|
| | 1998 | 1999 | 2000 | 2001 | 2002 | |
| Alabama A&M University | \$403,755 | \$449,013 | \$666,710 | \$675,111 | \$675,111 | \$2,869,700 |

AGRICULTURE IN THE CLASSROOM

Question. Please provide a description of expanded outreach activities being financed with the additional funds provided for fiscal year 2001 for the Agriculture in the Classroom program.

Answer. The additional funding for fiscal year 2001 for the Agriculture in the Classroom program was exceptionally helpful in broadening the reach of the program across the Nation. New initiatives were chosen in close collaboration with the National Agriculture in the Classroom Consortium. Ongoing outreach activities that were strengthened include the annual Agriculture in the Classroom National Conference, the Agriculture in the Classroom web site, and catalyzing State Agriculture in the Classroom Directors to play a more active leadership role. The additional funding also served new outreach activities, as follows:

Four sets of teaching materials were developed to support the Listening to the Prairie education program developed by the Agency's Sustainable Agriculture Research and Extension staff in collaboration with the Smithsonian Institution. The Listening to the Prairie display will tour selected libraries throughout the Nation over the next two years. The teaching materials will be used by elementary, middle school, and high school teachers whose classes visit the traveling display.

Work was begun on the development of a comprehensive scientific and educational review of teaching materials and preparation of a Resource Guide for Agriculture in the Classroom Teachers. The Guide will reduce redundancy, increase the use of high quality teaching materials, and assure that teaching materials are scientifically sound, educationally appropriate, and meet new and enhanced State learning standards

Funds will be used in cooperation with the White House Office of Science and Technology Policy, and the Office of the Science and Technology Adviser to the Secretary of State to develop outreach activities for Global Science and Technology Week, May 6–12, 2001. To highlight the international nature of science and the importance of math and science education in today's era of globalization, a special edition of the "Agriculture in the Classroom Notes Newsletter" was prepared and distributed, a mobile science laboratory visited a Washington, DC elementary school,

career opportunities in the food and agricultural sciences were highlighted, and acknowledgment of the work of the Classroom teachers provided by a Nobel Laureate was distributed.

Funds were also committed to support education research to determine the effectiveness and impacts of Agriculture in the Classroom programs in five States. This work will determine characteristics of successful and effective programs, and will be used to further develop and strengthen Agriculture in the Classroom in states desiring to expand their programs.

RURAL HEALTH

Question. Please give the Committee an update on the Louisiana and Mississippi rural health projects.

Answer. The Rural Health and Safety Education Extension Project funds health and safety education in Mississippi and Louisiana. These programs are recruiting students to the health professions and promoting rural practice by new health care providers to mitigate health risk factors.

CURRENT ACTIVITIES

In Mississippi, the Mississippi State University Extension Service coordinates the Mississippi Rural Health Corps with the state's 15 community and junior colleges. The purpose of the endeavor is to improve rural health through the education of Mississippi residents and the training of health care professionals in rural practice. Various health and economic development related organizations, in the public and private sectors, have worked with the Corps in support of its goals.

A variety of educational outreach activities provide the foundation for this program. The cornerstone of the program, training of nurses and allied health professionals, provides scholarships/loans to students willing to commit themselves to a period of service in rural Mississippi upon graduation. In addition, health education, the development of community-based healthcare coalitions, the Rural Medical Scholars program, and the Rural Health Explorers program have been instrumental in strengthening the health sector of Mississippi. This program also works with the Mississippi Rural Health Association to improve the health status of rural Mississippians.

A Community College Network connects the state's community and junior colleges, the Mississippi Extension Service, and the University of Mississippi Medical School. This technology connects multiple sites to conduct administrative and educational activities.

The Nurse Managed Family Care Center program conducted by Southern University and A & M College addresses health promotion and disease prevention for vulnerable populations residing in rural and inner city communities in southern Louisiana. This program is a collaborative effort of the Extension Service and the School of Nursing at Southern University. Services offered include health assessments, health training, teaching, and other health-care professional referrals. The services are provided through a nurse-managed center in a non-traditional setting—center and a mobile health unit. The mobile unit serves persons in a 50-mile radius of the School of Nursing. Quality, cost-effective, community-based primary health care services are being offered where graduate nurse faculty, nursing students, and physicians located in community health outreach centers assist women, children, and the elderly in understanding and utilizing self-care health practices.

Services include: physical examinations, childhood vaccinations, height and weight, blood pressure, and vision screenings. Health education is provided to participants to enhance health promotion and disease prevention by increasing self-care capabilities. Health education topics include nutrition, safety, breast self-examination, dental health, hypertension, and diabetes.

ACCOMPLISHMENTS

In fiscal year 2000, 426 scholarship/loans were made to nursing and allied health professional students enrolled in the state's community college system and 6 loans were awarded to community college nursing faculty members seeking advanced degrees. The loan recipients must commit themselves to a period of service in rural Mississippi upon graduation. Project funds provide a portion of the faculty salaries for the Mississippi Rural Health Corps. Through health education, skills training programs reach youth, parents of young children, adults with chronic diseases, and elder caregivers. Annually, the health education programs reach 60,000 families. Youth have improved their decision making skills related to health issues and adults have learned how to deal effectively with emergencies and practice family

safety. The Corps has facilitated the formation of more than 30 community-based health care coalitions.

Two newer additions to the Mississippi program include the Rural Medical Scholars and the Rural Health Explorers programs for youth. The Rural Medical Scholars program works with high school students who have an interest in being physicians in rural Mississippi. Students participated in a 6-week residential experience at Mississippi State University. The students completed two pre-med courses, "shadowed" physicians, and attended a lecture series for aspiring physicians.

The Scholars program has been expanded to include a Rural Health Explorers component for high school students with a more general interest in health care careers. The Explorers take one course, either anatomy or physiology, tour hospitals, interact with health care professionals, and talk with community college representatives about academic requirements for health care careers.

In Louisiana, the Nurse Managed Family Health Care Center served 400 Head-start students. In addition, 250 clients received health screening, health teaching, follow-up and referral services.

This program provides clinical settings for faculty and students. In this setting, research is generated and students and faculty can test nursing theories and models of practice. This project has strived to develop culturally appropriate educational materials and delivery methods. Graduates of the nursing program are better prepared to work with vulnerable population groups and function effectively in a variety of rural and inner-city settings.

Funds Distribution

The Rural Health and Safety Education Extension Program is funded at \$2,517,329 for fiscal year 2001. The Mississippi Rural Health Corps—Mississippi State University Extension Service—program receives about \$2.1 million of the total. Funds under this project will be used for salaries/wages, fringe benefits, college scholarships/loans, the Rural Medical Scholars program, the Rural Health Explorers program, the Community College Network, and administrative costs such as equipment, materials and supplies, travel, and publication/printing costs.

The Southern University and A & M College Nurse Managed Family Health Care Center program receives about \$0.4 million. Funds under this project will be used for salaries/wages, fringe benefits, equipment, materials and supplies, travel, and publication/printing costs. Both projects show 100 percent match with non-Federal funds.

Question. With each case of food borne illness costing \$1,300 in medical expenditures and lost productivity it is easy to understand why food safety is seen as a top priority for the Cooperative State Research, Education, and Extension Service. Please provide a listing of the food safety research projects funded through the Special Grants, National Research Initiative, Fund for Rural America, and Initiative for Future Agriculture and Food Systems programs in each of fiscal years 1999, 2000, and 2001. Include a description of the research work and the cost of the research project?

Answer. The Food Safety Program is a competitive and special grant program that consists of several components. A list of projects grouped by component is provided for the record.

[The information follows:]

| Institute | Title | Amount |
|--|---|-------------|
| SPECIAL RESEARCH GRANTS—1999 | | |
| University of Arkansas; Iowa State University; Kansas State University | Animal Science Food Safety Consortium | \$1,423,047 |
| Kansas State University | Ecology of E-coli 0157:H7 in Beef Cow-Calf Operations from Ranch Through Feedlot | 198,347 |
| Iowa State University | Operation of Food Irradiator | 187,120 |
| University of Georgia | Alliance for Food Protection | 140,340 |
| The Pennsylvania State University | Milk Safety | 233,900 |
| SPECIAL RESEARCH GRANTS—2000 | | |

USDA EPSCOR

Question. Please provide a chart listing, by state, the number of proposals submitted to each of the USDA EPSCoR award areas, and the number of those proposals which received funding for each of the past three fiscal years.

Answer. A list of EPSCoR awards by state is provided under the National Research Initiative Competitive Grants Program—NRICGP.

[The information follows:]

ECONOMIC RESEARCH SERVICE

Question. In the President's budget an increase is requested to continue the retail meat purchase price reporting system in which a large portion of the increase is for data purchase from retailers. How do you plan on protecting the confidentiality of the retailers that the information is being purchased from?

Answer. Ensuring data confidentiality has been an important goal from the start of the project to collect retail scanner data. In order to reassure stores about the confidentiality of this process, the initial data collection and processing will be handled by a third-party contractor. Many stores now sell scanner data to market information firms who process the data and re-sell statistics to food and package-good manufacturing firms. This contractor will provide us with summary statistics, not individual store data. There will be no way to identify firm-level information from the data received from the third-party contractor. Information will be further analyzed and summarized before it is posted to the ERS website for public consumption.

Question. Can you elaborate on the development of additional information regarding retail price measurements and price transmissions between retail, wholesale, and the farm level.

Answer. The Mandatory Livestock Price Reporting Act of 1999 requires USDA to provide better information on the average prices paid for cuts of meat and the sales volume moving through grocery stores. Currently, the only public source of retail food prices is the Bureau of Labor Statistics (BLS). This information is limited and the efforts of the Economic Research Service will provide better price information on retail meats. According to ERS, the price reporting system will significantly improve the quality of price measurement at the retail level. We will know more about price transmissions from wholesalers to grocery stores, but at this point efforts are not focused on improving price data from the farm to wholesale level. Early research on price transmission should identify whether the new retail price data shows a different pattern of price adjustment than retail prices calculated using BLS procedures.

The present data-collection systems do a poor job of tracking meat products once they leave the wholesale level. Currently, we do not know how much meat goes to retail grocery stores versus other areas, such as food service or exports. According to ERS, the new process of using grocery store scanner data is designed to better capture the average price that consumers pay for meat cuts. For instance, BLS prices are recorded as of a particular point in time and no adjustments are made to prices for a variety of consumer discounts, which are captured through scanner data. Also, price data collected by BLS is not associated with quantities sold. Not only will the scanner data provide better data on meat prices, it will provide data on the weight and type of cuts of meat. Thus, the new process will weight the prices

by sales volume. Consumers are likely to buy less of a product when its price is high than when it is low. We expect that the average price paid for meat cuts will be lower using this method than the average price reported by BLS for meat cuts.

Question. Do you foresee any shortfalls in the implementation of this program if new funds are not provided.

Answer. Without new funding, we would be unable to purchase data and improvements to price reporting would be limited. The kind of data required to improve price reporting as intended by the Mandatory Price Reporting Act is available only from commercial sources. Commercial purchase of data on retail prices and quantities of variable weight meat products will be the largest part of the annual expenses—approximately \$1 million per year.

Question. For the past three years the Economic Research Service (ERS) has been given the responsibility to manage the research program for the nation's food assistance programs. With a \$3 million decrease in funds proposed in the fiscal year 2002 budget, how will this affect the ongoing research programs carried out by ERS and how will it affect full-time equivalent (FTE) personnel requirements?

Answer. The President's budget for fiscal 2002 proposes to split the research funds with the Food and Nutrition Service (FNS) so that FNS can undertake necessary short-term programmatic information collections, policy studies and budget analyses. FNS studies are highly targeted and typically address a narrow program or policy related issue that are best handled by the program agency. This change will not affect ERS staffing because those researchers who would have been monitoring outside contracts will be redirected to high priority internally conducted research.

Question. Will there be a need to improve coordination between the Economic Research Service and the Food and Nutrition Service given the proposed sharing of research program monies?

Answer. While there will continue to be a need to closely coordinate research between the two agencies, we anticipate that this split will actually reduce the especially high degree of coordination needed for the short-term, highly programmatic studies that are currently being directed by the Economic Research Service.

Question. How does ERS prioritize the research projects it conducts for other USDA agencies and other organizations with the agency's normal workload?

Answer. In developing its research program, ERS attempts to anticipate the program and policy issues that USDA agencies will likely have to confront in the near future. ERS also seeks input from a broad constituency of policy officials, researchers, practitioners, advocates, industry groups, and service providers, and hosts a series of round-table discussions with representatives of these constituents to identify crucial research and policy information needs.

Question. What are the research priority areas for fiscal year 2002?

Answer. In general, ERS priorities include, among others, improving our understanding of the effects of trade agreements on agricultural markets, improving the effectiveness of policies designed to ensure a safe food supply, assessing the impacts of alternative farm production management systems and analyzing market trends for genetically modified crops. I will have ERS supply more specific information for the record.

[The information follows:]

Assessing the adaptation of the U.S. food and agricultural sector to changing market structure and post-WTO and post-NAFTA trade conditions. This includes analyzing factors that drive change in the structure and performance of domestic and global food and agriculture markets, and analyzing how global environmental change, international trade agreements, and foreign trade restrictions affect U.S. agricultural production, exports, imports, and income. A critical component of analysis of the implications of rapid structural change in food and agricultural markets is the ERS request for funding to improve the price reporting of meat products.

Building the analytical and empirical base for improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food. This includes analyzing the benefits of safer food, such as reducing direct medical costs and indirect costs associated with productivity losses from foodborne illnesses caused by microbial pathogens, and estimating the costs of alternative food safety policies.

Analyzing factors affecting dietary changes and trends in America's eating habits, including impacts on agricultural producers and the structure of the food industry, and providing economic evaluations of nutrition and food assistance programs, such as factors determining changes in Food Stamp program participation. The three research emphases for food assistance and nutrition studies conducted under the Food Assistance and Nutrition Research Program (FANRP) are diet and nutrition out-

comes, food program targeting and delivery, and program dynamics and administration.

Assessing the profitability and environmental impacts of alternative farm production management systems, including the cost-effectiveness and equity dimensions of public sector conservation policies and programs. ERS is also putting increased priority on understanding and analyzing trends in adoption of genetically modified crops and the emergence of markets for both genetically modified and non-genetically modified commodities.

Identifying how investments, technology, employment opportunities and job training, Federal policies, and demographic trends affect rural America's capacity to prosper in the global marketplace. This includes analysis of rural financial markets and how the availability of Federal credit, public spending, taxes, and regulations influence rural economic development.

Conducting the economic analysis required to support litigation of the Pigford Consent Decree which is from a class action lawsuit that alleges racial discrimination of USDA farm loan and benefit programs. ERS' role, for which it is requesting an increase of 600,000 is to generate an objective estimate of economic damages in each particular case using a consistent, understandable, and defensible methodology that is based on standardized farm accounting procedures.

Question. How much ERS research is conducted in-house and how much is contracted out?

Answer. The ERS research program is predominantly an in-house program supplemented with a number of small cooperative agreements with land-grant university researchers, with the exception of the food assistance research program. Currently, about 80 percent of the food assistance research is conducted outside the agency and 20 percent is conducted in-house.

AGRICULTURE RESEARCH

Question. What is the specific program rationale for terminating the following research projects being carried out by the Agricultural Research Service?

| | |
|------------------------------|-----------|
| Bioinformatics | \$474,000 |
| Biobased technology | 284,000 |
| Biomass-based energy | 900,000 |
| Citrus canker | 4,740,000 |
| Citrus tristeza | 740,000 |
| Exotic pest diseases | 1,247,000 |
| Pierce's Disease | 1,896,000 |
| Avian Leukosis—J Virus | 250,000 |
| Fusarium Head Blight | 798,200 |

The Committee notes that these research initiatives are budgeted also as increases in the fiscal year 2002 request.

Answer. The first seven items on the list are Special Research Grants funded under CSREES. No funding is proposed for these Special Research Grants in the fiscal year 2002 Cooperative State Research, Education, and Extension Service budget request. This action is consistent with the Administration's belief that the most effective use of taxpayer dollars is through competitively-awarded, peer-reviewed grants that meet National goals. Alternate funding from formula programs, State and local governments, and private sources could be used to support aspects of this program deemed to be of a priority at State and/or local levels.

The last two items on the list are Agricultural Research Service projects. A Congressional program increase of \$249,450 for research on avian leukosis J virus (an emerging virus infection that causes cancer-like-disease and production problems in chickens) was approved in fiscal year 2001. This increase was not included in the President's Budget for fiscal year 2002. Plans are to use available resources on research issues of higher national priority. ARS does, however, have an ongoing research program on avian retroviruses including avian leukosis J virus at the ARS Avian Diseases and Oncology Laboratory in East Lansing, Michigan. This ongoing research program will continue to provide necessary research information that will help the poultry industry in their efforts to control this important disease.

A Congressional program increase of \$798,200 for research on Fusarium Head Blight was approved in fiscal year 2001. This increase was not included in the President's Budget for fiscal year 2002. Plans are to use these available resources on research issues of higher national priority.

Question. What is the status of each of the ARS projects funded for fiscal year 2001? In many cases, ARS is to hire scientists to implement the research required under the Act. By project, what is the status of hiring new scientists?

Answer. ARS plans to hire approximately 100 additional scientists in order to implement increases provided in 2001 for budget initiatives and new projects established by Congress. The status of new ARS scientists being hired due to all fiscal year 2001 increases is provided for the record.

[The information follows:]

STATUS OF SY RECRUITMENT

[Fiscal Year 2001 Increase]

| Location | Job title | Recruitment status |
|------------------------------|---|---|
| Ithaca, NY | Cat 4 Bioinformatics | Certificate issued 5/8/01. |
| Leetown, WV | Research Geneticist (Animal) | Vacancy announcement closed 3/20/01. |
| Wyndmoor, PA | Chemist/Food Technologist | Position description is being finalized; Selection has been made. |
| Beltsville, MD ANRI/FTSL | Microbiologist/Food Technologist | Vacancy announcement closes 6/11/01. |
| Beltsville, ANRI/FTSL | MD Microbiologist/Food Technologist | Vacancy announcement closes 6/25/01. |
| Beltsville, MD ANRI/ISL | Agricultural Engineer | Completed. Filled by internal reassignment Biomed. Eng. |
| Wyndmoor, PA | Research Chemist | Readvertisement closed 4/19/01; Certificate issued 4/24/01. |
| Beltsville, MD ANRI/AMBL | Research Chemist | NPS disapproved proposed position Description 5/8/01. Supervisor is Making changes. |
| Plum Island, NY | VMO and Microbiologist | Tentative effective date of 7/10/01. Microbiologist. Action pending. |
| Montpellier, France | Entomologist | Position description being prepared. |
| Beltsville, MD PSI/CAIBL | Research Chemist | Recruitment action received. Selection made. |
| Leetown, WV | Research Physiologist | Certificate issued 4/4/01. |
| Orono, ME | Soil Scientist | Certificate issued 4/16/01. |
| University Park, PA | Soil Scientist/Agronomist | Recruitment action pending |
| Frederick, MD | Plant Pathologist | Certificate issued 5/7/01. |
| Kearneysville, WV | Plant Geneticist/Molecular Biologist/Plant Pathologist. | Certificates issued 4/16/01 and 5/9/01. |
| Beltsville, MD ANRI/PBSEL | Research Molecular Biologist | Vacancy announcement closed 5/7/01. |
| Ithaca, NY | Ecologist | Selection effective 2/11/01. |
| Beltsville, MD Nat'l Arb/F&N | Research Agronomist | Position moved to the National Arboretum. Supervisor is writing the position description. |
| Struttgart, AR | Research Fishery Biologist | Certificate issued 4/13/01. |
| Athens, GA | Veterinary Medical Officer | Student trainee to be converted (pending graduation) |
| New Orleans, LA | Agricultural Engineer | Recruitment action initiated. |
| Winter Haven, FL | Research Chemist | Closed 4/9/01; SME reviewing applications. |
| Auburn, AL | Molecular Biologist/Microbiologist | Selection made; EOD 6/3/01. |
| Miami, FL | Research Geneticist | Selection made; EOD 11/5/00. |
| Starkville, MS | Res. Plant Pathologist/Physiologist | Selection made; EOD 9/10/01. |
| Las Cruces, NM | Research Textile Technologist | Selection made; EOD 4/22/01. |
| Las Cruces, NM | Agricultural Mechanical Engineer | Certificate issued 3/28/01. |
| Booneville, AR | Research Animal Scientist | Drafting vacancy announcement |
| Athens, GA | Res. Food Tech/Agricultural Engr. | Certificate issued 4/6/01. |
| Athens, GA | Res. Food Tech/Agricultural Engr. | Announcement closes 5/29/01. |
| College Station, TX | Microbiologist | Selection made; EOD 3/11/01. |
| Athens, GA | Microbiologist | Certificate issued 2/26/01; interviews being conducted. |
| Lubbock, TX | Microbiologist | Certificate issued 4/13/01. |
| Athens, GA | Research Physiologist | Certificate issued 4/6/01. |
| Athens, GA | Res. Plant Pathologist/Microbiologist | Closed 3/26/01; SME reviewing applications. |
| Little Rock, AR | Immunologist | Closed 5/25/01. |
| Florence, SC | Soil Scientist | Selection made; EOD 4/22/01. |
| Gainesville, FL | Research Entomologist | Certificate issued 3/30/01. |
| Auburn, AL | Soil Scientist/Res. Agon./Res. Hydr | Readvertised; Closed 4/30/01; Certificate issued 5/11/01. |
| Stoneville, MS | Res. Geneticist/Animal Scientist | Selection made; EOD pending receipt Of PhD in September 2001. |

STATUS OF SY RECRUITMENT—Continued

| Ft. Collins, CO | Weed Sci./Ecologist | Vacancy reannounced. Closed 6/11/01. |
| Sidney, MT | Entom./Weed Sci. | Recruitment pending. |
| Grand Forks, ND | Geneticist | No recruitment action initiated. |

Question. Describe current research and funding for Foot-and-Mouth Disease (FMD). What are your priority research issues? What progress has been made to date on each research project?

Answer. Current ARS research priorities are: 1) development of highly specific and rapid diagnostic technology, and 2) development of a vaccine that can be deployed in case of an outbreak. The current ARS funding for the Foot-and-Mouth Dis-

ease research program is \$5,230,800. ARS has developed and is currently validating a highly specific nucleic acid on-site detection technology that allows minimally trained personnel using a briefcase-sized device to definitively identify FMD virus on the farm within an hour. This on-site technology can also be adapted to screen imported carcasses for animals that have been previously infected with FMD and also for animals that have been vaccinated against the disease. ARS will test two promising vaccine candidates. The first is a synthetic peptide vaccine produced by a company on Long Island, New York. The technology is based on research conducted by ARS scientists at Plum Island Animal Disease Center (PIADC) over the past 20 years. The company indicates that this vaccine protects swine and has been selling the product in Taiwan and China. ARS is currently proposing to work with this company to examine the vaccine's protective ability for cattle and sheep and to determine if the virus is carried by vaccinated animals that were later exposed to infection. This peptide vaccine would be the only readily available product should the U.S. urgently need to vaccinate animals with a type of virus vaccine not present in the North American Vaccine Bank. The second candidate vaccine is an ARS-developed adenovirus vectored (genetically engineered) FMD vaccine that has been shown to protect swine in laboratory studies. This work will be extended to tests in cattle and sheep to determine if all species are protected. These vaccines differ in several features and need to be compared for efficacy, particularly for their ability to protect under outbreak conditions.

CSREES provides only limited funding for research directly focused on the virus itself through the National Research Initiative which must go to the ARS facility at Plum Island. In addition, CSREES has funded four additional projects related to FMD which are primarily focused on economic impacts of the disease and the evaluation of potential management response systems that might be employed in the event of an outbreak of FMD. Three of these projects are funded through Formula Funds—Hatch and Animal Health—and one with funds from the National Research Initiative. All of the projects are located at the University of California-Davis.

Question. How are U.S. Foot-and-Mouth Disease research, control and eradication activities coordinated with those of Great Britain, Canada and others? Have these countries applied the same technologies and strategies as would the U.S. under similar circumstances?

Answer. ARS research supports the regulatory activities of APHIS in control and eradication of FMD. ARS also has collaborative research with Great Britain and other nations. ARS is developing new rapid diagnostic capabilities to test for FMD and is working with Great Britain to evaluate the technology. ARS coordinates its vaccine research with APHIS priorities for vaccines. ARS conducts collaborative research with several nations that have endemic FMD including South Africa to develop new vaccines that can be produced in those nations.

APHIS coordinates its Foot-and-Mouth Disease program with many countries. The Agency has provided a support role to Great Britain during its most recent outbreak. In general, APHIS coordinates its animal health activities with other member countries of the International Organization of Epizootics (OIE). The OIE is the internationally recognized standard-setting body for diagnostic testing and vaccines. Through this organization, APHIS also helps to establish international guidelines for surveillance and monitoring. Great Britain and other members of the World Trade Organization abide by the standards of the OIE.

In the countries of the Western hemisphere, APHIS actively coordinates FMD research, control, and eradication activities. Mexico and the U.S. have had a joint commission since 1948, with an APHIS co-director stationed in Mexico City. APHIS also works closely with Canada through the North American Animal Health Committee. The two countries do test exercises and perform outbreak scenarios where they recently tested their vaccination programs. Mexico, Canada, and the U.S. share the North American Vaccine Bank, which contains many prevalent strains of FMD ready in the event of an outbreak in any of the three countries.

Due to the threat of FMD coming overland, APHIS maintains bilateral agreements with each country of Central America. In Panama, APHIS performs FMD laboratory testing, monitoring, and surveillance activities through the US-Panama Cooperative Program for the Prevention of Foot-and-Mouth Disease, with the goal of preventing outbreaks from coming in from Colombia.

In South America, where FMD is endemic, APHIS is involved in bilateral as well as regional programs to prevent FMD. APHIS has been working in Colombia on maintaining a barrier for FMD on the Panama-Colombia border. The Agency also supports the hemispheric plan, based on Bolivia, Brazil, Ecuador, Peru, and Venezuela working together to eradicate FMD. Eradicating FMD from the hemisphere would greatly reduce the risk of an outbreak in the United States.

Question. Should the U.S. find FMD within its borders next week, how would APHIS and other agencies utilize and deploy existing research detection and vaccine technologies? What actions would the U.S. implement?

Answer. If APHIS were to confirm an outbreak of FMD in the United States, APHIS would respond according to the Agency's FMD response plan. Because specific outbreak situations vary, and each State's emergency response capabilities differ, APHIS' FMD response plan is designed to be flexible and dynamic. APHIS' FMD response plan taps State and Federal resources as available, and allows the Agency's animal health expertise and coordination skills to fill any remaining gaps. After identification of disease subtype, APHIS would activate the FMD vaccine bank, order vaccine doses, and consider using the vaccine as a tool in our eradication effort. APHIS would also work with the Agricultural Research Service (ARS) to transfer technology from the laboratory which has been proven to be useful in our response effort, to the field. An example of this technology is the use of rapid detection tests.

Upon the initial confirmation of FMD, APHIS and State officials would immediately begin investigating the source and trace all animals that may have come into contact with the disease. These officials apprise both State and Federal officials on the status of their investigation and will also initiate emergency response efforts at the State and local level. These measures include notifying State agriculture and, if necessary, public health officials of the disease detection, securing the biosecurity of the affected site including depopulating the whole herd, establishing and maintaining animal movement quarantines, and alerting officials in neighboring States.

APHIS would expect to pay fair market value for all animals, products, or articles destroyed as part of an FMD eradication program. Additionally, the Agency would pay for certain directly associated costs like cleaning and disinfection of affected premises and care and feed for vaccinated animals until they are destroyed, should we employ that eradication tool. The basic principle is to ensure that owners do not have to incur out of pocket costs or suffer the loss of the value of their animals. The policy would cover animals, products, or articles we must destroy regardless of where we find them.

Question. Your budget recommends an increase of \$5 million for Bovine Spongiform Encephalopathy (BSE), or "Mad Cow Disease" which, to date, has had a devastating impact on Great Britain and Europe. Have USDA scientists been engaged in research collaboration with these countries concerning these outbreaks? What actions would the U.S. take under similar circumstances?

Answer. ARS has no research effort specifically targeted to the unique problem of Bovine Spongiform Encephalopathy (BSE). ARS scientists at the Animal Disease Research Unit (ADRU) in Pullman, Washington are currently collaborating with their counterparts at the National Center for Foreign Animal Disease, Winnipeg, Canada and the Veterinary Laboratories Agency in Weybridge, U.K. and USDA-APHIS to validate reagents that potentially can be used for BSE surveillance. These reagents, which bind to the causative agent of disease (prions), were developed from research to test for scrapie, a TSE disease of sheep directly related to BSE in cattle. This test, known as the third-eyelid-test, is the only practical live animal test for scrapie disease in sheep. At the Western Regional Research Center, Albany, California, ARS has initiated a research program to develop methods to detect for the presence of ruminant proteins and central nervous system (CNS) tissue in animal foods and feeds. Prohibition of feeding ruminant derived tissues to cattle is known to be an effective way of breaking the chain of transmission of BSE disease. If a TSE of cattle (BSE) were found in the U.S., slaughter and restriction on movement of ruminants and ruminant byproducts should be based on environmental monitoring as well as conventional epidemiology and diagnostics. USDA will provide the appropriate regulatory and action agencies, and the pharmaceutical industry the tools to identify and contain any potential exposure of humans to infectious materials.

The CSREES role in the instance of an outbreak of BSE would be to provide funding to scientists in various research centers, including Federal facilities to conduct needed research as determined by mutual consultation with ARS and APHIS.

Question. USDA/ARS is funding research on Transmissible Spongiform Encephalopathy (TSE). Where is this research conducted? How much is currently spent on TSE? Please describe these programs. Are there other TSEs which we are not funding? How much funding is required to put a meaningful TSE research program in effect?

Answer. ARS conducts Transmissible Spongiform Encephalopathy (TSE) research on scrapie in sheep, and chronic wasting disease (CWD) in deer and elk, both naturally occurring TSE diseases within the U.S. This research is conducted at the National Animal Disease Center (NADC) in Ames, Iowa, and the Animal Disease Re-

search Laboratories (ADRL) in Pullman, Washington. ARS funding for this research is currently \$2.6 million. The research programs focus on: (1) developing control measures for sheep scrapie and CWD through improved diagnostic tests, defining genetic (prion) susceptibility, and defining the routes of transmission through cells and secreted molecules; (2) developing and validating the nictating membrane biopsy (third-eyelid-test) for the preclinical diagnosis of scrapie in sheep; (3) determining if U.S. agents that cause Spongiform Encephalopathy in sheep and mule deer will cause a disease in cattle resembling BSE; (4) determining if the agent of CWD will cause scrapie in sheep; and (5) developing diagnostic methods that can detect TSE in live and dead animals. Currently, ARS has no research effort specifically targeted to the unique problem of Bovine Spongiform Encephalopathy (BSE) in cattle. The recently published report (May, 2001) from the ARS-BSE workshop indicated several critical research priorities that need to be immediately addressed in order to provide new tools for use in prevention and controls strategies to further reduce the risk of TSE diseases in the U.S. Current funding levels must be significantly increased in order to address these priorities. To initiate these research priorities is outlined in the agency's fiscal year 2002 budget includes an increase of \$5 million for BSE research.

The following table shows research and control funds for BSE and other TSEs, by agency.

UNITED STATES DEPARTMENT OF AGRICULTURE—TRANSMISSIBLE SPONGIFORM
ENCEPHALOPATHIES
[In thousands of dollars]

| | 2000 | 2001 Estimate | 2002 Budget |
|---|--------|---------------|-------------|
| Bovine Spongiform Encephalopathy: Research: Agricultural Research Service | 0 | 0 | 5,000 |
| Control: Animal and Plant Health Inspection Service | 78 | 78 | 78 |
| Other Transmissible Spongiform Encephalopathies: | | | |
| Research: | | | |
| Agricultural Research Service | 2,589 | 2,622 | 2,622 |
| Cooperative State Research, Education, and Extension Service | 325 | 388 | 294 |
| Control: Animal and Plant Health Inspection Service | 16,072 | 8,983 | 21,942 |
| Total, USDA TSEs | 19,064 | 12,071 | 29,936 |

Question. How does TSE and BSE differ? How much reliable information does the scientific community (here and abroad) have on BSE and TSE?

Answer. Transmissible spongiform encephalopathies (TSE's) are a family of progressive, degenerative, fatal neurological diseases that affect both animals and humans. TSE's take their name in-part from the brain lesions that these diseases cause, the lesions leaving the brain with numerous holes, giving the appearance similar to that of a sponge. The modified host protein or prion hypothesis is generally the accepted theory as regards to the nature of the infectious agents. The major animal forms of these diseases are bovine spongiform encephalopathy (BSE) in cattle, scrapie in sheep and goats, chronic wasting disease (CWD) in deer and elk, transmissible mink encephalopathy (TME), and feline spongiform encephalopathy (FSE), which is the expression of BSE in domestic cats. The human forms of these diseases are Creutzfeldt-Jacob disease (CJD), new-variant Creutzfeldt-Jacob disease (nvCJD) whose causative agent is indistinguishable from BSE, Gerstmann-Strausslaer-Scheinker syndrome (GSS) the familial form of CJD, fatal familial insomnia (FFI) an inherited TSE similar to familial CJD, and Kuru, a TSE restricted to the Fore people of New Guinea and spread by ritualistic cannibalism.

There has been considerable research effort by the scientific community to understand specific TSE's. Expert reports are available from the Council for Agricultural Science and Technology in the U.S. and the Ministry of Agriculture, Fisheries, and Food (MAFF) in the U.K. Kuru is now primarily of historical importance since cannibalism is prohibited. Although scrapie was first recognized in the U.K. and other Western countries more than 250 years ago, the means of natural transmission have still not been fully defined. It is thought to be spread most commonly from ewe to offspring and to other lambs through contact with the placenta and placental fluids. Studies have found no scientific evidence that scrapie poses a risk to human health. ARS has developed the first practical preclinical test for the disease. CWD was first

recognized in the U.S. in 1967. It naturally affects free ranging deer and Rocky Mountain elk. The origin of CWD and routes of transmission are not known. There is no reliable test for CWD in the live animal and post mortem testing involves the detection of the agent in the central nervous system. CWD is not a USDA program disease and legal tests for diagnosis of disease in clinical and preclinical deer and elk are not yet validated. BSE as a clinical disorder in cattle was first reported in the U.K. in 1986. BSE is thought to originate from contamination of feed by infectious material in meat and bone meal from rendered livestock. The infectious agent appears to be an infectious ruminant protein (Prp-sc) recycled through the rendering process. The BSE is thought to have originated in sheep and jumped the species barrier into cattle. A novel TSE of humans, nvCJD was reported in 1996. This disorder is believed to have arisen by ingestion of tissue or food products contaminated with the transmissible agent of BSE.

Despite research efforts there are still many critical questions and issues relative to TSE's. These include: determining the nature, structure and function of the TSE agents; what is the mechanism of transmission of TSE agents, and how does the species barrier to transmission of TSE's work; developing methods to detect and type TSE's both pre-clinically, postmortem, and in feeds and foods; how does TSE disease occur; how do host genetics influence TSE disease susceptibility; what is the epidemiology of TSE diseases; and can methods to inactivate the TSE agents be developed.

Question. Your budget proposes to define the nature, transmission, detection and diagnosis of BSE. Please describe in detail the planned implementation of the proposed research. Where will this research be done in the U.S.?

Answer. The ARS research implementation plan for BSE includes several projects. One set of projects is an integrated approach for improved detection of BSE and will be conducted at the ARS Animal Disease Research Unit (ADRU), Pullman, Washington and the Western Regional Research Center (WRRRC), Albany, California. ARS research will: (a) validate the gold standard assay for TSEs; (b) develop a system for differentiating the TSEs endemic to North American ruminants from BSE; (c) develop methods for real-time testing of cattle in slaughter facilities; and (d) develop methods for detecting PrP-TSE (prion proteins) in materials not intended for human food. The plan includes collaboration with the National Center for Foreign Animal Disease (NCFAD), Winnipeg, Canada, to test postmortem samples and validate the final reagent set and protocol. BSE test validation will include brain samples from cattle exhibiting neurologic signs and previously examined by histology and immunohistochemistry. The ARS laboratory in Pullman, WA is also collaborating with Colorado State and Wyoming State Veterinary Diagnostic Laboratories (CS-WSVDL) for PrP-TSE detection and pathology, CJD testing, and diagnostic methods development in brain tissue from deer and elk. The CS-WSVDL will assist in validation of a live-animal test for scrapie and a preclinical test diagnostic or slaughter test. ARS is collaborating with the University of Washington to develop rodent detection assays of infectivity and with Washington State University to develop specific reagents, monoclonal antibody to PrP-TSE.

Another set of ARS projects focuses on development and validation of detection methods for TSEs in live animals and will be conducted at the National Animal Disease Center (NADC), Ames, Iowa. ARS will also determine whether imported sheep were infected with BSE or another TSE. Research will be carried out in the Virus and Prion Diseases of Livestock Research Unit at NADC in collaboration with APHIS National Veterinary Services Laboratory, Ames, Iowa and Veterinary Laboratories Agency, Weybridge, U.K. The NADC is collaborating with the Veterinary Laboratories Agency (V L.A), Weybridge, U.K., using postmortem samples to validate the final reagent set and protocol. This collaboration will provide U.S. researchers access to otherwise unavailable infected cattle and tissues.

Question. What other Federal agencies are involved in BSE and TSE research and control activities? How is ARS coordinating its research with CDC, HHS, FDA, etc.? How much money is being spent by the Federal Government for research and control activities for these diseases overall? Who is coordinating the U.S. effort in these areas?

Answer. Federal agencies that have an interest in TSE/BSE research and control include: USDA-ARS, USDA-APHIS, USDA-FSIS, CDC, FDA-CFSAN, FDA-CVM, NIH, and the Department of State. Coordination of USDA efforts is through the Office of the Secretary of Agriculture. ARS is prioritizing and coordinating its research activities with other Federal agencies through specific workshops organized at the agencies highest level. Workshop reports are circulated in a timely manner to all interested Federal agencies and stakeholders. The total funding for all Federal Government efforts is unknown, however, ARS funding for TSE research is currently \$2.6 million.

With regards to specific agency involvement: ARS conducts Transmissible Spongiform Encephalopathy (TSE) research on scrapie in sheep, and chronic wasting disease (CWD) in deer and elk, both naturally occurring TSE diseases within the U.S. ARS has no research effort specifically targeted to Bovine Spongiform Encephalopathy (BSE), however, ARS scientists collaborate with their counterparts at the National Center for Foreign Animal Disease, Winnipeg, Canada, Veterinary Laboratories Agency in Weybridge, U.K. and USDA-APHIS to validate reagents that potentially can be used for BSE surveillance. USDA's Food Safety and Inspection Service inspects all cattle before they can be approved for use as human food; use of cattle with unidentified neurological diseases is prohibited. The USDA's Animal and Plant Health Inspection Service (APHIS) enforces explicit import regulations covering animals and animal products offered for import into the United States to prevent the importation of foreign exotic diseases such as BSE. USDA-APHIS prohibits the importation of live ruminants from countries where BSE is known to exist in native cattle. APHIS controls the importation of live ruminants and most ruminant products from all of Europe. APHIS also implements an aggressive BSE monitoring program examining the brains of cattle exhibiting various abnormal behaviors, including neurological symptoms. No evidence of BSE has been found in these U.S. cattle specimens.

Agencies within the Department of Health and Human Services (DHHS) have a long-standing commitment to research, epidemiological studies and consumer protection involving BSE and variant and classic CJD. The Food and Drug Administration (FDA) prohibits the use of most mammalian protein in the manufacture of animal feeds given to ruminant animals, such as cows, sheep and goats. The regulation also requires process and control systems to ensure that feed for ruminants does not contain the prohibited mammalian tissue. This prohibition is a preventative measure designed to protect animals from potential transmissible degenerative neurological diseases such as BSE and to minimize any potential risk to humans. If a case of BSE were found in the United States, these measures would also help to prevent the spread of BSE through feeds in U.S. cattle. FDA issued guidelines to blood centers to reduce the theoretical risk of transmission of vCJD to recipients of blood products. This precautionary measure recommended procedures for deferring potential donors who may have been significantly exposed to food and other cattle-derived products in BSE-endemic countries. FDA's present guidelines ask blood centers to exclude potential donors who have spent six or more cumulative months in the U.K. between January 1, 1980, and December 31, 1996, from donating blood. Further revision to this guidance may be forthcoming with new information regarding other countries' BSE experiences. FDA's TSE Advisory Committee recently offered advice on revising the guidelines to include potential donors who have lived an aggregate of 10 years in France, Ireland and Portugal. FDA also provides guidance on the use of bovine materials from countries affected by BSE in non-food products, for example gelatin from bones for oral consumption or cosmetic use. The Center for Disease Control (CDC) conducts regular surveillance for any trends and current incidence of vCJD among humans in the U.S. The National Institutes of Health (NIH) conducts research on various TSE's: BSE, CJD, vCJD and related neurological diseases through their Maryland and Rocky Mountain Laboratories. NIH has a particular interest on the molecular biology of prion protein folding and its role in the induction of TSE disease.

Question. There are a number of plant and animal diseases of critical economic importance to American agriculture. Some of these diseases have become noteworthy recently. Please provide the Committee with the current status of research projects and current funding (by Agency) for each project listed: Citrus Canker, Citrus Tristeza, Pierce's disease, Avian Newcastle disease, Bovine Tuberculosis, John's disease, African Swine Fever, West Nile Virus, Avian Influenza, Plum Pox Virus, Asian Longhorned Beetle and Wheat Scab.

Answer. In fiscal year 2001, \$4,739,550 was appropriated for the Citrus Canker Special Research Grant. The grant proposal was received on January 30, 2001 and the proposal is undergoing programmatic review. In fiscal year 2001, \$740,368 was appropriated for the Citrus Tristeza Special Research Grants. The grant proposals were due by February 15, 2001, and the proposals are undergoing programmatic review. In fiscal year 2001, \$1,895,820, was appropriated for the Pierce's Disease Special Research Grant. The grant proposal was received on January 24, 2001, and is awaiting administrative review and final signature. In fiscal year 2001, \$324,285, was appropriated for the Bovine Tuberculosis Special Research Grant. The grant proposal was received on March 12, 2001, and is awaiting administrative review and final signature.

Current status of research on Citrus Canker:

ARS is conducting research on citrus canker at Ft. Pierce, Florida, and Beltsville, MD, in support of regulatory and action agencies to control this devastating disease. These include: biological control methods to stop or slow the spread of the disease; molecular and genetics approaches to determine virulence factors; epidemiological methods to better understand the disease cycle and dissemination characteristics; and early detection technologies. Current fiscal year 2001 funding: \$315,000.

Current status of research on Citrus Tristeza Virus (CTV):

ARS scientists at Ft. Pierce, Florida, are identifying exotic CTV strains and vectors which threaten citrus production. The biological diversity and molecular basis of pathogenicity and virulence among strains are being determined. Regulatory actions are being supported by determining the genetic, epidemiological, biochemical, and serological characteristics of CTV. Researchers at Frederick, Maryland, are studying vector transmission characteristics of CTV. ARS laboratories at Fresno, California, and Beltsville, Maryland, are examining the diversity of CTV strains and developing improved methods for maintaining and storing isolates, and determining their host range. Current fiscal year 2001 funding is \$2,320,000 for all locations.

Current status of research on Pierce's Disease:

To combat Pierce's Disease and the vector transmitting it, research is being coordinated at the Horticultural Crop Research Laboratory at Parlier, California. Research includes efforts to better understand the causative bacterium's host range and potential pathogenicity for California crops, particularly grapes. Epidemiology of the disease is also being determined. Current fiscal year 2001 research funding is: \$1,098,000.

Current status of research on Avian Newcastle disease:

The ARS research program on avian Newcastle is directed to: improve diagnostic tests; develop improved vaccines; determine genetic and biologic mechanisms controlling Newcastle Disease Virus (NDV) virulence; use molecular epidemiology to determine origin of NDV strains and predict geographic spread; identify and characterize molecular markers for NDV pathotyping; and determine the frequency and mechanisms for NDV persistence in clinically normal poultry. Current fiscal year 2001 funding is \$786,000.

Current status of research on Bovine Tuberculosis (TB):

ARS in collaboration with industry, APHIS, other Federal agencies, and State and university cooperators developed a joint regulatory and research strategy for TB in livestock, deer, and elk. Under ARS scientific leadership, research goals were established to: (1) define interactions between cattle, white tailed deer, and elk and *M. bovis*; (2) develop and improve tests for diagnosis of *M. bovis* infection in these species; and (3) develop improved methods for strain differentiation of *M. bovis* isolates. ARS recently initiated research to address the diagnosis, pathogenesis, and epidemiology of TB in white tailed deer and to develop vaccines to control tuberculosis in deer. Current fiscal year 2001 funding is \$1,432,000.

Current status of research on Johne's disease:

The ARS program on Johne's disease (a bacterial disease caused by *M. paratuberculosis*) is conducted at the Bacterial Disease of Livestock Research Unit at the National Animal Disease Center, Ames, Iowa. The program's objectives are: (1) to sequence the complete genome of *M. paratuberculosis*, (2) develop highly sensitive and specific diagnostic technology and study of host immune responses during the different stages of disease, (3) determine shedding of *M. paratuberculosis* in milk of naturally infected cows at the farm level and evaluate survival of *M. paratuberculosis* in milk after heat treatment, and (4) identify immunogens of *M. paratuberculosis* by random and directed expression library immunization (DNA vaccines). Current fiscal year 2001 funding is \$1,618,000.

A new focus is being added to the ARS research program at the Western Regional Research Center in Albany, California, includes testing for the presence of *M. paratuberculosis* in animal manure. The testing in this program results from the need to develop the knowledge and technology to prevent the transmission of epizootic pathogens, including *M. paratuberculosis*, from animal manure to food products for human consumption.

Current status on African Swine Fever:

ARS program on African swine fever (ASF) is conducted at the Plum Island Animal Disease Center. The research is focused on: (1) identification of pathobiologically significant ASF genes that might assist in developing a disease control

strategy, and (2) Defining protective immune responses to ASF virus and other significant foreign animal disease threat agents. Current fiscal year 2001 funding is \$6,400,000.

Current status of research on West Nile Virus (WNV):

Advanced mosquito trapping methods developed by ARS scientists in Gainesville, Florida, are being used in New York City, in association with the Wildlife Conservation Society. In fiscal year 2001, methods will be developed for the same purpose in Connecticut in cooperation with the Connecticut Agricultural Experiment Station. Also, an alternative (non-pesticidal) technology for control of the larval stages of mosquito WNV vectors is being tested. Additionally, ARS scientists at the Southeast Poultry Research Laboratory (SEPRL) examined the susceptibility of chickens, to answer questions about viremia, incubation period, clinical signs, and antibody response. Both chickens and turkeys developed high viremias and shed virus in feces. Contact birds remained healthy and virus-free. The ARS, Arthropod-Borne Animal Diseases Research Laboratory (ABADRL), Laramie, Wyoming, has all arthropods viruses in their research mission. The laboratory is conducting research at the request of APHIS to develop a WNV vaccine. Current fiscal year 2001 funding is \$798,000.

Current status of research on Avian Influenza:

The ARS program on avian influenza is conducted at the Southeast Poultry Research Laboratory (SEPRL) in Athens, Georgia. The program is focused on issues related to epidemiology, molecular virology, vaccines and pathogenesis of avian influenza. The United States, Mexican, Hong Kong and Italian virus isolates received from APHIS are being classified for disease-causing potential at the SEPRL. Scientists at SEPRL are developing and evaluating techniques to predict which mild forms of virus will change to more deadly virus. ARS is collaborating with private industry on recombinant and inactivated vaccines and improved diagnostic tests for avian influenza. ARS is also evaluating new vaccines to protect U.S. poultry from the threat of Hong Kong H5N1 and other types of avian influenza should they be introduced to the U.S. Current fiscal year 2001 funding is \$1,391,000.

Current status of research on Plum Pox Virus (PPV):

The ARS research program on PPV is focused on improved detection and characterization, virus-vector transmission, and enhancement of germplasm for resistance, through both biotechnology and conventional breeding techniques. ARS scientists at Frederick, Maryland, and Kearneysville, West Virginia, are developing this integrated disease management system to support ongoing eradication efforts and to minimize the impact of the disease. Current fiscal year 2001 funding: \$1,232,000.

Current Status of research on Asian Longhorned Beetle (ALB):

ALB systematics and identification keys have been developed by the Systematics Entomology Laboratory, Beltsville, MD. Two ALB pheromones have been discovered and are being patented (A347907) by the Chemicals Affecting Insect Behavior Laboratory, Beltsville, MD. Previously, it was not believed that the beetles communicated by smell. The chemicals will be developed into a trap for monitoring. Researchers at the Beneficial Insects Introduction Research Laboratory, Newark, DE, have shown that adult beetles disperse nearly one mile each year, rather than 100 yards as previously thought. This information has resulted in a widening of the beetle containment zone by APHIS. Using novel acoustic tools developed at Newark, DE, researchers were able to detect beetles in living trees in the field. The practicality of using this approach for monitoring is being investigated. Two natural enemies of ALB have been discovered in China by researchers at Newark and are being evaluated as biocontrol agents. Current fiscal year 2001 funding is \$821,000.

Current status of research on Wheat Scab:

Improved resistance to Wheat scab, (*Fusarium head blight*), is being developed at the ARS Cereal Disease Laboratory at St. Paul, Minnesota. Research at Peoria, Illinois is being conducted to determine the genetics of toxin biosynthesis and genetic variability in the pathogen is being studied at ARS locations in Fargo, North Dakota and Albany, California. ARS researchers in Raleigh, North Carolina and Beltsville, Maryland are improving disease control strategies and researchers at Madison, Wisconsin are examining the effects of the disease on nutrient and seed quality. Finally, ARS participates in the U.S. Wheat and Barley Scab Initiative which is a consortium of Federal, state, and private researchers, growers, and others concerned about the losses caused by scab in wheat and barley. The research initiative focuses on six distinct program areas: Variety development and coordinated screening nurseries; Epidemiology (how scab develops, spreads) and disease management; Food safety, toxicology, and utilization; Biotechnology; Chemical and biological control,

and Germplasm introduction and evaluation. Researchers from 22 states and 6 locations within ARS are involved. Current fiscal year 2001 funding for all wheat scab research is \$8,818,600.

Question. Describe for the Committee the status and corresponding funding for these projects carried out by APHIS. To what extent does APHIS carry out methods development and scientific services for these projects.

Answer. The APHIS Plant Methods Development program provides advanced scientific and technological capabilities to protect and improve U.S. agriculture. Methods development supports APHIS programs by optimizing existing pest management practices and by developing new technologies for pest exclusion, detection, survey, and management. This is accomplished by evaluating biocontrol organisms, evaluating new biological and chemical materials, adapting or inventing equipment, providing technical consultation and training, collecting and disseminating pertinent information, and integrating technological advancements into integrated pest management systems. APHIS conducts cooperative programs with State and local agencies and organizations to control or eradicate plant pests and diseases, and to control or eradicate animal diseases.

The Agricultural Research Service (ARS) is the principal research agency of the Department of Agriculture charged with conducting research to expand the knowledge and technology necessary to maintain and increase the productivity and quality of crop plants, and animals, and animal products. ARS provides research on broad regional and national problems; research to support Federal action and regulatory agencies; and expertise to meet national emergencies. ARS conducts research to find ways to protect plants from diseases, insects, and weeds. ARS also conducts research to assure the quality and safety of animal products used as food for humans; and research to reduce losses due to pathogens, diseases, parasites, and insect pests.

The citrus canker methods development APHIS has funded thus far is still in its early stages and has not yielded any significant results.

In regard to citrus tristeza, APHIS has worked on the control of brown citrus aphid, the vector for this disease. APHIS supported some studies in Florida with pathogens that can be applied in a manner similar to an insecticide spray. Also, APHIS funded a small (\$50,000) cooperative agreement with the University of Florida to learn more about the vector. APHIS has only recently begun to work on Pierce's Disease and its vector, the Glassy-winged Sharpshooter (GWSS) in California. APHIS has teamed up with both the private sector and the Agricultural Research Service to look at ways of identifying this disease more quickly for the growers. Also, APHIS has also begun to seek ways to separate the pathotype that attacks grapes from the one that attacks citrus, almonds and oleanders. Additionally, APHIS is working on developing the use of airborne spectral analysis systems to detect this disease early in the disease cycle before it becomes a source of inoculum for other vines. This work is being funded by approximately \$250,000 for APHIS. In addition, APHIS provided ARS with \$150,000 for their work in this area, and the one private group is willing to work with APHIS for now at no cost to the Government. APHIS also awarded approximately \$5.2 million to universities in California through a competitive grant process.

In fiscal year 2000, APHIS spent approximately \$1 million on methods development to address Plum Pox Virus (PPV). APHIS gathered preliminary data on population dynamics and seasonal distribution of aphid species in infected orchards in Pennsylvania. Also, APHIS determined that none of the weed species in the heavily infected orchards carry the virus. In addition, APHIS determined the incidence of PPV within infected orchards through an intensive survey and this helped us tailor our survey plan in Pennsylvania and nationally. Our data also indicates that the mild D Strain of PPV is the only strain involved in this infestation. APHIS is coordinating with the Agricultural Research Service to determine future plum pox methods development and research needs. APHIS anticipates continuing to conduct confirmatory tests for new finds; typing the finds to strain, and acting as a back-up to the State-run labs; establishing laboratory testing standard operating procedures and quality control protocols; evaluating known foreign strains to determine strain differences which may determine the infection pathway into the United States; and ensuring State laboratories conducting routine PPV diagnostic tests meet established quality control standards. Laboratory testing for PPV identification is a crucial element in the survey program because infected plant material cannot be reliably identified based on visual symptoms.

APHIS recently allotted \$1.6 million to the Forest Service for Asian Longhorned Beetle. This funding will support continued ALB research conducted by the U.S. Forest Service on attractant activity; detection technology detection technology, including the development of acoustical detection tools; DNA characterization of ALB

populations and biotypes; development and evaluation of control technologies, including new research to develop biologically-based control technologies (field testing of four species of nematodes, microsporidia and Bt biopesticide); methods and protocols for monitoring ALB in the urban-wildland interface; improved rearing methods for quarantine populations; continued development and evaluation of trap designs; and, new studies to understand dispersal and life history in natural forests. Forest Service research is conducted in quarantine and in China, and in collaboration with the Agricultural Research Service, APHIS methods development, and U.S. and Chinese university scientists. This research will not yield any meaningful results until perhaps fiscal year 2003. APHIS does not fund any research projects on Wheat Scab.

While APHIS does not fund any research projects on Avian Newcastle disease, John's disease, African Swine Fever, West Nile Virus (WNV), or Avian Influenza (AI), its National Veterinary Services Laboratories (NVSL) in Ames, Iowa, does conduct diagnostic testing on sample submissions through routine monitoring and surveillance. In fiscal year 2000, APHIS used \$375,000 in contingency funds to test serum and tissue samples at NVSL from approximately 440 clinically-ill equine in 30 different states for WNV. In fiscal year 2001, APHIS will use \$400,000 for this same purpose. In addition, APHIS tested 1,457 specimens from live-bird markets in the Northeastern United States for AI. The Agency isolated AI subtype H7N2 from 1 of the 439 specimens from New Jersey and 104 of the 900 specimens from New York. Specimens from Connecticut (16), Massachusetts (76), New Hampshire (2), and Rhode Island (24) were negative for AI. In fiscal year 2000, APHIS spent \$100,000 to support bovine tuberculosis research activities. APHIS provided these funds to Michigan State University to study the transmission of tuberculosis in Michigan's free ranging white-tailed deer population. In fiscal year 2001, APHIS received \$53 million from the Commodity Credit Corporation to accelerate the eradication of bovine tuberculosis. Another \$7 million was received from the fiscal year 2001 Miscellaneous Appropriations Act. Of this \$60 million, close to \$200,000 will be spent on evaluating promising field diagnostic tests such as skin testing and \$165,000 will be spent on evaluating promising vaccines.

Question. Please describe for the Committee the beginning point in which methods development or technical services aspects of the APHIS mission occurs for these projects?

Answer. APHIS is subject to the Federal appropriations process, and must therefore identify its methods development needs approximately 2 years before the funds are made available. The "beginning point" from a functional perspective is when APHIS identifies a programmatic need in an activity, such as domestic, international, or port operations, APHIS' first look at available technologies, contact experts and researchers (internationally as well as scientists within this country, including the Agricultural Research Service) in the subject area, and determine whether solutions can be implemented to preclude the entry of pests or diseases, to detect and to identify new ones or those of programmatic significance, and to eradicate or suppress them where they occur. In some cases, if technology is available but merely needs to be slightly adapted for implementation, then APHIS may commit the necessary resources to do so. If the programmatic needs are such that immediate solutions can not reasonably be implemented with minor modification of a technology, or the scope is such that APHIS does not have adequate resources to address the issue, then APHIS would attempt to communicate these more "long-term" research needs to our sister agencies and researchers both within the United States and abroad.

NATIONAL PLANT GERMPLASM SYSTEM (NPGS)

Question. Last year, the Department stated that a static budget for the National Plant Germplasm System (NPGS) would have severe programmatic ramifications throughout the NPGS. Did the USDA request an increase for the NPGS for fiscal year 2002 in its request to OMB and, if so, how much did the USDA request for fiscal year 2002?

Answer. Because of the change in Administration, the sequence of events used to develop the fiscal year 2002 budget was somewhat different from the usual process. Without a full complement of policy-level officials, much of the budget was developed through negotiations directly between the Secretary and the Office of Management and Budget. Much of this abbreviated budget development process took place during the weeks between inauguration and the release of the President's budget blueprint on February 28, 2001. As a result, there is not a set of formal agency and Department-level proposals.

Question. Last week, the USDA Advisory Committee on Agricultural Biotechnology agreed to recommend that funding be doubled for the National Plant Germplasm System (NPGS). What steps will you take to implement this recommendation?

Answer. The recent recommendations of the USDA Advisory Committee on Agricultural Biotechnology (ACAB), together with the Administration's strategic plans and budgetary targets, and input from other customers, cooperators, and stakeholders will be taken into account when formulating the Agency's fiscal year 2003 budget request. The Agency will continue to provide requested information to the ACAB regarding the NPGS's status. The Secretary will review the agency's request in the overall context of priorities for all of the Department's missions.

Question. Traditionally, the NPGS has supported food, feed, and fiber security in the U.S. Today, we have the most stable food supply in the world. Why is the NPGS important and what is the cost to the Nation of not supporting the NPGS to the extent requested by the ARS?

Answer. Genetic raw materials, water, air, soil, sunlight, and management practices comprise the agricultural production system that sustains humanity, and currently provides the United States with an affordable, highly diverse, and nutritious diet. Although the U.S. today has perhaps the most stable food supply in the world, its systems of renewable resource production and land stewardship face formidable challenges in the new millennium. Among the most exacting challenges is successfully adapting to the accelerating rates of change in factors affecting agricultural productivity. Climatic extremes may now occur more frequently due to human activities. Water and soils are being depleted more rapidly. As global agricultural production incorporates more fertilizers, herbicides, or pesticides, water and soils are also increasingly threatened by pollution. Unless new technologies, including new crop varieties derived from germplasm in the NPGS, are developed and utilized, the costs to the Nation may be environmental deterioration that threatens agricultural production. In addition, regulations and other proposed remedies for those phenomena that may rapidly complicate resource management, food and fiber production, and processing will be other costs. Environmental deterioration and the preceding complications, in turn, may result in more rapidly increasing prices paid by consumers, more volatile commercial markets, reduced profits for producers, and a narrower competitive edge for U.S. products in world markets. More costly food may result in less nutritious diets for the poor.

Globally, natural plant communities and landscapes that contain potentially useful plants are disappearing. Burgeoning human populations worldwide are increasingly urban, with cities now occupying ever more hectares of formerly productive agricultural land. As a result, rates of agricultural productivity can be raised only if the remaining land under cultivation yields more agricultural production. New, more intensive production practices implemented throughout the Nation (e.g., higher density plantings, reduced tillage and chemical inputs) place new demands on crops. Formerly minor pathogens are now economically important because of changing production practices. New, more virulent genetic variants of already important pathogens and pests are cause for grave concern. These provide an impetus for assaying NPGS germplasm for new sources of host-plant resistance. Furthermore, economic constraints to agricultural profitability underscore the immediate need for value-added and alternative crops for increasing the monetary return to producers (especially in rural areas), and for efficiently diversifying the productive capacity of U.S. agriculture. The NPGS will likely be the sources for such new crops.

The rapid destruction of natural habitats and agricultural productive capacity may be most extreme in the developing countries, where a wealth of genetic resources vital to U.S. agriculture is endangered. Essentially all the major crops we grow and use originated there. Consequently, the stability of U.S. agriculture is based primarily on crops that were imported long ago and on their continual genetic improvement via more recently acquired genes conserved in the NPGS collections. The cost to the Nation of not adequately supporting the NPGS may be extinction of these resources, or inaccessibility caused by lack of operating funds. That may increase the genetic vulnerability of agriculture to rapidly evolving pests, pathogens, environmental changes, and to competitive market demands, which change continually and rapidly according to consumer preferences and advances in processing technology. The demands placed on U.S. agriculture by a rapidly changing world can only be met by technologies that optimally harness the inherent genetic potential of NPGS germplasm so as to maximize profits, security of supply, price stability, market competitiveness, and avoid crop losses from genetic vulnerability. More rapid and efficient methods for identifying useful properties of germplasm, and for manipulating genetic and genomic material and information, are required. These new methods will include more effective breeding strategies and more comprehen-

sive knowledge of crop genomic structures. The new scientific approaches of genomics and biotechnology, when applied to NPGS germplasm, are critical for developing improved crops that enable producers to maximize yields of high-quality products, but minimize chemical input, water and soil depletion, water and soil contamination, as well as production costs.

Paradoxically, sole reliance on the preceding methods of genetic improvement may lead to superior but excessively narrow genetic bases for crop gene pools. As a result, the Nation's future food, fiber, feed, ornamental, and industrial product supply may become more vulnerable to rapidly changing pathogens, pests, or environmental extremes. It may be less abundant, nutritious, and diverse, hence less capable of adapting to changing regulatory concerns or to global change in climates and commercial markets. The cost to the Nation of such developments would be catastrophic. Adequate funding is needed for the NPGS in order to ensure that accessions are available for distribution, and that essential germplasm acquisition, maintenance and regeneration, preservation and conservation, and characterization and evaluation activities are carried out. Consequently, the NPGS, which furnishes the means for broadening crop gene pools, is crucial to developing safer, more secure, and more efficient agricultural systems. Its genetic resources are literally the basis of U.S. agriculture.

Question. For fiscal year 2000 and fiscal year 2001, the agricultural appropriations bills provided increases for the NPGS of \$1.75 million and \$3 million, respectively. Please provide the subcommittee with a detailed list, by NPGS site, of where the additional funds were spent, for what purposes the funds were used, and whether the additional funds were critical for maintaining or improving the program level at the particular site.

Answer.

Fiscal year 2000 (\$1.75 million gross allocation).

Albany, CA: (\$250,000 gross).—This funding increase enabled a scientist and support staff to be hired to characterize, with leading-edge genomic approaches, small grains (wheat, rye, and barley) genetic resources. The research will also help develop more effective and efficient genetic markers to facilitate small grains agronomic evaluation and breeding. Furthermore, it will expand bioinformatics/database development and refinement efforts for linking the GrainGenes genome database more closely to small grains germplasm databases such as the Germplasm Resources Information Network (GRIN) in the U.S. and the International Center for Maize (Corn) and Wheat Research (CIMMYT) wheat database system. The additional resources are crucial for enabling the NPGS to intensify its program of genetic and genomic characterization of small grains germplasm with leading-edge tools and technologies, such as nucleotide sequencing and comparative genomic approaches.

Ft. Collins, CO: (\$250,000 gross).—The funding increase enabled one research scientist and one support scientist to be hired to develop and apply long-term preservation protocols for clonal and desiccation-resistant seed germplasm. The budgetary increase was crucial for supporting research wherein "stress" genes in blackberry were isolated; mechanisms whereby cells of mint adapt to ultra-cold temperatures were elucidated, and which resulted in new methods for long-term preservation of garlic bulbs and embryos of citrus, coffee and wild rice. A technician was hired to strengthen the clonal preservation operations and additional part-time staff were hired for seed quality evaluation. The technician was important for increasing the National Seed Storage Laboratory's (NSSL's) capacity to store clonal germplasm over the long-term, for a few species, and the additional temporary staff increased the efficiency for storage of seed.

Ames, IA: (\$250,000 gross).—Prior to the fiscal year 2000 increase, the NPGS site at Ames, IA, required funds to maintain the then current operations and staffing levels, due primarily to increased personnel and operating costs. The budget increase in fiscal year 2000 supported two additional temporary Federal support staff, two additional student support staff, purchased much-needed equipment, and covered wage and benefit increases for that year.

Columbia, MO: (\$250,000 gross).—For maize (corn) germplasm, characterization, evaluation, and enhancement of the large NPGS collection of this crop are priority needs. The fiscal year 2000 funding increase expands efforts to evaluate and characterize poorly-studied NPGS maize germplasm for genes conditioning adaptation, productivity, and host-plant resistance to major pathogens and pests of maize. The new funds enable researchers to employ up-to-date genetic/genomic technology to detect latent genetic diversity in maize, and to develop genetic markers closely associated with agriculturally-important traits, so that the markers can facilitate incorporation of such traits into adapted germplasm. Together with cooperators throughout

the U.S., scientists in Columbia are conducting one component of the GEM Project, which is genetically enhancing public maize germplasm by incorporating genetic diversity from unadapted germplasm for productivity, quality, and resistance to biotic and abiotic stresses. Finally, these funds are supporting a collaborative effort among personnel at Columbia, MO, Ames, IA, and elsewhere to link the MaizeDB database more closely to maize germplasm databases such as the NPGS-wide GRIN database and the System-wide Information Network for Genetic Resources (SINGER) databases for the international agricultural research centers, especially the CIMMYT maize database.

Beltsville, MD: (\$250,000 gross).—This increase enabled the NPGS's database system GRIN (Germplasm Resources Information Network) to retain the requisite staffing level, to purchase maintenance agreements for the GRIN's hardware and software, and to fund critical operating expenses. Had these funds been unavailable, three permanent staff members may have been terminated and software and hardware maintenance may have been deferred.

Ithaca/Geneva, NY: (\$250,000 gross).—The budgetary increase was partially devoted to hiring a molecular biologist and a laboratory technician to develop DNA technologies to more efficiently and effectively preserve tomato, onion, cole crops, winter squash, and buckwheat germplasm. The remaining funds were applied to updating aging seed production equipment and facilities, and to upgrading computer software and hardware for seed germplasm data management capabilities. The budget increase was essential for preserving and improving the quality of the seed germplasm collection at this site so that it began to approach international standards for viability, phytosanitation, and availability.

Pullman, WA: (\$250,000 gross).—This budget increase was partially devoted to establishing a new greenhouse manager position that is very important for enhancing operational efficiency. Also, a research geneticist was hired to expand genetic marker and comparative genomic characterization for cool season legumes, dry beans, beets, forage legumes and grasses, etc. The additional funds were integral for developing, maintaining, and enhancing genetic marker and genomic data management and bioinformatic capabilities by enabling continual upgrading (both technical, and in terms of additional data) of software and hardware, for germplasm data management.

Fiscal year 2001 (\$2,993,400 gross):

Phoenix, AZ: (\$149,600 gross).—The fiscal year 2001 budget increase was critical for expanding germplasm evaluation or characterization research to identify or characterize new sources of agronomically important traits in Pima cotton, and for the new crops guayule (source of hypoallergenic rubber), and Lesquerella (new oilseed crop). The additional funds are enhancing this site's capabilities to regenerate, store, and/or maintain guayule and Lesquerella germplasm so that more is available to researchers and breeders. New cotton, guayule, and Lesquerella germplasm will be acquired to replenish current supplies, or to fill genetic gaps in the collection.

Davis, CA: (\$199,600 gross).—Because of long deferred repair and maintenance of facilities, vehicles, and implements due to many years of fiscal deficits, the fiscal year 2001 increase was applied mainly to renovating and repairing basic infrastructure at this site. One temporary technical staff was hired for orchard maintenance, where personnel are still needed. Next year, the infrastructure renovation should be complete, and the new funds will be applied to characterizing germplasm. Currently, only the walnut and fig collections are well-described. Without such genetic descriptions and characterizations, germplasm users lack the means for efficiently selecting material for their purposes. The fiscal year 2001 funds will be critical for hiring a scientist specializing in germplasm characterization to generate data crucial for efficient management and use of germplasm, so that potential users have descriptive data available to select material with certain characteristics, rather than to pick, almost randomly, from names on a list, without recourse to additional information.

Riverside, CA: (\$199,600 gross).—The new funds enabled the recruitment of a plant pathologist to increase the amount of pathogen testing and elimination in citrus (orange, lemon, lime, grapefruit and related species), thereby addressing the critical need to increase the amount of germplasm available to breeders and researchers, as well as increasing the germplasm that this site could acquire.

Ft. Collins, CO: (\$199,600 gross).—The fiscal year 2001 increase enabled hiring of a support scientist and technician. The support scientist serves as an instrumentation specialist for the entire NSSL research effort, enabling research integration that has facilitated study of the effects of provenance on propagule quality, the results of which may lead to more consistent survival of seeds following ultracold storage. The technician helped establish gene expression analysis and cloning, impor-

tant molecular approaches for studying plant acclimation to drought and cold. The fiscal year 2001 funds will add another scientist to the clonal plant preservation program to help adapt and modify protocols for preserving vegetatively propagated plant germplasm, thereby enabling the ultracold storage of a variety of clonal crop germplasm.

Washington, D.C.: (\$149,600 gross).—The fiscal year 2001 budget increase has expanded the volume of woody ornamental germplasm accessions actively managed, which will make more germplasm available to the scientific community. It has provided funding critical for expanding the current effort to coordinate the North American Plant Collections Consortium (NAPCC), and enabled stronger linkage between the former and the U.S. National Arboretum's woody germplasm management effort. The additional funds have expanded efforts to modify current protocols or develop new methods for optimal woody ornamental germplasm management, including new molecular marker assay systems, and have expanded the scope and volume of data and information management activities.

Griffin, GA: (\$299,300 gross).—The fiscal year 2001 funds were critical for expanding the volume of germplasm accessions available to the scientific community, developing new methods for optimal germplasm management, and expanding the data management program. Operating funds for each germplasm curator were quadrupled, enabling an increase in the amount of germplasm regenerated and otherwise managed. A germination technician is being hired to conduct germinations needed to set accurate regeneration priorities and provide users with higher quality seed. A retired agronomist's position was re-filled, which bolstered management of the warm-season forage and turf grass national collection. Temporary summer help will handle the increased amount of germplasm regenerated. Without the additional funds, regenerations would have been severely reduced or eliminated because there would have been no labor to plant, manage, harvest, and thresh seed from regenerated accessions. The new program for seed germination program and quality would not exist. The curatorial staff would have been insufficient to handle the workload.

Ames, IA: (\$239,500 gross).—The fiscal year 2001 funding increase provided additional seed storage, seed processing, lab equipment, and office resources for integrating the Genetic Enhancement of Maize (GEM) Project into this site's overall operational framework. The new funds were critical for hiring an additional temporary Federal employee and additional student labor. It funded normal wage and benefit increases, and covered a 50 percent increase in energy costs. These funds were critical for building capacity to increase germplasm regeneration, evaluation, characterization, and distribution efforts.

Aberdeen, ID: (\$219,500 gross).—Many of the new funds purchased critical equipment (e.g., planter and thresher) and supplies critical for germplasm management. Four full-time Federal technical positions will strengthen operations at this wheat, barley, oats, and rice germplasm site. All of the preceding progress was dependent on the new funds.

Urbana, IL: (\$199,600 gross).—The new funds enabled the soybean germplasm program to buy a new high purity seed thresher and a new vehicle for field work. Additional temporary personnel were hired to assist in processing seeds, and a new permanent technician position was established. Before the fiscal year 2001 increase, the entire budget was devoted to salaries and utilities; the increase was critical for providing an operating budget for germplasm management and research.

Ithaca/Geneva, NY: (\$124,800 gross).—Note that this location received an additional \$249,600 gross for germplasm management via a separate fiscal year 2001 budget line) Some of the budgetary increase was devoted to hiring a permanent field technician and part-time field assistance, leasing beehives for controlled pollination, and to DNA technology development. The new resources helped the genebank approach the international standards for seed viability testing, whereby all seed lots have known germination rates and procedures have been established for determining viability as a normal part of the management process. Furthermore, the amount of germplasm available to the scientific community has increased, as has the volume of associated characterization and evaluation data. Scientists and technicians were hired to amplify the apple, grape, and tart cherry germplasm management effort, and to develop and deploy DNA markers to assess genetic diversity in fruit germplasm.

Corvallis, OR: (\$219,500 gross).—Many of the new funds will support temporary technical personnel to assist in the field and greenhouse management of strawberry and other berry and nut germplasm. Additional funds will expand the critical effort to evaluate small fruit and mint germplasm for horticultural merit. The remainder of the increase will bolster budgets for travel, staff training, supplies, equipment, utilities, and maintenance. This funding increase was critical to maintaining oper-

ational capacity of this genebank. Without this increase, key permanent positions would have been terminated, because of the budgetary impact of this year's increased energy and fuel costs.

Charleston, SC: (\$149,600 gross).—The fiscal year 2001 increase to the U.S. Vegetable Laboratory expanded germplasm evaluation research on sweet potato, cole crops, melons, peppers, and southern peas. This research is identifying or characterizing new sources of horticulturally important traits. Whenever possible, these or previously identified priority traits are being incorporated into enhanced breeding lines of the preceding crops, so as to make superior, better-documented germplasm accessions available to breeders and plant scientists.

College Station, TX: (\$249,500 gross).—Funds will initially be used to expand greenhouse space, and to expand germplasm regeneration and characterization efforts. The increase enabled the continued employment of a staff member who was scheduled to be terminated in April 2001, due to lack of funds. The pecan orchards could be fertilized this year, greatly aiding trees that were unfertilized last year and stressed by last year's drought. Top priorities are hiring seasonal help at two worksites (Brownwood and College Station, TX) and buying equipment key for more efficient operations. The pecan/hickory orchards are not irrigated, and acquiring a reliable irrigation system is critical for the long-term security of the collection.

Pullman, WA: (\$244,500 gross).—The funds devoted to Pullman and a worksite at Prosser covered additional personnel costs and general operations support that is crucial for both germplasm maintenance and research.

Madison/Sturgeon Bay, WI: (\$149,600 gross).—Most of the new funds were devoted to hiring additional personnel, buying needed equipment, and conducting long-deferred facility upgrades. A scientist is being recruited to manage research and evaluation projects, and part-time labor is being hired to conduct additional genetic analyses, seed increases, etc., for the national potato germplasm collection. The new funds were critical for remodeling and outfitting this site's laboratory to conduct molecular marker analyses, enabling more rapid progress assessing the optimal genebank management practices for maximizing the capture and preservation of genetic diversity.

Question. It is our understanding that many sites are unable to fill positions of persons who have retired because of the lack of funding necessary to meet cost of living increases, escalating energy costs, and maintenance of NPGS facilities. Please provide the subcommittee with a list by site of positions terminated within the past two fiscal years and that will be terminated during fiscal year 2002 unless the site receives an increase in funding.

Answer. Permanent positions at NPGS sites have been abolished not only after incumbents retire, but also after they leave voluntarily to take other jobs, etc. Furthermore, to manage increasing costs with a static budget, many site managers exercise fiscal prudence by hiring temporary rather than permanent staff to provide the budgetary flexibility needed. But offering temporary rather than permanent appointments makes recruitment of high-quality staff difficult.

Davis, CA.—Because of the current level of financial support for this site, and uncertain future energy prices, fiscal prudence dictated that a new technician position be a temporary, rather than permanent appointment, so as to provide budgetary flexibility to redirect resources to maintaining living collections that require constant maintenance.

Riverside CA.—One technician position was terminated in fiscal year 2000 when the incumbent transferred. Unencumbered funds were used to renovate and upgrade a high-volume air-conditioning system. With the fiscal year 2001 increase, the technician position may be re-established, but probably as a temporary appointment, so as to conserve funds to cover substantially higher energy costs, inflation and cost-of-living increases.

Ft. Collins, CO.—Following the retirement of one incumbent, one research scientist position was terminated this fiscal year, leaving a void in this site's capability to conduct research on seed physiology and molecular biology relevant to more than 90 percent of the NPGS collection. Without funding increases in fiscal year 2002, increased operating expenses will necessitate abolishing one technician position, four temporary student positions, and one visiting scholar position. Loss of those positions will impede critical research on cryopreservation, and on other innovative, more efficient means for conserving germplasm.

Griffin, GA.—During the past two fiscal years, five temporary technical positions were terminated and three permanent positions were hired in replacement. Unless another budget increase occurs in fiscal year 2002, fewer temporary workers will be hired, reducing the number of germplasm samples that can be regenerated, and the scope of laboratory operations.

Hilo, HI.—One permanent technical position was terminated when the incumbent transferred. Because of funding constraints, only two ½ time, temporary technicians could be hired in replacement, which does not satisfy the ongoing need for two additional, permanent technical assistance positions to address key, core managerial functions.

Ames, IA.—Following retirement of a research entomologist in fiscal year 2001, funds encumbered by that position were devoted to support a new breeder/coordinator position for the Genetic Enhancement of Maize (GEM) program. If the GEM receives no new resources in fiscal year 2002, either the research entomologist position will not be re-established, or the new breeder/coordinator position will go unfilled. If no additional resources are not forthcoming, two or three temporary technical support positions would be terminated each year for the foreseeable future, and germplasm management operations would diminish. There would be little or no opportunity to adopt new technologies, such as geographical information systems (GIS) information systems and molecular markers to germplasm management.

Corvallis, OR.—One graduate research assistant position and one temporary technical assistant position were terminated during the past two fiscal years, because of lack of fiscal resources. Without an additional base fund increase, a permanent field manager position may be eliminated during fiscal year 2002.

Mayagüez, PR.—After retirements during the past two fiscal years, two administrative positions were terminated so as to meet increased indirect research costs.

College Station, TX.—Retirement of a technician in fiscal year 2000 caused personnel reassignments, with the net loss of an employee to the pecan germplasm management program. The impending termination of a full-time non-Federal employee was at least temporarily avoided by the fiscal year 2001 budget increase, but it may be threatened if no budget increase occurs in fiscal year 2002. The cotton germplasm program anticipates retirements of four support staff by 2002; with current budget levels, some of the former positions would be terminated.

Question. Have the escalating energy costs had an effect on the ability of the NPGS sites to maintain their program effort?

Answer. The effects of escalating energy costs on NPGS sites are highly variable throughout the U.S. Some effects have been direct, e.g., higher costs for running cold rooms, natural gas for drying harvested crops, and fuel for gasoline/diesel-powered machinery. The effects have also been indirect, e.g., higher costs for goods and services due to increased energy prices. Most of these items are essential so higher costs divert funds from other uses, e.g., research, non-essential maintenance, etc.

The NPGS sites in California have been affected the most severely; average cost increases for electricity of nearly 50 percent are forecast for the next year. At Davis, CA, cost estimates for goods and services procured locally have increased more than 10 percent in the last three months. At the NPGS sites in Riverside, CA, and Parlier, CA, the more immediate threats are not increased power costs but, rather, power outages. Parlier is suffering from “rolling blackouts”, which affect computer use, and reduce the effectiveness of climate control in growth chambers, refrigerators and freezers. Without power to run the greenhouse cooling system at Riverside, high temperatures might kill citrus trees, and months of pathogen testing might be lost because some assays require consistently cool temperatures. Loss of power might also destroy DNA samples and expensive chemicals stored in refrigerators and freezers. Should power costs in CA continue to increase substantially, fewer funds would be available to hire temporary employees and for operations, with the result that germplasm management efforts would diminish.

The NPGS site at Mayagüez, PR, has suffered a 57 percent increase in electricity costs during the last few months. These costs are projected to continue for the foreseeable future. As a result, planned purchases of farm equipment may be postponed, and fewer temporary field laborers may be hired, thereby slowing the rate of progress with key managerial tasks.

Similarly, the NPGS site at Urbana, IL, is planning for a 55 percent increase in energy costs for the coming fiscal year by altering plans for future operations. Without the fiscal year 2001 budget increase, no funds would have been available to pay for the increased cost of running the germplasm storage building.

Energy costs have increased at the Ames, IA, site 50 percent so far during fiscal year 2001, due to rising fuel, fertilizer, utility, transportation, and plastic products costs. When electricity rates are re-negotiated later this year, utility costs may double, necessitating redirection of funds.

Energy surcharges for transportation of goods and materials, plus direct increases in gasoline, propane, electricity, travel, and postal costs have occurred at the NPGS site at Corvallis, OR. The energy rates are forecast to double next year, necessitating that funds must be diverted from performing non-essential maintenance to pay for the forecast increased utility costs.

Utility costs comprise much of the cost of running the National Seed Storage Laboratory at Ft. Collins, CO. Actual usage of steam and water for the first six months of fiscal year 2001 indicates that the costs of these utilities will double, thereby reducing the amount of funds available for other operating expenses, temporary research appointments, etc.

At College Station, TX, the cost of operating greenhouse and cold rooms for cotton may rise by up to 100 percent, but cost estimates are still preliminary. Energy costs this year for the pecan program have increased 46 percent. To reduce energy costs, more plants have been transferred from greenhouses to the field, with a concomitant increase in plant mortality. This increased cost is met from the operating budget, reducing the amount of maintenance that can be conducted on facilities and equipment, and the amount of additional summer labor that can be hired.

Question. Do you have materials in the NPGS that are at risk for loss? If we lose germplasm due to the lack of regeneration, is it always possible to replace it? What percentage of NPGS germplasm is not in long-term, back-up storage?

Answer. Duplicate germplasm samples and duplicate copies of databases maintained in at least two physically-separate locations represent perhaps the most effective safeguards against the risk of catastrophic loss from weather-related causes, other natural phenomena, equipment failure, and human activity, be it intentional or unintentional.

It is not always possible to replace germplasm samples that are lost due to lack of regeneration when they are not duplicated within the NPGS, obtainable from other germplasm collections or genebanks within the U.S. or internationally, currently grown by farmers or produced by seed companies or nurseries, or if they are extinct in nature, as is the case with some wild species. Some of the genetic components of the "lost samples" may be conserved in other, genetically closely-related samples. But the degree of genetic redundancy between such samples may be quite variable and unpredictable. Consequently, germplasm managers in general do not assume that genetically closely-related samples necessarily contain precisely the same genetic components of the "lost samples," some of which may be key to current and future genetic improvement crops.

At present, ca. 20 percent of the seed samples and ca. 86 percent of the clonally-propagated samples in the NPGS collection of 430,000 samples are not duplicated in long-term storage, and consequently, are at a higher risk of catastrophic loss than are the duplicated samples. Some of the samples that are not duplicated within the NPGS are duplicated in other nations (e.g., the NPGS pineapple collection is duplicated in Martinique) or at International Agricultural Research Centers (IARCs). But, with increasing fiscal shortfalls at other institutions, the NPGS cannot assume that duplicates of "lost" germplasm can be readily obtained elsewhere.

As the preceding data indicate, the risk is greatest for clonally-propagated germplasm. With many clonal crops, long-term "backup" methods (e.g., cryopreservation) do not exist; more funds are needed for NPGS researchers to develop this technology.

Germplasm may also be at risk from slower, more insidious processes such as gradual loss of viability, loss of genetic integrity, infectious disease, etc., that deteriorate the quality of germplasm and associated data.

Question. What percentage of accessions is unavailable for distribution and why are they unavailable?

Answer. For the NPGS as a whole, approximately 15.5 percent of the nearly 436,000 total accessions is unavailable for distribution. Notably, the percentage of accessions unavailable varies widely across the different crops and sites of the NPGS (see table below). For example, nearly all of the pecan accessions at the Brownwood/College Station site are available for distribution, whereas in contrast nearly all citrus accessions are not currently available.

For the most part, the accessions are unavailable because they consist of too few seeds or plants, and/or because of uncertain viability and disease status. Lack of personnel and operating funds for standard seed and clonal increases, for special propagation techniques (e.g., tissue culture), and insufficient field and greenhouse space are the most common causes for such unavailability. Many of the unavailable accessions are wild species; they often require scarce greenhouse space for seed increase, prohibitively expensive special techniques for propagation, or funds for research to develop such techniques.

Some discussion of certain figures listed below is warranted. The unavailable maize genetic stocks in Urbana are primarily newly received materials, many from NSF-funded plant genome projects, that require seed increase before sufficient quantities are available for distribution to users. The many unavailable citrus accessions are largely result from their uncertain disease status; quarantine restrictions for citrus are manifold. Transport of citrus across state lines is highly regulated,

and until funds are available for disease indexing, most of the accessions cannot be transported to researchers in Florida, Texas, etc. In crops other than citrus, quarantine restrictions also contribute to germplasm being unavailable for distribution. The percentage of accessions unavailable for regeneration is provided for the record. [The information follows:]

| <i>Selected NPGS site</i> | <i>Percent unavailable accessions</i> |
|--|---------------------------------------|
| Brownwood/College Station, TX (pecan) | >1 |
| Davis, CA (tomato) | 3.1 |
| Sturgeon Bay/Madison, WI (potatoes) | 5 |
| Hilo, HI (tropical fruits) | 5 |
| Aberdeen, ID (small grains) | 8 |
| Pullman, WA (plant introduction station) | 10 |
| Griffin, GA (plant introduction station) | 15 |
| Davis, CA (fruit and nut, clonal) | 22 |
| Geneva, NY (plant introduction station) | 28 |
| Urbana, IL (maize genetic stock) | ca. 40 |
| Riverside, CA (citrus) | ca. 95 |

Question. For fiscal year 2000 and fiscal year 2001, please provide the dollar amount and overall percentage of the NPGS budget spent on each of the following categories related to germplasm: maintenance, regeneration, evaluation, acquisition, and characterization.

Answer. Of the total \$26.7 million allocated to the NPGS in fiscal year 2000 about 63 percent (\$16.9 million) was devoted to germplasm conservation and preservation, which includes the activities of maintenance and regeneration. \$3 million (11 percent) was devoted to germplasm acquisition, and the remaining 26 percent (\$6.8 million) was devoted collectively to germplasm characterization and evaluation, categories that often overlap substantially. In fiscal year 2001 a total of \$32.2 million is currently allocated to the NPGS with 62 percent (\$19.9 million) devoted to germplasm maintenance and regeneration, and \$3.3 million (10 percent) to germplasm acquisition. The remaining 28 percent (\$9 million) was devoted collectively to germplasm characterization and evaluation, categories that often overlap substantially. At specific NPGS sites (e.g., plant introduction stations, crop-specific collections of clonal germplasm, grains, oilseeds, etc.) that both maintain and regenerate germplasm, the budgetary percentage devoted to maintenance and regeneration may be 75 percent or higher.

Question. Do you have sufficient resources to manage the materials that are in the quarantine centers in a manner that fulfills the demands of the users? Have materials died in quarantine centers? Are the materials made available to the requesters in a timely manner?

Answer. In general, the Plant Germplasm Quarantine Office/National Plant Germplasm Quarantine Center (PGQO) in Beltsville, MD, can manage the plant germplasm in quarantine successfully, provided the amount of germplasm in the PGQO does not exceed current capacity, which is determined primarily by the funding available for personnel, operations, and facilities. To ensure that its capacity is not exceeded by demand, the PGQO is establishing annual quotas for each type of germplasm. These were communicated to germplasm users in May 1999 and put into effect starting in fiscal year 2000. The quotas vary somewhat over years based on factors such as the germplasm in the quarantine testing "pipeline" at the beginning of the year, changes in testing protocols, and changes in program goals.

No significant germplasm losses have occurred in the potato, sweet potato, rice, or sugarcane held by the PGQO. In the past, fruit tree accessions in the PGQO orchards were lost because of inadequate care, and insufficient attention to matching the work load with the resources available to tend to this germplasm. These problems were addressed and loss has been minimal during the recent years of orchard testing.

Some replicates of accessions have been lost to herbicide injury but, in these cases, a sufficient amount of backup material was available to repeat the tests as necessary. Occasionally, replicate samples of blackberry, raspberry, or currant perish from winter damage in the screenhouses. But, these samples are "backed up" so the accession is not lost, but its release from quarantine is delayed because the tests must be repeated. Losses from winter kill have been minor during recent years because of mild weather, and improved horticultural care. Sweet potatoes, Irish potatoes, and currants are backed-up in tissue culture for additional security.

The stone fruit (cherry, peach) quarantine program is conducted entirely in greenhouses and screenhouses, where germplasm loss is relatively rare, but does occur occasionally because of several factors that are not unique to PGQO: (1) the inher-

ent difficulty of maintaining trees in pots for years; and, (2) cherry and peach accessions received by PGQO as budwood are often difficult to propagate, especially after days in international transit, and may die before they are established.

Germplasm is made available ("released") from quarantine as rapidly as quarantine regulations and/or "pathogen clean up" permit. The only crop with a backlog of accessions awaiting quarantine testing is rice, with a 4,000 accession backlog. The rice backlog can be addressed if the testing protocol is being revised to continue quarantine testing at Beltsville with seed production of quarantined accessions in North Carolina (where rice is no longer grown commercially). For other crops, the release/backlog situation is summarized below:

- Pome fruits (apples, pears, quince) are now released "provisionally" within one year if the first round of testing is negative and if the propagative material is available. Under the "provisional release policy," germplasm users can propagate and evaluate the germplasm prior to its final release from quarantine. This policy has been very popular with germplasm users, and is feasible because of the PCR test for phytoplasmas. Final release still requires at least 3–5 years because test trees must produce fruit for evaluation of symptoms: there is no technological substitute for the fruit evaluation.
- Stone fruits (cherry, peach) are also provisionally released after one year, but full release requires at least 3–5 years for germplasm imported as budwood. But germplasm imported as seed can be released sooner (12–18 months) because less testing is required.
- Sugarcane imported from other nations requires 18–24 months in quarantine, whereas sugarcane shipped interstate (e.g, Louisiana to Florida) requires 12–18 months. Current molecular technology will probably not accelerate the release time, although the former may improve the accuracy of test results.
- Rice cannot be released from quarantine until it sets seed, which can require 100 to 240 days, depending on the specific germplasm. Notably, quarantine testing could be conducted entirely from in vitro tissue culture and germplasm released in 30 days but, because it would be distributed in the form of tissue-cultured plantlets rather than true seed, the user community has not been interested in this method.
- The quarantine process for potatoes and sweet potatoes require 18–24 months; tests require one year and are repeated. The testing required for true potato seed is substantially less than for potato tubers.
- The quarantine process for currants and gooseberries requires 3–5 years, necessitated by waiting for plants to fruit so they can be evaluated for the reversion virus. There is a PCR-based test for the reversion virus but APHIS has not accepted it, although Agriculture Canada has done so. The PCR test could enable provisional release after one year, if the propagative material is available.
- The quarantine process for raspberries requires about 3 years.

Question. With current resources, are you able to take advantage of modern molecular techniques to accelerate the rate of quarantine testing for crops such as rice, apples, cherries, sweet potatoes, and others?

Answer. Molecular diagnostic techniques alone may not accelerate the final release of germplasm from quarantine but they may accelerate the provisional release of germplasm, as described above for pome and stone fruits. The tests will detect target pathogens that have been thoroughly characterized genetically, but not other "exotic" pathogens which are often essentially unknown scientifically, except for symptoms on the plant or fruit. Thus, molecular diagnostic tests will not completely replace the time-consuming visual observations of plants currently required by APHIS regulations. Consequently, the speed of the entire quarantine process may be more closely related to principles of scientific risk assessment and/or the field and greenhouse capacity, rather than to modern molecular technology.

Despite the preceding factors, the current staffing level at the Plant Germplasm Quarantine Office (PGQO) does not enable the PGQO to take full advantage of molecular diagnostic techniques.

- Pome (apple, pear) and stone fruits (cherry, plum, peach).*—The polymerase chain reaction (PCR)-based test for phytoplasmas and molecular hybridization assays for viroids have enabled provisional quarantine release within one year, providing adequate budwood is available. Additional technical assistance is needed to fully utilize new greenhouse and screenhouse space, implement more fully this molecular testing program, and further accelerate the quarantine process.
- Stone fruits.*—Implementation of a PCR-based test for sharka (plum pox) could supplement the plant graft testing on indicator species, but would require additional resources for implementation, and additional technical assistance to fully utilize new greenhouse and screenhouse space.

- Sugarcane*.—Current quarantine testing relies on observations of symptoms on greenhouse-grown plants, which is not ideal for sugarcane. Molecular tests for Fiji virus (Oceania) and sugarcane mosaic gemini virus (Africa) are under development at PGQO. Implementing these tests, which might result in provisional quarantine release, will require additional staff resources for the PGQO.
- Rice*.—Molecular techniques are not required to accelerate pathogen diagnostic testing with rice, because the key pathogens are readily culturable bacteria. Additional technical assistance is needed to fully utilize new greenhouse and screenhouse space for the rice quarantine program.
- Currants and gooseberries*.—A PCR-based assay for the reversion virus in these plants should be implemented, but this will require APHIS approval and additional staff resources for PGQO.
- Potatoes and sweet potatoes*.—A PCR-based test for phytoplasma should be implemented to improve the accuracy and reliability of the potato/sweet potato pathogen detection, but would not necessarily accelerate the rate whereby germplasm is released from quarantine. Additional technical assistance is needed to fully utilize new greenhouse and screenhouse space and to bolster this molecular testing program.

Question. Have the germplasm materials at the Griffin, Georgia, and Pullman, Washington, facilities been tested for viability?

Answer. Of the 68,900 germplasm accessions at Pullman, WA, 32.2 percent have undergone germination testing at Pullman during the 11-year period of 1991–2001. Most of the germination tests were conducted during the last 6 years (1995–2001). Roughly one-half of the 68 percent of the collection that has not been tested recently comprises samples of legumes, which often survive 40 years or more in storage.

During the last 11 years, few of the more than 81,000 seed-propagated accessions at Griffin, GA, have undergone germination testing at Griffin; approximately 60 percent of the samples stored at Griffin have been tested recently for viability at the National Seed Storage Laboratory (NSSL), Fort Collins, CO, which provides important information for managing Griffin collection. There are 686 clonally-propagated sweet potato accessions at Griffin that are regularly checked visually for health and vigor.

Duplicate samples of 77 percent of the seed-propagated accessions from Griffin, GA, and 85 percent of the accessions from Pullman have been deposited at the NSSL, Ft. Collins, CO. The viabilities of many, but not all, of these duplicate samples were tested by NSSL before being deposited in long-term storage and the germination information made available to curators at Griffin, GA, and Pullman, WA, as was mentioned above.

Question. Do all the facilities have viability testing plans and procedures in place and do they have the resources sufficient to follow such plans and procedures?

Answer. No, not all of the NPGS facilities have viability testing plans and procedures in place, as some sites (e.g., Palmer AK; Columbus, OH; Parlier, CA) were only recently established, and the precise scope of their germplasm holdings is still under consideration. The preceding sites are still in the process of securing needed equipment, facilities, and other infrastructure. Some years ago, the NPGS conducted a system-wide effort to ensure that each existing NPGS site had an operations manual that included such viability testing plans and procedures. As a result, the “older” NPGS sites generally do have such plans and procedures in place, especially for major crops, where there may be extensive information regarding the expected long-term seed viability. In contrast, for wild species, or for “minor/specialty crops,” such as many ornamental species, viability testing procedures have not yet been developed, so no testing procedures exist. More resources are needed to conduct research at NPGS sites and elsewhere to develop those standard assays.

The linchpin of the NPGS’s viability testing program is the National Seed Storage Laboratory (NSSL) at Ft. Collins, CO, which preserves the “base” collection which holds duplicate samples of NPGS germplasm as a back-up to materials at the active sites. The NSSL conducts viability tests on all seed samples when they are initially received for deposit in long-term storage. NSSL’s plans and procedures stipulate viability monitoring every 15 years for all samples with a viability percentage of 85 percent or higher when last tested. Due to budgetary limitations, this target has not been attainable, and the NSSL must rely on an outside laboratory to conduct at a fee about 2,500 tests each year. Although germination tests are standard, seed vigor testing would also be desirable, but insufficient funds are available to initiate such testing.

The NSSL’s research program develops for the NPGS viability monitoring tools to predict longevity so that monitoring frequency is optimal, and to measure changes in viability non-destructively. At present, the NSSL scientific staff is insufficient for developing efficient and non-invasive viability assays for seeds, or to de-

velop molecular markers that evaluate genetic and environmental influences on seed quality. Furthermore, development of viability assays for wild species and “minor crops” is limited by insufficient quantities of seeds or other propagules for experimentation. Currently, technical staff is insufficient for mass producing experimental propagules, which involves very labor intensive procedures.

The resources available for implementing established viability plans and procedures vary considerably across the “active” NPGS sites, i.e., those that distribute seeds, tubers, and cuttings directly to scientists. Thanks to funding increases in fiscal year 2000 and fiscal year 2001, the genebank at Ithaca/Geneva, NY, has resources to implement testing plans and procedures aimed at maintaining seed germplasm collections at international standards. Similarly, potato samples at Madison/Sturgeon Bay, WI, are tested at least every five years, and this site currently has sufficient funds to conduct research on improving germplasm viability and on improving the efficiency of viability assessments. The site at Pullman, WA, has sufficient personnel, germination testing facilities, and testing protocols to assess seed viability, but there is a significant backlog of samples needing viability testing (over 60 percent of the collection). During this last fiscal year, resources were redirected for added support for viability assessment, but this site still needs one additional half-time worker to conduct requisite viability testing. The small grains collection at Aberdeen, ID, has a plan in place to monitor viability of all cultivated accessions every 10 years. For the wild relatives of crops, monitoring does not begin until the seed is at least 20 years old because most of the wild seed seem to retain viability longer. At Urbana, IL, funds are available for regrowing soybean samples every ten years and those of wild soybean relatives every 15 years, so that nearly all samples are of sufficiently high quality for distribution.

The NPGS site at Ames, IA, has developed detailed guidelines for viability testing that include a flow chart enabling planning and tracking the testing process for each accession, and recording all germination methods used. Each accession is tested generally at five-year intervals, although this interval can be reduced or lengthened, based on experimental results. Thanks to development of new custom software, and bar coding, the testing efficiency and accuracy have increased, thereby increasing the number of tests performed per year. There are still backlogs of germination tests for certain crops, and appropriate tests do not exist for all the species conserved but, as a whole, a recent assessment of this program found that the testing program is nearly meeting its goals.

Prior to the fiscal year 2001 budget increase, the Griffin, GA, site had no funds, personnel, facilities, equipment, or supplies available for germination tests. Established plans or procedures “in place” had little meaning because there were no means for conducting such tests. With the budget increase, a germination testing program is being established, but with suboptimal technical support and equipment. Consequently, it will require years to test the many (81,000 samples) there, and also test newly acquired or regrown samples.

Viability of cotton seeds are tested when materials are backed-up at NSSL, because the active site at College Station, TX, lacks resources for such testing. Such assays are crucial with some of the wild species with limited periods of seed viability, but resources are lacking for research in this area. Similarly, at Mayaguez, PR, lack of funds, personnel, and the large size of the collection has impeded progress with viability testing on sorghum, 5,000 of which may have very poor viability.

For some clonally propagated crops maintained in orchards (e.g., citrus), visual monitoring is sufficient for assessing viability. Staff at Davis, CA, and at NSSL are conducting pilot cryopreservation experiments on cherries and grape, but results to date have been disappointing. Pilot studies on embryo culture methods for fruit and nut crops have begun. Genetic fidelity testing for cherries and grapes is underway, and may have immediate impact on management methods. At College Station, TX, water delivery to orchards and greenhouses is the primary threat to maintaining pecan and hickory germplasm. Resources are lacking to monitor water quality.

Question. What percentage of the NPGS collection requires timely regeneration to maintain its genetic integrity? With current resources, and at the current rate of regenerating accessions, how long would it take the ARS to regenerate those accessions?

Answer. In our response, we assume that 1) “timely” means “during the next 2–5 years” (consistent with the 1997 GAO study of the NPGS), and 2) “regeneration” is relevant for the 400,000 + seed-propagated NPGS germplasm accessions. Because of the variable quality and quantity of data available, the accuracy and precision of the following percentages vary. Across the NPGS, the median percentage of collections that require regeneration during the next 2–5 years seems to be about 30 percent. The percentage information is provided for the record.

[The information follows:]

| <i>Selected NPGS collections</i> | <i>Estimated percentage requiring regeneration during the next 2-5 years</i> |
|--|--|
| Tomato genetic stock (Davis) | 20-50 |
| Soybean (Urbana) | 50 |
| Cotton (College Station) | 50-60 |
| Seed-propagated fruits and nuts (Corvallis) | 50 |
| Seed propagated accessions (Ames) | 20 |
| Seed propagated accessions (Griffin) | 30 |
| Seed propagated accessions (Geneva) | 2-97 |
| Small grains (Aberdeen) | 8-9 |
| Seed propagated accessions (Mayaguez) | 10-50 |
| Seed propagated accessions (Pullman) | 3 |
| National Seed Storage Laboratory (Ft. Collins) | 30 |

Regeneration rate is determined not only by fiscal resources available for that activity, but also strongly by the biological properties of each crop (breeding system, genetic constitution, growth rate, duration, etc.). Therefore, information for representative individual seed-propagated crops is presented. Because of the variable quality and quantity of data available, the accuracy and precision of the following figures vary. Across the NPGS, the median period required to regenerate these accessions seems to be more or less 9 years. But, importantly, for a substantial proportion of these accessions, especially of wild species (e.g., tomato, potato), research and development will be required to first develop methods for successful regeneration. The estimated years required to regenerate accessions is provided for the record.

[The information follows:]

| Selected NPGS collections | Estimated years required to regenerate accessions |
|--|---|
| Tomato genetic stock (Davis) | 3-7 |
| Soybean (Urbana) | 5 |
| Cotton (College Station) | 10-15 |
| Seed-propagated accessions (Corvallis) | No resources are currently available for regenerating those accessions. |
| Seed propagated accessions (Ames) | 2-23 |
| Seed propagated accessions (Griffin) | 12-15 |
| Seed propagated accessions (Geneva) | 1-25 |
| Small grains (Aberdeen) | 5-10 |
| Seed propagated accessions (Mayaguez) | 10 |
| Seed propagated accessions (Pullman) | 7-10 |
| National Seed Storage Laboratory | Regeneration of base (Ft. Collins) collection is conducted at active sites. |

Question. What resources are needed to develop the methodology to ensure long-term preservation of the viability of the clonally and seed propagated material in storage?

Answer. Resources are needed not only to develop effective seed storage or orchard/greenhouse preservation protocol (e.g., cryopreservation, green-house pot culture) that preserves viability, but also for more efficient methods (less time, less cost, fewer materials) of long-term preservation. In many cases, resources are needed to test the genetic fidelity/authenticity of stored materials.

The National Seed Storage Laboratory (NSSL) at Ft. Collins, CO, is the NPGS central site for long-term germplasm preservation. Although cryopreservation protocols exist for propagules (sexually or asexually derived) innately extremely tolerant of low temperature or moisture stresses, and for propagules sensitive to these stresses but, because of their small size (<1,000 cells), are amenable to other approaches, there are hundreds of species and tens of thousands of samples, for which cryopreservation methods are lacking. Despite some progress, many barriers remain for efficient cryopreservation of the former samples, and too few scientists are addressing these problems.

Plant material may often be insufficient for such experiments because methods are usually labor intensive; there is usually insufficient support staff to implement procedures on the wide scale required. More support scientists are needed to apply technology and more technicians are needed to enhance propagule production and processing and to implement a viability-monitoring program. Staff support is needed for further research on documentation of stress physiology of uncharacterized spe-

cies before they are placed in a routine storage environment, on greater longevity of propagules so that monitoring and regeneration frequencies can be extended, on greater capabilities to regenerate large quantities of high quality propagules, on assessments of genetic diversity within and among accessions and genetic shifts resulting from storage so that the size of collections can be optimized, appropriate samples can be archived, species or varieties lacking preservation protocols can be prioritized, and the impact of mortality on genetic diversity can be assessed.

Specific preservation protocols must be developed for species represented by more than 30,000 NPGS samples. Clonal protocols for liquid nitrogen storage are very specific to species or sub-species; these protocols must be adapted for hundreds if not thousands of species. A nondestructive seed viability monitoring test is needed to reduce the destruction of seeds during testing. The research to develop the latter will require extensive resources in addition to time to adapt protocols for germplasm storage.

NPGS sites that primarily manage clonally-propagated germplasm face many of the same resource issues. Current funding at Riverside, CA, is insufficient for developing methods for storing citrus seeds at cryogenic temperatures, so all citrus germplasm is maintained clonally as orchard trees, which is expensive. Similarly, much of the tropical germplasm at Hilo, HI, and Mayagüez, PR, is preserved in orchards or in pots in greenhouses. Resources are needed to develop reliable methods for long-term cryopreservation of tropical/subtropical clonally-propagated fruit germplasm at both sites. Thanks to research conducted previously at Hilo, HI, pineapple, breadfruit, and tea are stored in tissue culture for the medium term, but limited storage space and personnel impede progress. Funds for additional technical assistance are needed to back up in cryogenic storage and *in vitro* culture more of the small fruit and nut samples at Corvallis, OR. For fully a half of the collection, scientific techniques must be developed to do so. Additional facilities (a tissue culture lab facility), an additional scientist, technician, supplies, and equipment (growth chambers, laminar flow hood, microscopes) are needed at Ithaca/Geneva, NY, for long-term storage of clonally-propagated grape germplasm as buds or other tissues.

At Pullman, WA, continued development of infrastructure through capital improvements is needed to expand and improve greenhouse, screenhouse, and growth chamber space needed to develop seed increase protocols, or where the actual increases are conducted, because the accessions are either not adapted to the local area or because of diseases (primarily viral). Greenhouse seed increase provides not only the best yields per plant per accession, but also by far the best quality of seed. Similarly, at Aberdeen, ID, the paucity of greenhouse space is limiting the rate for regenerating the backlog of wild species.

For pecans and hickory, additional resources are needed to develop molecular genetic tools for analyzing the structure of genetic diversity in native populations. Such data will help with establishing a viable *in situ* conservation strategy, which would be the best for these native tree species. The research also may help establish improved, *ex situ* plantations selected for improved performance in particular geographic regions (from which continued selection can contribute to long-term regional improvement), for verification of cultivar identity, as well as for the long-term development of marker-aided selection to improve the efficiency of the breeding program. The molecular marker work is funded by a grant that expires this year. At current budget levels, there are no resources to continue using the markers in routine assays.

Sufficient resources are available to preserve the viability of clonally-and seed-propagated potato germplasm at Madison/Sturgeon Bay, WI. However, additional resources are needed to develop genetic markers for assessing the genetic fidelity/authenticity of stored potato germplasm. Similarly, the system for long-term preservation for cotton at College Station, TX, seems to be adequate, except that additional resources would be welcome for more rapidly moving new materials through the seed increase and document phases to be incorporated into the long-term base collection.

Methods are available for ensuring long-term preservation for the vast majority of species maintained at Ames, IA. But for some crops, appropriate protocols are not yet available. Staff at that site collaborate with staff at NSSL on those issues. Resources are currently unavailable to examine the genetic component of longevity under actual, long-term storage conditions, and genetic shifts in accessions as a result of the regeneration process itself, both independent of, and related to, genetic shifts under long-term storage conditions. Relatively few accessions at Ames, IA, are maintained vegetatively but they often possess special characteristics, for which reliable safe, long-term preservation methods are lacking. Such germplasm is maintained in field and greenhouse plantings, with no organized system of off-site

backup. Little is known about their long-term health, with respect to the broad range of microbes present as latent infections for extended periods of time.

The costs of ongoing, long-term planting or long-term maintenance in the greenhouse vary widely depending on re-propagation frequency, adaptation to field conditions, etc. Nevertheless, reliable protocols for slow-growth, in-vitro shoot-tip culture or cryogenic preservation of buds could decrease per unit preservation costs. Such protocols are generally lacking and, even when they are available, two important issues remain: (1) how easily can generic protocols be modified to work well on a broad range of genotypes, and (2) do the plants that are recovered after storage preserve the genetic integrity of the source material?

A research geneticist, additional lab technicians, and updated DNA sequencers are needed in Griffin, GA, to test the genetic authenticity of clonal germplasm stored in tissue culture and in the greenhouse. Methods for maintaining sweet potato via cryopreservation rather than the current labor-intensive tissue culture system are needed, not only to save time and money, but to reduce the risk of losing valuable germplasm. Increased funding for the molecular lab would also increase testing for duplication and genetic redundancy, which not only increase storage and regeneration costs, but also hamper evaluation efforts wherein genetically identical accessions may be assessed. Similarly, no genetic fidelity tests are conducted on sorghum in Mayagüez, PR, which is especially worrisome for accessions with low viability. Additional resources are needed for that genetic testing.

Question. Does the NPGS have the resources to effectively use geographic information system tools to identify gaps in the U.S. collection?

Answer. In addition to the resources available for geographical information systems (GIS) analyses, methodological and data quality factors may strongly affect how effectively GIS can identify genetic gaps in the NPGS's collection. Of course, the resources that have been available historically may have strongly affected the preceding factors.

First, for each crop or species under consideration, the strength of the association between genetic variation and ecogeographical factors must be determined before GIS analyses of ecogeographical data can be considered a reliable means for predicting genetic divergence or diversity. There are few resources throughout the NPGS to hire personnel with GIS expertise to integrate genetic diversity data with geographic information. NPGS sites such as at Ft. Collins, CO, have the potential to utilize the GIS to reduce duplication, improve the quality of the collection through core subsets, and identify locations for growout that would be cost efficient, but they lack funding for personnel to generate such genetic data, or with needed GIS background or computer skills.

Second, basic information about the degree of reliability for the ecogeographical information itself is generally lacking. GIS relies on the accuracy of the available latitude and longitude data to identify sites that environmental factors suggest may contain genetic variation valuable to sample. For example, the ecogeographical information available for the pecan and hickory collection at College Station, TX, lacks the precision needed for GIS analyses. Development of such information, a long-term project, is required for this site to use GIS techniques to integrate ecogeographical information with molecular estimates of genetic variation. The major limitations to progress are insufficient resources for personnel.

Third, lack of latitude/longitude/elevation data, or any accurate location data at all, may simply preclude use of GIS to analyze many thousands of older accessions (e.g., in citrus). As funds permit, locations such as Ames, IA, and Beltsville, MD, are retrospectively determining the latitude and longitude of the origin of NPGS accessions. But additional resources are needed for permanent data entry specialists to do that, and to computerize descriptive information recorded only on paper. But, in contrast, the Aberdeen, ID, site had sufficient resources to map almost all possible germplasm samples by their latitude and longitude with GIS software and electronic gazeteers.

Finally, lack of resources for identifying the optimal GIS approach and for confirming the validity of initial experiments may impede application of GIS to identify genetic gaps in the NPGS collection. For example, at Beltsville, MD, inadequate resources for technical support is greatly limiting implementation of an original approach for applying GIS technology to identify gaps in the NPGS collections and prioritizing acquisition needs. Resources are similarly lacking at Pullman/Prosser, WA, and at the soybean collection at Urbana, IL. In general, throughout the NPGS there are few resources for applying existing techniques to the many important crop gene pools and very limited capacity for developing more sophisticated tools for more in depth analysis of collections, needs, and priorities.

Question. Does the NPGS have the resources to analyze the plant collections for gaps and the resources to prioritize the collections using this procedure?

Answer. As with the preceding question, factors other than resource availability, such as methodological and data quality issues, may be key for developing the means for applying GIS and molecular genetic analyses to managerial/curatorial decision-making, such as gap analyses and setting priorities for germplasm management.

First, let us presume that “gaps” mean absence from the collections of key genes, genotypes, varieties, etc. Before GIS technology can be applied to identifying gaps, and the technological merit of this approach assessed, basic information is needed regarding the genetic structure of crop genepools and their distribution in nature, farmers’ fields, and in gene banks. Besides the major crops, relatively little is known about the total genetic diversity of other crop species; the genetic diversity within and among populations/accessions of a species; the number of accessions needed to fully represent the genetic diversity of a species; and the relationship between morphological traits, environmental plasticity and genetic diversity. Molecular analytical procedures must be developed for each species so that genetic relationships among genebank samples can be estimated.

For example, little or nothing is known of the genetic diversity in many wild perennial sunflowers. A gap in the genetic coverage of the NPGS collection of wild relatives of sorghum is suspected, but a lack of genetic data makes it difficult to confirm this or to estimate the size of such gap. The current status of “wild” citrus and date palms in nature is unclear, and political barriers currently impede access to some nations where these crops originated. Much descriptive literature on these crops is very old (1800’s) and probably not always accurate. Similarly, taxonomic treatments for many minor (especially tropical) and even some major crops are currently insufficient to identify gaps. Up-to-date taxonomic classifications, accurate data on native distributions, and access to important taxonomic reference data, all critical for analyzing gaps, may be lacking. With the current level of support, the staff of taxonomists associated with the NPGS struggles to adequately meet the ever-increasing demands for taxonomic data.

In some NPGS sites, lack of resources impedes the ability to conduct gap analysis with GIS and/or molecular approaches. At Pullman, WA, resources are needed to format the passport data so that it can be analyzed by GIS. Furthermore, once passport data are ready, both morphological and molecular markers must be combined in databases. For many of the species within its collection, NPGS lacks sufficient scientific staff or molecular genetic labs with high throughput capabilities to perform the prerequisite genetic assays. This is especially the case for large collections, e.g., 30,000 + sorghum samples managed at Mayagüez, PR, and Griffin, GA, where resources are not available to analyze the entire collection for gaps.

Resources are lacking to continue molecular analyses, funded by a competitive grant, that are providing critical baseline genetic data for pecans and hickories at College Station, TX. Furthermore, permanent “in-house” personnel trained in plant population analysis and interpretation are needed there. The genebank at Corvallis, OR, lacks resources for molecular analysis of temperate fruit or nut collections to identify gaps. Additional molecular tools, in conjunction with extant information on morphological traits and ecogeographical location, would provide a more precise estimate for genetic diversity in the collections. Where, such as at Aberdeen, ID, the necessary ecogeographical baseline data and GIS tools are available for initiating GIS assisted gap analyses, resources (money and techniques) may be lacking to evaluate samples at the molecular level and thereby identify gaps.

Limited genetic resources, often from competitive grants, have been available for NPGS scientists to complete an extensive survey of potato genetic variability and systematic relationships during the last 15 years, providing a detailed accounting of the gaps in the NPGS and other potato germplasm collections. Also, some “gap analyses” (that have not employed GIS) have been conducted on very small plant collections, where they also uncovered putative duplicates/redundancies, which may occur especially in poorly-characterized collections of clonally-propagated crops. For example, molecular analyses detected little genetic variation among samples of tannier at Mayagüez, PR. Analyses may also be conducted at the level of species, e.g., the Beltsville, MD, site is determining the presence or absence of wild crop relatives and the number of accessions for these species in the NPGS collections, then will use GIS tools to analyze the ecogeographic origin of existing accessions as a first step in the analysis of gaps and prioritization of acquisition needs.

In some cases, molecular analyses have successfully detected gaps in genetic diversity, and resources were available for NPGS scientists to collect new material to fill those gaps. A comprehensive molecular analysis of the pea collection at Pullman, WA, revealed that newly discovered genetic variants almost always occurred in samples from Turkey. As a result, several collecting expeditions were mounted in Turkey until it was believed that the genetic gap was filled. Similarly, genetic research

at Davis, CA, with wild relatives of the cultivated grape identified species that may be of special interest to grape breeders. As a result, scientists are planning to collect wild grape species from Armenia, and assess its diversity. Also, plans are underway to collect wild Chinese grape species in danger of extinction in nature. There are few Chinese grape samples in the NPGS, and those sample's properties suggest that this poor representation represents a major gap.

Question. What is the status of international efforts to exchange germplasm and is any germplasm located outside of the U.S. at a risk of loss? What agencies or entities are involved in assessing whether germplasm is at a risk of loss on an international basis?

Answer. During the last decade—especially during the last five years—developments in international and national legislation and diplomatic agreements have complicated, or sometimes precluded, free international exchange of germplasm. Part of this trend is the result of the philosophical change from considering germplasm the “common heritage of humankind,” to formal recognition of nations’ sovereignty over the germplasm within their own borders. The Convention on Biological Diversity (CBD) and other legislation now require that “prior informed consent” and arrangements for “benefit sharing” be established before germplasm can be exchanged. Although such provisions are considered by some as the basis for durable germplasm conservation and exchange, to some extent, they have slowed the rate of germplasm exchange, and sometimes impeded the ability of scientists to visit endangered locales and at least perform a “triage” to save crop germplasm. Negotiations that precede plant exchange are now considerably longer, more complicated, and consequently germplasm exchange may be more expensive than ever before.

Outside of the United States, destruction of natural and agricultural habitat and of traditional cultures is proceeding at an accelerated rate that threatens germplasm. Although other nations (especially in the developing world) have established genebanks and reserves for natural vegetation, on a global scale, the capacity to manage germplasm in gene banks or in reserves has probably not increased substantially. At present, many genebanks in other nations have very limited capacity, and conservation reserves are often not adequately managed. Also, on a global scale, enhanced capacity in some nations (e.g., several developing nations) has been “canceled out” by lost capacity in other nations (e.g., Russia, some nations of the Former Soviet Union), by cutbacks in funding to some of the CGIAR centers, etc. Consequently, germplasm outside of the U.S. is still at risk. As limited resources permit, staff of the NPGS are working with officials in Russia and elsewhere to place duplicate germplasm samples in the NPGS for safekeeping.

Finally, economic “globalization” has benefitted many worldwide through substantial expansion in international trade and through development of transportation infrastructure (e.g., roads, airfields, navigational channels), affording ever easier access to previously remote regions that may facilitate germplasm collection, tourism, agricultural development, etc. But, this access has also increased the danger to germplasm in nature, as formerly pristine regions are converted from traditional agriculture and/or natural habitats to more intensive agricultural and forestry practices. Concurrently, the traditional cultures of indigenous peoples, and their rich lore about plant uses, may be lost. Lastly, penetration into pristine regions provides invasion routes for additional exotic, invasive species which may rapidly deteriorate the landscape and endanger potentially valuable germplasm of traditional crops and their wild relatives.

The International Plant Genetic Resources Institute (IPGRI), an international agricultural research center (IARC) supported by the World Bank through the Consultative Group for International Agriculture Research (CGIAR), has as part of its mission the monitoring of germplasm loss internationally. Similarly, the Food and Agricultural Organization of the United Nations (FAO) maintains the World Information and Early Warning System (WIEWS) to disseminate information about germplasm at risk, and as an instrument for the periodic assessment of the state of the world’s crop germplasm. The USDA/ARS National Plant Germplasm System (NPGS) collaborates closely especially with IPGRI on projects to assess the status of germplasm in specific crops, e.g., peanuts. The U.S. government provides 20 percent of the funding for the FAO, and the NPGS contributes information to the WIEWS.

Question. What is the availability and condition of collections at the international agricultural research centers and have the collections been evaluated adequately?

Answer. The availability and condition of the crop germplasm collections at the international agricultural research centers (IARCs), and the degree to which germplasm has been evaluated adequately, varies widely from IARC to IARC, and across the individual crop collections at each IARC. For some crops, samples from the IARCs are generally readily available, although they may not be adequately

evaluated. Recently, there has been a very active exchange of dry bean germplasm between NPGS at Pullman, WA, and scientists at CIAT, an IARC in Colombia. At other IARCs, unless NPGS scientists have established a collaborative research effort with that IARC's scientists, germplasm access may be problematic. Access by U.S. researchers to germplasm in IARCs or held by other countries may be seriously compromised as a result of the forthcoming FAO International Undertaking, which will regulate worldwide access to plant germplasm.

The quality of germplasm collections at the IARCs is highly variable. It is generally believed that resources for periodic viability testing of the collections held at the IARC's does not exist, therefore viability testing is not done. It is difficult to monitor the condition of collections without that information, but resources are generally not going to germplasm viability testing or regeneration on a routine basis at these centers. The NPGS site at Beltsville, MD, is assessing the quality of IARC collections with respect to species representation, numbers of accessions per species, geographic origin of accessions, etc. Eventually, this information may be used to compare the contents of IARC collections with contents of the NPGS collections to identify "global" gaps, redundancies etc.

Collections of cool-season legumes (chickpea, lentil, pea) at the International Center for Agricultural Research in Desert Areas (in Syria) and the International Center for Research in the Semi-Arid Tropics (in India) seem to be of generally high quality, and readily accessible to researchers. The International Center for Maize (Corn) and Wheat Research (CIMMYT) has excellent germplasm storage facilities, but the condition of their collections is directly related to their condition at the time of deposit, and varies greatly. In contrast, there are few germplasm collections of tropical/subtropical fruits at IARCs and they may not be of high quality or adequately evaluated. Banana and cacao may be exceptions, but even collections of these crops may deteriorate due to unstable political climate and lack of funding. Many clonal collections of tropical fruit crops in IARCs are unreplicated and accessions grafted into different and unknown rootstocks, thereby greatly complicating evaluations.

A molecular assessment of the genetic diversity in crops in both the IARC and U.S. collections would help the U.S. assess its needs, the countries where it could expect to exchange germplasm, and its interdependence on any countries holding valuable collections or wild relatives in situ. For example, additional evaluations of horticultural merit are needed for collections of white potatoes and sweet potatoes at the International Potato Center (CIP, in Peru). Furthermore, germplasm in most of the other IARCs and in national collections have not been evaluated well, or at all, for conditions and traits of benefit to U.S. needs. Indeed, most of the samples in IARC genebanks have not been evaluated adequately for performance under temperate conditions.

Finally, for some globally important crops, there are no IARC collections. For all practical considerations, the NPGS collection at College Station, TX, serves as the international collection for cotton, and the collection at Urbana, IL, serves a similar role for soybean.

Question. If there is not a substantial increase in the NPGS budget of \$20 million as ARS requested, what are some of the forecast ramifications?

Answer. As mentioned in answer to a previous question, there were no formal agency or Departmental budget requests. The ramifications of a static NPGS budget for fiscal years 2002–2006 can be forecast from both a fiscal and a programmatic standpoint. From a fiscal standpoint, consider the current budget of \$32.2 million, and assume the following: (1) inflation reduces purchasing power at a rate of 2.6 percent per year (the mean calculated from annual estimates for this period in the fiscal year 2001 Budget Analytical Perspectives); and (2) personnel costs increase by 3.4 percent per year (the mean calculated from annual estimates for this period in the fiscal year 2001 Budget Analytical Perspectives). Given the preceding figures, and a static budget during fiscal years 2002–2006, the purchasing power of the NPGS budget would decrease by 14 percent from inflation. During the same period, the current percentage (15 percent) of the NPGS budget devoted to non-salary items (equipment, operations, travel) would decrease by 18 percent to 13 percent. Adjusted for inflation, the non-salary budget would effectively be reduced to less than 10 percent of the total NPGS budget. And, at certain NPGS sites, that percentage would be substantially less than 10 percent.

A static budget during fiscal years 2002–2006 would have severe programmatic ramifications throughout the NPGS. The budgets of some sites are already running deficits that are accompanied by substantial programmatic effects. Funding at many sites would be insufficient not only for salaries of temporary employees, but also for some permanent curatorial staff. At many sites, no funds would be available for util-

ities, travel, operations, facility repairs or expansion, supplies, or equipment. Position vacancies would be abolished to provide funds for operations.

With a static budget during fiscal years 2002–2006, the NPGS would by necessity focus nearly exclusively on providing security for databases and for germplasm stored in coldrooms, greenhouses, and field plantings. Purchase of equipment key for germplasm security might be precluded. Acquisition of endangered germplasm would slow or cease, as would evaluation of germplasm for agronomically or horticulturally valuable traits. The rate of duplicating (backing-up) germplasm and testing it for health, viability, or genetic integrity would slow or cease. Germplasm would move through the quarantine process more slowly, or not at all. Germplasm currently at risk would perhaps be endangered further, whereas additional germplasm might also be endangered. As the funds available for maintaining each accession shrank, the supply of germplasm would shrink, which would limit germplasm distribution, and impede the progress of important research and breeding programs. Should additional funds become available in later years, they would initially be devoted to restoring the NPGS to its state in fiscal year 2002, rather than to progress on new initiatives.

A static budget would preclude the NPGS from exploiting the new tools of genomics and biotechnology to develop more effective and efficient means of maintaining and regenerating germplasm. The ramifications would be especially severe for clonally-propagated crops, many of which cannot now be preserved by long-term tissue culture or cryopreservation.

Lastly, there is currently more demand (more frequent requests, and more samples per request) from scientists for germplasm for research, and more public interest in conserving genetic diversity and in exploiting it for crop improvement, than at anytime in the past. For example, soybean farmers through the United Soybean Board and state checkoffs have been and still are investing millions to exploit soybean germplasm. Researchers are already finding new genes for improved levels of disease resistance and yield. Genomic technology is identifying loci and allelic variants important for yield, seed composition, disease resistance and other economically important traits in soybean, tomato, and other crops. The major funding increases for plant genomic research at NSF will generate many new specialized genetic stocks for the NPGS to manage. For example, NSF-funded research will generate at least 50,000 new maize (corn) genetic stocks, which would more than double the size of the NPGS maize stock center. Just when researchers can use germplasm more effectively and efficiently than ever before, just when its clientele is demanding more from the NPGS, and just when the NPGS, if sufficiently funded, could deliver more than ever before to its customers, the NPGS would struggle just to maintain staff, facilities, and germplasm.

Question. If NPGS received an increase of \$10 million for fiscal year 2002, what would you be able to accomplish with the additional resources?

Answer. An NPGS-wide \$10 million funding increase would enable the NPGS as a whole to accelerate substantially its progress in all facets of plant genetic resource management. As a result, the time needed to regenerate accessions that are endangered because of low seed number or viability would be shortened dramatically, thus safeguarding much of the germplasm currently at risk. An additional 6–7 scientists could be hired. The number of permanent, full-time technicians, information management personnel, or support scientists could be increased by about 40. At sites that employ substantial crews of part-time or seasonal workers, many more of these workers would be hired.

More germplasm would be safeguarded by newly developed cryopreservation and *in vitro* culture technologies. The genetic diversity in entire collections could be characterized by new, high throughput methods for assessing genetic diversity. Funds would be available to adapt the latest technology of genomics and bioinformatics to germplasm management by hiring scientists trained in genome analyses, bioinformaticists, and computational biologists. New, specialized databases would be constructed to meet specific user needs. Some genebanks would have the resources to begin to distribute germplasm in the form of isolated, purified DNA for molecular studies.

Costly new specialized facilities, e.g., specialized greenhouses, screenhouses, growth chambers, and laboratories, could be constructed. New greenhouses and screenhouses are needed throughout the NPGS, especially if new funding were available to intensify germplasm regeneration, maintenance, and quarantine programs. With crops that are cultivated worldwide, the genetic variability and ecological adaptation within the crop are so broad that no one site is suitable for cultivating all varieties in the field, so some must be grown in greenhouses. Furthermore, until *in vitro* culture techniques are developed for particular clonally-propa-

gated germplasm, greenhouses and screenhouses can serve as back-up sites for accessions that are now maintained solely in orchards at other sites.

Question. Does the NPGS have sufficient resources to handle the projected increase in specialized genetic stocks generated by the publicly funded plant genome programs? Please provide the dollar amount and the percentage of the NPGS budget for specialized genetic stocks on a location-by-location basis.

Answer. During the next decade, the specialized genetic stocks and research tools produced by public plant genome projects supported by the National Science Foundation and USDA/National Research Initiative (NRI) will substantially increase the size of the NPGS's specialized genetic stock collections. If the funding currently available for supporting these stock collections does not increase proportionately, then resources will not be sufficient for optimally conserving and distributing these valuable research tools.

For example, managers of pea, common bean, and lettuce genetic resources at Pullman, WA, are being asked to curate numerous special genetic stocks developed for gene mapping and characterization projects supported primarily by the NRI, but the personnel, equipment, and facilities currently are insufficient to do so. Current funding and facilities devoted to tomato and potato genetic stocks would need to be expanded extensively to handle thousands of new genetic stocks that may be generated by public tomato or potato genome projects.

Genome projects will increase the numbers of maize (corn) genetic stocks enormously. One large maize genome project funded by NSF in 1999 is generating ca. 50,000 new genetic lines. As a result, the maize genetic stock collection at Urbana, IL, will require at least one additional technician and accompanying increased budget for operations to manage those lines alone. As the stocks arrive during the next few years, additional climate-controlled seed storage space must be available, which will require construction. New greenhouses are needed for cultivating some of the new stocks safely. Thus, the impact of this one project on the NPGS will be on the order of \$50,000–\$75,000 annually, adjusted upward for inflation, for the foreseeable future. And that quantity reflects only increased operational costs: capital improvements (greenhouse, cold storage space) would further increase the total cost. The current ARS base budget for the maize genetic stock collection does not suffice even for handling the new genetic stocks generated just by that one (albeit large) project. It is uncertain how many more such projects will be funded by NSF or NRI in the future, but each has the potential of increasing the demand on the NPGS's resources by a similar amount.

Similarly, funds have not been available to maintain cotton genetic stocks at College Station, TX, that cannot be managed according to routine procedures for this crop. It is anticipated that a number of publicly-funded cotton genome projects will deposit genetic stocks in the collection, especially because the projects are supported by grant funds, which will expire soon.

Soybean genetic stocks currently comprise little of the soybean collection at Urbana, IL. It is uncertain whether the numerous soybean genome projects will greatly increase the number of genetic stocks incorporated into that collection. At present about 1.4 percent of the 100,000+ samples at the National Small Grains Collection at Aberdeen, ID, are genetic stocks. Current resources are sufficient to manage these stocks.

Furthermore, resources are needed to conduct research (at Ft. Collins, CO, and elsewhere) on how to effectively conserve some genetic lines with altered synthesis of and response to plant growth regulators. Their seeds are not amenable to conventional storage.

A summary of the fiscal resources devoted specifically to managing genetic stock collections is provided, site by site. One research project at Urbana, IL, is devoted completely to managing such a collection (for maize, i.e., corn). For other crops, genetic stock collections are often considerably smaller than that for maize, and these efforts are thoroughly integrated with much larger general crop germplasm management efforts. In these cases, a relatively small percentage (<10 percent) of total funds in the relevant research project is devoted specifically to managing genetic stocks. For the total NPGS budget of ca. \$32 million, an estimated \$587,600, or 1.8 percent, is devoted to managing crop genetic stocks.

[The information follows:]

| Site | Percent of relevant research project devoted to genetic stocks | Funds |
|---------------------------------------|--|----------|
| Aberdeen, ID (wheat and barley) | 6.0 | \$83,900 |
| Urbana IL (maize) | 100.0 | 357,200 |

| Site | Percent of relevant research project devoted to genetic stocks | Funds |
|---|--|--------|
| Urbana, IL (soybeans) | 4.0 | 27,700 |
| Ithaca/Geneva, NY (tomato) (funds transferred to University of California, Davis, CA) | 6.7 | 54,300 |
| College Station, TX (cotton) | 4.0 | 58,800 |
| Pullman, WA (pea) | 0.3 | 5,700 |

AGRICULTURAL RESEARCH SERVICE (ARS) BUILDINGS AND FACILITIES

Question. The President's fiscal year 2002 budget proposes a \$44 million reduction in funding for Agricultural Research Service buildings and facilities. The President's budget blueprint indicates that the Department will conduct a comprehensive review of overall facility needs. Agriculture research facilities have been reviewed on numerous occasions. The last I am aware of was submitted in August of 1999 by the Strategic Planning Task Force required by the 1996 Farm Bill to conduct a study of USDA research facilities and report back to the Secretary of Agriculture and the Congress. Why is a new, comprehensive facilities' review needed? What does the Administration hope it will accomplish that the others did not? What guidance has been given for this review; who will conduct the review; and when is it expected to be completed?

Answer. Comprehensive review of USDA research facilities is needed as part of the Administration's review of budget proposals and priorities for preparation of the fiscal year 2003 and future budgets. Although no formal guidance has been issued regarding the review of facility needs, it is anticipated that existing reports will be utilized for this review. Updated information is required, however, to determine long-term cost commitments for projects, utilization rates for existing space, and other determining factors that impact capital investment decisions. In addition, an analysis of research program priorities as they relate to facility condition should be part of our new analysis.

Question. The Congress has initiated funding for a number of projects which are needed and supported by the Department and the ARS even if they do not make the Administration's priority list for inclusion in the President's budget request. Given budgetary constraints, these projects have been funded incrementally over a number of years. A number of projects funded in past appropriations Acts can now be completed if the final increment of construction funding is provided for fiscal year 2002. Given the investment made to date and to avoid further escalation in total cost, wouldn't it make more sense to complete these projects rather than to initiate new projects or new phases of projects as the President's fiscal year 2002 budget proposes?

Answer. There are times when priorities change or when projects are recognized as local or regional priorities when they are not part of the national research agenda established in the annual budget process. Projects chosen for funding in the 2002 budget are those serving national needs, including the major regional research centers of the Agricultural Research Service. Most of these projects are continuing long-term modernization efforts at existing facilities. While prior year investment to fund construction projects is an important factor and requires our prudent review, the ultimate goal of completion does not serve as the decisive measure when determining priority for funding proposals.

Question. The fiscal year 2002 budget requests \$3.762 million to continue modernization of the Plum Island Animal Disease Center in Greenport, NY. Research on foot-and-mouth disease and other foreign animal diseases that are an ongoing threat to livestock is currently conducted at this location. Are the current facilities at Plum Island adequate to conduct this work?

Answer. The requested modernization of the Plum Island Animal Disease Center (PIADC) in Greenport, New York is an essential component of the requirement to ensure the successful research on Foot-and-Mouth Disease (FMD) and other foreign animal diseases. The facility, although safe, is not a state-of-the-art facility. The high containment animal housing space is limited and currently is being used for research on FMD. Modernization of these research and diagnostic facilities is critical if we are to meet the threats posed by exotic foreign animal diseases to U.S. American agriculture and to human health worldwide, as PIADC is the only Federal U.S. facility where research of this caliber can be conducted.

Question. Funding of \$20.5 million has been provided to date for the Western Human Nutrition Research Center, Davis, CA. It was my understanding that the project scope had been down-sized to enable the project to be completed within the

funds appropriated. The fiscal year 2002 budget requests \$5 million to restore the facility to its original scope. Why?

Answer. The Agricultural Research Service was appropriated \$20,350,000 for the design and construction of this facility. However, because of escalating building and construction costs in California, the facility's original scope had to be reduced from 49,000 GSF to 43,000 GSF to meet the funding available for this construction project. While such a down-sized facility would still accommodate the projected staffing level of 16 scientists, the ARS space allocations would be reduced for most functions, including lab space, human studies space, offices and storage areas. Moreover, the down-sized facility would not provide room for future program growth which could only be accommodated in space in other university-owned buildings on the UC-Davis campus. The benefits of consolidation in a single facility—to ARS and UC-Davis campus—would be foregone.

INFORMATION TECHNOLOGY/SECURITY

Question. On April 30, 2001, the Chicago Tribune reported that due to lax computer security, the National Agricultural Statistics Service (NASS) has left highly sensitive crop forecasting data vulnerable and open to hackers and others who would want to profit from having access to such data. What has the Department done to investigate this matter and what steps has it taken to ensure that vital data such as this throughout the Department and at its data center in New Orleans and Kansas City are adequately protected from unauthorized access and misuse?

Answer. The Office of the Chief Information Officer (OCIO) has examined the issues raised in the Chicago Tribune article and informed me that the allegations are misleading. This is due, in part, to misunderstandings of NASS security procedures and the perceived threat.

Both OCIO and Office of Inspector General (OIG) have concluded their reviews of this issue. OIG has issued an opinion that NASS information is secure. They offered some recommendations to further tighten security and OCIO is working to help strengthen NASS's security program in identified areas. In addition, security reviews have been concluded at the Department's major centers. I will have OCIO provide more specific information on these security issues.

[The information follows:]

OCIO is currently working with the General Accounting Office (GAO), which has begun its own review of NASS security practices. Information related to the NASS crop forecasting process and security of the forecasting data has been provided. In addition, NASS systems are currently on OCIO's oversight review plan. A comprehensive security review will be conducted following the conclusion of the GAO review.

In November, a site assessment team, comprised of security specialists, conducted an onsite security risk assessment at the USDA National Finance Center (NFC). The team reviewed NFC's computer and telecommunications environment. Additionally, they interviewed security personnel to determine if security measures, both in place and planned, are adequate to protect the integrity, availability and safety of NFC's information resources. The review established a security baseline for measuring progress at NFC and resulted in numerous findings, most of which were easily remedied. Others, however, will require additional follow-up efforts to adequately mitigate. Follow-up configuration management training also resulted from this review. None of the vulnerabilities found related to the potential compromise of NASS data.

The Cyber Security Program Office staff recently concluded security reviews (both physical and cyber-security) of IT facilities at the National Information Technology Center (NITC) in Kansas City. The NITC review assessed security measures already in place and planned for NITC. The review was conducted to determine if measures are adequate to protect the information resources hosted at NITC, and also establishing a security baseline for measuring future progress and mitigating risks. This review was similar to one conducted recently at the National Finance Center (NFC) in New Orleans and is part of Cyber Security's risk-based security review program. In addition, contracted security specialists recently completed an exhaustive study of NITC security requirements and existing security controls. Recommendations for improvement in NITC security posture have been delivered and are currently under consideration by NITC and OCIO management. These recommendations include an analysis of alternative methods for encrypting sensitive data managed by NITC systems.

Question. Over the last several years we and others have raised questions and expressed concerns about USDA's management of and plans associated with its multi-billion dollar effort to modernize business processes and information technology for

its county based agencies. What assurances can you give us that this critical effort is on track and is being managed in a cost-effective and efficient manner?

Answer. The USDA Chief Information Officer has been assigned direct management responsibility for the information technology portion of the Service Center Modernization Initiative (SCMI) and has taken steps to ensure that this effort is managed cost-effectively and efficiently. A central management structure, headed by an Office of the Chief Information Officer (OCIO) executive and assisted by a central project management office manages the effort. The OCIO has also engaged experienced private-sector support to provide assistance. According to OCIO, integrated project plans are being used to ensure that the project is managed in an efficient and cost effective manner. Funds provided by the Congress for this initiative are being managed by the OCIO, and the National Food and Agriculture Council and the OCIO develop budgets and monitor spending. Status reports are prepared and circulated internally, and OCIO also submits quarterly reports to Congress on implementation of the Common Computing Environment.

Question. For some time, USDA has been trying to improve its financial management systems, which includes implementing its Foundation Financial Information System (FFIS). Where does USDA stand in resolving its financial management problems?

Answer. USDA is making significant progress in implementing FFIS. The Department's largest agencies are now using FFIS, and by October 1, 2002, all USDA agencies will be using FFIS. FFIS is intended to be the foundation for other departmentwide or "corporate" systems initiatives needed to ensure that the program and financial data fed into FFIS is reliable. The Department has been formulating plans for these corporate systems and will be implementing them in the coming years. We will also address agency-specific financial reporting problems, which together with improved financial management systems, should improve our audit opinion in fiscal year 2001.

Question. Where does USDA stand on implementing the Freedom to E-File Act for enabling farmers and others to access and file paperwork electronically with the Department? Does USDA plan to implement GAO's recent e-File report recommendations?

Answer. In the short term, we are continuing to expand the number of redesigned forms available on the common Service Center e-Government web site. The initial requirement of the Freedom to E-File Act was met through the deployment of commonly used Rural Development, Farm Service Agency, and Natural Resources Conservation Service forms to this site.

USDA is in agreement with the recommendations in a recent GAO report on our implementation of the Freedom to E-File Act. A senior executive is leading our e-Government efforts. He is working with agency e-Government executives on department-wide and agency-specific plans to implement e-Government programs and processes, consistent with legislative requirements and GAO recommendations.

Question. Table 22-1 of the President's budget shows that total information technology (IT) investments for USDA will increase from \$1.383 billion in fiscal year 2001 to \$1.488 billion in fiscal year 2002. What are the major and significant projects that will be supported by the fiscal year 2002 funding level requested? Did USDA's CIO and Executive Information Technology Investment Review Board (EITIRB) review and approve each one as part of USDA's fiscal year 2002 capital planning and investment control process? Were any problems identified as part of their review of these projects and, if so, what actions were taken to address them? Which funded projects were not part of USDA's fiscal year 2002 capital planning and investment control process, and why was each project excluded from this process?

Answer. I will have the Chief Information Officer provide that information for the record.

[The information follows:]

USDA's CIO and Executive Information Technology Investment Review Board (EITIRB) reviewed and prioritized all major projects as part of USDA's fiscal year 2002 capital planning and investment control process. A project is defined as "major" if it meets one of several criteria, such as having a total life cycle cost greater than \$50 million, has a significant multi-agency impact, is mandated by legislation, or is identified as a priority by the Secretary. Significant investments are those which do not meet the criteria to be classified as "major", but are still deemed significant to an agency's business processes. The EITIRB does not review significant projects although these projects are still part of USDA's Capital Planning and Investment Control (CPIC) Process. Significant investments are reviewed at the agency level, and OCIO is working with agencies to ensure that each agency has set up IT executive review boards to review and approve significant and other information

technology investments. Significant investments are also reviewed by the CIO through USDA's IT Investment Moratorium. Small IT projects and activities that are neither classified as major or significant, as defined by the Office of Management and Budget are not part of the CPIC process.

Issues or concerns raised during the EITIRB's review are addressed by meeting with affected investment principals, requesting improved/clarifying documentation of proposed alternatives, and monitoring of progress to meet agreed upon objectives. Investment activities may be restricted until all conditions are met.

Following is a list of the major and significant information technology investments proposed as part of the fiscal year 2002 budget for the record.

MAJOR IT INVESTMENTS PROPOSED FOR FISCAL YEAR 2002

Farm and Foreign Agricultural Services.—FSA—CORE Accounting System (CORE); FSA-Processed Commodities Inventory Management System FNS/AMS/FSA; RMA-Emerging Information Technology Architecture; RMA-Infrastructure Modernization, Support, and Training (IMST).

Food, Nutrition and Consumer Services.—Food Stamp Program Integrated Information System (FSPIIS) Redesign; Special Nutrition Programs Integrated Information System (SNPIIS) Redesign; Food Acquisition Tracking and Entitlement System (FATES) FNS/AMS/FSA; Agency Financial Management System (AFMS); FSPIIS Legacy System; SNPIIS Legacy System; Electronic Benefit Transfer (EBT)—Grants to States; Advanced Planning Documents (APDs)—Grants to States.

Food Safety.—FSIS Automated Corporate Technology Suite (FACTS); FSIS-Field Automation Information Management (FAIM).

Natural Resources and Environment.—FS-Project 615 (IBM) FS IT Infrastructure; FS-Integrated Personnel System (IPS); FS-Connect Human Resources; FS-Timber Information Management (TIM); FS-INFRA; FS-Natural Resources Information System (NRIS); NRCS-New Combined Administrative Management System (CAMS—HR) NRCS/FSA/RD; NRCS-Data Acquisition.

Research, Education, and Economics.—REE Information System (REEIS).

Rural Development.—Dedicated Loan Origination and Servicing System (DLOS); New Guaranteed Loan System RD/FSA; Rural Utility Loan Servicing System; Program Funds Control System RD/FSA; Automated Multi-Housing System.

Marketing and Regulatory Programs.—AMS-Livestock Mandatory Price Reporting; APHIS-Integrated System Acquisition Project (ISAP).

Departmental Administration.—Integrated Acquisition System (IAS); Employment Complaints Tracking System (ECTS).

Staff Offices.—OCIO-Universal Telecommunications Network (UTN); OCIO-Service Center Modernization Initiative (SCM—IT); OCIO-Capital Planning and Investment Control WI—TIPS (CPIC); OCFO-Foundation Financial Management Information System (FFIS); OCFO-Payroll Engine; OCFO-Thrift Savings Plan (TSP).

SIGNIFICANT IT INVESTMENTS PROPOSED FOR FISCAL YEAR 2002

Farm and Foreign Agricultural Services.—FSA-Grain Inventory Management System (GIMS); FSA-Management of Agricultural Credit Systems (MAC); FSA-Debt and Loan Restructuring System (DALRS); FSA-Farm Loan Information and Delivery System; FSA-Farm and Home Plan (FHP); FSA-Guaranteed Loan System (GLS); FSA-Cotton Management Systems (CMS); FSA-AMTA Enrollment and PFC Payments System; FSA-Acreage Reporting and Compliance Systems; FSA-Automated Price Support System (APSS); FSA-Geological Information System (GIS); FSA-Common Computing Environment (CCE) Hardware and Software; FSA-Information Systems Security Program; FSA-Field Office Telecommunication; FSA-Field Office Voice and Data Support; FSA-LAN, MAN, WAN, and Server Hardware; FSA-Microcomputer Hardware—KC Complex; FSA-PC Software and Support; FSA-Service Center Hardware Maintenance; FSA-Provide Microcomputer Hardware and Software; FSA-LAN/WAN/Voice Project—Service Center Implementation; FAS-Financial Accounting and Reporting System (FARS); FAS-Overseas Computer Systems; FAS Core Information and Communication Systems; FAS-Wide E-Commerce (GPEA & FFMIA Implementation).

Food, Nutrition, and Consumer Services.—EBT—FNS Direct Operations; EBT—Account Management Agent (AMA); Food Program Information Infrastructure Modernization (FPIIM); FSP—Certification and Issuance Support (DRS, CRIMS); FSP—Store Tracking, Authorization and Redemption System (STARS); Automated Funds Control System (AFCS).

Food Safety.—Performance Based Inspection System; Laboratory Information Management System Security.

Natural Resources and Environment.—Forest Service FFIS; FS-National Financial Applications; FS-Central Accounting System (CAS) Feeders; FS-Automated Timber Sale Accounting System; FS-Budget & Ledger System for CAS; FS-Enterprise-wide Data Warehouse; FS-Budget Formulation & Execution System; FS-Automated Land Project (ALP); FS-Weather Information Management System (WIMS) FS-Resource Ordering and Status System (ROSS); FS-Forest Inventory & Analysis; FS-Radio Communication; NRCS-Financial Management Information System—Legacy; NRCS-Water and Climate Information System; NRCS-Strategic Analysis and Assessment Information System; NRCS-Telecommunication Infrastructure.

Research, Education, and Economics.—ARS-Radio Program; ARS-Integrated Program Management System (RMIS redesign); ARS-Biotechnology; Cooperative Research, Education, and Extension Management System (C-REEMS); NASS-Estimates Processing and Dissemination; NASS-Census and Survey Processing Systems; NASS-Information Technology Support and Delivery; NASS Research System.

Rural Development.—Program Loan Accounting System RD/FSA; Centralized Help Desk; Data Warehousing; Paperwork Elimination; Credit Reform.

Marketing and Regulatory Programs.—Automated Targeting System (ATS); Wildlife Services MIS 2000; Port Information Network Operations (PIN-Ops); Market News.

Question. USDA's Chief Information Officer's (CIO's) fiscal year 2002 budget shows that more than \$60 million in working capital funds will be used for IT projects in fiscal year 2001 and fiscal year 2002. What specific IT projects were funded out of the Department's working capital fund in fiscal year 2001 and which specific projects have been approved for fiscal year 2002?

Answer. The Office of the Chief Information Officer uses working capital funds to support both the National Information Technology Center (NITC) and the Telecommunications Services and Operations (TSO).

The NITC provides enterprise server services and application development services to governmental agencies both inside and outside the Department of Agriculture. The NITC does not fund projects per se. NITC is a data center and provides data center services to USDA and non-USDA customers on a competitive, 100 percent fee-for-service basis. NITC services include a wide range of IT infrastructure support to achieve effective mission performance and program delivery for customer agencies. According to OCIO, current major initiatives NITC is undertaking include: cyber security and disaster recovery planning, and continuing to strengthen its IT infrastructure to support customers' needs as they move to e-Government service delivery.

TSO's working capital fund operational projects are based on continuing upgrades to support wide area network services, local area network systems, and a variety of other telecommunications services. According to OCIO, TSO efforts are now focused on the USDA Universal Telecommunications Network which will provide all USDA agencies with cost-effective wide area network services, and improving basic local area network services.

Question.—The fiscal year 2002 budget for USDA's CIO shows \$7.6 million in capital equipment under the working capital funds. What will these funds be used for?

Answer. I will have the Chief Information Officer provide that information for the record.

[The information follows:]

USDA's CIO fiscal year 2002 capital equipment under the working capital funds breaks down as follows:

| | |
|---|------------------|
| Enterprise Server Services—NITC | \$6,425,000 |
| Application Development Services—NITC | 250,000 |
| Business Services—TSO | 40,000 |
| Network Engineering—TSO | 375,000 |
| Computer Services Unit—TSO | 55,000 |
| Network Services—TSO | 500,000 |
| TOTAL | 7,645,000 |

Funds expended for capital equipment maintain the dependability and cost effectiveness of NITC data center hardware and software. As new technology is released, NITC upgrades enterprise server configurations to keep current, vendor-supported versions of hardware and software for the NITC customers. In addition to purchasing enterprise server CPU hardware/software, NITC is also purchasing environmental control equipment, data storage equipment, mid-range computer technology, telecommunications equipment, LAN server equipment, web security and application development tools. All of these capital equipment outlays are in response to customer demands and, as stated previously, replenished every year on a 100 per-

cent fee-for-service basis. Furthermore, these expenses are depreciated to NITC customers over a period of time.

TSO's working capital fund estimated capital investment dollars for fiscal year 2002 will be used to upgrade existing systems and to purchase essential equipment including: Oracle software upgrade, test bed server, integration of the video system infrastructure, South Building renovation (new switches) phase III, three firewalls, Local Area Network (LAN) upgrade, intrusion detection, spare router cards, and a network modeling tool suite.

Question. USDA's CIO budget shows that a total of \$3,383,045 of Y2K emergency supplemental funds remain to be obligated in fiscal year 2001. Why are these funds still needed and for what specific purposes will they be used?

Answer. According to OCIO, the Department of Agriculture fiscal year 2001 carry-over balance is targeted for continued Year 2000 conversion activities in fiscal year 2001, along with payment of services rendered but not yet billed to the Department, including telecommunications services. The dollars being spent are targeted toward a wide spectrum of non-mission critical Year 2000 compliance expenditures, which include scientific and laboratory equipment upgrades, hardware upgrades and replacements, software upgrades and replacements, telecommunication system remediation and program management.

Question. USDA's budget shows that \$2.036 million of the remaining ADP cap was still unobligated as of the beginning of fiscal year 2001. What's the status of these funds and what activities will they fund?

Answer. The \$2.036 million remaining under the CCC ADP cap will be expended by the end of fiscal year 2001. The funds under the ADP cap will be used to cover essential basic operating costs and maintenance of legacy systems.

GOVERNMENT PERFORMANCE AND RESULTS ACT (GPRA)

Question. What are USDA's key performance goals for improving the management and use of information technology throughout the Department during fiscal years 2001 and 2002?

Answer. The following are USDA's information technology goals and performance goals for fiscal years 2001 and 2002:

- Establish a common computing environment for USDA Service Centers, which includes hardware, software, security, websites, telecommunications and databases.
- Transition to an e-Government environment.

Question. What key goals were not met and why?

Answer. In fiscal year 2000, key IT goals for the Department were set forth in the OCIO annual performance plan; all key targets were met or exceeded. The Department will evaluate its success in meeting the above performance goals at the close of Fiscal years 2001 and 2002 and make information available on the goals achieved and not achieved at those points.

SERVICE CENTER MODERNIZATION INITIATIVE (SCMI) AND PLAN

Question. USDA funds its Service Center Modernization Initiative (SCMI) effort through various appropriations and accounts. This includes Common Computing Environment (CCE) direct appropriations, obligations from other appropriation accounts, emergency and supplemental funding provisions, additional contributions/funds from FSA, NRCS and RD's salaries and expense and other accounts, and from CCC ADP and other section 11 accounts. Provide a consolidated table related to the Service Center Modernization Initiative that will include all such accounts for Fiscal years 2000, 2001, and 2002. Also include unobligated balances, a justification for each of the fiscal year 2002 budget items, an explanation of how they relate to the overall effort, and whom at the department is responsible for managing and overseeing each of these funds.

Answer. The Service Center Modernization Initiative (SCMI) is critical to making the Department's field office structure leaner, more efficient, and customer-focused. Significant progress has been made in collocating FSA's, NRCS', and RD's field offices into one-stop USDA Service Centers. Key to the success of the SCMI is the establishment of a common computing environment (CCE) that allows the Service Center agencies to share information and reduce the redundant requests, office visits, and paperwork faced by customers participating in multiple programs. CCE is also critical to meeting the requirements of the Freedom to E-File Act e-Government. I will have the detailed information you requested provided for the record.

[The information follows:]

SERVICE CENTER MODERNIZATION FUNDING SOURCES AND LEVELS

[Dollars in Thousands]

| Activity | Actual fiscal year 2000 | Estimate fiscal year 2001 | President's budget fiscal year 2002 |
|-------------------------------------|----------------------------|------------------------------|---|
| BPR/Management: | | | |
| Business Process Reengineering: | | | |
| FSA | \$6,249 | \$3,303 | \$11,350 |
| NRCS | 3,400 | 3,100 | 1,700 |
| RD | 1,800 | 3,300 | 2,429 |

| FSA | 17,795 | 13,899 | 25,682 |
| NRCS | 28,242 | 25,580 | 25,119 |
| RD | 5,919 | 9,419 | 9,564 |
| Grand Total | 54,337 | 118,666 | 119,734 |

Note: Fiscal year 2001 and 2002 levels subject to change based on availability of agency contributions. Totals may not add due to rounding. FSA's funding comes from its salaries and expenses account, RD's funding comes from its salaries and expenses account, and NRCS's funding comes from its conservation operations account.

(a) Includes fiscal year 2000 appropriation provided to the Office of the Secretary for CCE that was obligated in fiscal year 2000 and fiscal year 2001 as well as funds appropriated to the CCE account. Fiscal year 2001 amount includes \$40 million provided through the fiscal year 2001 appropriations act and \$19.5 million in emergency funding.

Business process reengineering involves teams of Service Center employees reviewing their agencies' business practices and determining how these practices can

be streamlined or improved to provide better service. Currently, there are about 20 active projects in various stages of development focusing on core business areas such as lending, managing risk, conservation and environment, community development and outreach, and administration. Each of these projects is led and funded by one of the Service Center agencies.

Change management and program management refers to the overall coordination of SCMI activities carried out by the National Food and Agriculture Council (NFAC) staff. It supports customer service training, communications activities and special projects. Funding is contributed by the Agencies and managed by the NFAC staff.

The Integrated Technology funding area provides for the IT infrastructure needed to modernize Service Center program delivery operations. The Information Technology Working Group (ITWG) established by the USDA CIO manages this effort and funding. This category is further broken down into the CCE Hardware/Software component and the Telecom/LAN/WAN/Voice component as follows:

—*Common Computing Environment (CCE).*—The CCE is providing Service Centers with common and updated information systems by acquiring and deploying the servers, workstations, printers, software, and other tools necessary to maximize program and customer service, as well as other administrative efficiencies. Improvements include employee access to email, the Internet, and software productivity tools (e.g., word processing) that will save both employee and customer time. CCE also provides the technical infrastructure necessary for the use of Geographical Information Systems (GIS) in the Service Centers. A priority for fiscal year 2002 is the acquisition of application servers to support reengineered business processes and geographic information systems.

—*Telecom/LAN/WAN/Voice.*—The Service Center agencies' existing telecommunications capacity, or bandwidth must keep pace with the growing customer, partner, business, and legislative demands for electronic access. This project will enable the Agencies to improve network capacity and performance in support of customer demands and the requirements of legislative mandates.

Base data acquisition funds will allow us to continue the development of Geographic Information Systems (GIS) data layers. GIS will provide Service Center agencies with the ability to improve customer service in many ways. For example, determinations of field measurements, classifications and uses will be more accurate and timely. Base data funding is managed by each Agency. Coordination occurs through an interagency GIS team that also coordinates with other USDA agencies and external partners. While we have made significant progress, we will need your continued support over the next few years to complete key data layers and implement our reengineered processes. Fiscal year 2002 funding will maintain the current level of NRCS base data acquisition, but will accelerate the FSA Common Land Unit digitizing that is a key data layer needed by all three agencies.

Question. What kinds of technical refreshments are planned over the next several years for the thousands of high-end desk-top computers, notebooks, workstations and peripherals already purchased and deployed and how much will it cost?

Answer. USDA recognizes the need to regularly refresh technology components as they age and has included that concept in long range plans. We will be determining our fiscal year 2003 needs for technology refreshment during the budget process this summer. The initial priorities will be to replace workstations purchased early in the CCE implementation.

Question. What is the current status and estimated completion date associated with implementing each of the major projects identified in USDA's December 2000 Service Center IT Modernization Plan?

Answer. An integrated project plan has been developed for each of the nine projects. Individual tasks needed to complete these projects are built around the overall milestones laid out for the various components of the Common Computing Environment (CCE). Specific information is provided for the record.

[The information follows.]

Fiscal year 2001

March 31, 2001—Deploy AS 400 servers to FSA to ensure connectivity to legacy systems and provide a basis for migrating program applications. STATUS: Completed.

April 30, 2001 to September 30, 2001—Pilot test telecommunications alternatives and develop Internet plan to upgrade capacity to support e-Business and agency web applications. STATUS: Underway, pilot will continue into the fall of 2001, plan will be complete in September 2001.

April 30, 2001 to September 30, 2001—Conduct comprehensive information and systems security planning and analysis. STATUS: Underway, on schedule.

May 2001 to September 2001—Provide necessary systems and end-user training to support fiscal year 2001 initiatives. STATUS: On schedule.

June 30, 2001 to September 30, 2001—Acquire and deploy remaining workstations. STATUS: On schedule, deployment may continue into October.

June 30, 2001 to September 30, 2001—Support targeted implementation of selected technologies (GPS, digital cameras, etc.) STATUS: On schedule, team finalizing requirements.

June 30, 2001 to September 30, 2001—Acquire GIS enterprise license. STATUS: On schedule, procurement process initiated.

July 31, 2001 to October 31, 2000—Deploy Electronic Access Initiative investments and fund a second round of investments to provide a secure web environment to support e-Government STATUS: On schedule.

October 2000 to November 2001—Acquire and deploy shared network servers in all offices to enable enterprise-wide information sharing, common email, and remote management of workstations STATUS: Pilot installation completed and operational. Anticipate meeting end dates.

Fiscal year 2002

October 1, 2001 to September 30, 2002—Acquire and deploy application/GIS hardware and software nationwide; deploy enterprise-wide GIS software.

October 1, 2001 to September 30, 2002—Provide comprehensive end-user training to support the fiscal year 2002 initiatives listed above.

October 1, 2001 to September 30, 2002—Make the capital investments needed to upgrade telecommunications to support Internet and web applications.

Question. Does USDA still plan to have the SCMI completed and fully operational in 2002? If not, when will it be completed and how much will it cost in total to complete it?

Answer. The basic CCE infrastructure will be in place by the end of fiscal year 2002 with requested funding. Once the basic infrastructure is in place, additional investments will be considered to maintain the infrastructure and provide supporting devices that will enhance the capability and efficiency of the SCMI.

Question. The December 2000 plan also notes improved productivity at Service Centers by virtue of deploying a set of common tools such as e-mail, office automation software, secure Internet access and sharing, telecommunications, and business applications. Are USDA service centers' employees presently using these common tools? If not when will service center employees be able to use each of these tools?

Answer. According to OCIO and Service Center agency representatives, the Service Center agencies are now using shared telephone systems, data connections, internet access, common workstation software such as word processing and spread sheet and other applications. They are also using common GIS software, common web tools and equipment and common data definitions, data warehouse tools, administrative software and other tools. A common customer information management application is nearing completion, as are other shareable business applications. The employees are also supported by a common Help Desk system. With the deployment of the network servers by the end of fiscal year 2002, the employees will be on the same e-mail and messaging system and share new and sophisticated security tools.

Question. USDA's budget says that the Department is in the final stages of determining the cost effectiveness of placing an application server in every location or clustering them in fewer locations. When will USDA complete this analysis and what potential cost savings exist should the Department consolidate and employ more centralized server operations using larger capacity servers wherever possible? Did USDA perform a similar study before buying network servers for every location and, if not, why?

Answer. According to OCIO and Service Center agency representatives, the Common Computing Environment Applications Architecture that is scheduled for completion by the end of this year will address the question of centralizing or distributing application server operations. Potential cost savings have not been determined, but will be defined when this study is completed.

I have also been informed that a similar analysis was completed prior to the acquisition of the network servers. The analysis determined that the use of the current telecommunications facilities would have resulted in a delay of over 20 minutes for an employee requesting a typical customer file from a remote server. The cost of increased bandwidth telecommunications service was compared to placing servers at individual offices in the study, and it was determined that increased telecommunications was much more than the purchase of individual servers. An additional consideration was the continued ability to service customers even if the network connection became inoperable.

Question. Are the Service Center IT agencies using existing USDA contract vehicles or their own separate contracts to acquire the same or similar technologies and if so what's the rationale and cost implications for doing so? Has the CIO's office reviewed and approved using separate contract vehicles?

Answer. According to the Chief Information Officer, whenever possible, USDA Service Center agencies use existing USDA or other Federal Government contract vehicles to acquire goods and services. As of this date, existing contracts have been used for all CCE purchases. We expect to continue that approach unless there is a special need that cannot be met with an existing contract. The USDA CIO reviews and approves all contract purchases.

Question. Since 1995, USDA has had various efforts underway to reengineer business processes and reform service delivery in county offices across the U.S. Which business processes have USDA successfully reengineered for each of the farm service agencies? What efficiencies, savings, or benefits to customers have been gained as a result of each reengineered business process? When will USDA complete re-engineering the remaining ones?

Answer. I will have information on past reengineering efforts provided for the record. We will continue to build on these efforts through IT innovation and the implementation of e-Government initiatives.

[The information follows:]

The USDA Service Center agencies have made significant progress in business process reengineering (BPR). The agencies initial BPR projects documented the requirements for the current round of CCE equipment that is being deployed. These projects include the GIS based Customer Service, Wetland and Easement Toolkits that automate conservation planning and wetlands and environmental assessments. The Service Center Information Management (SCIMS) and Land Use projects, which provide the foundation for the agencies to manage customer and land records, are nearing completion. SCIMS will enable FSA, NRCS, RD and the Conservation Districts to fully share information and coordinate to improve service to customers. The agencies have developed and continue to evolve a common set of administrative processes including the Combined Administrative Management System (CAMS) which initially automates shared human resources management functions, the Office Information Profile (OIP) which provides information on offices, and common directives. OIP and CAMS are currently being integrated. These systems provide foundations on which the agencies will build.

Business process reengineering is an ongoing process, and work continues on a number of other projects. Following are two examples.

—Rural Development has made significant progress in reengineering and deploying applications such as the Guaranteed Loan and Multi-family Housing systems. It has also made significant progress in developing a common data warehousing systems that can help associate program data with demographic information.

—The Service Center agencies and their partners have developed an agreed upon set of data standards and definitions that enable the sharing of data. The agencies are developing a Resource Data Gateway for the creation and distribution of GIS data to the Service Centers and customers.

Through the Electronic Access Initiative, the Service Center agencies are working together to provide the infrastructure needed to enable customers to do business with the Department electronically and are planning to bring more services the Internet. These plans represent the next phase of agency business process re-engineering. Customer benefits and cost savings are beginning to be realized. For example, an NRCS soil conservationist reports that more conservation filter strip designs can be offered to customers because GIS has helped reduce the time it takes to develop them.

FREEDOM TO E-FILE ACT

Question. When the Freedom to E-File Act is fully implemented, how will farm services be improved and what specific business processes will be automated as a result? To what extent will farmers and others covered under the act still have to visit a service center to participate in USDA's programs?

Answer. Once the Act is fully implemented it is envisioned that the Service Center agencies and Risk Management Agency will provide services using both electronic and traditional methods to meet the varying needs of its customers. Some customers will conduct business solely via the Internet while others will continue to conduct business in the more traditional paper-based fashion or through a combination of electronic and traditional. The choice of the number of visits the customer makes to the office site will ultimately rest with the customer. Eventually,

virtually no trips to the USDA service centers will be required to conduct transactions. There will still be a need for some customer visits in June, 2002.

According to OCIO, most of the service center agencies' business processes are already automated in some manner. However, the migration to on-line delivery of information and services will impact virtually every one of the agencies' processes where interaction with the customer is required. These processes will have to be revamped in a manner that reasonably ensures customer understanding and successful use in the non-service center environment.

Question. What steps are being taken by the Department to ensure that USDA meets the Freedom to E-File Act legislative deadlines of December 1, 2001 and June 20, 2002 for providing farmers and others covered under the act the ability to file electronically for services with the Department? What has been accomplished so far?

Answer. The Department's e-Business Executive and the OCIO are working with Service Center Agency program and IT leaders to develop a comprehensive e-Government strategy and project plan within an overall framework which addresses common issues such as infrastructure, policies, training, and agency-specific program delivery requirements. The major accomplishment so far is that FSA, NRCS, and RD deployed a common Internet web site to meet the first set of requirements of the Freedom to E-File Act, which enables agricultural producers and RD customers to access and download forms used to participate in the agencies' respective programs and services. Additionally, RMA developed its implementation plan and sent guidance to private insurance providers on what they need to do to conduct transactions electronically by December 2001.

Question. GAO made a series of recommendations to help USDA better ensure success in meeting the provisions of the Freedom to E-File Act. Where does the department stand on implementing each GAO recommendation?

Answer. USDA agrees with the recommendations of the GAO report, that both the development of a comprehensive plan and the assignment of a senior-level official with overall responsibility, authority, and accountability for the effort, is necessary to ensure the Service Center agencies, together with the RMA, meet the tight deadlines of the Act.

We have a Senior Executive, as well as an executive working group coordinating efforts in the Department. We received OMB approval of resubmitted RD forms in March and are in the process of completing a comprehensive plan to meet the requirements of the Freedom to E-File Act.

ELECTRONIC SERVICE, E-GOV, AND GOVERNMENT PAPERWORK ELIMINATION ACT (GPEA)

Question. The Internet and other new technologies have made new demands on government agencies to greatly expand their ability to provide electronic services to the public. Where does USDA stand in developing and implementing an overall e-Gov strategy to help guide its e-Gov transition? What major obstacles are there to providing these kinds of electronic services at USDA and what efforts are underway to address them?

Answer. The Department is working to develop a framework for planning and implementing e-Government initiatives. According to the Chief Information Officer, this e-Government framework will serve as a blueprint of policies and procedures that articulates a defined vision and strategy to ensure a common understanding regarding e-Government and will give agencies knowledge with which to make good business decisions.

The major obstacles identified by OCIO and agencies include the resource-intensiveness of efforts, the need to organize activities across the Department, and the difficulty of authenticating the transmission of sensitive data. A readiness assessment of the agencies and customer groups relative to their capability to engage in e-Government will be conducted. We expect that more specific obstacles and challenges will be identified in this assessment relating to organizational and technical readiness to implement e-Government initiatives. We will also be evaluating the funding requirements and the need to scale existing telecommunications capabilities.

Question. The Government Paperwork Elimination Act (GPEA) specifically requires each agency, including USDA, to implement procedures necessary to offer secure electronic services for all its components and offices by October 2003. What progress has USDA made to implement GPEA?

Answer. USDA agencies developed initial plans for complying with GPEA in October 2000. These plans identified business processes deemed important to automate in accordance with OMB guidance. OCIO has been conducting customer service visits to each of the Department's agencies to understand the type of information, guidance, and support the agencies need to ensure good planning that leads to successful

implementation. OCIO is currently working with agency representatives to prepare a comprehensive e-Government framework of policies and procedures for the department. Efforts of agencies showing significant progress, including the Foreign Agricultural Service, Animal Plant and Health Inspection Service, and E-File Act agencies, will serve as a model for the rest of the Department in developing the framework and meeting GPEA requirements.

Question. Obviously, building and supporting a secure and private communications network infrastructure and electronic records management process will be of the utmost importance. What specific steps is the department taking to provide these very basic kinds of assurances to USDA customers and the public?

Answer. The strengthening of computer security and protection of the privacy of information in the Department's computer systems is a top priority. USDA agencies have been actively engaged in security planning at both the department and agency levels. The Department will continue to address security needs and privacy issues through close collaboration between the Secretary, OCIO, and individual USDA agencies. I will have the Chief Information Officer provide more detailed information for the record.

[The information follows:]

Long-term objectives are concentrated around building the compatible architectures of security, IT, and telecommunications which are flexible and capable of meeting both the service level requirements and the security requirements. With contractor assistance we will establish the telecommunications and security baselines, establish our technical options, and develop a security selection matrix and a security architecture maintenance process.

USDA has also taken important steps to implement its comprehensive action plan to strengthen Cyber Security. In fiscal year 2001, the Department has expanded the Cyber Security Program Office and begun implementation of key programs under its comprehensive security framework. The Associate CIO is working with the CIO, who also serves as the Department's Senior Official for Privacy Policy, and individual agencies to assure the privacy of customer and other confidential data maintained in USDA information systems.

Short-term objectives are concentrated around securing the outer perimeter of the Departments telecommunications backbone network and addressing immediate security needs. Specific steps include:

- Improving current delivery of services over the Internet. This is being accomplished by deploying additional firewalls, filtering in routers, and intrusion detection systems across the backbone network that together provide a much-improved level of network security.
- Improving network oversight. OCIO has purchased and installed scanning and penetration testing tools which are used to provide constant network monitoring.
- Developing specific security architecture components to meet short term needs which will be compatible with our long-term architecture goals.

In addition, the OCIO has been engaged with the USDA agencies to raise their awareness of the need to address electronic recordkeeping and to include electronic records requirements into both current and future systems design. Agencies have also been provided information on the migration of data and information from legacy to new systems and that the associated costs must be planned for as part of the system development life cycle costs. The need for long-term retention of records, such as loans that can span in excess of 40 years, is under discussion. Of concern is the need to plan for the verification, validation and authenticity, and the storage media as records as migrated from one systems to another.

USDA also has Departmental policy on electronic recordkeeping requirements. The USDA Department Records Officer has been actively engaged in external electronic recordkeeping groups to ensure USDA's policies address the current and future environments. While progress has been made, as USDA moves toward a broader electronic environment, where paper records are no longer the record copy, much more needs to be done. To further address this need, OCIO recently established an e-Government Program staff to further address electronic records requirements. OCIO will be forming a team of agency business experts, information technologists, and records officers to address electronic recordkeeping requirements in the Internet environment. To this end, USDA is exploring the need for a corporate information infrastructure and taxonomy to address common records disposition requirements. This corporate approach will enable USDA to address electronic recordkeeping issues more quickly and provide a common approach for USDA employees and a common message to USDA's customers regarding USDA's commitment to best recordkeeping requirements in the electronic environment.

INFORMATION TECHNOLOGY (IT) SECURITY

Question. Were security plans developed for all new IT investments approved for fiscal year 2002? If so, how and by whom were these plans evaluated, reviewed, and approved?

Answer. According to the Chief Information Officer, security requirements for USDA's Capital Planning and Investment Control Process were recently enhanced. More rigorous security requirements have been included to ensure that plans for all new systems identify specific security controls, costs, and schedules. This will ensure that security requirements are adequately addressed during the review of USDA information technology investments and that the Department will have a baseline from which to monitor security progress.

Both the Office of the Chief Information Officer (OCIO) and the Office of Inspector General (OIG) have concluded their reviews of this issue. OIG identified several weaknesses and NASS has already corrected most of them and aggressively implemented plans to correct the rest. In addition, security reviews have been concluded at the Department's major centers. I will have OCIO provide more specific information on these security issues.

According to OCIO, this year agency security plans were required to be signed by the respective agency head before submission to OCIO, thereby ensuring senior management scrutiny. All plans are initially assigned to a staff security specialist for review, followed by review by the Associate CIO for Cyber Security. If necessary, the submitting agency will be contacted for amplification or clarification prior to approval.

Question. USDA has been criticized in the past for having significant computer security weaknesses and in January 2001, GAO designated computer security at USDA as a major performance and accountability challenge. What management priority has the Department assigned computer security and where does USDA stand on implementing each of GAO's and the USDA OIG's recommendations?

Answer. The protection of the security and privacy of USDA information resources is a top management priority. The Department developed a comprehensive action plan to strengthen Cyber Security and has taken important steps to implement the plan. The Department's Associate CIO for Cyber Security is leading a corporate approach to protecting USDA information resources and is working with the CIO and individual agencies to assure the privacy of customer and other confidential data maintained in USDA information systems. The Department will continue to address security needs and privacy issues through close collaboration between my office, OCIO, and individual USDA agencies. I will have the Chief Information Officer provide more detailed information for the record.

[The information follows:]

USDA's "Action Plan to Strengthen USDA Information Security" provides a sound strategy, based on the best practices of leading organizations, for identifying computer security vulnerabilities and implementing mitigation procedures and mechanisms. Both the GAO and USDA's OIG have favorably reviewed this plan and have recommended implementation. Progress OCIO has made to implement its cyber security plan and address GAO and OIG recommendations include:

- The centralized management focus of the cyber security program will be strengthened and expanded to provide additional oversight and hands-on problem solving. This central management strategy will position USDA to be in accordance with oversight guidance, the requirements of legislative mandates, and the strategies practiced by many of the most successful government and private security organizations. Recent additions to the Cyber Security Program Office staff provide the Department with the expertise and experience necessary to improve USDA's cyber security posture.
- With funds provided in fiscal year 2001 to implement a Department-wide Risk Management program, the Cyber Security Program Office has contracted to develop risk assessment checklists, issue guidance, conduct training, and work directly with OCIO and the agencies in conducting risk assessments. Agencies will ultimately be responsible for conducting and funding agency risk assessments and providing the results of those risk assessments to the central Cyber Security Program Office. Risk assessments and subsequent data analyses will form the basis for the decision-making process required to protect USDA's critical cyber infrastructure.
- The OCIO Cyber Security Program project plan also calls for a major effort in fiscal year 2001 to refine the requirements for security architecture and begin its design and implementation. With these funds, contract expertise will be employed to assist with the refining of USDA security requirements, establishment on the Department's security baseline and the development of a security archi-

ecture methodology. Design and implementation of the security architecture will follow.

With funds specifically designated for these programs, OCIO's Cyber Security Program Office will continue to build on its work in the areas of risk management and security architecture development. Specific vulnerabilities and weaknesses cited in the most recent OIG review focuses on operational security controls and procedures. This review cited a large number of security weaknesses, some of which are highly sensitive. Most of the items identified by OIG have been corrected or mitigated.

Question. How much will be spent in fiscal year 2002 across USDA on information security management for staff, software, and other related expenses? [Please break out the number of information security management staff in and total security dollars spent at each agency and office.]

Answer. In large part, the cost for security of USDA information technology systems is not accounted for separately from overall capital investment costs. This is consistent with past Office of Management and Budget (OMB) direction. OCIO is currently working with agencies to develop an accurate estimation of fiscal year 2002 security expenditures. We will forward that information when it is available.

Question. What has USDA done to identify, track, and correct security weaknesses and vulnerabilities that exist throughout the Department? How many such instances have been reported since the beginning of fiscal year 2000, by each fiscal year, and by mission area/agency/staff office?

Answer. The Department is working to correct vulnerabilities identified by GAO and OIG as well as by the Cyber Security Program Office. Vulnerabilities are identified through audits, security reviews, and the scanning of our information systems. The CIO has informed me that while we do not have information in the format you requested, we do have information on vulnerabilities and efforts are underway to improve the way risks are tracked and managed. I will have that information provided for the record.

[The information follows:]

The OIG just completed an assessment of 1,200 of USDA's devices and found 3,300 high and medium security vulnerabilities within seven agencies. Their evaluation concluded all agencies tested had poor controls over physical and logical access to sensitive data and systems. The Cyber Security Program Office is implementing comprehensive programs to manage risks and work with agencies to correct vulnerabilities.

In fiscal year 2001, the Cyber Security Program began onsite reviews as part of the new Risk Management Program. Recognizing that comprehensive and thorough risk assessments of USDA's information assets must become an integral part of IT management within the Department, the OCIO Cyber Security Program began conducting onsite reviews at critical USDA facilities. Thus far, comprehensive assessments have included the National Finance Center and the National Information Technology Center. Vulnerabilities identified thus far, when added to those identified by GAO and OIG, total approximately 3,800.

The Department tracks and is working to correct operational security weaknesses identified by OIG and the Cyber Security Program staff. Vulnerabilities are identified through audits, security reviews, network scans, and intrusion detection monitors. Specific vulnerabilities and weaknesses cited in the most recent OIG review focuses on operational security controls and procedures. This review cited a large number of security weaknesses, some of which are highly sensitive. Most of the items identified by OIG have been corrected or mitigated. If the Committee desires, I will have the OCIO Cyber Security staff provide a briefing on the state of USDA computer system vulnerabilities.

Also in fiscal year 2001, the Cyber Security Program initiated its development of risk assessment tools as part of its Risk Management Program. The Cyber Security Program Office has made significant progress in developing the methodologies and tools required to perform effective risk assessments of the Department's information assets. Contract support has been obtained to develop risk assessment tools and to work directly with USDA agencies in conducting actual risk assessments. These risk assessment tools will be used to assess existing mission critical systems as well as future IT acquisitions. Contracts call for all risk assessment tools to be field-tested and independently appraised.

Funding received in fiscal year 2001 for staffing the OCIO Cyber Security Program has allowed USDA to add security specialists with the experience and expertise needed to train and counsel agency security staffs. Over the past year, experts in the fields of configuration management, mainframe and desktop security, physical security, risk management, network security, and other disciplines have been hired to both oversee the Department's Cyber Security Program and assist agency security specialists meet their respective security responsibilities.

Question. Have all USDA computer system and networks that handle highly sensitive data, including NASS information, been tested for vulnerabilities and risks? If so, what general types of problems were identified and what types of steps are being taken to address them?

Answer. USDA's Computer Security Program is following a risk-based facility review program to fully assess USDA's critical infrastructure. Computer security measures have been evaluated at our major data centers and NASS. This strategy involves on-site reviews of major USDA information management facilities based on their relative criticality to the organization. According to the Associate CIO for Cyber Security, facilities of the highest priority will be reviewed twice each year, and less critical facilities will be reviewed once each year. At the same time, the Cyber Security Program Office is implementing essential security programs and projects that include security risk management, a security architecture, configuration management, physical security management, intrusion detection and prevention, system certification, disaster recovery, and security standards and enterprise-side controls. I will have the CIO provide more specific information.

[The information follows:]

Vulnerabilities identified by OCIO, GAO and OIG generally fall into the following categories:

- Corrective actions for known vulnerabilities are not being implemented.
- Inadequate skills within USDA's security program to implement and maintain security devices and procedures.
- Low level of management attention to security requirements.
- Inadequate resources to acquire, implement and manage necessary security controls.
- Pressures arising from legislation and customer demand to move to new technologies that are inherently riskier without proper attention to security.
- Inadequate network and system access controls.
- Transmission of sensitive information in unencrypted formats.

To support current and future delivery of services over the Internet, USDA must develop a comprehensive electronic security architecture. Activities to improve the USDA security architecture thus far include deploying: 1) additional firewalls, 2) filtering in routers, and 3) intrusion detection systems that together provide a much-improved level of network security.

Funding was received in OCIO's fiscal year 2001 budget specific to the development of a USDA Security Architecture; a contract effort has begun to assist the Cyber Security Program staff with security architecture design. Additionally, the Department has already established firewalls across its telecommunications backbone network, procured system monitoring and evaluations tools, and is negotiating for a Department-wide contract to provide intrusion detection mechanisms. These devices will allow OCIO staff to participate in active network monitoring. Collectively, these security controls provide a more strict and coordinated enforcement of network access and use.

The OCIO has initiated a backbone security program to address a broad range of security issues. This program is designed to establish security standards and policies, identify and install security mechanism and tools and engage agencies in the application of uniform procedures that, collectively, will provide a rigorous set of standard security controls to ensure the integrity, availability and confidentiality of information transmitted across the Department's network. Specific activities planned or underway include:

- Encryption.*—The objective of this initiative is to identify a set of common encryption requirements that will ensure the safety of data transmitted across the USDA telecommunications backbone network. These requirements will address information asset classification, assessment of vulnerability, physical and logical controls, and the tools and procedures necessary to provide a rigorous process designed to eliminate the risk of fraud and misuse of sensitive information.
- Network Security.*—The USDA Network Security program is designed to implement security tools, procedures and policies designed to deter unauthorized and potentially damaging access to the Department's backbone telecommunications network. These mechanisms will provide both preventative and detective controls through a consistent monitoring and filtering system that will ensure the safety and reliability of information as it traverses the network. Additionally, the Department has requested additional support from law enforcement in investigating unauthorized access to our computer systems.

OCIO has already deployed firewalls, filtering in its routers, and intrusion detection systems that together provide a much-improved level of network security. For the USDA Telecommunications Backbone Network, firewalls have now been in-

stalled at every Internet access point. Scanning procedures and tools are in place and reports are produced daily. Three separate ISS scan tools and other security monitoring tools have been purchased and installed at USDA's headquarters complex. These devices will allow OCIO staff to participate in active network monitoring. Collectively, these security controls will provide a more strict and coordinated enforcement of network access and use.

—*Electronic Access Security Design.*—The objective of the Electronic Access Security Design initiative is to engage contractors to work with security and network personnel in USDA county-based agencies (RD, FSA, and NRCS) and the OCIO to develop and recommend a comprehensive information security program for Internet/Intranet/Extranet services (Web Farms) and to standardize security-related efforts. Outcomes expected from this effort include 1) a generalized logical architecture; 2) a physical implementation of the logical architecture including integration testing in a laboratory environment, and; 3) a generalized support infrastructure including staffing, policies, procedures, and management processes.

Agreement has now been reached on a USDA Web Farm architecture. At a minimum, all internet-based implementations must agree with the standards established for USDA firewall settings. Virtual Private Network's (VPN's) established to transmit sensitive data will follow the methodology already established within USDA for VPN tunneling. This will provide for secure data designations ranging from anonymous to "non-repudiation". Web Farm transmissions will be built on a standardized TCP/IP protocol stack and will require the segregation of public service traffic and USDA internal services. USDA services will be accessed only through authorized paths.

In addition to the logical controls and security personnel requirements, OCIO is currently in the process of establishing physical security standards for all Web Farm development. These standards, developed in conjunction with USDA's physical security staff, will set forth the minimum physical security requirements that must be met prior to implementation. The physical security requirements will be finalized by the end of fiscal year 2001.

Question. How is the Department overseeing the expanded use of electronic technologies to ensure there are adequate levels of security and privacy over Department-wide information resources?

Answer. Our Chief Information Officer is working closely with the Department's IT and business leaders to ensure adequate security and privacy as we expand the use of technology in conducting business. USDA must ensure the privacy of customer information, customer transactions, and other sensitive data it maintains. OCIO is currently in the process of updating functional requirements, position descriptions, and skill-set requirements for personnel who will be assigned responsibility for managing privacy issues. Comprehensive security policies and programs are also being implemented at the Department-level to ensure a corporate approach to mitigating security weaknesses and protecting customer privacy. Right now a risk management program and security architecture are under development and more programs are planned in implementing the Department's comprehensive security action plan.

According to the CIO, to ensure adequate security in meeting the mandates of the Freedom to E-File Act, cyber security program staff members have worked closely with Service Center agencies' personnel to develop and begin implementing a comprehensive Web Farm architecture with adequate security controls. This architecture utilizes common hardware, software, configurations, security, policies and procedures, and staffing to ensure an orderly transition to delivering services over the Internet.

USDA'S FOUNDATION FINANCIAL MANAGEMENT SYSTEMS (FFIS)

Question. When does USDA anticipate fully implementing FFIS and how much will the system cost to develop and operate once its completed?

Answer. FFIS will be fully implemented in all USDA agencies on October 1, 2002. An assessment is underway to determine the full operational costs once all seventeen USDA agencies/organizations are implemented and in full operation.

Question. How much does USDA plan to spend in fiscal year 2002 to further implement its FFIS and related improvements?

Answer. The USDA fiscal year 2002 FFIS implementation budget is \$17,468,700. Agencies have additional costs as they make improvements to their systems, which feed data to FFIS.

Question. How many agencies are currently using FFIS to input their financial information, and when does the Department expect all agencies/offices to be using FFIS?

Answer. There are currently eight USDA agencies using FFIS. All USDA agencies are expected to be using FFIS by October 1, 2002.

INFORMATION TECHNOLOGY (IT) CONTRACTING

Question. How much does USDA expect to spend in fiscal year 2002 for IT contractor support services by mission area/agency/office, and how much was spent for such services in fiscal year 2000/2001?

Answer. The Chief Information Officer provided the following table, which shows the fiscal year 2000, and estimated 2001 and 2002 funding for USDA IT contractor support services by agency:

USDA SUPPORT SERVICES COSTS BY AGENCY
[Millions of Dollars]

| Agency | Fiscal year 2000 | Fiscal year 2001 | Fiscal year 2002 |
|--|------------------|------------------|------------------|
| Agricultural Marketing Service | \$4.0 | \$4.8 | \$1.7 |
| Agricultural Research Service | 3.8 | 4.2 | 4.1 |
| Animal and Plant Health Inspection Service | 3.7 | 3.5 | 3.6 |
| Coop State Research, Education, & Extension | 2.1 | 3.0 | 3.4 |
| Departmental Administration | 4.9 | 7.3 | 13.9 |
| Economic Research Service | 0.4 | 0.2 | 0.2 |
| Farm Service Agency | 49.7 | 37.8 | 53.8 |
| Food and Nutrition Service | 10.5 | 9.9 | 12.0 |
| Food Safety and Inspection Service | 5.1 | 6.1 | 6.1 |
| Foreign Agricultural Service | 7.2 | 10.0 | 10.1 |
| Forest Service | 59.0 | 55.2 | 62.8 |
| Grain Inspection, Packers & Stockyards Admin | 0.1 | 0.1 | 0.1 |
| National Agricultural Statistics Service | 0.6 | 1.2 | 1.9 |
| National Appeals Division | | | |
| Natural Resources Conservation Service | 12.8 | 8.7 | 7.2 |
| Office of Budget and Program Analysis | | | 0.6 |
| Office of Communications | 0.0 | 0.0 | 0.0 |
| Office of General Counsel | | | |
| Office of Inspector General | 0.1 | 0.1 | 0.2 |
| Office of the Chief Economist | | 0.1 | 0.1 |
| Office of the Chief Financial Officer | 31.7 | 28.9 | 19.2 |
| Office of the Chief Information Officer | 26.4 | 32.6 | 29.4 |
| Risk Management Agency | 10.8 | 7.1 | 15.5 |
| Rural Development | 13.7 | 34.4 | 25.4 |
| U.S. Department of Agriculture | 246.6 | 255.2 | 271.3 |

Question. To what extent has USDA analyzed and assessed opportunities to outsource additional IT support services over the next several years? What specific areas would such outsourcing cover and what are the expected costs/benefits?

Answer. USDA has conducted its fiscal year 2000 FAIR Act Inventory as required and identified IT jobs that could potentially be outsourced. The OCIO and individual agencies are preparing to conduct cost comparisons for jobs in the Inventory. Once these studies are conducted, we will be able to identify costs and benefits of outsourcing these IT positions.

CHIEF INFORMATION OFFICER (CIO)

Question. What has the CIO identified as its major/key performance goals for fiscal year 2002?

Answer. I will have the Chief Information Officer provide that information for the record.

[The information follows:]

OCIO's performance goals for fiscal year 2001 and fiscal year 2002 are as follows:

Goal 1: Enhance Customer Service and Operational Support.

Performance Goals:

- Support the USDA Enterprise Architecture.
- Develop new services and increase OCIO customer base for existing services.
- Improve customer service quality.

- Develop and implement USDA Universal Telecommunication Network.
 - Improve performance of existing network through enhanced network management capabilities.
- Goal 2: Improve and Enhance Information Technology Capital Investments Process and The Skills of the Information Technology Workforce.

Performance Goals:

- Enhance the Capital Planning and Investment Control Process by increasing use of USDA's I-TIPS.
- Increase the number of corporate projects and information systems.
- Complete USDA IT skills assessment.
- Develop an IT Workforce plan.

Goal 3: Effective Stewardship through Enterprise Program Management Performance Goals:

- Develop and implement a common computing environment infrastructure for USDA's Service Centers which includes the whole package of hardware, software, security, websites, telecommunications and databases, but excludes the development of applications.
- Transformation to a fully integrated e-government environment.

Goal 4: Develop, Implement and Maintain a Secure and Confident IT Environment while Protecting Privacy.

Performance Goals:

- Provide policy, guidance and training to strengthen USDA information security to all USDA agencies.
- Evaluate all mission critical information systems and identify all vulnerabilities.
- Develop mitigation plans for vulnerabilities discovered through formal threat assessments.
- Develop policies and guidelines that provide agencies with security standards and repeatable procedures that ensure information assets remain safe and available.

Question. What are the total costs in fiscal year 2001 and fiscal year 2002 to operate the National Information Technology Center located in Ft. Collins, Colorado? (identify and include all categories of costs) What is the rationale and justification for maintaining the separate Ft Collins office and has USDA performed any cost/benefit studies of maintaining this separate office rather than performing its functions out of the CIO's headquarters office in Washington D.C.?

Answer. The NITC program in Fort Collins (NITC-FC) is an organizational division of NITC but is a separately funded activity within USDA's Working Capital Fund. NITC-FC obtains all of its funding through memorandums of understanding and reimbursable agreements with customer agencies that choose to use NITC-FC's services. It receives no appropriated funds. The Department maintains the Ft. Collins, Colorado, location because that is where many of its customers and the projects it supports are located. I will have the CIO provide more information for the record.

[The information follows:]

The budgeted costs for NITC-FC for fiscal years 2001 and 2002 are as follows:

| Cost Category | Fiscal year 2001 | Fiscal year 2002 |
|--|------------------|------------------|
| Federal Personnel Costs | \$3,792,000 | \$3,932,000 |
| Contract Services | 2,499,000 | 2,570,000 |
| Rents, Communications, Utilities | 348,000 | 356,000 |
| Equipment and Depreciation | 154,000 | 267,000 |
| Travel and Transportation | 145,000 | 149,000 |
| Software and Supplies | 100,000 | 102,000 |
| Total | 7,038,000 | 7,376,000 |

No formal cost benefit studies have been conducted since a data center consolidation study was performed by Booz, Allen and Hamilton, Inc., in 1985. This study provided the basis for the current NITC organizational structure.

USDA continues to maintain this development staff in Fort Collins, Colorado because many of the customers and major projects supported by this staff are also located in Fort Collins, including the Forest Service, the Natural Resources Conservation Service, the Animal and Plant Health Inspection Service and others. This allows NITC direct access to customers and helps to reduce costs including travel and long-distance communications. NITC's high-quality, low-cost information technology (IT) services have resulted in many new projects for the Fort Collins division over the last decade. Many of the applications that the NITC Fort Collins division sup-

ports are national applications that are used by all USDA agencies and other Federal agencies, such as the General Services Administration's FTS 2001 applications.

The overall cost of living is lower in Fort Collins than the Washington, D.C. area. This allows NITC to recruit and retain both Federal and contractor positions at a much lower cost to customers. Fort Collins is part of the Rest of the U.S. (RUS) locality pay structure and has lower salary and benefit costs than the D.C. area. Contractor support costs are also lower than they would be in D.C., which saves customers additional money.

TELECOMMUNICATIONS MANAGEMENT

Question. Several years ago, the Department said that it spent more than \$200 million annually for telecommunications services. How much does USDA currently spend on telecommunications each year? (Please break these costs out by major category and by mission area, agency, and office.)

Answer. I will have the CIO provide that information.

[The information follows:]

The following amounts consist of local and long distance services (not including international) for voice, data and video telecommunications (other than radio) developed in January 2000.

USDA Telecommunication Costs

[Millions of Dollars]

| <i>Mission Area / Agency</i> | <i>Fiscal year 2000</i> |
|--|-------------------------|
| Foreign Agricultural Service: | \$2.326 |
| Farm Service Agency | 58.024 |
| Risk Management Agency | 6.621 |
| Food, Nutrition & Consumer Services: Food & Nutrition Services | 1.069 |
| Food Safety: Food Safety & Inspection Service | 0.650 |
| Natural Resources & Environment: | |
| Forest Service | 48.900 |
| Natural Resources Conservation Service | 24.170 |
| Research, Education & Economics: | |
| Agricultural Research Service | 7.369 |
| Coop State Res, Edu, & Ext Service | 1.378 |
| Economic Research Service | 4.348 |
| National Agricultural Statistics Service | 2.288 |
| Rural Development: Rural Development | 14.713 |
| Marketing & Regulatory Programs: | |
| Agricultural Marketing Service | 3.257 |
| Animal & Plant Health Inspection | 11.790 |
| Grain Inspection, Packers & Stockyards Admin | 0.829 |
| Departmental Administration: Departmental Administration | 0.784 |
| Departmental Staff Offices: | |
| Office Chief Financial Officer ¹ | 1.714 |
| Office General Counsel | 0.322 |
| Office Inspector General | 0.986 |
| Office Communications | 0.311 |
| Office Chief Information Officer ¹ | 15.324 |
| National Appeals Division | 0.266 |
| SDA Total | 207.439 |

¹Numbers reflect total Appropriated and Working Capital Funding. These numbers are not adjusted for collections.

Question. Where does USDA stand with respect to implementing all of GAO's recommendations for improving Department-wide management of telecommunications?

Answer. According to OCIO, USDA has achieved closure on most GAO recommendations concerning Department-wide management of telecommunications. Open recommendations remain in the following two GAO telecommunications audits:

—AIMD-95-203—USDA Telecommunications: Better Management and Network Planning Could Save Millions

—AIMD-98-131—USDA Telecommunications: Strong Leadership Needed to Resolve Management Weaknesses, Achieve Savings

I will have the Chief Information Officer provide the status of these open recommendations for the record.

[The information follows:]

AIMD-95-203.—During fiscal year 2000, three of five open recommendations from AIMD-95-203 were closed. The two open recommendations can be summarized as follows:

- Establish and implement procedures for reviewing telecommunications resources at offices that USDA plans to close or relocate.
- Develop Departmental policy requiring agencies to establish management controls over the acquisition and use of telecommunications resources.

Recommendations and Actions Taken.—These two recommendations require that telecommunications inventory and compliance activities be undertaken. Following guidance provided by GAO, OCIO is working to leverage existing Service Center agency review efforts to address compliance requirements. OCIO is working with USDA agencies through the Telecommunications Mission Area Control Officers to develop an inventory system. Both of these activities are resource intensive, requiring sufficient funding, staffing, and time to complete.

AIMD-98-131. The purpose of this audit was to emphasize recommendations from previous audits:

- AIMD-95-97 USDA Telecommunications: Missed Opportunities to Save Millions
- AIMD-95-203 USDA Telecommunications: Better Management and Network Planning Could Save Millions
- AIMD-96-59 USDA Telecommunications: More Effort Needed to Address Telephone Abuse and Fraud

Recommendations and Actions Taken.—Over the past 18 months, OCIO has been aggressive in taking the steps necessary to obtain closure of two of the audits (AIMD-95-97 and AIMD-96-59). As noted under AIMD 95-203, OCIO has efforts underway to address the inventory and compliance issues needed to close the two remaining open recommendations. Based on feedback from GAO, AIMD-98-131 should be closed when AIMD-95-203 is closed.

YEAR 2000 ROLLOVER

Question. USDA has reported to OMB that it spent almost \$200 million to address the Year 2000 problem. What type of accounting controls existed over these funds and what lessons were learned from accounting for these emergency-type funding initiatives at USDA?

Answer. According to the Chief Information Officer, USDA established an accounting management program to monitor the tracking and use of all supplemental emergency funding in the department. This program used an on-line reporting capability, supported by the National Finance Center (NFC), to track financial obligations. Once an agency entered an obligation into the system, the transaction was tracked to completion. The CIO noted that a key lesson learned from accounting for emergency-type funding initiatives for was that having central control of funds is essential to oversight and investments.

Question. We understand that USDA hired a contractor to audit agency Year 2000 expenditures. When was this audit completed and what were the results?

Answer. The audit activity on USDA's Year 2000 expenditures is ongoing and scheduled for completion by May 31, 2001.

UNOBLIGATED BALANCES

Question. Provide actual/estimated fiscal year-end 2000, 2001, and 2002 unobligated balances, by account, with an explanation of amounts in excess of 10 percent of the total funding available at the beginning of the fiscal year.

[The information follows:]

EXPLANATION OF UNOBLIGATED BALANCES IN EXCESS OF 10 PERCENT OF TOTAL FUNDS AVAILABLE

Farm Service Agency

- Agricultural Conservation Program. This program is no longer authorized and USDA cannot obligate additional funds. The objectives of this program were incorporated into the Environmental Quality Incentives Program which is funded by the Commodity Credit Corporation.
- Emergency Conservation Program. Unobligated balances are needed in the event of unforeseen emergencies dealing with cases of severe damage to farmlands and rangelands resulting from natural disasters.

Risk Management Agency

- Federal Crop Insurance Corporation Fund. The estimated unobligated balances are roughly equivalent to the FCIC's outstanding capital stock of \$500 million.

Foreign Agricultural Service

—Salaries and Expenses. The unobligated balance includes \$4 million for the Cochran Fellowship Program, about \$6 million from the Department of State for overseas security enhancements, and about \$15 million from the Agency for International Development. The funds will be used to conduct required future activities.

Public Law 480.—More than 85 percent of the fiscal year 2000 unobligated balance represents Title I amounts for the Russia Food Assistance Program that will be obligated prior to the end of fiscal year 2001. The remaining amounts are for Titles II and III.

Rural Development

—Rural Housing Assistance Grants. Of the amount available for carryover, 80 percent of the total is for natural disasters which has had few requests for funding.

—Rural Empowerment Zones/Enterprise Community Grants. There are balances because of a delay in the clearance of the regulations needed to initiate the program for the Round II EZ/EC's.

—Rural Economic Development Grants. The funds for the Rural Economic Development Grants are provided from the interest differential on Rural Utilities Service (RUS) borrowers' cushion of credit accounts. Under the Cushion of Credit Payment Program, RUS borrowers are authorized to make voluntary advance payments on their loans and receive 5 percent interest on those advance payments. These advance payments, called "cushion of credit" payments, are held in the Rural Electrification and Telecommunications Liquidating Account. This account is credited monthly with a sum determined by multiplying the outstanding cushion of credit payments made after October 1, 1987, by the difference between the average weighted interest rate paid on outstanding certificates of beneficial ownership issued by the Fund and the 5 percent rate of interest provided to RUS borrowers on cushion of credit payments. At the end of the fiscal year, the cushion of credit payments in the Rural Electrification and Telecommunications Liquidating Account are transferred to the Rural Economic Development and Grants and used to make grants the next fiscal year.

—National Sheep Industry Improvement Center Revolving Fund. For the fund, \$25 million has been appropriated. The funds are authorized to carry out the authorized programs and activities of the Center without fiscal year limitation. Of the \$25 million available to date, \$14 million was obligated to an intermediary to make direct, indirect, and guaranteed loans. Also, \$4.8 million is being used for grants for marketing and promotion of lamb meat. The remaining funds will be used to carry out the intent of the revolving fund.

Natural Resources Conservation Service

—Watershed and Flood Prevention Operations. NRCS does not record an obligation until a Federal contract has been awarded, a project agreement has been executed, a cooperative agreement has been signed by the sponsor, or a long-term contract has been signed by the participant. It often takes a great period of time to accomplish this due to the complexity of the work. Some of the unobligated balances are due to an emergency supplemental that was passed later in the fiscal year.

—Forestry Incentives Program. NRCS does not record an obligation until a forest management plan is developed and approved. It often takes a great period of time to accomplish this due to the complexity of the work.

—Great Plains Conservation Program. This NRCS program is now conducted under the authority of the Environmental Quality Incentives Program. The unobligated balances will be maintained until all existing contracts are modified or expire.

—Colorado River Basin Salinity Program. This NRCS program is now conducted under the authority of the Environmental Quality Incentives Program. The unobligated balances will be maintained until all existing contracts are modified or expire.

—Wildlife Habitat Incentives Program. NRCS does not record an obligation until the wildlife habitat development plan is finalized. It often takes a great period of time to accomplish this due to the complexity of the work.

—Rural Clean Water Program. No needs are anticipated for the remaining unobligated funds because the implementation period for all projects has ended. The final payments have been made and the program will be closed out in 2001.

Agricultural Research Service

—Building and Facilities. Most of the balances in this account are for facilities projects that are awaiting additional appropriations in order to fully fund a complete segment of the project; waiting for completion of design work in order to award construction contracts, or currently in various phases of construction and funds are being obligated as the work progresses.

Cooperative State Research, Education and Extension Service

—Initiative for Future Agriculture and Food Systems. The 2002 Budget provides that 2001 unobligated balances carry over to fund the program in 2002 and postpone spending the new \$120 million to be appropriated for 2002 until 2003.

Agricultural Marketing Service

—Marketing Services. The unobligated balances in this account are reimbursed funds collected from fees paid by the agricultural industry customers for cotton and tobacco grading services. A balance is maintained to cover a 3 or 4 month reserve for unforeseen liabilities.

Animal and Plant Health Inspection Service

—Building and Facilities. Most of the balances in the account are for facilities that are in various phases of construction or repair and are being obligated as the work progresses.

Grain Inspection, Packers and Stockyards Administration

—Inspection and Weighing Services. A balance is maintained to cover a 3 or 4 month reserve for unforeseen liabilities.

Fund for Rural America.—The 2002 Budget provides that 2001 unobligated balances carry over to fund the program in 2002 and postpone spending the new \$60 million to be appropriated for 2002 until 2003.

QUESTIONS SUBMITTED BY SENATOR ARLEN SPECTER

DAIRY

Question. Milk prices dropped to \$9.63 per hundredweight at the end of 1999, the lowest price in 21 years (since August of 1978). This was a drop of \$7.71 from December of 1998, when the price was \$17.34. Over the past several years, price swings of 30 to 40 percent from one month to the next have become common.

Agriculture is the largest industry in Pennsylvania and dairy is its single largest component. Pennsylvania is the fourth largest dairy producer in the nation and there are approximately 9,900 dairy farms which produce \$1.73 billion worth of milk each year. Over the past decade, however, Pennsylvania has lost an average of 300–500 farmers per year. Between 1993 and 1998, Pennsylvania lost 11.4 percent of its dairy farmers. While facing record low prices, Pennsylvania farmers often have to deal with droughts, other natural disasters, high feed and transportation costs and other variables that challenge their ability to sustain their farms. Pennsylvania dairy farmers continue to face low farm prices for their milk. What action is the Administration taking to help dairy farmers who are facing record low milk prices?

Answer. USDA has purchased 300 million pounds of nonfat dry milk and 11 million pounds of cheese, so far in fiscal year 2001 (October 1–April 30), in order to support the price of milk used for manufactured products above \$9.90 cents per hundredweight. Expenditures of about \$400 million are expected for dairy product purchases under the price support program during fiscal year 2001. An additional \$6.7 million has been spent in the Dairy Export Incentive Program to aid in making export sales of dairy products during fiscal year 2001. An additional allotment for further export aid will become available July 1, 2001.

The Dairy Market Loss Assistance Program made payments to dairy producers of nearly 65 cents per hundredweight (cwt) on up to 39,000 cwt of milk production. Expenditures under this program are nearly complete and total about \$665 million.

The national average all-milk price for CY 2001 is expected to be \$1.70 cents per cwt higher than it was in CY 2000. This should increase dairy farm income from milk sales by about \$2.6 billion, or 13 percent. During the first quarter this year, "all milk price" was \$1.63 per cwt above the same period last year.

Question. What is the relationship between the price paid by consumers for milk in retail settings to the price received by dairy farmers for providing the milk?

Answer. There seems to be a limited relationship between retail price of milk and the prices received by farmers. In the short term, changes in prices received by farmers may not be reflected in the retail prices consumers pay. Economic studies on milk retail-farm gate price spread indicate that the farmer share of the retail milk prices is nearly 30 percent. Other factors such as the processing, transportation, distribution, wholesaling, marketing, advertizing, profits, etc. make up the rest. However, over the long-run, consistent changes in prices received by farmers get reflected in the retail price, i.e., a consistent increase or decrease in prices received by farmers will result in increase or decrease in retail prices, though the magnitude of the change may be different due to other components of the price spread. Market observations suggest that due to market forces and nature of the business practices, the reaction time is shorter for price increases compared to price decreases. Once increased, the downward adjustment of prices is "sticky."

Question. According to a recent General Accounting Office report (GAO-01-326), milk protein concentrate (MPC) imports grew rapidly between 1990 and 1999, and nearly doubled between 1998 and 1999. Many people involved in the dairy industry are concerned about the safety of MPC and circumvention of regulations prohibiting use of MPC in cheese production. Are these concerns valid and what activities is USDA undertaking to respond to these concerns?

Answer. As noted in the GAO report, the Food and Drug Administration found no violations of the use of imported MPCs in standardized cheese production in fiscal year 1999. The report does point out, however, that Vermont State inspectors in the year 2000 found two cheese plants that were using imported MPCs to make standardized cheeses in violation of Federal and state regulations, and that both of these plants discontinued the practice when issued warning letters by the State. FDA also has the responsibility of ensuring compliance of imported dairy products with U.S. public health requirements. Regarding the safety of MPCs, the GAO report states that "FDA officials told us that these imports pose little food safety risk and therefore receive minimal monitoring."

Question. What actions are currently being taken by USDA or other departments and agencies in coordination with USDA to defend U.S. farmers against Foot and Mouth Disease and Mad Cow Disease?

Answer. USDA has taken a number of recent actions to defend U.S. farmers against FMD and bovine spongiform encephalopathy, commonly referred to as mad cow disease. USDA has placed additional personnel at high-traffic international ports of entry to assist with passenger clearance, cargo inspection, cleaning and disinfection, and mail and small package inspection. As part of these efforts, approximately 350 additional staff are being hired, and USDA has authorized the use of an additional \$32 million from APHIS—user fee account to support this personnel increase through fiscal year 2002. APHIS is also accelerating the training and placement of supplementary detector dog teams at key air and cargo ports.

Since the first detection of FMD in the UK, USDA has been coordinating and meeting regularly with regional USDA officials, their counterparts with the U.S. Customs Service and the Department of Defense, State agriculture and veterinary officials, university experts, and airline/travel industry representatives.

APHIS has also held conference calls with State agriculture commissioners about USDA exclusion efforts. State agriculture commissioners were given the opportunity to ask APHIS officials questions about preparedness and response efforts should FMD ever be detected in the United States. APHIS officials have also met directly with State officials on several occasions.

To assist with preparedness, the National Association of State Departments of Agriculture is exploring acceptable methods of carcass disposal in each State. State officials have been asked to assume that the largest herd in the State has to be depopulated and carcasses disposed of as close to the premises as possible. This planning will greatly assist any future efforts to eradicate a foreign animal disease by depopulating and disposing of infected or potentially exposed animals.

APHIS continues to coordinate the weekly deployment of U.S. veterinary teams to the UK. These teams, comprised of State and Federal veterinarians, are providing assistance with the FMD eradication program there. Returning team members are

bringing back important information with regard to containing and eradicating an FMD outbreak. APHIS will continue to coordinate these assistance efforts for as long as requested by UK officials.

The Tripartite Exercise 2000, an FMD outbreak simulation involving Canada, Mexico, and the United States, resulted in a committed effort by all three countries to collaborate on efforts to prevent FMD in North America. As a result of lessons learned during the exercise, APHIS has updated its FMD response plan to incorporate new information about communication and vaccination in the event of an outbreak.

USDA has also embarked on an aggressive public information campaign in regard to FMD. These efforts have included posting additional advisory signs in airports, broadcasting public service announcements, and establishing an information hotline and website to inform the public of the steps that they can take to prevent FMD from entering the United States.

USDA has implemented numerous prevention, surveillance, and education measures to prevent the occurrence of BSE in our country's livestock population. Since 1989, we have severely restricted imports of cattle, other ruminants, and ruminant products from countries where BSE is known to exist. As a further precaution, we expanded the prohibition in 1997 to include the importation of all ruminants and most ruminant-origin products from European countries, including countries where BSE has not been reported. As of December 7, 2000, we have also prohibited all imports of rendered animal protein products, regardless of species, from Europe. This ban followed the determination by the European Union that some of this material was potentially cross-contaminated with the BSE agent.

APHIS and FSIS conduct an active surveillance program for BSE. The surveillance program includes monitoring of field cases of cattle exhibiting signs of neurological disease, cattle condemned at slaughter for neurologic reasons, rabies-negative cattle submitted to public health laboratories, neurologic cases submitted to veterinary diagnostic laboratories and teaching hospitals, and sampling of cattle that are nonambulatory (downer cattle/fallen stock) at slaughter. APHIS and FSIS have also cooperatively drafted an emergency response plan to be used in the event that a case of BSE is detected in the United States.

APHIS established a TSE (transmissible spongiform encephalopathy) Working Group in the late 1980s to study the issues surrounding this group of degenerative neurological diseases. TSEs include BSE and scrapie, a disease that affects sheep and has been present in the United States since at least 1947. The TSE Working Group makes policy recommendations for preventing BSE from entering the United States and serves as a liaison to Federal and State agencies to coordinate all efforts against BSE. Members of the Working Group also work with industry representatives and foreign governments to provide accurate technical information about TSEs.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN
(WIC)

Question. Concerns have been raised by the National Association of WIC Directors and other groups regarding the Administration's WIC participation projections for fiscal year 2002, upon which the budget request is predicated. How confident is the Administration in its projected average monthly participation of 7.25 million women, infants and children in this important program?

Answer. At this time we believe the Administration's projected average monthly participation of 7.25 million for fiscal year 2002 is accurate. However, projection of future WIC participation is inherently difficult and changes in economic conditions could impact demand for services. The Department plans to closely monitor the Program's participation over the next several months.

Question. The Commonwealth of Pennsylvania joined the Farmers Market Nutrition Program in 1989. Since that time, the program has provided WIC recipients the opportunity to purchase fresh food directly from local farmers. The Administration's budget includes approximately \$20 million for this crucial program, including \$9,956,000 from any funds not needed to maintain current WIC caseload levels. Given the importance of this program to so many low-income women and children throughout the nation, are you concerned about a funding shortfall that may occur if WIC caseload increases do not allow for transfer of this necessary additional \$9.956 million?

Answer. At this time, the Department believes that projected WIC caseload can be supported with funding levels requested in the fiscal year 2002 President's Budget request. However, should actual WIC participation exceed our projections, appropriations language that makes funding for the WIC Farmers' Market Nutrition Pro-

gram (FMNP) contingent on WIC Program caseload may be problematic for the FMNP in fiscal year 2002.

QUESTIONS SUBMITTED BY SENATOR LARRY CRAIG

NATIONAL NUTRITION MONITORING SYSTEM AND THE DISCONTINUATION OF THE USDA SURVEY, THE CONTINUING SURVEY OF FOOD INTAKES BY INDIVIDUALS (CSFII)

Question. In fiscal year 2000, USDA announced plans to discontinue its food consumption survey, the Continuing Survey of Food Intakes by Individuals (CSFII) due to lack of adequate funding. It is my understanding that in the absence of CSFII, USDA plans to rely on dietary data collected by the U.S. Department of Health and Human Services (DHHS). There is concern that without CSFII, USDA can no longer be assured it will receive the types of data needed in a timely fashion to support the multi-faceted functions of the Department.

Without the USDA data, how can USDA monitor and evaluate programs and how can we have access to the information we need to make programmatic adjustments to maximize benefit and minimize cost?

Answer. The USDA will not discontinue its food intake survey. The USDA Agricultural Research Service (ARS), and the Department of Health and Human Services (DHHS) National Center for Health Statistics (NCHS) have been planning over the past three years the integration of the Continuing Survey of Food Intakes by Individuals (CSFII) and the National Health and Nutrition Examination Survey (NHANES) as set forth in the National Nutrition Monitoring and Related Research Act of 1990. In the CSFII/NHANES integrated survey, the USDA will collect, process and analyze exactly the same information as the USDA had collected previously in a free standing CSFII. The data will be collected and processed using the USDA developed methodology and will be released in the same time frame as was previously released for the CSFII. In addition, the benefits of the integration allow for continuous annual collection of the data (as opposed to periodic collection previously), a full second day of data collection from all respondents, conversion of the foods consumed into approximately 50 percent more nutrients, an improved multipass method of dietary intake collection, and for the first time a linkage between the intake of foods and medical and diagnostic information for all respondents.

USDA is committed to collecting the important information provided by the CSFII. Integration with the NHANES survey will allow the Agency to perform this task with currently available funding; enhancing data that historically was collected by both the USDA and DHHS.

Question. My understanding is that both USDA and DHHS surveys collected dietary data on 5,000 individuals creating a 10,000 sample size. Since DHHS isn't planning to increase their sample size to compensate for the loss of the 5,000 household CSFII sample, what are the implications of losing half of the total number in the sample?

Answer. Ideally, the sample size should be much larger than even the 10,000 number. In recent conversations with Statistics Canada, we have learned that their national food consumption survey is planned at 30,000 respondents. While it is true that in the past both the NHANES and the CSFII included 5,000 respondents per year, both surveys were not necessarily ongoing at the same time. In addition, both surveys were periodic in that data collection proceeded for three years and was typically followed by a period of several years where no data were collected. So, in any given year, there could have been no data collected, 5,000 respondents, or a maximum of 10,000 respondents. While it is true that the integration of the two surveys will reduce the data collection to a maximum of 5,000 respondents, one of the benefits of the joined survey activities is that CSFII data will be truly continuous i.e., it will be collected every year. Furthermore, a single method of data collection should mitigate some of the inconsistencies that have been well noted between the CSFII and NHANES in the past. Ideally, however, increasing the sample size of the survey, which would be easy to do with the merged survey, would be highly desirable to continue to monitor the food intake of populations at risk. The issue of what is an adequate sample size is an important one; these nationwide food consumption surveys are extremely expensive to conduct.

Question. What data, or types of data, were collected by USDA in CSFII that will not be collected in the DHHS survey?

Answer. The combined survey will produce data that was not available previously including continuously collected data, a much enhanced nutrient analysis of foods consumed and important health information on respondents. In the CSFII/NHANES

integrated survey, the USDA will collect, process, and analyze exactly the same information as the Agency had previously collected in a free-standing CSFII. The major concern with the combined survey is information on seasonal variation in diets. This concern arises out of the fact that the data for day one of the survey will be collected in the NHANES mobile trailers, which are driven to the locations of data collection. Because of the reliance on the trailers, the ability to collect data in the middle of winter in cold climates is somewhat limited. USDA and DHHS are aware of this limitation and we have planned accordingly. DHHS has winterized the trailers and has made adjustments in scheduling in order to provide more cold weather data collection. In addition, we think that we will collect the information that we need on seasonal variation by collecting the second day of food intake data by telephone, which is obviously not going to be affected by weather. Telephone data collection works well with NHANES (approximately 85 percent response rate).

Data collected in the past has formed the basis for the Household Food Consumption Survey (HFCS). USDA is committed to collecting these data and we believe we can collect and release them similarly to what has been done in the past. These data were collected periodically by telephone from the CSFII respondents. The data now will be collected from the 5,000 integrated survey respondents.

Question. Given the many competing interests and various health measurements and assessments performed in the DHHS survey, can USDA guarantee that questions of interest to USDA always will be included in the DHHS survey?

Answer. While the nutrition component of the NHANES is small relative to the overall scope of the NHANES, it is an essential component. USDA has worked with DHHS for the past 4 years to develop and implement the integrated survey and both parties have been cooperative and made concessions to each other to accommodate the needs of customers and stakeholders of both surveys. This dialog and joint planning has been helpful to allow us to focus on what are the important pieces of information that are needed by the USDA for those who have relied on the CSFII. Throughout the planning process we have held numerous stakeholder meetings to ensure that we are aware of the needs of users of the data. It is interesting to note that several of the major users of the CSFII data have in the past been financial supporters of NHANES. It is also interesting to note that although there seems to be widespread support by USDA stakeholders for the merged survey, many of the concerns that have been raised would not have been met with a free standing CSFII, such as continued over sampling of children as was done by USDA in response to a one year appropriation. If at any time in the future, the USDA perceives that the needs of the users of our data are not being met, we will look at other ways of collecting the data.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

FOOT AND MOUTH DISEASE

Question. Madame Secretary, I appreciate your comments in regard to the question I verbally posed about the steps necessary to avoid an outbreak of Foot and Mouth Disease, or similar animal diseases in this country. As I mentioned, if an outbreak were to occur in my state, with its reliance on the dairy industry, the consequences would be absolutely devastating, a fact I also pointed out in my April 17th letter to you.

In that letter I mentioned a troubling story on this subject that appeared in the Wisconsin State Journal on April 4th which reported shortfalls in the inspection procedures at U.S. points of entry. That story made reference to specific incidents at O'Hare International Airport, which may be representative of international airports around the country. For example, a traveler who had been in the British countryside had to insist repeatedly to airport officials that special steps were necessary to disinfect her shoes. It should be recognized that many travelers to rural England spend time in the proximity of livestock (such as at a rural Bed and Breakfast) without necessarily considering their experience as being a "farm" visit.

While your response to my question provided general information, it did not specifically answer the question I asked. Have you had a chance to review that story and would you please respond to the concerns it raises regarding travelers like Ms. Randall and whether USDA has taken actions either internally or with other agencies to assure that incidents like the one reported will not occur?

Answer. We are concerned about such reports and continue to work with related agencies to reduce such incidents. All international travelers must state on their Customs declaration form whether or not they have been on a farm or in contact with livestock and if they are bringing any meat or dairy products from their travels

back with them. The Animal and Plant Health Inspection Service (APHIS) is working closely with the U.S. Immigration and Naturalization Service and U.S. Customs Service to ensure that they refer all passengers, who check “yes” to the agriculture question #11 on the Customs declaration, to an APHIS official. APHIS officials will inspect travelers’ baggage if they indicate they have been on a farm or in contact with livestock. We have determined that footwear that is clean (i.e., no appearance of manure, dirt, or other particulate matter) does not provide the appropriate conditions (i.e., moisture level, pH, and temperature) for the FMD virus to survive. Footwear that appears dirty can provide the appropriate conditions for carrying FMD and must be disinfected with detergent and bleach. To accommodate passengers who are still concerned that they could be carrying FMD after we inspect their footwear and determine there is no risk, APHIS inspection policy now states that our inspectors will disinfect their footwear at their request.

Question. If a confirmed outbreak of Foot and Mouth Disease were to occur in this country, what USDA procedures are in place for disease containment? In other words, what specific actions does USDA have as planned contingencies if an outbreak were to occur? Would USDA plan to offer compensation to affected livestock producers? How would USDA prevent the transportation of infected cattle within the United States? How would USDA handle infected herds? Would there be whole herd slaughters as we have witnessed in the UK?

Answer. If APHIS were to confirm an outbreak of FMD in the United States, APHIS would respond according to the Agency’s FMD response plan. Because specific outbreak situations vary, and each State’s emergency response capabilities differ, APHIS’ FMD response plan is designed to be flexible and dynamic. APHIS’ FMD response plan taps State and Federal resources as available, and allows the Agency’s animal health expertise and coordination skills to fill any remaining gaps.

Upon the initial confirmation of FMD, APHIS and State officials would immediately begin investigating the source and trace all animals that may have come into contact with the disease. These officials inform both State and Federal officials on the status of their investigation and will also initiate emergency response efforts at the State and local level. These measures include notifying State agriculture and, if necessary, public health officials of the disease detection; securing the biosecurity of the affected site including depopulating and disposing of the whole herd and cleaning and disinfecting premises; establishing and maintaining animal movement quarantines, and alerting officials in neighboring States and the international community. Upon spread of the disease, APHIS and States would enhance surveillance efforts, expand quarantines as needed, conduct a comprehensive public media campaign to alert the public on the signs and transmission of FMD. After identification of the subtype, APHIS would activate the FMD vaccine bank, order vaccine doses, and consider the use of vaccines as a tool in the eradication effort.

USDA has developed a compensation policy with the Office of Management and Budget and with input from other interested parties. The goal of this policy is to ensure that an outbreak is located and diseased or exposed animals are destroyed as soon as possible. For that, we need the full cooperation of all producers. For animals depopulated to eradicate a disease, USDA has traditionally paid an indemnity approximating the fair market value of the animals. We intend to provide compensation for the fair market value of animals depopulated due to FMD, possibly including other specific direct costs incurred by producers. We will provide more comprehensive information on our compensation policy in the near future.

Question. Please provide information regarding new technologies (including vaccines) that have been or are being developed to combat Foot and Mouth Disease or similar animal diseases.

Answer. ARS has developed and is currently validating a highly specific nucleic acid on-site detection technology that allows minimally trained personnel using a briefcase-sized device to definitively identify FMD virus on the farm within an hour. This on-site technology can also be adapted to screen imported carcasses for animals that have been previously infected with FMD and also for animals that have been vaccinated against the disease.

ARS will test two promising vaccine candidates. The first is a synthetic peptide vaccine that is being produced by a company on Long Island, NY. The technology is based on research conducted by ARS scientists at Plum Island Animal Disease Center (PIADC) over the past 20 years. The company has data to indicate that this vaccine protects swine from Type O FMD virus and has been selling the product in Taiwan and China. ARS is currently proposing to work with this company to examine the vaccine’s protective ability for cattle and sheep and to determine if the virus is carried by vaccinated animals that were later exposed to infection. This peptide vaccine would be the only readily available product should the U.S. urgently need to vaccinate animals with a type of virus vaccine not present in the North

American Vaccine Bank. The second candidate vaccine is an ARS-developed adenovirus vectored (genetically engineered) FMD vaccine that has been shown to protect swine in laboratory studies. This work will be extended to tests in cattle and sheep to determine if all species are protected. These two vaccines may differ in their ability to protect livestock in case of an outbreak and will be compared for likely efficacy in those conditions.

ARS also has a modest program on Vesicular stomatitis viruses (VSV); these are insect-transmitted viruses that cause vesicular disease in cattle, swine, horses and humans, and are clinically indistinguishable from foot-and-mouth disease. The ARS program on VSV is conducted at: (1) the Arthropod-Borne Animal Disease Research Laboratory (ABADRL), Laramie, Wyoming where scientists are investigating the role of biting arthropods in VSV transmission; and (2) at PIADC, Greenport, New York where researchers are determining genomic information useful for detecting exotic strains of VSV, and tracking the origin of VS strains causing outbreaks in the U.S. In addition they are carrying out pathogenesis studies in livestock that will be useful for development of vaccines and therapeutic agents. There are no VSV vaccines commercially available in the U.S. The livestock industry is reluctant to use traditional killed-virus vaccines because vaccinated animals would be serologically indistinguishable from infected ones, which would have important trade implications.

EMERGENCY ASSISTANCE

Question. We have all seen on recent national news broadcasts the flood waters that have been sweeping down the Midwest along the Mississippi, Wisconsin, Red Rivers and others. This year, the Mississippi River is cresting at record levels and lands in my state are still underwater and will be for some time. We don't know yet how badly scoured those lands will be or how costly the repair and recovery costs will be.

I have received a letter from Senator Wellstone from my neighboring state of Minnesota who reports that on top of already dismal conditions, just this last weekend the central part of his state received 5 to 8 inches of snow, and an additional 4 inches of rain fell over central and southeast Minnesota affecting literally millions of acres of farmland and posing increased threats from scab and other grain disease this year if, in fact, farmers are able to put a crop in the soil.

Secretary Veneman, I understand that the President's budget includes \$5.6 billion that can be made available to help people recover from the sort of devastation we are now seeing in the upper Midwest. It is also my understanding that that amount, \$5.6 billion, is the total for all government agencies and programs for recovery from natural disasters. How will USDA determine among all agencies how much of that \$5.6 billion should be allocated for agriculture related losses?

Answer. The \$5.6 billion National Emergency Reserve would provide for additional needs arising for major disasters above and beyond normal and average needs. The budget provides for average funding needs for disaster related programs such as USDA's fire fighting program, FEMA's disaster assistance and others. The allocation of funds from the Emergency Reserve would be proposed by the President and acted upon by the Congress. USDA will, of course, monitor disaster related conditions and needs related to its programs.

Question. Are there any other sources of funds within the budget available if recovery needs exceed \$5.6 billion?

Answer. The President's Budget also provides for a contingency reserve to allow for unanticipated priority spending needs including such things as emergency farm economic and disaster assistance.

Question. If there are no additional funds budgeted, then it would appear we are sending a message that Federal assistance to flood and storm victims may not be provided at levels similar to previous disasters. Do you believe that is fair to victims today, or do you believe that victims of, say for example Hurricane Floyd or the Grand Forks flood of 1997 were over compensated?

Answer. The budget does provide funding for various governmentwide disaster relief programs such as FEMA disaster assistance, USDA and DOI firefighting, and SBA disaster loans at levels commensurate with normal or average needs. The proposed Emergency Reserve is an attempt to provide a mechanism to meet major unexpected needs without resort to unplanned supplemental emergency programs which may be disruptive to overall budget planning and discipline.

Question. Does USDA have plans to assess the damage from current flood events and report those findings to the Congress with a request for supplemental funding? If so, how soon may we expect to receive such a request?

Answer. USDA is monitoring the flooding situation closely. However, funding needs assessments can only be made after the flood waters have receded. For the Emergency Watershed Protection (EWP) program, initial funding requirements will be determined within a few weeks of the water receding and the sites becoming accessible for technical evaluations.

Question. In what ways and how soon may victims of the current flooding in the Upper Midwest expect assistance from USDA?

Answer. We are continuing to monitor this situation, but cannot yet determine the extent of potential needs.

Question. Does the Bush Administration plan to respond to disaster needs occurring during fiscal year 2001 in a way that might differ from future years? If so, explain.

Answer. It is too early to determine whether or how planning in future years might be changed.

Question. Does USDA have plans to alter its policy in regard to disaster assistance to areas where there is a history of natural disasters, such as in frequently flooded areas? If so, how might that policy change?

Answer. We need to review this concern, before determining whether it is reasonable to explore any change in policy.

DAIRY COMPACTS

Question. Secretary Veneman, when we visited shortly after your confirmation as Secretary, I voiced my objection to the Northeast Dairy Compact and to the imposition of domestic trade barriers generally. Aside from the basic policy and constitutional questions that surround the issue of dairy compacts, dairy producers in Wisconsin are at risk of losing their livelihoods due to the market distorting features of the existing compact and face even more stringent difficulties if there were an expansion of compacts in other states.

Do you accept, as a matter of policy, that U.S. dairy producers in one region of the country should be allowed to suffer financial ruin due to market distorting features imposed on them by producers in another region of the country?

Answer. U.S. farm policy in general during the past several years has been to increase the role of market forces in determining what commodities are produced and consumed and in determining how much is produced and consumed. We think that in general that is the appropriate guiding principle for fostering an efficient farm sector. This applies to dairy as well. However, we recognize that adjustments in dairy policy toward market orientation have been gradual and that is not inappropriate given the nature of the dairy sector. With specific regard to the Northeast Dairy Compact, a number of studies have shown it has probably increased prices to consumers in the region, increased prices received by producers who sell milk in the Compact area and has slightly reduced prices to producers elsewhere. None of these studies have taken into account the recent supply control measures instituted in the Northeast Compact which may mitigate the effects on producers elsewhere. We are aware that GAO is currently studying the Northeast Compact and await its findings.

Question. Do you believe it is consistent with the Bush Administration's policy on free trade that we should seek free trade abroad, but not free trade at home?

Answer. We believe that in the long run free competitive markets both domestically and internationally are the appropriate goals to be moving forward. Having said that we are also cognizant of the costs of adjustment which would be affected by changes in policy.

Question. What would be the Bush Administration's view if the Northeast Dairy Compact was the creation of the European Union rather than a collection of states in this country? Would WTO principles apply in such a case?

Answer. The Northeast Dairy Compact acts to manage the market for producer milk within its region rather than to place direct restrictions on trade. It is our view that such compacts are not inconsistent with WTO principles, and although questions have been asked about the Northeast Compact by other WTO members, no serious allegations of noncompliance have been made against it.

Question. President Bush in Canada last week worked toward an agreement for Trade in the Americas to tear down trade barriers in this hemisphere. Does that agreement pertain to trade within the United States and if so, would it not be inconsistent with dairy compacts?

Answer. Interstate commerce within the United States is protected and regulated as provided for under the Constitution, and would not be limited or otherwise affected by the proposed Free Trade Area of the Americas or any other international trade agreement.

Question. Don't you believe it would be much more productive to develop a dairy policy that is national in scope that would treat all dairy producers fairly than one that pits one group of producers against another? Do you have any suggestions on how such a policy should be crafted? Are you willing to work with us toward the development of such a policy?

Answer. We will be willing to work with the Congress and all affected interests to search for an appropriate national policy for dairy. As your question indicates, the varying regional interests in dairy production make the formulation of a reasonable national policy challenging.

NATIONAL APPEALS DIVISION

Question. I have previously been concerned about a large number of decisions favorable to farmers by regional hearing officers being overturned by the Director of NAD. I also understand that NAD-wide training was held last year, emphasizing the planning and conduct of appeal hearings, including on-line training. What percentage of NAD employees have attended this training, and what benefits has NAD seen as a result of this?

Answer. According to NAD management, more than ninety-nine percent of NAD hearing officers attended NAD training conferences in 2000 and 2001. NAD's on-line training program is not yet complete. NAD is balancing available funds for training between providing traditional forms of training and continuing development of the on-line training program in fiscal year 2001. The training conferences emphasized listening, writing, format, reasoning, finding of fact, conclusions of law, judicial demeanor, subpoenas, hearing procedure and similar hearing- and determination-related matters.

As a result of training, NAD management says it is seeing improvements in the work of many hearing officers. NAD management reports that many hearing officers have applied the lessons of the training to hearing appeals and writing determinations. Hearings are more professional and determinations are better written with improved reasoning.

Question. Please provide information on how this training, and NAD's transition to its final rules published in June 1999, have affected the hearings process and outcomes, and how USDA has worked to ensure there is no bias against producers.

Answer. The Department will work hard to ensure that the NAD appeals process is fair and impartial. I will have NAD provide more specific information on its training program, final rules, and how the Department has worked to ensure there is no bias against producers.

[The information follows:]

The effects of training on the hearings process include increased professionalism in the way hearings are conducted and improvements in how determinations are written and supported by sound reasoning. The final rule involved only minor changes to the interim rule under which NAD operated since 1996. Changes implemented in the final rule involved the need for a personal signature in certain cases where it was not specified in the interim rule, options available to the hearing officer when a party fails to appear for a hearing, and delineating the status of third parties and interested parties. Overall, issuance of final rules had little substantive impact on the hearing process or the outcome of appeals.

NAD works to prevent bias through quality control procedures involving review of hearings and determinations to assure that all parties are treated alike and that all determinations are based solely on the application of the applicable regulations to the facts of the case. The Director has issued specific guidance in a NAD Directive, "Disqualification or Recusal from an Appeal," No. 99-08, dated March 19, 1999. Bias is not established by any recitation of numbers or percentages of determination results, but in a failure to conform to the highest standards of integrity and objectivity in applying the law. NAD adheres to such standards.

OFFICE OF THE CHIEF FINANCIAL OFFICER

Question. Please provide an update on the status of the current USDA financial management audit.

Answer. On February 26, 2001, the U.S. Department of Agriculture's (USDA) Office of Inspector General issued a disclaimer of opinion on the USDA Consolidated Financial Statements for fiscal year 2000. However, three of the Department's components—the Food and Nutrition Service, the Rural Telephone Bank; and the Federal Crop Insurance Corporation—received unqualified audit opinions and substantial progress has been made in improving the audit results of our other agencies. A variety of efforts are underway to resolve the Department's financial reporting

issues, and we are hopeful that these efforts will result in an improved audit opinion on the USDA consolidated financial statement for fiscal year 2001.

Question. How have the results of these audits, over the past three years, compared to other Federal agencies?

Answer. USDA received disclaimers of opinion on its consolidated financial statements for fiscal years 1998, 1999 and 2000. Of 24 major Federal agencies producing audited financial statements, seven, four, and two others in addition to USDA received disclaimers in 1998, 1999, and 2000 respectively.

COMMON COMPUTING ENVIRONMENT

Question. Please provide an update on establishment of the Common Computing Environment.

Answer. Since fiscal year 1998, the Service Center agencies (the Farm Service Agency, Rural Development, and the Natural Resources Conservation Service) have been replacing old, out-of-date and incompatible workstation computers with modern, common computing environment (CCE) workstations as part of the Department's Service Center Modernization Initiative. With requested resources in fiscal year 2002, we intend to complete the basic CCE infrastructure with the procurement of application servers and increased telecommunications capacity. I will have more detailed information provided for the record.

[The information follows:]

Priorities in fiscal year 2002 will include: increasing the Service Center agencies' telecommunications capacity and network security to allow customers to transact business electronically and acquiring high capacity servers needed to support the re-engineered business processes.

The CCE workstations have identical software consisting of office automation applications, such as word processing, and base program application software needed by one or more of the agencies. This common workstation and common "core" load of software make these machines interchangeable and provide employees with software that is in general use by the customer base and partners. It is anticipated that the remaining workstations will be procured in July/August 2001.

Network servers will provide full communications and connectivity of the Service Center workstations to the local and wide area networks. Network services that will be provided by these servers include security and access control, business quality electronic mail, printer and peripheral access, file storage and backup, and the management of local data for all employees within the Service Center. These servers also provide the mechanism for remote system management and configuration of the desktop and portable workstations. Currently, without the network servers, an update or fix of software on the workstations requires that an IT support person visits each office location and take each machine offline for about 1½ hours to perform the work. With the servers, these updates can be done remotely, from one location and during off hours so that no downtime or onsite work is required. Deployment of the network servers will begin later this year.

Additional funds from the Service Center agencies will complement the fiscal year 2002 CCE funding request by supporting continued business process re-engineering, data acquisition and training needed to reap the benefits of the new technology, as well as maintenance and support of existing legacy systems.

AGRICULTURE BUILDINGS AND FACILITIES AND RENTAL PAYMENTS

Question. I understand Phase One of the South Building Renovation is complete, and the contract bid period for Phase Two of the Renovation is currently underway. Please provide an estimated timetable on when Phase Two will be completed, and what the renovations entail.

Answer. Bids were received on April 13, 2001, for the Phase Two construction contract. Excluding delays due to unforeseen conditions, completion is scheduled for 1 year from the start date, with occupancy beginning in the summer of 2002.

The Phase Two renovation work includes total demolition of the existing interior construction of wing 4, except for First Floor historic preservation considerations involving existing corridor walls and doorways. The contract entails abatement of hazardous materials—*asbestos and lead paint*; upgraded mechanical, electrical, telecommunications and plumbing systems; new fire alarm and sprinkler systems; accommodations for persons with disabilities; and improved space tailored to the needs of the tenant agencies.

OFFICE OF THE GENERAL COUNSEL

Question. Last year, OGC was provided with \$500,000 in emergency funds to be used on activities relating to concentration and consolidation of agricultural busi-

nesses. Please provide an update on how these funds have been used to date, and plans for expending any remaining funds.

Answer. According to the OGC, these funds will be used to hire additional attorneys to handle regulatory and enforcement cases arising from concentration specifically in the livestock and poultry industries. Two new attorneys will be coming on board within the next several weeks to augment the legal staff handling concentration-related cases, and OGC is also seeking to hire up to two additional new attorneys for this work.

OUTREACH FOR SOCIALLY DISADVANTAGED FARMERS

Question. I understand that the majority of projects funded with section 2501 funds were completed in fiscal year 2000. Please provide information on new and completed projects funded in fiscal year 2001 with section 2501 dollars.

Answer. I have been informed that all but one of the section 2501 projects were completed in fiscal year 2000. One project will complete its 5-year project with funding from fiscal year 2001 monies. A request for new project proposals, will be issued soon, and the remainder of the fiscal year 2001 funds will be awarded to the selected proposals later this year.

Question. Were all available funds committed?

Answer. Except for the one project which will complete its 5-year project with fiscal year 2001 program funds, none of the fiscal year 2001 funds have been committed yet. We expect to commit them later this year.

Question. Please provide information on the requirements for receiving this money, as well as examples of successful and unsuccessful uses of section 2501 funds.

Answer. The Request for Proposals for new section 2501 projects will be announced shortly. To receive funds, applicants will need to show that they can responsibly meet the intent of the program—that is, to provide outreach and technical assistance to socially disadvantaged farmers and ranchers to help them own and operate farms and ranches and to participate in agricultural programs. We will provide a few examples of completed projects for the record.

[The information follows.]

Alabama A&M University developed a program of technical assistance to reverse the decline in the number of socially disadvantaged farmers and ranchers in its area and improve family living conditions. It increased the information available to the participants and increased their participation in Federal and local assistance programs.

Delaware State University and the University of Maryland Eastern Shore worked together to build small-scale agriculture and coordinate markets for farm products in their area. They provided intensive training in farm production and improved the financial planning of the participants. These participants played an important part in the economic revitalization of their small communities.

Langston University (Oklahoma) provided technical assistance in farm management and alternative use and non-farm activities, which improved farm income through better management and financial analysis and expanded the alternatives for part-time and off-farm employment.

Lac Courte Oreilles Objibwa Community College (Wisconsin) developed and implemented an agricultural and resource management program that integrated modern technology with traditional practices in farming and marketing activities. The project contributed to a more diverse and sustainable local farm economy.

AGRICULTURE RESEARCH

Question. There is a growing concern that funding for agricultural research is not keeping pace with needs, nor keeping in line with research in other sectors. For example, the President's budget requests funding of \$969 million for the Agricultural Research Service and \$994 million for the Cooperative State Research, Education, and Extension service, the two primary research agencies of USDA. When compared to other agencies such as the National Science Foundation or the National Institutes of Health, the total funding for USDA research is often the same level as the annual increases in the non-ag sector. This problem presents the reality of an exodus of skilled ag researchers to fields of science where Federal funds are more readily available. Also, at a time when emerging plant and animal pest and disease issues, plant and animal genetics issues, food safety issues, and a host of other challenges are facing U.S. farmers, this drain of expertise and overall lack on an adequate research base is most troubling. Can you explain why the administration has not placed a greater emphasis on agricultural research and why it lags so far behind the Federal research support in the non-ag sectors?

Answer. Maintaining and strengthening the competitive advantage of U.S. farmers will require investments in new technology. To meet these needs within a restrained budget, we have taken a hard look at priorities. The President's Budget provides funding to cover increased pay costs for in-house agricultural research and redirects priorities to fund increases in selected National priority areas. Proposed reductions are limited to earmarked projects and facility construction.

Question. Did you express to OMB or the White House during the development of the fiscal year 2002 budget the need to bring agricultural research more in line with other Federal research efforts?

Answer. Due to the change in Administration, much of the budget development for the 2002 President's budget was held in a few weeks directly following the Presidential Inauguration. I was assisted in negotiations by a small transition subcabinet-level policy staff. During this brief period of discussions, we focused on negotiating for funds to support my highest priority research initiatives. These initiatives include research on mad cow disease, biotechnology risk assessment, biobased products, maintaining a broad range of extramural research and education programs, and other high priority initiatives.

Question. Do you think that current levels of agricultural research are adequate to meet the challenges facing the U.S. farm sector today?

Answer. The research agencies consistently meet the challenges that arise with today's ever-changing global farm economy, including addressing needs ranging from organic production, to improved pest and disease control, to bioengineered foods. Research programs must serve small and minority farmers; sustain the rural economy and provide opportunities for growth; and support efforts to further develop markets locally and abroad. These programs must and do provide the scientific basis for a multitude of programs, such as producing high quality foods, examining human nutrition, developing sound production practices that minimize environmental impacts and emphasize economics, and numerous other areas important to the agriculture system, in the field, in the home, and elsewhere. By maintaining a balanced portfolio of extramural grants and in-house research funding, the Department is able to manage its research program in order to address high priority research areas identified by our stakeholders in the U.S. farm sector.

ECONOMIC RESEARCH SERVICE

Question. Please provide information in regard to the coordination of ERS with FNS on establishing studies and evaluations priorities on the subject of nutrition.

Answer. The Economic Research Service works closely with the Food and Nutrition Service (FNS) in identifying and setting research priorities. FNS is the primary client for these studies and thus receives considerable weight in determining priorities for research. In addition to an annual written list of research priorities provided by FNS to ERS, ERS staff are in almost daily contact with FNS about prioritizing its research needs. ERS also seeks input from other stakeholders including Congress, researchers, practitioners, advocates, industry groups, and service providers.

AGRICULTURAL RESEARCH SERVICE

Question. Please provide an update on activities regarding Integrated Farming Systems programs in Wisconsin or other states.

Answer. The Agricultural Research Service (ARS) at the U.S. Dairy Forage Research Center (USDfrc), the University of Wisconsin (UW) and the Michael Fields Agricultural Institute (MFAI) all continue to conduct research in a cooperative project on integrated farming systems in Wisconsin. The USDfrc is in the process of hiring an agroecologist and a research geneticist to join the integrated farming system project. The USDfrc conducts research on (1) developing low-input management of intensive grazing systems, giving emphasis to procedures that provide needed supplements to growing and lactating dairy cattle without nutrient buildup in pastures and loss to the environment; (2) evaluating and developing cropping systems that provide quality feed for profitable dairy farms in an environmentally safe manner; (3) developing strategies for managing nutrients in crop-livestock systems with special emphasis on animal manure to, at minimal cost, maximize nutrient recycling and minimize environmental risks; (4) investigating surface loss of phosphorus and nitrogen from pasture paddocks that have been managed in different ways; and (5) cooperate in a multi-agency/institute project on farm diversification—"Small Grains Initiative," the goal of which is to incorporate small grains and legumes into a normal corn-soybean rotation while taking into account both production and marketing objectives. Researchers at other ARS locations are also cooperating in this last project and with MFAI on topics such as soil quality. This group has

also received USDA grant funding to expand their efforts to develop cropping systems utilizing cover crops and manure to optimize nitrogen and phosphorus use while minimizing their loss to leaching and runoff.

One of ARS' National Programs is entitled, "Integrated Agricultural Systems." ARS research on "integrated farming systems" is a major activity across the country. This National Program is unique in that it addresses the context in which research is conducted as well as the scope of the research. Attributes of projects in the Integrated Agricultural Systems National Program include among others: active producer/stakeholder participation; determination of interactions among components; involvement of interdisciplinary teams and multi-organizational collaborators; optimum use of long-term studies; use of natural ecological and biological resources whenever appropriate; and consideration of economic, environmental, community, and social concerns. The Administration's 2002 budget recommendations for the ARS Integration of Agricultural Systems budget line item include an increase of \$484,000 for estimated pay cost increases in an effort to maintain the current level of scientific staffing in ARS.

Although it would be difficult for any one project to have all these attributes, there are ongoing ARS-led Integrated Agricultural Systems projects throughout the country that have many of these characteristics. For example, a project in Georgia, focusing on the use of cover crops and biocontrol, involves three ARS locations, three universities, a number of nongovernment organizations (NGOs) including Community in Schools and the Georgia Conservation Tillage Alliance, and multiple farmers with research sites on their farms. Another project led by ARS researchers in Ames, Iowa, is using farmers, consultants, university researchers, and NGOs, to develop environmentally sound and profitable farming systems for the highly erodible deep loess soils of the Cornbelt. An activity lead by scientists at the ARS unit in Mandan, North Dakota, in cooperation with seven other ARS Great Plains locations and numerous university cooperators and producers, is doing research on soil quality, cropping systems, and integrated crop-livestock production. One outcome, just released, is the decision support aid called "Crop Sequence Calculator" which enables northern plain farmers to choose the most profitable crop rotations based on their specific situation. More than 5,000 copies have already been distributed. Multiple ARS units across the Pacific Northwest, led by researchers in Corvallis, Oregon, are cooperating with other government agencies, NGOs, producers, and environmental groups to develop cropping systems compatible with salmon restoration. These, as well as other sustainable agricultural projects, are being conducted to meet the needs of ARS stakeholders expressed at the National Program workshops to address their integrated systems needs.

AGRICULTURAL RESEARCH SERVICE BUILDINGS AND FACILITIES

Question. Please provide an update on activities regarding planned improvements of the Cereal Crops Laboratory in Madison, Wisconsin.

Answer. ARS retained an architect-engineer to review the facility conditions and needs to support the research program at the Cereal Crops Laboratory in Madison, Wisconsin. The feasibility study identified three options to meet the needs of the program. The facility report requested by Congress is currently being reviewed in the Department. The report will assess the needs for the facilities in Madison, Wisconsin and provide current information on costs for the project.

Question. Please provide an update on activities regarding the National Animal Disease Laboratory in Ames, Iowa, including ARS coordination with APHIS regarding this facility.

Answer. In fiscal year 1999, ARS and APHIS agreed to develop a preliminary combined modernization plan. In combining modernization efforts of both agencies, efficiencies can be realized by consolidating facilities, and phasing of construction can be simplified by eliminating the need for swing space. Combining efforts also presents the opportunity to create a world class facility consisting of new, state-of-the-art structures for biocontainment research, diagnostics, and vaccine evaluation. New construction allows the structures to be optimally sited along an upgraded infrastructure spine; provides increased security, operations and maintenance efficiencies; and results in an enhanced research environment. The facility report requested by Congress was submitted on May 25, 2001. The report assesses the needs for the facilities in Ames, Iowa and provides current information on costs and scheduling for project alternatives.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

Question. Please provide information on Special Research Grants which as of fiscal year 2001 have received funding through this account for at least four consecu-

tive years and suggest other USDA grant programs for which these projects could compete.

Answer. Based on our funding history records, there are over 100 special grant projects which have been funded for the last four years. A table showing funding over the past four years for these grants is provided below for the record.

Some of these grants might qualify for funding under other grants programs administered by the Cooperative State Research, Education, and Extension Service—CSREES. CSREES administers programs related to a wide variety of national problem areas, including those that have a water quality, food safety, plant and animal genomics, biotechnology, or new uses focus. Many of the special grants projects tend to fall under these types of broad focus areas. However, the special grants provide earmarked funds for specific locations, without benefit of a competitive process including merit and peer review. Investigator-initiated basic research might qualify for support under broad national priorities of the National Research Initiative Competitive Grants Program. In addition, the Initiative for Future Agriculture and Food Systems gives priority to proposals that successfully integrate research, extension and education and/or address the concerns of small and mid-sized producers and land managers (especially in natural resource management and farm efficiency and profitability). The goal of IFAFS is to award large grants to multi-state, multi-institutional, and multi-disciplinary projects; preference will be given to those projects. Requests for proposals are modified each year to address the highest priority concerns for the U.S. agriculture and food system. CSREES administers a number of smaller programs that support work that is generally related to special grant topics, such as pest management and control programs, which might be funded under Improved Pest Control. These programs support alternative pest management practices. In addition, the Crops at Risk from Food Quality Protection Act—FQPA—Implementation and Risk Mitigation for Major Crops supports alternative pest management practices for crops at risk from loss of pest controls due to the FQPA. Food safety and water quality grants might also be supported under the programs under the Integrated Activities account.

WILDLIFE SERVICES

Question. Please provide an update on the agencies' non-lethal control activities and, in particular, the pilot programs in up to four states as provided in Public Law 106-387.

Answer. APHIS has taken steps to begin the project. APHIS has written a study protocol that will provide a statistically meaningful evaluation of the relative effectiveness of non-lethal predator management methods only versus the integrated approach of lethal and non-lethal management methods. This study is in addition to a broader, continuing research and methods development program APHIS conducts to protect livestock, crops, and human health and safety. APHIS devotes over 75 percent of their research effort to non-lethal development activities. APHIS has consulted with staffs of Senators Boxer and Smith, as well as with representatives from Defenders of Wildlife and the Humane Society of the United States, to identify the non-lethal methods to evaluate. The protocol calls for a four-year evaluation involving eight to twelve ranches each in California, Idaho, and West Virginia. The project is designed to evaluate both non-lethal and integrated management methods for two years on each ranch.

Question. Please provide information regarding the Wildlife Services activities in regard to wolf predation issues and control efforts in the Upper Midwest, including Minnesota, Wisconsin, and Michigan, and please compare the activities in that region with similar operations in the Rocky Mountain states.

Answer. The Minnesota wolf population has steadily increased from approximately 1,200 wolves in 1979, found only in the remote northeastern parts of the State, to approximately 2,600 wolves now. This population increase has caused a significant southern expansion with a contiguous range now covering approximately 40 percent of the State. Wisconsin began to monitor for wolf populations in 1979, with an initial report of 25 animals. In the late 1980s, this population began to steadily increase and there are approximately 250 wolves now. In 1995, wolf discoveries occurred in areas south of the northern Wisconsin region. As wolves began to occupy northern Wisconsin, individual wolf observations occurred in the Upper Peninsula of Michigan. The U.S. Fish and Wildlife Service (FWS) now estimates that approximately 200 wolves inhabit the Upper Peninsula. With this expanding natural population of gray wolves, we have been addressing wolf impacts in Minnesota since the mid 1970s. The population growth and expanding range have resulted in wolves moving into Wisconsin and Michigan. As the wolf population increases, so does the number of depredation incidents against livestock. We project our responses to wolf complaints in Minnesota, Wisconsin, and Michigan will reach 289 during fiscal year 2001, a 26 percent increase since fiscal year 1999.

The FWS gray wolf reintroduction in Wyoming (Yellowstone National Park) and Idaho has been so successful that wolf populations have expanded beyond original introduction site boundaries. From an original reintroduction of 66 wolves in 1995 and 1996, the FWS now estimates there are between 360-405 wolves in these two States. In addition, naturally occurring wolf populations in Montana have grown from an estimated 25-50 wolves in the early 1990s, to approximately 80 to 100 wolves today according to the FWS. In total, FWS estimates there are 440-505 wolves in the Northern Rocky Mountain area and that the total number of wolves

will triple in the next several years. APHIS—responsibility has increased significantly as a result of the wolf recovery efforts in Wyoming, Idaho, and Montana. We project our responses to wolf complaints in these States will reach 244 during fiscal year 2001, a 116 percent increase since fiscal year 1999. APHIS received \$1,000,000 in fiscal year 2001 for predator/wolf control in Idaho, Montana, and Wyoming which was allocated equally among the three States. We are evaluating the impact of these expanding wolf populations and our ability to provide adequate service with the increased funding.

ANIMAL WELFARE

Question. It has been brought to my attention that in the past several years, there have been a variety of instances in several states, including Missouri and Minnesota, in which USDA Animal Care Inspectors had found no cases of noncompliance at facilities with significant animal welfare problems, or where sanctions for noncompliance have been lax or unenforced. Please provide me with detailed information on how the USDA administers and enforces sanctions to Animal Welfare Act violators, and how you ensure that Animal Care Inspectors are completing detailed inspections of animal facilities.

Answer. APHIS conducts regulatory activities which ensure the humane care and treatment of animals and horses as required by the Animal Welfare Act (AWA) of 1966 as amended (7 U.S.C. 2131–2159). These activities include inspection of certain establishments which handle animals intended for research, exhibition, and sale as pets.

APHIS uses a variety of methods to assure that AWA inspections are thorough, complete, and conducted in a consistent, uniform manner. We rely heavily on proper training to insure that each animal care inspector has the background and knowledge to conduct a proper inspection. With fiscal year 2001 approximately halfway complete, the program has conducted three training courses for inspectors so far this year. One course concentrated on research facilities, and the other two focused on basic inspection techniques. APHIS also held a regional conference for animal care inspectors this year which included training designed to promote consistent, high quality inspections.

APHIS recently published an Animal Care Inspection Manual which outlines inspection procedures and also contains a checklist for inspectors to assure that they have covered all areas of the regulations that are pertinent to the facility being inspected. To help ensure that Animal Care Inspectors are completing detailed inspections of animal facilities, each inspector is supervised by a Supervisory Animal Care Specialist who conducts periodic reviews of the inspection process, and accompanies inspectors on actual inspections. These supervisors also review a random number of reports from each inspector to assure they are done properly and cover all areas prescribed in the AWA regulations.

With our recently developed Animal Care data base, we are able to statistically monitor the field inspection process by determining how many and what type of violations are written by each inspector, the number of inspections conducted, and other useful information to more effectively assure the inspections are conducted properly and thoroughly.

Enforcement activities are carried out by a separate investigative and enforcement (IE) staff funded under the Animal and Plant Health Regulatory Enforcement line-item. Animal Care program officials refer alleged violations identified during inspections to our investigative and enforcement unit for investigation. Headquarters IE staff review the completed investigative reports, and initiate an appropriate action based on a number of factors including the gravity of the violation, prior history, and size of the business.

Less serious infractions may be settled with an official notice of warning, while more serious cases may be resolved at the Agency level through stipulated civil penalty agreements with the violator or through formal administrative action before an Administrative Law Judge. Stipulations allow alleged violators to pay a fine, have their license suspended, or both, in lieu of formal administrative proceedings. Cases that warrant formal prosecution undergo Departmental review for legal sufficiency prior to issuance of a formal administrative complaint. Formal cases may be resolved by license suspensions, revocations, cease-and-desist orders, civil penalties, or combinations of these penalties through administrative procedures. APHIS also uses innovative settlements where appropriate to encourage compliance. In innovative settlements, the Agency allows a portion of the civil penalty to be used by the licensee or registrant to provide training or make repairs and/or upgrades to facilities to help ensure future compliance with the Act.

Question. I have been informed that the Animal Welfare Information Center has received an appropriation of \$750,000 to perform its activities without an increase in over a decade. It is also my understanding that more than 50 percent of the AWIC budget is transferred to the National Agricultural Library and Agricultural Research Service for overhead costs. Please explain why AWIC must provide such a large amount of its budget for AWI and ARS overhead costs.

Answer. The National Agricultural Library received an appropriation of \$750,000 in fiscal year 1986 to support an information service at NAL. There have been no increases in the base appropriation since then and several mandated permanent reductions have resulted in an overall decrease in the original appropriation of about 9 percent. To clarify, NAL and ARS do not take 50 percent of the budget for overhead. ARS, however, applies a 10 percent across-the-board assessment for overhead to support the agency's overall program and administrative management activities. The remaining 90 percent is allocated directly to the AWIC and the other NAL program and administrative activities that support the AWIC.

CRANBERRY PURCHASES

Question. The fiscal year 2001 Act provided \$30 million for the purchase of surplus cranberries. Please provide an update on those activities and please provide information in regard to how those funds have been directed toward the actual purchase of fruit (as directed by statute) and for the costs of processing (as has been reported).

Answer. As of May 16, 2001, AMS has purchased 32.7 million pounds of cranberry juice concentrate at a cost of \$16.2 million. In addition, the agency has purchased 3.25 million pounds of dried cranberries at a cost of \$5.5 mil., and 7.36 million pounds of canned cranberry sauce at a cost of \$3.4 mil. The agency is currently offering to purchase 4.05 million pounds of cranberry juice at an estimated cost of \$1.7 million. AMS buys processed cranberry products and does not track the cost of processing separately from the cost of the fruit.

AMS is committed to purchasing \$30 million surplus cranberries as directed by the Act. However, purchases are dependent on USDA's ability to find sufficient outlets that can take the product. AMS is working directly with the Food and Nutrition Service in this effort.

Although some portion of the funds available must be spent on processing to procure product in a form that is acceptable to recipients, the Department has donated sucrose for use in the production of cranberry juice concentrate to maximize the amount of cranberries that are being purchased.

CONSERVATION CRP TECHNICAL ASSISTANCE

Question. The fiscal year 2002 budget includes an appropriated amount to cover the cost of technical assistance associated with the Conservation Reserve Program. Previous to the 1996 Farm Bill, mandatory funds were available for technical assistance in this regard, but imposition of the Section 11 cap by the authorizing committee created the funding difficulties resulting in your 2002 request. Since this problem is a direct result of action by the authorizing committee, why did the President not submit a request to the authorizing committee to strike the cap they imposed?

Answer. Many of the conservation programs funded by the Commodity Credit Corporation, such as the Conservation Reserve Program, expire with the 1996 Farm Bill. Discussions regarding the appropriate farm policy for the future are underway and will continue this year. The request for CRP technical assistance funding under the Conservation Operations account addresses the short-term needs for fiscal year 2002.

RURAL DEVELOPMENT RURAL COMMUNITY ADVANCEMENT PROGRAM

Question. EPA Administrator Christine Todd Whitman recently stated that one reason for reviewing the arsenic level standard for drinking water was her concern that since arsenic levels are more prevalent in individual private wells than public drinking systems, the Bush Administration did not want to take action that might force public systems to close and make Americans more reliant on private well sources of drinking water.

If this is the Administration's concern, why was there not a substantial increase in the budget to allow more Americans access to public water systems in rural areas?

Answer. The Administration's position is that these standards need to be examined based on the best science available and that they need to be realistic in terms of what can be achieved by communities that rely on a public drinking water sys-

tem. While USDA's water and waste disposal program certainly helps rural communities obtain clean and safe drinking water, most projects require these communities to pay a fairly substantial portion of the cost for both constructing and operating a system. Consequently, the level of funding for the program is only one of the considerations that needs to go into the decision on these standards.

Question. To what extent are arsenic levels a problem in rural areas, especially in areas where no public systems are now available?

Answer. A May 2000 study conducted by the U.S. Geological Survey found that about 10 percent of the samples it took had an arsenic level exceeding the World Health Organization 19s provisional guideline. The samples were taken in about 24 percent of U.S. counties.

Question. Please provide information on the backlog of applications for the water and wastewater loan and grants program.

Answer. As of March 2001, there were 1,445 applications for water and waste disposal loans, totaling about \$2.2 billion, and 734 applications for water and waste disposal grants, totaling about \$757 million.

RURAL HOUSING SERVICE

Question. Calculations based on USDA estimates received last year show that the average home under the Section 502 program is financed for just over \$60,000. Is this calculation correct, and if not, what is the average amount of a direct loan, and a guaranteed unsubsidized loan, under the Section 502 Rural Housing Loan program?

Answer. Direct Section 502 loans averaged close to \$65,000 for fiscal year 2000 and are estimated to average about \$67,000 for 2002. Guaranteed loans, which are unsubsidized and tend to serve borrowers with more income than direct loan borrowers, averaged about \$74,000 for 2000 and are estimated to average about \$78,000 for 2002.

RURAL UTILITIES SERVICE

Question. Please provide information regarding the ability of rural electric providers to cope with increasing energy costs?

Answer. The President's energy task force report will address the root cause of the problems the Nation, including rural America, is experiencing due to increasing energy costs. The President has spoken repeatedly about his concerns for long-term solutions, including the development of additional power generating capacity. USDA's Rural Utilities Service (RUS) is already experiencing an increase in applications for generation projects. Demand side management is also necessary. RUS recently published proposed changes in its regulations to facilitate such action.

Question. What has been the effect of electric power deregulation on rural electric cooperatives?

Answer. Rural electric cooperatives with outstanding loans or loan guarantees from RUS are not regulated by the Federal Regulatory Energy Commission (FERC). However, they are impacted by FERC initiatives relating to the prices of electricity sold in wholesale markets, from which the cooperatives buy a portion of their power. Further, virtually all RUS borrowers are dependent upon transmission services to reach their customers. However, it appears that deregulation is not encouraging new providers to enter rural areas. In Pennsylvania, for example, 2 years after all the State's rural electric cooperatives elected to open their systems to full retail competition, not a single competitive provider has applied to serve these cooperatives.

Question. To what extent do rural electric providers have access to their own generation sources and for those that do not, are they being provided adequate access to other sources?

Answer. Nationwide, electric cooperatives, including rural electric cooperatives, generate about 55 percent of the power they need to serve their retail customers. The rest is obtained from wholesale markets. So far, the electric cooperatives have been able to secure the electricity they need to keep the lights on for their customers—but, in some instances, the purchases of peaking power on the spot market have come at a very high price.

Question. What percentage of Rural America has access to internet and broadband communications capabilities on a scale comparable to most urban areas in this country?

Answer. While an estimated 39 percent of rural households have some type of access to the internet, the quality of that access is, in many cases, far less than that in urban areas. For example, most users are able to connect to the internet at a minimum transmission rate of 28 kilobits per second, which is three times faster

than the capacity of many rural phone lines. Further, only 7.3 percent of rural household have access to broadband services.

HUMAN NUTRITION

Question. For many Americans, USDA nutrition programs are the only guarantee that they will have access to at least one nutritious meal a day. However, recent accounts of increased demands at food banks, questions about the quality of food children consume at school, and similar stories raise concern that some people, especially those most vulnerable, may be falling through the cracks.

Answer. The Department is keeping a close eye on the needs of the most vulnerable Americans, and we will take steps to help ensure that they have access to what they need to be properly nourished.

SCHOOL BREAKFAST START-UP GRANTS

Question. In my state of Wisconsin, I worked last year to help encourage schools to participate in USDA school breakfast programs as a way to help ensure that more children start their school day ready to learn. Can you please provide an update on how the Department is working with the State of Wisconsin on this program?

Answer. On February 12, 2001, FNS entered into a Grant Agreement with the Department of Public Instruction, the State agency that administers Child Nutrition Programs in Wisconsin. The Agreement was entered into pursuant to provisions in Public Law 106-387, the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act for Fiscal Year 2001, which directed the Secretary to provide Wisconsin with \$500,000 for school breakfast startup grants in the State. Under the terms of the Agreement, the State agency will provide grants to eligible school food authorities to help cover costs associated with implementing a School Breakfast Program (SBP) in currently non-participating schools.

The grant funds may be used for any local level costs that are allowable, reasonable, and necessary for a school to implement the SBP and, therefore, extend program benefits to a greater number of eligible children. The Agreement will require the State agency and school food authorities receiving funds to obligate those funds no later than September 30, 2002. The State agency will report on the use of the funds quarterly and will submit annual project reports describing the activities accomplished using the funds. FNS has provided the State agency with guidance, when requested and remains available to provide any assistance that the State may require.

NUTRITIONAL VALUE OF ASSISTANCE PROGRAMS

Question. There has recently been a lot of publicity about the nutritional value of foods consumed by children, especially while they are at school. Would you please provide your views on the adequacy of the nutritional value children are receiving, especially while at school?

Answer. The Child Nutrition Programs offer children meals that are affordable, convenient, and consistent with the Dietary Guidelines for Americans. I know that nutrition education is a top priority of the Department and is incorporated into all of the nutrition assistance programs.

The results of two recent reports sponsored by FNS provide some insight into the adequacy of the nutritional value of children's diets. Children's Diets in the Mid-1990s: Dietary Intake and Its Relationship with School Meal Participation shows that on average, children's reported daily mean intakes of most vitamins and minerals exceed the Recommended Dietary Allowances. Only a small percentage of children met the dietary recommendations for intake of total fat, saturated fat, fiber, and sodium. The school meal programs play a substantial role in the diets of school-aged children. Students who participate in both the school lunch and breakfast programs are more likely to meet the dietary standards for a variety of vitamins and minerals than students who participate in neither program. Participants also have a higher mean intake, at school and over 24 hours, of total fat, saturated fat, fiber, and sodium.

The School Nutrition Dietary Assessment Study-II indicates that the average meals offered in the National School Lunch Program and School Breakfast Program are both high in nutritional quality and well-balanced across a number of key nutrients. Since the implementation of the School Meals Initiative for Healthy Children in 1995, schools have significantly reduced the amount of fat and saturated fat in school meals, although the average school lunch still falls short of meeting the Dietary Guidelines for Americans recommendations for fat and saturated fat. These im-

provements have been accomplished while maintaining the overall nutrient contribution of the school meals.

SENIORS' FARMERS MARKET

Question. Last year, USDA developed a special farmers market program to help make fresh produce available to senior citizens. The program not only provided special benefits to seniors, it also helped provide an additional outlet for farmers products. Wisconsin is one of the states that is participating in this program. However, you have eliminated this program in the fiscal year 2002 budget. Please provide an overview of how this program will operate this year and explain why you did not choose to continue it next year.

Answer. The Seniors Farmers' Market Nutrition Pilot Program (SFMNPP) operates in 36 locations—30 States, 5 Indian Tribal Organizations and the District of Columbia. The program provides resources in the form of fresh, nutritious, unprepared, locally grown fruits, vegetables, and herbs from farmers' markets, roadside stands and community supported agriculture programs to low-income seniors. It also increases the domestic consumption of agricultural commodities by developing or aiding in the expansion of domestic farmers' markets, roadside stands, and community support of agriculture programs.

The 36 locations are: Alabama, Alaska, Arkansas, California, Chickasaw Nation (Oklahoma), Connecticut, District of Columbia, Florida, Grand Traverse Band of Ottawa and Chippewa Indians (Michigan), Hawaii, Illinois, Inter-Tribal Council of Michigan, Iowa, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi Band of Choctaw Indians, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, Osage Tribal Council (Oklahoma), South Carolina, Tennessee, Vermont, Virginia, Washington, West Virginia, and Wisconsin. A summary of the highlights of each program is attached.

As you know, funding for the SFMNPP comes from the Commodity Credit Corporation and does not require an appropriation. The SFMNPP was funded as a pilot program by the previous Administration. No decision has been made by the current Administration as to the continuation of the pilot program beyond fiscal year 2001.

THE EMERGENCY FOOD ASSISTANCE PROGRAM (TEFAP)

Question. It has come to my attention that food banks and other food distribution agencies have or may have to turn back donated food items because they do not have adequate resources for transportation and distribution costs. Please provide information on why this problem has suddenly become so serious.

Answer. The flow of USDA commodities available to the Emergency Food Assistance Program (TEFAP) increased significantly in fiscal year 2001. This increase was due in part to the enactment of the Agricultural Risk Protection Act of 2000 (Public Law 106-224).

In addition to the \$100 million worth of commodities purchased in fiscal year 2001, it is estimated that the bonus commodities that will be delivered to TEFAP State agencies in 2001 will exceed \$225 million. Included in this amount is the majority of bonus fruits and vegetables purchased for domestic consumption mandated by Public Law 106-224, the Agricultural Risk Protection Act of 2000. The Act required the Secretary to purchase specialty crops that experienced low prices during the 1998 or 1999 crop year. These commodities are provided in addition to commodities donated by other sources and make up a portion of the total amount of food distribution through the TEFAP distribution network.

Question. Are there available resources within USDA to help these local organizations?

Answer. All of the \$45 million in TEFAP administrative funds appropriated under the 2001 appropriations bill has been allocated to State agencies, which in turn allocate most of these funds to local organizations. Although available resources are very limited, the Department is in the process of examining the possibility of providing additional funding to support the distribution of TEFAP commodities.

Question. What funding would be necessary to ensure that local agencies have the necessary means to transport and distribute food donated through TEFAP?

Answer. The flow of USDA commodities available to the Emergency Food Assistance Program (TEFAP) increased significantly in fiscal year 2001, and this has led a number of States to express concern about administrative funding. All but a few of the 25 or so States responding to an informal survey report a shortage of administrative funding. The majority complain of serious strains on transportation, storage, or distribution. About a quarter of respondents have had to become more particular about which foods they will take, selecting only the most popular commodities for

fast turnover; and a quarter also report that they will not be able to take any more bonus foods this year, citing lack of administrative funds.

WIC PROGRAM

Question. The President's budget proposes funding for the WIC program at a level intended to serve 7.25 million people, the same number of people the Administration expects to serve in fiscal year 2001. What is the expected carryover of funds into fiscal year 2002 based on USDA's most recent data?

Answer. The budget estimates that about \$136 million from fiscal year 2001 will be available for use in fiscal year 2002. The actual amount is dependent on participation and costs in fiscal year 2001. We believe the \$136 million is a good estimate of the effects of costs and participation in fiscal year 2001.

Question. What has been the historical relationship between WIC participation and the unemployment rate? Do you believe there is a correlation between these two indicators?

Answer. I believe that unemployment does effect income eligibility. However, income eligibility is only one of the eligibility criteria used for participation in the WIC Program.

For most of WIC's history, participation was constrained by funding, and so did not respond to economic factors such as the unemployment rate. Therefore, it is correct that for most of WIC's history, participation did not tend to increase when unemployment went up, nor decrease when unemployment went down.

In 1997, WIC participation peaked at 7.4 million. After this, despite the absence of a clear funding constraint, participation fell slightly. It may be reasonable to assume that at this point, participation changes were more directly related to economic conditions. While the data from 1997 to 2001 suggests a relationship between unemployment and participation, these data are not adequate to permit construction of a model of that relationship that would enable us to "tie" changes in WIC participation to changes in the unemployment rate with any reasonable degree of accuracy.

It should also be noted that analyses of participation should consider factors other than economic changes that could affect participation decisions (eg., changes in program rules, welfare reform, etc.).

Question. Was the Administration's budget forecasts that the unemployment rate will rise in fiscal year 2002 to 4.6 percent taken into consideration when formulating the fiscal year 2002 budget for the WIC Program?

Answer. Although data from 1997-2001 suggest a positive relationship between unemployment and participation, these data are not adequate to permit construction of a model of that relationship that would enable us to "tie" changes in WIC participation to changes in the unemployment rate with any reasonable degree of accuracy. Such a model would be needed in order to factor changes in the unemployment rate into budget requests for WIC. The President's budget was constructed to maintain projected average fiscal year 2001 participation of 7.25 million.

Question. Is it the view of the Administration that if WIC participation demands increase as a result of higher levels of unemployment, adequate resources should be made available to cover the increased program demand?

Answer. The Administration's fiscal year 2002 request was constructed to maintain projected average fiscal year 2001 participation of 7.25 million. There are currently no waiting lists for the WIC program and, at present, we believe that the President's budget request for fiscal year 2002 is sufficient to continue to meet demand for the WIC program. However, we are aware that substantial changes in economic conditions may effect demand for the program. We plan to monitor the situation closely, and work with Congress to ensure that the program is funded at an appropriate level.

Question. Please provide an update on WIC referral services and, in particular, the status of the Presidential Memorandum on the subject of childhood immunization.

Answer. USDA is working with the Centers for Disease Control and Prevention to implement the directives outlined in the Executive Memorandum. A partnership composed of representatives from the National Association of WIC Directors, American Academy of Pediatrics, Association of State and Territorial Health Officials, Association of Immunization Managers, and Every Child By Two is providing guidance and assistance to implement current and future WIC immunization linkages to meet the directives of the Executive Memorandum. A working group of this partnership is finalizing a National strategic plan to improve immunization coverage levels of children participating in WIC.

A draft policy memorandum, written in collaboration with partners, was distributed to partners and State WIC agencies for comment in February 2001. The policy

memorandum outlined procedures for immunization screening and referral in the WIC Program, as directed by the Executive Memorandum. In response to comments, the policy memorandum is being redrafted and will be issued in June 2001.

CHILD AND ADULT CARE FEEDING PROGRAM

Question. Section 101 of Public Law 106-554, Division B, Title I expanded the eligibility criteria for participation in the Child and Adult Care Feeding Program (CACFP). Please provide information regarding USDA implementation of this provision including the number of CACFP providers and program beneficiaries have been made eligible under this new criteria.

Answer. The Department issued its implementation memorandum governing these expanded eligibility requirements to all CACFP State administering agencies on January 19, 2001. This memorandum laid out the basic eligibility requirements established in Public Law 106-554, contained guidance necessary for States to administer the program in the newly-eligible centers and reminded States of the importance of acting quickly to seek out, train and approve eligible centers. On February 26, 2001, the Department followed up the initial guidance with additional guidance based on questions received from States during the implementation process.

The Department has estimated the total number of potentially eligible centers to be approximately 4,600 and the number of children enrolled in those centers to be about 323,600. While we do not have a formal vehicle for collecting data on the number of centers actually participating under the expanded eligibility criteria, we do have anecdotal information suggesting that this number is considerably less than the eligible universe—probably no more than 130. State agencies are dealing with these eligibles in a number of different ways. Some are actively recruiting centers while others have done relatively little in this regard. For the most part, these States believe that the effort required to approve, train and monitor an entirely new group of centers which may be on the program for a relatively short period of time is not the best use of administrative resources, given the demands put on them under the CACFP Management

Question. Does the Bush Administration support making this change permanent and if not, please explain.

Answer. The President's fiscal year 2002 budget request did not include funding for extending this provision beyond the current fiscal year. However, we have not taken a final position on this issue and will not do so until the Food, Nutrition and Consumer Services policy team is in place.

Question. The Senate Report to accompany Public Law 106-387 includes language urging FNS to provide technical assistance and guidance to states that do not maximize the number of children served under CACFP and to pool certain Title XX funds with CCDBG funds to meet the technical requirement of current law. Please provide information regarding implementation of this directive.

Answer. Over the past several years, the Department has provided guidance and technical assistance to State agencies relative to the pooling of Title XX funding. Initial guidance was issued to all Child and Adult Care Food Program State administering agencies on July 6, 1999. Copies of that guidance have also been provided to the Congress. That guidance was also re-issued on April 6, 2000.

AGRICULTURAL TRADE DAIRY EXPORT INCENTIVES PROGRAM

Question. You have stressed the importance of international trade as a means to improve net farm income. I agree that we should pursue an aggressive strategy with our trading partners and we must remain vigilant that our agricultural trade interests are not compromised by long-term objectives of other sectors of the U.S. economy here at home.

One of the programs available to you now is the Dairy Export Incentives Program (DEIP). Over the past few years, significant quantities of U.S. dairy producers were allocated for shipment under DEIP, but for a number of reasons, those quantities were not shipped. Later, the U.S. dairy industry sought to have those quantities re-allocated for shipment under DEIP, but were told by the USDA that once allocations were issued, they could not be reissued regardless of whether they had been shipped or not. In explanation, we were told that during negotiations with our trading partners an agreement was reached that precluded reallocation under DEIP. However, in spite of our repeated requests, no documentation was provided that expressly laid out this agreement.

Do you believe that the practice of not reallocating unused DEIP quantities if the initial allocation was not shipped is consistent with U.S. trade objectives?

Answer. In response to a request included in the conference report accompanying the fiscal year 2001 Agriculture Appropriations Bill, the Department provided the Committees on Appropriations a report outlining USDA's position not to reallocate awarded but unshipped dairy product tonnage under the DEIP. The report concluded that authorizing the export of awarded but unshipped dairy product tonnage from as far back as 5 years ago would be inconsistent with the established U.S. methodology for reporting export subsidies to the WTO and would likely be viewed by our trading partners as an attempt to circumvent our subsidy reduction commitments. As the report indicated, such an action would provide limited economic benefit for U.S. dairy farmers.

We are now engaged in negotiations in the WTO to further liberalize trade in agricultural products, including the elimination of export subsidies. Taking steps that would be viewed by many as a circumvention of our current export subsidy commitments would be detrimental to our efforts in those negotiations. For these reasons, the reallocation of prior-year unshipped DEIP allocations would be inconsistent with U.S. trade objectives.

Question. Do you intend to continue the practice of not reallocating DEIP quantities under these circumstances?

Answer. With respect to the reallocation of quantities from previous years, no change of policy is anticipated. However, at this time, the Department is reviewing whether or not a modification of program operations for DEIP could be made to allow for the re-announcement of canceled tonnage within the confines of an allocation year. Preliminary discussions have already taken place with the industry.

Question. If you do intend to continue this practice, will you please provide to the Committee a copy of the express agreement that requires you to do so?

Answer. As indicated above, the Department is currently reviewing its allocation and reallocation procedures.

MILK PROTEIN CONCENTRATES (MPC'S)

Question. Dairy producers in Wisconsin and across the country are becoming increasingly alarmed by the level of MPC's being imported into the U.S. Is it the view of the Bush Administration that MPC imports are not subject to WTO requirements or should they be included as part of this country's dairy import strategy?

Answer. Milk Protein Concentrates are subject to a U.S. tariff commitment in the WTO to limit the import duty to 0.37 cents per kilogram. At the time of the Uruguay Round, this product was specifically provided for in our tariff schedule and was not subject to any import quotas of the type that were converted to tariff rate quotas (TRQs) under that agreement. Consequently, MPCs were not included in our dairy TRQs. The United States expects other countries to adhere to their international market access commitments just as other countries expect the United States to comply with its commitments. Changes in these commitments would require agreement with affected countries on compensation. Consequently, changes to these international obligations must be considered carefully, within the context of our overall World Trade Organization commitments.

Question. Please provide the Committee with information regarding the levels of MPC imports, the countries from which those imports originate, and the U.S. market use of these products.

Answer. Following are two tables showing 1999 and 2000 MPC imports by source and the monthly pattern of MPC imports through February 2001. Please note that following the pattern of the GAO report, these tables exclude the casein product also called milk protein concentrate. If that product were included it would add another 9,800 tons to the 1999 total and another 11,900 tons to the 2000 total.

According to the monthly data, starting in August 2000, the level of MPC imports began to decline, largely mirroring the upturn in international prices for nonfat dry milk (NDM). The strong upturn in international prices for NDM appears to have sharply reduced the incentive to produce and export MPCs.

We have no quantitative data as to what products are manufactured using imported MPCs. The GAO study suggested a rather wide range of products with the higher protein MPCs directed towards health and nutrition foods.

[The information follows:]

| Commodities Imported and Area/Countries of Origin | Cumulative to date | | | | December | | | |
|---|--------------------|-----------------|-----------------|-----------------|----------|------|-----------|-----------|
| | Quantity | | Value | | Quantity | | Value | |

Question. Please provide an estimate on the level to which these imports are affecting U.S. dairy producer prices.

Answer. It is our understanding that imported MPCs primarily substitute for NDM as a source of protein in beverage and food processing uses. MPC imports would therefore to some extent displace surplus NDM into CCC inventories as provided for under the dairy price support program. Currently and in recent years, the CCC purchase price places a floor under domestic NDM prices. Therefore, we believe imported MPCs have limited effect on U.S. dairy producer prices at present.

Question. Please provide information regarding potential food safety and animal health-related issues as they pertain to MPC imports, including contamination through the packaging or shipment of such products.

Answer. The public health aspects of MPC imports and use come under the purview of the Food and Drug Administration, but so far as we are aware no problems have been identified, whether through direct use of through packaging or shipment.

Animal health aspects of imported MPCs and of dairy products generally come under the responsibility of APHIS. As you are aware, APHIS has greatly stepped up its operations to guard against Foot and Mouth Disease (FMD) contamination from dairy and animal product imports generally from affected countries. We are confident the measures implemented by APHIS are providing adequate protection against FMD contamination and other disease threats to U.S. animal agriculture.

SANCTIONS

Question. What is the view of the Bush Administration in regard to making it easier for U.S. farm products to gain access to markets in Cuba?

Answer. The policy with regards to exporting farm products to Cuba was spelled out in the Trade Sanctions Reform and Export Enhancement Act of 2000. Among

other things, the legislation partially eases 40 years of trade sanctions for agricultural products by allowing U.S. companies to export agricultural products to Cuba, including agencies of the Cuban government, subject to certain restrictions. These restrictions generally revolve around the prohibitions on export financing by U.S. banks and the prohibition on any form of government assistance to facilitate U.S. exports. U.S. tourism to Cuba remains prohibited as does the prohibition on any imports from Cuba. The Bureau of Export Administration at the Department of Commerce is working diligently to finalize the new regulations required to implement the new policy.

Question. If agricultural trade restrictions with Cuba were relaxed, which U.S. farm commodities would primarily benefit?

Answer. Cuba currently imports roughly \$600 million worth of agricultural products a year. If agricultural trade restrictions were completely relaxed and Cuba were willing to import from the United States solely on the basis of sound economics, the United States would quickly become a significant supplier of wheat, feedgrains, rice, vegetable oil, beans, meat and dairy products. Cuba cannot produce enough of these products to meet its domestic needs and must source them from competitors that we believe would have a difficult time being competitive with U.S. offerings.

Question. Is it the view of the Bush Administration that free and open trade is an important step toward economic recovery of the farm sector and if so, should Cuba not be part of that strategy?

Answer. The Administration absolutely views free and open trade as vital to the economic interest of America's agricultural producers. It is for this reason that it is pursuing further multilateral trade liberalization through the WTO negotiating process as well as through regional pacts such as the FTAA. However, as was recently affirmed by the democratically elected Heads of State in the Final Declaration from the Summit of the Americas, regional integration in the hemisphere requires respect for democratic values. The rule of law and strict respect for the democratic system are, at the same time, a goal and a shared commitment and are an essential precondition of participation in the Summit of the Americas process. Yes, we look forward to the day when free and open trade is possible between the U.S. and Cuba, not just for agricultural products but for all products. However, the Cuban government must change its policies and embrace the democratic traditions referred to in the Final Declaration.

HUMANITARIAN FOOD ASSISTANCE

Question. Although the USDA 2002 budget for the appropriated level of Public Law 480, Title II is the same as fiscal year 2001, previous year balances will not be available in 2002, resulting in an overall program level reduction. This is occurring at time when world wide demand, especially in areas like Africa, are growing. Why does the USDA budget for fiscal year 2002 not provide, at least, the fiscal year 2001 program level for Public Law 480, Title II?

Answer. In order to meet the goal of restraining the growth in spending, some programs were continued at current funding levels. These include the Public Law 480 foreign food assistance programs, for which budget authority is maintained at the same level provided by Congress in 2001.

Question. Does the Department intend to utilize Section 416(b) authorities in fiscal year 2002 as a means to provide humanitarian food assistance? If not, please explain.

Answer. Our ability to provide donations of food commodities under the authority of section 416(b) in fiscal year 2002 will be determined in large part by the availability of domestic commodity surpluses. The domestic supply situation will not be known until the fall, and at that point the Administration can be expected to make a decision on the level and extent of section 416(b) donations in 2002.

Question. Does the Department support the international school lunch program as envisioned by former Senators McGovern and Dole? To what extent should the United States be a participant in this effort?

Answer. The Department is in the process of carrying out the Global Food for Education Initiative (GFEI) on pilot basis. Once the pilot program is completed and evaluated, the Administration will be in a position to decide whether the GFEI should be continued and on what scale.

With respect to U.S. participation, it is probably vital to any global school feeding effort as envisioned by the Senators. As you probably know, the United States is the world leader in providing global food assistance, and our leadership in such a global effort would be needed as a catalyst to encourage other countries to participate.

QUESTIONS SUBMITTED BY SENATOR TOM HARKIN

WIC

Question. Please clarify the budget's treatment of funding for the Supplemental Nutrition Program for Women, Infants and Children (WIC). The budget indicates an increase of about \$94 million for WIC compared to fiscal 2001. However, other budget documents indicate an increase of \$44 million in outlays, or according to the USDA budget summary, an increase of \$49 million in program level.

In any case, I am concerned that the requested amount is not adequate to keep up with the needs of the program's beneficiaries, especially if unemployment levels reach those assumed in the budget itself. I have received an estimate that as a result some 100,000 to 200,000 eligible women, infants and children who would receive assistance if funding were adequate will not receive assistance.

For the past several years, Congress, working with the Administration, has provided funding to allow WIC to serve essentially all eligible women, infants and children. It very strongly appears that the current budget proposal would back away from this commitment. Will you provide an explanation of the budget request for WIC funding and the adequacy of that request to serve all eligible WIC recipients?

Answer. The Administration's fiscal year 2002 request was constructed to maintain projected average fiscal year 2001 participation of 7.25 million. There are currently no waiting lists for the WIC program and, at present, we believe that the President's Budget request for fiscal year 2002 is sufficient to continue to meet demand for the WIC program. However, the Department is aware that substantial changes in economic conditions may effect demand for the program. We plan to monitor the situation closely, and work with Congress to ensure that the program is funded at an appropriate level.

Question. Does the budget figure for WIC take into account the impact of the assumptions in the budget regarding unemployment levels?

Answer. Although data from 1997-2001 suggest a positive relationship between unemployment and participation, these data are not adequate to permit construction of a model of that relationship that would enable us to "tie" changes in WIC participation to changes in the unemployment rate with any reasonable degree of accuracy. Such a model would be needed in order to factor changes in the unemployment rate into budget requests for WIC. The President's budget was constructed to maintain projected average fiscal year 2001 participation of 7.25 million.

Question. Will you commit to working with this Committee to make sure we keep our longstanding commitment to WIC?

Answer. The Department plans to closely monitor WIC Program participation and economic conditions during the course of the year and work with Congress to ensure that the program is funded at an appropriate level.

FOREIGN MARKET DEVELOPMENT (COOPERATOR) PROGRAM

Question. I am quite concerned about the level of funding in the budget for the Foreign Market Development (Cooperator) Program. In the past there have been carryover funds that helped to maintain the resources to support this important program. However, it does not appear that those carryover funds are available for fiscal 2002.

Please describe the resources that will be available to the FMD (Cooperator) Program in fiscal 2002 under the proposed budget and explain whether with this level of resources it will be possible to maintain fully the current programming levels for the program.

Answer. The CCC budget for fiscal year 2002 includes \$27.5 million for the FMD program, the same level as fiscal year 2001. We believe that with these funds, coupled with available carryover balances, current marketing plan levels can be maintained through fiscal year 2002.

MICROBIOLOGICAL PERFORMANCE STANDARDS

Question. I want to commend the Administration for moving forward with the appeal of the *Supreme Beef case*. I am sure you were offered many different opinions on whether USDA should appeal.

As I have said to you before, we need to have the most effective and scientifically sound microbiological performance standards possible. We need to continue to improve the standards that we have. But those standards absolutely must be enforceable. I have no doubt we can come up with better standards that all sides can support. However, some are fundamentally opposed to having any enforceable performance standards.

Is the decision to appeal the Supreme Beef decision a reflection of the Department's commitment to enforcing its microbiological performance standards?

Answer. The notice of appeal by USDA of Supreme Beef Processors, Inc. v. United States Department of Agriculture was filed on September 8, 2000. Under this Administration, required filings continue to be made by USDA and the appeal is moving forward.

Question. Do you support the current Salmonella performance standard?

Answer. The Salmonella performance standards were based on the best available estimates of national product prevalence (i.e. the percentage of product with Salmonella). The prevalence of Salmonella on raw meat and poultry products continues to decline by as much as half on raw chicken, for example. CDC reports sustained reductions in foodborne illness as well.

As you know, language accompanying the 2001 Agriculture Appropriations Act directed the Food Safety and Inspection Service to ask the National Advisory Committee on Microbiological Criteria for Foods (NACMCF) and the National Research Council of the National Academy of Sciences (NAS) for an evaluation of the role of scientifically determined criteria, including microbiological criteria, in the production and regulation of meat and poultry products. The information from these reports combined with the best available science will guide the Department's decisions on the Salmonella performance standards.

Question. Do you have plans for revising it?

Answer. USDA will continually review the performance standards to ensure that all food safety policies are based on sound scientific principles. Further, language accompanying the 2001 Agriculture Appropriations Act directed FSIS to ask the National Advisory Committee on Microbiological Criteria for Foods (NACMCF) and the National Research Council of the National Academy of Sciences (NAS) for an evaluation of the role of scientifically determined criteria, including microbiological criteria, in the production and regulation of meat and poultry products. FSIS is discussing the initiation of a study with NAS. Also, FSIS has also asked the Micro Committee to review and evaluate the Salmonella performance standards. Specifically, the NACMCF will advise FSIS on the use of indicator organisms as opposed to a specific pathogen, like Salmonella; whether it is scientifically appropriate and wise from a public health standpoint to incorporate regional and seasonal variations into performance standards; how quantitative baseline prevalence data should best be used to develop or modify performance standards; and what other key considerations are involved in using risk assessments to develop performance standards.

NATIONAL ANIMAL DISEASE CENTER: ARS AND APHIS FACILITIES AT AMES, IOWA

Question. The Appropriations Committee in the fiscal 2001 Appropriations measure required a report on the need and options for moving ahead with this project that was due on March 1. I understand that the draft report just went to OMB on April 20.

Clearly, the entire nation has become keenly aware of the costs and problems that can occur because of animal diseases. We can have great damage to animal agriculture and in some circumstances we face real risks to human health as well.

A highly respected international peer review group that USDA created to look at the draft report indicated that the need to move forward was urgent and should be considered an emergency, that the inadequacy of some of the facilities is astounding, that there is severe vulnerability, that current studies are restricted, and that the status quo is not an option. The group also indicated that the improvements would facilitate United States animal exports—which could presently be at some risk because of the poor quality of the existing facilities.

The group fully endorsed the draft plan's finding that the merging of the National Animal Disease Center and APHIS' Center for Veterinary Biologics and the National Veterinary Services Laboratories was the preferred option.

Will you give your personal attention to completing and releasing the required report as soon as possible and, more importantly, will the Administration support the work that is necessary at Ames, Iowa

Answer. The report, which was due March 1, 2001, was finally transmitted to the Congress on May 25, 2001. Delays were incurred in completing the report since the report dealt with major animal research and diagnostic facility needs of the Agricultural Research Service (ARS) and the Animal and Plant Health Inspection Service (APHIS). The report was devised through a series of meetings and reviews between the two agencies as well as consultants in Washington, D.C. and in Ames, IA. The report provides for several alternative plans ranging in cost from \$430 million to \$548 million.

LISTERIA

Question. Earlier this year, USDA published a proposal to require ready-to-eat meat and poultry processing plants to test for *Listeria* species in their plants. The rule would require plants producing hot dogs and deli meats to perform *Listeria* testing; however, the testing would be so infrequent that its value would be minimal. Plants would test for *Listeria* only one to four times a month, despite the fact that a lot of product can be produced during that time. This testing frequency is significantly less than that which many processors voluntarily follow today. Is one to four tests per month adequate to assure control of *Listeria*?

Answer. As part of the rulemaking process, FSIS has specifically requested public comment on the proposed testing frequencies. FSIS has held a scientific conference and a public meeting to discuss the proposed provisions, especially those that would require certain establishments to conduct environmental testing for *Listeria*.

FSIS also presented the proposed testing requirements and related scientific issues to the National Advisory Committee for Microbiological Criteria for Foods (NACMCF) for review. FSIS has extended the comment period for the proposed rule for 60 days to incorporate issues raised at a technical conference and public meeting on the proposed rule held May 8–10, 2001, here in Washington.

Question. Is more testing necessary to rapidly identify when plants are not controlling *Listeria*?

Answer. As part of the rulemaking, we encourage the industry and the public to provide any available information on alternative testing protocols that FSIS should consider in developing a policy for controlling *Listeria* contamination in ready-to-eat meat and poultry products.

 QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

Question. I see that the Rural Utilities Service budget has been cut by \$164 million for fiscal year 2002. This is cause for concern to those of us who represent rural America.

Let me give you just one example: Many rural areas have slow Internet service and need help achieving high-speed, broadband Internet access. It's highly unlikely that the private sector is willing to invest funds to bridge this digital divide. The Rural Telephone Bank program is the logical tool for meeting this need, but the Administration has eliminated this program. Don't you agree that high-speed broadband Internet access is crucial to any region's economic viability?

Answer. I certainly agree that rural America needs to have access to the Internet in order to share in the benefits of our information-oriented economy. Some rural areas already have such access, however, in general rural areas do not have the same access as many urban areas.

Question. If you do agree, isn't it necessary for USDA to continue to provide funding for the Rural Telephone Bank?

Answer. The Rural Telephone Bank (RTB) is an important source of funding for telecommunications. However, it is not necessary for USDA to continue to provide the financing for the RTB to make loans. Current law requires that the RTB be privatized and that process has already begun. The Administration's budget proposal to not provide the financing for RTB loans is intended to accelerate the privatization process. The RTB has the ability to obtain financing from the private sector.

 QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

EMERGENCY RESERVE FUND

Question. The Emergency Reserve Fund only provides \$5.6 billion for fiscal year 2002. And the Contingency Reserve Fund pits farm aid against Medicare, Social Security and defense spending needs. How is relying on the reserve funds a responsible method for ensuring our farmers get the support that they need?

Answer. In the long run, the better way to ensure that producers get the appropriate support is to develop improved ongoing programs which eliminate the necessity to rely heavily on year-to-year ad hoc emergency assistance. The improvements in crop insurance programs made by the Agricultural Risk Protection Act of 2000 was a step in that direction. In any case there is a likelihood that some, as yet hard to estimate, level of additional emergency assistance may be needed this year and/or next year. The budget, at least, attempts to recognize and allow for this contingency by identifying the Contingency Reserve. This is preferable to completely ignoring the possibility of emergency spending needs as has been done in some prior

years. As for the \$5.6 billion Emergency Reserve Fund for coping with major natural disasters, it is based on historical data and should be adequate for most circumstances for the disaster relief and related programs it addresses.

VALUE-ADDED COOPERATIVE FUNDING

Question. The Rural Business-Cooperative Service implemented a new grant for value-added cooperatives this year. These Value-Added Agricultural Product Market Development Grants have been popular. In Illinois, we have producers who want to form ethanol co-ops and producers who want to form the first farmer-owned pork processing plant in the country. However, there is no funding provided for these grants in the fiscal year 2002 budget. Will the Administration support additional funding for these grants?

Answer. The Value-Added Agricultural Product Market Development Grant program was authorized by the Agricultural Risk Protection Act of 2000. That Act also provided funding for the program, which is why there is no discretionary funding request for funds in the President's 2002 budget.

RURAL ECONOMIC AREA PARTNERSHIP

Question. The Southeastern Illinois Regional Planning and Development, the Greater Wabash Regional Planning, and the Southern Five Regional Planning and Development Commissions are seeking a Rural Economic Area Partnership (REAP) Zone designation for a 17-county area in Southern Illinois. I strongly support their request. When will USDA review this application/request and render a decision? Has the Department designated a staff person to work with these Illinois groups to compile the necessary information and offer technical assistance?

Answer. USDA's Rural Development Illinois State Office has been working with the three aforementioned planning commissions in preparing an application for a REAP zone designation for Southern Illinois. However, to date, no formal application has been submitted. Once an application is received, Dr. Norman Reid will serve as USDA's staff contact.

FOOD AID/DONATIONS

Question. Last year, I supported a provision to use \$25 million worth of surplus commodities in the section 416(b) program for food aid, or to be monetized for development projects, for communities heavily impacted by AIDS. Could you tell me what progress USDA has made in disbursing these funds? What kind of projects have PVOs and the World Food Program suggested and where?

Answer. Nine separate proposals with an HIV/AIDS component have been approved for commodity donations under section 416(b) authority this fiscal year. The total estimated cost of these proposals is just over \$21 million.

Eight of the approved programs are in sub-Saharan Africa, and the ninth is in eastern Europe. Two will be implemented by the World Food Program, and seven by private voluntary organizations. HIV/AIDS education, prevention, and related feeding or assistance programs are included among those approved. Program agreements with the cooperating sponsors are currently being developed, and the programs can move forward once the agreements are signed.

Question. I understand that the USDA plans to review recent donation activities under the section 416(b) program. As we see how this AIDS program progresses, I'd like to work with you on finding a more sustainable source of funding.

Answer. The Department is always willing to assist in whatever way we can.

Question. There is a bipartisan, bicameral interest in authorizing an international feeding initiative proposed by Ambassador George McGovern and Senator Bob Dole. I will be joining my colleagues Senators Harkin and Leahy in introducing legislation soon to authorize this initiative. Will the Administration support this proposed McGovern-Dole feeding initiative, and support funding for the program?

Answer: The Department is in the process of carrying out the Global Food for Education Initiative (GFEI) on a pilot basis. Once the pilot program is completed and evaluated, the Administration will be in a position to decide whether GFEI should be continued and on what scale. With respect to specific legislation authorizing the initiative on a permanent basis, the Administration has not yet developed a position.

Question. The Administration currently is implementing the Global Food for Education Initiative, a pilot of an international feeding program. The program is funded by \$300 million for fiscal year 2001. I am concerned that the lag time between funds from the pilot program and finding funds for the legislation will be disruptive. Is the Administration willing to support short-term funding so as to minimize disruption to implementing a permanent international feeding program?

Answer. The current pilot program is likely to continue into fiscal year 2002, simply because of the length of time needed to develop the individual project agreements with cooperating sponsors, procurement of the commodities and transportation services, shipment of the commodities, and then distribution overseas. Thus, the question of whether additional short-term funding might be needed is unlikely to arise until well into next year. Until the current pilot program is implemented and preliminary results known, it is difficult to take a position on prospective future funding for the initiative.

Question. Garnering international support for the McGovern-Dole proposal is important to the success of the program. Will the Administration bring this up at the next G8 meeting to build support among other member countries?

Answer. Items to be placed on the agenda for the next G8 summit currently are under consideration. The Global for Education Initiative is being considered as a possible item for discussion.

Question. The fiscal year 2002 budget includes \$478 million for the Export Enhancement Program. But the USDA only spent \$1 million in fiscal year 2000. I plan on introducing legislation that would authorize the USDA to reallocate unspent EEP monies for food aid and foreign market development programs. How does the Administration feel about reallocated unspent EEP funds?

Answer. The Administration has not taken a formal position on the proposal to authorize the reallocation of unused EEP funding. However, we would be willing to consider the proposal seriously as the Administration is committed to expanding access to overseas markets and the level of U.S. agricultural exports.

Question. As farmers are faced with more environmental challenges (water and air quality), how can we expect them to meet those challenges on such limited assistance?

Answer. We are very much aware of the environmental challenges facing farmers in today's economically stressed farm climate. We anticipate that these environmental challenges will be addressed in upcoming farm bill discussions.

Question. How can we expect farmers to try innovative conservation practices if there is not even enough funding for basic agriculture conservation programs?

Answer. We anticipate that environmental challenges facing farmers today will be thoroughly debated in upcoming farm bill discussions. In the meantime, USDA agencies such as the Natural Resources Conservation Service will continue to assist farmers in addressing environmental concerns with science based low-cost conservation practices. NRCS will also continue to rely on and support the innovation of farmers and ranchers in developing practical solutions to conservation problems.

Question. The Illinois NRCS has brought to my attention that they are facing a funding shortfall in fiscal year 2001 to pay technical staff because of reduced revenues of not having a Conservation Reserve Program sign-up this year. I recognize that the budget includes an increase in funding for CRP technical assistance, but that will not come until fiscal year 2002 and the Illinois NRCS needs the funds immediately. Will you support additional funds to pay for CRP technical assistance in fiscal year 2001?

Answer. In any given year, NRCS receives funding from several sources, including reimbursements from the Commodity Credit Corporation and supplemental appropriations to address disaster activities. The amount of shortfalls, if any, in funding for fiscal year 2001 will not be known until later this year when we know the full extent of reimbursements for CRP continuous signup activities and workload demands needed to address flooding and disaster activities in the Midwest and other places. In the meantime, adequate technical assistance funding will be available in fiscal year 2001 for the Conservation Reserve Enhancement Program (CREP) as well as the continuous CRP signup.

Question. But it appears, with respect to puppy mills, this is not an issue solely of funding. Authorizing legislation is needed to combat the problem. With Senator Santorum of Pennsylvania, I will be introducing bipartisan legislation to revoke licenses for chronic Animal Welfare Act violators, require proper socialization and veterinary care for animals in mass breeding conditions and limit breeding frequency. I hope that you will support this modest change in the law. Do you have any comment?

Answer. The Animal and Plant Health Inspection Service (APHIS) shares your concern for the welfare of animals in commercial breeding facilities and appreciates this opportunity to explain our efforts on their behalf. Under the Animal Welfare Act (AWA), APHIS requires individuals who breed certain animals—including dogs—for sale at the wholesale level to be licensed. These individuals must provide their animals with veterinary care, a balanced diet, clean and structurally sound housing, and protection from extremes of weather and temperature, among other things.

With regard to your proposal calling for proper socialization, current language in the AWA has requirements that licensed entities provide their animals with exercise. Certainly, APHIS believes that socialization, including exercise, is an important component to ensuring the health and care of licensed animals and would support additional socialization requirements that would benefit licensed animals.

With respect to the imposition of breeding requirements, APHIS believes that limiting breeding frequency may improve the overall welfare of breeding females. However, enforcement of such a requirement would be difficult due to the wide range of licensed breeds with varying ranges for appropriate breeding frequency. There is also widespread disagreement within the animal welfare community and commercial breeding industry regarding what constitutes appropriate breeding frequency.

I want to assure you that, in cases of serious or repeat violations of the AWA that remain uncorrected, alleged violators are prosecuted to the fullest extent of the law, including the imposition of penalties such as fines, license suspensions, and license revocations. Data for fiscal years 1996–1999 demonstrate our commitment to AWA enforcement. During that time, APHIS imposed more than \$3 million in monetary penalties and issued 122 revocations, suspensions, and disqualifications. The Department also moved forward in its efforts to expedite the prosecution of AWA offenders, virtually eliminating the backlog of cases awaiting resolution. You may be interested to learn that APHIS has proposed a regulation that would allow the Department to deny a license renewal if a facility is in chronic noncompliance. (Currently, we must renew any license if the appropriate fees are paid regardless of compliance history.) After completion of a thorough review of the numerous comments received, APHIS will determine how to proceed with rulemaking.

QUESTIONS SUBMITTED BY SENATOR TIM JOHNSON

CRP-WETLANDS PILOT PROJECT

Question. Madam Secretary, we have visited about a new pilot program I pushed last year to enroll farmed wetlands in the continuous CRP—which was enacted with some help from Senators Harkin, Kohl, Cochran, and Daschle. This two year pilot program was created by farmers and conservationists in South Dakota, and it would permit up to 500,000 acres of farmed wetlands to be enrolled under CRP in six states (ND, SD, MN, NE, IA, MT) of the Prairie Pothole Region. Currently, grass filter strips surrounding these farmed wetlands qualify for CRP, but not the actual wetland acreage. This has proven to be an inadequate incentive for the purpose of getting this sensitive land out of production.

Last year, this proposal was endorsed by the American Farm Bureau, National Farmers Union, the National Corn Growers Assoc., the American Soybean Assoc., the National Assoc. of Wheat Growers, Ducks Unlimited, Pheasants Forever, the National Wildlife Federation, the National Audubon Society, and the International Assoc. of Fish and Wildlife Agencies—just to name a few. The pilot project will provide landowners an alternative to farming these highly sensitive wetlands in order to achieve a number of benefits, including; improved water quality, reduced soil erosion, enhanced wildlife habitat and, less wetland drainage.

Unfortunately, the rule to begin the process for farmers to sign-up for the program has yet to be published in the Federal Register. While the severe and wet weather in South Dakota and other reaches of the country have delayed planting decisions and inadvertently could permit some to enroll in this program, further procrastination on the finalization of this rule will only hurt the chances for this program to succeed. I urge you to work with the appropriate agencies within USDA to ensure the rule for this CRP-wetlands pilot project is published in the Federal Register and that sign-up commence as soon as possible.

Answer. Thank you for your interest in the Conservation Reserve Program (CRP). The Farmable Wetlands Pilot Program rule for CRP is expected to be published in the Federal Register on May 2, 2001. We expect the sign-up activities to begin in May as well.

(Note: The notice was published in the Federal Register on May 2, 2001.)

COUNTRY-OF-ORIGIN LABELING (COL)

Question. Last month, I wrote you a letter regarding an effort by a coalition of meatpackers and retailers who've petitioned USDA to create a voluntary U.S. beef certification program titled "Beef: Made in the USA." To the extent that this voluntary certification program enabled producers, packers, and retailers to work together, I supported their effort. Yet, I have indicated to the coalition and USDA that I preferred to move forward with my bipartisan legislation (S. 280, the Consumer

Right to Know Act of 2001), which requires country-of-origin meat labels on beef, lamb, and pork meat products, as well as fruits and vegetables.

To qualify as “Beef: Made in the USA” under the voluntary system advocated by the coalition, U.S. beef products could originate from cattle raised and fed a mere 100 days in the U.S. For instance, under the proposal, a ribeye steak could be identified as “Beef: Made in the USA” even though it originated from a steer or heifer that was born in a foreign country, raised (perhaps up to one year) in a foreign country, and shipped to the U.S. at least 100 days prior to slaughter. Essentially, this means a beef product of foreign origin may be labeled as coming from the United States.

Given the recent and very real concerns about the spread of diseases such as Foot and Mouth disease (FMD) and BSE or “mad cow” in foreign countries, the requested definition of “U.S. beef” under this voluntary certification proposal is simply insufficient. Any certification or labeling program that even unintentionally permits beef from cattle where FMD or BSE have been discovered to be identified as “Made in the USA,” is misguided and risky. While current safeguards make this unlikely, the requested definition may blur the line and create unnecessary confusion and concern about the origin and safety of meat products originating in the U.S.

I believe the standard for beef to qualify as “Made in the USA” should be simple and truthful. As such, the standard should be that for any meat product to be identified as “U.S.” or “Made in the USA,” it should originate from an animal that is born, raised, and slaughtered in the U.S. Consumers expect no less and livestock producers deserve no less.

I ask USDA to immediately revise the petition to include my recommended strong standard for defining beef as “Made in the USA,” or to reject the coalition’s voluntary beef certification petition at this time, and work with the bipartisan Members of Congress who are favoring mandatory country-of-origin meat (and fruit and vegetable) labeling legislation that offers strong, meaningful standards for identifying food products as “Made in the USA.”

Answer. A Congressional directive contained in the Conference Report accompanying the fiscal year 2000 Agriculture Appropriations Act requires the Department, in consultation with the affected industries, to promulgate regulations defining which cattle and fresh beef products are “Products of the U.S.A.” In addition, the Department was also directed to determine what labeling terminology would best reflect that the beef products were derived from cattle born, raised, and slaughtered in the U.S. At this time an Advanced Notice of a Proposed Rulemaking is under consideration that would solicit industry input on how to define U.S. beef products, whether the scope of such labeling should be applied to poultry, what type of verification programs should be employed, and the potential impact on international trade. In light of these developments, the Department informed the industry coalition that sent the petition that the petition will not be addressed until the issues raised by Congress are addressed.

USDA-APHIS PRECEDENT FOR DEFINING THE ORIGIN OF BEEF CATTLE

Question. Madam Secretary, on Wednesday, June 28 of last year, USDA’s Animal and Plant Health Inspection Service (APHIS) issued an interim rule and request for public comment regarding regulations governing the importation of animals, meat, and meat products from Argentina, as an emergency measure to protect livestock herds in the United States from foot and mouth disease (FMD).

One of the conditions for the importation of fresh beef from Argentina—in the context of rule—was that the beef indeed originate from Argentina. APHIS indicated (on page 39783 of the Federal Register, Volume 65, No. 125, on Weds. June 28, 2000) that “in order to avoid any misunderstanding of their intent regarding the term originate,” they are specifying that “fresh beef, to be imported from Argentina, must originate from bovines that were born, raised, and slaughtered in Argentina.” APHIS goes on to say they consider this change “necessary to make it clear that beef exported from Argentina that comes from any animals born, raised, or slaughtered in a country other than Argentina may not be imported into the U.S.”

Now that imports of beef from Argentina have been suspended—for the second time in less than a year—this regulation is temporarily moot. However, APHIS’s definition of “originate” does set a precedent, in my mind and I’m sure in others, that the only clear and truthful way to describe a meat product as “originating” from someplace is to define or describe it as meat from an animal born, raised, and slaughtered in a given country before it can be said it “originates” from a given country.

Wouldn’t you agree that given this USDA precedent—albeit an APHIS precedent dealing with whether beef can be imported from Argentina in response to concerns

about FMD—demands that USDA consistently follow it in working on the voluntary beef certification program, the carcass grading rule, and negotiating with USTR and WTO partners in the context of defining “country-of-origin?”

Answer. The definition established by the Animal and Plant Health Inspection Service (APHIS) for use in the context of protecting U.S. agriculture from foreign animal diseases, does not necessarily set a precedent for use in defining a voluntary certification program’s specification, defining what animals and carcasses are eligible for USDA grading, or when negotiating with USTR and WTO partners in the context of defining “country-of-origin” for marketing purposes. It also does not affect FSIS country of origin labeling requirements.

USDA CARCASSES QUALITY GRADING RULE STATUS

Question. Madam Secretary, in 1999, the National Cattlemen’s Beef Association and the American Sheep Industry Association—in concert with other organizations such as R-CALF and National Farmers Union—petitioned USDA to end the grading of imported beef and lamb carcasses. Over 100 groups and individuals commented to USDA, and a majority requested that USDA discontinue grading of imported beef and lamb carcasses. Moreover, according to the Agricultural Marketing Service, this proposed rule only applies to around 150,000 beef and lamb carcasses imported annually. Therefore, this rule change, albeit modest, is certainly doable from an administrative standpoint.

American livestock producers invest millions of dollars annually to educate consumers about the quality, safety, and nutritional value of the meat produced on our ranches. Conversely, foreign nations do nothing to actively promote the value of USDA graded meat, yet they fight to ensure that meat products exported to the United States enjoy USDA quality grades when placed on retail shelves. For no defensible reason, this puts U.S. beef and lamb at a distinct competitive disadvantage in the retail market. Furthermore, this creates potential for unnecessary confusion among consumers whom may reasonably assume that a USDA grade shield indicates that a meat item is domestically produced.

Former USDA Secretary Glickman indicated that he’d support a rule change to discontinue grading on imported beef and lamb carcasses, yet, this rule was held-up in the transition. I am curious as to the status of this rule and encourage you and USDA to finalize a rule change to discontinue using USDA quality grades on imported beef and lamb.

Answer. A proposed rule that would discontinue the application of USDA grades to imported beef, lamb, veal, and calf carcasses was prepared and submitted to the Federal Register on January 19, 2001 for publication. As you stated, in accordance with White House Chief of Staff Andrew Card’s regulatory review memorandum dated January 20, 2001, this proposal was withdrawn from the Federal Register before it was published so that there was an opportunity for review to ensure that it reflected the policies of this Administration. Accordingly, this review is still ongoing and the Department is considering what course of action to take.

STATE AG CREDIT MEDIATION PROGRAM FUNDING

Question. Madam Secretary, last year I introduced legislation to re-authorize, expand, and clarify the state agricultural mediation program, a bill eventually adopted by Congress and signed into law as an amendment to the Grain Standards Act Reauthorization. Our reauthorization extends mediation through 2005.

This step was significant, Madam Secretary, because family farmers and ranchers in South Dakota and all across this country continue to suffer from a depressed rural economy and rock-bottom commodity prices. Agriculture is the backbone of our economy, and we must not fail to provide support to our family farmers and ranchers who are coping with these difficult times.

Each year Congress provides funding for state mediation, and these funds are matched with state funds to carry out the mediation program. Currently, twenty-five states participate in this mediation program, (including Alabama, Arkansas, Arizona, Florida, Idaho, Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Nebraska, Nevada, New Mexico, New York, New Jersey, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, Wisconsin, and Wyoming).

Four States—Mississippi, California, Colorado, and New York—are poised to begin new mediation programs this coming year. I believe this justifies the need for an increase in the Federal commitment to mediation, coupled with the fact that Congress clarified and expanded the scope of mediation last year to make clear that mediation can aim to resolve disputes such as wetland determinations, grazing issues, and USDA farm program matters, in addition to the traditional credit role of mediation.

The mediation program allows agricultural producers to settle their credit and farm program disputes in a fair way without digging themselves into legal debt. USDA's fiscal year 2002 budget suggests funding at \$3 million, despite the fact that additional states are coming on line this year, and Congress expanded the scope of mediation last year, I am urging you to support and increase for mediation.

Answer. The program has had some success in resolving disputes, particularly over issues relating to USDA's farm credit programs. USDA also other methods in place for resolving such disputes, such as the National Appeals Division. Our farm loan programs also provide extensive servicing options for borrowers who are having difficulties. Our field staff is there to help.

EFFORTS TO PREVENT BSE AND FMD

Question. Foreign outbreaks of the infectious virus FMD, tied to fear and confusion about the effects of BSE in Europe, have resulted in frightening, headline-grabbing news reports that concern many American consumers and livestock producers. While BSE has never been recorded in the U.S., and FMD was eradicated here in 1929, Congress and USDA can play a role to ensure the health of our domestic livestock herds and the safety of our meat and food supplies.

As you know, USDA currently enforces a ban on the import of ruminant animals and animal products (primarily beef-based) into this country. I applaud the Department's recent step to ban the import of all animal and animal products from the European Union (EU), in response to the spread of FMD.

Additionally, the Senate recently adopted legislation sponsored by over 30 Senators that requires reports from executive-level agencies—led by USDA—on the efficacy of current disease prevention safeguards, whether additional authorities are needed to prevent BSE and/or FMD, how well agencies at the executive level are cooperating, and whether additional funding is necessary to prevent either disease.

I am pleased that USDA's budget request for fiscal year 2002 increases funding for disease prevention. In fact, you seek to increase the Animal and Plant Health Inspection Service (APHIS) budget by \$174 million from fiscal year 2001, up to an \$849 million total for fiscal year 2002.

This should authorize additional resources to increase inspection personnel that protect against animal and plant diseases like FMD at major U.S. ports of entry. Specifically, USDA can hire approximately 350 additional personnel at critical ports and international airports to protect against pests and diseases. I am equally pleased with your requested \$13 million in additional program support to strengthen the Agriculture Quarantine Inspection Program (AQI), which helps protect the U.S. against animal diseases like FMD and BSE. Finally, in regards to increases in Agricultural Research Service (ARS) efforts to prevent diseases, I support your request for an increase of \$5 million for BSE-related research.

However, some indicate additional authorities may be needed to deal with a potential BSE outbreak in the U.S. Would you address whether USDA believes it is necessary for additional funding or authorities to prevent BSE and FMD?

Answer. We periodically assess funding and authority needs to facilitate quick and effective action. In the President's supplemental appropriations request, we included \$35 million for the Animal and Plant Health Inspection Service. This would chiefly be for dealing with foreign animal diseases.

MANDATORY PRICE REPORTING

Question. In 1999, Congress adopted mandatory price reporting—legislation sponsored by myself and many others in the Senate to require the major meatpackers to report the prices they pay for negotiated transactions of slaughter-ready livestock.

On April 2nd, USDA's Agricultural Marketing Service launched price reporting. I am curious as to how things have been progressing. Do you have any updates on price reporting? Does USDA need additional funds to ensure the proper functioning of price reporting?

Answer. Beginning in April 2001, packers have been submitting data to the Agricultural Marketing Service (AMS) via a secure Internet connection, allowing AMS to release some reports that do not compromise the identity of source packers. However, AMS has not been able to release a number of reports due to confidentiality provisions. The confidentiality provisions are being reviewed to determine if statistical procedures can be implemented that will allow for release of additional reports without disclosing the identity of source packers. The following reports have not been released due to technical problems: swine reports, cow cut reports, and lamb carcass reports. The technical problems are being investigated and will be corrected as soon as possible. Funds requested in the President's 2002 budget will ensure the proper functioning of mandatory price reporting activities.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

RURAL WATER AND WASTEWATER

Question. Madam Secretary, in our modern world, in a nation that enjoys a comparably high standard of living, it is difficult to conceive of areas where clean, safe, drinking water and sanitary wastewater disposal are unavailable. Yet, a recent Environmental Protection Agency report on the state of unmet drinking water needs across America found that for rural areas and communities of 10,000 or less, the total unmet need is nearly \$48 billion! In West Virginia alone, funding for water and wastewater programs is deficient by over \$41 million for 2001, based on the applications on hand. The backlog of applications awaiting funding across the nation totals nearly \$800 million in grants and \$2.2 billion in loans! Certainly this is a critical public health issue that should be addressed with all due speed.

In an effort to address rural water and wastewater needs, and to allow the Department of Agriculture to address its backlog of applications, I offered an amendment to the Congressional Budget Resolution for fiscal year 2002, which would increase domestic discretionary spending for rural water and waste water programs by \$1 billion. My amendment was adopted.

I am concerned that the President's budget for the Department of Agriculture ignores the backlog of applications and fails to respond to the need for water and wastewater projects. Instead, the President's budget proposes reductions for rural water and wastewater programs. Particularly disheartening is the budget's intent to reduce rural water and sewer grant programs, which help the neediest communities, below fiscal year 2000 funding levels. How do you justify a reduction in funding levels for rural water and waste water programs when such a basic need as clean, safe drinking water for all Americans has not yet been met?

Answer. The level of loan and grant assistance that would be offered by our ongoing water and waste disposal program in 2002 is not being reduced. It is the same as appropriated under the discretionary cap for 2001. The 2001 Appropriations Act did, however, include some emergency funding that did not count against the cap. This emergency funding remains available until expended. No additional funding is being requested on an emergency basis.

It is true that the 2002 budget reflects a reduction in budget authority for the water and waste disposal program. Recent declines in interest rates have reduced the subsidy rate on direct loans, which means that the cost to the Government for making the same amount of loans is less. This is a technical matter on how the program is budgeted, not one relating to the level of assistance the program is expected to provide.

Question. Would you support providing a fiscal year 2002 funding level for rural water and wastewater programs that would address the backlog of unfunded applications for rural water and wastewater projects?

Answer. A backlog of about \$3 billion in requests for water and waste disposal loans and grants has existed for the past several years. Some, but not all, of these requests are ready for funding. Due, in part, to the amount of time it takes to develop a typical water or waste disposal project, a backlog is not unexpected. Trying to eliminate it would put a stress on the approval process. The President's 2002 budget provides adequate funding to maintain the continuity of the program.

Question. Other than sufficient funding levels, are there other barriers prohibiting access to clean and safe drinking water for all Americans? If so, what are these barriers, and how would you eliminate them?

Answer. There are no real barriers. However, a typical water or waste disposal project represents a major undertaking for most rural communities. There may be engineering difficulties or environmental concerns. In almost all cases, a great deal of planning and coordination with local, State and other Federal agencies is necessary, which takes time.

EMERGENCIES

Question. Year after year the Appropriations Committee has scrambled to provide emergency assistance to farmers when natural disasters—such as floods, droughts, or hurricanes—strike. Already this year, the Mississippi River has spilled from its banks. The USDA has received more than 123 requests for emergency declarations since the beginning of April and many counties have already received disaster declarations in the first four months of 2001. Farmers may also face factors such as low prices for their products, regardless of improved marketing practices or trade with foreign nations. In sum, unpredictable events will undoubtedly negatively impact our nation's farmers during fiscal year 2002. In the President's budget for agriculture, under the guise of fiscal responsibility, there are no specific allowances for

emergency spending. Although the President's budget includes allowances for emergency spending, it does not make clear how that funding would be made available. While no one can control the powers of nature, Congress can certainly prepare to deal with the consequences of natural disasters and other unforeseen events, and the impact that these events will have on farmers. To do less than this is to leave our responsibilities unfulfilled.

Rather than reacting to emergencies as they arise, we may instead want to take proactive actions to ensure that there are no holes in the safety net for rural communities and farmers. For example, following the 1999 drought that devastated West Virginia's agricultural economy, I worked with then Agriculture Secretary Glickman, the Senator from Mississippi, Thad Cochran, and others to create a contingency fund of \$450 million to expedite Federal assistance should another disaster materialize. If drought struck, this contingency fund would be in place so that assistance could be immediately infused to address sudden agricultural emergencies. My initiative was really an ounce of prevention. It set aside funding to be made available only if a drought occurred, but as soon as a disaster is declared. Plans such as this are helpful in addressing drought more rapidly and, ultimately, reducing losses.

The drought contingency fund that I created ensured that should disaster occur funding would be made available for farmers expeditiously. Under the President's contingency fund, how quickly could funding be made available?

Answer. The President's budget proposal includes two provisions for potential emergency or unanticipated needs. The first is a National Emergency Reserve of \$5.6 billion which would be set aside under the budget resolution for use in meeting extraordinary large natural disaster needs, primarily but not exclusively, of the Federal Emergency Management Agency's disaster relief fund, USDA's and Department of Interior's fire fighting programs, and SBA disaster loan programs. This reserve would be allocated to the Appropriations Committees upon a Presidential request designating the proposed funding as an emergency, as well as, determination by the Budget Committees that appropriate criteria are met. This proposed change in procedures would restore discipline to the budget process and reduce needs for supplemental emergency appropriations. It would also ensure availability of budget authority for major disaster relief.

The President's budget also proposes a contingency reserve of about \$1 trillion over the next 10 years to be available to meet unanticipated or difficult to estimate in advance priority spending needs, including potential economic or disaster assistance for farmers. This reserve is included in the estimates of on-budget surpluses and provides for potential future increased spending needs. This proposal also, of course, depends on Congressional action to allocate and authorize funding. The President's contingency fund, thus, attempts to assure that funding will be available for unanticipated needs, but does not otherwise expedite the process of making funds available since Congressional action will be required.

Question. Should the so-called "contingency fund" from which the President's budget proposes emergency farm assistance be drawn be depleted for non-agricultural emergencies, what assistance will be available for farmers?

Answer. The Congress, of course, could choose to allocate additional funding for farm assistance through emergency supplemental appropriations or otherwise if necessary. Of course, we hope that the improved crop insurance and related programs provided by the Agricultural Risk Protection Act of 2000 and other ongoing programs will help meet any additional needs. And we understand the currently pending Congressional Budget Resolution may result in allocation of additional funding for farm assistance, so that there may be less likelihood that we will be faced with the problem you pose.

RESEARCH PROGRAMS/FOOD SAFETY/ADMINISTRATION PRIORITIES

Question. The President's budget cuts \$34 million from earmarked projects. I recognize the need to set funding priorities. However, I am concerned that the budget does not allow room for priorities which are not set by the Administration. In fact, the budget makes a point of redirecting funding focused on specific research projects, simply because they are Congressional earmarks, to the Administration's priorities. I am concerned that some Congressionally earmarked projects that provide critical components to Administration priorities have simply not been considered.

For example, a \$2 million earmark that I added to the fiscal year 2001 Agriculture Appropriations bill for Pasture-Based Beef Systems research at the Agricultural Research Service Appalachian Farming Systems Research Center, in Beaver, West Virginia, was eliminated. This project teams the Research Center with West

Virginia University, and Virginia Tech. The project's goal is to enhance the efficiency, profitability, sustainability, and environmental stewardship of grass-based beef production systems. Not only would this project provide a new economic opportunity for farmers, but it will also provide a nutritious, high quality, and safe meat product. As more attention is focused on food safety and healthy eating, more information is needed on profitable sustainable production systems such as pasture-based beef, which guards against serious food safety issues, such as animal disease in concentrated feeding areas, produces products high in beneficial fatty acids and nutrients, and reduces environmentally costly production methods. I hope that you will agree that the goals of the pasture-based beef project are important to the future of agriculture in America.

Other than the fact that they were earmarks, what criteria was used to reduce or eliminate funding for more than seventy Agricultural Research Service projects nationwide?

Answer. The President's fiscal year 2002 Budget recommended that all research projects which were added in fiscal year 2001 be discontinued in fiscal year 2002 to finance national high priority agricultural research initiatives in the following areas: emerging and exotic diseases and pests of plants and animals; biotechnology risk assessment; agricultural genome/bioinformatic tools; control of invasive species (weeds/arthropods); and biobased products and energy. The administration believes that taxpayer dollars must be spent on the highest priority needs of national significance.

RESEARCH FACILITIES

Question. Page 71 of the budget summary for the U.S. Department of Agriculture for fiscal year 2002 notes that innovative research depends upon the availability of modern facilities. However, the President's budget for fiscal year 2002 reduces funding for buildings and facilities to forty percent of the funding level for fiscal year 2001, and identifies specific science centers that would be the only centers eligible for improvement. In West Virginia, both the Appalachian Farming Systems Research Center in Beaver and the Appalachian Fruit Research Station in Kearneysville require improvements to their facilities. Without some of these improvements, research progress may be hampered, or even set back. How does the Department justify such a drastic cut to funding for research buildings and facilities when all of its laboratories are not completely modernized and fail to meet industry standards?

Answer. We recognize the need for substantial funding required for the modernization of ARS' buildings and facilities each year. However, the Administration believes that growth in Federal spending must be controlled and only the highest priority modernization and construction projects are requested in ARS' Buildings and Facilities for fiscal year 2002.

SENIOR FARMERS' MARKET NUTRITION PILOT PROGRAM

Question. A meeting I had with former Agriculture Secretary Glickman and Undersecretary Shumacher led to the implementation of the Senior Farmers' Market Nutrition Pilot program. This program is intended to improve the nutrition of low-income seniors by encouraging their connection with local farmers, while also improving market opportunities for farmers. The program will provide low-income seniors with coupons to use toward purchasing fresh fruits, vegetables, and herbs from farmers' markets, roadside stands, and community supported agriculture programs. The USDA announced that it would provide the West Virginia Department of Agriculture a grant for \$1.2 million to operate the Senior Farmers' Market Nutrition Pilot program in 2001. West Virginia expects that this program will benefit more than 50,000 seniors in eleven West Virginia counties this year. Nationwide, \$15 million was provided for this program in fiscal year 2001, but the President's budget does not include funding in its fiscal year 2002 budget for this project.

Would you agree that programs such as this, which help consumers and producers, can improve the health and economic well-being for all of the involved parties? What criteria was used in considering the elimination of this project?

Answer. The SFMNPP was funded as a pilot program by the previous Administration and no decision has been made by the current Administration whether it will be continued beyond the current fiscal year. I certainly agree that farmers' markets are of great benefit to both producers and consumers, and the Department intends to continue our ongoing involvement in encouraging farmers' markets, including providing funding to allow access by low-income households. The Department believes that the Senior Farmers' Market Nutrition Pilot Program (SFMNPP) will help sen-

ior citizens achieve the goal of consuming five servings of fruits and vegetables each day which will assist them in improving their nutritional health.

Question. What opportunities exist for expanding the Senior Farmers' Market Nutrition program?

Answer. Funding for the SFMNPP comes from the Commodity Credit Corporation and does not require an appropriation. The SFMNPP was funded as a pilot program by the previous Administration. No decision has been made by the current Administration as to the continuation of the pilot program beyond fiscal year 2001.

AQUACULTURE

Question. Could you provide a status regarding the National Center for Cool and Cold Water Aquaculture, including expected timetable for completion and dedication?

Answer. Design was awarded in March 1999. Construction was awarded in July 1999, and was originally expected to be completed by September 2000. Due to financial difficulties with the contractor, the government terminated the contract for default. A takeover agreement was signed in May 2000. Project completion will be in July 2001. A dedication ceremony is anticipated for mid-August.

Question. What funding is made available for the operation of the National Center for Cool and Cold Water Aquaculture in the President's budget?

Answer. Fiscal year 2002 funding available in the President's budget is \$3,328,400 (gross). Proposed project terminations total \$1,708,700.

SUBCOMMITTEE RECESS

Senator COCHRAN. Our next hearing is going to be on Thursday, May 3, at 10:00 a.m. in this room, 138 of the Dirksen Senate Office Building. At that time, we will hear from Department of Agriculture witnesses regarding assistance to producers and the farm economy.

This concludes the hearing. We are recessed.

[Whereupon, at 3:20 p.m., Wednesday, April 25, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2002**

THURSDAY, MAY 3, 2001

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:07 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Johnson, Kohl, and Dorgan.

DEPARTMENT OF AGRICULTURE

FARM AND FOREIGN AGRICULTURAL SERVICES

**STATEMENT OF THOMAS HUNT SHIPMAN, ACTING DEPUTY UNDER
SECRETARY**

ACCOMPANIED BY:

KEITH COLLINS, CHIEF ECONOMIST, DEPARTMENT OF AGRICULTURE

**DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF BUDGET AND
PROGRAM ANALYSIS, DEPARTMENT OF AGRICULTURE**

**JAMES LITTLE, ACTING ADMINISTRATOR, FARM SERVICE AGENCY,
DEPARTMENT OF AGRICULTURE**

**PHYLLIS W. HONOR, ACTING ADMINISTRATOR, RISK MANAGE-
MENT AGENCY, DEPARTMENT OF AGRICULTURE**

**MARY CHAMBLISS, ACTING GENERAL SALES MANAGER, DEPART-
MENT OF AGRICULTURE**

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The subcommittee will please come to order. Today the subcommittee continues the consideration of the fiscal year 2002 budget submitted by the President for the Department of Agriculture, which includes, of course, Rural Development and Related Agencies.

It gives me a special pleasure this morning to be able to welcome my good friend and former staff member, the Acting Deputy Under Secretary for Farm and Foreign Agriculture Services, Hunt Shipman, as a witness before our subcommittee; and also to welcome our friend Keith Collins, who is the chief economist of the Department of Agriculture. They are accompanied by Dennis Kaplan, who is representing the Department's budget office.

Today, we will review the emergency farm assistance programs being administered by USDA and the outlook for the farm economy.

Last year Congress approved nearly \$9 billion in crop and market loss assistance for agriculture producers. This assistance was provided under the authority of the Agricultural Risk Protection Act as well as the Agriculture Appropriations Bill.

Emergency funding for farmers is not specifically requested by the President in the budget request he has submitted to Congress. But the budget does propose a contingency fund to meet emergency requirements arising from natural disasters and unforeseen events; and a 10-year contingency reserve, which could be used to provide additional assistance to farmers, if needed.

I know the Department has made the implementation of emergency assistance programs a high priority. It has worked to promulgate regulations and disperse funds to producers.

The Committee looks forward to working with the Department on these and other efforts to help farmers and to strengthen the U.S. farm economy. We have the statements that have been prepared by the witnesses and they will be made a part of the record.

Mr. Shipman, you may proceed.

STATEMENT OF THOMAS HUNT SHIPMAN

Mr. SHIPMAN. Thanks very much, Senator. It is a humbling experience for me to be here today for three reasons—one to be here in the role that I am today; also, to be here in the company of Keith Collins, whose outstanding job I have been able to watch in my previous job on the other side of dias as he responded to these questions; and third, to represent the career staff that is here.

With me today are three acting administrators, who, along with people around the country, have worked so hard to implement the programs that Congress has authorized over the last few years and particularly in the fiscal year 2001 Agricultural Appropriations Act to assist farmers and ranchers around the country.

As I mentioned, with me today are the three acting administrators of the Farm Service Agency, the Risk Management Agency, and the Foreign Agricultural Service. They are Jim Little, Phyllis Honor and—well, my testimony is wrong, but Mary Chambliss as well. I am sorry.

Mr. SHIPMAN. Let me speak to each of the three agencies' activities and how they play into the delivery of emergency assistance in implementing the authorities that Congress has provided us and also in how that plays into the fiscal year 2002 budget.

In recent years, FSA has handled a tremendous increase in workload associated with the problems that we have seen in agriculture country all around our nation.

Marketing assistance loan placements have doubled between 1997 and the year 2000, loan deficiency payment transactions have increased over 5,000 percent or 51 times the 1995 level.

Marketing loan gains and loan deficiency payments increased from negligible levels in 1997 to over \$4 billion in 1999 and \$8 billion in the year 2000, and are expected to remain near \$7 billion for 2001 and \$5 billion in 2002.

Demand for farm operating, ownership, and emergency loans has increased more than 65 percent from the pre-farm-crisis period.

In the past year, FSA has implemented 24 new and reauthorized farm programs mandated by the fiscal year 2001 Agriculture Ap-

ropriations Act, as well as 17 programs authorized by the Agriculture Risk Protection Act of 2000 and the Military Construction Act of 2001. Farmers are now signing up or receiving payments for more than 20 programs that USDA has implemented.

FSA's ongoing commodity program activities include administration of production flexibility contracts, the Marketing Loan and Loan Deficiency Payment Programs, and the Non-Insured Crop Disaster Assistance Program.

In implementing the emergency and disaster assistance programs, Congress provided nearly \$14 billion including \$11 billion in loss payments for 1999 and 2000 crops.

For this fiscal year, Congress authorized \$1.8 billion for crop losses and nearly \$500 million to assist livestock producers.

About \$2 billion—\$2.2 billion—was provided for market loss and other emergency assistance in fiscal year 2001, including the dairy market loss assistance estimated at \$675 million, \$500 million for oilseeds, and emergency payments for apples, cranberries, potatoes, honey, peanuts, tobacco, nursery stock and other producers.

Signup has closed or is still under way for the 2000 Crop Disaster Program, the Florida Nursery Program, apple and cranberry market loss assistance, the Tri-Valley California Cooperative Insolvency Program, the 2000 Oilseed Program, the Peanut Marketing Assistance Program and the Tobacco Loss Assistance Program.

And signup will begin this month for the 2000 Disaster Quality Loss Program, the Apple and Potato Quality Loss Program, and the Potato Diversion Program.

Livestock producers are receiving benefits through the 2000 Livestock Assistance and Livestock Indemnity programs, the American Indian Livestock Feed Program, Poultry Enteritis Mortality Syndrome Program, wool and mohair loss assistance, and others that I will submit for the record. In total, more than 54,000 producers have applied for livestock aid totaling over \$270 million by April 16.

To date, nearly 1,300 counties in 34 States, more than 40 percent of all the counties in our country, are eligible for the Livestock Assistance Program.

The 2002 President's budget proposes to fund emergency needs, such as crop and livestock disaster assistance and emergency conservation, through a \$5.6 billion national emergency reserve. And this reserve would be available for sudden, urgent and unforeseen needs government-wide. Funds would be released from this reserve only after approval from the Congress and the President.

In the farm loan program, the loan portfolio is showing its best performance in many years, as evidenced by a direct loan delinquency rate of 12.3 percent, which is the lowest in 20 years. The guaranteed loan delinquency rate is at an all-time low of 1.8 percent, and the direct loan loss rate is at its lowest since 1987. In addition, our inventory of property is at its lowest since 1980.

For fiscal year 2002, the President's budget request will support \$3.9 billion in direct and guaranteed loans. And these loan levels will serve an estimated 37,000 producers.

In the conservation area, which is the second largest category of Commodity Credit Corporation expenditures, the largest program is the Conservation Reserve Program.

CRP enrollment is expected to reach 33.9 million acres at the end of this fiscal year and to reach its maximum authorized level of 36.4 million acres by December 31st of 2002.

Included in this are 4.2 million in cumulative acres that are projected to be enrolled under continuous signup, as well as 500,000 farmable wetland acres. Outlays for this program in 2002 are expected to be \$1.8 billion.

The Administrative Expenses budget has enabled FSA in the last two fiscal years to employ additional temporary staff to meet the heavy workload associated with administering ongoing and emergency assistance programs.

We are also continuing to re-engineer and streamline business processes, such as establishing the common computing environment, and to expand our E-government services and capabilities as mandated by Congress.

In the next year, we will continue to review our field office structure and to identify additional opportunities to improve efficiencies and realize savings. However, FSA continues to have significant temporary staffing needs that are reflected in our budget request for 2002.

The Risk Management Agency's top priority is to implement the Agricultural Risk Protection Act, or ARPA, of 2000, so that farmers can realize the benefits of an improved crop insurance program as soon as possible.

Title I of that Act includes a 5 year, \$7 billion initiative to make higher levels of protection more affordable and useful to producers, to provide better protection for farmers suffering multi-year losses, to expand risk management education and outreach opportunities, to stimulate development of new risk management products and to improve the program's integrity.

RMA began last year by reducing farmer-paid premiums and increasing yield coverage levels that were mandated as a part of the enactment of ARPA.

So far in 2001, crop insurance sales have increased substantially, with significantly more acreage covered under revenue insurance products. Crop revenue coverage has tripled and currently covers about 51 percent of all acreage reported today. Coverage under the revenue insurance program now available in the southern plains has increased about 7 percent.

RMA has worked closely with the Farm Service Agency to develop a coordinated plan that includes training, claims, audit and fraud referral procedures, and data reconciliation, which was such an important part of the discussion as Congress enacted the ARPA.

As a part of this plan, RMA will provide anti-fraud and loss adjustment training to over 2,500 Farm Service Agency State and county office personnel.

RMA has also worked with other USDA agencies to utilize contracting authority to make greater use of partnerships and private sector expertise in developing new risk management products.

The Agency has awarded four contracts to help develop new insurance plans for currently insured crops as well as new crop policies, and new types of risk management products.

The agency has studies underway on the cost of production pilot program, the feasibility of developing a pasture and range land in-

insurance program, new revenue coverage plans and a livestock pilot program. Also, it is planning to implement a pilot raspberry/blackberry crop insurance program for the 2002 crop year.

Another important function is to expand crop insurance participation in under-served regions. And RMA is working to expand its risk management activities and utilize forums such as producer meetings in the Cooperative State Research, Education, and Extension Service to provide that education.

The President's budget for 2002 includes full funding for implementing many of the crop insurance reforms authorized by Congress. This budget includes increases of \$232 million in mandatory spending to finance the additional subsidies in delivery expenses associated with additional participation, and \$9 million in discretionary spending, which includes \$4.5 million to finance data mining and improvements in information technology systems.

The Foreign Agriculture Service's primary mission is to continue to move forward in multilateral trade negotiations and to expand overseas markets intelligence and technical expertise that we need to support agricultural trade.

International negotiations to further liberalize agricultural trading practices are already underway under the auspices of the World Trade Organization.

And the United States has already offered a set of ambitious proposals for the negotiations that provide for the elimination of export subsidies, improved market access, reform of State trading enterprises, tighter rules on trade distorting domestic support and facilitation of trade in the products and new technologies.

USDA will work closely with the Office of the United States Trade Representative to secure an agreement which incorporates these objectives.

Negotiations are also underway to achieve a free trade area of the Americas by 2005. For agriculture, these objectives include eliminating support subsidies that affect trade in our hemisphere, identifying and reducing other trade distorting practices, and ensuring that sanitary and phytosanitary measures are based on science and conform with the Uruguay Round principles.

A successful conclusion of these negotiations will gain American farmers increased access to a region of 675 million people with a combined consumer buying power of over \$1.5 trillion.

But farmers and agricultural businesses do not just benefit from open markets, they depend on them for their income, as agriculture generally ranks among the top six industry groups in export sales. Dollar for dollar, we export more meat than steel, more corn than cosmetics, more wheat than coal, more bakery products than motor boats and more fruits and vegetables than household appliances.

Agriculture is also twice as dependent on exports as the general U.S. economy. So the apparent rebounding in our export numbers is a welcome trend.

Last year, agriculture exports were valued at \$51 billion. In fiscal year 2001, they are forecast to increase to \$53 billion.

The technical trade issues such as those related to food safety and biotechnology are among the toughest for us to deal with and have occupied much of the time of the Secretary and I in the first few months of this Administration.

It is important we participate actively in the international organizations that set technical standards that govern agricultural trade; and our focus will be in making sure that biotech and other approval regimes are transparent, predictable, and based on sound science.

Our budget request for 2002 reflects these concerns and includes increased funding to expand FAS's capabilities to address technical trade issues and to strengthen our market intelligence capabilities at overseas posts.

We will be focusing our efforts on 14 important markets around the world where opportunities to expand our exports appear to be greatest.

In addition, the budget also contemplates adequate funding for our export promotion and market development program so that we can benefit from emerging market opportunities, the Foreign Market Development or Cooperator Program, the Market Access Program, and the Quality Samples Programs are estimated to be funded at \$120 million for 2002, which is the same as the current fiscal year.

Our export guarantee programs are estimated at \$3.9 billion, an increase of more than \$100 million above fiscal year 2001.

And finally funding for the Export Enhancement Program is estimated at \$478 million, the statutory maximum and the same level as this year.

Funding for the Dairy Export Incentive Program is estimated at \$42 million, which is slightly higher than the current fiscal year.

PREPARED STATEMENTS

Mr. Chairman, this concludes my statement. And I look forward to answering any questions the subcommittee might have.

Senator COCHRAN. Thank you very much, Mr. Shipman.
[The statements follow:]

PREPARED STATEMENT OF THOMAS HUNT SHIPMAN

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today with USDA's Chief Economist, Keith Collins, to discuss our assistance to producers, both this year and as proposed in the President's fiscal year 2002 budget.

The mission of Farm and Foreign Agricultural Services is to secure the long-term vitality and global competitiveness of American agriculture through delivery of commodity, credit, conservation, insurance, and export programs. In the past several years, that mission has been tested by low commodity prices, weak overseas demand, and a continual onslaught of natural disasters. Improved market conditions have been slow to materialize, and with continued weakness in the farm economy, USDA will be closely monitoring crop and market conditions over the coming months.

In this economic environment, we have used our continuing authorities and recently enacted program and policy tools to help producers weather the market crises in production agriculture. Implementing those tools are the three agencies which comprise the mission area: the Farm Service Agency, Risk Management Agency, and the Foreign Agricultural Service. Each plays a significant role in USDA's continued efforts to help America's farmers and ranchers.

FARM SERVICE AGENCY (FSA)

The Farm Service Agency is USDA's principal organization for providing financial support to our nation's producers. Through its administration of farm commodity, credit, conservation, and emergency assistance programs, FSA helps to ensure a stable, accessible, affordable food supply while promoting stewardship of the land and providing assistance to our nation's farmers and ranchers.

In recent years, FSA has seen a tremendous increase in workload associated with tough times in farm country both in the agency's ongoing programs as well as in the dozens of new programs enacted to provide relief from market losses and natural disasters. Since 1993, FSA has experienced an 87 percent increase in program funding levels and a 24 percent reduction in staff.

At the same time, workload transaction volumes have increased substantially. Loan deficiency payments have increased over 5,000 percent or 51 times 1995 levels. Marketing assistance loan placements doubled between 1997 and 2000. Marketing loan gains and loan deficiency payments increased from negligible levels in 1997 to over \$4 billion in 1999 and \$8 billion in 2000 and are expected to remain near \$7 billion in 2001 and about \$5 billion in 2002. Demand for farm loans has increased more than 65 percent in recent years.

Supplemental appropriations in 2000 and 2001 have enabled FSA to employ additional temporary staff to meet the heavy workload needs of our ongoing and emergency assistance programs. To improve our service to our customers, we also are continuing to reengineer and streamline business processes, establish a common computing environment, and maximize efficiencies among the county-based agencies. However, FSA continues to have significant temporary staffing needs that are reflected in our budget request for fiscal year 2002.

Over the past year, FSA has implemented 24 new and reauthorized farm programs mandated by the fiscal year 2001 Agricultural Appropriations Act, as well as 17 programs authorized by the Agricultural Risk Protection Act of 2000 (ARPA) and the Military Construction Act of 2001. Farmers are now signing up or receiving payments for some two dozen programs.

Mr. Chairman, I'd now like to describe the efforts underway to help America's family farmers and ranchers.

Ongoing Commodity Programs

Production Flexibility Contract Payments.—The 1996 Farm Bill replaced the income support mechanisms of previous farm bills with production flexibility contract payments which are specified annually from 1996 through 2002 at a total of \$35.6 billion. From fiscal year 1999 through 2002, producers eligible for contract payments on their wheat, corn, grain sorghum, barley, oats, upland cotton or rice crops had the option of receiving them as two 50 percent payments or one 100 percent payment anytime during the fiscal year. So far in fiscal year 2001, farmers have opted to receive about \$3.2 billion of the \$4.1 billion available. In fiscal year 2002, production flexibility contract payments will total nearly \$4 billion.

Marketing Assistance Loans.—Non-recourse marketing assistance loans provide short-term financing to producers who harvest crops of wheat, feed grains, rice, minor oilseeds, soybeans and cotton. As of April 16, farmers had received \$6.1 billion through 151,740 loans on their 2000 crops. For their 1999 crops, an additional \$3.7 billion for 107,616 loans remains outstanding.

Loan Deficiency Payments (LDPs).—LDPs are made to producers who opt to forgo marketing assistance loans on their eligible crops. As of April 16, expenditures for the 2000 crop year totaled \$6.2 billion on over 2.8 million LDP transactions for wheat, feed grains, upland cotton, rice, soybeans and oilseeds. Effective only for the 2000 crop year, producers growing a contract commodity on a farm with no production flexibility contract are eligible for LDPs on their 2000 crop production. Also effective only for the 2000 crop year, payment limitations were doubled from \$75,000 to \$150,000—for LDPs and marketing loan gains for contract commodities, oilseeds, and honey.

Farm Storage Facility Loans.—Under this program, which provides low-cost financing for producers to build or upgrade on-farm storage handling facilities, FSA funded 1,980 loans totaling \$59.3 million for the 2000 crop year, of which \$56.7 million remains outstanding. As of April 16, 466 additional loans have been made for the 2001 crop year. So far this year, nearly \$16 million has been obligated, and \$5 million disbursed to producers. In fiscal year 2002, the budget proposes outlays of \$3 million to support a program level of \$125 million for farm storage facility loans.

Dairy Price Support Program.—This program was extended through December 31, 2001, and the Dairy Recourse Loan Program was postponed to January 1, 2002. As of April 1, 2001, FSA has purchased 772 million pounds of nonfat-dry milk and 11 million pounds of cheese under the Dairy Price Support program.

Emergency and Disaster Assistance Programs

Appropriations acts provided about \$5 billion in emergency assistance in 1999 and about \$8.5 billion in 2000 to help farmers cope with some of the lowest commodity prices in many years. The Agricultural Risk Protection Act (ARPA) provided an ad-

ditional \$6.5 billion in emergency funds for 2000. The fiscal year 2001 Appropriations Act provided an additional \$3.5 billion in emergency funds.

For 2002, the President's budget proposes to fund emergency needs such as crop disasters, emergency watershed protection, emergency conservation and other programs through a \$5.6 billion National Emergency Reserve. This reserve would cover sudden, urgent and unforeseen needs government-wide. Funds would be released from the reserve only after approval from both the President and the Congress. The President's budget also proposes approximately \$1 trillion over 10 years for a reserve to meet unanticipated emergency and special needs on a government-wide basis, including the potential need for assistance to farmers above levels in existing programs, such as marketing assistance loans and loan deficiency payment programs.

The status of our major program activity in fiscal year 2001 includes:

Crop Emergency Programs

Noninsured Crop Disaster Assistance Program (NAP).—The NAP has undergone a number of legislated reforms to improve its coverage for producers of uninsured crops. The ARPA eliminated the area loss requirement for individual eligibility and provided that all types or varieties of a crop may be considered to be a single eligible crop for NAP assistance. The 2001 NAP requires producers to be more proactive, they will need to apply for individual coverage similar to basic catastrophic crop insurance, and pay a \$100 service fee per crop. But they will know they are covered before disaster strikes. Since the 1995 crop year, 2,136 NAP areas have been approved and \$211.7 million paid in benefits. However, benefits for fiscal year 2001 are estimated at \$176.5 million.

2000 Crop Disaster Program (CDP).—The CDP compensates farmers if their losses exceed 35 percent of historic yields, providing greater benefits to those who bought insurance on their eligible crops. Unlike previous crop loss programs, the 2000 CDP payments will not be subject to a national proration factor; farmers will receive 100 percent of the approved payment. Signup began January 18 and is ongoing. To date, 200,039 producers have requested CDP benefits and 138,097 have been approved. As of April 9, nearly \$1.4 billion has been paid to producers.

2000 Disaster/Quality Loss Program.—This program compensates producers for crop quality losses which are not adequately covered under the CDP. For example, durum wheat producers in North Dakota and other States have experienced deep market discounts on their crops. Such discounts are not currently reflected in the FSA schedule of premiums and discounts used to adjust production for quality losses under the CDP. Also, certain crops which were not eligible for a quality adjustment under CDP—such as hay crops—will be eligible under this special program. We expect to begin signup in May.

Apple/Potato Quality Loss Program.—This program provides \$38 million to compensate apple and potato producers for quality losses due to weather or disease for both the 1999 and 2000 crops. Payments will be made regardless of whether a crop was harvested. We expect to begin signup in May.

2000 Florida Nursery Program.—The Nursery Program assists Florida producers who suffered nursery losses from October 1–December 31, 2000, due to weather, insect or disease damage. To date, 91 producers have requested benefits and 45 have been approved.

2000 Sugar Payment-in-Kind Program.—The Sugar PIK offered sugar beet producers the opportunity to divert a portion of their crop from harvest in exchange for sugar held in inventory by the CCC. Approximately 5,000 offers for over 101,000 acres—about 7 percent of the acreage planted to sugar beets—were accepted. CCC transferred over 277,000 tons of refined sugar, valued at \$105.5 million, to participating producers, resulting in a \$555,000 reduction in monthly CCC storage costs. The Sugar PIK Program also reduced potential forfeitures of loan collateral.

Apple Market Loss Assistance Program.—Apple Market Loss Assistance will provide nearly \$100 million in payments to apple producers to help offset market losses on their 1998 and 1999 production. Signup has been extended to May 4, and we expect to begin making payments by mid-June.

Cranberry Market Loss Assistance.—This program will provide nearly \$20 million to cranberry growers who suffered market losses when prices for their 1999 crop fell to a record low. Signup ended April 13, and we began making payments in late April.

Limited California Cooperative Insolvency Payment Program (Tri-Valley).—The Tri-Valley Program will make payments of \$20 million to 500 members of the Tri-Valley Growers Cooperative who produced 2000 crop tomatoes, pears, peaches, and apricots and who suffered losses due to the cooperative's insolvency. Signup ended April 24.

2000 Fresh Russet Potato Diversion Program (PDP).—PDP will make payments of \$10.3 million to potato growers on 2000 crop russet potatoes rendered unmarketable and diverted from normal trade channels to charitable institutions, livestock feed, or ethanol. The diversion period began April 13 and will end May 13. Signup will run from May 14 through June 13. We expect to make payments by early July.

Grazing Payments for 2001 Wheat, Barley or Oats (GRAZEOUT).—GRAZEOUT makes payments in lieu of loan deficiency payments to producers who forgo harvesting and graze out their 2001 wheat, barley, or oats acreage. Producers will receive payments estimated at \$60 million by September 30, 2001, under the same terms and conditions as if they harvested a crop and applied for a loan deficiency payment.

2000 Oilseeds Program.—The Oilseeds Program provides payments to producers who, in 2000, planted an oilseed crop that is eligible for marketing assistance loans. Signup for the program ran from October 16, 2000, through January 12 of this year, and FSA county offices began issuing payments in February. Nearly \$500 million in program payments have been issued to 591,695 producers in 47 States.

2000 Honey Loans.—Honey producers are eligible for nonrecourse marketing assistance loans and LDPs on their 2000 crop honey. As of April 18, FSA county offices had disbursed 726 marketing assistance loans totaling \$34.7 million and 5,619 LDPs totaling \$17.1 million on the 2000 honey crop.

Peanut Marketing Assistance Program (PMAP).—PMAP helps to compensate producers whose incomes have dropped in the 2000 crop year due to continued low commodity prices and increasing costs of production. Signup ran from October 2, 2000, through February 1, 2001. As of April 4, FSA county offices had disbursed \$63.7 million to approximately 50,000 peanut producers in 17 States.

Tobacco Loss Assistance Program (TLAP).—TLAP provided payments of \$340 million to owners or operators of flue-cured, fire-cured, burley, or cigar binder tobacco farms for which the 2000 quota or acreage was reduced due to a drop in the national marketing quota or acreage for that kind of tobacco. Growers on approximately 275,000 farms in 12 States were eligible for payments.

Tobacco Quota Holders Assistance.—This program provides supplemental assistance to quota holders who were not eligible under TLAP. OMB has only apportioned \$3 million for tobacco quota holder assistance. While a request for an increase to \$7 million is at OMB, it is not certain the request will be approved. Additionally, producer-owned cooperative marketing associations were allowed to fully settle their loans for 1999 crops of burley, flue-cured and cigar binder tobacco by forfeitures to the CCC. The tobacco covered by this provision is valued at \$591 million.

Livestock and Dairy Emergency Programs

2000 Livestock Assistance Program (LAP).—The 2000 LAP provides assistance in counties named as primary disaster areas under a Presidential or Secretarial designation. As of April 16, more than 54,000 producers have applied for aid totaling over \$270 million. Also as of April 16, 1,291 counties in 34 States more than 40 percent of all counties in the United States—have been approved for LAP. Included in the approvals are all counties in Alabama, Mississippi, and Utah, and 90 percent of the counties in Arkansas, Georgia, Louisiana, and Texas.

2000 Livestock Indemnity Program (LIP).—The 2000 LIP provides payments to producers for livestock losses during CY 2000 due to non-drought disasters in counties named in a Presidential or Secretarial disaster declaration. To date, approximately 1,050 livestock owners have requested benefits totaling \$765,000. In addition, indemnity payments of up to \$10 million are available to compensate contract growers who raise livestock owned by others. This program covers 1999 livestock losses, and has been extended to cover losses incurred through February 7, 2000.

American Indian Livestock Feed Program (AILFP).—AILFP is contracted as a government-to-government program to provide direct cash payments to livestock producers suffering from natural disasters on tribal lands. The program was originally funded from the sale of feed grains from disaster reserve stocks in 1977. With those funds exhausted, the program received additional funding of \$12 million in fiscal year 2001 to remain available until spent. Since the program began, it has provided assistance to 27 tribes.

Poult Enteritis Mortality Syndrome (PEMS) Program.—Funded at \$2 million, this program helps offset income losses suffered by contract growers as a result of an outbreak of PEMS from March 1, 2000, through April 30, 2001. When PEMS outbreaks occur, turkey producers must depopulate their turkey houses and leave them empty for two or more growing cycles. We expect about 100 contract growers to apply for benefits in early May.

Wool and Mohair Loss Assistance Program II.—Funded at nearly \$20 million in 2001, the program makes direct producer payments not to exceed 40 cents per

pound for wool and mohair due to continued low market prices. Signup has been extended through May 4, and payments are slated to be made by mid-June. Payments made in fiscal year 2000 totaled \$10.2 million.

Lamb Meat Adjustment Assistance Program.—In its second year, the program provides up to \$30 million total, with a target of \$10 million per year, in direct cash payments to help lamb and sheep growers improve their production efficiencies and the marketability of lamb meat, during a 3-year period from July 22, 1999, through July 31, 2002. As of April 16, payments for Year 2, which ends July 31, totaled nearly \$3.7 million. Payments in Year 1 of the program totaled \$12.7 million, for a total paid to date of nearly \$15.3 million.

Dairy Market Loss Assistance Program (DMLA).—DMLA, first implemented in 1999, to assist primarily small and mid-sized dairy operations that suffered losses from 1999 to the present, as well as new dairy producers or operations in 2000. DMLA III provides supplemental payments to dairy producers who received payments in the first two years of the program. As of April 3, fiscal year 2001 payments total \$655 million.

Bioenergy Program

In other actions to benefit America's farmers, FSA is implementing a Bioenergy Program in fiscal year 2001 to encourage the processing of surplus agricultural commodities for industrial uses. FSA has approved 54 agreements with 79 plants in 19 States for participation in the \$150 million program. Increased bioenergy production for fiscal year 2001 as a result of the program is projected to be 246.2 million gallons of ethanol and 36.5 million gallons of biodiesel.

Cry9C Seed Corn Purchase

USDA, through CCC, is implementing a program to purchase seed corn that contains the Cry9C protein. FSA has contacted 286 seed corn companies and has offered to purchase all seed corn containing the Cry9C protein for \$40 per unit. To date, 67 seed corn companies have indicated that they hold seed containing the Cry9C protein and that they want to enter into purchase contracts with CCC.

Starlink Corn Containment

On October 2, CCC offered to purchase 2000 crop Starlink corn from producers and to channel Starlink corn into industrial non-food and animal feed markets. Under this program, which was established in conjunction with EPA and FDA, CCC has purchased approximately 250,000 bushels at a cost of \$310,000. Aventis Crop Science has reimbursed CCC for all costs incurred in administering this purchase program.

Additionally, CCC is monitoring disposition of Starlink corn that was not sold to CCC to ensure that it is also disposed of through appropriate uses.

Farm Loan Programs

FSA offers direct and guaranteed farm ownership and operating loans to farmers who are unable to obtain sufficient credit from private sources. FSA borrowers range from beginning farmers and ranchers who cannot qualify for conventional loans because they have insufficient financial resources to established farmers who have suffered financial setbacks from natural disasters, or whose resources are too limited to maintain profitable farming operations.

The goal of FSA's farm loan program is to assist eligible individuals and families through supervised credit, outreach and technical assistance so that they become successful farmers and ranchers. Regardless of the type of loan, FSA's financial assistance provides a safety net for borrowers who have reasonable prospects for lasting economic viability in agriculture.

The FSA farm loan portfolio is showing its best performance in many years as evidenced by direct loan delinquency which is the lowest in over 20 years at 12.3 percent. The guaranteed loan delinquency is at an all-time low of 1.83 percent, and the direct loan loss rate is the lowest since 1987. In addition, inventory property numbers are the lowest since 1980.

In fiscal years 1999 and 2000, FSA provided loans and loan guarantees totaling \$7.5 billion to over 71,000 family farmers. Of this total, 24,000 were beginning and socially disadvantaged farmers, who received assistance totaling \$1.9 billion.

FSA has developed ways to decrease the paperwork burden on both farmers and lenders. The emergency loan process has been streamlined from 6 to 2 weeks. Both the guaranteed and direct loan programs now have a one-page application for loans of less than \$50,000. FSA also has been condensing direct loan regulations by deleting 1,200 pages of text and reducing the number of required forms by almost 30 percent. We have joined with the other service center agencies in a common Internet web site where customers of FSA, Rural Development and the Natural Resources

Conservation Service can download and complete the forms needed to participate in many agency programs and services.

In fiscal year 2001, demand for FSA's farm loan assistance remains strong. As of March 31, 2001, loans and loan guarantees totaling \$1.5 billion have assisted 15,000 farmers with their credit needs. A significant portion of this loan assistance—\$515 million—is being provided to 6,000 beginning and socially disadvantaged farmers. The lending season is currently at its busiest and most critical time, and FSA is working hard to rapidly process the thousands of applications coming into county offices.

For fiscal year 2002, the President's budget request will support \$3.8 billion in direct and guaranteed loans. We will continue to emphasize providing assistance to beginning and socially disadvantaged farmers, and will increase the proportion of loan amounts targeted to these groups to 30 percent.

For farm operating loans, the 2002 budget provides \$600 million for direct loans and \$2 billion for guaranteed loans. These loan levels will serve an estimated 31,000 farmers, of whom about 14,500 will receive direct loans. The availability of farm operating loans provides farmers with short term credit to finance the costs of maintaining or improving their farm operations, such as purchasing seed, fertilizer, livestock, feed, equipment and other supplies.

For farm ownership loans, the 2002 budget provides \$128 million in direct loans and \$1 billion in guaranteed loans. The 2002 levels will provide almost 6,000 people with the opportunity to acquire their own farm or save an existing one. About 1,250 borrowers would receive direct loans and 4,500 would receive guaranteed loans.

The 2002 budget also proposes funding for emergency loans at \$25 million, which is the same amount as appropriated for fiscal year 2001. The budget also proposes to maintain State mediation grants at the fiscal year 2001 level of \$3 million.

Conservation Programs

Conservation program outlays represent the second largest major category of CCC expenditures. FSA offers a variety of these programs for our Nation's farmers and ranchers, providing needed financial assistance to protect and enhance the environment. These programs include the Conservation Reserve Program, Emergency Conservation Program, Pasture Recovery Program, Debt for Nature Program, Biomass Pilot Projects, and the Farmable Wetlands Pilot Program. Also, FSA teams with NRCS in the administration of the Environmental Quality Incentives Program.

Conservation Reserve Program (CRP).—CRP is USDA's largest conservation/environmental program. CRP's purpose is to cost-effectively assist farmers in conserving and improving soil, water, air, and wildlife resources by retiring environmentally sensitive land from agricultural production and keeping the land in long-term resource conserving cover. Acreage is enrolled into the CRP through scheduled general signups and through a continuous, noncompetitive signup.

CRP enrollment is expected to total 33.9 million acres at the end of fiscal year 2001 and reach the maximum authorized level of 36.4 million acres by December 31, 2002. Included in this total are 4.2 million cumulative acres that are projected to be enrolled under the continuous signup as well as 500,000 farmable wetland acres. Outlays for fiscal year 2002 are estimated at \$1.8 billion.

As of March 2001, there were 522,480 active CRP contracts covering 33.5 million acres with associated annual rental payments of \$1.5 billion. General signup activity accounted for 74 percent of the contracts, 96 percent of the acres, and 91 percent of the annual outlays. Continuous signups, including the Conservation Reserve Enhancement Program, accounted for the remainder.

There will be no general signup for CRP in 2001. However, CRP participants whose contracts are scheduled to expire on September 30, 2001 may extend the expiration date for one year.

Through mid-March 2001, over 1.4 million acres have been enrolled under continuous signup practices such as filter strips, riparian buffers, contour grass strips, and grass waterways. The continuous signup has significantly increased the enrollment of these environmentally important lands. Financial incentives to encourage participation in the continuous signup such as up-front signing bonuses and incentives for practice installation and maintenance will total up to \$250 million from fiscal year 2001 through fiscal year 2002.

Continuous signup acreage also includes enrollment under the Conservation Reserve Enhancement Program (CREP), which is designed to target program benefits to address specific local and regional conservation problems. Currently, 15 States have approved CREP agreements, and another 9 States have CREP proposals pending. CREP is a results-oriented, community-centered partnership between USDA, State and tribal governments, and non-governmental groups. CREP currently ac-

counts for 2 percent of CRP contracts, less than 1 percent of the acres enrolled, and 1 percent of CRP outlays.

Emergency Conservation Program (ECP).—ECP provides emergency cost-share funding to farmers to rehabilitate farmland damaged by natural disaster and for carrying out emergency water conservation measures during periods of severe drought. During the last several years, ECP has been funded through emergency supplemental appropriations. A total of \$80 million was appropriated for fiscal year 2001. As of April 16, 2001, \$39.2 million in ECP funds had been allocated to States. While the Administration's budget proposes no ECP funding for fiscal year 2002, it does propose a \$5.6 billion National Emergency Reserve to cover unforeseen expenditure requirements.

Pasture Recovery Program (PRP).—PRP provides payments for reestablishing permanent vegetative cover to farmers who have suffered pasture losses due to drought. PRP is funded at \$40 million in fiscal year 2001. Through mid-April, \$27.5 million in payments had been distributed to farmers. Signup for the fiscal year 2001 PRP began on March 26, 2001, and ends on May 11, 2001.

Debt for Nature Program (DNP).—Also known as the Debt Cancellation Conservation Program, DNP provides that farmers with FSA loans secured by real estate may qualify for cancellation of a portion of their FSA indebtedness in exchange for a conservation contract on marginal cropland and other environmentally sensitive lands for conservation, recreation, and wildlife purposes. By the end of fiscal year 2000, FSA had closed 206 conservation contracts for a total of 82,225 acres enrolled in the program.

Farmable Wetlands Pilot Program.—This program provides for the enrollment of 500,000 acres of certain wetlands and buffer acreage on a pilot basis into the CRP during 2001 and 2002. The program will operate in Iowa, Minnesota, Montana, Nebraska, North Dakota, and South Dakota. Regulations will be issued in the near future.

Biomass Pilot Projects.—Biomass pilot projects, under which CRP acres may be harvested for biomass to be used for energy production, are authorized in up to 6 States. A notice was published on October 20, 2000, providing the opportunity for those interested to submit an application for consideration by December 12, 2000. An inter-agency team recently approved pilot projects in Iowa, Minnesota, New York, and Pennsylvania.

Service Center Modernization Initiative

As part of ongoing efforts to improve service delivery, FSA has completed installation of 2,557 new AS400 computers in its field offices, replacing the aging System 36s. The AS400s permit FSA offices to have full connectivity to the USDA service center local area network and the telecommunications infrastructure, and also ensure uninterrupted FSA program delivery while software applications are migrated to a common computing environment (CCE). A fully-implemented CCE will enable employees to take full advantage of reengineered business processes and time-saving software. Over the next year, we will continue to review our field office structure to identify additional opportunities to improve efficiency, realize savings, and address the growth in electronic transaction of farm business.

Fiscal Year 2002 Budget

The current 2002 CCC budget estimates largely reflect supply and demand assumptions for the 2001 crop, based on October 2000 data. CCC net expenditures for fiscal year 2002 are estimated at \$13.1 billion, down nearly \$7.5 billion from a level of \$20.5 billion in fiscal year 2001, and \$19.2 billion below the record high of \$32.3 billion in fiscal year 2000.

The net decrease in projected fiscal year 2002 CCC expenditures primarily reflects the expiration of \$4.5 billion in 2001 emergency and market loss assistance authorized by the Agricultural Risk Protection Act of 2000 and the 2001 Agriculture Appropriations Act. Other components include decreases of about \$1.4 billion in loan deficiency payments, nearly \$300 million in Section 416 ocean transportation, and about \$120 million in production flexibility contract payments.

Non-Federal county staff years are projected to decrease from 11,957 in 2001 to 11,496 in 2002 because the temporary staff years needed to carry out crop and market loss assistance programs are expected to decline modestly. However, FSA temporary staff years are expected to remain at twice the pre-farm-crisis levels of 1996 through 1998.

RISK MANAGEMENT AGENCY (RMA)

The Risk Management Agency administers the Crop Insurance Program and is USDA's primary organization for providing risk management services to farmers

and ranchers. By 2002, the Crop Insurance Program is expected to provide over \$36 billion in risk protection on about 222 million acres 84 percent of the nation's acres planted to principal crops.

Significant reforms to the program were enacted in the Agricultural Risk Protection Act of 2000 (ARPA) which build on the increased participation levels of recent years. Title I of the Act contains a 5-year, \$7 billion dollar initiative to make higher levels of protection more affordable and useful to producers, provide better protection to farmers suffering multi-year losses, expand risk management education opportunities, stimulate development of new risk management products, and improve program integrity.

Soon after enactment of ARPA last June, RMA implemented provisions of ARPA that lowered 2001 farmer-paid premiums, along with other changes in the program. As a result, farmers benefitted from higher levels of protection at less cost for their 2001 crops.

Under ARPA, revenue insurance plans will be much more affordable and changes to the Actual Production History (APH) system will help producers suffering multi-year losses retain a reasonable amount of insurance protection. The new APH provisions allow producers to substitute 60 percent of the applicable transitional county average yield (T-yield) when their actual yields are lower than 60 percent of that T-yield. This change can increase yield guarantees and protect producers who have suffered multiple losses by providing more coverage while continuing to assess premiums proportional with the additional risk.

RMA also acted to implement changes to the insurance fee structures required by ARPA and amended the Standard Reinsurance Agreement with reinsured companies to lower the expense reimbursement that private insurance providers receive for servicing catastrophic risk protection policies.

With the first wave of actions completed, RMA has begun implementing many of the more complex and forward-reaching provisions of Title I of ARPA aimed at expanding the crop insurance system, facilitating innovation, and improving program oversight. Currently, RMA offers 114 crop insurance products to the nation's producers.

Recent activities and accomplishments in implementing ARPA include:

Improving Compliance and Integrity

RMA has been working closely with FSA to address training of FSA personnel, consulting with FSA State Committees, claims audit and fraud referral procedures, and data reconciliation. As required by ARPA, a coordinated implementation plan was developed and signed by the Secretary on January 12, 2001, and presented to the crop insurance industry on January 18, 2001. Joint RMA/FSA teams were then expanded to include 23 participants from the reinsurance companies.

RMA plans to spend approximately \$2.25 million in fiscal year 2001 to provide anti-fraud and loss adjustment training to about 2,500 State and county FSA personnel. The first phase of training FSA State Office personnel in compliance and loss adjustment procedures was held in late March. In April, the training of FSA county personnel kicked off in several locations around the country; this training will continue through June, 2001. In fiscal year 2002, training will continue with updating of information and re-certification of participants.

The team set up to develop internal communications and coordinate procedures for the two agencies met with FSA State Committees in late January, and developed the reporting processes and procedures to follow when consulting on RMA crop insurance policies and procedures. These procedures were developed into a handbook that was distributed in April and is available for viewing on FSA and RMA websites.

In the data mining area, RMA entered into a contract with Tarleton State University to develop systems and technologies to identify indicators of waste, fraud, and abuse. Once the data mining capability is implemented, RMA field offices and FSA county offices will be able to forward potential fraud, waste, and abuse issues to investigative offices. Data management technologies will make compliance verification more accurate, efficient, and timely, thus allowing RMA to oversee a greatly expanded program. In April, strategies were developed for data reconciliation.

To reduce losses through the intentional filing of false or inaccurate claims with the Federal Crop Insurance Corporation (FCIC), Congress has encouraged extensive use of administrative sanctions available through ARPA and other statutes. New data management and referral processes, investigative capabilities, and cooperative efforts with reinsurance companies provide additional resources for identifying potential sanctions and closing cases. ARPA also adds new categories to the sanctions list. Third party program abusers, such as elevator operators, could not be reached

under previous sanctions authorities. Administrative sanctions provide an effective and direct way for FCIC to take action against program abusers.

Research and Development

RMA is currently implementing a number of changes in line with ARPA requirements for greater use of private sector expertise in developing new risk management tools.

The agency has awarded four contracts to help develop new insurance plans for currently insured crops, as well as new crop policies and new types of risk management programs. The contractors will help develop new products using these tentative priorities: Pasture, Rangeland and Forage Program feasibility study; Cost of Production Pilot Program; Revenue Coverage Plans study; Multi-Year Coverage study; California Fresh Vegetables; Cotton Quality Adjustment; Cotton Boll Weevil Eradication study; Tropical Crops and Trees; Coverage for Direct-Marketed Crops; Organic Crops study; and Silage Sorghum Program (insurance of dual-purpose sorghum harvested as silage). RMA also has a cooperative agreement with the University of Alaska Fairbanks Agricultural and Forestry Experiment Station to conduct initial research into the feasibility of developing a risk management strategy for wild sockeye salmon that addresses the economic needs of Bristol Bay fishermen.

New Pilot Programs

A Raspberry/Blackberry Crop Insurance Pilot Program will be implemented effective with the 2002 crop year in 7 counties in California, Oregon, and Washington.

Should the study on wild sockeye salmon indicate that it is indeed feasible to develop an insurance product addressing the economic needs of Alaskan fishermen, development will begin in fiscal year 2002.

A Livestock Risk Protection Program has been developed by a private insurance company and presented to the FCIC Board; approval is pending further development.

Education and Risk Management Assistance

To expand risk management education and provide special emphasis to under-served regions, RMA is funding producer education initiatives through the Cooperative State Research, Education, and Extension Service on the full range of risk management activities. These include futures, options, agricultural trade options, crop insurance, cash forward contracting, debt reduction, production diversification, farm resources risk reduction, and other risk management strategies.

With input from regional universities, State departments of agriculture, grower organizations, crop insurance and farm credit businesses, and other USDA offices, RMA is implementing a 5-year strategic plan and one-year action plan outlining the direction and focus of risk management education plans and activities for 15 under-served States. The program will be delivered primarily through these private partners, allowing RMA to leverage Federal funding with the resources and local expertise of these groups. A key initial focus is encouraging the use of the Adjusted Gross Revenue (AGR), or "whole farm" insurance in these areas. As of April 13, approximately 150 AGR policies have been sold in 11 under-served Northeast States.

In addition, RMA is implementing plans which target producers of specialty crops and under-served commodities. RMA continues to partner with public and private sector organizations which have the capacity to reach these producers with local level educational programs such as workshops and training sessions. During fiscal year 2000, 30,095 producers attended 858 RMA-coordinated risk management education sessions offered throughout the nation. For fiscal year 2001, it is estimated that 50,000 producers will attend 1,500 planned risk management education sessions to be held across the country for targeted producers and education partners.

Options Pilot Program

RMA announced a major expansion of the Dairy Options Pilot Program (DOPP), the innovative cost-sharing program that helps dairy farmers put a "floor" under the price they receive for milk using the options markets. USDA subsidizes both premiums and brokerage fees for participating dairy farmers. USDA will spend about \$24 million over the next 2 years expanding this program from 61 counties to 300 counties in 39 States.

Rounds I and II of DOPP have been completed and Round III will be conducted in fiscal year 2001. It is estimated that in Round III, which will include counties/States from Rounds I and II, plus an additional 176 counties, 14,000 producers will participate in the training and purchase an estimated 6,000 milk Put options.

Electronic Availability of Crop Insurance Information

RMA has received from each of the insurance providers the required E-business Implementation plan in response to the Freedom to E-File Act. These plans are currently being reviewed and evaluated.

Improved Storage & Management of Livestock and Poultry Waste

RMA is in the process of finalizing a cooperative agreement with America's Clean Water Foundation to study market-based mechanisms to assist producers with improved storage and management of livestock and poultry waste. The estimated \$1.7 million study will describe livestock and poultry handling and storage systems, failures in these systems and associated costs. The study also will identify existing market-oriented mechanisms that may be applied to assist producers to better manage the handling and storage of animal waste, and mitigate the environmental damages caused by system failures.

Management of Corporation

ARPA restructured the composition of the FCIC Board of Directors, increased Board membership from 7 to 10, established a term of office, and required the appointment of 6 private sector members.

ARPA also requires the Board to establish procedures for use in reviews of policies, plans of insurance, and related materials by independent reviewers and to contract with at least 5 persons to review each program. New products under review and Board consideration include a Livestock Risk Protection Program, a Timber Crop Coverage Program, and a Group Risk Protection Program. The Board also directed FCIC to conduct a study of localized prevented planting problems and to develop guidelines and proposed modifications to existing prevented planting provisions.

Administrative and Operating Expenses

In fiscal year 2002, discretionary account expenses are estimated to increase by \$9.3 million from the fiscal year 2001 level of \$65.5 million. The increase includes \$7.9 million for improvements in information technology systems, such as data mining, e-commerce, and data storage. These changes are needed to meet RMA's changing responsibilities resulting from the implementation of ARPA, particularly with regard to improved compliance and Internet applications for producers to purchase crop insurance on-line.

FCIC Fund

The fiscal year 2002 budget for the FCIC Fund proposes an estimated \$232.3 million increase in program spending over the fiscal year 2001 estimate of \$2.8 billion.

Premium subsidy is expected to increase to \$1.9 billion due, in part, to an estimated increase in participation. The increase in premium subsidy, of which \$190.2 million of the increase is for CAT and \$1.7 billion is for additional coverage, will enable us to provide producers a more cost-effective means of managing their risk.

Delivery expenses or administrative and operating expense reimbursements provided to approved insurance providers, are based on 24.5 percent of the estimated total premium for most non-CAT policies for fiscal year 2002 in accordance with the Agricultural Research, Extension, and Education Reform Act of 1998. As a result of increased total premium, RMA anticipates delivery expenses will amount to \$677.8 million, compared with the fiscal year 2001 estimate of \$461.2 million. The increase reflects increased program participation.

The fiscal year 2002 mandatory funding for ARPA initiatives is \$58 million, a decrease of \$9.5 million below the fiscal year 2001 estimates. The \$58 million includes \$3.5 million for improving program compliance and integrity; \$30 million for research and development; \$11 million for pilot programs for livestock and wild salmon; \$10 million for education and risk management assistance, and \$3.5 million for policy consideration and implementation.

FOREIGN AGRICULTURAL SERVICE (FAS)

The Foreign Agricultural Service administers a variety of export promotion, food assistance and foreign market development programs. The FAS mission is to serve U.S. agriculture's international interests by expanding export opportunities for U.S. agricultural, fish, and forest products and promoting world food security.

U.S. Trade Prospects

U.S. agricultural exports rebounded to \$50.9 billion in fiscal year 2000, an increase of \$1.7 billion over 1999. FAS expects this trend to continue in fiscal year 2001, with agricultural exports forecast to reach \$53 billion, up \$2.1 billion over

2000. Much of the gain is expected in Asia, as that region's economies continue to improve from the financial crisis of 1997-99. Export prospects are promising in both value and volume terms for most major commodities, including corn, wheat, soybeans, soybean meal, livestock products, and horticultural products.

FAS Program Activities

To support the goal of expanding export opportunities for our nation's producers and agribusinesses, FAS continues to use long-standing export programs vigorously. For example, the export credit guarantee programs facilitated sales of more than \$3 billion in U.S. agricultural products last year.

The GSM-102 program helped U.S. exporters register sales of more than \$400 million to Indonesia despite that country's economic uncertainties. The program helped U.S. exporters continue to develop markets in the Andean region, with U.S. sales of over \$122 million worth of feed grains and \$100 million of wheat.

The GSM-103 program helped U.S. exporters sell over \$13 million worth of wheat to Jordan and to re-enter the grain market in Tunisia with sales of \$9 million.

The Supplier Credit Guarantee Program was used for the first time by importers in West Africa and Central America, resulting in sales of over \$18 million to buyers in the West Africa Region, and about \$14.5 million to buyers in Central America.

The first guarantee was issued under the Facility Guarantee Program for a project to improve a grain elevator in the port of Veracruz, Mexico. When this project is completed, the facility will increase its capacity to import bulk grains from 5,000 to 20,000 tons per hour. It is expected to handle nearly 19 million tons of grain between 2000 and 2004, with about 87 percent of it coming from the United States.

With the aid of the Dairy Export Incentive Program (DEIP), U.S. exporters sold more than 95,000 tons of dairy products in fiscal year 2000. The Commodity Credit Corporation awarded more than \$78 million in bonuses to help U.S. dairy exporters meet prevailing world prices and develop foreign markets.

Use of the Export Enhancement Program was limited in 2000 because of market conditions, with bonuses of about \$1.6 million awarded for sales of more than 2,500 tons of frozen poultry.

We continue to stress the importance of market development. In 2000, FAS allocated \$90 million to 65 U.S. trade organizations, State regional groups, and cooperatives for export promotion activities under the Market Access Program (MAP), and allocated \$27.5 million to 25 trade organizations under the Foreign Market Development (FMD) program.

FAS introduced 735 Cochran Fellows from over 75 countries to U.S. products and policies in 2000. These Fellows met with U.S. agribusiness; attended trade shows, policy and food safety seminars; and received technical training related to market development. The Cochran Fellowship Program provides USDA with a unique opportunity to educate foreign governments and private sectors not only about U.S. products, but also about U.S. regulations and policies on critical issues such as food safety and biotechnology.

On the trade policy front, USDA works to open, expand, and maintain markets for U.S. agriculture. FAS was a key player in the successful launch of negotiations in March 2000 to further liberalize global agricultural trade under the World Trade Organization (WTO). In June 2000, the United States presented its comprehensive proposal to establish a framework for the new agricultural negotiations.

FAS continues to monitor aggressively foreign countries' compliance with Uruguay Round Agreement commitments. In calendar year 2000, the United States raised significant compliance issues with other WTO members, addressing policies that affected about \$450 million in U.S. agricultural trade.

To support both our export mission and our food security mission, FAS has used food aid to move commodities from the U.S. marketplace to needy people around the world.

Over the past two years (Fiscal Year 1999 and fiscal year 2000 food aid programs), FAS programmed more than 12 million metric tons in food aid to help feed millions of hungry people in more than 80 countries around the world—from the unprecedented assistance package for Russia to food relief for Kosovo refugees, famine victims in North Korea, and hurricane victims in Central America and the Caribbean. Total U.S. contributions accounted for more than 75 percent of total global emergency food aid to the Horn of Africa this past year, helping to avert large-scale starvation.

Under the authority of section 416(b) of the Agricultural Act of 1949, as amended (Section 416), the Commodity Credit Corporation (CCC) donated about \$500 million worth of commodities in fiscal year 2000, including about 2.6 million tons of wheat and wheat products, 168,000 tons of corn, 141,000 tons of rice, 130,000 tons of soy-

bean oil, and 26,000 tons of dry milk. These U.S. surpluses were put to good use, helping to relieve hunger and suffering abroad.

Concessional sales under Public Law 480, Title I, totaled about 1 million metric tons in fiscal 2000, including 500,000 metric tons of U.S. corn, 163,000 tons of soybean meal, more than 150,000 tons of wheat, and 135,000 tons of rice, among other products. These commodities, valued at an estimated \$157 million, went to eight countries. Another 413,000 tons of various U.S. commodities were donated to 12 countries under the Food for Progress program, with Title I-funded Food for Progress donations accounting for almost two-thirds of this tonnage.

In addition, FAS has undertaken a pilot Global Food for Education (GFE) Initiative. Under this year's \$300 million pilot, USDA is donating approximately 630,000 metric tons of surplus U.S. agricultural commodities for use in school feeding and pre-school nutrition projects in 38 developing countries. School feeding programs help will reach 9 million children, using donated corn, rice, soybeans, soybeans and vegetable oil, wheat products and nonfat dry milk.

In addition to food aid activities, FAS continues to serve as the coordinator for the U.S. Government's food security committee. Last September, the agency issued a national food security progress report that outlines how the United States is working to address our international and domestic food security goals.

Priorities for 2001 and 2002

Faced with competing demands for budgetary resources, a strong U.S. dollar and continued aggressive spending on market promotion by our competitors, USDA must redouble its efforts to improve the outlook for U.S. agricultural exports.

Topping the list of priorities for this year is moving forward in the multilateral trade negotiations on agriculture under the WTO. As part of the negotiating process, the U.S. must engage the developing world in the creation and implementation of appropriate trading rules and guidelines. This undertaking will take time, but it will be worth the investment. These countries represent our future growth markets. If we are to realize our goal of liberalizing trade through multinational bodies such as the WTO, we cannot ignore the concerns of developing countries, which make up the majority of WTO members.

FAS will continue to work with the countries that would like to join the WTO. While membership in the WTO is a high priority, we will continue to insist that these accessions be made on commercially viable terms that provide trade and investment opportunities for U.S. agriculture. This means that acceding countries, such as China, will need to implement trade policies and regulations that are fully consistent with WTO rules and obligations.

Another important area of work for FAS is the negotiation to establish the Free Trade Area of the Americas (FTAA). The FTAA is intended to be a comprehensive free trade agreement between the 34 democracies in the Western Hemisphere. Negotiations began in 1998 and are expected to conclude by 2005. By concluding the FTAA, the U.S. will gain liberalized access to a region of 675 million people with a combined consumer buying power of \$1.5 trillion.

FAS also is actively participating in the Asia Pacific Economic Cooperation (APEC) forum. Asia represents an important market for U.S. agriculture, and FAS is working with other APEC members to promote economic policies in the region to moderate economic shocks like the Asian economic crisis of 1997-98. We expect APEC to serve as the launching point for promoting continued trade liberalization within the region and in the WTO.

Another priority is how we deal with the trade issues surrounding products produced through biotechnology. Today's market environment for biotech products is unsettled. The demand by some users for non-biotech commodities only, the resulting calls for segregation by some handlers, and the indications that premiums and discounts may be appearing for non-biotech vs. biotech commodities are bound to have an effect on farmers' planting decisions.

This issue is likely to be a dominant one for U.S. agriculture in the immediate years ahead, whether in the WTO or in our bilateral relationships with customer and competitor nations alike. Our focus will be in making sure that biotech approval regimes, wherever they exist, are transparent, timely, predictable, and science-based.

FAS also will be working to improve the way we carry out our market development programs. The agency is currently in the process of refining its global marketing strategy that will target markets that offer the most growth opportunity. This will require a thorough evaluation of the U.S. opportunities and challenges in those markets, and close coordination with private industry partners. In the next 10 years, the growth markets are likely to be the developing countries in Asia (especially China and South East Asia, and possibly India) and Latin America. Gaining

market share in these high-growth markets is the most effective way to increase market share globally.

The global marketing strategy is also instrumental in the agency's ongoing review of overseas office locations and staffing. FAS is committed to strengthening overseas staffing to ensure that the United States is positioned to take advantage of the market opportunities created by market access initiatives as well as new opportunities offered by emerging growth markets.

Alleviating hunger and malnutrition in the world also presents a significant challenge. The global marketing strategy includes identifying the food security challenges that currently exist and are likely to emerge over the next decade. FAS will continue to use USDA's food aid programs to help developing countries meet their food needs.

Administrative and Operating Expenses

The fiscal year 2002 budget proposes a funding level of \$125.8 million for FAS. This represents an increase of \$6.4 million from this fiscal year and supports several important agency initiatives.

First, in order to strengthen the agency's market intelligence capabilities at our overseas posts, \$2.7 million is requested to provide additional support in 14 overseas locations where workload demands have become acute, including China, the Philippines, Colombia, Argentina, Thailand, and Turkey. This action will enable FAS to focus on the government policies and issues that can affect the competitiveness of U.S. exports, particularly competitor activities within that market, host country compliance with trade rules, and the formation of cooperative links for the upcoming WTO trade round.

An additional \$750,000 and 10 additional staff years are requested to improve FAS' ability to address and resolve technical trade issues. Technical trade issues, such as those related to food safety and biotechnology, have become the fastest growing and most sensitive trade issues in U.S. agriculture today. FAS is responsible for assuring regulatory actions taken by our trading partners do not impede our exports and comply with the WTO sanitary and phytosanitary disciplines.

Export Programs

For export programs, the fiscal year 2002 budget includes the following:

Export Credit Guarantee Programs.—The budget includes a projected overall program level of \$3.9 billion for export credit guarantees in fiscal year 2002. As in previous years, the budget estimates reflect actual levels of sales expected to be registered under the programs rather than authorized program levels. Of the total program level, \$3.4 billion will be made available under the GSM-102 program and \$100 million will be made available under the GSM-103 program. For supplier credit guarantees, the budget includes an estimated program level of \$330 million and an estimated program level of \$95 million for facility financing guarantees.

Foreign Market Development.—The fiscal year 2002 budget includes CCC funding of \$27.5 million for the Foreign Market Development (Cooperator) Program and \$2.5 million for the Quality Samples Program, both unchanged from this year. Under the Quality Samples Program, samples of U.S. agricultural products are provided to foreign importers in order to overcome trade and marketing barriers. This program is carried out through commodity organizations and agricultural trade associations.

Market Access Program (MAP).—The budget provides funding for MAP in 2002 at the maximum authorized level of \$90 million, unchanged from fiscal year 2001. Under MAP, CCC funds are used to reimburse participating organizations for a portion of their costs of carrying out overseas marketing and promotional activities.

Public Law 480.—For fiscal year 2002, the budget includes a total program level for all titles of Public Law 480 food assistance of \$995 million, which is expected to provide approximately 2.7 million metric tons of commodity assistance. In the case of Public Law 480 Title I credit sales, appropriated funding has been continued at the fiscal year 2001 level. However, the Title I credit level is reduced due to higher estimated subsidy costs for the program which result from changes in assumed county allocations and financial terms.

Export Enhancement Program (EEP).—World supply and demand conditions have limited EEP programming in recent years. However, the fiscal year 2002 budget does include a program level of \$478 million for the EEP, the maximum level authorized, and the awarding of EEP bonuses can be resumed whenever market conditions warrant.

Dairy Export Incentive Program (DEIP).—The budget assumes a DEIP program level of \$42 million for fiscal year 2002, slightly above the fiscal year 2001 estimate of \$34 million. These levels are reduced from those of recent years. A major factor in the decline is the sharp drop since 1999 in the average subsidy rate for nonfat

dry milk, the largest category of dairy products exported under DEIP. This development reflects higher world prices for nonfat dry milk and greater competitiveness for U.S. product in world markets.

The future offers continued opportunity for expansion of U.S. agricultural exports and trade. Strengthening our ability to compete globally has the direct payoff of increasing farm incomes and supporting rural economies.

Mr. Chairman, this concludes my statement. I will be glad to answer any questions.

PREPARED STATEMENT OF PHYLLIS W. HONOR

Mr. Chairman and members of the Subcommittee, I am pleased to testify in support of the President's fiscal year 2002 budget for the Risk Management Agency (RMA). The first year of the new millennium was a very good one for RMA and the farmers we serve. During it, we provided farmers approximately \$34.3 billion of protection on nearly 205 million acres through 1.3 million policies. Loss payments to hard hit farmers totaled almost \$2.5 billion. Further, with crop insurance guaranteeing a minimum, farmers across the nation were able to obtain operating loans and market their crops more aggressively.

Building upon the increased levels of participation in recent years—Congress passed the Agricultural Risk Protection Act of 2000 (ARPA). Title I of that law contains a five-year, \$7 billion initiative to make higher levels of protection more affordable and useful to producers, provide better protection to farmers suffering multi-year losses, expand risk management education opportunities, stimulate development of new risk management products, and improve program integrity.

Within days of enactment last June, RMA issued a package of administrative actions that lowered 2001 farmer-paid premiums and implemented other key provision of the new legislation. Most of these changes were finalized by RMA before the June 30 contract change date for fall-planted crops. As a result, farmers planting crops last fall immediately benefitted from higher levels of protection at less cost.

Under ARPA, revenue insurance plans will be much more affordable because premium subsidy now applies to both yield and price risks covered by the policy. Prior to the new law, producers paid 100 percent of the rate associated with the price. Further, changes to the Actual Production History (APH) system will help producers suffering multi-year losses retain a reasonable amount of insurance protection. The new APH provisions allow producers to substitute 60 percent of the applicable transitional (county average) yield (T-yield) when their actual yields are lower than 60 percent of that T-yield. This change can increase yield guarantees and protect producers who have suffered multiple losses by providing more coverage while continuing to assess premiums proportional with the additional risk.

RMA also acted to implement changes to the insurance fee structures required by ARPA and amended the Standard Reinsurance Agreement to lower the expense reimbursement that private insurance providers receive for servicing catastrophic risk protection policies.

With the first wave of actions completed, we have begun implementing many of the more complex and forward-reaching provisions of Title I aimed at expanding the crop insurance system, facilitating innovation, and improving program oversight. Some of these will unfold over the next several months, some over the next several years. Today, I would like to highlight our recent progress in implementing ARPA.

—*Improving Program Integrity.*—RMA has been working closely with the Farm Service Agency (FSA) to address training of FSA personnel, consultation with FSA State Committees, claims audit, fraud referrals, and data reconciliation. Five teams were developed to resolve operational details—they focused their tasks on developing internal communications and procedures for the two agencies to work together at the field level. As required by ARPA, a Coordinated Plan for Implementation was developed and signed by Secretary Glickman on January 12, 2001, and presented to the crop insurance industry on January 18, 2001. The teams were then expanded to include insurance company participants.

—RMA plans to spend approximately \$2.25 million over the next year to provide anti-fraud and loss adjustment training to about 2,500 county and State FSA personnel. RMA compliance and oversight training began in late March, and included review of the Consultation, Referrals, and Claims Audit procedures. These procedures were developed into a handbook that will be distributed in April.

—In the data mining area, RMA entered a \$5 million contract with Tarleton State University to develop systems and technologies to identify indicators of

waste, fraud, and abuse. Once the data mining capability is implemented, RMA field offices and FSA county offices will be able to forward potential fraud, waste, and abuse cases to investigative offices. The data management technologies will allow RMA to easily query over 25 million records to assess the need for individual analysis. Data mining will make compliance verification more accurate, efficient, and timely, thus allowing RMA to oversee a greatly expanded program.

—*Research and Development.*—RMA is currently implementing changes in program development required by ARPA. The bill requires the research and development of new risk management programs through partnerships and contracts. A comprehensive training program has been set in motion to provide a series of classes on contracting skills. These classes will give RMA staff needed information and skills to move forward in developing contract vehicles to implement ARPA. RMA is also working to retool its workforce and equip them with the knowledge and skills necessary to be successful in the new culture and way of doing business.

—The training that has been provided to date has already had significant impact on RMA's ability to accomplish tasks via contract. For example, RMA awarded four contracts to help develop new plans of crop insurance for currently insured crops, new crop policies, and new types of risk management programs. The contractors selected will help develop new products using these tentative priorities: Pasture, Rangeland and Forage Program, Cost of Production Policy, Revenue Coverage Plans (report), Multi-Year Coverage (report), California Fresh Vegetables, Cotton Quality Adjustment, Cotton Boll Weevil Eradication (study), Tropical Crops and Trees, Coverage for Direct-Marketed Crops, Organic Crops (report), and Silage Sorghum Program (insurance of dual-purpose sorghum harvested as silage).

—*Dairy Options Pilot Program (DOPP).*—RMA announced a major expansion of DOPP, the innovative cost-sharing program that helps dairy farmers put a “floor” under the price they receive for milk using the options markets. USDA subsidizes both premiums and brokerage fees for participating dairy farmers. USDA will spend about \$24 million over the next two years expanding this program. The program will expand from 61 counties to 300 counties in 39 States. A full list of participating counties is available at www.rma.usda.gov.

—*Education and Risk Management Assistance.*—ARPA provisions include expanding risk management education and providing special emphasis to under-served regions. To comply with the requirements of ARPA, RMA provided \$5 million to the Cooperative State Research, Education, and Extension Service this spring for the purpose of educating agricultural producers about the full range of risk management activities. These activities include futures, options, agricultural trade options, crop insurance, cash forward contracting, debt reduction, production diversification, farm resources risk reduction, and other risk management strategies.

—With input from regional universities, State departments of agriculture, grower organizations, crop insurance and farm credit businesses, and other USDA offices, RMA developed, and is currently implementing, a five-year strategic plan and one-year action plan outlining the direction and focus of risk management education plans and activities for 15 under-served States. The program will be delivered primarily through these private partners, allowing RMA to leverage the effectiveness of Federal funding with the unique resources and local expertise of these groups. A key initial focus was on encouraging the use of the Adjusted Gross Revenue, or “whole farm” insurance in these areas. The announcement by Secretary Glickman of the following 15 under-served States allowed RMA to hit the ground running. The under-served States include: Maine, Vermont, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Delaware, West Virginia, Nevada, Utah, and Wyoming.

—In addition, RMA has developed one-year action and five-year strategic plans which target producers of specialty crops and under-served commodities. RMA has and continues to partner with public and private sector organizations who have the capacity to reach these producers with local level educational programs such as workshops and training sessions.

ADMINISTRATIVE AND OPERATING (A&O) EXPENSES

Discretionary account expenses are estimated to increase by \$9.3 million from the fiscal year 2001 level of \$65.5 million. This increase includes \$2.8 million for data mining, data warehousing, and other data management technologies to increase

compliance and integrity of the crop insurance program; \$1.8 million for training and travel costs related to increased and revised responsibilities of RMA personnel; \$1.6 million for public information and civil rights activities aimed at increasing participation in the crop insurance program of women and minorities, and ensuring that under-served and socially disadvantaged producers have full access to RMA programs; \$1.7 million for information technology data systems to meet additional and increasing demands of the ARPA requirements; and \$1.4 million for pay costs, of which \$351,000 is for the annualization of the fiscal year 2001 pay raise and \$1.1 million is for the anticipated fiscal year 2002 pay raise.

FCIC FUND

The fiscal year 2002 budget for the FCIC Fund proposes an estimated \$232.3 million increase in program spending over the fiscal year 2001 estimate of \$2.8 billion.

Premium subsidy is expected to increase by \$190.2 million due, in part, to an estimated increase in participation. The premium subsidy provided by the Federal government ranges from 38 to 67 percent, depending on coverage levels. The government pays 100 percent of the catastrophic coverage (CAT) premium. The \$1.9 billion in premium subsidy, of which \$232.2 million is for CAT and \$1.7 billion is for additional coverage, assists in providing producers a cost-effective means of managing their risk.

Delivery expenses, or administrative and operating expense reimbursements provided to approved insurance providers, are based on 24.5 percent of the estimated total premium for most non-CAT policies in fiscal year 2002 in accordance with the Agricultural Research, Extension, and Education Reform Act of 1998. As a result of increased total premium, RMA anticipates delivery expenses in the amount of \$677.8 million, compared with the fiscal year 2001 estimate of \$461.2 million.

RMA also expects excess losses, which are based on calculations of increased premium and program losses, to increase by \$48 million to a level of \$408 million. This estimate supports a loss ratio of 1.075 and is authorized under the appropriation language "such sums as may be necessary." Without these funds, which directly support the mission and goal of the Agency, FCIC would be unable to fully fund expected indemnities, thereby weakening producers' safety net.

The fiscal year 2002 budget assumes \$58 million to fund ARPA initiatives. The \$58 million includes funds for: improving program compliance and integrity (\$3.5 million), research and development (\$30 million), pilot programs for livestock and wild salmon (\$11 million), education and risk management assistance (\$10 million), and policy consideration and implementation (\$3.5 million).

CONCLUSION

Congress first authorized Federal crop insurance in the 1930s along with other initiatives to help agriculture recover from the combined effects of the Great Depression and the Dust Bowl. FCIC was created in 1938 to carry out the program and, initially, was started as an experiment. Crop insurance activities were mostly limited to major crops in the main producing areas.

Within the past decade, covered acres have increased from 80 million to over 200 million, from one insurance product to dozens, from a few crops to approximately 120. The program has nearly quadrupled in size. In 1999 and 2000, insurers quickly and efficiently paid out in excess of \$4.8 billion to cover losses of farmers.

At the same time RMA is directing a growing program, we are dramatically changing the way in which we bring new products to market, conduct outreach, and provide oversight. The ARPA has improved the program's ability to be a broad and effective means for producers to manage their production risk. RMA has responded deliberately and methodically to this challenge, and we believe we are well on track to implement the new provisions in a timely and farmer-friendly way. We are committed to providing producers with effective crop insurance coverage at an affordable price. Crop Insurance is one of the tools of a farm safety net that can best help farmers deal with the changing nature of agriculture in the 21st century.

We appreciate your continued support as we transform our Agency and our programs to better serve the risk management needs of the American farmer.

PREPARED STATEMENT OF MATTIE R. SHARPLESS, ACTING ADMINISTRATOR, FOREIGN AGRICULTURE SERVICE

Mr. Chairman, members of the Subcommittee, I appreciate the opportunity to review the work of the Foreign Agricultural Service (FAS) and to present the President's budget request for FAS programs for fiscal year 2002.

U.S. Trade Prospects

U.S. agricultural exports rebounded to \$50.9 billion in fiscal year 2000, an increase of \$1.7 billion over 1999. FAS expects this trend to continue in fiscal year 2001, with agricultural exports forecast to reach \$53 billion, up \$2.1 billion over fiscal year 2000. Much of the gain is expected in Asia, as that region's economic growth continues to rebound from the financial crisis of 1997-99. Export prospects are promising in both value and volume terms for most major commodities, including corn, wheat, soybeans, soybean meal, livestock products, and horticultural products.

The FAS mission remains constant: we are committed to expanding export opportunities for U.S. agricultural, fish, and forest products, and to helping in the alleviation of world hunger and food insecurity. Given today's budgetary environment, these goals must be accomplished through better public/private sector collaboration, strategic planning, greater use of technology, and resource management.

FAS Program Activities

To support our goal of expanding export opportunities for U.S. agricultural, fish, and forest products, we continue to use our long-standing export programs vigorously. For example, the export credit guarantee programs facilitated sales of more than \$3 billion in U.S. agricultural products last year. The GSM-102 program helped U.S. exporters register sales of more than \$400 million to Indonesia despite that country's economic uncertainties. The program helped U.S. exporters continue to develop markets in the Andean region, with U.S. sales of over \$122 million worth of feed grains and \$100 million of wheat. The GSM-103 program helped U.S. exporters sell over \$13 million worth of wheat to Jordan and to re-enter the grain market in Tunisia with sales of \$9 million. The Supplier Credit Guarantee Program was used for the first time by importers in West Africa and Central America, resulting in sales of over \$18 million to buyers in the West Africa Region, and about \$14.5 million to buyers in Central America. The first guarantee was issued under the Facility Guarantee Program for a project to improve a grain elevator in the port of Veracruz, Mexico. When this project is completed, the facility will increase its capacity to import bulk grains from 5,000 to 20,000 tons per hour. It is expected to handle nearly 19 million tons of grain between fiscal year 2000 and fiscal year 2004, with about 87 percent of it coming from the United States.

With the aid of the Dairy Export Incentive Program (DEIP), U.S. exporters sold more than 95,000 tons of dairy products in fiscal year 2000. The Commodity Credit Corporation awarded more than \$78 million in bonuses to help U.S. dairy exporters meet prevailing world prices and develop foreign markets. Use of the Export Enhancement Program was limited in 2000 because of market conditions, with bonuses of about \$1.6 million awarded for sales of more than 2,500 tons of frozen poultry.

We continue to stress the importance of market development. In 2000, we allocated \$90 million to 65 U.S. trade organizations, State regional groups, and cooperatives for export promotion activities under the Market Access Program (MAP), and allocated \$27.5 million to 25 trade organizations under the Foreign Market Development (FMD) program.

The Cochran Fellowship Program provides USDA with a unique opportunity to educate foreign governments and private sectors, not only about U.S. products, but also about U.S. regulations and policies on critical issues such as food safety and biotechnology. FAS introduced 735 Cochran Fellows from over 75 countries to U.S. products and policies in 2000. These Fellows met with U.S. agribusinesses; attended trade shows, policy and food safety seminars; and received technical training related to market development.

On the trade policy front, USDA works to open, expand, and maintain markets for U.S. agriculture. FAS was a key player in the successful launch of negotiations in March 2000 to further liberalize global agricultural trade under the World Trade Organization (WTO). In June 2000, the United States presented its comprehensive proposal to establish a framework for the new agricultural negotiations. In June 2000, the United States tabled a credible and well-received comprehensive proposal which called for the substantial reduction of tariffs and trade-distorting domestic support, and the elimination of export subsidies.

FAS continues to monitor aggressively foreign countries' compliance with Uruguay Round Agreement commitments. In calendar year 2000, the United States raised significant compliance issues with other WTO members, addressing policies that affected about \$450 million in U.S. agricultural trade.

To support both our export mission and our food security mission, we have used food aid to move commodities from the U.S. marketplace to needy people around the world.

Over the past two years (fiscal year 1999 and fiscal year 2000 food aid programs), FAS programmed more than 12 million metric tons in food aid to help feed millions of hungry people in more than 80 countries around the world—from the unprecedented assistance package for Russia to food relief for Kosovo refugees, famine victims in North Korea, and hurricane victims in Central America and the Caribbean. Total U.S. contributions accounted for more than 75 percent of total global emergency food aid to the Horn of Africa this past year, helping to avert large-scale starvation.

Under the authority of Section 416(b) of the Agricultural Act of 1949, as amended (Section 416), the Commodity Credit Corporation (CCC) donated about \$500 million worth of commodities in fiscal year 2000, including about 2.6 million tons of wheat and wheat products; 168,000 tons of corn; 141,000 tons of rice; 130,000 tons of soybean oil; and 26,000 tons of non-fat dry milk. These U.S. surpluses were put to good use, helping to relieve hunger and suffering abroad.

Concessional sales under Public Law 480, Title I, totaled about 1 million metric tons in fiscal year 2000, including 500,000 metric tons of U.S. corn; 163,000 tons of soybean meal; more than 150,000 tons of wheat; and 135,000 tons of rice, among other products. These commodities, valued at an estimated \$157 million, went to eight countries. Another 413,000 tons of various U.S. commodities were donated to 12 countries under the Food for Progress program, with Title I-funded Food for Progress donations accounting for almost two-thirds of this tonnage.

In addition, we have undertaken a pilot Global Food for Education (GFE) Initiative. This year, USDA is donating approximately 630,000 metric tons of surplus U.S. agricultural commodities for use in school feeding and pre-school nutrition projects in developing countries. School feeding programs help assure that children attend and remain in school, improve childhood development and achievement, and thereby contribute to more self-reliant, productive societies.

In addition to our food aid activities, FAS continues to serve as the coordinator for the U.S. Government's food security committee. Last September, we issued a national food security progress report that outlines how the United States is working to address our international and domestic food security goals.

Priorities for fiscal year 2001 and fiscal year 2002

Faced with competing demands for budgetary resources, a strong U.S. dollar and continued aggressive spending on market promotion by our competitors, we must redouble our efforts to improve the outlook for U.S. agricultural exports. For this year, we plan to continue to:

- Pinpoint constraints to exports of U.S. agricultural, fish, and forest products;
- Work to remove trade barriers and trade-distorting practices;
- Safeguard U.S. agricultural interests by advocating strongly U.S. policies in the international community;
- Help producers, processors, and exporters to strengthen their export knowledge and skills;
- Ensure that the U.S. farm, forest and fishery sectors have timely and complete intelligence about emerging market opportunities;
- Inform foreign buyers about the superior quality and reliable quantities of agricultural products offered by U.S. producers, and educate them about how to locate U.S. products;
- Use our export credit guarantee programs to reach new customers for U.S. agriculture;
- Use our food aid authorities to help hungry people overseas and farmers here at home;
- Use USDA export assistance programs, such as the Foreign Market Development Program and the Market Access Program, effectively to pursue export opportunities; and
- Work with emerging markets and developing countries to promote economic development to help meet the U.S. commitment to reduce by half the number of food insecure persons by 2015.

I would like to take a few moments to discuss our top priorities for fiscal years 2001 and 2002.

At the top of our list is moving forward in the multilateral trade negotiations on agriculture under the WTO. With the submission of our comprehensive proposal last June, the United States has taken a leading role in the WTO negotiations underway in Geneva. The WTO multilateral negotiations are the best place to address needed reforms in world agriculture because it is only in the WTO that we have broad disciplines on market access, subsidies, and technical measures.

As part of the negotiating process, we must engage the developing world in the creation and implementation of appropriate trading rules and guidelines. This un-

dertaking will take time, but it will be worth the investment. These countries represent our future growth markets. If we are to realize our goal of liberalizing trade through multinational bodies such as the WTO, we cannot ignore the concerns of developing countries, which make up the majority of WTO members.

We also will continue to work with the countries that would like to join the WTO. While membership in the WTO is a high priority, we will continue to insist that these accessions be made on commercially viable terms that provide trade and investment opportunities for U.S. agriculture. This means that acceding countries will need to implement trade policies and regulations that are fully consistent with WTO rules and obligations.

China is a perfect illustration of this strategy. Although we are pleased with the U.S.-China accession agreement, and with China's bid for WTO accession nearing completion, soon our work will shift toward implementation of the agreements. Chinese concessions will be important for improved access opportunities; but we must remain vigilant and work with Chinese officials to ensure market opening.

With more than 1.2 billion people, or one-fifth of the world's population, China's accession to the WTO will give U.S. agriculture access to the world's second largest economy in terms of domestic purchasing power. This could result in at least \$2 billion in additional U.S. agricultural exports by 2005.

China's WTO accession will strengthen the global trading system, slash barriers to U.S. agriculture, give U.S. farmers and agribusinesses stronger protection against unfair trade practices and import surges, and create a more level and consistent playing field in this market.

In order to realize these gains, we will be vigilant to ensure that China lives up to its WTO commitments, effectively administers tariff-rate quotas, eliminates discriminatory licensing, and fully implements the Agricultural Cooperation Agreement reducing phytosanitary barriers for citrus, wheat, and meat.

Another important area of work for FAS is the negotiation to establish the Free Trade Area of the Americas (FTAA). The FTAA is intended to be a comprehensive free trade agreement between the 34 democracies in the Western Hemisphere. Negotiations began in 1998 and are expected to conclude by 2005. By concluding the FTAA, the United States will gain liberalized access to a region of 675 million people with a combined consumer buying power of \$1.5 trillion.

For several years now, the other countries in this hemisphere have been removing trade barriers to each other's trade. There are currently more than 30 reciprocal trade agreements in the hemisphere. The United States is a participant in only one, the North American Free Trade Agreement (NAFTA). USDA's analysis shows that if the United States remains outside of this process, our agricultural exports to the region will be displaced by other hemispheric suppliers at a cost of about \$200 million a year. On the other hand, U.S. participation in these agreements could mean an increase in agricultural exports of around \$750 million annually. However, this negotiation will be particularly challenging since the Latin American countries are also major agricultural exporters.

We also are actively participating in the Asia Pacific Economic Cooperation (APEC) forum. Asia represents an important market for U.S. agriculture; and we are working with other APEC members to promote economic policies in the region to moderate economic shocks like the Asian economic crisis of 1997-98. We expect APEC to serve as the launching point for promoting continued trade liberalization within the region and in the WTO and we will be working through the APEC food system to realize this goal.

Another priority is how we deal with the issues surrounding products produced through biotechnology. There is a lot to say about what is happening in the biotechnology field and how it is affecting trade. I could go on at length to describe our efforts at USDA to try to stay on top of the issue or to ensure that government actions on labeling and product approval in Japan, the European Union, Korea, Australia, New Zealand, and elsewhere, do not lead to irrational policies that reduce market access for U.S. commodities.

But I believe that events of the past year have resulted in an environment for biotech products that is as unsettled as it has ever been during the short commercial life of this new technology. The demand by some users for non-biotech commodities only, the resulting calls for segregation by some handlers, and the indications that premiums and discounts may be appearing for non-biotech vs. biotech commodities are bound to have an effect on farmers' decisions regarding what to plant next year.

This issue is likely to be a dominant one for U.S. agriculture in the immediate years ahead, whether in the WTO or in our bilateral relationships with customer and competitor nations alike. That is why we have said that when it comes to biotechnology and the next trade round, our focus will be in making sure that biotech

approval regimes, wherever they exist, are transparent, timely, predictable, and science-based.

We also will be working to improve the way we carry out our market development programs. FAS is currently in the process of refining its global marketing strategy that will target those markets that offer the most growth opportunity. To capture the opportunities and address the challenges that lie ahead, FAS needs to build on the considerable progress it has made in the past three and a half years in implementing strategic planning at all levels of the Agency.

We must protect our hard-won gains in mature markets of Western Europe and Japan, and at the same time, set aggressive but achievable growth targets in those markets that offer the most potential. This will require a thorough evaluation of the U.S. opportunities and challenges in those markets, and close coordination with our private industry partners to turn the opportunities to our advantage and the challenges into opportunities. In the next 10 years, the growth markets are likely to be the developing countries in Asia (especially China and South East Asia, and possibly India) and Latin America. Gaining market share in these high-growth markets is the most effective way to increase market share globally.

Our global marketing strategy is also instrumental in our ongoing review of our overseas office locations and staffing. We must continue to strengthen our staffing in FAS overseas offices to ensure that we are positioned to take advantage of the market opportunities created by our market access initiatives as well as new opportunities offered by emerging growth markets.

Alleviating hunger and malnutrition in the world also presents a significant challenge. One means to ensure this issue is addressed appropriately is to identify within the global marketing strategy the food security challenges that currently exist and are likely to emerge over the next decade. We will continue to use our food aid programs to help developing countries that lack the financial means to meet their food needs.

Budget Request

After three consecutive years of essentially straight-lined budgets, we appreciate the increases provided in the fiscal year 2001 appropriation for FAS. The net increase of just under \$6.0 million allows FAS to fund fiscal year 2001 pay cost increases fully and partially cover higher overseas operating costs. Additionally, FAS is able to add 15 staff years for food aid and monetization activities, as well as increase our overseas staff in Ukraine and the Balkans.

We believe the future offers continued opportunity for the expansion of U.S. agricultural exports. Strengthening our ability to compete globally has the direct payoff of increased farm income for America's farmers and ranchers and the continued economic development of rural communities. Our fiscal year 2002 request builds on the foundation provided by this Committee in fiscal year 2001.

Mr. Chairman, the fiscal year 2002 budget proposes a funding level of \$125.8 million for FAS. This represents an increase of \$6.4 million and supports several important agency initiatives.

First, in order to strengthen the agency's market intelligence capabilities at our overseas posts, \$2.7 million is requested to place 3 new American officers and 27 new foreign service nationals on Personal Services Agreements (PSAs) in 14 overseas locations where workload demands have become acute. Over the past several years, FAS overseas offices have experienced dramatic increases in workload, particularly that associated with complex trade policy, sanitary and phytosanitary, and food security issues. Meeting these priority workload demands, in addition to regular commodity reporting, marketing, and representation functions, has overwhelmed the capacity of many of our offices in important geographic areas.

As an example, under the bilateral agreement reached with China relating to its accession to the WTO, U.S. agriculture should have increased access for a range of products with lowered tariffs, as I mentioned earlier. However, existing staff is overwhelmed with requests for commodity and market intelligence, intervention on sanitary and phytosanitary (SPS) issues, and official and commercial visitors. FAS has assigned an officer to monitor the agreement, but has no marketing officer ready to identify potential opportunities and work with the private sector to take advantage of them. Currently, FAS simply lacks the staff resources needed to handle these opportunities—a situation repeated in numerous locations around the world.

The PSAs would assume a greater portion of core office responsibilities, thus allowing FAS Agricultural Counselors and Attaches more flexibility to focus on the government policies and issues that can affect the competitiveness of U.S. exports, particularly competitor activities within that market, host country compliance with existing trade rules, and the formation of cooperative links for the upcoming WTO trade round. Increased resources will be directed to China, Philippines, Canada, Co-

lombia, Thailand, Israel, Turkey, El Salvador, Korea, Brazil, Russia, Argentina, Nigeria and India.

Second, the budget requests \$750,000 and 10 additional staff years to improve FAS' ability to address and resolve technical trade issues. Technical trade issues, such as the commercialization of food products produced using biotechnology, have become the fastest growing and most sensitive trade issues in U.S. agriculture today and is one of the Agency's key priorities that I mentioned earlier. In addition to biotechnology, U.S. agriculture and our exporters are facing other critical challenges related to technical issues associated with food safety, changing production methods to address environmental concerns, the growing global concern over Bovine Spongiform Encephalopathy (BSE) or mad cow disease, and the expansion of foot and mouth disease. In all cases, FAS is responsible for ensuring regulatory actions taken by our trading partners do not impede our exports and comply with the WTO SPS disciplines. However, existing staff levels only allow FAS to react, on a piecemeal basis, to immediate issues such as StarLink and the BSE outbreak in the European Union.

The additional 10 staff years requested will allow FAS to develop a cohesive strategy for addressing technical market access issues in current major markets and facilitating our entry into newer growth markets. Among other things, staff will be dedicated to developing a strategy for building a coalition of countries important to negotiations and discussions in international organizations. This represents an opportunity to avoid future market access issues by establishing relationships with appropriate government departments and officials. Developing a core group of countries with similar approaches to food safety and biotechnology will be crucial to the United States meeting its goals in international fora.

Finally, the budget includes \$2.9 million to fund projected pay cost increases in fiscal year 2002. Budget constraints forced FAS to absorb pay costs in three of the past four fiscal years. Absorption of these costs in fiscal year 2002 would constrain programs.

Export Programs

Mr. Chairman, the export promotion, food assistance and foreign market development programs administered by FAS are key to expanding global market opportunities for U.S. agricultural producers. Our program proposals provide the tools to meet these new sales opportunities.

Export Credit Guarantee Programs.—The budget includes a projected overall program level of \$3.9 billion for export credit guarantees in fiscal year 2002. As in previous years, the budget estimates reflect actual levels of sales expected to be registered under the programs rather than authorized program levels. Of the total program level, \$3.4 billion will be made available under the GSM-102 program and \$100 million will be made available under the GSM-103 program. For supplier credit guarantees, the budget includes an estimated program level of \$330 million and an estimated program level of \$95 million for facility financing guarantees.

Foreign Market Development.—The fiscal year 2002 budget includes Commodity Credit Corporation (CCC) funding of \$27.5 million for the Foreign Market Development (Cooperator) Program, unchanged from last year. The CCC estimates also include \$2.5 million in funding from CCC for the Quality Samples Program. Under this program, samples of U.S. agricultural products are provided to foreign importers in order to overcome trade and marketing barriers by promoting a better understanding and appreciation of the high quality characteristics of U.S. agricultural products. The Quality Samples Program is carried out through commodity organizations and agricultural trade associations.

Market Access Program (MAP).—The CCC estimates provide funding for MAP in fiscal year 2002 at the maximum authorized level of \$90 million, unchanged from fiscal year 2001.

Public Law 480.—For fiscal year 2002, the budget includes a total program level for all titles of Public Law 480 food assistance of \$995 million, which is expected to provide approximately 2.7 million metric tons of commodity assistance. In the case of Public Law 480 Title I credit sales, appropriated funding has been continued at the fiscal year 2001 level. However, the Title I credit level is reduced due to higher estimated subsidy costs for the program which result from changes in county allocations and financial terms.

Export Enhancement Program (EEP).—World supply and demand conditions have limited EEP programming in recent years. However, the fiscal year 2002 budget does include a program level of \$478 million for the EEP, the maximum level authorized by the Agricultural Trade Act of 1978, and the awarding of EEP bonuses can be resumed whenever market conditions warrant.

Dairy Export Incentive Program (DEIP).—The budget assumes a DEIP program level of \$42 million for fiscal year 2002, slightly above the fiscal year 2001 estimate of \$34 million. These levels are reduced from those of recent years for a number of reasons. Foremost among these reasons is the fact that the average subsidy rate for nonfat dry milk, the largest category of dairy products exported under DEIP, has declined from \$1,040 per metric ton in fiscal year 1999 to a rate of \$121 per metric ton during the first 6 months of fiscal year 2001. This development reflects higher world prices for nonfat dry milk and greater competitiveness for U.S. product in world markets.

This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

Senator COCHRAN. Mr. Collins, we would be pleased to hear from you now.

STATEMENT OF KEITH COLLINS

Mr. COLLINS. Thank you very much, Mr. Chairman, Mr. Kohl, and Mr. Johnson. Thanks for the invitation to join you today in your review of farm and trade programs.

I, too, would say I am delighted to be here to join with Mr. Shipman, who as you know, has brought high energy, a quick wit and most importantly, I think, a good nature to the USDA. And so we are pleased to have him.

You asked me to briefly describe the state of the overall farm economy and I am going to do that by first discussing a few positive developments and then as economists should do, offering a few concerns.

Despite the downturn in farm markets since 1997, there are some encouraging signs in the farm economy, and Mr. Shipman just ended on one of them, and that is U.S. agricultural exports, which two years ago were \$49 billion, last year \$51 billion and this year we expect \$53 billion, with much of this year's gain in high value and value-added products, such as meats and horticultural products.

I would point out: Our expected exports to Canada and Mexico this year. We are forecasting them to reach \$15.2 billion. If you go back to 1996, when we had our all-time record high level of farm exports of \$60 billion, our exports to our NAFTA partners in that year were only \$11 billion. So we are gaining materially here in the western hemisphere.

A second encouraging sign is that some of the global crop markets are beginning to move toward better supply and demand balance.

And I will give you an example; look at total world grain stocks at the end of this marketing year. We are expecting them to be 240 million tons. If you go back to 1998 marketing year, they ended at 280 million tons.

So the current level of stocks is not excessive by historical standards and it does suggest if there were to be some material disruption in production around the world, we could have a sharp boost in grain prices.

A third encouraging sign is that U.S. producers appear to be reducing plantings of major crops in response to a little bit lower net market returns.

Last year, in fact, planted acreage to the principal crops rose. This year producers have indicated plans to reduce crops such as

corn by four percent and in total area in principal crops by about 3.5 million acres or 1.5 percent.

A fourth encouraging sign is that livestock prices and returns for the most part are up. In fact, we just reported that cash receipts for livestock and poultry for the year 2000 were a record high.

We saw record high beef production in the year 2000, and at the same time we saw fed cattle prices average \$70 per hundred weight, which would be an unusually propitious experience for our nation's cattle ranchers.

Hog receipts were also up 37 percent in the year 2000. And despite being very weak last year, we think that this year milk prices will average the fourth highest level ever.

A fifth encouraging sign has been a strong rural economy, providing off-farm job opportunities for farmers and ranchers. Today, four out of five farm households have one or more spouses earning income off the farm.

This and the strength of the national economy have boosted farm household incomes and made many farm households less vulnerable to downturns in the farm economy.

Well, despite these encouraging signs, a strong rebound in market returns for major crops is probably not likely without a significant weather disruption around the world or an unexpected surge in demand this year. And that is because there are a few not so encouraging signs in the farm economy.

One of those on the export front is simply the overall global economy, which is now growing at a much slower rate than most analysts expected at the start of this year.

A second problem we have is the exchange value of the dollar, which remains very high relative to the mid-1990s. And that, of course, prevents people who import our products from seeing the full discount that they would otherwise see in our prices.

And it also insulates our competitors from declines in farm prices as well. And I will give you as an example soybeans, where we see right now a 25-year low in the soybean price, and yet soybean production in Brazil and Argentina has increased 20 percent over the past 2 years.

Another discomfiting factor is the price of energy-based farm production inputs. Last year, high gasoline and diesel prices raised farm production expenses for energy-based inputs by \$2.9 billion.

And I think this year we are going to see a similar increase of that magnitude, something on the order of a \$5 billion to \$6 billion increase over a 2-year period in energy-based production expenses.

Another factor of concern is the dependence of farm income on government payments. Last calendar year, farmers received a record high \$22 billion.

This year we expect that to fall to \$14 billion, with part of that decline due to the ongoing provisions of the 1996 Farm Bill, but most of that decline due to reduced supplemental assistance payments.

Although market revenue is expected to be up this year, lower government payments—of course, I am assuming that in the absence of any legislation at this point—lower government payments and higher production costs would reduce U.S. net cash farm income by some ten percent.

And, of course, that projected decline is what has put Congress in the position of providing supplemental assistance again in 2001.

I would like to end by just profiling a couple of key developments to look for in commodity markets this year. For wheat, we have the lowest acreage in 28 years. We also have a poor condition in the winter wheat crop. That suggests to me that wheat stocks could be drawn down fairly substantially this year and we could see stronger prices in 2001 and 2002.

We also are seeing some shift out of corn this year. And I think that combined with very strong feed and industrial use, particularly 18 consecutive months of record high ethanol production in the United States, will pull corn stocks down in the 2001 season and improve corn prices as well.

However, the record large soybean crop that is in prospect for this year—large southern hemisphere crops, as well, could push soybean prices even lower.

Cotton prospective planted area this year is the second highest planted area since 1962. And I think that, together with the fact that China looks like it is going to be producing more cotton has put cotton right now at 25-year lows in price. And I think those prices are going to remain under some pressure.

I think the same is true for rice. We have a fairly tight market for long-grain rice. However the world has abundant rice supplies so that is going to keep pressure on that market.

For horticultural products, the record is mixed. We have several crops like potatoes, cranberries and apples that are facing market weakness due to large supplies, but we also expect horticultural exports to be record high this year. And that is going to benefit some of those commodities.

As I mentioned earlier, we are seeing stronger markets for meats and milk. Animal disease problems in Europe are having a small positive effect on our protein feed exports to replace meat and bonemeal and, I think, may strengthen slightly our exports of pork and poultry as some foreign buyers shift away from E.U. beef.

On balance, Mr. Chairman, there are some hopeful signs and U.S. agriculture, including an improving supply/demand balance, higher farm prices for some of our major commodities in prospect.

PREPARED STATEMENT

U.S. farm households have also shown resiliency in maintaining their financial position and standard of living over the last couple of years. Nevertheless, net income from crop markets continues to be the key weak spot in the farm economy.

Thank you.

Senator COCHRAN. Thank you, Mr. Collins.

[The statement follows:]

PREPARED STATEMENT OF KEITH COLLINS

Mr. Chairman, thanks for the invitation to discuss the current situation and outlook for U.S. agriculture. While the overall farm situation of the past couple years of generally weak markets continues, there are some signs of improvement. Global demand is slowly getting better, livestock prices and returns are for the most part up, global grain stocks are not excessive when compared with use, and reduced U.S. plantings could lead to lower grain stocks and higher prices in 2001. Nevertheless, a strong increase in farm prices and income from the marketplace for major crops

appears unlikely, unless adverse weather leads to a shortfall in global crop production. In addition, increases in prices for energy-related farm inputs continue to push up farm production expenses, and adverse weather is reducing crop production prospects and delaying spring planting in some areas.

General Overview

The U.S. economy has benefitted from income growth, low unemployment, surging productivity, low inflation, and low interest rates the past several years. While these economic trends have also helped farmers and ranchers, other economic factors, such as foreign competition, a strong dollar, and economic recession in foreign countries reduced U.S. agricultural exports and prices received by farmers.

Our most recent monthly data for April 2001 shows some price improvement. The index of prices received by producers for all crops was up 4 percent from a year ago and the index of prices received for livestock and livestock products was up 11 percent. While farm prices are generally up, they are recovering from unusually low levels. For the 1999/00 marketing year, the average price of soybeans was the lowest since 1972/73, the prices of corn and wheat the lowest since 1986/87, the price of rice the lowest since 1992/93, and the price of cotton the lowest since 1974/75. Cattle and hog prices were also relatively weak in 1999 but were up 6 and 31 percent, respectively, in 2000. Milk prices were relatively strong in 1999 but fell to a 9-year low in 2000.

Many producers, during the last several years, also have been adversely affected by weather-related problems and, more recently, increases in prices for energy-related inputs. Soil moisture levels remain very low in parts of the Southeast, Florida, west Texas, and the Northwest. Sierra snow pack levels, which provide water to California's reservoirs for electricity generation and farmland irrigation, were below normal this past winter. Cool and wet weather is delaying spring fieldwork in parts of the Midwest, and below normal rainfall in the Southern Plains last fall has adversely affected winter wheat stands and increased abandonment.

Congress responded to the problems caused by low commodity prices and adverse weather by authorizing nearly \$25 billion in supplemental assistance the past three years, greatly limiting the farm financial stress that farmers and ranchers would otherwise have faced. These supplemental payments, plus payments authorized under the 1996 Farm Bill, pushed government payments to a record-high \$22 billion in calendar year 2000 and Commodity Credit Corporation (CCC) outlays to a record \$32 billion in fiscal year 2000. If Congress had not provided nearly \$9 billion in supplemental assistance, net cash income would have likely fallen to \$47.5 billion in 2000, the lowest level since the farm financial crisis of the mid-1980s. Instead, net cash income reached \$56.4 billion in 2000, nearly \$2 billion above the average of the 1990s.

Outlook for U.S. Agricultural Exports

In the mid-1990s, the value of U.S. agricultural exports rose sharply peaking at a record \$60 billion in fiscal year 1996, as world gross domestic product (GDP) grew at an annual rate of 3 percent and global grain and oilseed production fell about 4 percent. Over the next 3 years, the value of U.S. agricultural exports fell by nearly \$11 billion, as good weather and strong prices led to an abrupt turnaround in world crop production and world economic growth, excluding the United States, dropped to 1.3 percent. In fiscal year 2001, the value of U.S. agricultural exports is forecast to reach \$53 billion, up from last year's \$50.9 billion.

The outlook for agricultural exports generally appears more positive than in recent years. While world GDP, excluding the United States, is expected to slow from last year's high rate of nearly 4 percent, it is expected to continue to remain firm at over 2.5 percent in 2001 and above 3 percent in 2002. Several Asian, Latin American, and Middle Eastern countries that were in recession in 1998 and 1999 are now registering steady growth.

Another key factor for U.S. agricultural exports is the U.S. exchange rate. Between April 1995 and January 2001, the U.S. real agricultural trade-weighted exchange rate appreciated by 25 percent relative to the currencies of countries that import U.S. agricultural products, thus increasing the price importers must pay in terms of their own currency. And over this period, the U.S. dollar appreciated nearly 40 percent relative to the currencies of U.S. agricultural competitors, which helped insulate their producers from lower world prices. Declining interest rates and a slowing economy should weaken the dollar somewhat in 2001, making U.S. agricultural products modestly more attractive to foreign buyers.

Outlook for Farm Income

In 2001, farm cash receipts are forecast to reach \$200 billion, up \$4 billion from last year and \$16 billion from the average of the 1990s, although \$8 billion below

the record set in 1997. Compared to 1997, crop receipts are projected to be down \$11 billion in 2001, while livestock receipts are forecast to be up about \$3 billion. These figures mask steep declines in cash receipts and income for major field crops. Cash receipts for grains, soybeans, and cotton declined from a record \$57 billion in 1997 to \$43 billion in 2000 but are projected to increase slightly to \$45 billion in 2001.

Despite improving cash receipts, USDA currently forecasts a decline in net cash farm income in 2001 to under \$51 billion, down from \$56.4 billion last year, as production expenses continue to rise and government payments decline. This decline assumes no supplemental assistance for the 2001 crops. Increases in petroleum prices and prices for other production inputs increased farmers' production expenses by 4 percent or \$7.6 billion in 2000, with higher fuel and oil prices accounting for about one-third of the increase. In 2001, farmers' total cash production expenses are forecast to increase \$1.5 billion to a record \$179.5 billion. Higher petroleum and natural gas prices have increased the prices of diesel fuel and nitrogen fertilizer, and repair, marketing, and labor costs are also expected to increase in 2001.

Government payments have offset much of the decline in major crop cash receipts since 1998, helping to maintain producers' cash flow. Direct government payments to farmers reached a record \$22 billion last year, up from \$8 billion in 1997. In 2000, direct government payments included nearly \$5 billion in Production Flexibility Contract (PFC) payments, \$6.4 billion in loan deficiency payments, \$2 billion in conservation program payments, and nearly \$9 billion in supplemental (crop and market loss) assistance.

In calendar 2001, government payments are projected to decline about \$8 billion to slightly over \$14 billion. With no supplemental aid legislation in place for the 2001 crops, supplemental assistance to farmers and ranchers is forecast to fall from nearly \$9 billion last year to about \$3.5 billion in 2001. The supplemental assistance that is expected to be paid out in 2001 was authorized by Congress last year to cover crop and market losses producers incurred in 2000. Scheduled annual reductions in PFC payments under the 1996 Farm Bill and lower loan deficiency payments, reflecting improving prices for major crops, are forecast to reduce government payments by \$2.5–\$3.0 billion in 2001.

Net cash farm income on a crop year basis for the major field crops—wheat, rice, corn, sorghum, oats, barley, cotton and soybeans—excluding government payments was quite low for the 1999–2000 crops and is projected to remain low in 2001. Net cash farm income for major field crops averaged \$43.4 during 1999–2000 and is projected to rise to \$46 billion for crop year 2001, compared with the average of \$51 billion during the 1990s and \$54.5 billion for the 1995–99 crops. Direct government payments were equal to three-fourths of net cash income for major field crops in 1999 and more than two-thirds of net cash income in 2000. In 2001, net cash income for major field crops is projected to fall by more than \$6 billion. The projected decline in income in 2001 is about equivalent to the amount of market loss assistance Congress authorized last year for major field crops.

Outlook for Farm Finance

Farm financial conditions remain stable, aided by record government payments and greater off-farm income. The debt-to-asset ratio remains stable at about 16 percent, down from 23 percent during the farm financial crises of the mid-1980s, and farm real estate values and land rental rates generally continue to rise. All major farm lender institutions continue to experience historically low levels of loan delinquencies, foreclosures, net loan charges, and loan restructuring. At the end of 1999, nearly 60 percent of all farms reported they had no outstanding debt.

Farm debt rose 2.4 percent in 2000, surpassing \$180 billion for the first time since 1984. In 2001, farm debt is forecast to increase to slightly under \$183 billion. As a percent of the value of farm assets, farm debt is expected to remain unchanged from last year's 16.1 percent. Even though farmers' balance sheets are much improved from the mid-1980s, the forecast drop in farm income in 2001 would reduce somewhat farmers' ability to repay existing debt. In 2001, farmers are forecast to use, on average, 65 percent of their maximum feasible debt—which is termed debt repayment capacity utilization (DRCU) and is calculated based on income and interest rates. This use of feasible debt would be up from 60 percent in 1999 and 2000.

USDA research suggests that commercial farms that cannot service their debt and stop performing on their loans usually have debt equal to 240 percent or more of their maximum feasible debt. In both 1999 and 2000, about 50,000 of the nation's 512,000 commercial farms had debt of 240 percent or more of maximum feasible debt. In 2001, the number of commercial farming operations with debt of 240 percent or more is forecast to increase to 70,000.

In addition to record government payments, improved off-farm income opportunities for farm households have helped avoid more serious farm financial problems. Off-farm earnings are a significant source of income for farm households and help insulate them from financial difficulty when the farm economy weakens. Eighty percent of all farmers or their spouse are employed off the farm. In recent years, about 90 percent of the total income of the average farm household is derived from off-farm sources. Earnings of farm operator households from off-farm sources averaged an estimated \$60,000 in 2000, up from less than \$36,000 in 1992. Combining income from farm and off-farm sources, farm operators averaged over \$64,000 in total household income in 1999, about 17 percent higher than the average income of all U.S. households.

While nationally farm financial conditions appear secure, regional and sector problems persist. The combination of low prices and adverse weather in the Southeast, southern plains and elsewhere has contributed to regional pockets of farm financial stress. In addition, production agriculture consists of a diverse group of farms and ranches with varying degrees of financial success, which a single aggregate performance indicator such as net farm income cannot capture.

Farm Financial Characteristics by Farm Type

Net cash income and net farm income are single dimension indicators that can be used to track sector performance over time. Aggregate performance measures, however, mask the wide distribution of earnings in the farm sector, discount off-farm income and wealth, and do not reveal debt service problems or signal the occurrence of farm failures. The farm typology, recently developed by the Economic Research Service, provides a useful framework for examining the wide array of farm and farm household financial circumstances exhibited by the sector today.

When crop prices are low and aggregate farm income falls, the common expectation is that farm household income will also decline leading to a lower standard of living for farm families. However, for the majority of farm households (62 percent), the farm business operator's primary occupation is something other than farming. Indeed, the financial well-being of most farm families is much more dependent on general economic conditions and the local economy and than on commodity prices.

That said, the condition of the farm economy matters most to the 800,000 farm households in which the primary occupation of the operator is farming. Farm households in which the primary occupation of the operator was farming had an average household income of \$55,000 in 1999, compared with \$70,000 for farm households in which the primary occupation of the operator was something other than farming. Nearly one in three farm-dependent households had consumption expenditures that exceeded household income. These households had to withdraw from savings, or borrow or liquidate assets in order to accommodate income short falls.

A common perception is that low returns from farming lead to a low rate of wealth creation for farm households. On average, farm households are wealthier than their non-farm counterparts and have seen their wealth increase at a faster rate during the 1990s than non-farm households. Much of this wealth advantage is associated with the ownership of farmland. Agricultural land values have steadily increased in the last decade and these gains are in part attributable to government payments.

According to data collected through USDA's Agricultural Resource Management Study (ARMS), slightly over 40 percent of all farm operators received farm program payments in 1999. Recipients of farm program payments tend to be concentrated in the largest farm typology classes, since payments are principally based on current or historical plantings of program crops. About 80 percent of full-time family farms with sales between \$100,000-\$500,000 (farming occupation/higher sales and large family farms) received farm program payments. These two groups, consisting of 12 percent of all farms, received 46 percent of total government payments to farm operators in 1999 and, on average, farm program payments made up 14 percent of gross cash income on these farms. Family farms with sales of \$500,000 or more, 3 percent of all farms, received 22 percent of total farm program payments and, on average, each farm received just over \$85,000 in government payments. Farm program payments accounted for about 6 percent of gross cash income on these very large farms. Limited-resource family farms (small farms with less than \$100,000 in gross sales, farm assets less than \$150,000 and total operator household income less than \$20,000), 6 percent of all farms, received \$4,000 in government payments, on average, but these payments accounted for over 25 percent of average gross cash income on these farms. About 1 percent of farm program payments went to limited-resource family farms in 1999. Larger farms received more of their government payments from PFC payments and loan deficiency programs, while smaller farms received more of their payments from the Conservation Reserve Program (CRP).

Slightly over 40 percent of all farms reported having outstanding farm debt at the end of 1999, indicating that debt is not a source of capital for the majority of farms. Farm loan delinquency rates (percent of loans with payment past due 30 days or more) peaked in 1987 at 11 percent of total loan volume and declined throughout most of the 1990s, remaining around 3 percent for the last several years. Comparison of actual debt levels with the maximum amount of debt that can be serviced by household income suggests that 17 percent of farm households experienced debt repayment problems in 1999. Repayment problems varied ranging from 10 percent for retirement farm households, which borrowed primarily for non-farm purposes, to nearly one in four for large family farms.

The American Bankers Association (ABA) conducts a survey of agricultural banks to track the number of farms going out of business each year. The majority of farm sales are normal attrition and voluntary liquidations (80 percent). Farm bankruptcy filings peaked at 4.2 percent in 1986 and ranged between 1 and 2 percent for most of the 1990s.

Outlook for Major Crop and Livestock Commodities

Major crop prices for the 2000/01 season are generally expected to register modest improvement from last year, reflecting another year of large global production of major crops and ample stocks. While it is too early to predict a substantial recovery in major crop prices in 2001, global stock levels going into the 2001 season are projected to be down from a year earlier. At the end of this season, global grain stocks are projected to be down 11 percent from a year ago and the lowest since 1996/97. As a result, world grain prices could move up sharply if weather adversely affects global crop production over the next several months.

In 2000, U.S. producers planted the lowest wheat acreage since 1973. Wheat prices this marketing year are forecast to average \$2.60–\$2.70 per bushel, up from last season's \$2.48. The increase in prices reflects lower total supplies, increasing total use, and declining world and U.S. carryover stocks. Total use is forecast to increase by 44 million bushels over last year's nearly 2.4 billion bushels, as food use, feed use, and exports are all expected to register modest gains. Wheat exports are projected to reach 1.1 billion bushels, the highest since the 1995/96 season. A major factor supporting higher exports was weather, as weather reduced the size of Australia's crop and the quality of EU's crop in 2000. Ending stocks are forecast to fall for the second consecutive year, from 950 million bushels at the end of last season to 829 million bushels at the end of this marketing year.

Lower wheat supplies in 2001/02 could lead to another year of reduced carryover and improved farm prices. Growers have indicated intentions to plant 60.3 million acres to wheat in 2001, down 4 percent from 2000. Some of the winter wheat was seeded late because it was initially very dry followed by very wet weather. As a result, much of this wheat did not emerge until spring, and the wheat that did emerge last fall was in poor shape going into the winter. Over one-third of the winter wheat crop in Kansas and Oklahoma currently is rated in very poor or poor condition. Some producers are leaving the land fallow or tearing the wheat up and planting row crops. Others are grazing cattle on their winter wheat acreage or planning to cut the wheat for hay. Also, spring wheat plantings have been stalled in some parts of the Northern Plains because of flooding and wet conditions. While weather conditions in coming weeks will be very important, the poor condition of winter wheat in parts of the Southern Plains and sparse rains in the Pacific Northwest is likely to lead to lower wheat yields in 2001.

The 2000/01 corn crop of 9.97 billion bushels was the second highest on record, as plantings expanded by 2 million acres and growing conditions were generally quite favorable for much of the Midwest. The bigger crop and large beginning stocks resulted in the largest supplies of corn since 1987/88. With total supplies up sharply from one year ago, ending stocks are forecast to increase by over 230 million bushels from last season's 1.72 billion bushels to the highest level since 1992/93. Total corn use this season is projected to reach a record 9.75 billion bushels, compared with last season's 9.52 billion bushels, primarily reflecting expanding domestic use. Both feed use and food, seed and industrial use are expected to reach record levels. Corn used for alcohol production is projected to total 615 million bushels, up 9 percent from a year earlier and up 50 percent from a decade ago. Corn exports are expected to be about unchanged from last year, even though foreign corn production is down about 10 percent this season. Concerns about the potential presence of StarLink in U.S. corn likely contributed to Japan and South Korea purchasing more corn from Argentina and Brazil. The farm price of corn for the 2000/01 marketing year is forecast to average \$1.80–\$1.90 per bushel, compared with last year's \$1.82 per bushel.

Higher natural gas prices will increase corn producers' fertilizer and irrigation costs in 2001. These higher costs are expected to reduce corn plantings in 2001. In

early March, corn growers indicated they intend to plant 76.7 million acres of corn in 2001, down 4 percent from 2000 and down 1 percent from 1999. Below-normal temperatures, combined with excessive moisture, is delaying corn plantings in some areas, but corn planting progress overall is only marginally below the 5-year average. Depending on the weather over the next few weeks, corn plantings could advance rapidly with little loss in yield potential. Assuming normal weather, lower acreage, another year of good export opportunities supported by continued global economic growth, and expanding ethanol use would reduce ending stocks by several hundred million bushels, strengthening market prospects for corn in 2001/02.

Soybean plantings and production were record-high in 2000. Soybean production reached nearly 2.8 billion bushels, up 4 percent from a year earlier, which more than offset lower carry-in stocks and caused total soybean supplies to increase about 2 percent in 2000/01. Most of the increase in supplies is expected to go into higher total use. Domestic crush is forecast to exceed the record set in 1998/99 by 1 percent and U.S. soybean exports could eclipse last year's record of 973 million bushels by 2 percent. Still, with ample supplies, soybean prices for 2000/01 are projected to average \$4.45-\$4.55 per bushel, compared with last season's \$4.63.

Less fall planted wheat, higher fertilizer prices, planting flexibility, and the benefits of the soybean marketing loan program provide an incentive for producers to further expand soybean plantings in 2001. In early March, producers indicated they intend to plant a record 76.7 million acres to soybeans in 2001, up 3 percent from last year. Continued delays in corn plantings caused by excessive moisture and cool temperatures could lead to some additional acreage being planted to soybeans. Assuming normal weather, higher acreage could lead to another year of record soybean production and rising carryover, although total use could also reach another record in 2001/02. The EU's ban on the use of meat and bone meal in animal feeds could raise soybean meal exports, but foreign competition is likely to remain intense. Under the pressure of rising stocks, soybean prices could fall further during the 2001/02 marketing year.

Cotton production rose 1 percent in 2000, even though drought caused significant yield losses in some areas of the country. Despite a slightly higher total supply, U.S. cotton mill use is projected to decline from last season's 10.2 million bales to 9.3 million bales, as textile imports continue to grow. Reflecting the sharp decline in domestic mill use and modestly higher exports, stocks of cotton at the end of the 2000/01 season are projected to reach 5 million bales, a 12-year high. From August 2000 through February 2001, the farm price of cotton averaged 54.6 cents per pound, compared with last year's season average price of 45 cents. However, prices have sunk recently as production in both China and the U.S. is likely to expand this year.

Farmers intend to plant 15.6 million acres to cotton in 2001, up less than 1 percent from last year. This would be the largest cotton acreage since 1995 and the second largest since 1962. Assuming a return to more normal weather, total cotton supplies for the 2001/02 season could reach the highest level in 35 years. With a rebound in domestic mill use unlikely, U.S. cotton exports would need to reach a nearly unprecedented 10 million bales to prevent 2001/02 carryover from surpassing projected carryover for the 2000/01 season. Strong competition for export markets and large supplies are expected to continue to pressure U.S. cotton prices during the 2001/02 season.

Rice production, in 2000, fell 7 percent from the record of 206 million cwt. set in 1999, causing total supplies at the beginning of the crop year to decline 4 percent from the previous year. Total carryover stocks are projected to fall from last season's 27.5 million cwt. to 24.3 million cwt. at the end of this season, as the drop in total supplies is projected to be partially offset by lower total use. This season, the farm price of rice is forecast to average \$5.65-\$5.75 per cwt., compared with last season's \$5.93. Producers indicated in early March that they intend to increase rice plantings by 1 percent in 2001.

Large sugar production in 1999/00 resulted in large forfeitures of sugar to the CCC last year. In order to reduce government inventories of sugar and prevent additional forfeitures, USDA announced a Payment-in-Kind (PIK) Program for 2000-crop sugar under which beet producers could elect to divert a portion of their contracted acreage from production in exchange for in-kind payments in the form of CCC-owned sugar. Under the program, 102,000 acres of beet sugar were diverted from production in 2000 cutting sugar production by an estimated 275,000 tons. On April 1, 2001, the CCC owned nearly 800,000 tons of sugar. For all of 2000/01, sugar production is down an estimated 552,000 tons, which has reduced, but not eliminated, the prospect of additional forfeitures to the CCC in 2001. For the 2001/02 season, farmers indicated plans to reduce sugar beet planted acreage, mainly in California and the Plains States. Looking ahead, import commitments under existing inter-

national trade agreements (including Mexico), the potential for over quota or second tier imports from Mexico, continuing imports of sugar-containing products that are exempt from import restraint and trend growth in U.S. yields could continue to pressure sugar prices, leading to further CCC stock accumulation over the next several years, unless U.S. sugar production declines.

In 2000, hog prices averaged \$44.70 per cwt. for the year, up 31 percent from a year earlier. Responding to low returns, producers began to reduce their breeding herds in late 1998 and continued to reduce them in 1999 and through much of 2000. Responding to improved returns, producers began increasing farrowings at the end of 2000. The increase in farrowings is expected to cause pork production to rise about 1 percent in 2001. Hog prices are forecast to average \$42–\$44 per cwt. in 2001, but rising hog and poultry production could push hog prices to the mid-\$30 range during the fourth quarter.

In 2001, liquidation of the nation's cattle herd is expected to finally lead to reduced beef production. In 2000, lower cattle and calf numbers did not translate into less beef production, as record slaughter weights and increased placements of cattle in feedlots, due to reduced forage supplies caused by dry weather, led to record beef production. The most severe winter since 1992/93 reduced fed beef production and increased cow slaughter during the first quarter of 2001. Net placements of cattle on feed during March were 12 percent below 2000 and 14 percent below 1999 levels. During the last half of 2001, reduced placements of cattle on feed are expected to lead to a 5-percent decline in beef production. For all of 2001, beef production is forecast to be down 4 percent, with choice steer prices averaging \$74–\$77 per cwt., compared with \$69.65 in 2000 and \$65.56 in 1999.

Recent concerns over Bovine Spongiform Encephalopathy (BSE) and outbreaks of foot-and-mouth disease (FMD) in a number of countries are expected to have little impact on U.S. livestock markets. The United States has banned beef imports from the EU since 1996, so the recent outbreak of FMD in the United Kingdom, Ireland, France, and the Netherlands is not expected to directly affect U.S. beef imports. The United States exports grain-fed beef which is higher priced than EU grass-fed product, so these products do not compete in the same markets.

The United States imports pork from a number of EU countries, primarily Denmark, and imports of fresh, chilled, and frozen pork products are now banned. However, the amount of EU pork imports covered by the ban represents just 0.6 percent of total U.S. pork consumption. Although a number of countries have bans in place on imports of EU pork, imports to South Korea, Taiwan, and Russia had been forecast to decline after EU subsidies were dramatically reduced in mid-2000. On April 25, Japan lifted its ban on imports of pork from Denmark, the major U.S. competitor. This allows Japanese importers to resume imports of Danish product instead of switching to pork from North America. Expansion of U.S. exports to Russia will be limited by Russia's recent announcement that it will allow red meat imports from most of the EU.

Broiler prices are projected to average 57–60 cents per pound in 2001, compared with 56.2 cents per pound in 1999. In response to low prices through most of 2000, producers have reduced the rate of expansion in broiler production. In 2000, broiler production rose 2.5 percent which followed a 7-percent increase in 1999. In 2001, broiler production is forecast to increase by 1 percent. Broiler exports continue to show considerable strength. In 2001, broiler exports are forecast to reach 5.7 billion pounds, up 3 percent from last year and up 16 percent from two years ago.

Increased milk production caused milk prices to collapse at the end of 1999, as producers responded to two consecutive years of strong returns. In 2000, the all-milk price averaged \$12.40 per cwt., a 9-year low. In response to the collapse in milk prices, Congress authorized payments of \$0.65 per cwt. to dairy producers on production of up to 39,000 cwt. and extended the price support program for milk through the end of calendar year 2001. Extension of the price support program, rising milk production, and a desire to maintain dairy producers' incomes has led to the largest government purchases and inventories of nonfat dry milk since the mid-1980s. On April 1, 2001, the CCC held 772 million pounds of nonfat dry milk in inventory.

Cow numbers have begun to decline in response to last year's low milk prices and cold winter weather caused milk production per cow to fall in the first quarter. These factors are expected to cause milk production to decline in 2001, following increases of over 3 percent in both 1999 and 2000. Declining milk production and continued increases in demand for dairy products caused wholesale butter and cheese prices and farm-level milk prices to increase sharply in recent months. The all-milk price is forecast to average \$13.85–\$14.35 per cwt. in 2001, compared with the average of \$13.57 per cwt. during the 1990s.

The outlook for horticultural crops is very uneven. As a group, cash receipts for horticultural crops are projected to be up in 2001 and the value of exports is forecast to reach a record \$11.3 billion in fiscal year 2001. However, farm prices for some horticultural crops, including apples, cranberries, grapefruit, lemons, pears, and potatoes, are being adversely affected by large supplies. In addition, irrigation water constraints and higher electricity prices in the west are likely to cause some reduction in horticultural production, particularly for processing vegetables.

Longer-term Outlook

Over the next several years, the market situation for major crops is expected to gradually improve. Rising world demand and continued progress toward freer trade are projected to lead to steady increases in U.S. agricultural exports and farm prices and cash receipts for major crops. Increases in domestic food, feed, and industrial uses could also contribute to higher farm prices for major crops. Assuming no additional supplemental aid and continuation of current farm programs, farm income could fall below recent levels over the next few years, as gains in cash receipts fail to offset sharply lower government payments. Farm program spending carried out through the CCC is projected to decline to \$20 billion in fiscal year 2001 and to \$13 billion in fiscal year 2002 before stabilizing at \$8–\$10 billion thereafter under continuation of current law. Beyond the next few years, the outlook for the farm sector improves as expanding exports further strengthen farm commodity prices and increases in farm income and farm asset values help to moderate farm financial stress.

Mr. Chairman, that completes my testimony and I would be pleased to respond to questions.

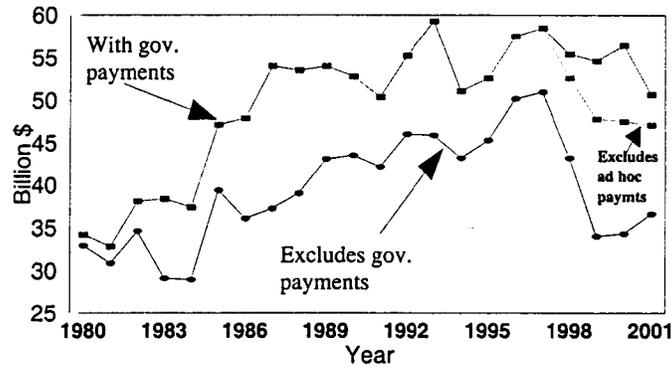

Farm Economic Indicators

| Commodity Prices | Unit | 1996/97 | 1997/98 | 1998/99 | 1999/00 | 2000/01 |

The share of farm households with debt repayment problems in 1999 varies by farm typology.

Senator COCHRAN. I appreciate very much the obvious hard work that has gone into the preparation of the statements for the subcommittee this morning by our witnesses.

I have made some notes and have some questions to ask. But before I do that, I am going to yield to my good friend from Wisconsin, the Senator from Wisconsin, the Ranking Member of this subcommittee for any statement that he wishes to make, and any questions.

Remembering that we do have a Senator from South Dakota, who got here before you did, I am going to recognize you anyway. Senator KOHL. Well, I do thank you.
 Senator COCHRAN. He will be patient.

PREPARED STATEMENTS

Senator KOHL. And I thank the Senator from South Dakota.

I have a statement for the record and I will proceed to a few questions that I would like to ask.

Senator COCHRAN. Your statement and those of any other members will be included in the record.

[The statements follow:]

PREPARED STATEMENT OF SENATOR HERB KOHL

Thank you, Chairman Cochran. I would like to welcome our panel here this morning and I look forward to hearing from all of you on your views regarding the status of today's farm economy.

I would also like to congratulate Mr. Hunt Shipman on his new position at the Department of Agriculture. Hunt, throughout your tenure, more than a decade with the distinguished Senator from Mississippi, Chairman Cochran, you have been an outstanding public servant for all of American agriculture. I want to thank you for all you have done for this Subcommittee and congratulate you on your new position.

The facts are clear. Our agriculture sector is changing. America has come a long way from the days when a vast majority of our people lived, worked, and depended on the land for survival. New technology resulting in more efficiency means we are producing more with less. Today, roughly 2 million farmers and ranchers feed us and the world. However, low prices in most commodities continue to place economic stress on our farms and rural economies. We see more and more farmers finding jobs off the farm to make ends meet. We continue to face the problems of urban sprawl that threaten our arable land. And increased concentration and consolidation in the industry shrink producers' ability to receive a fair price for their product.

We can and we must do better for our farmers. Congress has provided nearly \$25 billion in supplemental assistance over the last three years. But that is not the only answer. Today, half of total farm income comes from the government—and let me tell you, no one in this room or out on the farm is proud of that fact. This morning I want to hear from you on how you think this Subcommittee should craft an appropriations bill that provides the right combination of funding for important programs that will equip our farmers and ranchers with the tools they need to protect their land, market their products, and make a living.

The dairy industry has been particularly hit with depressed prices. This is devastating to my State of Wisconsin—America's Dairyland. In order to help keep farmers in business I have worked with Chairman Cochran and others to provide emergency supplemental assistance to dairy producers over the past three years. If this supplemental assistance is ever to be reduced, we need something different. We need a national and equitable program to treat all dairy farmers fairly. Regional Compacts are not the answer. I have worked with Senator Santorum from Pennsylvania on a bill that is an attractive alternative to regional cartels. That bill is S. 294, the National Dairy Farmer's Fairness Act. I look forward to the Administration's support of this legislation.

The challenges that face today's agriculture sector are vast and far-reaching. Today, we need from you advice on where you think this Subcommittee needs to focus its work this year. I look forward to working with you and the Secretary on making sure we provide the necessary funding to meet the demands of our agriculture community.

Again, thanks for testifying this morning and I look forward to hearing from each of you.

PREPARED STATEMENT OF SENATOR TIM JOHNSON

Thank you Chairman Cochran, Ranking Member Kohl and members of the subcommittee, I am pleased to participate in today's subcommittee hearing on the state of the agricultural economy and steps to provide assistance to America's family farmers and ranchers during these tough economic times.

I welcome Keith Collins, Chief Economist for the United States Department of Agriculture (USDA) and Hunt Shipman, Acting Undersecretary of USDA's Farm and Foreign Agricultural Services. I look forward to their insight on the agricultural economy and about what USDA is doing to provide support to producers.

Mr. Chairman, simply put, America's agricultural economic engine is misfiring, it's just not hitting on all cylinders. Since agriculture comprises a significant share of the economy in South Dakota (one-fourth of the total economic output in my State, more than double that of any other industry in South Dakota) the poor agricultural economy is leaving South Dakota's overall economy vulnerable to weak conditions as well. Unfortunately, a host of factors are contributing to this weakened condition which began late in 1997 (early in 1998).

First, our nation's family farmers and ranchers have experienced a price crisis of near-historical proportions. Nationally, soybean prices have collapsed to a 29-year low, and corn and wheat prices are hovering at a 15-year price low. In South Dakota, the prices farmers received for major cash crops (such as corn, soybeans, and wheat) just last month were substantially lower than when the current farm bill was enacted, and with the exception of wheat, prices are even lower today than they were just one year ago. (Due to a dry fall, volatile winter, and wet spring, acres of wheat will be lower across South Dakota and the country, and overall, winter wheat conditions are below average throughout South Dakota and other regions of the U.S., leading to higher futures prices and higher cash bids at local elevators today.)

[In bushels]

| Crops | April, 2001 | 1 Year Ago | 1996 | Change from 1996 |
|----------------|-------------|------------|------|------------------|
| Corn | 1.69 | 1.85 | 3.55 | -1.86 |
| Soybeans | 3.97 | 4.87 | 7.00 | -3.03 |
| Wheat | 2.81 | 2.54 | 4.77 | -1.96 |

Tough economic conditions for farmers have been perpetuated by a series of weather-related disasters in certain regions of the country. Entire crops have been wiped out by flooding, drought, hail, and wind in many areas of South Dakota the last few years. Furthermore, surplus crop production—both here and abroad—weak global demand, marketplace concentration, and an inadequate farm safety have all contributed to the current farm crisis.

So, just when farmers thought their condition could not get worse, the cost of energy-related inputs like fuel and fertilizer have skyrocketed. In addition, USDA economists predict repair, equipment, marketing, and labor expenses for farmers to increase in 2001. Given the input-intensive nature of production agriculture, a combination of increased production expenses and decreased prices situates farmers and ranchers in a price-cost squeeze that makes it nearly impossible for them to earn income that covers expenses.

As a result of a woefully inadequate farm bill, Congress has enacted multi-billion dollar disaster programs in the last 3 years—a record \$28 billion in fiscal year 2000. It should be noted direct government payments accounted for around three-fourths of net cash income for major field crops in 1999 and for about two-thirds in 2000. In many States, farmers are receiving more of their total net farm income from the government rather than from the marketplace. Was this the promise of the 1996 farm bill? I certainly hope not.

Clearly, the 1996 farm bill fails to provide a meaningful, fiscally-responsible, safety-net for farmers when prices are poor on an annual and sustained basis. Already, we have worked to carve out nearly \$9 billion in supplemental assistance for 2001 because many Senators joined my effort on the budget resolution to provide for this emergency reserve this year. (It is yet to be seen what the budget resolution conference committee will do with this Senate passed provision of \$9 billion in 2001 emergency aid.) This 2001 crop year assistance—if passed—will become the fourth consecutive emergency aid package for farmers and ranchers likely to compensate producers for low prices and potential production losses resulting from weather-related disasters. Obviously I will support this, but I would suggest farmers and taxpayers deserve better. That is why I offered an amendment to the Senate budget resolution to provide over \$88 billion from fiscal years 2002 through 2011 in order for Congress to write a new farm bill. Unfortunately, my amendment was defeated, but we did work to restore nearly \$58 billion over the same period for a new farm bill re-write.

I believe Congress can and should amend current farm policy immediately to provide a more predictable, secure safety-net for farmers in 2001 and 2002—essentially

modifying the farm bill now instead of waiting until it expires. It is time for a new farm bill that provides a meaningful income safety net, is reasonable in cost to the American taxpayers, yet assures some level of economic security for our nation's family farmers and ranchers.

One farm bill alternative I have introduced is S. 130, the Flexible Fallow farm bill amendment. Under my proposal, farmers electing to devote a portion of their total crop acreage to conservation-use receive a higher loan rate on their remaining crop production. On an annual and crop-by-crop basis, farmers can choose to conserve up to thirty percent of their total crop acreage. An adjustable loan rate schedule is a key feature of Flex Fallow. With the exception of wheat and soybeans, the proposed base loan rates for zero percentage participation in Flex Fallow (full production) are set at 2001 levels. Participation in Flex Fallow is directly proportional to increased loan rates. For corn, wheat, and soybeans, loan rates increase by one percent for each one percent increase in conservation-use.

Iowa State University economist Neil Harl believes my Flex Fallow proposal is "the missing link to the 1996 farm bill," because it works in a market-oriented fashion yet provides an income safety net.

USDA's proposed budget adequately addresses some of our agricultural, trading, and food safety priorities. Yet, I believe it fails to make some specific and significant investments in a secure farm safety net, conservation programs, efforts to restore marketplace competition, and rural development. Moreover, despite the fact that over 20 major farm and commodity groups in the country—from Farm Bureau to Farmers Union, and including cattlemen, pork producers, corn, wheat, dairy, soybeans, cotton, rice, sugar producers, and others—have asked for increased support for a new farm bill and additional emergency aid for farmers and ranchers at levels similar to that of last year, the proposed USDA budget includes no support for a new farm bill or room for emergency aid—save the so-called contingency reserve. I am disappointed that USDA's budget does not include funding for a new farm bill that will ensure economic security for family farmers, ranchers, and rural communities now and into the future.

I am specifically concerned about the cuts or elimination of funds in fiscal year 2002 for important conservation programs such as the Wetlands Reserve Program, the Wildlife Habitat Incentives Program, and the Emergency Conservation Program. Farmers, other landowners, and society as a whole continue to desire more options to ensure the proper stewardship of our nation's soil and water resources. With agricultural conservation programs oversubscribed by nearly six times the available funding, this is clearly the wrong direction to take with conservation funding, and I plan to work in the subcommittee to secure funds that promote greater use of conservation programs instead of cutting or eliminating them altogether.

Thank you Mr. Chairman, this concludes my opening statement. I look forward to asking questions of the witnesses.

PREPARED STATEMENT OF SENATOR BYRON L. DORGAN

Mr. Chairman, I would like to welcome Hunt Shipman, the Acting Deputy Under Secretary for Farm and Foreign Agricultural Services, to this hearing today. I probably should say welcome back, since the Under Secretary was, until recently, working for the Chairman of this Subcommittee. I also want to welcome USDA's Chief Economist, Keith Collins, to this hearing. Thank you both for coming.

Last week, the Chief Economist and I fenced some about when the Quality Loss portion of the Crop Loss Disaster Program was going to be implemented. Today, I want to assure both of you, and the employees of the Farm Service Agency, that I understand the complex nature of the legislation. I also want to thank the Agency for all the hard work that has been put forth by everyone involved. I have never doubted that the Agency was not trying to get this program out to the farmers at the earliest possible date.

Having said that, I still want to impress on you the need to get the notice for this program published. We all know that there will be some lag time after publication to allow for county office staff training and to get the software finished and downloaded. I urge you to include in the publication examples of how the program will be implemented so that farmers and their bankers have some way to estimate the assistance that will be forthcoming to them.

Discussing the implementation of disaster programs allows for a very good segue into the topic of FSA staff levels. You have acknowledged the difficulties facing FSA as they try to deliver Congressionally mandated programs over the last few years. The Administration's budget provides level funding for FSA full time staff particularly in the field. It is my belief—and that of many county level FSA employees who

deal directly with farmers—that there is a need for more help in those county offices.

In a visit to a local FSA office in a fairly large county in North Dakota, I asked about staff needs. A seasoned veteran of many years told me that the office had experienced a Reduction In Force of seven Full Time Employees from the peak years of employment in the 1980s, but that the workload that was being asked of them was larger than anything she had ever experienced since coming to work in the office.

Now, we all know computerization can make an office more efficient, but technology can't make up for that many people. I am concerned about the personal stress that is being placed on these workers and their families. I don't think that we are doing all we can to alleviate this problem.

We know from the Chief Economist's testimony that USDA will need to continue to be an integral part of a farm's operation for the foreseeable future. I have asked County Executive Directors what Congress should do, and have been told an additional full-time employee in many of these county offices would make all the difference in the world.

All the major farm and commodity organizations, including the American Farm Bureau, the National Farmers Union, the National Association of Wheat Growers, the National Cotton Council and the National Corn Growers, to name just a few, have requested emergency assistance for farmers once again this year. As we are well aware, nothing has changed in the farm economy, and this Subcommittee will need to address these needs.

Mr. Chairman, as the fiscal year 2002 Agriculture Appropriations bill moves forward, I hope this Subcommittee will consider addressing fully the needs of America's farmers, and the FSA staff who serve them at local county levels.

PREPARED STATEMENT OF RICHARD J. DURBIN

Chairman Cochran, thank you for holding this important hearing today. I would like to welcome Hunt Shipman, Acting Deputy Under Secretary for Farm and Foreign Agricultural Services to the hearing this morning, and Chief Economist Keith Collins. I appreciate the opportunity to continue the budget discussion we started with Secretary Ann Veneman on April 25.

The mission of Farm and Foreign Agricultural Services is to ensure the well-being of U.S. agriculture through delivery of commodity, credit, conservation, insurance and export programs.

Although the Department's fiscal year 2002 budget is a good start, I am concerned that it is insufficient to meet the Farm and Foreign Agricultural Services mission. I've noticed that the Department's fiscal year 2002 budget contains no emergency funding. The Administration is relying on its proposed National Emergency Reserve Fund or Contingency Reserve Fund—neither of which exist at this time—to provide farmers with Federal assistance.

The proposed Emergency Reserve Fund would only be given \$5.6 billion in fiscal year 2002 to respond to all types of disasters, including floods, earthquakes, hurricanes, droughts, and the kinds of emergency payments farmers will need. While I am open to efforts to prepare for unexpected emergencies, the continuing farm slump is different. We know the need. Congress has appropriated more than \$5.6 billion for farm assistance alone in each of the years since the farm economy's downturn began.

As for offering the Contingency Reserve Fund as an option for funding, this approach pits farm aid against Medicare, Social Security and defense spending needs. I wonder, how is relying on these reserve funds, which compete with other national needs, a responsible method for ensuring our farmers get the support they desperately need?

Congress has provided approximately \$25 billion in emergency agriculture aid since 1998. Farm groups have requested up to a \$12 billion increase in the agriculture budget for fiscal year 2002 in anticipation of another year of depressed commodity prices and higher input costs. The Senate passed an amendment to the budget resolution that would allow for \$9 billion in additional emergency agricultural assistance this fiscal year. I supported that measure.

My colleagues will not be shocked to learn that government payments in 2000 made up nearly half of net farm income. The USDA predicts that without government payments, farm income will fall in 2001 to \$4.1 billion. A recent study by the University of Illinois shows that Illinois farm income is up slightly in 2000, but that government payments still account for 21 percent of gross farm returns. In fact, many families have to go off the farm to earn money to pay for simple living ex-

penses and income and Social Security taxes. I am also concerned that the budget provides zero-funding for popular conservation programs such as the Wetlands Reserve Program and the Wildlife Habitat Incentives Program. It also under funds the Environmental Quality Incentives Program, despite strong support from producers and Congress to raise funding for this program.

In fact, the Illinois Delegation has proposed an innovative approach to improving water quality by asking producers to work together to prevent pollution of the Illinois River Basin. It is called Illinois Rivers 2020, and it relies on many of the zero-funded and underfunded agriculture conservation programs. I'll be asking Chairman Cochran and Senator Kohl for their help in funding this innovative program.

Farmers are increasingly faced with environmental challenges, and many of these programs face a serious backlog of applications that outstrip available funding. If we ask them to be better stewards of their land then we must provide them with the resources they need to accomplish this goal. I hope the Administration will work with Congress to improve conservation funding.

Allow me to touch briefly on export programs, in particular, foreign food assistance. Just this morning I joined Ambassador George McGovern and former Senator Bob Dole in front of the Capitol to introduce a bipartisan bill to create an international feeding program for children in need around the world.

It is estimated that nearly 300 million children throughout the world go to bed hungry at night. And of those children, some 130 million kids don't attend school mainly because their parents need them to stay at home or work to earn income for the family.

This legislation is based on a proposal by Ambassador McGovern and Mr. Dole, who are the fathers of the U.S. school lunch program. By amending the Public Law 480 program, the bill authorizes the USDA to work with private voluntary organizations, cooperatives and international organizations, such as the World Food Programme, to feed and create incentives for children to stay in school.

Just as this surely will benefit children, it will also add value to agricultural products at home. This proposal will benefit agricultural producers, processors, millers, packaging manufacturers, rail and motor transportation and commercial shippers and ports.

I appreciate the Administration's commitment of \$300 million in surplus commodities for the Global Food For Education Initiative pilot program, which jump started the McGovern-Dole proposal. I hope the Administration will support this new legislation.

Mr. Chairman, again thank you for the opportunity to raise these issues.

DAIRY POLICY

Senator KOHL. First I would like to discuss dairy policy, gentlemen. Dairy policy in the United States continues to include features that are particularly harmful to the Upper Midwest, which, as you know, is one of the primary dairy production areas in our country.

One component of this flawed policy is the introduction a few years ago of regional dairy compacts—a Northeast dairy compact in particular. To make matters worse, the House of Representatives just this week introduced legislation to expand, as you know, the concept of dairy compacts to many other States.

President Bush has said he wants to establish free trade in all of the Americas, which would be a comprehensive free trade agreement between the 34 democracies in the Western Hemisphere. I think that is a great idea. I am very supportive of that.

But I would strongly suggest that before the President seeks free trade among 34 countries, or along with that, he must also guarantee that we continue to insist upon free trade among the 50 United States, which has been characteristic of our economy since the first day of our country's inception, as you know, and which many people would argue is the miracle of our economy. Among the 50 States, there are no restrictions. There have never been any restrictions on the free flow of goods and products in our country.

Last year, the Congress again provided financial assistance to dairy producers suffering from historic low prices. While prices have rebounded somewhat, they are still far below the cost of production. And Wisconsin and other States continue to have great difficulty.

I have just three questions. Does the Bush Administration believe that it is important to continue to move agriculture products as well as all other products and all other services freely throughout the United States?

And if there are any reservations or any suggestions that you are not sure, or you cannot speak for the Administration, please say so.

Mr. SHIPMAN. Mr. Chairman and Senator Kohl, the Administration obviously understands the point of your question and has not taken a position on dairy policy thus far as a part of an overall Farm Bill strategy for this coming year. Obviously, the points that you make are well taken.

Senator KOHL. You are not saying anything. I will not stop until you say something. Are you saying that the Administration may be prepared to depart from that policy, which has been the hallmark of the American economy since the beginning of this country? Are you saying that is a possibility?

Mr. SHIPMAN. Senator, I think one could argue that our current milk marketing order system does not provide for unencumbered trade among States in dairy products as it is right now.

Senator KOHL. I agree with that.

Mr. SHIPMAN. So for me to answer your question with respect to the future would be to take a position on dairy policy that this Administration has not taken thus far.

Dr. Collins may be able to add more to it.

Mr. COLLINS. Well, I will not venture into the policy arena here. But I will make a factual observation that may assuage you, Mr. Kohl, and that is that the Northeast Dairy Compact, certainly one feature of this problem of moving milk freely in the United States, expires at the end of September and the President's budget does not have a proposal in it to continue the Northeast Dairy Compact. That is simply a factual observation.

Senator KOHL. Okay. And of course, that is very encouraging to hear.

One of the Senators from the Northeast States has gone on record as saying in published remarks in some of his hometown newspapers that he fully expects it to be continued just as it was incepted, 4 years ago by just sticking it into a year-end omnibus bill, which has several hundred thousand components to it. If they cannot get the votes, and they have not been able to get the votes—that is the way they hope to have it continued—the way it was originated.

And, I am arguing for Wisconsin, but as I hope you are able to perceive, I am arguing a bigger principle.

If I were just arguing for Wisconsin, you win some, you lose some and that is the way it goes. But this whole business of suggesting that we are—we may be willing or the Administration may be willing—just as the Clinton—this is not partisan here. The Clinton Administration allowed it to happen too.

So I am not speaking here as a Democrat to Republicans, but I would like to hope that this Administration—more so than the Clinton Administration—is committed to the principle of free trade in this country.

And that there is nothing that unique about the dairy industry. It is a commodity, you know. I mean, it is not all that much different from wheat or grain or corn or strawberries or so many other items that we might mention in the agricultural sector that need to have access throughout our country, if they are going to be able to sustain themselves.

The dairy industry arguably is the same thing, with problems. But the other agricultural sectors, as you know, have problems too.

So, the question is why would we make an exception for dairy or why would the Administration, so committed to business as they should be? I am a businessman. That is my background, whether you know it or not. That is my background.

Mr. COLLINS. Right. Well, I would just—

Senator KOHL. This is god-awful policy. It really is.

And I would like to hope that this year the Administration is prepared to do whatever it takes not to allow this to become a part of—because it will come down the pike in different forms next year and next year and next year, if we allow it to, go on this year.

There will be other commodities and other industries and other services that will begin to ask for the same kinds of protections. And they will now have had something to point to.

You know, if we started with this industry, then why would we be prepared to say no to the next Senator from the next State that would like to protect their particular industry? And then where does it stop, except in really hurting the American economy?

I am sorry, Mr. Collins. I know you were going to say something.

Mr. COLLINS. It would probably be more prudent not to.

But I guess I would say that, the Administration has not confronted this yet and the resolution of that, well, as you point out, would be an exercise in political economy.

But I think from our point at USDA, one of the things we can certainly point out is what the effects are on the economy of having not only a compact in one area of the country but a broadened one in many other areas of the country.

And there have been lots of studies done and you have certainly seen them. The studies indicate potential to cause a disruption in the most efficient use of our resources in this country.

They do provide some benefit to the producers in the compact area. Economists have looked at that and agreed with that.

Compacts also have said that is probably not a very efficient way to benefit the producers in that area. So I think, our job will be within the administration as they confront this issue to try and bring an informed discussion of all the effects of this kind of policy to their attention and hope that a good solid, reasoned decision is made.

Senator KOHL. Just to add what you said about benefitting the producers. As you know, almost every impartial estimate has come to the conclusion that benefitting producers does not benefit the consumers.

Mr. COLLINS. Oh, absolutely.

Senator KOHL. And for every producer, there are 10,000 or 20,000 consumers.

Mr. COLLINS. I do not disagree with that.

Senator KOHL. I mean——

Mr. COLLINS. I think that is true.

Senator KOHL. You know, it just does not make any sense.

Now, in connection with that, as you know, Senator Santorum and I have introduced a bill, S. 294, which would establish a counter cyclical national dairy program, which in effect means that if we get below \$12.50 a hundred weight, we begin to respond to producers.

Would you care to comment on that in any way you wish?

Mr. COLLINS. Well, I have not really looked at all the details of your bill. It provides producers a direct payment when milk prices go below \$12.50. From an economic point of view, some of those provisions if they are closely tied to a producer's production decision, cause me a little bit of concern, because they blunt the response that you would like to see when prices get low.

People have complained continually over the last couple of years that in the face of low prices, American agricultural production has not cut back. One of the reasons it does not is because we provide lots of payments to producers, so that they do not necessarily see the full force of lower market prices.

Understanding that lower market prices cause some pain on producers, nevertheless that is how you get adjustments in markets. So to some extent, proposals that would provide producers payments that are tied to their production—and I do not know if this is tied to their production, but if it is, it tends to blunt the market response, which is a concern.

On the other hand, I would say that dairy producers have just gone through a very difficult year in the year 2000. They had milk prices that were at a 9-year low and so, you can make a case for providing some financial assistance.

There are those all kinds of countercyclical programs. The only general concern I would raise is that would be considered as amber and subject to discipline under the WTO would cause an economist some concern because it would be production distorting.

DAIRY EXPORT INCENTIVE PROGRAM

Senator KOHL. Okay. I would like to ask a question on the Dairy Export Incentive Program (DEIP).

The President's budget provides for just a slight increase in the Dairy Export Incentive Program from the previous year. However, it is my understanding that there are approximately 40,000 tons of non-fat dry milk awards that had been allocated under DEIP, but for some reason were never shipped.

Although industry requests have been made for this tonnage to be reallocated, the previous Administration had taken the position that a reallocation would be in violation of the United States WTO commitments.

Further since the Article Nine rollover authority expired on June 30th, 2000, these unshipped quantities cannot be made available under DEIP.

Is the Article Nine rollover authority expressly tied to previously allocated but unshipped tonnage in addition to previously unallocated tonnage? Do you have any response to that?

Mr. SHIPMAN. Senator, if I might, if you would allow me to ask Mary Chambliss—

Senator KOHL. Sure.

Mr. SHIPMAN (continuing). Our acting General Sales Manager, as well as our acting administrator of the Foreign Agricultural Service.

Senator KOHL. Thank you.

Ms. CHAMBLISS. Good morning, Senator. I will try to shed some light on your question and then, because this is a somewhat complicated issue, with our colleagues in the dairy industry, which we have discussed frequently, I will also provide more information for the record, if that is acceptable.

[The information follows:]

Question. Is Article 9 “rollover” authority expressly tied to previously allocated but unshipped tonnage in addition to previously unallocated tonnage?

Answer. The U.S. had already used the maximum flexibility allowable under Article 9 “rollover” for nonfat dry milk by bringing forward DEIP allocations un-awarded in previous years prior to the June 30, 2000 expiration of that provision.

Question. Does the current Administration take the view that a reallocation of unshipped tonnage under DEIP would be a violation of our WTO commitments and if so, what action will USDA take to better ensure that all allocations are actually shipped?

Answer. Authorizing the export of awarded but unshipped dairy product tonnage would be inconsistent with the established U.S. methodology for reporting export subsidies to the WTO and would likely be viewed by our trading partners as an attempt to circumvent our subsidy reduction commitments. We are now engaged in negotiations in the WTO to further liberalize trade in agricultural products, including the elimination of export subsidies. Taking steps that would be viewed by many as a circumvention of our current export subsidy commitments would be detrimental to our efforts in those negotiations. The Department is reviewing whether re-announcement of canceled tonnage within the confines of an allocation year can be accomplished. If it is decided to modify the DEIP operations to allow for this, it is expected that this action would alleviate the majority of any problems with unshipped tonnage.

Mr. CHAMBLISS. I am familiar with the rollover issue. It really goes back to the original position we took in the Uruguay Round and gets back to the base period and how we, in that negotiation, identified our base period.

It did not include rollover tonnages, because the base period allowed us to maximize our capabilities under the dairy export subsidy program, which is why we did not undertake the rollover.

As you note, of course it expired at the end of June. You are probably also aware that this year we have had quite a bit of success with commercial dairy exports. They have done quite well. They did very well last year. And they are doing quite well this year.

The next year begins July 1 and, as you know, the budget provides \$42 million for the DEIP program, for next year.

We are also looking internally at different ways that we administer that program to see if there is some flexibility that might be even more helpful to the dairy industry and we are continuing to undertake that review. Thank you.

Mr. COLLINS. And can I add one thing to that? Your question was about Article Nine. In my view, Article Nine is binding here.

Ms. CHAMBLISS. Yes.

Mr. COLLINS. Article Nine says that in the last year of the agreement, we have to have our DEIP authorizations down to a fixed percentage of what they were in the base period. So you cannot add beyond that, or you go above the fixed percentage.

Prior to the last year, the first 5 years of the implementation period, you could go above that. You could roll over.

But when you get to the last year and beyond in the Uruguay Round agreement, Article Nine—without being a lawyer, just my reading of it—says to me that our DEIP bonuses have to be within a fixed percentage of our base period.

Senator KOHL. Okay.

Ms. CHAMBLISS. Which is what the \$42 million would reflect.

Senator KOHL. Right.

Ms. CHAMBLISS. Yes.

Senator KOHL. I will just ask one other question, Mr. Chairman—

Senator COCHRAN. Sure.

Senator KOHL (continuing). Then I will submit the other questions for the record.

I appreciate your statements on the importance of trade to the agricultural sector and I agree that we must stay vigilant to protect our place in those markets.

However, we must also be careful not to rely too heavily on exports. As we learned in recent years, following the Asian economic collapse, U.S. agriculture should not be left to the fragile whims of foreign economies.

One trade issue that currently faces the dairy industry is dramatic increase in milk protein concentrates, MPC, imports. To what extent are milk protein concentrates displacing U.S. dairy products in domestic markets?

Does the USDA take the position that MPC's are subject to review under the WTO? If not, will USDA take actions to ensure that they become subject to such review?

And if the Administration is not willing to take a strong stand to stop MPC's, which can devastate the U.S. dairy sector, what signals does that send to our trading partners about our willingness to stand firm on interests of great importance to U.S. agriculture?

Mr. COLLINS. Senator, I would make a comment on MPC's. This is an issue, which has gotten larger over the last couple of years as imports of dry milk protein concentrate have grown.

GAO has recently completely a study on this and pointed out that they have grown by 600 percent since 1995.

Nevertheless, they are still a fairly small percentage of our total milk balance sheet. The problem here, of course, is this is a product that did not exist when we set tariffs and quotas.

This is a product that comes in at 70 to 90 percent protein. At the time we set all these quotas and tariffs, basically, everything we were importing had less than 40 percent protein.

So it is a product that is not subject to a quota and a very minimal tariff. So we are constrained to the extent that we can deal with this.

You can certainly deal with it, with a trade case, like a section 201 or 301, if the imports were to be shown to be disruptive or dumped.

It is also an issue that could be brought up at the next WTO discussions. It is really not unlike the situation we had with stuffed molasses and sugar, or peanut paste imports from Mexico, all of which were products that were not imported when we set tariffs and quotas, or when we tariffed and set quotas. And so it is a difficult issue in that regard.

The only thing I could say is it has been brought to our attention. We are looking at it. And I cannot tell you how or what we would propose to resolve it at this point.

CRANBERRY MARKETING

Senator KOHL. Okay. As I turn this hearing back to the Chairman, I just want to make this comment to you, Mr. Shipman: When Secretary Veneman testified before the subcommittee last week, I asked her about the status of the cranberry market volume reduction order that is important to cranberry growers, not only in my State, but in other States as well.

Secretary Veneman assured me and this subcommittee that action would be taken within days. And I noticed that nothing on the subject has been published in the Federal Register since last week's hearing.

I understand that the statement is "in the works." Is that right?

Mr. SHIPMAN. Yes, sir.

Senator KOHL. Does that mean it is going to get done very shortly or what?

Mr. SHIPMAN. I think you have quoted Secretary Veneman correctly in quantifying the time before action is taken on this as a matter of days. That is an accurate statement.

There were some decisions that had to be made within USDA in order to prepare the final documentation necessary. Those decisions were made in the time frame that she talked about. And the final paperwork is in the final clearance in USDA, and since today is Thursday, I will not promise it to you before the end of this week, but certainly by next week, I think we will have something ready to go.

Senator KOHL. That would be great. And I thank you very much. And I thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

The Senator from South Dakota, Mr. Johnson.

FARM ECONOMY

Senator JOHNSON. Well, thank you, Mr. Chairman. And I too want to join in welcoming Mr. Collins, Mr. Shipman and Mr. Kaplan to the Committee today.

The U.S. Ag economy engine is misfiring. Although we have had a remarkable decade in the past, the economy as a whole, our Ag economy and rural economies tend to struggle all across this country.

With a price crisis—with soybean, corn and wheat prices all around 15-year lows in terms of prices and now coupled with high-energy related costs impacting not just fuel, but fertilizer as well,

it has put a lot of our producers in a very difficult price cost squeeze in America.

We have offset some of that over the last three years, as you have indicated in your testimony with multi-billion dollar disaster legislation, a record \$28 billion in fiscal year 2000. And the discussion is already in early stages about what level of relief is likely to be next year.

But with the producers of grain and—and—alike all across my home State, there is a lot of headshaking about this.

They recognize that it has put a lot of money out in the countryside, but it is not sustainable and it is not the philosophy our producers, where they want to grow dependent on to this degree either way.

The whims of political budgetmaking in Washington is not something that they can take to their banker. It is not something that they can rely on. And we have found ourselves, I think, in an Ag income strategy that almost everyone would concede is not the long-term solution to our problems in rural America.

NEW FARM BILL

We are going to begin debate later this year on a farm bill and on mechanisms for improving the farm safety net. And I would like to ask Mr. Shipman, do you have any early notion about a time frame whereby the Administration would be proposing concrete farm bill strategies for this Congress?

Mr. SHIPMAN. Senator, let me just say that Secretary Veneman is very cognizant of the time frame that is being contemplated, both by Chairman Combest as a part of the budget resolution, and in the interest of members in trying to proceed with dispatch on a farm bill strategy here within the Congress.

And certainly she intends for the Department to be actively engaged in that discussion. And we will—as soon as we can have, hopefully, a full complement of undersecretaries confirmed by the Senate, we will be able to engage in that with all of the power that they will bring to us.

Senator JOHNSON. Well, I appreciate that you are still in a transitional mode here a bit, and I understand that. But I have to urge very expeditious progress in this matter.

We need the White House to be engaged in this debate, and sooner rather than later, as we come together both on the budget and on the policy side. How on earth are we going to break out of this dependence on ad hoc disaster legislation, which is a disaster in its own right?

I also have some concern about what many people around the country are interpreting as a bit of a retreat on the part of the Administration from our commitment to conservation programs.

With reductions in wetlands reserves, wildlife habitat and emergency conservation programs, it would seem to me that these are areas where we could create win/win strategies, which are WTO legal, which have a good environmental and family producer consequence.

And I would hope that we do not leave green strategies out of the overall mix of where we are going to go with the next farm bill.

BIOENERGY PROGRAMS

I am also concerned, as we talk about energy, about the future of last year's legislation to create a bioenergy program and whether the \$150 million that was in that program, which has been instrumental in helping to promote bioenergy production to move ahead.

We have four or five ethanol plants underway in my home State of South Dakota. Some of this funding has been helpful in that regard. And I would hope that the USDA would remain an active partner in helping to promote these alternative, especially plant-based, energy strategies.

Any comment, Mr. Shipman, about where you see USDA coming down on those kinds of programs?

Mr. SHIPMAN. Senator, Dr. Collins has been participating in some energy discussions within the Administration, and I will ask him to comment, too.

But before I do that, let me just say that I think part of the Secretary's strategy for the farm bill, as she has articulated it thus far, has been that all options are on the table. And she wants all the interested and involved parties around the table to discuss that.

And I think she is committed to doing it, and we are committed to making sure that we are actively engaged in that.

Mr. COLLINS. Mr. Johnson, I think when you talk about the problems in the farm economy, certainly, you know, one hope for the future is that we can dramatically expand the non-food use of farm products. And energy would be a big part of that. So I think this is certainly a bipartisan issue.

I think the last Administration has and, this Administration is going to be committed to trying to do that through the tools of research and programs.

Our budget proposal for 2002 in energy research and programs in USDA is about \$245 million. Our discretionary budget proposal is \$82 million for energy. Two years ago it was \$73 million.

So we are trying to increase our research on energy, not just ethanol, but biomass generally, including biodiesel. We have an expanded research program. We are redirecting some funds in ARS as well. And the CC Bioenergy Program that we are running this year is in our budget again for next year. And we think that is helping.

As you probably know, there is something like seven ethanol plants under construction right now nationally. There is a bunch more about to go under construction.

There are about 40 ethanol plants that are expanding their capacity right now. The most recent data we have got was for the month of March. Ethanol production was 113,000 barrels per day, which is equivalent to about 1.73 billion gallons per year.

Last year, we ran about 1.6 billion gallons. As I mentioned in my comments, we had 18 consecutive months of record-setting ethanol production. So we are on a bandwagon for ethanol.

And what we need to do now is make sure we have resources to help with some of these other areas where we are not as far along, where the economics are not as good. And I think we are going to try and do that.

Senator JOHNSON. Lastly, because I know that my colleague from North Dakota wants—has some questions as well, I was struck by your testimony, Mr. Collins, where you indicate that 80 percent of all farmers or their spouses are employed off the farm. And in recent years, about 90 percent of total income of the average farm household is derived from off-farm sources—90 percent from off-farm sources.

You then go on to note that farm operators averaged over \$64,000 in total household income in 1999; actually, 17 percent higher than the average income of all U.S. households.

I can tell you I have an awful lot of South Dakota farm operators who do not have \$60,000 off-farm income opportunities in their communities and in their counties. And while that average sounds high, I wonder if you have any offhand notion of what the median would turn out to be—

Mr. COLLINS. Not the median, but I could add—

Senator JOHNSON (continuing). In terms of farm operator income.

Mr. COLLINS. I could add a couple of points to this. Your observation is a good one. You have to be careful with averages, no matter what you are looking at.

That data reflects the fact that when we go out every year in February and we do our farm financial survey, one of the first questions we ask farmers is, “What is your principal occupation?”

Sixty-two percent of all the farm operators tell us it is not farming. It is something else. So the question is: Do you want to count those as farms or not? Well, we do, when we add up all these income numbers.

So you have a whole lot of farm households, over 800,000 that we have called lifestyle or leisure farms. And so they tend to inflate those income numbers.

And we can break those down any number of ways, you would like. One way to break them down is to look at the average household income of those who say their principal occupation is farming versus those who say it is not. Then the income falls a little bit.

For those who say their principal occupation is farming, the average household income in 1999 was about \$55,000, which is down from the \$65,000 overall average. For those who say it is not farming, their average was over \$70,000.

And then when you get into that \$55,000, you can break that down into size of farms. And if you look at some of the smaller size categories of farms for which we have hundreds of thousands of farms who are principally engaged in agriculture, I believe for the smallest category, up to \$100,000 in sales, and there are several hundred thousand farms in that category, their average household income is about \$35,000.

So if you start taking these numbers apart geographically and by size of farms, you can certainly identify several hundred thousand farms that have very low household incomes, well below the national average.

Senator JOHNSON. Thank you.

I yield back.

Senator COCHRAN. The Senator from North Dakota, Mr. Dorgan.

Senator DORGAN. Mr. Chairman, thank you very much.

And thank you for being here today.

I sometimes get a bit despondent when I read through testimony and see the number of agencies and programs within the USDA.

I mean, we such a proliferation of different enterprises going on and I think most of us would think that we have maybe three basic goals.

One is trying to get farmers a decent income, so that during tough times, you have a bridge over price depressions; second, to promote some conservation; and third, promote some exports that contribute to the income; and then fourth, while it is not your primary issue, to make sure we have safe food domestically.

And as I take a look at all of these different enterprises we are involved in, I wonder, to what extent do they contribute to those goals?

But let me ask you a question about the issue of targeting. We have talked about how much money we spent on trying to help family farms in the last 4 years.

We really have not targeted that help. My whole theory is that we ought to be about the business of trying to help family farms and not agro-factories. Agro-factories have the financial wherewithal to withstand price depressions. Family farms do not.

We really do not have much of a targeting mechanism with respect to how we are spending this money, do we?

Mr. COLLINS. Mr. Dorgan, not really. We do not. Our payments are based on sort of the historical evolution of these programs, which are based on a commodity. And we do have payment limits.

Senator DORGAN. What—what kind of income from the government would the larger enterprises have gotten in the last year, on a grain farm, for example?

Mr. COLLINS. We could work out examples for you. I could tell you that generally as farms get larger, this is speaking of all farms nationally, as their sales go up, the percent of their gross income from government payments goes down.

To give you an example, for farms that sell more than \$500,000 a year in agriculture products, if my memory serves me right, I think about 8 percent of their gross income is from government payments; whereas if you look at the very small farms, what we call the limited resource farms, those with sales of less than \$100,000 a year, with a very small asset base and very small net income, their government payments account for about 25 percent of their share of gross income.

There are a couple of reasons for that. One is some of the very large farms are not crop farms. You know, they tend to be livestock farms, poultry farms, whatever. And the other reason is that it may well be that we see a little bit of the payment limit kicking in on some of those very large farms.

Senator DORGAN. But another way of looking at it is in evaluating the amount of income that goes to the larger farmers, the percentage of income that goes to the larger farmers is much, much higher.

Mr. COLLINS. Oh, yes. Oh, yes.

Senator DORGAN. Second, let me ask you about the trade picture. You have testified today about the strength in dollar, which has an inhibiting design on our trade opportunities.

What do you see happening with respect to agricultural trade in the coming year?

Mr. COLLINS. Well, our current forecast is only for fiscal year 2001 and our projection is \$53 billion compared with \$51 billion last year.

First of all, the increase is fairly small, but at least it is positive. Most of it is not bulk commodities. It is not corn, for example. It is meats where we expect record volume. And it is horticultural products where we expect record value.

Senator DORGAN. And in your projections for our trade circumstances, do you see the GMO issue playing a significant role in the coming couple of years?

Mr. COLLINS. I really do not. I think that we have certainly heard from some of our potential customers like Japan telling us that they do not want GMO wheat. We have heard from some domestic customers like large food processors that they do not want GMO sugar, for example.

But we do have lots of GMO products, round-up ready soybeans, bt cotton. These represent high proportions of the crop. They are being traded quite competitively and wanted in the world marketplace. And I expect that to continue.

The only real dilemma we have had over the last year has been related to Starlink with its peculiar approval, its bifurcated approval, which generally led to the problem that we have. But we think we are getting by the Starlink problem, at least we hope we are.

We are running a lot of programs at USDA to deal with Starlink, and we seem to be starting to put that problem behind us. That has had probably a minor effect on our corn exports this year.

Mr. SHIPMAN. And, Senator, if I might add to that, as well?

Senator DORGAN. Sure.

Mr. SHIPMAN. You know, part of the budget request this year is to provide additional resources to the Foreign Agricultural Service to address these types of technical issues that seem to be on the forefront of what we deal with most in trade these days.

Those resources will enable us to better combat those, as well as we are continuing to work with our trading partners in Europe and in Asia to ensure that the regimes that they put in place on these are scientifically based and I am confident that we will be able to continue in that regard.

COMMODITY LOAN RATES

Senator DORGAN. You referenced in your testimony the substantial increase in soybean acres. I do not know whether you are familiar with legislation that I have introduced talking about equalization of loan rates.

I contend and I think with some validity that loan rates for wheat, for example, are radically out of synch vis-a-vis the loan rates for oilseeds. I do not propose to bring the rates for oilseeds down. I propose to bring wheat and feed grains up.

Do you surmise that part of the reason for the increase in soybean acres has to do with people planning because of the farm program, the incentive in the farm program to raise oilseeds vis-a-vis wheat?

And if so, is that not exactly the position that we wanted to get out of?

Mr. COLLINS. I think that is certainly a factor. It is complicated this year by the energy cost issue as well, because about 40 percent of the operating costs of producing corn per acre are energy based; for soybeans, energy is only about 10 or 15 percent.

So the energy issue has pushed some people into soybeans this year, but I do think that what we have seen—

Senator DORGAN. The same was true last year, right, in the—

Mr. COLLINS. Not as much last year. Last year, the increase was pretty much just in fuel, diesel fuel. This year, the increase—

Senator DORGAN. I meant the increase in soybean acres.

Mr. COLLINS. Oh, yes. We had 74.5 million acres last year. This year we are expecting 76.7 million. We had an increase last year, and a bigger increase this year, a 3-percent increase this year. That is a sizeable one-year increase, and so I think that energy has added to that.

It probably would have gone up anyway, even if we did not have the big increase in nitrogen costs. And I think the loan rate is certainly a factor in that.

Senator DORGAN. Because farmers and their lenders would take a look at the loan rate and say, "Gosh. This is not about what the market suggests that I should do. It is about what the loan rates suggest I should do. The loan rate is so much more attractive for oilseeds"—

Mr. COLLINS. Sure.

Senator DORGAN. "than it is for wheat or feed grains that—that I really ought to be considering the protection that exists for oilseeds."

Mr. COLLINS. I think that is a factor.

Mr. SHIPMAN. But Senator, I think you cannot look at these issues independently.

If you would go to the Chairman's State, as an example, and look at the current market prices and futures prices for cotton, where soybeans could very well be a substitute crop, farmers are doing the economics and looking at the input costs of cotton for that return versus soybeans and are making market-based decisions as well.

In other parts of the country, energy costs may factor more or less into it. So I think it is dangerous for us to look at farm programs solely and then look at market prices solely and to make those comparisons independently. Obviously, farmers have to look at all those things at once, and I think they are.

Senator DORGAN. But would you not agree that the loan rates are out of whack? I mean, clearly the loan rate for oilseeds is not in synch in terms of cost production and also a 5-year Olympic average of price and so on with wheat and feed grains. Would you not agree with that?

Mr. SHIPMAN. I would agree with Dr. Collins about that and—

Senator DORGAN. And I am not suggesting we should bring the loan rate for oilseeds down. I happen to think that we ought to have better price protection for wheat and feed grains.

All right. Well, I mean there is a lot to talk about and I was almost tempted to talk about amber boxes whenever I hear someone describe these things.

It makes me want to talk about trade some. But I will spare the Chairman and Ranking Member that.

Look—can I just make one point about trade?

Senator COCHRAN. Sure, of course.

Senator DORGAN. This is not about your programs. But do you know that today, on Thursday, every pound of beef that we send from the United States to Japan has a 38.5 percent tariff on it? And that is acceptable to the WTO.

Mr. COLLINS. Well, that is right. That is because the WTO started with everybody's existing levels and went down the same percentage.

Senator DORGAN. It is not going down. It is 38.5 percent with a snap-back provision. That is—

Mr. COLLINS. With a snap-back, right.

Senator DORGAN. That is the bilateral agreement we have with Japan. And we actually had feasts and celebrations for having done that about 12 years ago.

And so when people talk to me about boxes and our capability in trade, all I have to do is look at Japan or China or Canada or Mexico and pick out any one of about two-dozen egregious provisions that are injuring our producers, that no one is doing anything about. You mentioned stuffed molasses as one example. No one is lifting a finger to do anything about that.

So we should have a longer discussion about it. I will not prolong the trade issue today. There are other venues to do that.

Thanks for being here. You run a large organization with a lot of very complicated programs. In your testimony you talked about the quality loss adjustment and gave some time frames of May for that. I appreciate that. Thank you very much.

Mr. SHIPMAN. Thank you, Senator.

FSA STAFFING

Senator COCHRAN. Thank you very much, Senator.

Mr. Shipman, I know that earlier this week or last week, you had a chance to speak to Farm Service Agency employees who were here in Washington.

I met with some from our State as well, and they were talking particularly about the problem of temporary staff having to be brought in to handle the increased workload for the signups and the disaster programs that we had authorized and funded.

Is there any plan or is reflected in this budget the need to improve the field office structure and the permanent staffing in the Farm Service Agency offices to deal with the expected workloads of the future?

Mr. SHIPMAN. Senator, there was a large office consolidation effort that occurred early in the last Administration. I think we need to reevaluate all opportunities for us to utilize technology enhancements that are available now that might not have even been available 5, 6, 7, 8 years ago, and to see if there are opportunities for us to gain additional savings that could be re-channeled into staffing needs and other things.

With respect to the current budget request, I might ask Mr. Kaplan or Jim Little to speak to that, as well.

Senator COCHRAN. Mr. Kaplan.

Mr. KAPLAN. As far as permanent staffing is concerned for the Farm Service Agency, it is the same in 2002 as we plan to have in 2001. Temporary staffing does go down from 2,461 to 2,000 staff years.

We expect less of a disaster program or we do not want to assume a disaster program, and the requested staffing should meet the needs of the FSA, is what we are told.

Senator COCHRAN. If there is an additional program, a benefit program approved by Congress this year to farmers, will we have to take another look at that, in terms of the reduction in temporary staff?

Could they actually handle another disaster program without having any temporary or additional permanent employees in these offices?

Mr. SHIPMAN. Senator, I think that would be dependent upon what commodity prices are at the time and what the staffing needs to process marketing loan and loan deficiency payment applications are at that time as well.

As you may recall, in the last 2 years, as Congress has provided emergency disaster assistance to the Department to deliver to farmers, it has provided with it supplemental appropriations or authorities to utilize a percentage of the funding for delivery expenses.

And so that may very well be necessary depending on what the current conditions are if Congress approves a program.

Senator COCHRAN. Thank you.

Mr. Collins, we talked about the outlook for the farm economy, and you gave us some good news and then some not-so-good news in your assessment of the situation.

Comparing the outlook for this crop year with what we observed last year and the year before, can you predict whether farmers will be just as in need of additional assistance for market loss or other benefit program assistance as they were for the past 2 years?

Mr. COLLINS. The only way I can really do that is by looking at projected net income and if you look at it just for the principal program crops, let us say wheat, rice, the four feed grains, cotton and add soybeans to that, then it would look like for the 2001 and 2002 crop year that net income will fall in the range of \$6 billion below what it was the last couple of years.

Just coincidentally that happens to be close to the kinds of numbers people are talking about for financial assistance—maybe it is not coincidental—for the 2001 and 2002 crop year.

Net returns from the market the last 2 years have been very weak. They are going to get a little bit better in the 2001 and 2002 crop year. But then we are going to have the problem of higher production costs. And so when I am giving you a figure, I am talking about net income.

Production costs were fairly stable in the mid-1990s then they shot up last year and they are going to shoot up again this year. And so even though the market is getting a little better, it will put net income from the marketplace about where it was a year ago.

Senator COCHRAN. Is the increase in costs mainly attributable to increased energy costs?

Mr. COLLINS. Energy costs are the single biggest factor. We also have higher labor costs, as well. But energy is the single biggest increase.

Senator COCHRAN. Senator Johnson, I think, asked you about the renewable energy resources and you talked about ethanol.

Mr. COLLINS. Right.

Senator COCHRAN. And are there any other programs like that or any activities like that in agriculture to produce energy resources on the farm that would help reduce the costs? Are any of these technologies up to the point now where they actually will have the prospect of reducing energy costs in the future?

Mr. COLLINS. Not really reducing energy costs. Agriculture's contribution to the total energy picture in the nation is pretty small.

Of the total energy used in the United States, renewable energy only accounts for about 3 or 4 percent. Of the total gasoline burned in the United States, ethanol only accounts for 1.2 percent. Of the total diesel burned in the United States, biodiesel accounts for basically zero.

So agriculture is not going to bring down the prices of energy in the United States over the next few years. Over the long term, agriculture can do some things. Agriculture can make a greater contribution to electricity production for example.

The CRP program this year has a biomass pilot project, where up to 250,000 acres could be used to produce energy, and all of that is being used to produce electricity. So there are some electricity gains that could be made. But that is going to take years. There are some biodiesel gains that could be made. That is going to take years.

The real big gain is ethanol right now, which accounts for 600 million bushels of corn, and that makes a material difference in the LDP's that we are paying out. That does make a difference in the cost of the corn program.

But there really not much else like ethanol. There is increasing production of what people call bio-products or bio-chemicals is resins, coatings, lubricants, plastics, these kinds of things, which are made from agricultural materials.

And that is helping the industrial demand, again, primarily for corn. But over time we need new technologies that can help convert the other types of agricultural materials into these products as well.

FARM LOAN REPAYMENT

Senator COCHRAN. In looking at the needs of farmers in the credit area, I was interested in an assessment of the payment of loans and the fact that the repayment rate has been better than in years past. That is encouraging.

Is it because farmers are not borrowing or using the credit programs that are authorized to be administered by USDA? How do you account for those significant improvements?

Mr. SHIPMAN. Senator, I am not sure that I can answer your question specifically. I think it is a combination of things, and I will ask Jim Little if he can speak more specifically to that.

In its continued depressed condition the farm economy may be driving what would normally be commercial bank borrowers to the government. And so we may be displacing higher risk borrowers, if you will, with lower risk ones.

And I think also it is a factor of the changes in the program that Congress has authorized and the restrictions that have been placed on borrowing through the last farm bill. Those dividends are beginning to pay.

Jim, do you have—

Senator COCHRAN. Mr. Little, come up to the table and give us your reaction to that.

Mr. LITTLE. Thank you, Mr. Chairman. I think some of it might have to do with the Debt Collection Improvement Act of 1996. We have done a little bit better—a lot better job in administering the programs, as well as making an effort to work with the borrowers in getting their repayments. The Debt Collection Improvement Act authorizes an offset program with the Department of Treasury, so we have a lot better collection tools.

Also, the States have better information that we provide to them, and they are working with the borrowers one on one in attempting to get them to repay, as well as making compromises, along with the debt offset program. I believe these factors have a lot to do with the reduction in the delinquency rate.

Senator COCHRAN. Do you know how much is on hand for Farm Service Agency loans and loan guarantees as compared to the levels we appropriated for fiscal year 2001?

Mr. LITTLE. I do not have that amount at the tip of my fingers.

Senator COCHRAN. Well, you can submit that for the record. And we would like to know if you expect that any supplemental funding might be needed for any of these programs during the current fiscal year?

Mr. LITTLE. Yes, sir. We will provide that for the record.

[The information follows:]

FARM SERVICE AGENCY

[Status of Farm Loan Programs as of April 30, 2001]

| Program | Funding (in millions of dollars) | | | Number of loans made |
|---|----------------------------------|-----------|-----------|----------------------|
| | Supportable ¹ | Obligated | Available | |
| Direct: | | | | |
| Farm Operating | \$700 | \$490.5 | \$209.5 | 9,918 |
| Farm Ownership | 156 | 128.5 | 27.5 | 1,159 |
| Emergency | 298.5 | 59.6 | 238.9 | 1,155 |
| Indian Land Acquisition | 2 | 0.1 | 1.9 | 1 |
| Boll Weevil Eradication | 100 | 10 | 90 | 1 |
| Seed Loans | 35 | 27.1 | 7.9 | 581 |
| Apple Loans | 99.6 | 6.2 | 93.4 | 221 |
| Guaranteed: | | | | |
| Operating, Unsubsidized | 1,187.1 | 659.6 | 527.5 | 4,075 |
| Operating, with Interest Assistance | 473.3 | 383.9 | 89.4 | 2,185 |
| Ownership, Unsubsidized | 1,009.5 | 443.9 | 565.6 | 1,822 |

¹ Supportable includes fiscal year 2001 appropriations and fiscal year 2000 carryover unobligated balances.

The Farm Service Agency does not plan to request any supplemental funding for the farm loan programs for fiscal year 2001.

Senator COCHRAN. Okay. Let me ask a question on another subject, foreign trade. We talked about the expansion of trade and ne-

gotiating new agreements, trying to help make sure we get a share of emerging markets for farmers in America.

Is there a realistic expectation that these increased market opportunities will help increase prices of U.S. farm products, the money that farmers are actually making? What is your assessment of that, Mr. Collins?

Mr. COLLINS. I think that is our goal. I think—

Senator COCHRAN. Yes. But farmers tell me sometimes, they say, “It is great to have these new markets expanded, but I am not seeing it reflected in the prices that we are getting from our commodities.”

Mr. COLLINS. I can appreciate that. We certainly had the Uruguay Round adopted with great fanfare, and farmers asked me, you know, “Where are the benefits of it? I have watched my exports go from \$60 billion down to \$50 billion over the last few years.”

And the answer is complicated. There are a lot of things that have happened in the world, particularly the economic problems in Asia and Latin America and Russia and the exchange rate, and large crops around the world and that sort of thing. But if you look at American agriculture, the only best hope we really have is to expand market demand.

We are going to have tremendous productivity gains in the future. We have always had tremendous productivity gains.

We have the GMO revolution before us. And I think what we have to do is work on reducing production costs and work on expanding demand. And expanding demand will be through, I hope, non-food products, but also we can look around the world and we can see—as everyone says, 94 percent of the world’s population is outside of the United States.

We have strong growth, income prospects in Latin America, North Africa in the Middle East, and Asia. And those are going to be prime growth markets in years to come. And a lot of that growth is going to be not necessarily in corn or wheat or rice. It is going to be in value-added and high-value products.

And, of course, that can benefit bulk products. You know, the more meat we export, the more soybean meal is going out as meat. Corn is going out as meat. Barley is going out as meat. Sorghum is going out as meat. So it can help the bulk products as well.

But over the next couple of years I see a slow recovery in exports. In fact, I would guess that we would not hit our \$60 billion figure that we hit in 1996—I think we would not hit that until like 2003 or 2004.

But the point is: You have to keep building this demand base, and that is what our export programs are trying to do. At some point, we are going to get the engine of the world economy firing in all eight cylinders and then, hopefully, we will see the kind of growth in exports that we saw through much of the 1990s pick up again. But I cannot tell you exactly when that is going to occur.

EMERGENCY DISASTER ASSISTANCE PAYMENTS

Senator COCHRAN. With respect to the disaster emergency assistance program this year, it is encouraging that now in place are signup notices, and there are clear signs that progress is being made in getting the regulations out. It is really amazing to me that

so much work by the new Administration has been done so quickly to get us to this point.

Will there be a time that you can expect when all payments will actually be made to those who are eligible? Can you look ahead and predict when that date will be?

Mr. SHIPMAN. Senator, when Secretary Veneman first came into office, I set a goal in my own mind that we would try and be done with the crop disaster program, the crop quantity loss, if you will, within 60 days.

And I think we met it or came very close to that. And taking into account the complexity of the crop quality loss program, I have been hoping that at least within 60 days of completion of the quantity loss, we would be done with the quality loss. And I think we are on track to meet that.

As far as when the final payments will be done, that depends largely on how long a signup we have. But it is important to remember in both of these programs and in all of those that Congress did not place specific dollar limitations on, once a producer completes his application, and we process it, we can issue a check almost immediately.

Now, there are programs such as the Tri-Valley Cooperative Program and others which are dollar limited. The oilseeds program is another example, where it was limited to \$500 million. In those cases we have to allow the signup to complete, the county offices to transmit that data back to Washington, and us to apply a proration factor.

But in the specific examples of crop quantity and quality losses, once those producers submit their applications and we process them, we should be able to issue a check; maybe not immediately, but certainly we can do so before the signup is complete.

Senator COCHRAN. I congratulate you on the leadership you are providing and the success that you have had in meeting those target dates.

A couple of questions that I had planned to ask about biotechnology and trade and the effect have already been asked and answered by other Senators.

I am glad that we are apparently getting a better handle on this, and the people around the country and around the world are understanding that biotechnology is not a bad word necessarily. It has provided a lot of efficiencies and safer supplies of food in more instances than not.

One of our food aid programs is Public Law 480 and the Title I program particularly. And I notice in the budget there is something called a "Blueprint for New Beginnings," and the Administration proposes to undertake a review of Public Law 480 Title I to evaluate its continued effectiveness in meeting market development objectives.

Do you know how long this evaluation will take and what it involves, and what market development objectives may be used to evaluate the effectiveness of the program?

Mr. SHIPMAN. Senator, this is a top-to-bottom review, as I would describe, to borrow from the Pentagon's evaluation of some of its operations, a top-to-bottom review of our food aid programs within

the Department that was, agreed to as you mentioned, a part of the President's budget blueprint.

We will be cooperating with the Office of Management and Budget to do that. And it will encompass all aspects of what our food aid program objectives are and how we administer that program.

We look forward to participating in that and to completing it expeditiously. But to my knowledge that process has not yet begun. And so it would be difficult for me to provide you with an expected target date.

Senator COCHRAN. My last question has to do with crop insurance, one of, I am sure, your favorite subjects.

The Agricultural Risk Protection Act, when it was passed by Congress and signed by President Clinton in June of 2000, has resulted in the Farm Service Agency and the Risk Management Agency reconciling data that will be used to combat fraud and abuse.

Can you provide the members of the subcommittee with a report on the data reconciliation process and when the process might be complete?

Mr. SHIPMAN. Senator, let me first ask that you let us submit a more detailed answer for the record. But in general terms, the Risk Management Agency entered into contracts with Tarleton University and one other vendor, as I recall, to participate in some data mining activities in evaluating the information that we have, and in trying to come up with methods by which we can compare Farm Service Agency data with Risk Management Agency data and to have analogies that can occur which will show us where there are potentials for fraud and abuse and other things.

That is an ongoing process that we are hopeful will yield—along with the cooperative role or arrangement between RMA and FSA at the county office level—a better compliance system that will get rid of some of the perceived problems with the crop insurance program in general. We are hopeful that we can utilize this technology in order to do that.

[The information follows:]

The Risk Management Agency (RMA) and Farm Service Agency (FSA) are working on procedures for data reconciliation, which will be Part 4 of the RMA/FSA 4-RM Handbook. This handbook details procedures for the implementation of the Agricultural Risk Protection Act of 2000 (AR-PA). The reconciliation will initially include four basic fields: producer identification, acreage, share, and production. The reconciliation of RMA and FSA data will zero in on 19 FSA program (loan deficiency payment) crops. The procedures should be finalized by June 30, 2001, and will then be included in the Handbook. The reconciliation should begin by August 31, 2001, for crop year 2001 and will include three of the four basic fields, excluding production. Changes to other similar RMA/FSA data will be made in fiscal year 2002. RMA and FSA will continue to maintain their respective data bases.

Senator COCHRAN. I am hopeful that we can see a crop insurance program in place that will make it less likely that annual emergency bills will be necessary. That would be one of the results of a workable, affordable crop insurance program that works like farmers expect it to.

But we do have to make sure that those who are abusing the program or who are engaging in fraudulent practices are not successful in continuing that. And there has to be a budget impact on all that, as well.

Well, I appreciate very much the witnesses' cooperation with our Committee today at this hearing to examine the state of our farm economy and the budget request as it relates to farmers and the assistance programs that are funded in the budget to help make it more likely that farmers can operate profitably, and we can strengthen our farm economy.

This concludes today's hearing. We appreciate very much, as I said, the cooperation of the chief economist and our new deputy undersecretary, Mr. Shipman.

ADDITIONAL SUBMITTED QUESTIONS

Additional questions may be submitted in writing by the Committee members, and we hope you will be able to answer them within a reasonable time.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO THE FARM SERVICE AGENCY

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

PRODUCTION FLEXIBILITY CONTRACT PAYMENTS

Question. Given that the scheduled annual reduction in Production Flexibility Contract (PFC) payments under the 1996 Farm Bill and lower loan deficiency payments are to reduce government payments by \$2.5 to \$3 billion in 2001, is a second PFC payment needed to help farmers at least break even this year?

Answer. Farmers may need additional government payments depending on final plantings, harvested yields per acre, and market prices. According to the fiscal year 2002 President's Budget estimates, PFC payments and marketing loan benefits (loan deficiency payments and marketing loan gains) are expected to decline from \$12.2 billion for the 2000 crop year to \$9.7 billion for the 2001 crop year, a decrease of \$2.5 billion. However, under the baseline projections, market revenues for the wheat, feed grains, upland cotton, rice, and oilseeds are expected to increase about \$1.2 billion for the 2001 crop compared with the 2000 crop, partially offsetting the decline in government payments.

Commitment at this time to a specific type and level of additional assistance is premature, particularly since spring planting is not complete. World weather patterns are still a major influencing factor that will affect the outcome of plantings, harvested yields, and market prices.

EFFECTS OF ENERGY COSTS

Question. How have increases in petroleum and natural gas prices affected specifically the poultry industry, a major industry in my State?

Answer. Last winter saw dramatic increases in the cost of heating poultry houses. Many producers saw their costs more than double, resulting in negative returns. While some integrators modified their heating allowances, these increases fell far short of meeting the increased costs. With the heating season now over, higher petroleum and natural gas prices are not expected to have a significant direct impact on poultry producers, and with rising prices for poultry products, grower returns are expected to return to profitable levels.

Question. What other agricultural sectors have been hit extremely hard by the increased energy and fuel costs?

Answer. In general, the farm economy appears to be responding efficiently and in a normal market-oriented way to increased energy prices. Most farmers are facing higher costs of production and reduced incomes due to higher energy prices. Production costs are also up for food processing and distribution, but very little effect is expected on retail food prices or the supply of food.

The Department's current forecast of U.S. farm income for 2001 placed farm expenditures on fuels and oils, electricity, fertilizer and pesticides at \$30.9 billion, up \$700 million from 2000. Developments since the forecast was made indicate that

farm spending on farm energy inputs may actually increase by \$2 to 3 billion, further eroding farm income.

Sectors of the farm economy that are experiencing or are expected to experience disproportionate adverse impacts from higher energy prices are those that are relatively energy intensive—irrigated crops in the West that have high pumping costs, corn production due to both high fertilizer inputs and the need for grain drying, cotton ginners due to drying, and horticultural producers who have very little flexibility in adjusting to higher energy prices.

Question. How will these increased energy and fuel costs affect irrigated crops, especially in the Southeast?

Answer. Southeastern irrigated agriculture should experience less of an impact than western areas due to both the lower amount of water used per acre and the higher per acre value of the crops irrigated. While increases in energy prices are expected to decrease growers' returns, total acres irrigated in the southeast are expected to remain relatively unchanged. The most recent agriculture census indicated that in 1998 about 2 to 3 percent of total irrigated acres suffered diminished yields resulting from interruptions due to high energy costs. Given the recent increases in energy prices, yield impacts are expected to increase. Farmers are expected to respond to the higher energy prices by reducing the volume of water used and switching to crops requiring less water.

FARM INCOME

Question. I am very concerned with the agriculture credit situation that our farmers are currently facing. Low market prices have placed our producers in a state that makes their individual cash flow more important than ever. What suggestions do you have to assure credit availability in the near future?

Answer. Ample credit is available through commercial lending sources for family farmers, contingent upon their ability to conduct a profitable farming operation. Unfortunately, low commodity prices and weather problems have made it difficult for some family farmers to finance their farming operations. This situation has created strong demand for FSA credit assistance. In fiscal years 1999 and 2000, FSA provided loans and loan guarantees totaling \$7.5 billion to 71,000 family farmers. Beginning farmers use FSA direct loan programs to establish family farms, while established farmers use FSA guaranteed loans to sustain their existing farm businesses.

Full funding of the direct and guaranteed loan programs will allow family farmers, who are unable to obtain credit from a commercial source, an opportunity to secure financing until an improvement in economic conditions returns.

Question. With the farm economy in the state that it is, what is happening in the land market?

Answer. Farmland prices depend both on landowners' and land buyers' expectations about profits that agriculture may provide in the future, and, particularly in the Northeast and West, on the demand for rural land for development and recreation. The value of farm real estate rose in 2000 and USDA forecasts that it will be steady in 2001, indicating that farmland owners anticipate that either Government programs or the marketplace will provide them with adequate returns on their land and other assets.

Farm Real Estate Values in the 1990's

[In billions of dollars]

| <i>Year</i> | <i>Real Estate Value</i> |
|-----------------------|--------------------------|
| 1990 | 619.1 |
| 1991 | 624.8 |
| 1992 | 640.8 |
| 1993 | 677.6 |
| 1994 | 704.1 |
| 1995 | 740.5 |
| 1996 | 769.5 |
| 1997 | 808.2 |
| 1998 | 841.8 |
| 1999 | 870.0 |
| 2000 | 874.4 |
| 2001 (forecast) | 883.1 |

Of course, national statistics mask the diverse conditions facing producers across the country. The latest available USDA statistics show that per acre land prices de-

clined slightly in 1999 in three Corn Belt States. Corresponding statistics for 2000 will be available in July 2001.

FARM REAL ESTATE—AVERAGE VALUE PER ACRE, BY REGION AND STATE

[January 1, 1996–2000]

| State | 1996 | 1997 | 1998 | 1999 | 2000 | Change 1999–2000 (Percent) |
|-------------------------|---------|---------|---------|---------|---------|----------------------------------|
| Northeast: | \$2,220 | \$2,240 | \$2,280 | \$2,370 | \$2,470 | 4.2 |
| CT | 5,950 | 5,950 | 5,950 | 6,300 | 6,600 | 4.8 |
| DE | 2,550 | 2,580 | 2,660 | 2,750 | 2,850 | 3.6 |
| ME | 1,150 | 1,170 | 1,190 | 1,200 | 1,210 | 0.8 |
| MD | 3,110 | 3,150 | 3,180 | 3,300 | 3,500 | 6.1 |
| MA | 5,100 | 5,150 | 5,210 | 5,500 | 5,900 | 7.3 |
| NH | 2,250 | 2,250 | 2,250 | 2,250 | 2,300 | 2.2 |
| NJ | 7,100 | 7,100 | 7,000 | 7,000 | 7,100 | 1.4 |
| NY | 1,260 | 1,250 | 1,280 | 1,340 | 1,410 | 5.2 |
| PA | 2,270 | 2,300 | 2,390 | 2,500 | 2,620 | 4.8 |
| RI | 6,500 | 6,500 | 6,500 | 6,500 | 6,500 | 0.0 |
| VT | 1,490 | 1,500 | 1,520 | 1,570 | 1,640 | 4.5 |
| Lake States: | 1,130 | 1,200 | 1,280 | 1,390 | 1,490 | 7.2 |
| MI | 1,420 | 1,530 | 1,670 | 1,850 | 2,100 | 13.5 |
| MN | 1,030 | 1,090 | 1,160 | 1,230 | 1,270 | 3.3 |
| WI | 1,130 | 1,170 | 1,240 | 1,370 | 1,500 | 9.5 |
| Corn Belt: | 1,510 | 1,610 | 1,730 | 1,830 | 1,840 | 0.5 |
| IL | 1,900 | 1,980 | 2,130 | 2,250 | 2,220 | -1.3 |
| IN | 1,740 | 1,870 | 2,060 | 2,220 | 2,210 | -0.5 |
| IA | 1,450 | 1,600 | 1,700 | 1,770 | 1,750 | -1.1 |

FARM REAL ESTATE—AVERAGE VALUE PER ACRE, BY REGION AND STATE—Continued

[January 1, 1996–2000]

| State | 1996 | 1997 | 1998 | 1999 | 2000 | Change 1999–2000 (Percent) |
|------------------------|------|------|------|-------|-------|----------------------------------|
| Total, 48 States | 887 | 926 | 974 | 1,020 | 1,050 | 2.9 |

¹ Excludes Native American Reservation Land.

Federal Reserve Bank analyses also provide information on recent regional land value trends. The following are excerpts from their latest available reports:

Kansas City District.—In this district, which covers Kansas, Missouri, Nebraska, Oklahoma, Colorado, New Mexico and Wyoming, farmland values climbed in the fourth quarter of 2000, finishing their strongest year since 1997. In 2000, district cropland values rose nearly 4 percent while district ranchland values surged nearly 7 percent. All district States posted strong gains in farmland values during 2000 with Kansas and the Mountain States leading the way. Many district bankers noted that recent gains in farmland values came in response to non-farm demand factors and hefty government payments rather than good times in the industry.

Minneapolis District.—In this district, which covers Montana, North Dakota, South Dakota, Minnesota, northwestern Wisconsin, and the Upper Peninsula of Michigan, cropland prices increased over last winter's prices from an average of 5 percent in Minnesota to 15 percent in western Wisconsin. In addition, pasture land price increases ranged from an average of 5 percent in Minnesota to 11 percent in South Dakota over those of a year ago.

Chicago District.—In this district, which covers Illinois, Indiana, Iowa, Michigan (except for the Upper Peninsula), and Wisconsin (except for the northwestern portion), percent changes in the dollar value of "good farmland" from January 1, 2000, to January 1, 2001, were: Illinois, +4; Indiana, +7; Iowa, +7; Michigan, +3; and Wisconsin, +8.

Question. Are farmland prices declining and reducing the equity position of farmers?

Answer. Farm real estate values increased throughout the 1990's and 2000, and USDA forecasts they will be stable in 2001. Farm land accounts for about 78 percent of the value of farm assets. Thus, stable or increasing land prices are crucial in maintaining farmers' equity positions, also commonly called net worth. A major downturn in landowners' expectations about the ability of agriculture to produce profits—whether due to market conditions, input costs, or changes in Government programs—could bring about large declines in farm real estate values, significantly eroding the equity position of farmers.

Question. Is this declining equity position making it difficult for farmers to borrow money to meet operating expenses?

Answer. Farmers' equity, or net worth, increased each year in the 1990's and in 2000. USDA forecasts a further 1-percent increase in 2001. Farm real estate values will help provide farmers with the collateral needed to qualify for loans.

Farm Equity in the 1990's

[In billions of dollars]

| Year | Farm Equity |
|-----------------------|-------------|
| 1990 | 702.6 |
| 1991 | 705.0 |
| 1992 | 729.3 |
| 1993 | 768.2 |
| 1994 | 789.3 |
| 1995 | 816.8 |
| 1996 | 848.7 |
| 1997 | 887.7 |
| 1998 | 912.7 |
| 1999 | 940.2 |
| 2000 | 941.6 |
| 2001 (forecast) | 951.0 |

COMMODITY LOAN RATES

Question. Agriculture commodity organizations have testified that the current commodity loan rates are not equal. If loan rates are raised and become equal, how do you believe the commodity market would respond?

Answer. Nearly all of the farm and commodity groups have called for some changes to marketing assistance loan rates as established under the Federal Agriculture Improvement and Reform Act of 1996 (FAIR Act). With the exception of the American Soybean Association (ASA), these calls for loan rate realignment have been based on concerns that the current soybean loan rate, relative to the loan rates for other commodities, distorts farmer planting decisions in favor of soybeans. The \$5.26-per-bushel soybean loan rate is substantially higher than the average per-bushel variable cash expenses incurred producing a bushel of soybeans. Adjusting per-acre variable cash expenses to a per-bushel basis using a moving 5-year average for yield, the soybean loan rate exceeds per-bushel variable cash expenses by 160 percent. The corn and wheat loan rates exceed variable cash expenses by 60 and 80 percent, respectively.

Soybean acreage has expanded substantially since the mid-1990's. Between 1996 and 2001 (based on 2001 producer planting intentions reported in the March 2001 Prospective Plantings), soybean acreage has increased from 64.2 million acres to 76.7 million acres, an increase of 12.5 million acres, or 19 percent. During this same period, corn acreage fell by 2.5 million acres, or 3 percent, and wheat acreage fell by 14.8 million acres, or 20 percent. As ASA has argued in its recent testimony before the House Agriculture Committee, not all of this increase in soybean acreage and decrease in corn and wheat acreage has been the result of the \$5.26-per-bushel soybean loan rate.

Soybean acreage increased substantially during the early 1990's, growing from 57.8 million acres in 1990 to 64.2 million acres in 1996, an increase of 6.4 million acres, or 11 percent. Nearly all of the increase in soybean acreage in 1996, 1997, and 1998 resulted from planting flexibility offered under the FAIR Act, which eliminated planting restrictions and planting requirements to protect program crop acreage bases. Soybean acreage in these years also expanded as the result of new varieties better adapted to the western and northern growing areas and the advent of biotech crops like Roundup Ready soybeans.

Realigning loan rates so that they do not favor the planting of soybeans would likely cause some acreage to shift from soybeans to other commodities. Thus, assuming no other supply and demand changes, soybean market prices would increase while market prices would decrease for the commodities for which plantings increase.

CONSERVATION RESERVE PROGRAM ACREAGE

Question. Most economists seem to believe that the depressed commodity prices are directly related to excess supply of each product. With this in mind, would it be beneficial to increase acreage limitation within the current Conservation Reserve Program?

Answer. There are really two questions or issues: (1) What impact would increasing CRP enrollment have on commodity prices, and (2) What would be the consequences of higher commodity prices? The answer to the first question hinges on the response both domestically and internationally. Expansion of CRP would be expected to reduce domestic supply and thereby increase commodity prices and increase U.S. farm income, especially when increases in aggregate CRP rental payments are included. The extent of the commodity supply and price impacts largely depend on the actual net change in planted acreage of each commodity that occurs as a result of the change in CRP enrollment. Typically plantings decline, but not by an amount equal to the increased CRP acreage. This mitigates the commodity supply and price effects, which is compounded if increases in international production occur.

An earlier analysis of the price impacts of expanding the CRP gives an indication of the magnitude of crop price changes that could be attributable to a future expansion of the program. As an example, the analysis suggested that increasing the program to 45 million acres could result in wheat, corn, and soybean price increases of 15 cents, 2 cents, and 25 cents per bushel, respectively, compared with a 36.4-million-acre program. Price impacts would amount to about half of these levels for a 40-million-acre program.

The second issue relates to the consequences on the farm sector and society of lower commodity supplies and higher commodity prices. While crop income is generally expected to increase and landowners would benefit, net incomes of livestock producers may decline. Consumers lose whenever supplies decline and prices in-

crease. Again, past economic studies have concluded that the CRP at current levels has resulted in net economic benefits to domestic and foreign producers and consumers, but only when estimates of the environmental benefits are included. Based on these studies, enlarging the program above the current 36.4-million-acre limit may result in net benefits for society.

CROP LOSS ASSISTANCE

Question. It is my understanding that a producer is eligible for payment under the Crop Quality Loss Program as long as 20 percent of the affected area experiences quality loss. Is my assumption correct?

Answer. No, it is not. Producers will be eligible for a Quality Loss Program (QLP) payment if they provide written documentation substantiating that the harvested production of a crop produced in the 2000 crop year suffered a minimum of a 20 percent reduction in quality due to an eligible cause of loss. Affected production may be calculated using the smallest measurable unit for which acceptable records exist, such as bale, truck load, bin or bunk. County "average" quality loss percentages are not applicable to QLP.

Question. Additionally, will a producer be able to choose to collect the quality loss payment or the crop loss disaster payment?

Answer. Producers can receive both a CDP payment and a QLP payment. However, payment cannot be received for the same loss under both CDP and QLP. If a portion of the CDP payment includes a quality adjustment, the calculated QLP payment will be reduced by the portion of the CDP payment attributed to quality losses.

STARLINK BUY-BACK/BIOENGINEERED FOODS

Question. USDA has recently announced a purchase program for seed containing the protein (Cry9C) found in StarLink corn. Out of 300 contracts sent out to the seed companies by USDA, 78 seed companies reported contaminated seed and signed up to participate in the buy-back program. Do you have any concern that the remaining 148 companies not participating in the program may be selling contaminated seed?

Answer. No, companies involved have recovered and taken control of all lots of hybrid seed corn found to have the Cry9C protein. Seed companies routinely test their products for impurities and many took steps to detect Cry9C before USDA recommended testing procedures on December 29, 2000. Additionally, CCC has directly contacted all seed companies to stress the importance of testing and advised them not to sell any seed corn that tests positive for the Cry9C protein. Press releases have also been issued advising farmers to not plant any seed corn this year that has not been tested or verified to be negative for the protein. Farmers have been advised to return any positive or untested seed to their dealer for a full refund.

Question. The Washington Post has reported that StarLink was found in new categories of corn products such as corn bread, polenta, and hush puppies in tests conducted by the company, Aventis, that developed the corn. In your opinion, will this trigger more food recalls and cause more countries that are opposed to genetically-engineered food to avoid U.S. food products?

Answer. The new information provided by Aventis appears to support the Environmental Protection Agency's (EPA's) assessment that the wet-milling process effectively eliminates StarLink from finished products. The reports did indicate that the dry-milling process denatures but does not totally eliminate pure 100 percent StarLink in finished food products. However, StarLink is no longer approved for production, and therefore, the 100 percent pure StarLink will not be grown this year. EPA, the U.S. Food and Drug Administration, and USDA are continuing to coordinate an aggressive Federal effort, in cooperation with growers, millers, the food industry and Aventis, to divert StarLink corn away from the human food supply.

Through the Cry9C Protein Seed Corn Purchase Program (Program), USDA is removing the Cry9C protein from the food chain and destroying it before it has an opportunity to spread further. Under this program, USDA is purchasing for destruction, seed corn that contains any Cry9C protein. Current estimates are that the testing procedures detect concentrations of less than 1 percent. Given this low detection threshold and the destruction of known seed containing the protein, it is highly unlikely that the Cry9C protein will show up on any tests on this year's corn crop. USDA has been very successful in working with growers and seed companies to ensure that seed intended for the 2001 growing season is tested for the presence of Cry9C (StarLink) and is not planted if found to contain Cry9C. Therefore, we believe there should be no additional food recalls or foreign concerns for the 2001 U.S. corn crop.

QUESTIONS SUBMITTED BY SENATOR ARLEN SPECTER

LDP PROGRAM REPAYMENTS IN PENNSYLVANIA

Question. I contacted Secretary Glickman last year and Secretary Veneman in February of this year to request assistance in resolving an unacceptable situation in Erie County, Pennsylvania. Specifically, due to erroneous actions taken by the Farm Service Agency Office in Waterford, Pennsylvania, hundreds of Erie County farmers were told to repay loan deficiency payments they had received for 1998 and 1999 crop years. These farmers report they would have been entitled to these payments had USDA employees correctly assisted them in filling out the applications. A recent article in a Northwestern PA publication indicates that USDA has chosen to reverse its earlier decision with regard to repayment, although only for those who have not made repayments. My office has not been informed of any such decision by the Department.

Is this report accurate?

Answer. No, this report is not correct; USDA has not reversed its decision.

Question. If so, how does the Administration justify holding farmers in Erie County to different standards with regard to this situation?

Answer. The standards are uniform for everyone.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

STATE MEDIATION GRANTS

Question. Please provide information regarding the number and type of problem resolutions that have been achieved through this program and include estimates on dollar amounts of loans that were prevented from being discharged through bankruptcy or other final resolutions that would have been counter to the interests of either party.

Answer. The USDA State mediation programs have helped resolve many areas of disputes, including farm loans, price support payments, wetland determinations, conservation compliance, and Conservation Reserve Program payment eligibility. The most difficult disputes to resolve involve farm loan programs, which represent 60 percent of mediation cases. Disputes involving the Conservation Reserve Program and production flexibility contracts represent the bulk of the other cases. Dispute issues involving rural housing loans, rural business loans, and crop insurance are considered appropriate for mediation by the USDA State mediation programs. The number of mediation clients increased from 4,140 in fiscal year 1999 to 4,673 in fiscal year 2000. The number of agreements or resolutions increased from 2,898 in fiscal year 1999 to 3,411 in 2000.

It is difficult to estimate the dollar amounts of loans that were prevented from being discharged through bankruptcy as a result of mediation. We do know that conflict is an expensive business. To the extent that regulations and procedures provide opportunities for voluntary resolution of disputes, financial benefits of mediation accrue not only to USDA but to other governmental institutions, businesses, and individuals, including farmers and ranchers. For example, State mediation cases usually cost between \$400 to \$800 a case depending on the complexity of the dispute and the number of participants involved. The average resolution rate is over 73 percent. The Nebraska Department of Agriculture reported that a significant amount of money is saved by parties using the Nebraska State Mediation Program since the attorney fees alone for a person in bankruptcy average between \$3,500 and \$7,500. Many of the savings are intangible such as restoring communications between farmers and lenders, helping producers improve their decision making abilities, and helping farmers better understand their options thereby making the ultimate solution more workable for them.

NEW MARKETS—BIOTECHNOLOGY

Question. It has been recently reported that scientists have discovered a gene in certain plants that can be modified that would increase the amount of oil the plant would produce, thereby, increasing its use for bio-energy. Does USDA support increased research and development in bio-energy and do you think that renewable energy derived from farm products can serve to replace conventional fossil fuels to any meaningful extent in terms both of decreasing our energy dependence on foreign sources and increasing farm income?

Answer. USDA does support increased research and development in bio-energy. In fiscal year 2001 the Agricultural Research Service will be investing \$6.867 million in research on this issue, CSREES will be investing \$6.594 million, the Forest

Service will be investing \$1 million, and the Commodity Credit Corporation will be investing \$150 million in incentive payments to develop increased production of biofuels. In addition, the Conservation Reserve Program (CRP) is conducting a demonstration project using grass and trees from six CRP locations to evaluate the feasibility of co-firing and firing electric power generation using biomass.

We do believe that renewable energy from farm products replaces a significant amount of conventional fossil fuels and decreases our dependence on foreign oil. We have conducted an analysis to determine the effect of replacing methyl tertiary butyl ether (MTBE) with ethanol. Results of that analysis indicated that the price of corn would rise by an annual average of 15 cents per bushel over the 2000 to 2010 period as a result of the increased demand for corn as a feedstock to produce ethanol. Over the same period, annual average net farm income would increase by about \$1.2 billion. Replacing MTBE as an oxygenate in gasoline would result in annual demand for about 4.5 billion gallons of ethanol, about 2.5 times the 2001 annual consumption, which is expected to be about 1.8 billion gallons.

QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

FARM PROGRAM DELIVERY

Question. It's likely that the farm economy will not improve this year, and there is a good chance that there will be an effort advanced by Congress to provide more emergency help similar to what has taken place the past few years.

In a visit to a local Farm Service Agency office in a fairly large county in North Dakota, I asked about staff needs. A seasoned veteran of many years told me that the office had experienced a reduction in force of seven full-time employees from the peak years of employment in the 1980's, but that the workload that was being asked of them was larger than anything she had ever experienced since coming to work in the office.

Obviously, local County FSA office staff are stretched to the limit, and I am concerned about the personal stress that is being placed on these workers and their families.

Computerization has made up for some of this loss of staff, but not all. Local County Executive Directors tell me one additional full time employee would greatly reduce the burden for existing staff. This is because temporary staff cannot be charged with many of the tasks, simply because they are not there long enough to warrant the training required.

Would the Administration support an increase in staff for local offices, given the need that is quite apparent?

Answer. FSA county offices have successfully implemented more than 25 new disaster and economic assistance programs over the last several years. Much of this unanticipated workload was completed due to the appropriation of supplemental funding and the subsequent hiring of temporary staffing. The agency relies on the flexibility of temporary staffing in order to best meet the changing workload activity levels and locations associated with the disaster and economic assistance programs.

FSA acknowledges the tremendous workload impact that these increased activities have had on the permanent workforce. Through the placement of temporary staffing, FSA has tried to minimize the impact on employee morale and stress issues. To increase permanent staffing levels at this time, however, would impact budgetary resources, limit flexibility of remaining staffing distribution, and put the agency in the position of potential reductions-in-force when workload activities return to normal ongoing operations.

AG MEDIATION

Question. USDA is requesting \$3 million for State agricultural mediation grants for fiscal year 2002—the same as last year. However, four new programs in California, Colorado, Mississippi and New York have pending certification applications. Since this is a growing program due to the continued depressed farm economy, it has been suggested that \$4.5 to \$5 million would be a more appropriate funding level.

Have any States been turned down for participation in this program due to a lack of funding?

Answer. No States have been turned down for participation in the USDA State mediation program. California is the 26th State to be certified by USDA. The certified States are:

Alabama; Arizona; Arkansas; California; Florida; Idaho; Illinois; Indiana; Iowa; Kansas; Maryland; Michigan; Minnesota; Missouri; Nebraska; Nevada; New Jersey;

New Mexico; North Dakota; Oklahoma; South Dakota; Texas; Utah; Washington; Wisconsin; Wyoming.

Colorado, Maine, Mississippi, New York and Tennessee State officials are interested in becoming certified pending availability of mediation grant funds.

These 26 certified States requested matching Federal grants totaling over \$3.825 million. In fiscal year 2001, \$3 million was appropriated, and each State's grant was prorated to approximately 78 percent of the request. This has resulted in States contributing more than their 30 percent share in order to maintain viable agricultural mediation programs.

QUALITY LOSS PROGRAM

I want to thank USDA for its commitment to start the signup for the quality loss program in May. The Farm Service Agency has struggled to get this complex legislation implemented, and I want to thank the Agency for all the hard work that has been put forth by everyone involved. I have never doubted that the Agency was not trying to get this program out to the farmers at the earliest possible date.

Having said that, I still want to impress on you the need to get the notice for this program published. We all know that there will be some lag time after publication to allow for county office staff training and to get the software finished and downloaded. I urge you to include in the publication examples of how the program will be implemented so that farmers and their bankers have some way to estimate the assistance that will be forthcoming to them.

Question. Once again, I thank you for committing to begin a signup for the Quality Loss Program in May. Obviously, there is still some work to do on the interpretation. Can you tell me if the "decision memo" has reached the Secretary's office for consideration yet?

Answer. All necessary decisions to begin signup have been made.

Question. Considering the late date of implementation and the fact that financial plans have been made with question marks with regards to the specifics of this program, will the notice include examples so that farmers and their bankers have some indication of what they can expect for assistance?

Answer. The notice will include examples and explain eligibility requirements for a QLP payment, including providing acceptable evidence of the quality loss.

FRUIT AND VEGETABLE VIOLATIONS RULE

The Fruit and Vegetable Rule contained in the 1996 farm bill was intended to keep farmers from switching program crop acres to fruit and vegetable production while pocketing AMTA payments. If a farmer planted a fruit or vegetable on a program acre, the fine was the value of the crop planted.

A number of farmers who grow dry beans in ND have inadvertently violated this rule due to farm reconstitutions, putting land into or out of CRP, etc. The fines range from \$1,000 to \$53,000. The farmer with the \$53,000 fine has annual AMTA payments of \$17,000 for his entire farm.

In ND, the fine for growing dry beans on program acres was calculated the following way: the county yield (1,000) × a set price (\$.18) = \$180/acre

A retroactive rule change was put in place in January:

—1st violation—a fine of 3 times the AMTA payment on the acres in question.

(For ND, a \$30 to \$45/acre fine instead of \$180)

—2nd violation—the fine reverts to the original rule.

The rule change was withdrawn for review in late January of this year.

Question. What is the status of the potential rule?

Answer. The Department is still considering whether to publish a final rule.

Question. Don't you agree that the penalty for the 1st violation under this change is a sufficient deterrent, and that leaving the original "drop dead" fine in place for the 2nd violation is a good compromise in that it alleviates ruinous fines to inadvertent violators while protecting the traditional fruit and vegetable growers?

Answer. There are varying opinions on this matter. During the comment period, some people advocated that no change in the rule should be made.

QUESTIONS SUBMITTED BY SENATOR TIM JOHNSON

BIOENERGY PROGRAM

Question. In South Dakota, the Bioenergy Program has already benefitted three ethanol companies and four specific plants. Broin Enterprises of Scotland, SD—my State's first ethanol plant, and Heartland Grain Fuels—with ethanol plants in

Huron and Aberdeen, SD—have both been approved for compensation under the Bioenergy Program.

Additionally, Dakota Ethanol, a new 40 million gallon farmer-owned ethanol plant based near Wentworth, SD, has tentatively been approved for compensation subject to the completion of the plant's construction yet this year.

Can you verify for certain if the Administration has included the authorized \$150 million for the Bioenergy Program for fiscal year 2002 (in addition to the \$150 million approved for fiscal year 2001)? Additionally, I believe the Bioenergy Program has merit and needs to be extended beyond 2002. Please tell me what the future holds for the Bioenergy Program in the USDA CCC budget.

Answer. Yes, the Administration has included the authorized \$150 million for the Bioenergy Program for fiscal year 2002. It is shown in the CCC Commodity Estimates Book, fiscal year 2002 President's Budget, Presentation No. 0301, dated April 9, 2001.

FARM BILL EMERGENCY AID

I believe Congress can and should amend current farm policy immediately to provide a more predictable secure safety-net for farmers in 2001 and 2002—essentially modifying the farm bill now instead of waiting until it expires. It is time for a new farm bill that provides a meaningful income safety net, is reasonable in cost to the American taxpayers, yet assures some level of economic security for our nation's family farmers and ranchers.

Question. When can we expect USDA to offer any suggestions for re-writing the farm bill?

Answer. The Administration plans to begin a process this month to develop policy proposals that will be included in a new farm bill. This process is expected to be completed by the end of the summer.

STATE AG MEDIATION GRANTS PROGRAM FUNDING

Question. The President's budget requests \$3 million for State Mediation Grants for fiscal year 2002, although it has been suggested that \$4.5 to \$5 million is needed to adequately fund this program.

Can you provide a list of the States which have requested to participate in this program but have been turned down for lack of funding?

Answer. No States with qualified programs have been turned down for participation in the State Mediation Grants program. This fiscal year 26 State programs requested matching Federal grants totaling \$3.825 million. With an appropriation of \$3 million, each State received approximately 78 percent of its request. Several States including Colorado, Maine, Mississippi, New York and Tennessee are interested in becoming certified pending availability of mediation grant funds.

Question. Please provide information relating to any problems identified by currently participating States associated with low funding levels.

Answer. Participating States are unable to engage in some of the activities authorized under the program. The Grain Standards and Warehouse Improvement Act of 2000, which reauthorizes the State Mediation Grants program through 2005, also authorizes the use of matching grant funds for financial advisory and counseling services. At the pro rated level, States are not able to assume this additional responsibility. States also are unable to address the full range of issues that the law makes subject to mediation.

In addition, officials in five more States are interested in becoming certified pending availability of mediation grant funds. The Federal share is authorized at 70 percent of the cost of a States's program, with the State contributing the remaining 30 percent. In fiscal year 2001 States have had to provide more than their required level of matching funds in order to maintain their operations. If Federal funds were further pro rated, there could come a point at which a State would consider its program not to be viable.

CONSERVATION PROGRAM CUTS

Question. USDA's proposed budget adequately addresses some of our agricultural, trading, and food safety priorities. Yet, I believe it fails to make some specific and significant investments in a secure farm safety net, conservation programs, efforts to restore marketplace competition, and rural development.

I am specifically concerned about the cuts or elimination of funds in fiscal year 2002 for important conservation programs such as the Wetlands Reserve Program, the Wildlife Habitat Incentives Program, and the Emergency Conservation Program.

Can we expect USDA to re-evaluate their position on significant cuts to conservation programs?

Answer. President Bush has made it clear that providing a farm security net consistent with the free market, including assistance to farmers to protect our farm-based natural resources, is a key objective of USDA's mission. USDA is reviewing and analyzing program and policy options, to be considered in the next Farm Bill, that would achieve this objective. Objectives within this review and analysis process include (1) establishment of the appropriate balance between the two major approaches to resource protection—i.e., major land use change, such as cropland retirement, and better management and protection of working farmlands, (2) better targeting of funding for programs and policies involving either approach, and (3) more and better cooperation with local and State governments to ensure that the Federal funds are best spent and funding leverage is maximized.

The Wetlands Reserve Program and the Wildlife Habitat Incentive Program have reached the acreage and/or funding limits established under the Federal Agriculture Improvement and Reform Act of 1996. Any future recommendations for these two programs or programs of these types will be developed within the farm bill review and analysis process. The President's Budget requests no funding for the Emergency Conservation Program for fiscal year 2002. However, the \$5.6 billion Government-wide National Emergency Reserve proposed in the President's Budget could provide for emergency conservation needs.

Question. Does USDA agree that programs like CRP, WRP, the new Farmable Wetlands Pilot, and others should be considered as part of a farm bill?

Answer. USDA is in the process of reviewing and analyzing conservation policies and programs to be considered for the next farm bill. The important resource conservation actions and policies embodied in the current Conservation Reserve Program, Wetland Reserve Program, and the Farmable Wetlands Pilot Program will be carefully reviewed and evaluated in establishing our conservation program proposals and priorities.

WOOL ASSISTANCE PROGRAM

Question. Some sheep producers in South Dakota have indicated to me that although the signup period for the ad hoc wool assistance program ends this Friday (May 4), actual payments will not be made until mid to late June. Sheep growers truly expect the payments to be made in May.

Can you confirm when the payments will be made on this program?

Answer. The target date for payments under the Wool and Mohair Market Loss Assistance Program (WAMLAP) II is the week of June 20, 2001.

Question. Also, can you provide me with the wool payments per State and how many producers are participating in the emergency wool program?

Answer. There are approximately 66,800 sheep and lamb operations that participated in WAMLAP I. Participation in WAMLAP II will not be known until the program's conclusion. Attached is a breakdown by State of WAMLAP I payment activity.

| Wool and Mohair Market Loss Assistance Program as of May 2, 2001 (Data Transmitted From Counties as of April 30, 2001) | | | | |
|--|-----------------------------|-------------------------------|---------------------------------|------------------------|
| Funds Available | | | | \$10,500,000.00 |

FY 2000

FOOTNOTES:

- 1/ These announcement footnotes are indicative only. See actual provisions set forth in Program Announcements. These FAS news releases are available on the internet at <http://www.fas.usda.gov> or through fax polling. Callers should set their fax machines for polling and dial (202) 720-1728. For additional information, contact the FAS Information Division (202) 720-7115.
- 2/ Except as noted, the following terms apply:
 -Coverage is available on an FAS/FOB basis
 -Maximum coverage is 98% of port value for GSM 102/103, SCGP is 65% of port value and FGP is 95% of port value.
 -Final registration date for is 9/30/00
 -Final export date is 11/30/00
- 3/ UNLESS OTHERWISE INDICATED, GSM-102 is shown in months, 103 in years, FGP in years and SCGP in days. *For SCGP no interest coverage is offered.
- 4/ Coverage on a C&F basis is available on sales made on C&F or CIF basis.
- 5/ Commodities as reflected in program announcement PR-0450-99 or as superseded. Credit terms as set forth in country/ regional program announcements.
- 6/ Credit terms for solid wood products, wood pulp and wood chips are offered up to 720 days.
- 7/ For Breeder Livestock, animal genetics, feeder cattle and poultry breeder stock, coverage is available on C&F basis to point of ocean vessel or international carrier discharge.
- 8/ For credit periods exceeding 6 months, principal repayments plus accrued interest are due at 6 month intervals.
- 9/ Products have been determined to be "high value products". See program announcement for details.
- 10/ Mexico(102)- Total authorization was \$1.5 billion, however, \$500 million remains unallocated i.e., non-operational.
- 11/ Mexico(103)-Total authorization was \$100.0 million, however, \$65.0 million remains unallocated i.e., non-operational.
- 12/ Korea(102)-Total authorization was \$590.0 million, however, \$15.0 million remains unallocated i.e., non-operational.
- 13/ Pakistan(102)-Total authorization was \$210.0 million, however, \$85.0 million remains unallocated i.e., non-operational.
- 14/ Egypt(102)-All commodities except poultry parts are eligible.
- 15/ Jordan(102)-The eligible buyer for the \$40.0 million line of credit is Ministry of Industry & Trade.
- 16/ Jordan(103)-The eligible buyer is Ministry of Industry & Trade.
- 17/ Tunisia(102)-For the \$10.0 million line of credit the eligible buyer is National Office of Oil.
- 18/ Tunisia(103)-The eligible buyer is Office National de Cereales.
- 19/ Lebanon(102)-For the \$3.0 million line of credit the eligible bank is the Central Bank of Lebanon.
- 20/ Lebanon(103)-For the \$7.0 million line of credit the eligible bank is the Central Bank of Lebanon.
- 21/ Korea(102)-The contractual shipping period for oilseeds and wheat has been extended to December 31, 2000.
- 22/ Uzbekistan(102)-Coverage on C&F basis to named point of destination.

ECG 09-00

QUESTIONS SUBMITTED TO THE FOREIGN AGRICULTURAL SERVICE

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

STARLINK BUY-BACK/BIOENGINEERED FOODS

Question. The Washington Post has reported that StarLink was found in new categories of corn products such as corn bread, polenta, and hush puppies in tests conducted by the company, Aventis, that developed the corn.

In your opinion, will this trigger more food recalls and cause more countries that are opposed to genetically-engineered food to avoid U.S. food products?

Answer. It is our understanding that Aventis, in a petition to EPA, described a new, more sensitive test for the StarLink protein (Cry9C) in finished foods. Aventis submitted data showing that in some food products made from dry milled corn meal, such as corn muffins, the StarLink protein was not broken down, although the level of the protein in the food was greatly reduced. The products tested were made from 100 percent StarLink corn. In addition, Aventis' recent submission supported a report EPA issued in March for public comment which showed that the process of wet-milling corn effectively eliminates StarLink protein from finished food products, such as corn oil, corn syrup, alcohol, and corn starch. However, contrary to what was reported in the Washington Post article, Aventis did not itself test any commercial food products and so did not find any StarLink in such foods. EPA will carefully evaluate this new information as it continues to review Aventis' pending request to completely authorize StarLink corn in the human food supply.

Pending a comprehensive evaluation of all scientific information available on human health concerns related to StarLink corn, EPA, the U.S. Food and Drug Administration (FDA) and the U.S. Department of Agriculture are continuing to coordinate an aggressive Federal effort, in cooperation with growers, millers, the food industry, and Aventis to divert StarLink corn away from the human food supply. USDA has been very successful working with growers and seed companies to ensure that bags of corn seed intended for the 2001 growing season are tested for the presence of StarLink corn and are not planted if found to contain StarLink. FDA and the Centers for Disease Control and Prevention (CDC) are continuing their investigation of cases in which people reported experiencing allergic reactions from eating corn products. Results of this investigation will be made public as soon as they are available.

Due to these extraordinary efforts, we are hopeful that few if any future food recalls due to the new test will be necessary, and that countries importing U.S. corn may rest assured that it is safe.

AGRICULTURAL TRADE/FOREIGN AGRICULTURAL SERVICE

Question. Last week, the Secretary testified that the Administration has established an ambitious trade expansion agenda, and USDA will be a "full and active participant in that effort." Can you be more specific about the major trade barriers faced by U.S. agriculture and how the Department is working and coordinating its efforts to further reduce trade-distorting policies, ensure fair competition in global markets, and expand and enhance economic and trade opportunities for U.S. agriculture?

Answer. There are numerous areas where USDA is working, together with USTR and other U.S. Government agencies, to remove barriers to U.S. agricultural exports. In addition to the numerous bilateral issues that come up on a regular basis, as indicated in the explanatory notes for FAS, one of the most significant USDA activities is the WTO negotiations on agriculture. These negotiations began in early 2000, as required by the WTO Agreement on Agriculture, and are making good progress. This is an important opportunity to reduce barriers in all of our trading partners with one agreement. Many significant barriers to our exports will be addressed in these WTO negotiations. In the area of market access, the most significant barrier we face is high tariffs. Average world tariffs for agricultural products are higher than 60 percent, compared to the U.S. average of around 12 percent. We have proposed that these tariffs be reduced substantially and in a manner that reduces disparities among countries. In the area of subsidies, the European Union spends more than \$5 billion in export subsidies annually, nearly 90 percent of all the export subsidies notified to the WTO. We have proposed that all export subsidies be eliminated. These are just some of the issues that are being dealt with in the WTO agriculture negotiations. For a complete listing of our proposals please look on the FAS web site (www.FAS.USDA.gov) under Trade Policy. USDA is also working closely with USTR and other agencies on regional and bilateral free trade

agreement negotiations such as the Free Trade Area of the Americas, the Chile FTA, and the Singapore FTA.

Another important area where U.S. agriculture faces barriers to our exports is the area of Sanitary and Phytosanitary (SPS) restrictions. While every country has the right to protect the health and safety of its consumers and to protect its producers from diseases and pests, these types of measures are often used to restrict trade without an appropriate scientific basis. USDA works with other government agencies, including FDA and USTR, to remove or modify these measures so that they do not impede U.S. exports. We also work to develop appropriate standards in the international standard setting bodies and to educate the authorities in developing countries so that their governments are less likely to adopt measures which do not meet the requirements of the WTO SPS agreement.

Another important area of work for USDA is to limit the restrictions being established in many countries on trade in the products of biotechnology. As these products become more common in international trade, many countries are proposing labeling and other measures to control their use and distribution. FAS does not currently have sufficient resources to keep up with the growing work load generated by these changes and, therefore, the President's budget has proposed additional funding for that purpose.

Question. The fiscal year 2002 budget is an increase of \$6.4 million above the fiscal year 2001 level to enhance the Foreign Agricultural Service's capabilities to address technical trade issues and to strengthen the Service's market intelligence capabilities at its overseas posts. Please give us an assessment of our current capabilities in each of these areas and how our efforts will be strengthened with the additional funds requested.

Answer. Roughly half of this increase covers non-discretionary increases in salaries and benefits associated with the proposed fiscal year 2002 pay raise. The remainder is intended for expanding overseas market intelligence capacity and dealing with technical trade barriers.

FAS overseas posts have traditionally focused on providing market research and intelligence, promoting U.S. products through marketing activities, and administering food aid programs. Since the Uruguay Round, this workload has been increased by the need to ensure foreign market access through trade policy activities. Growth of this portion of an already heavy workload, especially as it relates to non-tariff barriers, has shifted attention in our overseas posts from traditional reporting to trade policy interventions. Nevertheless, at this time we are unable to follow WTO compliance systematically, even to the extent of translating and analyzing other countries' formal WTO notifications of intended changes in regulations and laws. Our efforts to shift from gathering market intelligence on traditional bulk commodities to increasing emphasis on the faster-growing consumer-ready market segment have been hampered by diversion of staff resources to market access issues. We are missing market opportunities. New overseas staff will handle routine market intelligence and analytical chores as well as bolster our ability to track compliance with WTO obligations. Adding staff for this routine work will free our American agricultural attaches to focus on high-priority market access tasks, while ensuring that unbiased, accurate, and time-critical market intelligence continues to flow.

In Washington, additional trade policy staff will focus on knocking down or preventing the erection of non-scientific, technical trade barriers. Some such barriers already keep U.S. products out of foreign markets, such as Europe's ban on bioengineered corn. Examples of potential future barriers could include bans on bioengineered cotton, which is already in the marketplace, or bioengineered wheat, which could be on the market in the next 3 years. Current staffing permits FAS to react ad hoc to crises. It is already not sufficient to review systematically foreign government compliance with WTO obligations, to develop and implement strategies for dealing with the growth in technical trade barrier activity, to resolve technical issues of commercializing new products of biotechnology, or to ensure support of U.S. positions on food safety when they are debated within standard-setting international organizations.

Question. Where do the greatest opportunities to expand U.S. agricultural exports exist? How are these determined?

Answer. The Foreign Agricultural Service has set a goal of increasing the U.S. share of world agricultural exports from its current level of 18 percent to 22 percent by 2010. To be successful in reaching this overall goal, the Department must increasingly focus its trade policy efforts and export promotion programs and activities in those markets expected to be the most dynamic import growth markets of the next 10 years. Our experience and empirical evidence indicate that the greatest opportunities are in the emerging markets of China, Southeast Asia and Latin Amer-

ica (especially Mexico). In the somewhat longer term, India should be added to the list.

This determination is based on two primary factors. The first factor is based on identifying where overall food consumption growth is expected to be greatest given projected increases in consumer incomes and the propensities to translate those income gains into increased food consumption. This roughly translates into identifying the countries where the growth in the middle class is expected to be the greatest. One of the first consumer “needs” to be satisfied during the transition to middle class is food—namely, the quantity and variety of food consumed. In 19 of the world’s largest developing countries, experts have projected 600 million additional middle class consumers will emerge by 2006—the large majority are in the markets listed above.

The second factor involves those countries with very high market access barriers where reductions in those barriers through trade negotiations would translate into significant new opportunities for U.S. exporters. With the exception of Mexico, many of the countries identified above impose substantial barriers to U.S. exporters. For example, agricultural tariffs average 62 percent in WTO countries as a whole and over 100 percent (super tariffs) in a number of developing countries such as India. Levels that high not only sharply reduce U.S. exports, they act as a tax on local consumers, which leads to higher domestic prices and reduced overall food demand. The higher prices, in turn, lead to overproduction by local producers and is just another form of domestic support—paid for by consumers instead of taxpayers.

For the countries listed above, the combination of these two factors put them at the top of our list of “best growth market” prospects over the next 10 years. U.S. success in these growth markets will largely determine whether FAS’ 22 percent market share goal will be achieved. However, there will be fierce competition among the world’s major exporters (i.e. the EU and Cairns Group) to capture a large share of this new demand. Given the significant role that exchange rates play plus the increasing export expansion commitments of our competitors, especially in the area of market development, it is still too early to predict who will capture the lion’s share of these new export opportunities.

COCHRAN FELLOWSHIP PROGRAM

Question. The fiscal year 2002 budget proposes to maintain appropriations for the Cochran Fellowship Program at a level of \$4 million. What are the benefits of this program, not only in terms of educating foreign participants about U.S. products, but educating them about U.S. policies on issues such as food safety and biotechnology?

Answer. In fiscal year 2001, we expect to provide training programs for over 830 international participants from about 75 countries. This will be about a 14 percent increase in the number of participants from fiscal year 2000. Roughly half of these activities will directly involve providing training to potential international buyers of U.S. agricultural products, and will include making direct contact between U.S. agricultural producers and potential buyers. These activities will provide U.S. producers the opportunity to showcase not only the variety of U.S. products available on the market but to educate potential consumers about the uses and quality of these products. Many of these potential buyers are from countries not currently importing U.S. agricultural products.

Because market access issues in the areas of food safety and biotechnology remain a significant constraint to increased market opportunities, the Cochran Fellowship Program is working with FAS Agricultural Affairs Offices overseas and with our USDA regulatory agencies to provide training in these areas. For example: USDA’s Animal and Plant Health Inspection Service (APHIS) and Food Safety and Inspection Service (FSIS) are working with the Cochran Program to provide training to their counterparts in other countries in animal diseases and meat and poultry inspection. We expect to provide training to over 50 international participants in these areas in fiscal year 2001. We also expect to provide training to over 70 international regulators, scientists, and journalists regarding biotechnology issues. In addition, we will organize World Trade Organization (WTO) accession training activities for about 15 international policy makers in fiscal year 2001.

Question. How has the Cochran Fellowship Program contributed to our market development efforts?

Answer. The Cochran Fellowship Program works with FAS Agricultural Affairs and Agricultural Trade Offices overseas, as well as with U.S. agricultural trade and market development associations, to identify candidates for training that benefit market development efforts. This process has proven successful in the past. Examples include the following:

- Turkish participants who attended a Food Executive Program in fiscal year 2000 have already imported biscuits, cheese cake, popcorn, and peanuts from the U.S. and plan to import over \$5 million in 2001;
- A Russian participant purchased a 54 head dairy goat herd (valued at over \$1 million);
- A Moldovan participant has been buying U.S. soybeans for human consumption and has recently opened 10 new shops due to increased demand;
- Vietnamese and Colombian participants started importing California wine as a result of their training; a participant from India reports that he started importing cherries, apricots, prunes, and other items;
- A Polish participant purchased 5,300 portions of U.S. cattle semen; and
- The American Soybean Association states that the Cochran Program has benefited U.S. export of soybeans to Russia.

Question. In past years, additional funding has been provided for the program through AID and the CCC emerging markets program. Is additional funding being provided for the program in fiscal year 2001?

Answer. The Cochran Fellowship Program received \$1.662 million from AID through the Freedom Support Act in fiscal year 2001 for activities in the Independent States of the Former Soviet Union. To date we have received \$720,000 in fiscal year 2001 funding from the CCC Emerging Markets Program in support of Cochran activities in China, Southern Africa, and Serbia/Montenegro. We intend to request additional funds for Vietnam and Russia in the near future.

Question. Is the fiscal year 2002 funding level proposed for the Cochran Fellowship Program sufficient to extend fellowships to all countries which seek to participate in the program? If not, what additional funding would be required to meet these requests?

Answer. Each year the demand for the Cochran Fellowship Program expands, not only for additional countries but also to increase the size and scope of the program in some countries. In fiscal year 2001, for example, the program expanded into seven new countries (Yemen, Bolivia, Ecuador, Peru, Zimbabwe, Mozambique, and Botswana), requests for the number of Cochran fellows increased about 14 percent from 735 participants to over 830 participants, and we have seen significant expansion in requests for training in food safety, biotechnology, WTO accession, and the global food for education program. We estimate that the budget request is sufficient to meet the needs of the program.

Question. Please provide the fiscal year 2000 and 2001 program participant levels by country and region.

Answer. In fiscal year 2000, the Cochran Fellowship Program provided training for 735 international participants from 70 countries. Participant numbers by region and by country follow:

Asia.—180 participants from nine countries: Malaysia (16 participants), China (43), Thailand (29), Indonesia (23), Philippines (19), Vietnam (31), India (11), Pakistan (2), and Sri Lanka (6).

Latin America and Caribbean.—165 participants from 23 countries: Mexico (16), Venezuela (15), Trinidad & Tobago (13), Antigua (1), Barbados (9), Dominica (1), Grenada (1), Haiti (1), Jamaica (23), Dominican Republic (2), St. Kitts & Nevis (3), St. Lucia (3), St. Vincent (2), Panama (7), Colombia (26), Guatemala (8), Honduras (4), Costa Rica (11), Nicaragua (6), Brazil (5), El Salvador (4), Guyana (2), and Uruguay (2).

Eastern Europe.—156 participants from 16 countries: Turkey (15), Poland (20), Hungary (10), Czech Republic (18), Slovakia (10), Albania (2), Bulgaria (15), Slovenia (10), Croatia (14), Latvia (8), Estonia (8), Lithuania (3), Romania (12), Bosnia (4), Macedonia (1), and Montenegro (6).

Africa and Middle East.—48 participants from 11 countries: Cote d' Ivoire (4), Ghana (1), Senegal (2), Nigeria (4), South Africa (6), Kenya (8), Uganda (4), Tanzania (1), Tunisia (8), Morocco (7), and Oman (3).

Independent States of the Former Soviet Union.—186 participants from 11 countries: Russia (41), Ukraine (21), Kazakstan (20), Kyrgyzstan (18), Uzbekistan (17), Turkmenistan (13), Tajikistan (4), Armenia (8), Moldova (17), Georgia (18), and Azerbaijan (9).

The Cochran Fellowship Program has selected over 830 participants for the program in fiscal year 2001. The largest regional increases are in Asian and Latin America and Caribbean countries, as these are considered the largest growth markets for U.S. agricultural products. The program is also expanding in Sub-Saharan Africa, and the Middle East.

Question. Please provide examples of the benefits of the 2000 Cochran Fellowship Program to U.S. agriculture.

Answer. Several examples of the benefits of fiscal year 2000 programs, include:

- A Regional Southeast Asia Biotechnology training program for regulators and journalists from Thailand, Malaysia, Indonesia, the Philippines, and Vietnam led to a number of positive local newspaper articles on the safety of U.S. biotechnology products.
- The Cochran Program worked with several U.S. companies to provide dairy genetics training to African dairy technicians in fiscal years 1998, 1999 and 2000. These programs enhanced the trade linkages with U.S. companies and U.S. genetic exports to the region have expanded significantly.
- The FAS Agricultural Trade Office (ATO) in Shanghai, China reports that a Chinese wood products team “reported more use of U.S. wood products, such as maple, cherry, and walnut, in their projects. And as these companies are major players or trend setters in interior decoration it also influenced the use of American wood products by other companies.”
- Two Malaysian participants placed orders for trial shipments of Medjool dates, pecans, salted pistachios, prune concentrate, and other products after their Cochran training. The FAS Agricultural Office in Malaysia States: “The first-hand knowledge acquired served as a foundation for these importers to look to the United States for premium and quality products.”
- An Indian participant in a Cochran supermarket program reports that he developed business relationships with several U.S. companies during the training. He reports that: “One container of grain has just arrived and another with Oregon cherries, California apricots, prunes, and other canned items will be here next month.” Fiscal year 2000 was the first year for the Cochran Program in India.
- A fiscal year 1999 Vietnamese participant in a consumer food program reports that he “has set up a distribution center and plans to import 20 percent of the food products from the United States.”
- The FAS Agricultural Trade Office in Miami reports that a 1999 Cochran participant is now the largest distributor in Barbados and has significantly increased imports of U.S. produce, especially organic, to supply hotels and cruise ships and increased Certified Angus Beef and other meat products. In addition, two chefs are now using new products from the U.S. in their menus, such as organic produce, gourmet mushrooms, and duck products.
- As a result of a Cochran Program, a Colombian company reports they have introduced California wine to the largest supermarket chain in Colombia, and are working with another Cochran team member to continue their marketing activities to other Latin American countries.
- Following his fiscal year 2000 training program, a Kazakh fellow organized a private farmers market and established a school to train private farmers in the Pavlodar Oblask.
- A Cochran Program for Polish veterinarians laid the foundation for new health certificates for shipment of U.S. livestock to Poland. The FAS Office in Warsaw estimates that these certificates will allow for the continued export of \$50 to \$60 million of U.S. commodities.

EXPORT CREDIT GUARANTEE ACTIVITIES

Question. Please provide a listing of the activities supported under each of the four export credit guarantee activities in fiscal year 2000 and in fiscal year 2001 to date: Supplier Credit Guarantees, Facilities Guarantees, GSM-102 and GSM-103.

Answer. The information follows:

ACTIVITIES FOR FISCAL YEAR 2001 ARE AS OF APRIL 27, 2001

Summary of FY 2000 Export Credit Guarantee Program Activity for GSM-102 as of close of business:

September 30, 2000

FINAL

| Country / Commodity (Maximum Credit Period 3/) | Announced Allocations FY 2000 | Exporter Applications Received | Balance | Remarks/Additional Information 1/ 2/ |
|---|-------------------------------------|--------------------------------------|---------|--|

FY 2001

FOOTNOTES:

- 1/ These announcement footnotes are indicative only. See actual provisions set forth in Program Announcements. These FAS news releases are available on the internet at <http://www.fas.usda.gov> or through fax polling. Callers should set their fax machines for polling and dial (202) 720-1728. For additional information, contact the FAS Information Division (202) 720-7115.
- 2/ Except as noted, the following terms apply:
 - Coverage is available on an FAS/FOB basis
 - Maximum coverage is 98% of port value for GSM 102/103, SCGP is 65% of port value and FGP is 95% of port value.
 - Final registration date for is 9/30/01
 - Final export date is 11/30/01
- 3/ UNLESS OTHERWISE INDICATED, GSM-102 is shown in months, 103 and FGP in years, and SCGP in days *For SCGP no interest coverage is offered.
- 4/ Coverage on a C&F basis is available on sales made on C&F or CIF basis.
- 5/ Commodities as reflected in program announcement PR-0240-00 or as superseded. Credit terms as set forth in country/ regional program announcements.
- 6/ Credit terms for solid wood products, wood pulp and wood chips are offered up to 720 days.
- 7/ For Breeder Livestock, animal genetics, feeder cattle and poultry breeder stock, coverage is available on C&F basis to point of ocean vessel or international carrier discharge.
- 8/ For credit periods exceeding 6 months, principal repayments plus accrued interest are due at 6 month intervals.
- 9/ Products have been determined to be "high value products". See program announcement for details.
- 10/ Korea(102)--Total authorization was \$590.0 million, however, \$15.0 million remains unallocated i.e., non-operational.
- 11/ Mexico(102)-- Total authorization was \$1.0 billion, however, \$500.0 million remains unallocated i.e., non-operational.
- 12/ Tunisia(102)-- For the \$10.0 million allocation the eligible buyer is National Office of Oil and the eligible bank is Central Bank of Tunisia.
- 13/ Tunisia(103)-- The eligible bank is Central Bank of Tunisia.
- 14/ Jordan(102)--For the \$40.0 million line of credit the eligible buyer is Ministry of Industry & Trade.
- 15/ Jordan(103)--The eligible buyer is Ministry of Industry & Trade.

CATFISH IMPORTS

Question. The U.S. catfish industry has had an analysis done of the economic indicators of injury due to imports of frozen catfish fillets from Vietnam. The analysis concluded that data suggests that imports of frozen catfish fillets from Vietnam have both displaced significant volumes of U.S. produced frozen catfish fillets and kept U.S. producers' prices suppressed. This has affected the earnings and business prospects of U.S. catfish farmers and processors. The industry has been advised that an antidumping (Section 731) petition should be filed against imports of frozen catfish from Vietnam.

How can the Department best help the catfish industry to publicize its concern over the injury being inflicted by the imports from Vietnam and its desire for active consideration of an antidumping petition?

Answer. The Department is aware of the concerns of the catfish industry and believes that a greater understanding of the various competitive factors involved best serves as a platform for future action should that be deemed the appropriate response. USDA is working with an interagency working group, under USTR, to discuss and analyze various issues and options pertaining to the catfish industry's concerns about increasing imports from Vietnam. In part due to the U.S. industry's concerns and issues raised under the catfish interagency working group, the U.S. Food and Drug Administration has issued an import alert requiring that catfish from Vietnam be labeled with its common or usual name, not simply "catfish." This FDA alert was issued in response to Vietnamese exports being mislabeled as "catfish" even though U.S. common or usual name requirements do not permit that name for the Vietnamese species. We are hopeful that the recent FDA import alert has been effective and will eliminate the need for further actions. Other possible trade remedies might include: Requesting the U.S. International Trade Commission to conduct a Section 332 fact-finding investigation; filing an antidumping investigation; or filing a Section 406 non-market safeguard investigation.

QUESTIONS SUBMITTED BY SENATOR ARLEN SPECTER

BYRD AMENDMENT ON DUMPING

Question. The fiscal year 2001 Agriculture Appropriations bill included financial assistance to industries which are the victims of continued dumping and subsidization by our nation's trade partners. It required that antidumping and countervailing duties collected by U.S. Customs be set aside for grants to U.S. producers for certain purposes, including research and development, equipment, and health care and pension benefits. This legislation was expected to alleviate some of the hemorrhaging taking place in the agriculture industry, without modifying the circumstances in which antidumping or countervailing duties may be imposed or the amount of such duties.

What actions are the Administration taking to return antidumping and countervailing duties collected under this legislation to petitioners in the agriculture industry who sought relief from continued dumping and subsidization?

Answer. The U.S. Customs Service in the Treasury Department is responsible for implementation of the Byrd amendment. We understand that it is presently completing draft implementing regulations that will be reviewed by the Treasury Department and will then be made available for public comment.

Question. Concerns have been raised that our competitors in the World Trade Organization intend to challenge this legislation since they allege it is inconsistent with the principles of the General Agreement on Tariff and Trade of 1994 (GATT). In response to these concerns, I sent a letter, along with 13 of my colleagues, to President Bush urging the Administration to support this legislation on February 14, 2001. Are these concerns valid and what actions are the Administration taking to support this measure?

Answer. We believe the Byrd amendment is fully consistent with our international obligations. If a challenge is brought, the U.S. government will vigorously defend the law. So far, there have been no requests for formation of a WTO dispute settlement panel.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

DAIRY EXPORT INCENTIVE PROGRAM (DEIP)

Question. The President's budget provides for a slight increase in the Dairy Export Incentive Program from the previous year. However, it is my understanding there are approximately 40,000 tons of nonfat dry milk awards that had been allocated under DEIP, but for some reason were never shipped. Although industry requests had been made for this tonnage to be reallocated, the previous Administration had taken the position that a reallocation would be in violation of the United States WTO commitments. Further, since the Article 9 "rollover" authority expired on June 30, 2000, these unshipped quantities cannot be made available under DEIP.

Is Article 9 "rollover" authority expressly tied to previously allocated but unshipped tonnage in addition to previously unallocated tonnage?

Answer. Based on the U.S. methodology for reporting on export subsidy reduction commitments, the rollover authority applies only to previously unallocated tonnage. The U.S. has already used the maximum flexibility allowable under Article 9 "rollover" for nonfat dry milk by bringing forward DEIP allocations un-awarded in previous years prior to the June 30, 2000, expiration of that provision.

Question. Does the current Administration take the view that a reallocation of unshipped tonnage under DEIP would be a violation of our World Trade Organization (WTO) commitments and if so, what action will USDA take to better ensure that all allocations are actually shipped?

Answer. Authorizing the export of awarded but unshipped dairy product tonnage would be inconsistent with the established U.S. methodology for reporting export subsidies to the WTO and would likely be viewed by our trading partners as an attempt to circumvent our subsidy reduction commitments. We are now engaged in negotiations in the WTO to further liberalize trade in agricultural products, including the elimination of export subsidies. Taking steps that would be viewed by many as a circumvention of our current export subsidy commitments would be detrimental to our efforts in those negotiations. The Department is reviewing whether re-announcement of canceled tonnage within the confines of an allocation year can be accomplished. If it is decided to modify the DEIP operations to allow for this, it is expected that this action would alleviate the majority of any problems with unshipped tonnage.

INTERNATIONAL TRADE/MPC

Question. I appreciate your statements on the importance of trade to the agriculture sector and I agree that we must stay vigilant to protect our place in those markets. However, we must be careful not to rely too heavily on exports, as we learned in recent years following the Asian economic collapse. U.S. agriculture must not be left to the fragile whims of foreign economies. One trade issue that currently faces the dairy industry is the dramatic increase in Milk Protein Concentrate (MPC) imports.

To what extent are Milk Protein Concentrates (MPCs) displacing U.S. dairy products in domestic markets?

Answer. We have no hard quantitative data as to what products are manufactured using imported MPCs. A GAO study suggested a rather wide range of prod-

ucts with the higher protein MPCs directed towards health and nutrition foods. Having said that, it is our understanding that imported MPCs primarily substitute for nonfat dry milk (NDM) as a source of protein in beverage and food processing uses. MPC imports would, therefore, to some extent displace NDM. However, currently and in recent years, the CCC purchase price places a floor under domestic NDM prices. Therefore, we believe imported MPCs have little if any effect on U.S. dairy producer prices at present.

Question. Does USDA take the position that MPCs are subject to review under the WTO and if not, will USDA take actions to ensure that they become subject to such review.

Answer. Milk Protein Concentrates are subject to a U.S. tariff commitment in the WTO to limit the import duty to 0.37 cents per kilogram. At the time of the Uruguay Round, this product was specifically provided for in our tariff schedule and was not subject to any import quotas of the type that were converted to tariff rate quotas (TRQs) under that agreement. Consequently, MPCs were not included in our dairy TRQs. The United States expects other countries to adhere to their international market access commitments just as other countries expect the United States to comply with our commitments. Changes in these commitments would require agreement with affected countries on compensation. Consequently, changes to these international obligations must be considered carefully, within the context of our overall World Trade Organization commitments.

Question. If the Bush Administration is not willing to take a strong stand to stop MPCs, which can devastate the U.S. dairy economy, what signals does that send to our trading partners about our willingness to stand firm in the interest of U.S. agriculture?

Answer. As we have indicated, MPC imports have not been limited by quota and, therefore, could not have been included in our dairy TRQs when these were created during Uruguay Round negotiations. Revising commitments such as these require the agreement of our trading partners, generally through a process of consultation and negotiation. We will continue to stoutly defend the interests of U.S. agriculture in international negotiations. By adhering to our own commitments, we signal to our trading partners our firm expectation that they also abide by the commitments they have made with us.

EMERGENCY FARM ASSISTANCE

Question. Mr. Shipman, you mention that the fiscal year 2002 budget includes \$5.6 billion for natural emergencies and an additional amount totaling \$1 trillion over the next ten years for other unforeseen needs. It is my understanding that the \$5.6 billion would be to cover all emergency responses, government-wide.

What mechanism is in place to determine how much of the \$5.6 billion would be allocated to agricultural related losses? Would assistance have to be delayed until the end of fiscal year 2002 before any allocations could be made?

Answer. The \$5.6 billion National Emergency Reserve would provide for additional needs arising from major disasters above and beyond normal and average needs. Through disaster related programs such as USDA's fire fighting program and FEMA's disaster assistance, the budget provides for average funding needs related to disasters. The allocation of funds from the Emergency Reserve would be proposed by the President and acted upon by the Congress. USDA would monitor disaster related conditions and needs related to its programs to assure timely assistance, and work with the Administration and Congress to expedite assistance from the National Emergency Reserve.

Question. What if natural disaster losses far exceed \$5.6 billion? How much of the \$1 trillion could be made available immediately?

Answer. In addition to the National Emergency Reserve, the President's Budget provides an additional amount totaling \$1 trillion over the next ten years for a contingency reserve to allow for unanticipated priority spending needs, including emergency farm economic and disaster assistance. USDA would continue to work closely with the Administration and Congress to expedite assistance in the event that natural disaster losses exceed \$5.6 billion.

Question. How does USDA suggest that farm market loss assistance, if necessary, be allocated, especially for commodities that are not normally associated with ongoing USDA farm programs? Would you support assistance through some counter-cyclical formula, or would you prefer "freedom-to-farm" style payments that are not necessarily tied to actual need?

Answer. In terms of emergency assistance to be provided before a new farm bill is developed and put in place, we believe it will be necessary to assess the needs for assistance as they emerge and to balance that against the time available and

to take into consideration administrative feasibility. Market loss assistance for the major program crops has been provided utilizing the production flexibility contract formula the past 3 years. This procedure can be utilized by the Department to deliver market loss assistance in a very timely way on short notice without the need for a time consuming and burdensome signup process. However, as you note, this approach does not efficiently target producers of other commodities when there may be special needs. For the longer term, we would like to work with Congress in developing a new Farm Bill which will provide an adequate safety net so that ad hoc emergency market loss assistance would not be necessary. In terms of the objectives served by market loss assistance, some form of counter-cyclical support, whether it be based on the marketing assistance loan program and/or other formula, should probably be considered as a component of the safety net along with de-coupled payments along the lines of the current program. We will be reviewing approaches for consideration in the coming weeks and look forward to further discussions with Congress during the Farm Bill process.

Question. How would USDA respond to emergency needs that require a response this fiscal year?

Answer. As we discussed in the previous question, the short time available to provide any assistance during the fiscal year, would dictate a careful look at administrative feasibility as a limiting factor on the type of assistance that could be delivered this year if the need arises.

FOOT AND MOUTH DISEASE

When Secretary Veneman testified before us last week, I reminded her of the special importance of preventing an outbreak of Foot and Mouth Disease (or other serious animal disease) to a State like Wisconsin where the dairy industry, and its associated reliance on animal health, is so important to the State and regional economy. Since our hearing last week, Secretary Veneman has suggested that if an outbreak were to occur in this country, that USDA would provide compensation.

Question. In what form might that compensation take shape, and further, in a State like Wisconsin, would that compensation also cover losses such as dairy production losses that would be in addition to the actual loss of the dairy herd?

Answer. USDA has developed a compensation policy with the Office of Management and Budget and with input from other interested parties. The goal of this policy is to ensure that an outbreak is located and diseased or exposed animals are destroyed as soon as possible. For that, we need the full cooperation of all producers. For animals depopulated to eradicate a disease, USDA has traditionally paid an indemnity approximating the fair market value of the animals. We intend to provide compensation for the fair market value of animals depopulated due to FMD, possibly including other specific direct costs incurred by producers. We will provide more comprehensive information on our compensation policy in the near future.

GLOBAL SCHOOL FEEDING PROGRAM

Question. Former Senators George McGovern and Bob Dole have been actively supporting a Global School Feeding Program as an important step to improve nutrition, education, and ultimately, life in underdeveloped parts of the world. This year, USDA is providing \$300 million for the Global Food for Education Initiative, consistent with the vision of Senators McGovern and Dole.

Does the Bush Administration continue to support this effort?

Answer. The Department is in the process of implementing the pilot program. Decisions about further programming will depend on an evaluation of the success of the pilot in meeting its stated objectives.

Question. Does USDA have authorization to continue the activity begun under the previous Administration in the absence of Congressional action?

Answer. The Department is carrying out the pilot program under the authority of section 416(b) of the Agricultural Act of 1949. Section 416(b) is permanent authority which permits the Secretary of Agriculture to make available CCC-owned commodities for donation overseas.

QUESTIONS SUBMITTED BY SENATOR TOM HARKIN

EXPORT CREDIT GUARANTEES

Question. I wrote Secretary Veneman and Secretary O'Neill last month expressing my concern about the apparent readiness of the U.S. to accede to a proposal in the OECD to scale back substantially our GSM export credit guarantee programs. The OECD proposal would essentially eliminate the long-term GSM-103 program, cut

roughly in half the time allowed for repayment of other GSM credit and increase premiums and fees for GSM credit guarantees.

The GSM export credit guarantee programs are a critically important part of our nation's efforts to facilitate agricultural exports. For fiscal 2000, the GSM programs supported \$3.8 billion in export credit, but the actual Federal outlays were only a fraction of that amount at \$200 million. In addition, the U.S. spent about \$200 million overall on the Market Access Program, the Foreign Market Development Program, the Export Enhancement Program and the Dairy Export Incentive Program.

By contrast, the EU alone spends about \$6 billion a year on direct export subsidies, and foreign governments spend some \$230 million a year on market promotion—not counting various other export subsidizing policies. So I am very concerned that we not give up what is really our only export supporting program of any magnitude without getting concessions from the EU on export subsidies and from other countries on government trading enterprises.

What can you tell me about the status of these negotiations and whether the U.S. is still prepared to accept the Organization for Economic Cooperation and Development (OECD) proposal?

Answer. The United States and all other participants to these negotiations, except Canada, have accepted the draft proposal. Because the Canadians have not yet conveyed their intention to accept or reject the proposal, discussions in the OECD have not been concluded. We are very aware of the concerns expressed by members of Congress on this matter. We are also aware that most sectors of U.S. agriculture who currently benefit from the GSM program support our acceptance of the current proposal under discussion in the OECD. Our common goal, shared with both Congress and the agricultural community, is to assure the continuation of these GSM programs and maximize their benefit to U.S. agriculture. The U.S. Government has made clear that we will not accept any further changes in the draft proposal.

CONSERVATION RESERVE PROGRAM TECHNICAL ASSISTANCE

Question. The fiscal year 2002 Budget request contains a provision that would direct the NRCS to provide technical assistance for the Conservation Reserve Program (CRP), a conservation program funded by the Commodity Credit Corporation (CCC), out of its Conservation Operations Account, instead of receiving reimbursement from the CCC. I am concerned about this change. I fear that this dangerous approach to funding conservation technical assistance would force NRCS to redirect staff to those areas of the country that have the most CRP participation at the cost of other programs. Moreover, this policy may leave some counties in the U.S. without a basic program of conservation assistance; leave many farmers and ranchers without a source of assistance to help with nutrient management planning, soil erosion assistance, and water quality issues, which have been the cornerstone of conservation on private lands; and seriously impact the ability of the agency to respond with disaster assistance in the Emergency Watershed Program.

Has the Department considered the consequences and long-term implications of funding Farm Bill program implementation with Conservation Operations funding?

Answer. Under current law, the Conservation Reserve Program is authorized through calendar year 2002. Commodity Credit Corporation funds to reimburse NRCS for costs of providing technical assistance in support of the CRP are subject to the Section 11 cap on reimbursements to State and Federal government agencies. There is not sufficient funding within the cap to cover the CRP technical assistance costs estimated to be incurred by NRCS. The proposal to use Conservation Operations funding for CRP technical assistance reflects a request for funding that the Congress has appropriated in recent years through emergency funding in order to prevent any disruption of CRP activities. The Department will consider a longer term solution as we develop proposals for the new Farm Bill.

Question. Has the Department consulted with its own General Counsel on whether NRCS has legislative authority under Conservation Operations to perform work on the CRP?

Answer. Yes, the Department's General Counsel has been consulted on the proposed language change for the Conservation Operations account.

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Question. Competitors of the United States in agricultural exports are shifting more resources into market development activities because they are "green box" programs under the WTO rules. The EU has increased market development 21 percent and the Cairns Group 110 percent between 1995 and 1998.

For fiscal 2002, the President's budget the Cooperator Program would allocate \$27.5 million, which is \$6 million below the current marketing plan level of \$33.5

million. (For every Federal dollar the cooperators receive from the Federal government, producers match \$1.30 through checkoff and other funds.)

How can U.S. farmers hope to compete in international markets when they are provided less resources for market development than farmers in other countries, and even less than the U.S. provided last year?

Answer. There are many policy and macroeconomic factors that affect our producers' ability to compete in international markets. However, as agricultural systems become more global in scope and more responsive to market forces, the role of market development is expected to grow since it stimulates foreign demand and differentiates U.S. products from those of our competitors. With 96 percent of the world's population outside the United States, stimulating that demand is a major challenge but one that can pay big dividends to producers in the form of higher exports and increased farm income.

Our competitors and their producer groups have already recognized this. We estimate they have collectively increased their market development commitment by 50 percent since the Uruguay Round (1995) to over \$1 billion a year. In contrast, the total U.S. market development commitment has grown by only a fraction since 1995. As a result, the market development "investment" gap is growing which concerns us greatly due to its implications for long term competitiveness.

In response to this investment gap, USDA has encouraged U.S. producer groups that participate in its main market development programs—the Market Access Program (MAP) and the Foreign Market Development program (FMD)—to increase their financial commitment to this effort. Those that do are rewarded through the MAP and FMD program allocation processes. The response by program participants has been impressive, especially in light of the difficult financial situation many U.S. producers find themselves. For MAP, U.S. industry contributions rose to a record 95 percent of U.S. government funding in 2000 (or 95 cents of industry funds for every dollar in U.S. government funds)—up from just 30 percent in 1992. For the FMD program, industry contributions stand at a near record 130 percent, up from 75 percent in 1992. Statistics like these demonstrate producers' commitment to market development and their willingness to share in its cost.

QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

FOOD AID

Question. Secretary Veneman has stated: "The budget includes a commitment to take a further look at the USDA's foreign food assistance programs to be sure they are effective in achieving their objectives. The study has not yet been designed . . . we want to ensure that these programs significantly benefit farmers, target necessary humanitarian feeding needs and avoid adverse commercial impacts."

Family farmers produce a safe and abundant food supply for this country and the world and then are told by the marketplace that it is of little value. At the same time, hundreds of millions of people around the world still go to bed hungry every night. I think this disconnect is atrocious, and have always been a strong advocate of this nation's food assistance programs. I am all for improving our food assistance programs.

Could you explain further the goals of the Administration's proposed study of the Foreign Food Assistance programs?

Answer. The goals that have been identified to date include an evaluation of the continued effectiveness of U.S. food assistance programs. The study will look at program structures and effectiveness, administrative structure, and the decision-making processes.

SURPLUS COMMODITY PROGRAM 416(B) AND PUBLIC LAW 480

The U.S. continues to hold grain and soybean carry over stocks at record high levels and farm-gate prices are at historic lows. This situation continues to destabilize the U.S. agricultural economy.

The Administration's budget estimates 2001 expenditures for Public Law 480 to be \$1.107 billion. 2000 expenditures were \$1.293 billion. Section 416(b) cannot be relied upon to make up the difference since, as the budget states, the types and levels of commodities vary year-to-year and often are not available at all from the CCC inventory. Yet, the Administration is suggesting a cut of \$112 million for the Public Law 480 account from 2001 estimates and \$298 million from actual 2000 expenditures.

Question. How will the U.S. maintain its commitments and be prepared to meet emergency needs without maintaining a level of funding equal to previous years?

Answer. One of the objectives of the fiscal year 2002 budget set by the President is to slow the growth of Federal spending. Accordingly, some programs are proposed to be continued at current funding levels. The Public Law 480 foreign food assistance programs have proposed budget authority at the same level provided by Congress in fiscal year 2001. Our ability to provide donations of food commodities under the authority of Section 416(b) in fiscal year 2002 will be determined in large part by the availability of domestic commodity surpluses. The domestic supply situation will not be known until the fall, and at that point the Administration can be expected to make a decision on the level and extent of section 416(b) donations in 2002.

QUESTION SUBMITTED TO THE AGRICULTURAL MARKETING SERVICE

QUESTION SUBMITTED BY SENATOR TIM JOHNSON

LAMB MEAT ADJUSTMENT ASSISTANCE PROGRAM

Question. The most common question on the lamb meat adjustment assistance program I receive from SD sheep producers is whether USDA make any adjustments to the year two or three programs for feeder and slaughter lambs, suggesting that the standards for the slaughter lamb quality should be expanded to include a wider range of lamb carcasses including yield grade 3 lambs with the current standard of yield grade 2 lambs only. The average qualifying percentage of lamb so far is less than 30 percent.

Do you have any thoughts on this?

Answer. There will most likely be no change in the standards to include yield grade 3 lambs in the year three programs for feeder and slaughter lambs. The purpose of the program was to design assistance measures to help the industry improve its competitiveness and to facilitate efforts to adjust import competition as outlined in the petition filed before the U.S. International Trade Commission (USITC). Thus, payments must continue to be limited to yield grade 2 if they are to serve as an incentive for the production of higher quality, more competitive lambs. Year three payments may be incorporated, if necessary, to assure that the program does not over-spend the funds allocated.

QUESTIONS SUBMITTED TO THE CHIEF ECONOMIST

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

DAIRY POLICY

Question. United States dairy policy continues to include features that are particularly harmful to the Upper Midwest, which is one of the primary dairy production areas in the country. One component of this flawed policy is the introduction of regional dairy compacts such as the one currently in place in the Northeast. To make matters worse, the House of Representatives just this week introduced legislation to expand dairy compacts to other States.

President Bush wants to establish the "Free Trade Area of the Americas" which would be a comprehensive free trade agreement between the 34 democracies in the Western Hemisphere. We have all heard the speeches and we have all seen the photo opportunities. I strongly suggest that before President Bush seeks free trade among 34 countries, he guarantees free trade among the 50 United States. We should support free trade at home just as strenuously as we do internationally.

Last year, Congress again provided financial assistance to dairy producers suffering from historical low market prices. While prices have rebounded somewhat, they are still far below the costs of production and Wisconsin continues daily to lose dairy farmers.

Does the Bush Administration believe that it is important to move agricultural products freely throughout the United States?

Answer. The Bush Administration firmly believes that agricultural products should move freely throughout the United States and throughout the world, and the Administration is fully committed to enforce all existing laws pertaining to the movement of agricultural products in interstate commerce. I would note that no court has found the Northeast Interstate Dairy Compact to be in violation of any State or Federal law.

Question. Please provide your thoughts on the best way to achieve a national dairy policy that treats all producers fairly and meaningfully, that does not send improper market signals, and that minimizes the different treatment of producers who operate in different regions of the country.

Answer. There is no question that dairy policy has been extremely controversial, with many producers feeling that they are being disadvantaged by the current system. In addition, some milk processors believe the current system does not meet their needs. Over the next few months, the Administration will develop its recommendations for the 2002 Farm Bill. In that process, we will actively seek out the advise and counsel for the Congress and the dairy industry and make a concerted effort to reach a consensus on dairy policy.

Question. Would you please comment on S. 294, the legislation I introduced along with Senator Santorum to establish a counter-cyclical national dairy program?

Answer. Many farm groups have proposed establishing counter-cyclical programs in which farm program payments would vary inversely with the level of market prices. In some instances, the proposed programs would increase considerably farm program outlays. Furthermore, the amount of aid provided to producers under these proposed programs and other programs that would continue could exceed our current World Trade Organization (WTO) commitment on production distorting support, which would likely decline under a new trade agreement. These are vitally important considerations that go beyond dairy policy, but encompass all aspects of farm policy. The Bush Administration is committed to developing a 2002 Farm Bill proposal that meets the needs of all producers but also meets spending targets and is consistent with current WTO obligations and the Administration's proposal for future trade reforms.

The Administration does not support S. 294, as drafted, for the following reasons. First, the bill would provide payments to producers to compensate for low milk prices in fiscal year 2000. These payments would be in addition to emergency assistance already provided by Congress to compensate for low milk prices in 2000 in the fiscal year 2001 Agriculture and Related Agencies Appropriations bill. Second, S. 294 triggers payments on all of a producer's milk production, not to exceed 26,000 hundredweight, based on the Class III milk price for the previous year. While the Class III price may be low, the prices of other classes of milk may not. Thus, the triggered payments may not be commensurate with the level of income producers receive from the marketplace. Lastly, the Administration has several concerns regarding the supply management provision of the bill in which producers may receive a bonus payment if they do not increase production from the previous year.

QUESTION SUBMITTED TO THE RISK MANAGEMENT AGENCY

QUESTION SUBMITTED BY SENATOR BRYON L. DORGAN

CROP INSURANCE COVERAGE OF UNHARVESTED SUNFLOWERS AND CORN IN NORTH DAKOTA

Question. Wet weather starting with rain the last week in October and ending with November snowfalls caused over 100,000 acres of sunflowers and corn to be left in ND fields as of November 30, 2000 and December 10, 2000. These are the respective dates harvest is to be completed in the Crop Insurance contracts. Despite an agreement I reached with the Risk Management Agency early last January, some farmers have had the appraised amount of the crop left in the fields charged towards their insurance coverage.

Six weeks of rain and snow at the end of the sunflower and corn harvest prevented the completion of harvest. This weather occurred during the insurance period—and should have been cause for leniency when considering losses. Many fields contained enough crop so there wasn't any payment of indemnity based on a November 30 or December 10 adjustment. The contract was closed out, and, in some cases the crop has been lost. The end result is the same as if a hail storm had wiped the crop out during the summer. Some harvesting did take place after the Contract Harvest Date and was an indication that farmers were interested in getting the crop—not collecting the insurance. Farmers who bought crop insurance in good faith deserve coverage on this lost production. Procedure does exist in RMA rules to extend coverage on a case by case basis—and would have been a safeguard against fraud or abuse. This insurance is too costly to have coverage denied when the bad weather that prevented harvest occurred during the insurance period and the end result was that some of the crop was ultimately lost this spring. Enclosed are pictures of one

of the corn fields in question under water this spring. (Note: RMA did not receive the picture.)

Can you assure me that the RMA will look into this and resolve this issue fairly? Don't you think a farmer who has tried to harvest his crop—but has been prevented from doing so by six weeks of rain and snow—ought to receive full crop insurance if the crop is ultimately lost?

Answer. Senator, RMA appreciates that some farmers were adversely impacted by bad weather at the end of last year and that some producers were unable to harvest their crops by the “end of the insurance period” which is stated in their crop insurance policy. Because of the questions you raised on this issue RMA has been reviewing our policies and procedures to ensure that producers are treated fairly in these cases. However, insurance contracts are between insurance companies and farmers, not RMA and it is the responsibility of the companies to ascertain the individual facts for each producer and apply the policy provisions correctly and consistently.

RMA did issue additional guidance for the 2000 crop year as a result of your inquiries that gave companies sufficient flexibility to address the late season weather conditions, while taking into account each producer's situation on a case by case basis. Insurance companies have a responsibility to determine if any losses were caused by an insured peril or if the delays in harvesting were due to other uninsurable circumstances. In discussions with the companies, the issue of program integrity was raised regarding individual producers that had been identified as having a problem with a late season harvest. RMA knows that you fully support the emphasis on contract compliance in order to safeguard the program for those farmers who have legitimate insurable losses.

RMA understands that the insurance companies have resolved this matter with most of the farmers affected by the late season weather conditions. However, there remain a few farmers for which this issue has not been fully resolved. RMA will continue to monitor this issue and will review the facts of any individual producer's specific claim to ensure that the policy was correctly administered by the insurance provider.

SUBCOMMITTEE RECESS

Senator COCHRAN. Our next hearing is scheduled for Thursday, May 10, at 10 o'clock in the morning in this room, 138, the Dirksen Senate Office Building. At that time we will hear from witnesses from the Department of Health and Human Services on the President's budget request for the Food and Drug Administration.

Until then, the subcommittee stands in recess.

[Whereupon, at 11:37 a.m., Thursday, May 3, the subcommittee was recessed, to reconvene at 10 a.m., Thursday, May 10.]

**AGRICULTURE, RURAL DEVELOPMENT, AND

TRITION**

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The subcommittee will please come to order.

Today I am pleased to convene a meeting of our subcommittee to continue our hearings on the fiscal year 2002 budget submitted by the President for Agriculture, Rural Development, and Related Agencies. This morning we are pleased to welcome witnesses from the Food and Drug Administration in the Department of Health and Human Services to present the portion of the budget that relates to the activities under the jurisdiction of the Food and Drug Administration.

This morning specifically we welcome the Acting Principal Deputy Commissioner of FDA, Dr. Bernard Schwetz. He is accompanied by Linda Suydam, Senior Associate Commissioner of the FDA; Jeffrey Weber, FDA's Acting Senior Associate Commissioner

for Management and Systems; and Kerry Weems, Acting Deputy Assistant Secretary for Budget of the Department of Health and Human Services.

The committee is well aware of the Food and Drug Administration's achievements and challenges. Not only must the agency ensure that life-saving and other beneficial products and devices are brought to the market as quickly as possible, but it must also protect the public's health and safety by making sure these products are safe and effective. Its responsibility extends from foods to medical devices to animal drugs and blood products. FDA not only regulates domestic products, but must ensure that imports of these same products are equally safe and effective for the public use. It is a very challenging task, even more so because of a marketplace, which is not only growing rapidly, but becoming increasingly sophisticated and complex.

We appreciate the attendance of other Senators this morning. I am going to recognize them for any opening statements that they might wish to make at this point, and then we will invite our witnesses to summarize their written testimony, which will be made a part of the record in full.

Senator Bond.

STATEMENT OF SENATOR CHRISTOPHER S. BOND

Senator BOND. Thank you very much, Mr. Chairman. I join with you in welcoming Dr. Schwetz and colleagues and say, as I think you and all Americans would express, how much we appreciate the tremendous work that the FDA does day in, day out, year in, and year out to ensure that we have the safest food supply, the safest medical systems in the world. We have the right, I believe, to take pride in what you are doing, and we want to ensure that we provide you the resources to continue your good work to ensure the highest standards of safety.

I have a particular interest in one area. I notice on page 2 of your testimony submitted for the record, Dr. Schwetz, you point out the work you are doing with bioengineering of plants and animals. Plant biotechnology is something that has tremendous potential for the future. I have talked to scientists who tell me that really this is perhaps the third technological revolution after the Industrial Revolution, the Information Technology Revolution. We have the opportunity to make significant strides in improving human nutrition, limiting impacts on the environment and the use of harsh chemicals, and ensuring that we deliver, perhaps even through nutraceuticals, the kinds of vaccines and other treatments that are needed particularly throughout the third world.

At the same time, we have seen, beginning in Europe and spreading somewhat into this country, an hysterical attack by what I would call, in some instances, modern day Luddites, in other instances, simply farmers in other countries who do not want to see our farmers continue to maintain and build on the technological edge they have in producing food more efficiently and more nutritiously. In this country, there are those who represent competing food groups who are financing this hysteria, plus the usual group of suspects who are simply out making money off of spreading false information.

But you have taken a strong stand with respect to the testing and the regulation of biotechnology, assuring that science and not politics leads the way. If you find something that does have an allergen or if you find a problem with it, we need to know. We want to make sure that product does not reach the market or does not reach the market without adequate labels or whatever protections you think are important. You have to answer the fundamental question: Is it safe or is it not safe and under what conditions? I think that your continued working doing that and using the very best science available is extremely important to our scientific advances and to continuing to improve the human condition throughout the world.

I predict some day, when the benefits of this technology emerge very clearly on behalf of human health and the environment, we will have to send out a search party to try to find members of the nay-sayer community who have been so vociferous in opposing this because they do not understand it. I do not understand it, but I know what it can do. And I depend upon you to make sure that what it does is healthy. I commend you for it. It is vitally important.

GENERIC ANIMAL DRUG PRODUCER

I will have some very specific questions to submit on behalf of the record, Mr. Chairman, if you do not mind.

But I do have to raise one particular matter that I wish you would look into that is very serious in my State. It relates to the regulation of a particular generic animal drug producer in Missouri called Phoenix Scientific. I do not expect you to comment on it, and I know this is a regulatory matter, but I am hearing from a desperate company that is about to go out of business because of regulations. If there is something wrong, they need to know. If it is excessive regulatory inquiry, that is something that you need to look at, I think, from the headquarters.

I have no way of knowing, without all the facts of the matter, what the problems are, but I do know that the company reports to have had no lawsuits, no recalls, no accidents, no animal deaths, no negative tests on sanitary conditions, no previous enforcement actions against it. And as we hear from veterinarians in the area of northwest Missouri they serve, they say they get fine products and they do not know why they cannot get them.

The company is desperate. They have hired regulatory consultants. They are bombarding me. Their workers are calling us saying, we are about to lose our jobs. This company is the sole producer of products that livestock people use, and veterinarians tell me they cannot get the product anymore.

If there is a legitimate problem, it is hard to imagine why it has taken 2 years of regulatory investigation not to come up with a specific answer or a clear-cut series of directions as to what they must do to resolve them. According to what they tell us, the regulators have not even outlined the changes the company needs to make to be deemed in compliance.

Now, I know that the Kansas City district has had a dramatic increase in enforcement actions overall in the last year relative to the previous 10. I do not know whether that would indicate you

were not doing an adequate job for the previous 10 years or if they are overdoing it now, but months and months have passed with no resolution. The company obviously has an incentive to fix the problems that are preventing them from producing and selling and earning the money they need to pay the wages. The company is losing money. Farmers soon will be without the products. The employees are concerned.

I would just ask that you take a top level look at this to find out if there are problems that need to be resolved, then lay them out and let them know what needs to be done to make sure that they meet their legal obligations to ensure animal safety. But also, I ask that you ensure that the inspectors conduct their responsibilities in a fair, impartial and expeditious manner.

I apologize for having to take up the time of the committee, but it is a serious question. And I thank the chairman.

Senator COCHRAN. Thank you, Senator Johnson.

STATEMENT OF SENATOR TIM JOHNSON

Senator JOHNSON. Well, thank you, Mr. Chairman. I will submit a full statement for the record.

I would like to just comment briefly here this morning at the outset.

First, I welcome obviously Dr. Schwetz, as well as the other members of the panel, as well as Dr. Sundlof, who I had an opportunity to meet with earlier in my office this past week or so.

My primary concerns on the hearing today revolve around the Office of Generic Drugs at the FDA, as well as the Center for Veterinary Medicine. About a month ago, I met with Dr. Sundlof to discuss FDA actions to prevent BSE, or mad cow disease, in the United States. I look forward to testimony and your insights and the progress that FDA has made since our meeting.

BSE

I am pleased that FDA's 2002 budget request of \$1.4 billion represents a significant increase over 2001.

In our discussion with Dr. Sundlof, we discussed the FDA 1997 rule that U.S. rendering plants and feed mills ban the mixing of animal protein in manufactured ruminant feed and that feed mills apply cautionary labels on feed products with ingredients that may contain non-approved mammalian protein. In that meeting, FDA made an assurance to inspect 100 percent of all feed mills in addition to reinspection of feed mills that were found to be out of compliance with the ban by September 30 of this year. I am pleased that the testimony today includes a commitment to do just that.

During our meeting, it was reported that over 1,000 feed mills are licensed under the FDA and that 16 percent failed to prevent the commingling of bone and meat material in ruminant feed and 12 percent failed to issue warning labels on feed containing material prohibited for ruminant feed.

Today livestock producers in my State of South Dakota and across the country are being asked to certify that they are not feeding prohibited material to cattle and sheep to prevent an outbreak of mad cow disease. If any feed mills and others are knowingly

avoiding compliance with the FDA's rule, it creates serious marketing uncertainty for cattle and sheep producers and feeders who might unfairly be held accountable for unknowingly using feed in ruminant material.

So, I look forward to comments on how the FDA will assure that feed mills and renderers do, in fact, comply with the ban by your prescribed time table of September 30, 2001, and also given the fact that the FDA contracts with States to inspect feed mills and rendering plants and that up to 80 percent of all inspections are done by State officials and not the FDA, I am interested in this collaborative effort and how effective and airtight it really is.

GENERIC DRUG APPROVALS

A second matter that I will be interested in today has to do with the Office of Generic Drugs and my concern about access to affordable and safe prescription drugs. I am concerned with a number of applications for generic drug approvals that will be coming before the Office of Generic Drugs in the future and whether or not the OGD will have sufficient resources to meet the statutory 180-day time frame necessary for approval of these applications.

PREPARED STATEMENTS

I am also concerned about allegations of conflicts of interest within the FDA advisory committee and any comments that might be had there.

So, Mr. Chairman, thank you for holding this very timely hearing and I look forward to the testimony today.

[The statements follow:]

PREPARED STATEMENT OF SENATOR TIM JOHNSON

Thank you Chairman Cochran, Ranking Member Kohl and members of the subcommittee, I am pleased to participate in today's hearing on the fiscal year 2002 budget request for the Food and Drug Administration (FDA).

I welcome Dr. Bernard Schwetz, Acting Principal Deputy FDA Commissioner, as well as other FDA officials here today including Dr. Stephen Sundlof, Director of FDA's Center for Veterinary Medicine. One month ago I met with Dr. Sundlof to discuss the actions taken by FDA to prevent an outbreak of Bovine Spongiform Encephalopathy (BSE also known as "mad cow" disease) in the United States. I discovered a great deal from that encounter and I look forward to your insight on the progress FDA has made since our meeting to strengthen existing safeguards that keep BSE out of our country.

Mr. Chairman, the day-to-day operations of FDA reach every single American person, it is clear this agency has an awesome responsibility. I am pleased FDA's fiscal year 2002 budget request of \$1.4 billion represents an increase of \$123 million over fiscal year 2001. Congress and the American people expect FDA to protect our health and promote our well-being and today, I would like to focus on a few of these timely and critical matters under FDA's jurisdiction.

Commissioner Schwetz, earlier this year I wrote you a letter requesting a meeting concerning FDA efforts to prevent the occurrence of BSE in the United States. Given the confusion tied to the effects of BSE in Europe, I believe it is imperative that Congress and the FDA make every attempt now to ensure that domestic feed supplies, livestock herds, vaccines, and meat products remain safe for the consuming public.

As I mentioned earlier, I was pleased that on April 5, Dr. Stephen Sundlof, Director of FDA's Center for Veterinary Medicine, met with me to discuss the efficacy of a 1997 FDA rule that U.S. rendering plants and feed mills end the mixing of animal protein in manufactured ruminant feed, and that feed mills apply cautionary labels on feed products with ingredients that may contain "non-approved" mammalian protein.

In this meeting, FDA made an assurance to inspect 100 percent of all feed mills—in addition to re-inspections of feed mills that were found to be out of compliance with the ban—by September 30 of this year. This comprehensive inspection approach should help ensure that prohibited animal meat and bone material is not being mixed with ruminant (cattle, sheep, goat) feed. I am especially pleased to recognize that your testimony today supports the commitment you made in our meeting. Because it is believed BSE was first caused in the United Kingdom when sheep meat and bone meal was fed to cattle, it is imperative that FDA take precautions to guarantee that domestic feed supplies are not “contaminated.”

During our meeting, Dr. Sundlof reported to me that of U.S. renderers inspected by FDA, 10 percent failed to prevent the co-mingling of meat and bone material in potential feedstuffs and 11 percent failed to properly affix labels or other precautionary statements to products containing prohibited material.

Additionally, over 1,000 feed mills are licensed under the FDA, and 16 percent of these licensed feed mills failed to prevent the co-mingling of bone and meat material in ruminant feed and 12 percent failed to issue warning labels or notifications on feed containing material prohibited for ruminant feed. Today, livestock producers in South Dakota and across the country are being asked to certify that they are not feeding prohibited material to cattle and sheep in an effort to prevent an outbreak of mad cow disease. If any feed mills and others are knowingly avoiding compliance with FDA’s rule, it creates serious marketing uncertainty for cattle and sheep producers and feeders who might unfairly be held accountable for unknowingly using feed with ruminant material. Current conditions warrant that anything less than full compliance with this rule is unacceptable, so I look forward to your comments on how FDA will assure that feed mills and renderers comply in a meaningful way by your prescribed timetable of September 30, 2001.

I also discovered from Dr. Sundlof that FDA contracts with individual States to inspect feed mills and rendering plants, and that remarkably up to 80 percent of all inspections are done by State officials and not the FDA. I am curious to learn how effective this collaborative effort really is, and I believe this subcommittee should explore the need to make certain that FDA has enough resources and people to do inspections, or, that we have sufficient funds to provide States with compensation for their efforts.

However, I am pleased that FDA made BSE prevention efforts a top priority in their fiscal year 2002 budget request. Indeed, FDA has targeted \$15 million in the fiscal year 2002 budget request to protect consumers against the variant Creutzfeldt-Jakob disease (vCJD), a fatal disease in Europe linked to BSE. FDA has also tapped a contingency fund within its Center for Veterinary Medicine to re-program \$2.4 million in fiscal year 2001 to conduct the inspections and reinspection of feed mills and renderers.

Beef cattle production represents the largest segment of South Dakota’s agricultural economy. If mad cow disease or Foot and Mouth Disease (FMD) were to invade South Dakota or the U.S., the effects could be monumental. It is simply incumbent upon Congress and the FDA to identify whether or not current BSE safeguards are being followed in a serious way. Proactive measures now will reassure consumers and livestock producers that our ruminant feed products, domestic livestock herds, and food supplies are safe.

South Dakotans and others across the country are also concerned about access to affordable and safe prescription drugs, and FDA’s Office of Generic Drugs (OGD) is charged with the responsibility of approving and marketing new generic drugs as patents on brand-name drugs expire. Over the next five years, the patents on approximately \$34 billion in sales of brand drugs will expire. Studies have indicated a generic drug typically enters the market priced 30 percent less than the brand product and consumer savings increase up to 80 percent on average after two years. This translates into significant savings to consumers and health care programs such as VA, Defense, Medicaid, and Medicare. In fact, consumers stand to save over \$5 billion as patents on a number of blockbuster drugs expire.

However, I believe more should be done to make health care providers, managed care organizations, health insurers and consumer organizations better informed about the safety and equivalency requirements for generic drugs. Lack of knowledge and awareness about generic drugs reduces the likelihood that these groups will recommend or use generic drugs when they are available as a substitute to brand products. Furthermore, preconceived concerns about the quality of generic drugs, although unwarranted, can adversely impact patients’ treatment programs. I believe these constituencies need to know that the equivalency between generics and brand products will lead to greater health care savings. In fact, studies have indicated that a 1 percent increase in the use of generic drugs will result in over \$1 billion in savings to consumers and health care providers. Moreover, due to the number of brand

patents due to expire, I am concerned with the extraordinary number of applications for generic drug approvals that will come before the Office of Generic Drugs in the future and whether or not the OGD will have sufficient resources to meet the statutory 180-day timeframe necessary to approve these generic applications. Lack of adequate scientific personnel prolongs delays to the approval process resulting in lost savings to patients and health care providers. I look forward to your insight on the OGD's capacity to handle this workload.

Finally, I am concerned about the potential for conflicts-of-interest within FDA Advisory Committees. Your testimony states that, "research expenditures by the pharmaceutical industry alone have tripled since 1990. More and more complex products, which arrive at FDA's gate for preclinical and clinical studies design consultation, for marketing application review, and, for post-approval continuing reassessment are products of the growing NIH research budget and of academic and industry research fueled by NIH. We will ensure that FDA will not become a bottleneck in getting these public health breakthroughs to the public while serving as the trusted, independent, efficient gatekeeper it is now."

However, in recent years, questions have been raised regarding the nature of the FDA Advisory Committee decision making process, and whether FDA Advisory Committee actions are truly independent. In fact, the Los Angeles Times did a series of articles on FDA advisory committees and the conflicts-of-interest that are pervasive among members of the committees. The findings included that some FDA advisory committee members are allowed to remain as consultants or researchers for the same companies whose products they are evaluating. In the case of Rezulin, which was pulled from the market last March due to its alleged connection with nearly 400 deaths, it was noted that FDA officials collaborated closely with the makers of the drug, providing "inside information and favors at critical moments throughout the development and marketing of Rezulin." To the agency's credit, FDA released an internal report acknowledging that the agency committed "possible missteps" in its handling of this case. Nonetheless, I believe it is imperative that FDA make assurances to Congress—and the American public—that these apparent conflict-of-interest questions will be addressed in a straightforward fashion. We must have confidence that the public's trust is not being violated, nor their health jeopardized, by these advisory committees.

Thank you Mr. Chairman, this concludes my opening statement.

PREPARED STATEMENT OF SENATOR HERB KOHL

Thank you, Senator Cochran. It is good to be here this morning. Dr. Schwetz, thank you for coming to testify, and I look forward to hearing from you regarding the 2002 budget for the Food and Drug Administration.

FDA has a mandate that touches the lives of nearly every American, every day. Monitoring and ensuring the safety of more than one trillion dollars worth of consumer products, including nearly all food and medicine, is no small task. And you are doing a good job, evidenced by the fact that 80 percent of Americans gave the FDA a favorable rating in a recent survey.

However, times are rapidly changing, and for you to continue doing a good job, you must remain at the forefront of the changes. The boom in medical technology, the advances in drug development, the globalization of the marketplace, the outbreak of animal diseases and high-technology agriculture—including the introduction of milk protein concentrates—all require greater knowledge and attention from a first-class workforce than ever before.

The President's fiscal year 2002 budget provides \$1.414 billion for FDA, an increase of \$123 million over fiscal year 2001. While a nine percent budget increase is commendable, especially when the overall Federal budget is very lean, it is necessary to keep consumers safe.

Of this increase, \$40 million is necessary to meet mandatory cost-of-living and pay related increases for FDA employees. Over the past eight years, FDA has had to absorb \$284 million for these mandatory costs, causing staffing levels in program areas not funded by user fees to decrease by 10 percent. This means 10 percent fewer scientists, physicians, nurses and other public health specialists working to ensure that the food our families eat, and the medicine our children and parents take, is safe. Taking this into consideration, \$40 million seems like a small price to pay to ensure the retention of top-notch employees.

The globalization of today's marketplace has increased the number of foreign-produced imports FDA is charged with regulating from 1.5 million in 1992 to approximately 6 million in 2000, totaling \$80 billion worth of products. Currently, FDA has the ability to inspect less than one percent of these products. This is a fact that I

find alarming. While I realize that it is impossible and truly unnecessary to inspect 100 percent of all products imported into the United States and purchased by consumers, I think that one percent is a number that must be raised. The President's budget has requested \$25 million to prevent substandard products from reaching the U.S. market, whether they are imported or produced here at home. Again, this seems like a small amount to ensure the safety of \$1 trillion worth of food and health-care products. I am interested to hear what you think is an adequate amount of products to be inspected, and how much money is necessary to inspect that amount.

Dr. Schwetz, I applaud the FDA for doing an exceptional job of protecting the public and keeping consumer confidence high, something we enjoy in the U.S. that many other countries in the world do not. FDA holds its products to the highest standards of approval, and we hold you to that same standard. Mr. Chairman, I look forward to working with you to make sure that FDA's budget this year enables the Agency to continue keeping American consumers safe.

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

The Food and Drug Administration is one of the most important government agencies we have here in America. It is charged with overseeing the safety of nearly 25 percent of our economy today. From complex medical devices such as heart pacemakers to the safety of a teething ring that a baby sucks on.

Over the past few years, many industries regulated by the FDA have invested enormously in bringing new products to development and we here in Congress have been committed to increasing resources for scientific research including the search for new medications, at NIH. Couple those with the completion of the decoding of the human genome and you can see how the workload for FDA has been growing exponentially.

Furthermore, with increased globalization of trade and movement of both individuals and commercial products, FDA is challenged even more to maintain the highest standards for protection of the public from harm.

At a time when the agency's workload is clearly expanding, unfortunately, its staffing levels have fallen. The agency has had to absorb unfunded pay raises and other inflationary costs without additional funding for several years. So I am happy to see that this year's budget does include \$40 million for pay-raises and COLAs for agency staff.

As you know, I have had a long interest in food safety. The United States has been blessed with one of the safest and most abundant food supplies in the world. Yet food-borne illness is recognized as a significant public health problem in our country. The Centers for Disease Control and Prevention estimate that 76 million illnesses, 325,000 hospitalizations, and 5,000 deaths are caused by food-borne pathogens annually.

We have the science and know-how to make our food supply even safer. And as the public learns of global threats to food and animal safety—diseases like “mad cow” and foot and mouth—and new, unfamiliar technologies—like genetically engineered crops and animals—we need to make sure that public confidence in food safety remains high.

I recently announced that I will soon introduce the National Food Security and Safety Act to strengthen our national defenses against mad cow disease and related threats. This bill will apply sound science and good common sense to make our borders more secure, improve our surveillance activities, and remove from the food supply—for humans and animals—some animal-derived materials that could potentially spread mad cow. We'll also get these same materials out of non-food items, like cosmetics and medicines.

I also plan to reintroduce the Genetically Engineered Foods Act. While I strongly support biotechnology, I've seen farmers in Illinois and throughout the country get hurt by some grave mistakes. We must be able to better assure farmers of an available market for biotech crops, and assure consumers of the safety and effective oversight of this new technology. My bill will accomplish both these aims.

All food safety threats—whether salmonella or mad cow—are made more difficult to manage by our highly fractured food safety system. Serious questions have been raised about the ability of the current regulatory system to ensure the safety of the food supply and to manage emerging hazards and new technologies. This system was devised nearly one hundred years ago, when the food system looked very different than it does today. Now, in addition to a domestic food industry with tens of thousands of processors all over the country, a vast quantity of food is being imported to our country.

Currently, Federal oversight for food safety is fragmented with at least 12 different Federal agencies, 35 different laws governing food safety, and 28 House and Senate subcommittees with food safety oversight. With overlapping jurisdictions and scattered responsibilities, Federal agencies often lack accountability on food safety-related issues.

For that reason, I will also be reintroducing the Safe Food Act. This legislation would unite food safety and inspection activities in a single agency with a clear mission to protect the public health. While most people acknowledge that the current fragmented food safety system must be streamlined and modernized in order to meet the needs of consumers, the details of a new structure need to be developed in an open, participatory process that builds confidence on the part of all who will deal with that agency.

Food safety is vital to protect the health and well being of the American public and the food industry. And our food safety system is tested each and every day when millions of Americans sit down to eat. One of the best things we can do to protect the public health and save lives is unite federal food safety activities in one agency.

Unfortunately, despite the expectation that we would see the first federal budget to coordinate food safety spending activities across a range of agencies, the fiscal year 2002 budget proposed by the Bush Administration maintains the status quo—business as usual. Proposed food safety spending continues to be doled out and dispersed among the varied agencies, which share jurisdiction over the various elements of Federal food safety responsibility. In August 1998, a Cabinet-level council of regulators was tasked under Executive Order 13100 to develop a unified food safety budget designed to streamline and channel resources to areas of greatest need. It looks like an important opportunity might have been missed to critically evaluate food safety spending in a cohesive way.

Food Chemical News (4/16/01) reported “USDA’s Food Safety and Inspection Service has once again sought the lion’s share of inspection funding, primarily because meat plants have a congressional mandate to be continuously inspected. Given what has been requested for FDA for fiscal year 2002, those programs will undoubtedly struggle to make ends meet, even though that agency is charged with regulating the vast majority of food products, some of which pose as much risk as meat and poultry. Some of these gross disparities were supposed to be addressed in this budget cycle, as federal regulators were supposed to work together to weigh the risks posed by various foods and target resources accordingly—at least as far as the law would allow. Turf battles were supposed to be set aside and a federal vision of food safety regulation was supposed to emerge. What happened?”

I want to work with the Administration to design and implement a more streamlined system—and budget—to strengthen food safety and better protect public health. I hope the Department will continue to explore this idea and work with me on ensuring that our food supply is the safest in the world.

On a less positive note, I would like to mention my dissatisfaction with the agency’s responsiveness in two areas. First, when I was Chairman of the Agriculture Appropriations committee in 1994, I placed a requirement in the fiscal year 1995 report accompanying the bill to require the agency to set up a gene therapy tracking system for individuals. This had been sought by patient groups representing those most likely to be included in gene therapy trials. FDA moved while I was chairman to begin developing such a tracking system, but since then, they seem to have forgotten the fiscal year 1995 requirement.

Following the tragic death of Jesse Gelsinger, it was discovered that we have a myriad of problems with gene therapy trials. These problems highlighted the need for an effective tracking system. So last year at this FDA budget hearing, I asked FDA to tell me about their plans for instituting this system and I received a “non-answer.”

With Chairman Cochran’s assistance, we placed a requirement in this year’s appropriations bill for FDA to submit a full budget and implementation plan by the end of January. The agency missed the deadline and I extended it to April 1st. However, the report the agency sent up was entirely inadequate. It did not contain a budget nor did it contain a detailed plan for implementation.

I am still waiting for a reply and am very dissatisfied with the agency’s foot-dragging. It is very difficult for Congress to provide the agency the funding it needs if it will not give us details of the likely expenses of addressing areas of concern.

In addition, in January I requested similar information on the budget resources necessary for full implementation of the new tissue safety regulations. I have yet to receive a reply to that letter.

As I said earlier, I am happy to see the agency receive new staff resources but am extremely disturbed by the agency’s lack of responsiveness in these two areas

that are of grave concern to the public. Such foot dragging is neither necessary nor acceptable. I hope we can expect a new attentiveness to these issues in the coming weeks.

Mr. Chairman, I am pleased to have this opportunity to discuss these important issues today, and I look forward to working with you as we craft the coming year's budget for this critical agency.

Senator COCHRAN. Thank you, Senator.

Dr. Schwetz, we welcome you again to the committee. You may proceed.

Dr. SCHWETZ. Good morning. Thank you very much.

Mr. Chairman and members of the committee, I am Bernard Schwetz, the Acting Principal Deputy Commissioner of the U.S. Food and Drug Administration. I would like to introduce my colleagues: Dr. Linda Suydam, Senior Associate Commissioner of the FDA; Mr. Jeff Weber, Acting Senior Associate Commissioner for Management and Systems of the FDA; and Mr. Kerry Weems, the Acting Deputy Assistant Secretary of the Department of Health and Human Services. We are honored to have this opportunity to discuss the challenges facing the FDA.

You have seen my written testimony describing many of the agency's recent accomplishments, and I do not intend to address them in depth today.

SCIENCE AND TECHNOLOGY CHALLENGES

What I would like to discuss with you is FDA's role in today's rapidly changing scientific environment and the challenges we face in answering the increasingly complex questions that arise as we review these new technologies. FDA's challenges fall into four distinct but interrelated areas. First, innovations in science and technology are transforming the types of products FDA regulates and the speed at which they are generated. Second, consumers' demand for access to reliable health information is growing dramatically. The third challenge I will discuss is the increasing globalization of essentially all aspects of the industries and products that we oversee. And finally, our responsibility to quickly address emerging public health threats. So, let me expand on each of these areas.

First, substantial Government and private sector investments in biomedical research are resulting in hundreds of new and innovative products that are either in the R&D pipeline or have already arrived at the agency. To put it into perspective, consider that research expenditures by the pharmaceutical industry alone have more than tripled over the last decade. Likewise, bipartisan efforts are doubling the budget of NIH. As new products are generated by the academic and industry research, fueled by NIH, they must be evaluated by FDA staff with the scientific expertise to assess their benefits and risks. We want to ensure that FDA will not become a bottleneck in getting safe and effective products and therapies to the public.

PUBLIC TRUST

FDA's second challenge, maintaining the public's trust and confidence, is illustrated by the issues that arise with the successful mapping of the humane genome. This astonishing feat of modern science has generated both hope and concern throughout the sci-

entific community and the public with the promise of new genetic tests, gene-based designer drugs, and comprehensive genomics-based health care. To make the right science-based public health decisions, FDA's scientists must be on the leading edge in their specific scientific disciplines.

GLOBALIZATION

The third challenge I mentioned is the globalization of industry, a trend that is expanding FDA's role in protecting and promoting the health of Americans, as we strive to assure the safety of products grown or manufactured overseas for sale in the United States.

Finally, FDA faces the daily challenge of integrating its current workload with the challenge of emerging public health threats such as BSE, or mad cow disease.

FDA's fiscal year 2002 budget requests a total of \$1.4 billion, an increase of \$123 million over fiscal year 2001. The increases are targeted to specific initiatives, including BSE, food safety, and human subject protection. This request includes a total of \$204 million in user fees. \$20 million of this amount is for new user fees, for which authorizing legislation is needed.

PROFESSIONAL STAFF

FDA's greatest resource is our staff. The professional workforce necessary to meet our public health mission requires a focus on the scientific principles upon which our decisions are based. In fiscal year 2002, FDA is requesting \$40 million to fund mandatory pay-related increases. This increase will allow FDA to maintain current levels of performance and improve the drug review process.

BSE

One of our major challenges is preventing the entry of BSE, or mad cow disease, into the U.S. FDA has been vigilant in this area for many years, and so far we have seen no cases of BSE in the U.S. We are working hard, in conjunction with other Federal, State, and private sector groups, to keep BSE out and we are prepared to prevent its spread if there ever is a case in cattle in this country. FDA is requesting a \$15 million increase to support BSE activities.

IMPORTS AND INSPECTIONS

Inspections and imports represent another challenging area. Although we inspect manufacturing facilities prior to approval of new drugs and devices, today FDA performs routine inspections of only 28 percent of drug facilities and 16 percent of high-risk medical device facilities each year. FDA currently inspects overseas medical device firms only once every decade. From a safety perspective, this is unacceptable.

IMPORTED PRODUCTS

Imported products also represent a challenge. The majority of active pharmaceutical ingredients marketed in the United States are manufactured overseas. In addition, the importation of food from other countries has been growing rapidly over the past decade and

continues to grow. In fiscal year 2002, we expect to receive 7 million food import entries. FDA physically inspects less than 1 percent of all imported FDA regulated products. To restore this capacity, FDA is requesting \$25 million for imports and inspections. This includes \$14.7 million in new import fees. This increase will allow us to improve public confidence in the standards of imported drugs, biologic, and device products.

FDA APPROVALS

In the area of medical products, FDA reviewed over 17,000 applications for drug, biologic, and device products in the year 2000. Of these, 97 percent were approved. 160 of these approvals were for products that had never previously been marketed in any form in the United States. Many of these products represent advances in the prevention, diagnosis, and treatment of serious and life-threatening diseases.

At the same time, FDA's responsibilities do not end with product approval, but continue throughout the entire product life cycle. Therefore, new product approvals lead to another set of challenges, monitoring adverse event reports for marketed products and taking appropriate action when necessary and reducing the incidence of medical errors. We are developing a systems approach for this issue, requesting \$10 million in funding to support adverse event reporting.

CLINICAL TRIALS

FDA is also responsible for protecting patients involved in clinical trials and ensuring that the data gathered from these trials concerning the safety and effectiveness of a product are accurate. Many of the products we may later approve require testing in humans prior to marketing, and the protection of human subjects in clinical trials is an ongoing challenge for us. We are requesting an increase of \$10 million to increase the number of inspections and, in particular, target high-risk clinical trials.

FOOD SAFETY

Touching briefly on another challenge, we have made major improvements in food safety, from decreasing the incidence of food-borne illness to developing mechanisms to monitor antimicrobial resistance. And yet, an estimated 76 million Americans get sick from food-borne illnesses each year, and more than 5,000 die as a result. We are requesting \$14.7 million for food safety activities. A portion of this amount, \$5.3 million represents new fees for export certification. When added to the other food safety related activities included under our other priorities, 16 percent of our requested increase will be for supporting FDA's food safety responsibilities.

INFRASTRUCTURE SUPPORT

The final challenge I will mention is our commitment to ensuring that our staff has the tools necessary to meet the agency's public health mission. We are requesting resources to complete the move of our Center for Drug Evaluation and Research to the new headquarters facility at White Oak, to complete construction of the new

Los Angeles laboratory, and to begin acquisition of a new financial management system.

PREPARED STATEMENT

Let me end my comments by emphasizing the importance of science to FDA's mission. The number and complexity of products and issues coming before FDA demand that the agency have the very best scientific capability to evaluate them. FDA must have a critical mass of top-notch scientific and medical expertise to assess these products and answer new questions. As the gatekeeper for new products and technology, FDA has a decisive impact on their safety, effectiveness, and the speed of their availability to the public.

Mr. Chairman this concludes my statement. My colleagues and I will be happy to answer any questions that the committee has today.

[The statement follows:]

PREPARED STATEMENT OF BERNARD SCHWETZ

Mr. Chairman, members of the Committee, my name is Bernard Schwetz and I am honored to be sitting before you today. As the Acting Principal Deputy Commissioner for the Food and Drug Administration, I appreciate the opportunity to discuss some of the accomplishments, as well as the challenges FDA faces in the new century. It's fair to say that this new century presents FDA with unprecedented challenges:

- the rapid transformation of the science and technology that generates the products FDA must regulate;
- increasing expectations of consumers with changing demographics and consumption habits to easily obtain medical and risk-related information;
- the expanding and evolving composition of global trade and production; and,
- emerging public health threats.

The United States is leading the world into an era of scientific achievements that can yield unprecedented gains for human health and nourishment. Industry's research and development pipelines abound with blueprints for hundreds of new and innovative products and processes that can literally transform life's experience, as we have known it. Such marvels of science as cell and gene therapy; genomics-based drugs; surgical robotics; and bioengineered plants and animals are in sight or within our grasp, and their potential for saving lives, improving the quality of life and enhancing the economy is enormous. But it also must be recognized that their potential for harm is enormous, if these new technologies are not appropriately overseen by individuals who understand them as well as by their proponents.

For many of these revolutionary products, the greatest hurdle is not in the realm of technology, but in the consumers' distrust of their dramatically different performance and features. The critical task of overcoming this formidable obstacle at the onset of the new age of technology is one of FDA's greatest challenges. The public expects that food set on the family table will be safe and wholesome; that new medical products, drugs, biologicals, and medical devices, available in a timely manner, will have demonstrated real benefits that outweigh their known risks; and, that the product information will be useful and understandable. To meet such high expectations, FDA must continually earn and re-earn, with each new technology, the trust of consumers. Day-in and day-out, this proud Agency must prove that it is up to this daunting challenge. A most recent example involves our efforts to manage the threat of Bovine Spongiform Encephalopathy (BSE or "mad cow disease") that has cost the European community billions of dollars, almost 100 lives, and has undermined the trust of Europeans in their governments.

A recent survey of five Federal regulatory agencies conducted by the Pew Research Center and Princeton Research Survey Associates, found that from 72 to 85 percent of consumers, health professionals, patients, and industry representatives said they trusted FDA to make the right decisions. The results placed FDA at the top of the survey's charts, with an overall favorable rating above 80 percent, more than twice the approval rate of government agencies in general. While we take great pride in such numbers and what they represent, technology is moving too swiftly for us to be content.

Each year presents even more challenges for FDA. Issues are increasingly complex and the breadth of FDA's responsibility ever expanding. While many of our constituents primarily focus on the product marketing application review process, it has become increasingly clear that FDA's eye must be equally focused on the full life cycle of all the products we regulate—post market as well as pre-market activities and developments. The changes and challenges facing us were never so apparent then when the successful mapping of the human genome was announced late last year. This has brought us to the threshold of a frontier that promises to transform the diagnosis, treatment and even prevention of diseases that today still cripple many in our society. Francis Collins, Director of the National Human Genome Research Institute at NIH, recently made a number of predictions about where genome research could lead in the next three decades. His forecast for the next ten years includes such things as genetic tests for a dozen medical conditions, and preimplantation genetic diagnosis, with primary care physicians practicing genetic medicine. There are hundreds of genetic tests under development and available in the United States. Only eight have been submitted to and approved by FDA. In 20 years, Dr. Collins predicts the availability of gene-based designer drugs to treat diabetes and hypertension, and cancer therapy precisely targeted to a tumor's molecular fingerprint. For FDA this means coordinating drug and genetic diagnostic development hand-in-hand. In 30 years, it's likely that comprehensive genomics-based health care will be the norm. Products will need to evolve from the research laboratory to well characterized therapeutics with established safety and effectiveness. To make these critical judgments, requires that FDA scientists remain on the leading edge in their specific scientific disciplines.

Substantial resources are needed to carry out FDA's mission. Research expenditures by the pharmaceutical industry alone have more than tripled since 1990. More and more complex products, which arrive at FDA's gate for preclinical and clinical studies design consultation, for marketing application review, and, for post-approval continuing reassessment are products of the growing NIH research budget and of academic and industry research fueled by NIH. We will ensure that FDA will not become a bottleneck in getting these public health breakthroughs to the public while serving as the trusted, independent, efficient gatekeeper it is now. Today, I would like to highlight some of FDA's many accomplishments of the past year that impact all Americans and touch on the new and challenging responsibilities of the twenty-first century.

FOOD SAFETY

Over the course of the past several years, with your support, the FDA has made great strides in improving the safety of the nation's food supply. Through a food borne illness surveillance system known as FoodNet (partially funded through FDA), the CDC has documented reductions in food borne illness for a number of important food pathogens. These reductions reflect the hard work of not just FDA, but other Federal agencies, and our State and local counterparts.

The FDA has always maintained that the strength of our regulatory program comes from the underlying science base. Last winter, we published two draft risk assessments addressing listeria and vibrio parahemolyticus and we have since held public meetings to hear public reaction to them. These risk assessments are also enabling FDA to play a leadership role internationally.

The safety assessment of antimicrobial drugs for use in food-producing animals includes monitoring for the development of resistance. Monitoring is done through the National Antimicrobial Resistance Monitoring System (NARMS), which was initiated in 1996 as collaboration between the FDA, the Centers for Disease Control, and the United States Department of Agriculture. Its purpose is to prospectively monitor the antimicrobial resistance of human, animal, and animal product isolates of selected enteric bacteria. NARMS data have been used to initiate field investigations of outbreaks of illness marked by a pathogen which displayed an unusual antimicrobial resistance pattern; assess the human health impact of fluoroquinolone use in poultry; stimulate research in molecular characteristics of resistance emergence and transfer; and, improve our knowledge of risk factors associated with the development of an antimicrobial-resistant infection. NARMS data have also triggered broader research projects of prudent antimicrobial use in animals and in the role of the environment in the emergence and spread of antimicrobial resistance.

MEDICAL PRODUCTS

During this past year, FDA's three major human medical product centers, the Center for Drug Evaluation and Research, (CDER), the Center for Biologics Evaluation and Research, (CBER), and the Center for Devices and Radiological Health,

(CDRH), demonstrated strong scientific expertise and efficiency by reviewing over 17,100 marketing applications for drug, biologic, and device products. The outcome of these reviews was that approximately 16,600 total products were found to have the required scientific data for approval for marketing in the United States. Of these, there were 160 approvals of medications and medical devices that had never previously been marketed in any form in the USA. Many of these approvals represent an impressive advance in the prevention, diagnosis and treatment for serious and life-threatening diseases.

Groups that particularly benefit from these approved medications and medical devices include cancer patients, patients with heart disease, children, women, and the elderly. In addition, FDA's approvals strengthened surgical flexibility with several state-of-the-art devices that reduce the risks of complex surgical procedures.

CANCER PATIENTS

Several products approved contributed to the prevention, early diagnosis or treatment of cancer, the second deadliest disease in the United States affecting eight million Americans. Two of the new cancer medications, Trisenox and Mylotarg, were approved for cancers of the white blood cells. For women, Nolvadex (tamoxifen citrate) was approved last year for a new use to reduce the risk of invasive breast cancer with preinvasive cancer of the mammary ducts.

Three of the cancer treatments approved were medical devices. A laser system was approved that enhances a physician's ability to distinguish small harmless growths from pre-cancerous growths in the colon. A surgical sealant was approved for sealing air leaks in lungs following the removal of cancerous tumors. A third device, for early cancer diagnosis, is the first mammography system that produces digital images on a solid-state receptor instead of analog images on a radiographic film. Early diagnosis remains the best weapon against breast cancer, which annually affects 180,000 women—of which approximately twenty-five percent die of the disease.

An example of the cutting-edge research currently being conducted that will transform the way we diagnosis and treat cancer is the FDA/NIH Tissue Proteomics Program which is the only one of its kind in the world. This joint effort of CBER and the National Cancer Institute (NCI) focuses on the development and use of proteomic tools for the early detection of cancer and other diseases. The project's accomplishments include the development of methods for early disease detection, the identification of new therapeutic targets and the discovery of new biomarkers for drug-induced patient toxicity. This bench-to-bedside model has resulted in a first-of-its-kind clinical trial that incorporates a "proteomic portrait" of the disease in human tissue that could lead to customized, patient tailored therapeutics. Currently, this research has identified over 150 proteins that are aberrantly expressed in human prostate, lung, breast, ovary, esophageal, and colon cancer. Furthermore, a new artificial-intelligence computer software system has been invented and developed to reveal protein patterns that can be used as surrogate markers of therapeutic efficacy, toxicity and early disease detection.

This is but one example of the work being conducted also at CDER, NCTR, and CFSAN concerning predictive modeling and standards modification using common databases and computational science.

CHILDREN AND INFANTS

Several new products approved last year for pediatric and obstetric use were either specifically designed for the youngest patients or were adult drugs now approved also for use in children. Approvals included: the OxiFirst Fetal Oxygen Saturation Monitoring System, which represents the first major technological development in fetal monitoring in three decades; Prevnar, a pneumococcal vaccine for infants and toddlers under the age of two which was designed to prevent invasive diseases caused by *Streptococcus pneumoniae*, including bacteremia, an infection of the blood stream that affects about 35,000 infants and toddlers in the U.S., and meningitis, an infection of the lining of the brain or spinal cord that is diagnosed in about 17,500 infants a year; and, Pulmicort Respules (budesonide inhalation suspension), the first anti-inflammatory corticosteroid formulated for inhalation using a nebulizer in the 1–8 year-old age group.

WOMEN

FDA approved several other products to treat diseases that either exclusively or predominantly affect women. Remicade (inflixmab) was approved for the reduction in signs and symptoms of rheumatoid arthritis, which affects more than 8 million Americans, three-fourths of whom are women. Another approval was Novantrone,

for the treatment of advanced or chronic multiple sclerosis. The disease affects up to 350,000 Americans, 66–75 percent of whom are women.

FDA also continued successfully working with the States and the American College of Radiology to monitor mammography facilities. This successful partnership helps assure high quality mammography services to women.

CARDIAC PATIENTS AND THE ELDERLY

Examples of new products for patients with heart disease and the elderly include several novel devices and important medications. Two of the devices use catheters to deliver radiation inside a coronary stent following the reopening of a blocked artery. The radiation helps reduce the risk of new tissue growth inside the coronary stent and the resulting repeated narrowing of the artery. Among the products designed primarily for the elderly, Visudyne (verteporfin for injection) is the first therapy to slow vision loss in people with the classic type of “Wet Age-Related Macular Degeneration.”

DIABETES

FDA has recently approved the first minimally invasive glucose meter (the Minimed System) for use in monitoring patients with diabetes. Most recently, FDA has approved the first non-invasive device used to detect trends and track patterns in glucose levels in adults. The device is used together with finger prick blood tests to monitor glucose blood levels. FDA and industry scientists need to continue to work together to make sure that the accuracy of the new devices is high enough for reliable home use.

DRUGS FOR RESISTANT INFECTIONS

Another important product that passed the FDA’s rigorous review for safety and effectiveness last year included the first drug of a new class of antibiotics that addresses treatment for the emerging serious public health threat of vancomycin-resistant bacterial infections.

STATE OF THE ART ROBOTIC MEDICAL DEVICES

Finally, I am happy to report the approval by our Center for Devices and Radiologic Health of a promising new surgical system that incorporates cutting-edge robotics technology.

These products are only a small sample of the new drugs, biological products and medical devices the agency approved last year in its role of public health promoter. In addition, CDER issued 244 approvals of generic counterparts of original drugs. Generic drugs substantially reduce the cost of purchasing pharmaceuticals by typically offering price discounts from 50 percent to 75 percent. Similarly, CDRH cleared for market almost 3,500 so-called 510 (k) devices, products that are similar to devices already on the market.

In addition to approving a host of important new medical products in 2000, FDA has continued not only to meet—but also to exceed—virtually all of its product review and product development consultation performance goals under the Prescription Drug User Fee Act (PDUFA). For example, for the fifth straight year, FDA reviewed 100 percent of PDUFA marketing applications within the time frames agreed with Congress. Because of this review efficiency and thoroughness, last year, FDA approved 20 products classified as priority drugs—drugs that have a real benefit beyond existing therapies—in the median time of only 6 months. Moreover, although PDUFA goals specify review times and not approval times, actual approval times (FDA review time plus the time it takes companies to answer deficiencies identified by FDA) have decreased around 60 percent since the program started.

BLOOD SAFETY AND REGULATION OF TISSUES

Each year more than 3 million Americans receive donated blood. While blood and blood-derivatives can be life saving, they can transmit undetected infectious disease. Assuring the safety of and preventing shortages in, the blood supply continues to be one of FDA’s priorities.

Tissues have long been transplanted in medicine for widespread uses such as skin replacement after severe burns, tendons and ligaments to repair injuries, heart valves to replace defective ones, corneas to restore eyesight, and the use of human semen and implantation of eggs to help infertile couples. In recent years, scientists have developed new techniques, many derived from biotechnology, that enhance and expand the use of human cells and tissues as therapeutic products. These new techniques hold the promise of some day providing therapies for cancer, AIDS, Parkin-

son's Disease, hemophilia, anemia, diabetes, and other serious conditions. A GAO report, published in December 1997, supported strengthening requirements for tissue establishments. In January 2001, the Office of Inspector General published two reports, "Informed Consent in Tissue Donation, Expectations and Realities", and "Oversight of Tissue Banking". The latter report recommended that FDA expedite the publication of its regulatory agenda that requires registration of tissue banks, enhanced donor suitability screening and testing, and the use of good tissue practice. It also recommended that FDA increase the number of inspections of tissue establishments performed to enhance oversight.

FDA strengthens its public health promotion role in many other ways such as (1) refusing to approve products not shown to have real benefits that outweigh their known risks; (2) assuring adequate information on appropriate use for approved products; and, (3) monitoring and continually reassessing new data that are developed after products go on the larger general market in the U.S. Last year, FDA also issued 125 draft and final guidance documents to clarify requirements and facilitate industry's compliance with FDA's product efficacy, safety and quality standards.

GLOBAL TRADE AND GLOBAL PRODUCTION

FDA has also worked closely with international organizations to harmonize requirements and standards for the products we regulate. This work recognizes not only the international nature of our regulated industries but also our collective need to share expertise concerning new products in both the pre- and post-approval phases across all borders.

FDA is the recognized gold standard. Our regulatory approaches are often cited by officials in other countries. For example, in the wake of recent European food crises, including BSE and dioxin in meat and dairy products, European Commission President Romano Prodi advised the European Parliament that one way to prevent more food crises in the future would be to establish a European food agency modeled on the FDA. Numerous foreign delegations have visited FDA over the past year to discuss food safety regulation.

FDA is a leader in international food safety harmonization efforts through the Codex Alimentarius, and has worked with WHO and FAO to increase the profile of food safety issues around the globe.

In the area of drugs and biologicals, we now have more than 50 guidances that have been agreed-upon by FDA, its counterpart agencies in the European Union, Canada, and Japan, and the innovator drug and biologic industries in these countries. These guidelines cover very specific topics regarding drug and biologic pre-clinical and clinical testing, manufacturing, post-approval continual reassessment and regulatory submissions. One major advance in this effort has been an agreement on the content of periodic safety updates on approved products. With this agreement, we can now be assured that regulators in those regions will be able to receive the same safety information at the same time about products being marketed in their countries. In addition, we have agreed on electronic format and transfer standards to facilitate and to make even more efficient the electronic transfer of safety information between companies and regulatory agencies in these regions.

This terminology allows even more efficient and more accurate transfer of new post-approval safety data around the globe and facilitate better, more informed public health decisions about the ongoing safety profile of marketed products. Most recently, through this process, known as the International Conference on Harmonization (ICH), we have reached agreement on "A Common Technical Document" that will standardize the format for the major portions of a marketing application across these regions. With such a core document, a pharmaceutical or biologic firm seeking approval of a product in one or more of the participating countries will be able to submit essentially the same document to each country. The influence of ICH is now spreading even beyond the original regions as other nations build their regulatory infrastructures and use the ICH guidances as their own standards.

We've also made progress in the realm of international harmonization of medical devices. Along with our counterparts from the EU, Japan, Canada, and Australia, we are developing protocols that will permit harmonization among these five entities and their regulation of medical devices.

In the spirit of transparency, FDA's website, launched in 1995, provides another essential way of exposing the agency to the public we serve. Materials posted on the web include materials to be discussed at upcoming advisory committees, enforcement actions, talk papers, speeches, and educational information. Our website has received numerous awards from such quarters as Popular Science magazine, the Dow Jones Business Director, and Tufts University's Nutrition Navigator. Moreover, it is linked to 8,000 other health, consumer, medical, and educational websites.

These kinds of activities help prepare us for the global environment in which most of the products we oversee now exist. This helps us to more successfully bridge differences in government, language, and culture. In short, they prepare us for what is to come by providing a blueprint for harmonization around the world. This globalization of product development, testing, and ultimately trade, further highlights the need for a strong and robust FDA. As trade agreements and policies are negotiated, the maintenance of strong public support requires that a scientifically strong regulatory agency have a forceful voice in those discussions on matters that will affect the health of the American public.

CHALLENGES

Despite the significant strides made in the public health arena over the past few years, FDA faces formidable challenges in the near future. I would like to highlight some of these for you today. FDA's fiscal year 2002 request totals \$1.414 billion, an increase of \$123 million over fiscal year 2001. The increases over fiscal year 2001 are targeted to specific initiatives to include: funds to prevent the spread of mad cow disease; to expand food safety activities; and, to protect human subjects in clinical trials. In addition, of the funds requested, \$204 million will be derived from industry-specific user fees, including \$20 million in new fees for food export certificates and import operations.

OUR MOST IMPORTANT RESOURCE

Cutting edge science and technology are providing us with new opportunities and challenges every day. Over the past few decades we have seen large investments by both the public and private sector in biomedical research and biotechnology that will result in the development of an abundance of new products that need to be assessed before entry into the marketplace and during their use. As these products enter the marketplace, they should change the very face of health care in America and should help us all lead longer, healthier lives. They should also bring enormous economic benefits by reducing the cost of health care. Having a high performing, science-based regulatory agency to render decisions regarding the safety and efficacy of these products reaps great public health benefits for all of us.

In fiscal year 2002, FDA requests \$40,000,000 to fund mandatory pay-related increases. This increase for base resources focuses on pay adjustments because personnel are so essential to accomplishing the Agency's mission. These resources will enable FDA to maintain current levels of performance, and to continue to improve the drug review process. Payroll increases are needed to cover about half of the staff involved in the drug application review process not supported by PDUFA user fees; to improve the ability to assure the safety of regulated products; to inspect and investigate domestic and foreign manufacturers; and, to participate in Mutual Recognition Agreements with countries to establish global standards for foods and pharmaceuticals. We need now, more than ever, your continued support to assure FDA is ready to respond to these challenges. Bovine Spongiform Encephalopathy (BSE)

BSE is one of a group of progressive degenerative neurological diseases known as transmissible spongiform encephalopathies (TSEs). BSE is a TSE of cattle. TSE diseases are always fatal. There are six TSE diseases that affect humans, of which Creutzfeldt-Jakob disease (CJD) and variant Creutzfeldt-Jakob disease (vCJD) are best known. vCJD is believed to be transmitted to humans by the consumption of food products contaminated with the agent of BSE.

Since the BSE epidemic began in 1986, more than 176,000 cases of BSE have now been confirmed in Great Britain. To date, over 90 human lives have been lost in Europe due to vCJD. Now cases of BSE in cattle have also been reported in other European countries. Here in the United States, we have been fortunate. To date, BSE has not been detected in our cattle herds and we have not had any patients diagnosed with vCJD. Based on the UK experience, if BSE were to be encountered in the U.S., it would have not only an obvious potential impact on our public health, but also a monumental impact on our beef industries, with initial U.S. revenue losses estimated to reach over \$15 billion. To protect consumers, it is essential to implement and monitor a multi-layered safeguard system to ensure that BSE regulations and guidance principles are followed. BSE has a potential impact on many biological products such as vaccines, cells or cell-derived products, and blood. It is important for the FDA to have an active research, review and inspection program to assure product safety.

Bovine-derived materials have traditionally been used in the manufacture of many biological products, including vaccines. To date, there are no reports of BSE contamination of pharmaceutical or biological products. To minimize the possibility of contamination in such products, the FDA recommended in the Federal Register

on August 29, 1994, and again in 1996, that manufacturers not use materials derived from cattle that were born, raised, or slaughtered in countries where BSE is known to exist. The FDA referred manufacturers to the listing of such countries that is maintained by the U.S. Department of Agriculture.

In addition to FDA's regulation which prohibits the feeding of mammalian protein to ruminant animals, the Animal and Plant Health Inspection Service (APHIS), of the United States Department of Agriculture, has placed restrictions banning the importation of live ruminants and certain ruminant products from thirty-one countries. FDA, in conjunction and cooperation with APHIS, has issued a series of import alerts and bulletins regarding products, which FDA regulates. Many products regulated by FDA contain these banned substances and it is important to enhance and make as comprehensive as possible our BSE monitoring system to identify products that may pose a health risk and ensure they do not enter the U.S. FDA has also issued guidelines to Blood Centers to exclude potential donors who have spent six or more cumulative months in the U.K. between January 1, 1980 and December 31, 1996, from donating blood. At the Transmissible Spongiform Encephalopathies Advisory Committee (TSEAC) in January 2001, the Committee recommended the deferral of donors who lived in France, Ireland or Portugal for a period of ten years between 1980 and the present. We need to continue to monitor BSE activities and revise our current policies as needed based on new information.

The focus for FDA and its partners in other agencies has been prevention. Using the best science known at this time, the U. S. has an aggressive multi-faceted program in place to try to prevent the establishment and spread of BSE. The Agency has committed to inspecting 100 percent of all feed mills, plus re-inspections of those establishments not in compliance by the end of fiscal year 2001. Within the planned resources, this would have been impossible. FDA has looked internally at several other sources to redirect to BSE needs. We have tapped into the FDA contingency fund for the first time in several years plus moved priorities within the field portion of the Animal Drugs and Feeds program. BSE is a high priority, and the Agency is working to meet its commitments.

To prevent exposure of American citizens and food animals to the agent of BSE, the Agency is requesting \$15,000,000 in fiscal year 2002 for needed BSE activities. With this funding, FDA will increase monitoring of imports to ensure prohibited materials do not enter the United States; conduct targeted BSE inspections of all renderers and licensed and non-FDA licensed feed mills handling prohibited material, such as meat and bone meal on a yearly basis; provide training to Federal and State inspectors on the current BSE situation; conduct market studies to identify food, dietary supplements, and cosmetic products containing spinal cord and other at risk products; conduct research on Chronic Wasting

Disease (a TSE), which affects elk, deer, and other domestic game and pen-reared animals in the United States; and, conduct follow-up education on for-cause inspections of biological products, blood, and vaccines.

IMPORTS AND INSPECTIONS ACTIVITIES

FDA is responsible for ensuring the safety of products produced and distributed by more than 100,000 domestic establishments. The Agency uses its inspectional authority, as directed by statute, to provide this assurance. For many establishments, the law requires FDA to conduct inspections at specified time intervals, such as once every two years. Resource constraints over the past several years have seriously impaired FDA's ability to meet its statutory biennial inspection requirements. By fiscal year 2002, FDA will be responsible for ensuring the safety of almost 7 million line entries of imported products that cross our borders annually. The sources of many of these entries are diversified and include an increasing number of products from countries that are typically categorized as emerging economies, with developing regulatory infrastructures. FDA conducts sampling and end point product testing as a means of determining that imports have been properly produced.

To restore this seriously impaired capacity, FDA must increase foreign and physical port inspections and oversight of foreign producers to be able to maintain the safety of products on the market that we believe Americans expect and demand, additional funding of \$25,000,000 is requested for imports and inspections. This includes \$10,300,000 in budget authority and \$14,700,000 in new import user fees. With this funding, FDA will increase inspections of domestic medical device manufacturers; surveillance of imported tissues and other imported biological products; sample analyses of domestic and imported drug products; criminal investigation of fraudulent drug imports; and, sample collection, analysis, and field exams of imported foods and dietary supplements. This increase will also allow us to improve public confidence in the standards of drugs, biological, and device products imported

from the European Union, and intensify drug inspections in developing countries. FDA plans to expand import entry review resources to keep pace with the increase in line entries and modernize the OASIS import data processing system to provide import reviewers with more rapid and direct access to information necessary for entry decisions.

Inspections and import surveillance are the primary means of assuring the safety of marketed products. Consumers rely on the FDA to prevent dangerous and unreliable products from entering into commerce. Despite a decrease in the overall number of inspections, in fiscal year 2000, FDA conducted 880 foreign inspections, which represented a twelve-percent increase over fiscal year 1999. However, FDA physically examined less than one percent of all entries offered for import into the United States. While the FDA continues to undertake initiatives to improve the safety of imported products, there is often no substitute for physically examining these products.

REDUCED ADVERSE EVENTS RELATED TO MEDICAL PRODUCTS

FDA is responsible for ensuring that the benefits of approved products continue to outweigh their newly discovered risks after product approval. Historically, the Agency has primarily relied upon a voluntary, passive reporting system in which consumers, manufacturers and health professionals submit reports of suspected adverse product reactions to FDA or the manufacturers of the products who then, by regulation, must submit the reports to FDA. This voluntary system was designed primarily to signal the possible existence of new rare, but serious, side effects of marketed products, which are most often of a frequency that they could never be detected in routine clinical trial programs because of the size limitations of most product development clinical trial programs. About 1–3 percent of the total number of products approved each year have had to be removed later because of rare, but serious, new side effects discovered through this system. Each year FDA receives more than 350,000 of these kinds of reports of suspected product adverse reactions. These reports must be investigated, analyzed and acted upon promptly. While we have invested heavily in making this system more efficient, there are areas of post-approval product injury of which we believe we should be focusing to improve our abilities to make medical products safer.

For example, not all safety issues relate to direct toxicity of the medical product. Some product related injuries are the result of inappropriate use or erroneous use of the product, which, if it had been used properly would not have resulted in injury. The Department of Health and Human Services established a Patient Safety Task Force to integrate the collection of data on medical errors—including medication errors—to coordinate research and analysis efforts and, to collaborate on reducing the occurrence of injuries that result from medical errors. The task force's goal is to reduce medical errors by fifty percent over five years through the development of a coordinated, easy to use, confidential reporting system which will minimize the burden of reporting suspected medical errors or conditions that might result in medical errors. Biological product safety is also of concern, including vaccine safety, infectious disease risks, and blood and tissue safety to name a few.

To meet some of these challenges, FDA is adopting a systems approach, of which the most significant component is the identification of and response to adverse events that are reported in the U.S. With an increase in funding of \$10,000,000, FDA plans to hire staff to analyze and evaluate the adverse event reports and determine appropriate responses; speed the identification and reporting of adverse events by enhancing existing data systems and linking them with other health care databases for reports involving medical devices, drugs and biologics; educate consumers and health care professionals on the importance of preventing and reporting medical errors; and, initiating a modernized AER system for dietary supplements. FDA plans to increase the number of annual inspections of clinical trials by more than 20 percent with an emphasis on high-risks trials.

Many patient deaths and injuries are associated with the use of FDA-regulated medical products. In medical devices, we estimate there are about 300,000 injuries related to device misuse annually, and we believe most of these errors are avoidable user errors that could and should be corrected. The FDA believes that roughly half of these deaths and injuries can be avoided by fully implementing its strategies. Thousands of lives and billions of dollars can be saved.

PROTECTING VOLUNTEERS AND THE INTEGRITY OF DATA IN CLINICAL TRIALS

FDA is responsible for protecting patients involved in clinical trials, and ensuring that the data gathered from these trials concerning the safety and effectiveness of a product are accurate when included in the product application. To do this, FDA

inspects stakeholders in all areas of the clinical trial process—manufacturers, clinical investigators, institutional review boards (IRB), and contractors to ensure that the data FDA receives are accurate and reliable.

Enhanced protection for human research subjects becomes more complex not only with the increasingly complex nature of the products being tested, but also with the increasing complexity of the design of clinical trials, the numbers of research projects and study volunteers and the diversity of patient populations included in clinical trials increases. The death of a volunteer subject in a gene therapy study has triggered considerable public concern in this area.

Gene therapy involves the treatment of genetic diseases by trying to replace a defective gene. As the field has developed, it has expanded to include a broad range of different potential therapeutic interventions. FDA's scientific leadership in this area was no more evident than when earlier this year, researchers from our biologics program were able to verify that a vaccine used in a gene therapy protocol at St. Jude Children's Research Hospital contained no traces of HIV as previously suspected.

FDA, whose product reviews depend on the validity of clinical trial data, monitors the entire system. The Agency conducts about 1,200 trial-associated inspections per year (1,100 domestic and 100 foreign), some of which involve extensive interviews with IRB members and examination of their records, procedures, and responsiveness to participants' concerns. FDA's efforts to protect human subjects generally emphasize education, outreach, and training programs for investigators and members of the IRBs.

FDA is requesting an increase in funding of \$10,000,000 to increase the number of inspections by one-third, and in particular, target high-risk clinical trials. Inspections will cover clinical investigators, IRBs, sponsors, monitors, and contract research organizations. This increase will also focus on increasing scientific and regulatory training for FDA investigators to make them more efficient and effective; improving the inspection process for IRBs; and, enhancing follow-up compliance activities. We are also requesting funds to support the expansion of Medsun. We are establishing a network of hospitals to give statistically reliable data on device use and misuse. This will provide FDA and the community good feedback when problems occur.

Of the 1,200 trial-based inspections conducted annually, 600 are clinical inspections. This figure represents only two percent of the 30,000 clinical sites involving FDA-regulated products. The remaining inspections include Institutional Review Boards (300), sponsors/contract research organizations (75), and non-clinical (100) studies. While the Agency understands it cannot inspect every clinical study, added funds will enable FDA to increase its inspections and lower the risks to volunteers in clinical studies.

FOOD SAFETY

Each year, an estimated 76 million Americans get sick, more than 300,000 are hospitalized, and 5,000 die as a result of foodborne illnesses. The populations at greatest risk of serious illness are primarily the very young, the elderly, pregnant women, and those with compromised immune systems. The Centers for Disease Control and Prevention, (CDC) estimate that foodborne illnesses cost the nation more than \$8 billion annually in medical expenses and lost productivity.

With your support over the past several years, FDA has made great progress in developing an integrated national food safety system. Working in collaboration with the Centers for Disease Control and Prevention, U.S. Department of Agriculture and State and local governments, we have put in place important prevention programs and, when food borne illnesses occur, we are identifying outbreaks of food borne illness earlier, translating into fewer deaths and illnesses. FDA's prevention programs include our seafood HACCP program, our Good Agricultural Practices program for fresh produce, our program for fresh sprouts, a greatly expanded import surveillance program, and a new HACCP program for fresh fruit and vegetable juices. These programs are science-based and are supported by a rigorous foundation of high quality research and risk assessment.

Although the U.S. food supply is among the world's safest, an increase in the variety of foods and convenience items has brought accompanying concerns about public health. In addition, the complexities of the food industry, from production to packaging, to shipping, are increasing.

The multi-agency Food Safety Initiative (FSI) initially focused on reducing the number of illnesses caused by microbial contamination of food and water. Recent efforts towards achieving this goal have included increased efforts in reducing Listeria

monocytogenes contamination and the development of inspection and testing programs for shell eggs to reduce the risk of Salmonella enteritidis illness will be necessary.

We must also position ourselves to broaden the original focus of the FSI from only microbial contamination to include chemical contaminants and pesticide contamination, and other food hazards as well including food allergens.

Over fifty bioengineered foods are now marketed in the United States, most of which contain improvements that resist pests or herbicides. USDA oversees the planting and field trials of the crops, EPA has oversight of the pesticides that are engineered into crops, and FDA evaluates the food safety and nutritional aspects of the food. Although drugs produced using biotechnology have been widely accepted, the topic of bioengineered foods has generated much controversy, particularly about whether these foods should be labeled as genetically modified.

The latest concern has been over the strain of bioengineered corn, reported in several food products that were never approved by EPA for that use. Currently, FDA has a voluntary process through which companies marketing bioengineered foods consult with the agency on safety and other regulatory issues prior to marketing. Recently, we issued a proposed rule to make the voluntary process mandatory and to require companies to provide sufficient data to establish that the bioengineered food is as safe as its conventional counterpart. FDA also issued guidance for public comment as the appropriate labeling for foods developed through biotechnology. However, in response to growing public concerns over bioengineered foods, and concerns about our current process, additional strong scientific expertise is needed in this area to increase our oversight and our laboratory analysis capabilities.

In fiscal year 2002, FDA requests a total increase of \$14,700,000 for food safety activities, of which \$9,400,000 is budget authority and \$5,300,000 represents new fees for export certification. With the additional funding, FDA will:

- Expand the scope of food safety inspection beyond microbial contamination of foods to include chemical and pesticide contamination as well as to prevent cross-contamination with food allergens;
- Develop inspection and testing programs for shell eggs to reduce the risk of Salmonella enteritidis illness;
- Develop, in conjunction with NCTR, new methodologies to identify adverse effects of genetically modified foods, drug residues in foods and antibiotic-resistant strains of bacteria, using new molecular biomarkers and methods identified through genomic and proteomic technologies; and,
- Develop new risk assessment methods in collaboration with NCTR. New approaches will be validated for incorporating model uncertainties into microbial risk assessment.

Through a combination of FDA and State contract inspections, domestic firms that produce products at high risk of microbiological contamination have been inspected more frequently. Several years ago, such firms were inspected on the average of only once every three to four years. In fiscal year 2000, FDA inspected over 90 percent of the 6,250 high-risk establishments. In fiscal year 2001, the Agency expects to inspect 90–100 percent of high-risk establishments.

Section 801 (e)(4)(B) of the Federal Food, Drug and Cosmetic Act authorizes the recoupment of fees of up to \$175 for export certificates for drugs, animal drugs and devices. This section, however, does not cover the collection of user fees for export certificates for foods. FDA spends millions of dollars in food safety resources to support the specific needs of U.S. food exporters. The enactment of food export certification user fees will allow FDA to devote more attention and resources to food safety activities benefiting the entire population.

INFRASTRUCTURE SUPPORT

GSA is in the process of consolidating many of FDA's headquarter facilities at the former site of the Naval Surface Warfare Center in White Oak, Maryland. Under the first phase of this project, the Center for Drugs Evaluation and Research (CDER) laboratory building is scheduled for completion in fiscal year 2002. While GSA is responsible for the construction of this multi-year project, FDA is responsible for the actual move of staff and equipment, as well as certain telecommunication and equipment costs. FDA is requesting \$6,000,000 for one-time costs to equip and occupy the CDER laboratory portion of the facility.

With the support of Congress, the construction of the new Los Angeles laboratory, which analyzes twenty-five percent of all imported food samples, is now underway. To complete the project on time and move from the present facility by March 2003, when our lease expires, FDA is requesting \$3,000,000 for a total of \$23,000,000 to complete construction of the new laboratory.

DHHS has also formed a financial working group to oversee streamlining of financial operations in an effort to enhance coordination, eliminate duplication of effort and develop unified approaches to financial management. To further improve the Agency's financial management, FDA is requesting \$8,300,000 to begin initial acquisition and implementation of a new financial system. The Agency is working to minimize costs by taking advantage of work already performed by other DHHS agencies similar to FDA in scope and transaction volume.

FDA is also requesting an increase in current user fees to enhance the review process of new human drugs and biological products and established fees for applications, establishments and approved products. The fiscal year 2002 budget request includes \$204 million in user fees. Of this amount \$20 million are new fees for which authorizing legislation is needed—\$15 million for import activities and \$5 million to provide certifications requested by food exporters. Drug and device exporters already cover such costs. PDUFA includes a total of \$162 million, which includes an increase of \$12 million for review of drug and biologic applications. MQSA includes \$.5 million for inflation.

CLOSING

I thank you for the opportunity to share with you the breadth of FDA's responsibilities. FDA touches the life of every citizen through the medicines we take or feed for our animals, the blood products we may need one day, through the food we eat, the cosmetics we use, and, the medical devices in use today. Americans expect FDA to remain vigilant, to promote their health and well being, and to protect them from unacceptable hazards to our population at large, and to assure that they are adequately informed about the myriad hazards about which they will have to decide as individuals whether or not they are willing to accept. Significant investments must be made to keep this agency strong and at the forefront of the science upon which its regulatory mandate is based. The returns on that investment will be an agency that is equal to the challenges it faces and able to keep the confidence and trust of the American public. A strong FDA is clearly good for the consumer and industry alike, which in turn is good for the economy and health of our great nation. I appreciate your interest and continued support of the agency and its public health mission. This year is expected to be another exciting one for the Agency and I look forward to working with you as we face the challenges ahead.

Senator COCHRAN. Thank you very much, Dr. Schwetz. We appreciate your cooperation with our committee and the detail in which you present your budget request this morning.

BSE FUNDING

I notice that in connection with the mad cow disease, or BSE, issue that the budget requests \$15 million in additional funds to protect against illness associated in Europe with the consumption of meat with BSE, or mad cow disease. What activities will the agency emphasize during this next year with these additional funds?

Dr. SCHWETZ. The additional funds will help us cover several areas. Clearly one of them is to be sure that we continue the inspection of those facilities that are potential sources of getting ruminant proteins into other ruminants. So, a fair amount of it will go for our inspection capabilities for rendering plants, for feed mills, and for protein blenders that could be the source of a problem.

We work with the States to get this job done. We talked in the past about getting through 100 percent of the inspections by September, but that is not the end of the need. The need is for us to be inspecting these sites on a continual basis, so the additional money allows us to have more money go through to the States to get the inspections done, and more people within the FDA to continue to do the inspections.

Another part of it has to do with education and communication with the people out there who need to know more about what the 1997 regulation actually means and how serious we are about implementing it. We still are encountering people who should know what the 1997 rule said who do not seem to know all the details of what is expected under that rule. So, part of the money will go for continuing to educate the people who need to know about the problems of keeping records, of commingling feeds, of labeling feeds in the feed mills and rendering plants so that we avoid exposure.

Another part of it has to do with research. It is amazing, for as long as this kind of a disease has been around, that we do not know more about the cause of the disease and how it is transmitted from one animal to another, in some cases from one species to another. We do not have adequate methods yet for being able to very easily detect the presence of ruminant protein in feed products. So, that is one of the areas of research.

Another one has to do with being able to identify the prions in materials that might be contaminated with the prion that is associated with spreading the disease.

So, between inspections, additional educational activities, and research, those represent the kinds of major activities that we will be moving forward on.

IMPORT INSPECTIONS

Senator COCHRAN. While FDA has responsibilities for examining and inspecting imports, it is clear that the import numbers are increasing. We are importing so much more foodstuffs and other items that require inspection or are subject to our inspection laws. I wonder how FDA is able to cope with these increases, and I wonder whether the funding proposed in the next year's budget will give you a better opportunity to physically inspect and examine more of the entries being offered for import into the United States?

Dr. SCHWETZ. Additional money that we are asking for will certainly improve our ability to deal with import questions. The money is not the only thing, though, that we depend on for improving our ability to manage imports coming into the country. The money, of course, will help to put more FDA people in those situations at ports of entry or outside the United States to help ensure inspections outside the United States, as well as at the import sites.

In addition, we are working with a number of other groups who can help us to manage the risk that imports represent. We continue to work closely with Customs and with USDA, so that we use some of the capabilities that they have to help us with import alerts, and with the inspections at borders. They are very willing to help us. So, part of the strategy for the future to improve our ability to manage the import concern has to do with working more closely with Customs and with USDA to use the civil money penalties that they have and to use databases that they have.

We are trying to move up on knowing for sure who the problem importers are and be able to deal with them more effectively so that when a shipment comes in from a foreign company, or organization, that has a history of violations, that we are able to deal with them more quickly than we can today by virtue of having bet-

ter record systems to be able to alert the inspectors immediately that this is a shipment of potential concern and deal with it accordingly.

We are trying to mark imports that come in that are not allowed to be imported so that they are more easily identified from the standpoint of coming to another port and coming into the country through another site.

So, there are a number of things that this money will help us do, everything from more people to more infrastructure, working with other countries to develop the capabilities of doing inspections by some of their people through agreements on equivalency of inspections. So, there are a number of different fronts that we are working on, but clearly having the resources to put more FDA people behind this is very important.

PRODUCT WITHDRAWALS—POST MARKET

Senator COCHRAN. You also have responsibilities for what is called postmarket surveillance. These are related to drugs in one instance which come onto the market and are available to patients more quickly in greater number now than ever before. You mentioned in your statement that 1 to 3 percent of products approved each year have to be removed from the market because of serious side effects that are discovered after they are in the marketplace. Is this a fairly usual percentage, or is this increasing? Are you troubled by this factor, and do you need more support in this area from the budget point of view?

Dr. SCHWETZ. We are troubled anytime a product has to be withdrawn from the market because it suggests that one of several things happened.

First of all, we cannot collect enough data ahead of time to assure that every product that is approved will be safe under all conditions of use. So, it means that we did not quite have enough information yet and we learned more as we expanded from a small group of maybe tens of thousands of people to millions of people. There are rare events that you discover when you scale up to a larger level of use.

It could mean that we did not anticipate some conditions of use or some health conditions in which a product might be used, and we learn more after the product is approved than we learned about it during premarket as we watch for those adverse events. So, anytime an adverse event happens, it is important to us.

But there are more drugs for which adverse events are being recognized now and more drugs that are being withdrawn, but the percentage of new drugs that are approved that are withdrawn has not increased over the last 20 to 30 years. The increase reflects the larger number of drugs being approved, not that the drugs being approved are more dangerous than they were before or that we are looking harder for effects. We are looking hard for whatever we can use to evaluate the safety of drugs after they are approved. But on a percentage basis of approvals, the withdrawals have stayed the same for the last two or three decades.

PRESCRIPTION TO OTC

Senator COCHRAN. There was a story in the morning paper about drugs that were once described as having serious side effects and requiring prescriptions now should be considered as over-the-counter medicines because the side effects are not nearly as serious as the FDA or somebody said they were. What is your reaction to that problem, and is the FDA monitoring that to make sure that prescription drugs are not continued to be recognized as prescription drugs if the reason for it, in the first place, is no longer appertaining to those drugs?

Dr. SCHWETZ. Well, usually the manufacturers come forward and request that a drug, for which there is now a considerable amount of clinical experience, be considered for a switch from prescription to over-the-counter. So, it is something that we have looked at for many drugs, and a lot of drugs that were prescription are now over-the-counter. So, it is a usual practice for drugs where the consequences of taking them represent minimal health risks.

DIETARY SUPPLEMENTS

Senator COCHRAN. This is my last question, too. I assure my colleague, Senator Johnson, I am going to stop asking questions here.

You recently came down to the University of Mississippi, and I was fortunate enough to be able to be there and hear you deliver the annual Hartman lecture that is sponsored by the university's pharmacy school. You talked about dietary supplements and the challenges being faced with regulation or non regulation in that area. FDA has warned the public that there could be risks involved that consumers may not be able to discern. You noted some adverse event reports for certain supplements and noted that they were worrisome.

Could you tell us, in summary, what are the risks to the consumers in our country that stem from taking dietary supplements? How can they be assured that these are safe and whether or not the public needs to be warned in some formal way about the risks involved?

Dr. SCHWETZ. Some dietary supplements clearly are safe and are beneficial to a lot of people. But as you point out, there are concerns for some of the dietary supplements from the standpoint of a number of aspects that they might be causing harm.

One of them is that some dietary supplements are known to interact with drugs that are being given to a patient for a specific disease, and they might change the availability of that drug that is being given to actively treat a disease. A dietary supplement in combination with that might make the drug less bioavailable or it might cause metabolic changes so that the drug that you are expecting to have a beneficial effect is in a different form because of a change in metabolism related to the presence of a dietary supplement. So, the interaction with other drugs that are being taken or other substances that are being taken, even if it might not be a drug, is one concern.

Secondly is the inherent toxic properties of some of the components of dietary supplements themselves. So, there are components of some dietary supplements where you might expect that you

would see a toxic effect to the nervous system or to the kidneys or the liver or whatever the target organ might be.

Another concern about dietary supplements is that they are derived from plants that grow under widely varying conditions, and we have known for many years that in times of drought, for example, there are chemicals in plants that are not there in good growing conditions. The possibility exists that some of those toxic materials might find their way into some of the batches of dietary supplements.

The other concern is that people rely on dietary supplements when they should be seeking a more aggressive form of therapy. We are concerned if a person takes a dietary supplement to treat a problem when in fact they should be seeking more serious medical care.

One of the things that we have been working on to prevent some of these surprises is the use of Good Manufacturing practices to help standardize the manufacturing processes for these products. One of the dangers that I talked about when I was at Ole Miss is the fact that quality control is not as tight as we would like it to be. It is not as tight as it is for drugs. So, in many cases we do not know for sure what the active ingredient is in a dietary supplement that accounts for its effect. In addition, we do not know if the amount that was in this batch is also going to be in the next batch and the next one. So, Good Manufacturing practices will help that.

The other thing that we are working on and that is part of the 2002 budget is having a greater capability for tracking adverse events that might be associated with dietary supplements. There was a recent report that suggested that one of the things the FDA should have is a more extensive capability for tracking adverse events from dietary supplement use. So, that is something that we are also working on.

Senator COCHRAN. Thank you very much. A very interesting response.

Senator Johnson.

GENERIC DRUG RESOURCES

Senator JOHNSON. Well, yes, thank you, Chairman Cochran.

Dr. Schwetz, over the next 5 years the patents on about \$34 billion in sales of brand drugs are going to expire, and studies have indicated that generic drugs typically enter the market priced about 30 percent less than the brand product, and consumer savings increase up to 80 percent on average over 2 years. A 1 percent increase in use of generic drugs will result in about \$1 billion in savings to consumers and health care providers, we are told.

But with this extraordinary number of applications for generic drug approvals that will come before the Office of Generic Drugs in the future, I wonder whether the OGD will have sufficient resources to meet the 180-day statutory time frame necessary to approve these generic applications.

How do you anticipate the Office of Generic Drugs managing the prospect of a significant influx of abbreviated new drug applications, and has the administration requested an increase in resources to meet the demand? And do you feel that the FDA ought

to be more aggressively involved in consumer education programs designed to increase the public awareness of generic drug options?

Dr. SCHWETZ. Thank you for your questions because we are trying to improve our timely review of the generic drugs. There is a request for additional money to provide pay costs for our people to get work done more quickly than we have in the past to try to meet our statutory requirement. So, part of it is having enough people to get the job done.

One of the reasons we are working so hard for the pay related increases this year is that when we put more money into a program, like generic drugs, the money is actually used for that program as opposed to paying the mandatory salary and inflation needs, as we have in the past, where it may look like we have put more money in it, but actually what we are doing is paying the salaries of the people who are there. Over those years, we have actually lost people from the agency to be able to do some of these tasks. So, the mandatory pay increase will help that, plus any amount of money that would be available to help hire additional scientists and physicians to do this work.

Part of it is also to tap into databases that will give us additional information about the effects of these drugs under use conditions.

In addition to getting more data and more people, as you point out, we are making an effort to have more information go out to the public to increase confidence in generic drugs. It is our desire to make more information available to the public to allow the people to decide whether they want to use generics or not.

Senator JOHNSON. How are you doing that?

Dr. SCHWETZ. It is probably best to ask Dr. Woodcock, the head of our Center for Drugs, to expand in more detail on how that will happen. Janet?

Dr. WOODCOCK. Good morning. There are several information campaigns that we are embarking on. One is directed to consumers to inform them of basically the scientific basis for making generic drugs available because there is quite a belief out there amongst the patient population that they are not as good and that they would be getting an inferior product. And we really think we can stand behind the generic drugs that we approve, that they are pharmaceutically equivalent to the innovator product.

Another large group of people we need to reach better is the pharmacy community because they still maintain the belief, in some cases, that generic drugs are inferior. So, we need to target toward them more scientific information on how we do these approvals so they understand the scientific basis for generic drugs.

Senator JOHNSON. Is the President's proposed budget adequate for this purpose, or do we need to be looking at that as this committee examines the FDA budget?

Dr. WOODCOCK. We are beginning these campaigns now in the current fiscal year and we hope we will be able to continue them within the President's budget next year.

BSE ENFORCEMENT ACTIONS

Senator JOHNSON. Thank you.

Just one last question. I appreciate Dr. Schwetz's discussion of this issue. Let me just follow on a little bit on the BSE issue, and

that is to the steps that the FDA is willing to take if a feed mill or rendering plant does not meet your September 30 deadline for compliance with your feed mixing ban and whether the reprogrammed funds, \$2.4 million in 2001 within the FDA's Center for Vet Medicine, will be sufficient to handle these aggressive inspection and reinspection plans.

Dr. SCHWETZ. Yes, they are sufficient from the standpoint that we react to the most egregious problems that we have. So, the money that we have available will certainly be used for those situations that represent the greatest risk of BSE being spread. But since we used money from the contingency fund, and money from other agency activities to do more inspections and other work on mad cow disease this year, the additional money that we are asking for will help to replenish some of those activities and let them go on as they were before, and allow us to do new things on mad cow disease as well.

Senator JOHNSON. And as to what happens to plants that do not meet the September 30 deadline?

Dr. SCHWETZ. I would ask if Dr. Sundlof could help to answer that question.

Dr. SUNDLOF. Thank you and thank you, Senator Johnson.

We have stepped up some of the enforcement actions against firms that continue to fail or fail in the first place to comply with the rule, and now we are going to direct warning letters. As soon as we get to a firm that we find out of compliance, they immediately get a warning letter.

There were about 834 firms that we found to be out of compliance. On reinspection, we are finding about 93 percent of those are now in compliance on second inspection. That means that there is still 7 percent of those firms that are not in compliance. We have issued 31 recalls now of feed. So, we are really stepping up the enforcement aspect of the 1997 rule. With the funds that will be available in the next fiscal year, we intend to increase that even more.

We are putting all of the information on the firms that were inspected on our website. So, anybody can go to our website now and find out which firms are in compliance, and which firms are not in compliance. We think that is going to have immeasurable impact on bringing people around to compliance with the rule.

Senator JOHNSON. Well, I appreciate your testimony on this. While I think that the FDA has acted in a very timely, aggressive manner, it cannot be, I think, overstated how catastrophic an occurrence of BSE in the United States would be to the livestock industry and to our agricultural economy in general. So, I look forward to continuing to work with you on these issues. Thank you.

Mr. Chairman, I yield back.

IMPORTATION OF CATFISH

Senator COCHRAN. Thank you very much, Senator Johnson.

There is one parochial issue in our State of Mississippi that I am going to ask you about now. We have a flourishing catfish industry in our State. It has grown very much over a long period of time. They are encountering difficulty with import competition from Southeast Asia, particularly Vietnam, of seafood products that are

labeled as if they are the same products as grown in our domestic catfish farms in Mississippi and other States. The problem is that while FDA sent out an import alert calling attention to misbranded seafood and possibly the presence of Salmonella, there is some question about whether these alerts have been effective and whether the interdiction of improper shipments of seafood have been effective to protect the consuming public or to fully advise the consumers what they are buying.

My question is whether the proposed budget for FDA's Center for Veterinary Medicine, Office of Surveillance and Compliance provides the funding to facilitate the development of a methodology and technology necessary for the proper testing of import tolerances for banned substances? And does FDA's Office of Seafood have the resources it needs to address the increasing volume of imported seafood both at the border and in the U.S. marketplace?

Dr. SCHWETZ. The increases in budget certainly move us in the direction of being able to do more than we have in the past. Regarding the possibility of more accurately being able to detect catfish that are some other varieties of catfish coming in from foreign countries than what we would call catfish here, I would ask Mr. Levitt if he would provide additional help on that.

Senator COCHRAN. Mr. Levitt, you may come forward.

Mr. LEVITT. Thank you.

As you point out, there are responsibilities both for my center, the Food Center, and for the Center for Veterinary Medicine. The import alert, as you correctly point out, is designed to try and be sure American consumers know what they are buying and if there are differences in the kind of fish, they are readily apparent to consumers. Again, as Dr. Schwetz said, the money we have for greater surveillance over imports will move us in that direction, but also the numbers, you have to realize, of imported foods, as well as all of our products, are growing dramatically. We have seen over the last 8 years a quadrupling in the number of food imports in the United States. So, we are continuing to do, as Dr. Schwetz pointed out, a number of different things to address that. Part of that is through the import alert, looking to be sure that the fish is properly labeled and identified for the consumer. So, we will be able to do more of what you are asking.

PATIENT SAFETY TASK FORCE

Senator COCHRAN. Dr. Schwetz, you indicate in your testimony that the Department has established a patient safety task force to integrate the collection of data on medical errors with a goal of reducing medical errors by 50 percent over a 5-year period. What is the FDA's role in this effort and what kind of baseline, if any, has the task force established for measuring progress in meeting its goal?

Dr. SCHWETZ. I will let Dr. Woodcock expand on the answer to that, but there are a number of ways that we are trying to prevent medical errors. For example, whether or not a name that is requested for a new drug is a name that looks like other drugs and could cause confusion. The fact that information on labels might not be clear enough to have people read the label quickly and draw the right conclusion. If they are only going to read part of the label,

do they read the part of the label that conveys the most critical information at the very beginning. Once someone says they have read the label, have they really drawn the wrong conclusion or the right conclusion from what they have seen? So, there are a number of things.

As we test these kinds of new labels and new drug names on groups of people who have not been involved in the review of the drug itself, but are kind of naive to the information, we are trying to improve the quality of information that there is that users would eventually have, either physicians or other people in health care or the consumer himself, so that the right conclusion is drawn from the information.

But, Dr. Woodcock, would you expand more?

Senator COCHRAN. Dr. Woodcock.

Dr. WOODCOCK. Certainly. The collaboration amongst the four agencies is basically intended to make sure no information is lost. I think the best way to explain this is by an example.

The Agency for Health Care Quality Research is pursuing reporting of medical errors, as you know. One of the defined medical errors that might be reported into those systems is a malfunction of a medical device. We want to make sure that when errors or problems like that are reported into State or Federal reporting systems, not to the FDA, that the FDA can respond because we know about them. A malfunctioning device is really under the purview of the Center for Devices. It is something the Device Center would have to take action on to improve the design of that device or have better warnings and precautions around it or maybe even take it off the market.

So, the concern is with the interest in reporting systems for medical errors—medical errors are not as straightforward as one might think and often they involve a regulated product. For example, blood is another good example of where there are a lot of errors involved in administering blood, some of them fatal, but they involve the Biologics Center, the way blood banks operate, the way blood is labeled and so forth.

So, we are trying to reduce duplication of reporting requirements on facilities, as well as make sure the information is shared with the relevant parties so they can take whatever responsibility they have.

BLOOD ACTION PLAN

Senator COCHRAN. Thank you.

That leads to an observation. In fiscal year 1998, in the appropriations bill, there was a statement of managers dealing with development of a blood product tracking system, a notification system. FDA issued an advance notice of rulemaking in 1999, but as I understand it, it has not completed the implementation of a blood products safety mechanism. I am told that manufacturers have sought to establish a voluntary notification system through a third party that has had some problems.

A lack of confidence in the system has resulted in poor enrollment by the hemophilia community.

My question is what will the FDA do to move forward to finalize its proposed rule to require manufacturer tracking of blood-derived products and prompt patient notification of adverse events?

Dr. SCHWETZ. I would ask if Dr. Zoon could answer that question.

Dr. ZOON. Thank you very much for the opportunity.

As you know, the agency has been working on a blood safety action plan, and this has been in coordination with but the National Institutes of Health and the Centers for Disease Control. One element of that blood action plan did involve the advanced notice of proposed rulemaking that you have mentioned. This part of the blood action plan, as you also alluded to, is currently being conducted on a voluntary basis by the industry. We are very interested in moving this initiative forward. There are multiple competing parts of the blood action plan, but this is one that we appreciate your interest in and will look into its status and move it along.

NARMS

Senator COCHRAN. Thank you very much.

FDA has been analyzing the effects of antibiotic use in food-producing animals through the National Antimicrobial Resistance Monitoring System, specifically looking at antimicrobial resistance. What agency decisions or priorities have been affected by use of this National Antimicrobial Resistance Monitoring System and the data that has been collected?

Dr. SCHWETZ. The data from NARMS have helped to support decisions within the agency now and during this past year. The data we are collecting through this monitoring system give us a good baseline of information upon which to make decisions on other drugs where we are just beginning to collect information and new drugs that will be approved in the future that have antibiotic activity.

During this past year, we have been tracking the information through this NARMS system. What we find from the use of fluoroquinolone drugs in the poultry industry and the increased incidence of antibiotic resistance that we saw with *Campylobacter* led to the statement by the agency that we were withdrawing the approval of fluoroquinolones in the poultry industry. So, that is one example of where the data have helped us to review information that led us to do a risk assessment of fluoroquinolone use and, in the specific case of poultry, to make a decision that we should withdraw the approval of it. It can still be used in other farm species but not in poultry.

We have also begun to look at information, or other antibiotics and the use and their correlation with what we are seeing in NARMS. One that we are looking at right now is a drug called virginiamycin, which has a human drug counterpart. We are looking at the information. We are reviewing what is available on virginiamycin as another candidate that might be increasing antibiotic resistance, and eventually if we have enough information, we may do a risk assessment of the impact on humans. That is another example of where we will be doing that.

Senator COCHRAN. We had a hearing exploring this in another setting last year and we learned an awful lot about how antimicrobial resistance was becoming a very, very serious problem,

not just from the animal feed standpoint, but the prescription of drugs that are unnecessary in a lot of cases. Somebody has a cold and they go see the doctor and he gives them an antibiotic, and they may be suffering from a sinus condition that is not an infection and would not respond to that drug when it was given. But that is what the patient wants. That is what the doctor prescribes.

It has so many aspects. Sometimes we do concentrate in one area and forget about the other things that can be changed that will help deal with the problem too. But these are very serious problems and very challenging areas, I am sure, of inquiry. The more we know about it, the better off we will all be. Right?

Dr. SCHWETZ. Yes.

Senator COCHRAN. Or so we hope, anyway. If we have got sense enough to act on the facts rather than our suspicions.

INFRASTRUCTURE FUNDING

Last year we provided funding in the buildings and facilities area of the budget for the first phase of construction of the new Los Angeles laboratory. I know that was a high priority on the FDA's wish list, and I am curious to know what progress is being made on the project.

Dr. SCHWETZ. There has been considerable progress made on the Los Angeles laboratory. Thank you all for your support to keep this moving. The \$3 million that is proposed in the budget for 2002, plus the \$20 million that we have received already has gotten us started, and will bring the Los Angeles laboratory to completion. This is a very important lab for us because about 25 percent of the foods that we inspect that come into the country come through that laboratory. So, we are making good progress on completing that.

Senator COCHRAN. Another budget request that deals with equipment and laboratories is the \$6 million requested to equip and occupy a new laboratory for the Center for Drug Evaluation and Research as part of the agency's long-range move to a consolidated headquarters in Maryland. Is that project on schedule, and will all of the \$6 million be needed in the next fiscal year?

Dr. SCHWETZ. That project is moving. The ground breaking for the Center for Drug facility happened last fall. So, the GSA funding is what is going to build that building, and the \$6 million that is in our budget will help to move the Center for Drugs people into that facility as the first phase of consolidating all of our activities out there on that campus, all of the activities that relate to the medical products, the Center for Drugs, the Center for Devices, the Center for Biologics. Eventually the FDA Office of the Commissioner would be there and the headquarters for the Office of Regulatory Affairs, the field operation. So, eventually we are going to be bringing all of that onto that campus.

I would ask Mr. Weber if he would offer any additional information about whether this is on time or not.

Mr. WEBER. The project is on time. The community is very supportive and I think they are making sure that the project stays on time. We are expecting to move in between the end of 2002 and the beginning of 2003. Some of the funds would be needed before the staff moves in for telecommunications costs and things like that, and the money is being requested as 2-year funds so that if some

of the project is funded in 2003, we would have the money carried over for that purpose.

Senator COCHRAN. I appreciate very much your attendance at the hearing this morning and the response to our questions and the cooperation with members of our subcommittee in answering their special areas of concern.

ADDITIONAL COMMITTEE QUESTIONS

We will continue to review the budget and we may submit questions in writing that we did not ask this morning. We hope that you will be able to respond to them in a timely fashion.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

BOVINE SPONGIFORM ENCEPHALOPATHY (BSE) OR "MAD COW DISEASE"

Question. "Mad Cow Disease", or BSE, is of great concern today. Please describe FDA's role with respect to protecting this country from the threat of BSE, in terms of what activities FDA undertakes, and which regulated products BSE may affect.

Answer. One of the goals of FDA's activities regarding transmissible spongiform encephalopathies, or TSEs, is to minimize the risk of the introduction of bovine spongiform encephalopathy, or BSE, into U.S. cattle, and to minimize the risk of amplification of BSE in the U.S. cattle herd, if BSE were ever to be found in U.S. cattle. On August 4, 1997, FDA's regulation entitled "Substances Prohibited From Use in Animal Food or Feed; Animal Proteins Prohibited in Ruminant Feed", 21 CFR 589.2000, became effective. The purpose of the rule is specifically to meet this goal. FDA has developed a three-pronged approach in its efforts to realize 100 percent compliance with the 1997 feed rule.

The first prong is education. Providing education for both licensed and non-licensed feed mills, as well as State and Federal inspectors conducting FDA inspections, helps to ensure a full understanding of the feed rule and increases compliance. State feed control officials and trade organizations representing renderers, feed mills, and other parts of the organizations representing renderers, feed mills, and other parts of the livestock feeding industry have played a large role in helping to educate groups within the feed industry. The FDA has also conducted more than 25 individual training sessions for FDA district and State personnel.

The second prong is a strong and visible inspection presence. FDA's goal is to inspect 100 percent of all known renderers, protein blenders, and feed mills, and to inspect as many ruminant feeders as possible. The Agency has coordinated inspections with State feed control officials so that all firms found in violation will be re-inspected to confirm that corrective actions have been implemented. FDA plans to continue to monitor the status of compliance with the rule by firms handling prohibited material, such as meat and bone meal, by maintaining an on-going inspection and reinspection program. In addition, FDA plans to continue to monitor the status of the industry for compliance with the rule by inspection and implementation of a sampling program to check for the presence of prohibited proteins in ruminant feeds.

The third prong is enforcement action. FDA is prepared to initiate enforcement action, under the Federal Food, Drug, & Cosmetic Act, FFD&C Act, to ensure compliance with the feed rule. Actions may include issuance of warning letters, product seizures, injunctions, or prosecutions, in addition to firm-initiated recalls to remove adulterated or misbranded products from the market place.

In addition, FDA is enhancing its vigilance at U.S. ports of entry for regulated products which BSE may affect, such as animal protein, including feeds. Other regulated products BSE may affect are gelatin-containing products for oral consumption, such as candy and capsules, as well as cosmetics and dietary supplements. FDA issued an Import Alert on January 20, 2001, and a new Import Bulletin on March 1, 2001. These new documents provide a detailed second-line system for identifying at the ports products about which FDA has potential BSE concerns. FDA has coordinated its actions with Customs and USDA's Animal and Plant Health Inspection Service, APHIS. It is important to note that the FDA, as well as Customs, and APHIS, are dependent upon the import community, which includes brokers, import-

ers, and shippers, for the entry and manifest data with which to identify products consisting of, or containing, materials of concern from BSE and BSE-high-risk countries. Products which are not declared correctly or are described by importers or brokers so as to hide their animal origin or country of origin, may not be detected through FDA import monitoring.

In order to achieve and maintain a sufficient level of accuracy in data on products submitted for importation into the U.S., FDA has trained importers and brokers in the submission of such data and periodically evaluated the quality of such data by company data submitted with original entry documents. These are labor intensive activities, and our resources are severely limited.

Question. FDA recently sought and received an apportionment of \$2.4 million in unobligated contingency funds appropriated in fiscal years 1990 and 1991 to reimburse FDA for "extraordinary costs" associated with the BSE threat. What are the "extraordinary" costs associated with BSE which caused FDA to use the contingency fund?

Answer. The extraordinary costs related to the BSE threat were not provided for in budget estimates, because of the nature of the way this issue evolved during the current fiscal year. The Animal Drugs and Feeds program is relatively small in size and the use of this Fund provides a way to deal with this emergency without disruption of important ongoing programs. The unusual costs related to the BSE threat include supplies, travel, and contracts, including contracts with the States to do product screening and inspections.

Question. The statute requires that emergency contingency appropriations be available only "to meet unanticipated costs of emergency activities not provided for in budget estimates" and "after maximum absorption of such costs within the remainder of the account". Please specify how the FDA activities associated with the BSE threat were determined to have met each of these two requirements.

Answer. In order for FDA to deal with the unanticipated need to screen certain products to prevent BSE, we have been able to reassign some of our existing staff from relatively lower-priority work to the BSE-related work.

Question. How does the total level of funding for BSE-related activities proposed for fiscal year 2002 compare with the levels provided for each of fiscal years 2000 and 2001? Please provide a comparison of the activities associated with BSE undertaken in each of fiscal years 2000 and 2001 and proposed for fiscal year 2002, including the level of funding and staff years for each activity.

Answer. In fiscal year 2000 FDA spent approximately \$3.8 million on TSE related activities. These activities included: Statutory and non-statutory inspection of feed mills, renderers, and producers, through the use of FDA and State contract inspections; conducting research on blood and blood products; developing regulations to screen and test blood donors for BSE/CJD; reviewing and approving vaccines and therapeutic biologic products of which many use human or animal materials in production; and, conducting applied regulatory research to understand TSEs.

In fiscal year 2001 FDA had planned on spending approximately \$3.8 million, but given the recent events related to BSE in Europe, FDA has had to adjust its plan within the animal drugs and feeds programs. Adding to the base resources from fiscal year 2000, FDA will internally shift resources from lower priority programs to cover domestic inspections and import entry review and import label examinations. In fiscal year 2001 FDA also tapped into the contingency fund for one time funds of \$2.4 million. These funds covered additional State contracts for domestic inspections, training for FDA employees, and importers, scientific equipment for laboratory analysis, methods development and validation, IT enhancements, market studies to identify food and cosmetic products containing specific risk products, and overtime and travel costs incurred by the field. In fiscal year 2002 FDA has requested an additional \$15.0 million for BSE activities.

[The information follows:]

Foods Program, \$1.1 million

Expand work efforts to identify food and cosmetic products containing brain, spinal cord, and other specific risk materials (SRMs); the origin of the animal; and country of origin;

Research the risk factors and mechanism for CWD which affects elk, deer and other domestic game/pen-reared animals;

Participate in international BSE meetings to ensure safety of the U.S. food supply; and

Provide up-to-date information on the emerging public health issues to the public.

Biologics, \$0.5 million

Address the potential BSE threat to the safety of biological products. Two biological product areas affected include the safety of the blood supply and the safety of vaccines derived from bovine-sourced material.

Animal Drugs and Feeds \$13.1 million (\$2.2 million Center, \$10.9 million Field)

Conduct targeted BSE inspections of all renderers and licensed and non-FDA licensed feed mills handling prohibited material, such as meat and bone meal on a yearly basis, and conduct reinspections of those with compliance deficiencies, taking appropriate enforcement actions for repeated or egregious violations;

Leverage with State agencies by funding approximately 4,000 contract inspections of feed mills and renderers, and conduct compliance, follow-up, and audit inspections to State contracts;

Review and evaluate field inspection data and take enforcement action when necessary;

Develop a domestic sampling plan, collecting and analyzing 600 domestic feed, and feed component samples for BSE related contaminants. In addition, the Animal Drugs and Feeds Program will increase the number of import samples by 600. This sampling plan will ensure proper labeling of animal feeds and feed components;

Provide intensive line entry and label review, when appropriate, of an anticipated 175,000 import line entries for use in domestic commerce for the Animal Drugs and Feeds Program by expanding import staff by 17 FTE;

Conduct additional training for Federal and State inspectors on the BSE feed regulation, update them on the current European Union situation, Animal Plant and Health Inspection Service (APHIS) authority and approach, and what to look for and how and when to sample;

Develop and validate detection methods for BSE, collaborating with experts and foreign scientists to assist in developing BSE methods;

Modernize the existing information technology infrastructure to facilitate electronic inspection reporting and information collection and distribution; and,

Educate industry and the general public on BSE through public meetings, publications, and FDA's website.

Other Activities, \$0.3 million

Provide advice and counsel on legal matters, render opinions, and support rule-making proceedings, legislative matters, policy deliberations, and domestic and international negotiations; and,

Provide litigation support for enforcement, defensive and third-party matters.

BLOOD SAFETY

Question. The conferees, in the statement of managers accompanying the fiscal year 1998 appropriations Act, requested that FDA move forward with development of a blood product tracking and notification system. FDA issued an advanced notice of proposed rulemaking in August 1999, but it has not completed implementation of this important blood product safety mechanism. When will the FDA move forward to finalize its proposed rule to require manufacturer tracking of blood-derived products and prompt patient notification of adverse events?

Answer. The advance notice of proposed rulemaking, or ANPR, "Plasma Derivatives and Other Blood-Derived Products; Requirements for Tracking and Notification," was published on August 19, 1999, in the Federal Register. The development of the final rule on the blood product tracking and notification system is part of Blood Action Plan in coordination with the National Institutes of Health and the Centers for Disease Control and Prevention. There are competing parts of the Action Plan. Programs for notifying recipients in cases of issues related to blood product quality and safety are presently voluntary. FDA is expediting this rulemaking process. Comments to the ANPR have been organized and are being reviewed. We anticipate that the proposed rule will be published by June 2002, and the final rule will be published by August 2003.

APPLICATION REVIEW PERFORMANCE

Question. You indicate that there has been sustained high performance in application review for prescription drugs, particularly for new drugs. Yet, the performance is not as high—in fact, far below statutory requirements—in other product areas. Where do you see gaps in application review, and is closing those gaps a priority?

Answer. There are four types of applications where there are or could be significant gaps in review performance. We are trying to close the performance gaps for

all of these applications by using additional resources when available, redirecting resources to higher priority applications, and by improving the review process.

During fiscal year 2000, FDA approved 232 Abbreviated New Drug Applications, ANDAs. This is an increase over the 198 approved last fiscal year. Of these, several represent the first time a generic has been approved for a product. Significant strides were made toward a paperless review environment. With \$1.5 million in funding earmarked for satisfying information technology needs, FDA purchased upgraded hardware and software, and contractual support for the review of electronic submissions.

Beginning in January 1997, FDA implemented a procedure to reduce approval times by allowing reviewers to utilize a facsimile amendment. Facsimile amendments are requests from reviewers to applicants for clarification/resolution of minor deficiencies. This procedure resulted in review times exceeding 6 months, but shortened overall approval times. In June 2000, a slight modification to the facsimile amendment procedure was made and this modification to the procedure will better enable FDA to act upon its target percentage of ANDAs within 6 months.

The inability of FDA to meet the 6-month goal is also a function of the existing backlog of chemistry and microbiology reviews. To address these backlogs, FDA restructured the review process, added reviewers, and added project managers. FDA believes that these initiatives will reduce the chemistry and microbiology backlog allowing reviewers to get to the applications sooner and lessen the effect of the facsimile amendments on the 6-month review goal.

It is widely recognized that meeting the current statutory time frame is an unrealistic goal for all food and color additive petitions, especially the more complex ones. The impracticability of the current time frame was acknowledged in the report from the June 1995 House hearing, and a recommendation to change the time frame to, 360 days of receipt, was included in the Agency's testimony before the House Committee on Government Reform and Oversight in 1996.

Since the 1995 and 1996 hearings, the Food and Drug Modernization Act, FDAMA established a notification process for food contact substances. The premarket notification program began to fully operate on January 18, 2000. Several factors will influence future performance in reviewing food and color additive petitions within 360 days. The most important of these factors is the implementation of the new premarket notification process. By fiscal year 2001, we expect that many of the simpler food additive petitions that can be completed within 360 days will be filed under the notification program and thus decrease the workload for food and color additive petitions. However, since the remaining petitions are likely to be more complex and take more time to review, Agency performance may decline initially. Similarly, the premarket notification program may also initially increase the fraction of pending petitions that are overdue because many recently submitted petitions for food contact substances will have been converted to notifications. Once the notification and the petition review processes are well established, FDA expects performance on food and color additive petitions to increase substantially toward full performance in succeeding years beginning in fiscal year 2002.

The Animal Drugs and Feeds Program does not have sufficient resources to review and act on all new animal drug application actions received within the statutory time frame of 180 days. Recent resource increases in the drug review area will allow the Center for Veterinary Medicine, CVM to recruit and hire review scientists. These increased personnel resources will boost our compliance rate from 75 percent in fiscal year 2001 to 80 percent in fiscal year 2002.

In fiscal year 2000, FDA performance was 96 percent for the premarket device applications received in the first six months. The performance strategy is to redirect resources from low-risk to high-risk devices. Also, efforts such as early meetings with manufacturers, modular review, streamlined reviews, and product development protocols have resulted in faster reviews. PMA submissions will continue to increase in fiscal year 2001 and fiscal year 2002 due to technology advances, increased use of computerized and miniaturized devices. Therefore, it is expected that fiscal year 2002 will not only be a year of more submissions but submissions will require multiple reviewers with different areas of expertise. Reviews will be more complex and take even more science time. This could adversely affect review performance in the future.

I would be happy to provide the information requested arrayed according to application type, relevant statute, and fiscal year 2000 performance.

[The information follows:]

| Time frame | Relevant statute | Fiscal year 2000 performance ¹ (percent) |
|--|--|---|
| Review abbreviated new drug applications (ANDAs) within 180 days. (Drugs) ² . | FFD&C Act Sec. 505(j) | 56 |
| Review Food and color additive petitions within 360 days (Foods). Goals are based on 360 days. The statute provides for 90 days with one additional 90-day extension for a total of 180 days. ³ . | FFD&C Act Sec. 409(c)(2) for food additive petitions and Sec. 721(d)(1) for color additive petitions.. | 77 |
| Review new animal drug applications (NADAs) & abbreviated new animal drug applications (ANADAs) within 180 days. (Veterinary Drugs). | FFD&C Act Sec. 512(c)(1) | 74 |
| Review premarket approval applications (PMAs) within 1800 days. (Devices). | FFD&C Act Sec. 515(d)(1)(A) | 96 |

¹ Potential performance computes the percent that we will reach if all the currently pending within goal submissions are given within goal reviews. Current performance figures may appear low since the fiscal year 2000 cohort is just reaching goal date maturity.

² FDA is required to take an action on generic drug applications within 180 days. FDA had a goal of reviewing 60 percent of applications in fiscal year 1999. That goal was not met, in part, due to a procedure that held applications open while the firm responded to deficiencies in the final stages of review. This approach has been revised. The goal for fiscal year 2000 is 45 percent, 50 percent for fiscal year 2001, and 55 percent for fiscal year 2002. Performance data for fiscal year 2000 will not be available until 180 days after the close of fiscal year 2000. However, based on preliminary estimates, it appears FDA will meet its goal of 45 percent for fiscal year 2000.

³ The statutory requirement—FD&C Act Section 409(c)(2)—for action on a food additive petition is ninety days, with one additional ninety-day extension for a total of 180 days. (A similar provision for color additives is found in FD&C Act Section 721(d)(1).) Nevertheless, for these petitions, application review goals are based on 360 days as recommended by House Report 104-436. During the period January 1, 2000 to September 30, 2000, FDA completed the safety evaluation within 360 days on: 5 of the 5 food additive petitions received in fiscal year 1999 that qualified for expedited review—those that are expected to have a significant impact on food safety. In addition, FDA completed the safety evaluation within 360 days on 59 of the 77 food and color additive petitions received in fiscal year 1999 that did not qualify for expedited review.

Question. Using the fiscal year 2002 request as a base, what additional amount of funding and number of staff years would be required to allow FDA to meet the statutory requirements?

Answer. The Agency is currently in the process of developing long-range estimates for resource needs associated with closing the gap between current performance and meeting statutory requirements. The estimates will include: a range of estimated resources, assumptions in determining the estimate, and caveats that indicate what types of uncertainties or changes would alter the estimates.

DEVICES

Question. Section 515(d) of the Federal Food, Drug, and Cosmetic Act requires FDA to approve or deny a PMA within 180 days. The FDA budget justification indicates that the statutory requirement is to review 100 percent of PMA first actions within 180 days. Is this in fact the agency's view? What is the difference between "first action" and approving or denying an application?

Answer. Section 515(d) of the Federal Food, Drug, and Cosmetic Act requires FDA to approve or deny premarket approval application, or PMA, within 180 days. It is FDA's goal to meet the statutory time frame. This includes completing our review and first action within 180 days. A first action includes the final action of approving or denying an application. First actions also include interim decision letters in which FDA lists additional information that is required from the PMA applicant in order to make the application approvable. These interim first actions include approvable, not approvable, and major deficiency letters. Not approvable and major deficiency letters cause the 180-day review clock to restart, that is it is reset to zero, when the PMA applicant submits responses to these letters. An approvable letter temporarily stops the clock while the applicant prepares a response, and the clock resumes running when we receive the response.

Question. What additional funding would FDA require from the President's fiscal year 2002 budget request to meet statutory review times for medical devices. Please provide a detailed justification of the estimate provided, along with an explanation as to how the additional funds would be used to meet statutory review times.

Answer. FDA expects to expend the same level of funding in fiscal year 2002 as in fiscal year 2001 for medical device reviews, plus corresponding pay increases in fiscal year 2002 associated with this function. The Agency is currently in the process of developing long range estimates for resource needs associated with medical device

reviews. The estimates will include: a range of estimated resources, assumptions in predicting the number of anticipated applications and associated establishment inspections, and caveats that indicate what types of uncertainties or changes would alter the estimates.

Question. Please provide for each of the last 5 fiscal years the dollar amount and full-time equivalent (FTE) positions that have been expended at the Center for Devices and Radiological Health (CDRH) on premarket review for each of the following: 510(k) submissions, PMAs, PMA supplements, IDEs, IDE supplements, IDE amendments, and HDEs.

Answer. I would be happy to provide for the record, a table showing the FTEs and dollars expended by CDRH on premarket review for five years: Fiscal years 1996–2000. Please note that CDRH includes HDEs with PMAs and PMA supplements in its data tracking, so data are not available for HDEs alone. Also, CDRH does not track IDE Amendments alone; they are counted with all IDEs.

[The information follows:]

[Dollars in thousands]

| Review activity | Fiscal year— | | | | | | | | | |
|------------------------------------|--------------|--------|------|--------|------|--------|------|--------|------|--------|
| | 1996 | | 1997 | | 1998 | | 1999 | | 2000 | |
| | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount |
| 510(k) | 243 | \$19.9 | 185 | \$16.0 | 184 | \$16.6 | 166 | \$15.2 | 154 | \$15.3 |
| PMAs ¹ | 113 | 9.5 | 158 | 13.2 | 95 | 8.7 | 98 | 9.5 | 109 | 10.7 |
| PMA Supplements ² | 31 | 2.6 | 19 | 1.7 | 39 | 3.5 | 46 | 4.3 | 49 | 5.1 |
| IDEs ³ | 53 | 4.3 | 55 | 4.5 | 59 | 5.1 | 53 | 4.9 | 46 | 4.5 |
| IDE Supplements | 32 | 2.7 | 35 | 2.7 | 41 | 3.6 | 36 | 3.4 | 46 | 4.5 |

¹ Includes amendments and HDEs—separate data for HDEs are not available.

² Includes HDEs—separate data for HDEs are not available.

³ Includes IDE amendments—separate data for IDE amendments are not available.

Question. Please provide for each of the last 5 fiscal years the dollar amount and FTEs that have been expended on educational activities for reviewers and CDRH participation in standards development.

Answer. I would be happy to provide for the record a table showing the FTEs and dollars expended by CDRH during fiscal years 1996–2000 for the activities you requested. Please note that CDRH did not collect separate data on educational activities for reviewers from fiscal years 1996–1998. Also, please note that medical device standards activities include development of international standards, and domestic mandatory and domestic voluntary standards under the Medical Device Authority.

[The information follows:]

[Dollars in thousands]

| Activity | Fiscal year— | | | | | | | | | |
|---|--------------|--------|------|--------|------|--------|------|--------|------|--------|
| | 1996 | | 1997 | | 1998 | | 1999 | | 2000 | |
| | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount |
| Educational Activity ¹ | N/A | N/A | N/A | N/A | N/A | N/A | 12 | \$1.1 | 13 | \$1.2 |
| Standards Development | 43 | \$3.8 | 65 | \$5.2 | 74 | \$7.1 | 70 | 7.2 | 53 | 5.6 |

¹ There are no comparable data on educational activities in CDRH prior to fiscal year 1999.

Question. Please provide for each of the last 5 fiscal years the dollar amount and FTEs that have been expended on the following: domestic inspections, foreign inspections, post-market surveillance, MedSUN, device tracking, bioresearch monitoring, and medical device reporting requirements.

Answer. For the record, I will provide a table showing FTEs and dollars expended by FDA's Center for Devices and Radiological Health, or CDRH, during fiscal years 1996–2000 for the activities you requested. To clarify the table, let me explain CDRH does not collect separate data on resources expended for investigations. This information is collected under the heading, "Quality Systems/Certification." Other activities included in the category are footnoted on the table. MedSUN and Medical Device Reporting Requirements data are not tracked separately, but are combined into a single adverse event reporting category. MedSUN was a pilot program through fiscal year 2000 and fiscal year 2001 is its first year of implementation.

[The information follows:]

(Dollars in thousands)

| Activity | Fiscal year— | | | | | | | | | |
|---|--------------|--------|------|--------|------|--------|------|--------|------|--------|
| | 1996 | | 1997 | | 1998 | | 1999 | | 2000 | |
| | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount |
| Quality Systems/Certification | 33 | \$2.7 | 25 | \$2.1 | 20 | \$1.8 | 18 | \$1.6 | 17 | \$1.6 |
| Postmarket Surveillance | 57 | 5.5 | 36 | 3.4 | 38 | 3.3 | 36 | 3.8 | 19 | 2.1 |
| Adverse Event Reporting (incl MedSUN & Medical Device Reporting Requirements | 36 | 3.8 | 44 | 4.4 | 37 | 4.4 | 37 | 5.1 | 38 | 5.8 |
| Device Tracking | 1 | 1.0 | 1 | .1 | 1 | .1 | 1 | .1 | 1 | .1 |
| Bioresearch Monitoring | 22 | 1.7 | 22 | 1.7 | 23 | 2.1 | 20 | 1.7 | 20 | 1.9 |

Question. Please provide for each of the last 5 fiscal years the dollar amount and FTEs that have been expended on non-review scientific activities.

Answer. For the record, I will submit a table with the FTE and dollars expended by CDRH on medical device non-review scientific activities.

[The information follows:]

| Activity | Fiscal year— | | | | | | | | | |
|--|--------------|--------|------|--------|------|--------|------|--------|------|--------|
| | 1996 | | 1997 | | 1998 | | 1999 | | 2000 | |
| | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount | FTE | Amount |
| Non-Review Scientific Activities | 75 | \$8.1 | 73 | \$6.3 | 79 | \$7.5 | 78 | \$8.7 | 67 | \$8.9 |

Question. Please provide for each of the last 5 fiscal years the dollar amounts that have been expended at CDRH on contracting with outside experts to assist in the review of each of the following types of submissions: 510(k)s, PMAs, PMA supplements, IDEs, and HDEs.

Answer. When funding levels and circumstances permit, FDA uses its authority to contract out with outside technical expertise when such expertise is needed. For example, in fiscal year 2000, FDA hired 70 Special Government Employees to participate on the medical devices advisory committees. FDA has a Document Control Contract for maintaining the physical integrity of such documents as IDE, 510(k), and PMA submissions. A scanning contract is used to convert medical device and radiological health documents to electronic form to improve document storage and retrieval. FDA has also contracted with the Oak Ridge Institute for Science and Education, or ORISE, fellowship program to recruit experts to participate in reviews. FDA has allocated fiscal year 2001 funds to continue these contracts. I would be happy to provide for the record a chart that shows the expenditures for the Medical Device Advisory Committees, the Scanning Contract and the Document Control Contract for the past five years. We cannot break down these amounts by application type since they support the entire device review process.

[The information follows:]

| Fiscal year | Medical device advisory committees | Scanning contract | Document control contract |
|-------------|------------------------------------|-------------------|---------------------------|
| 1996 | \$450 | \$373 | \$1.2 |
| 1997 | .486 | .375 | 1.0 |
| 1998 | .581 | .450 | 1.1 |
| 1999 | .474 | ¹ .000 | 1.1 |
| 2000 | ² .594 | .459 | 1.1 |

¹There were sufficient multiyear funds in the fiscal year 1998 contract to perform this operation through fiscal year 1999.

²Salary cap for Advisory Committee members increased from \$150.00 to \$389.80 per day.

Question. What level of funding is proposed in the fiscal year 2002 budget for review, oversight, and enforcement activities of users and manufacturers of all reprocessed medical devices, as compared to the level provided in each of fiscal years 2000 and 2001?

Answer. FDA expects the Medical Device program to expend about \$2.8 million on reprocessing and reuse of single use devices. In fiscal year 2001 FDA requested and received \$2.8 million for medical device reuse to be allocated for premarket review, enforcement, and oversight activities related to users and manufacturers of all

reprocessed medical devices. FDA has been staffing up to handle the anticipated workload and believes that the current budget allocations should be sufficient to handle the 510(k) submissions that we receive.

PRESCRIPTION DRUG USER FEE ACT (PDUFA) REAUTHORIZATION

Question. The user fee program for prescription drug review (PDUFA) is authorized through this fiscal year. What are the agency's primary concerns in negotiating the next phase of PDUFA?

Answer. The Administration is currently in the process of reviewing PDUFA II. While prescription drug user fees have been successful in improving FDA's ability to review new drugs for safety and efficacy quickly, we are evaluating the program to identify potential improvements to PDUFA II. We look forward to working with Congress and industry as we move closer to the sunset date for PDUFA II.

POST-MARKET SURVEILLANCE

Question. FDA evaluates the safety and nutrition of bioengineered foods, and last month issued a proposed rule to make the voluntary consulting process mandatory. What information would the FDA require from firms wishing to market bioengineered foods? What benefit would be gained from this data?

Answer. Under the proposed rule, FDA would require that a notifier attest that the food is as safe as comparable food is lawful, and justify that statement in a narrative. FDA would also require that a notifier identify any uses that may be unsuitable. The data and information FDA would require under the proposed rule would enable FDA to assess on an ongoing basis whether plant-derived bioengineered foods are as safe as their conventional counterparts, do not contain unapproved food additives, and if the names of the foods are appropriate in light of any compositional changes to the food. A summary of what the proposed rule from January 18, 2001, would require of the data and information is provided for the record.

[The information follows:]

SUMMARY OF DATA AND INFORMATION

1. the identity and source of introduced genetic material;
2. the function of substances that will be present in the food as a result of the introduced genetic material;
3. intended changes to the composition of the food;
4. how the food was developed;
5. genes, if any, that encode resistance to an antibiotic;
6. the potential that proteins introduced into the food will be allergenic; and,
7. levels of significant nutrients and naturally occurring toxicants.

Question. FDA inspects an extremely small fraction of imported products, the majority of which are foods. The agency also conducts inspections of foreign exporting firms and equivalency audits of foreign regulatory systems in many product areas. What is FDA's import strategy? What mix of activities would best assure the safety of imported products? Are we heading in that direction and making appropriate investments?

Answer. FDA has multiple strategies given the different types of products and commodities the Agency regulates. All FDA's Centers have a component which develops compliance programs and assignments specific for imported products under the jurisdiction of that Center and in consultation with the Office of Regulatory Affairs, ORA. The best mix of ORA activities is: a combination of foreign inspections; field examinations and sample analyses; investigations of substituted, substandard or smuggled goods; analysis of epidemiological data; and evaluations of U.S. Customs house brokers, filers, to ensure integrity of data submitted to U.S. Customs Service and FDA via ACS/OASIS. Also import alerts and bulletins may be proposed by the Centers specific for imported products when emerging issues and problems become evident. Additionally, activities which promote equivalency, known as Mutual Recognition Agreements and Memorandum of Agreement, are a key component for assurance of the safety of imported products. However, overall import enforcement activities play a key role as well. To strengthen FDA's import enforcement, there have been a series of training courses for field import personnel held in 2000-2001 to promote interaction with U.S. Customs Service and effective enforcement through the application of U.S. Customs laws and regulations.

FOOD SAFETY

Question. Congress has provided FDA with substantial food safety resources during the past 4 years. Can you outline some of the accomplishments achieved with these resources?

Answer. Resources provided to FDA have allowed us to change the way we conduct our business of ensuring a safe food supply and to make many changes to improve the public health. We have focused our attention on the big-picture public health goal of reducing foodborne illness and a much more comprehensive “farm-to-table” approach. These efforts have allowed FDA to make considerable progress in reducing foodborne illness and antimicrobial resistance. FoodNet data show an overall reduction of 20 percent for foodborne illness for selected pathogens. With the resources provided we have been able to step up our efforts to ensure that FDA-regulated products comply with consumer protection laws and regulations enforced by the agency. For example, last year we increased our “high-risk” food inspections by 90 percent over the previous year. We have advanced the public health with our education efforts targeted to consumers who are more susceptible to certain risks by giving them the information they can use to make an informed choice. We taken great strides forward in our public-private partnerships with industry, academia and Federal and State governments in putting forth four simple food safety messages for consumers. In collaboration with our scientific business partners we have made important strides toward better scientific data, methods and models. The overall accomplishments are many.

With the continued support of the Congress in fiscal year 2002, we anticipate further gains in additional reductions in foodborne illness, including illness from chemical and pesticide contamination. A summary will be provided for the record.

In overseeing seafood safety, last year alone FDA issued 148 warning letters and an injunction, against firms for noncompliance with the seafood HACCP regulations. FDA has been able to detect outbreaks quicker and to provide coordinated investigations using PulseNet. Examples of outbreaks where the capability of PulseNet was used include: shingella sonnei in five-layer bean dip; salmonella typhimurium in clover sprouts; and salmonella baidon in tomatoes. The National Antimicrobial Resistance Monitoring System, NARMS, has been expanded substantially. NARMS monitors the emergence and spread of resistance in enteric bacteria and helps to ensure the continued safety and effectiveness of veterinary antimicrobials. NARMS data has been used to:

[The information follows:]

NARMS Data Usage

Initiate field investigations of outbreaks of illness marked by a pathogen that displayed an unusual antimicrobial resistance pattern;

Assess the human health impact of fluoroquinolone use in poultry;

Stimulate research in molecular characteristics of resistance emergence and transfer;

Prove our knowledge of risk factors associated with the development of an antimicrobial-resistant infection; and

Trigger broader research on the prudent antimicrobial use in animals and the role of the environment in the emergence and spread of antimicrobial resistance.

In addition, the Agency has

Developed a document, “Multi-state Foodborne Outbreak Investigations: Guidelines for Improving Coordination and Communication”;

Published a final rule designed to improve the safety of fruit and vegetable juices;

Established procedures to prevent distribution of unsafe imported food by requiring that shipments from “bad actor” importers be held in a secure storage facility at the importers’ expense until released by FDA;

Published a proposed rule that will require marking food shipments refused for safety reasons to indicate that the product was denied entry in the U.S.;

Collaborated with the National Science Teachers Association and created a professional development program for teachers and a supplementary science curriculum to encourage safe food handling behaviors on the part of students, many of whom work in food service establishments;

Began a prioritized review of new and previously approved antimicrobial drugs for use in animals, especially those used for sub-therapeutic purposes, and develop training and guidance for the regulated industry in conducting pre-approval studies;

Finalized the FDA framework document “A Proposed Framework for Evaluating and Assuring the Human Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food Producing Animals.”;

Expanded efforts to determine how use of antimicrobial agents in food-producing animals contributes to the selection and spread of multi-resistant bacteria in human food and animal feeds; and,

Initiated a pilot study with Mexico on monitoring system for antimicrobial resistance in Salmonella.

Specifically, in the areas of research and risk assessment FDA

Completed a draft risk assessment on the estimated public health risk associated with eating raw oysters containing *Vibrio parahaemolyticus*;

Completed a draft risk assessment on the potential relative risk of listeriosis from eating certain ready-to-eat foods;

Developed a method, being used by FDA as well as CDC, for detecting *Cyclospora* and providing the first isolation of the pathogen from food product associated with human illness;

Completed research to demonstrate that surface heating of apples is not an effective method of improving the safety of apple juice;

Demonstrated that temperature plays a critical role in inactivation of common types of *Clostridium botulinum* spores during high pressure processing;

Demonstrated that pulsed electric field energy and heat work together in the destruction of *Listeria monocytogenes*;

Developed a method to characterize new and unusual strains of pathogenic *E. coli*.

Conducted studies that indicate that poultry products may serve as reservoirs of fluoroquinolone-resistant *Campylobacter* spp;

Conducted research that indicates that FDA may need to standardize the identification techniques used to characterize the components of competitive exclusion products used to pre-infect chickens, preventing adverse bacterial infections;

Conducted research on bacteria contained in commercial competitive exclusion products that contain vancomycin-resistant genes;

Developed statistical models for microbial risk assessment and submitted them for publication;

Conducted a quantitative risk assessment that modeled the human health impact of fluoroquinolone-resistant *Campylobacter* infections associated with consumption of chicken. The risk assessment showed that development of resistance in food-producing animals has an impact on human health by compromising the effectiveness of human medicines;

Improved methods for the detection of *Vibrio parahaemolyticus* and transferred the technology to FDA and State regulatory laboratories;

Continued research on dose-response modeling of microbial risk assessment;

Continued studies on the measurement of the effect of low level antibiotic residues on the human intestinal flora; and,

Continued efforts towards developing a protocol to look at probiotic (viable bacterial cultures that are beneficial to the host) effects on the host organism's defenses.

Question. For fiscal year 2001, the Committee indicated that FDA was to provide \$2,000,000 as the annual base level of funding for the National Center for Food Safety and Technology, NCFST, and to provide an additional \$1,000,000 to the Center for collaborative research in support of the President's food safety initiative. Please provide an update on the activities being carried out by NCFST and a status report on the fiscal year 2001 funding for the Center.

Answer. The Agency provided \$2,993,400, which reflects enacted levels adjusted for the 0.22 percent rescission to support the National Center for Food Safety and Technology's, NCFST, collaborative research in food safety among government, academia, and private industry. NCFST is the nation's only research consortium of industry, government, and academia to address the food safety implications of emerging technologies in food processing, packaging, biotechnology. The NCFST is a cost effective resource for developing and exploring new technologies. By spreading the cost and risk of doing research, companies can control their costs while putting themselves on the cutting edge of new technology developments. For the record we will provide some recent accomplishments of the Center.

[The information follows:]

CENTER ACCOMPLISHMENTS

1. *Irradiation Task Force.*—Research at NCFST involving twenty meat processors and plastic packaging companies resulted in data to support a petition to FDA to allow the safe use of plastic polymers for use with E-beam irradiation. This work received temporary approval enabling industry to launch irradiated hamburger which was free of the harmful pathogen *E. coli* O157:H7.

2. *Alfalfa Sprouts Task Force*.—The NCFST worked with the International Sprout Growers Association to develop Good Manufacturing Practices, testing protocols, seed certification and intervention processes to make safe sprouted products. Since the implementation of these guidelines, the incidence of outbreaks attributed to alfalfa sprouts has been significantly reduced.

3. *Aseptic Processing of Foods with Particles*.—The NCFST is recognized as a world leader in the area of aseptic processing of foods. This new technology will allow food processors to make “fresh-like” soups and stews that rival home-made.

4. *Department of Defense Dual Use of Science and Technology (DUST)*.—Five member companies of the Center recently received a grant from the Department of Defense to conduct the science necessary to validate the use of High Pressure Processing to sterilize foods. This pioneering technology makes it possible to process foods with minimal changes to the fresh character of the product and thus provide improved military rations. It will also have significant commercial applications.

Question. What level of funding is included in the fiscal year 2002 budget request for the National Center for Food Safety and Technology?

Answer. In fiscal year 2002, FDA plans to expend \$3,000,000 in support of the National Center for Food Safety and Technology’s, NCFST, collaborative research activities. The fiscal year 2001 rescission of .22 percent reduced the \$3.0 million fiscal year 2001 Appropriations by \$6,600. This collaborative research effort between government, academia, and private industry supports the food safety implications of emerging technologies in food processing, packaging, biotechnology. The NCFST is a cost effective resource for developing and exploring new technologies. By spreading the cost and risk of doing research, companies can control their costs while putting themselves on the cutting edge of new technology developments.

Question. How much is included in the fiscal year 2002 budget request for FDA activities in support of Codex Alimentarius, as compared to the fiscal year 2001 level?

Answer. FDA expects to expend around \$1.8 million in fiscal year 2001 and approximately \$2.1 million in fiscal year 2002 for its work associated with the Codex Alimentarius.

Question. Please give us an update on activities conducted by FDA in support of Codex Alimentarius.

Answer. Codex participants recognize the U.S. as a worldwide leader when it comes to accomplishing Codex’s mission. Most recently FDA participated in the development of the Principles and Guidelines for Microbiological Risk, and assessing risks concerning Listeria in ready to eat foods. FDA further assisted Codex with the formulation of guidelines for bioengineered foods and the labeling of such products. In reference to a country’s control over imports, FDA provides technical guidance for the Judgement of Equivalence of Food Import/Export Systems along with developing guidelines for the Food Import Control Systems. Finally, FDA chairs the working group developing the General Standard for Food Additives that involves a comprehensive review of the safety and use of substances added to food directly generally. FDA recognizes that public interest in Codex is very significant and tries to keep interested parties informed as much as possible via regular emails, mail and public meetings.

PROPOSED TRANSFER AUTHORITY

Question. The fiscal year 2002 budget proposes to include FDA in the Department of Health and Human Services (DHHS) departmental transfer authority. The budget justification indicates that this transfer authority will allow DHHS to assist the FDA in responding to emerging public health issues. Please give some examples.

Answer. The transfer authority would be a mechanism for providing funding to allow FDA to respond quickly and efficiently to emerging health issues. Examples of this type of health issue include product tampering such as Tylenol and baby food, and breast implant tissues. Another example would be the expenses FDA has incurred during Fiscal 2001 for efforts to prevent BSE in this country. For this fiscal year, we were able to use some Contingency Fund funds that were appropriated in past years.

Question. Also, the proposed transfer authority would not only allow DHHS to transfer funding to FDA but from FDA. What is the justification for allowing DHHS to transfer funds from FDA?

Answer. Language authorizing this transfer is proposed for inclusion in the Labor, Health and Human Services, Education and Related Agencies Appropriation Act general provisions. This would give the Secretary of DHHS authority to transfer funds to meet pressing needs in FDA, or in other DHHS components as the case

may be, even though FDA's appropriations are in a different appropriations bill than most of the DHHS components.

EXCESS FEE COLLECTIONS

Question. The fiscal year 2002 budget proposes new salaries and expenses appropriations account language which would provide FDA the authority to credit to the account PDUFA fees that may have been collected in excess of the amounts appropriated in a previous year. Have such excess collections occurred in past years? Please indicate the amount in each of the past three fiscal years. Also, please identify the amount in excess collections projected to be available for fiscal year 2002.

Answer. I will be happy to provide that information. During the first five years of the Prescription Drug User Fee Act the Act authorized the collection amount to be increased by inflation and set a collection limitation not to exceed the amount in the appropriating legislation. If the fees for applications being submitted to agency exceeded the amount appropriated, prorated refunds were provided to the drug companies. Such excess collections were refunded for three years—1994, 1996, and 1997. FDAMA amended PDUFA to give FDA the ability, after 1997, to keep any fees above the appropriation limitation and specified that any excess collection amount should offset the amount of fees to be collected in future years. The purpose of the fiscal year 2002 appropriation language change is simply to have the appropriation language parallel the authorizing language. So far the only fiscal year in which fee collections have exceeded the specified appropriation amount is fiscal year 1998, and the amount collected in excess of appropriations was \$324,776. However, several requests for refunds or waivers are pending against this balance, and FDA will not know for certain if excess collections have been realized until all of these claims have been decided. The amount of excess collections is noted below in a table being submitted for the record. The table represented is as of September 30, 2000, and is updated annually with the Collections Realized in FDA's Financial Report required by the Prescription Drug User Fee Act of 1992 as amended by the Food and Drug Administration Modernization Act of 1997.

[The information follows:]

| Fiscal year | Collections realized | Collection ceiling | Potential offset to future collections |
|-------------|----------------------|--------------------|--|
| 1998 | \$117,446,776 | \$117,133,000 | \$324,776 |
| 1999 | 122,011,516 | 132,273,000 | |
| 2000 | 137,698,948 | 145,434,000 | |
| 2001 | Not Available | 149,273,000 | Not Available |
| 2002 | Not Available | 161,716,000 | Not Available |

CLINICAL PHARMACOLOGY PROGRAM

Question. What level of funding is included in the fiscal year 2002 budget request for the Clinical Pharmacology Program?

Answer. FDA expects the Clinical Pharmacology Program to be funded at \$500,000 in fiscal year 2002, the same level as fiscal year 2001.

Question. Please explain the importance of this program to FDA.

Answer. The Clinical Pharmacology Program provides financial assistance to investigators who conduct research as part of their clinical pharmacology training program. This program is funded through cooperative agreements. I will be happy to provide a more specific description of the Clinical Pharmacology Program for the record.

[The information follows:]

Specific goals important to the public health include:

- Advancing scientific knowledge of mechanisms of in vitro/in vivo metabolism/drug interactions;
- Characterization of individual exposure-response to drugs; and,
- The effect of age, gender, and race on drug disposition and exposure response relationships. Projects that fulfill any one or a combination of the following specific objectives are considered for funding;
- Mechanistic understanding of drug-drug, drug-food, and drug-non-prescription product interactions;
- Research to develop and evaluate biomarkers, and noninvasive imaging as a way to assess safety and efficacy;

- Computer modeling and clinical trial simulations: evaluation of clinical study designs to confirm drug safety and efficacy;
- Evaluation of techniques in gender, age, race, and liver/kidney function-specific differences in drug response and drug interactions;
- Development of electronic databases to capture key metabolism/drug interaction data and provide a linkage to an expert system to assist the New Drug Application (NDA) review; and
- Research to define the clinical pharmacology characteristics of complex drug substances to assure proper use, define the biopharmaceutical characteristics of the active ingredients, and develop ways to establish equivalency of dosage forms to establish standards.

Question. What cooperative agreements are being supported with the funding provided for the program for fiscal year 2001? Please indicate the level of funding for each.

Answer. In fiscal year 2001, FDA awarded \$500,000 in clinical pharmacology grants to Indiana University. Indiana University was the grantee recipient as well in fiscal year 2000 in the amount of \$459,992. Previous grantees in this program include: University of Illinois at Peoria, Meharry Medical College, State University of New York at Binghamton, and the Mayo Clinic.

OFFICE OF GENERIC DRUGS

Question. Please identify the level of funding and number of staff years requested for fiscal year 2002 for the Office of Generic Drugs, as compared with the fiscal year 2001 levels.

Answer. For fiscal year 2001, FDA projects to expend an estimated \$15.4 million for the Office of Generic Drugs—OGD, including the support of 143 Full-Time Equivalent positions. The Agency did not request a specific increase for OGD in fiscal year 2002, but plans to devote the same number of staff in fiscal year 2002 as in fiscal year 2001. Additional funds in fiscal year 2002 will come from the requested increase for pay raises. The Office of Generics would receive approximately \$0.8 million of the \$40 million requested increase in pay.

Question. Please provide the level of funding and number of staff years provided for the previous four fiscal years (fiscal year 1998 to fiscal year 2001) for the Office of Generic Drugs. If these dollar levels or number of staff years differ from the increases earmarked by the Congress, please provide an explanation as to why there is a difference.

Answer. For the record we are providing a table of funding and FTE levels, including operating funds that have been available specifically to the Office of Generic Drugs, OGD.

[The information follows:]

| Fiscal year | Actual/ planned FTE | Actual/planned expenditures (amount) | Congressionally appropriated funds included in fiscal year total |
|-------------|------------------------|--|--|
| 1998 | 123 | \$9,997 | +\$1.0 million for the Office of Generic Drugs to assist with accelerated approvals (House Report 105-178). |
| 1999 | 130 | 11,217 | +\$1.0 million for the Office of Generic Drugs (Conference Report 105-763) |
| 2000 | 134 | 14,733 | +\$1.8 million (\$1.9 million for the Office of Generic Drugs [Senate Report 106-80] minus fiscal year 2000 Budget Recission). +\$1.5 million in Tobacco reprogramming funds (one-time funding) for Information Technology purchases in fiscal year 2000. |
| 2001 | 143 | ¹ 15,362 | +\$1.2 million for the Office of Generic Drugs to reduce generic drug application review and approval times (Conference Report 106-948). |

¹ Planned.

PROPOSED REDUCTION

Question. The budget justification indicates that the fiscal year 2002 salaries and expenses request includes a reduction of \$1,497,000 from the fiscal year 2001 appropriation. Please identify and provide an explanation for this proposed reduction.

Answer. FDA's fiscal year 2001 appropriations contained language directing FDA to provide \$1.5 million for a contract with the New Mexico State University's (NMSU) Physical Science Laboratory (PSL) to establish a lab for conducting "rapid

screening analyses” of fresh fruits and vegetables (imported and domestic) for microbial contamination. FDA is providing a contract in the amount of \$1,497,000, adjusted for the .22 percent recission with New Mexico State University’s Physical Science Laboratory (NMSU/PSL). The NMSU Project Manager and FDA agreed that the project should focus on method evaluation of rapid testing methods. These would include micro and biochemical lab tests as well as evaluation of field test kits for our investigators. While the lab is not ready to handle regulatory samples it could be used to gather data in evaluation of rapid testing methods. The lab’s work will help in the goal of reducing the time that it takes for perishable products to go from harvest to market. In order to allow for time to evaluate the work of the laboratory, no resources are requested for this project in fiscal year 2002.

NEW USER FEES

Question. The fiscal year 2002 budget proposes new user fees for import operations and food export certification, estimated to bring in \$14.7 million and \$5.3 million, respectively. What discussions has the Department and/or agency had with industry on these new user fee proposals?

Answer. FDA believes user fees can be used to accelerate performance as long as strategic plans, performance measures, and goals are an integral part of any user fee proposal. The user fees being proposed here can be implemented within a reasonable timeframe. For example, discussions have taken place with industry in the past with regards to Export certification fees, so it is believed this can be implemented in a short time span. The imports fee would most likely require longer discussions with our stakeholders. However, we believe the importer/broker community would benefit greatly by the faster turn-around times, elimination of large volumes of paperwork and reduced costs of doing business.

Question. When will these legislative proposals be submitted to the Congress for consideration and what success do you believe they will have?

Answer. The proposals are currently undergoing clearance by the administration.

Question. The budget justification indicates that if the proposed new user fees for imports are not authorized and implemented, a larger portion of the budget authority will be needed to support the import program. Does this mean that the Administration would submit a budget amendment requesting additional funds or that you would simply reprioritize within the existing fiscal year 2002 appropriations request to provide additional support for the import program?

Answer. It means the Agency could reprioritize within the existing fiscal year 2002 appropriations request for inspections to provide additional support for the import program. No budget amendment will be requested if the user fees are not authorized.

ADVERSE EVENTS REPORTING/“MEDICAL ERRORS”

Question. An increase of \$6.8 million was provided for fiscal year 2001 for improvements to FDA’s current system of post-market surveillance to identify adverse events associated with products on the market. Would you please give us an update on the status of this effort. What is the total amount of funding being provided for fiscal year 2001 for adverse events reporting?

Answer. The Agency allocated the \$6.785 million to the human drugs, biologics, and medical device programs in fiscal year 2001 for the purpose of improving the reporting and analysis of adverse events. The fiscal year 2001 increase to the post-market surveillance activities related to adverse event reports, brings the total funding level in fiscal year 2001 to an estimated \$48 million. FDA receives over 250,000 total for all products adverse event reports associated with pharmaceuticals each year. Over one-third of these adverse events are judged to be preventable. FDA implemented a new version of the pharmaceutical Adverse Event Reporting System, or AERS, in January 2001 which allows for state-of-the-art analytic capabilities. A priority in 2001 is to develop and propose new regulations requiring electronic submission of adverse event reports by manufacturers, expanding the current pilot program. I would be happy to provide for the record a summary of how the fiscal year 2001 increased funding will be used.

[The information follows:]

Fiscal year 2001 Funding for Adverse Events

Access drug utilization databases that can provide FDA with data on patient drug use acquired by individuals in an ambulatory care or inpatient setting;

Implement a pharmaceutical marketing database service contract that will provide data regarding current and long-term trends in drug and biologic utilization and prescriptions;

Design and develop up-to-date reporting systems that permit manufacturers of biological products to report problems, product defects, and potential adverse reactions to the Agency;

Train field staff to improve information gathered through investigation of consumer complaints and to upgrade the field data system to provide consumer complaint data that complements ACERS. Reporting systems include collection of error and accident events that occur during manufacturing processes or storage of products from blood product manufacturers and blood banking facilities; and

Further develop the Medical Product Surveillance Network (MedSUN). The idea of a Sentinel User Reporting System originated with a provision in the fiscal year 1997 Food and Drug Administration Modernization Act. MedSUN helps correct the severe under-reporting of adverse events by user facilities, and improves the quantity and quality of data received from the user community. The funds will be used to expand the program by an additional 25 hospitals, and possibly 15–30 nursing homes. Recruitment of facilities will begin this summer. Funds also are being used to develop the MedSUN database, which will give FDA the ability to analyze the causes and contributing factors associated with the adverse events, and to provide feedback to device manufacturers.

Question. The fiscal year 2002 budget requests an additional \$10 million to improve FDA's system for monitoring adverse events associated with marketed products. What activities will be undertaken with the additional funds requested? Please indicate the total fiscal year 2002 funding requested, by activity, as compared with the fiscal year 2001 base funding level.

Answer. In fiscal year 2002, FDA requests an increase in funding of \$10 million to safeguard patients against adverse events associated with the use of drugs, biological agents, medical devices, foods and dietary supplements by improving FDA's systems for monitoring marketed products. Many patient deaths and injuries are associated with the use of FDA-regulated medical products. The FDA believes that roughly half of these deaths and injuries can be avoided by fully implementing its strategies. Thousands of lives and billions of dollars can be saved. We would be happy to provide a list of specific adverse event or patient safety goals for each programmatic increase in fiscal year 2002. The Agency is also providing base resource information per your request.

[The information follows:]

Human Drugs Program

5. Complete FDA's new on-line adverse event reporting system (ACERS) for drugs and Biologics, and provide rapid assessment of injuries and deaths associated with the use of these products;

6. Develop links to hospital-based information systems to better support hospital staff working on the "front lines" of patient safety. This includes improving the reporting systems to address under-reporting and incomplete reporting of medical errors, as well as increased use of other electronic systems to monitor problems with use of drug products. Access to drug utilization databases can also provide the Agency with data on patient drug use by individuals in an ambulatory care or inpatient setting;

7. Increase FDA's capacity to do the multi-factor analysis necessary to correctly identify the sources of safety problems and potential solutions. This includes establishing links to safety databases maintained within community-level healthcare delivery systems and regional-level safety surveillance systems, and adding to expertise in medical epidemiology and statistical analysis;

8. Develop linkages to government and private health care databases. Access to broad-based health information databases will allow for more rapid exploration of potentially serious drug-related problems and more rigorous investigations than currently possible;

9. Expand educational and training programs for health care providers and the public to promote the safe use of products;

10. Investigate reported errors and develop error reduction strategies with manufacturers and the medical community; and,

11. Upgrade field investigational data systems to complement agency error tracking systems, and to provide better information on the incidence of medical errors.

Biologics Program

8. Expand and upgrade the current Biological Product Deviation Reporting System (BDR). This system contains reports from the product manufacturer of any event associated with the manufacturing of a biological product, including testing, processing, packing, labeling, and storage, or with the holding or distribution of a

licensed biological product in which the safety, purity, or potency of a distributed product may be affected.

9. Expand the monitoring of reports from the Vaccine Adverse Event Reporting System (VERS), MIDWATCH and hospital fatality reports for biologic related cases. FDA proposes to link to existing external data sources held by both private and government organizations. For example, emergency rooms, poison control centers, health care systems, and the Centers for Disease Control and Prevention, all collect important information on adverse reactions.

10. Explore the feasibility of utilizing the Medical Errors Reporting System for Transfusion Medicine (MARS-TM) to perform data aggregation and analysis for ACERS. MARS-TM was developed under NIH funding and could serve as the model for the FDA blood error reporting. MARS-TM encourages non-punitive reporting with a well-defined codified method of reporting.

Medical Devices Program

11. Maintain the existing 100 facilities in the program, which includes both hospitals and nursing homes;

12. Recruit between 75–100 new user facilities and expand the program to include other types of user facilities such as ambulatory care surgical centers; and,

13. Expand data analytic capability, and outreach and feedback opportunities to the medical community, industry, and other stakeholders.

Foods Program

14. Consolidate five existing Adverse Event systems within the Foods Program into one comprehensive, center-wide system to capture and evaluate consumer adverse event reports for foods, food and color additives, cosmetics, and dietary supplements;

15. Develop external interfaces with the Agency wide Field Accomplishments Tracking System (FACTS) and ACERS to share data; and,

16. Supply system users with classification, indexing, research and management tools, and materials for the evaluation of adverse events.

FDA RESOURCES DEVOTED TO AERS/MEDICATION ERROS/PATIENT SAFETY

| | Estimated fiscal year 2001 | | Requested fiscal year 2002 | |
|--------------------|----------------------------|---------------|----------------------------|---------------|
| | FTE | Amount | FTE | Amount |
| CFSAN | 10 | \$1,900 | 14 | \$2,900 |
| CDER | 93 | 24,500 | 107 | 28,100 |
| CBER | 17 | 1,700 | 25 | 3,700 |
| CVM | 9 | 1,600 | 9 | 1,600 |
| CDRH | 48 | 8,500 | 48 | 10,500 |
| ORA | 75 | 7,100 | 81 | 8,100 |
| Other Act. | 16 | 2,800 | 19 | 3,200 |
| Total | 268 | 48,100 | 303 | 58,100 |

BIOLOGICS

Question. What is the status of regulations that would require the release of what is now confidential information from biological investigational new drug applications involving gene therapy and xenotransplantation? Concern has been expressed that this proposal goes too far, in that it would require the release of trade secret and confidential commercial information that could jeopardize the proprietary nature of research protocols. Also, is there coordination of this proposal with NIH guidelines involving gene therapy? What is the justification for two agencies of DHHS reviewing gene therapy protocols?

Answer. On January 18, 2001, FDA published a proposed rule entitled, "Availability for Public Disclosure and Submission to FDA for Public Disclosure of Certain Data and Information Related to Human Gene Therapy or Xenotransplantation." In response to that proposed rule, approximately 280 public comments—currently 136 written comments and 145 electronic comments were submitted—have been initially reviewed and summarized. FDA will convene a task group to consider these comments; determine what changes to the rulemaking should be made in response to the comments; write responses to all comments; and agree upon a timeline to complete these tasks. In general, the public commented that more information should

be made public, while some but not all of the industry, commented that too much confidential information would be made public under the rule. FDA is meeting and corresponding with the Office of Biotechnology Activities, National Institutes of Health—the NIH—regularly to assure that our efforts are coordinated.

The FDA and NIH have different roles and responsibilities with regards to gene therapy. As with any clinical trial involving a drug or a biologic, FDA has clear responsibilities for the regulatory oversight of gene therapy clinical trials; that is, to assure the safety, purity, potency and efficacy of gene therapy products. In particular, 21 Code of Federal Regulations 312.22 (a) says, “FDA’s primary objectives in reviewing an IND are, in all phases of the investigation, to assure the safety and rights of subjects, and, in Phase 2 and 3, to help assure that the quality of the scientific evaluation of drugs is adequate to permit an evaluation of the drug’s effectiveness and safety.”

Additionally, in 1984 and 1986, the Federal government proposed, as part of a coordinated policy for biotechnology, that the NIH’s Recombinant DNA Advisory Committee, the RAC, would review recombinant DNA gene therapy products used in human clinical trials.

Question. What is the proposed FDA fiscal year 2002 budget for review of gene therapy, as compared to the fiscal year 2001 level?

Answer. FDA’s fiscal year 2002 budget request includes \$500,000 for gene therapy. In fiscal year 2001 FDA is devoting one time funding of \$750,000 for the gene therapy data base.

Question. FDA has indicated that it is developing guidances on growth hormone and human insulin drug products. Will these guidances require clinical trials for effectiveness? Would these products be approved for safety and effectiveness? If only for safety, what is FDA’s statutory authority to approve products for safety only?

Answer. FDA is developing guidances on growth hormone and human insulin drug products to describe what scientific and technical information should be submitted in applications for these drugs. These guidances are not yet ready or publication. When they are completed, they will be published in draft for public comment. There are a number of technical and scientific issues still to be resolved in determining what information sponsors should submit for FDA to assess whether growth hormone and human insulin products are safe and effective.

FISCAL YEAR 2001 FUNDING INCREASES

Question. Would you please give us an update on the status of each of the following activities for which increased appropriations were provided for fiscal year 2001:

- \$5.0 million for enforcement of Internet drug sales;
- \$5.0 million for counter-bioterrorism activities;
- \$9 million for inspections;
- \$30 million for food safety;
- \$1 million for dietary supplements;
- \$1 million for orphan product grants;
- \$1.2 million for the Office of Generic Drugs;
- \$22.879 million for premarket review; and
- \$6.8 million for adverse events reporting.

Answer. I would be happy to provide that information for the record.
[The information follows:]

Internet Drug Sales \$5.0 million for enforcement

In fiscal year 2001, FDA’s overall goal is to reduce the illegal promotion, sales, and distribution of approved and unapproved prescription pharmaceuticals via the Internet. FDA enhanced its enforcement effort of Internet sites that violate Federal laws relating to prescription drugs, and has undertaken a greater public education campaign to help consumer’s shop wisely for approved pharmaceuticals online.

FDA’s strategy focuses on putting a halt to illicit or illegal activity by identifying the pharmaceutical Internet sites that pose the greatest threat. The Agency is using prevailing Internet hardware and software to carry out surveillance and investigative activities and focuses on sites identified by FDA investigators and consumers via FDA’s Internet site (<http://www.fda.gov/oc/buyonline/buyonlineform.htm>). FDA is supporting a rapid response team to deal with these sites. FDA is working closely with State regulatory officials and other Federal agencies to leverage resources and expedite the process of eliminating fraudulent activity on Internet sites. The Agency also works with the U.S. Customs Service, the Drug Enforcement Administration, and the Postal Service to monitor prescription drug imports coming into this country from all sources.

Countering Bioterrorism + \$5 million

FDA is an important contributor to the Nation's capability to respond to potential chemical and biological threats from bioterrorism. FDA's role includes assuring that new vaccines and drugs are safe and effective, safeguarding the food supply, and conducting research for diagnostic tools and treatment of disease outbreaks. Unlike other DHHS agencies that are participants in the Administration's anti-bioterrorism initiative, FDA plays a critical but less visible role with respect to its programs. Whether the issue is the development and use of rapid diagnostics to quickly identify a suspected biological agent or the capability to make available and administer large quantities of a vaccine or drug to counter the effects of a bioweapon, FDA's research is the linchpin that makes it possible for the Centers for Disease Control and Prevention (CDC), the National Institutes of Health (NIH), the Office of Emergency Preparedness (OEP), the Department of Defense (DOD), and others to carry out such activities.

FDA conducts research on the development of new analytical approaches and methodologies, and determines if new products provide needed benefits without causing adverse side effects that would outweigh those benefits. This research includes both laboratory and non-laboratory investigation to support FDA regulatory responsibilities both immediately, and in the long-term. With the fiscal year 2001 funding, FDA will:

Foods

Conduct research to develop rapid methods of detection of biological agents, such as anthrax, that could be used by terrorists. Techniques will be developed to confirm the results of less specific detection methods. These detection methods will provide necessary surveillance tools needed for monitoring programs.

Human Drugs

Participate in the planning and coordination of public health responses to bioterrorist attacks.

Prepare field staff to safely seize, remove, and dispose of contaminated products by developing procedures and providing appropriate facilities and equipment.

Develop inspection methods and procedures to assure the safety of regulated products at manufacturers' facilities and other establishments.

Biologics

Engage in activities contributing to the expeditious development and licensure of new vaccines for anthrax and smallpox and the associated vaccinia immune globulin products used to treat or prevent serious vaccinia infections brought on by the smallpox vaccine.

Improve scientific expertise in monoclonal antibody therapies, new approaches in the use of biotherapeutics, animal and human derived immune globulins in the treatment of viral and bacterial diseases as well as emerging infectious diseases. Antibodies are immune-system proteins that attack foreign invaders like germs, or that neutralize substances the body is over-producing. Monoclonal antibodies are artificial, highly purified antibodies, made by combining animal and human genetic material, that work with exquisite precision in small doses. This will enhance our ability to identify, treat and test for previously unrecognized threats.

—Develop regulatory models to accommodate the need for preparedness in the case of an emergency attack. For example, procedures and protocols are being developed to enable the use of investigational new drugs in as highly controlled, safe manner for particular emergency situations, such as responding to a bioterrorist attack that exposed individuals to the agent that causes anthrax. These products must be reviewed and approved prior to large-scale productions necessary to create and maintain a stockpile. Staff must guide the products through the regulatory process, including the manufacturing process, preclinical testing, clinical trials, and the licensing and approval process. This process is extremely complex and early involvement by staff is critical to the success of the expedited review process.

Participate in the planning and coordination of public health responses to bioterrorist attacks.

Develop inspection methods and procedures to assure the safety of regulated products at manufacturers' facilities and other establishments.

Animal Drugs

Explore ways to prevent microorganism and toxic chemicals including pesticides from entering animal feeds and food-producing animals. Develop methods for detecting the presence of pathogenic microorganisms and/or the toxins produced by the microorganism to effectively identify a threat and respond appropriately.

Medical Devices

Prepare expert reviewers for a significant increase in the number of premarket submissions, (many as IDE applications) as the bioterrorism response program progresses.

Monitor and evaluate the public health needs and impact of products used in conjunction with bioterrorism response (in vitro diagnostic devices, portable ventilators, syringes, gloves, and other standard equipment

NCTR

Expand the mass spectrometry-based approaches to identify biomarkers of toxicity associated with biological warfare agents. This technique will significantly increase the ability to rapidly identify and characterize biological agents that could be used as weapons.

Develop novel techniques to identify new bacteriological and chemical contaminants in the food supply. These techniques can crossover to provide methods of assessment for potential biochemical terrorist tools. Maintaining currency in analytical techniques will ensure the American public has the best and most accurate tools to fight food borne disease as well as identify biological warfare agents.

Office of Regulatory Affairs—\$9 million for inspections

FDA is utilizing the additional funding to make modest improvements in statutory inspection coverage through additional FDA inspections and the use of leveraging and expanding existing State contracts. The requested funds will prevent the FDA from falling behind the fiscal year 2000 level of inspectional effort and to offset absorptions of inflationary increases. FDA will:

- Conduct more inspections for Human Drugs, Biologics, Animal Drugs and Medical Devices, where the law requires specific inspection frequency;
- Expand State contracts to further leverage inspectional coverage in all program areas; and
- Improve the existing levels of annual inspectional coverage.

Food Safety \$30 million

The funding has allowed FDA to make considerable progress in reducing foodborne illness and antimicrobial resistance. FoodNet data show an overall reduction of 20 percent for foodborne illness for selected pathogens. With the resources provided we have been able to step up our efforts to ensure that FDA-regulated products comply with consumer protection laws and regulations enforced by the agency. In fiscal year 2001 we increased our “high-risk” food inspections by 90 percent over the previous year. We have advanced the public health with our education efforts targeted to consumers who are more susceptible to certain risks by giving them the information they can use to make an informed choice. Other activities in 2001 include:

- Expand domestic inspections to ensure annual inspections of all high-risk food establishments and enhance laboratory capabilities for the analytical support associated with inspectional activity;
- Implement State audit programs to ensure consistent application of regulations and develop consistent nationwide standards for on-farm preventive controls for egg producers and food handling practices at retail;
- Implement the Hazard Analysis Control Point (HACCP) system for fruit and vegetable juices;
- Develop and evaluate on-farm intervention strategies and/or technologies to improve testing methodologies for Salmonella Enteritidis (SE) on the farm and in eggs, evaluate commercial processing technologies and practices, and conduct research to understand the ecology and epidemiology of SE in the hen and farm environment;
- Complete the National Antimicrobial Resistance Monitoring System (NARMS) by adding national and international data collection sites as well as including major species of micro-organisms that cause foodborne disease;
- Expand support and expertise in molecular methods that can be used to rapidly identify markers of toxicity of foodborne pathogens; and
- Develop new methods for routine surveillance of fluoroquinolone resistant Salmonella and Campylobacter to provide the data needed to make informed risk decisions concerning the use of quinolone-based antimicrobials in poultry and antibiotic resistance.

Dietary Supplements \$1 million

FDA is currently collaborating with the National Center for Natural Products Research in Oxford, Mississippi to review botanicals in dietary supplements. The ability to identify and analyze specific components in ingredients, including botanical

ingredients and in finished products is an essential component of research and regulatory programs directed at ensuring the safety and effectiveness of dietary supplements.

Orphan Grants \$1 million

The Orphan Grants program has \$12,514,000 available for grants in fiscal year 2001, an increase of \$1,000,000 over fiscal year 2000. Activities in the Orphan Drugs Program have included the receipt of 69 applications of which four were considered non-responsive leaving 65 for review.

Office of Generic Drugs \$1.2 million

The increase was used to annualize the positions added in fiscal year 2000 and add several additional FTE. Several of these staffers are already on-board, fully trained, and demonstrating high levels of productivity. With this additional increase, all chemistry reviewer vacancies are currently filled. The Office of Generic Drugs, OGD, continues to refine the review process to increase efficiency. The Agency is exploring ways to increase resources devoted to information technology for the review of generic drug applications. The OGD is attempting to close the gap between the performance at 180 days and the significant increase in overall performance at 210 days so that the first action is taken within the statutory time frame. We also plan to revise the current system for amendment designation, major versus minor, to improve total review times.

Premarket Review \$22.879 million

FDA's increase for premarket review was used to strengthen the science base focusing on efficiencies in the premarket application review program. FDA must have well-trained scientific experts current with cutting edge technology. Additional activities include:

- Enhance scientific capabilities to better manage risks associated with emerging biotech foods. FDA and industry have consulted on approximately 40 new bio-engineered food products to date;
- Expedite reviews of generic drugs;
- Reduce review times for animal drugs for quicker market access;
- Improve the safety of children's vaccines through the National Vaccine Safety Program, NVSP, which will reduce the risk of disease transmission through vaccines;
- Improve the quality and safety of the nation's blood supply with better diagnostic tests that reduce the threat of emerging blood-borne infectious diseases being transmitted through blood;
- Improve pandemic flu activities to reduce the incidence and severity of influenza;
- Increase product review activities and develop standards for high-risk medical device re-use applications for reprocessed devices meant for single use.

Adverse Event Reporting \$6.8 million

FDA is working with Departments across the Federal government to improve health care through the prevention of medical errors and enhancement of patient safety. The agency will continue to increase its capabilities to protect patient safety. With the additional \$6.8 million, FDA has been able to speed initiatives to further reduce medical errors by:

- Expanding the capacity for active surveillance of problems with medical products through the Adverse Event Reporting Systems;
- Developing links to hospital-based information systems, to better support hospital staff working on the "front lines" of patient safety. This includes improving the reporting systems for blood errors and accidents, continued implementation of the Medical Device Surveillance Network (MedSUN) to address under-reporting and incomplete reporting of medical device problems, and to extend its capacity to include drug reports, as well as increased use of other electronic systems to monitor problems with use of drug products;
- Increasing the capacity to do the multi-factor analysis to correctly identify the sources of safety problems and potential solutions. This includes establishing links to safety databases maintained within community-level healthcare delivery systems and regional-level safety surveillance systems, and adding to expertise in medical epidemiology and statistical analysis;
- Increasing FDA's capacity to act on safety findings, including better risk communication to providers and patients who use medical products; regulatory steps to correct product design and manufacturing problems; and partnerships with other health agencies and health care organizations;

—is will reduce the existing backlog of reports and improve the quality of assessing and managing risk identified from AERS reports related to animal drugs.

FISCAL YEAR 2001 AND 2002 BASE FUNDING

Question. Please provide the fiscal year 2002 base funding and staff year levels for each of the activities listed above, as compared to the fiscal year 2001 level.

Answer. I would be happy to provide the requested base funding levels for each of the above activities in fiscal year 2001 and fiscal year 2002.

[The information follows:]

(Dollars in millions)

| Activity ¹ | Estimated fiscal year 2001 | | Requested fiscal year 2002 | |
|---------------------------------------|----------------------------|-------|----------------------------|-------|
| | Amount | FTE | Amount | FTE |
| Internet drug sales | \$10.6 | 90 | \$10.9 | 90 |
| Counter-bioterrorism activities | 7.0 | 46 | 7.4 | 46 |
| Imports and Inspections | 341.8 | 3,143 | 366.8 | 3,238 |
| Food safety | 335.9 | 2,588 | 350.6 | 2,655 |

| Premarket review ² | 560.6 | 4,411 | 587.2 | 4,429 |
| Adverse events reporting | 48.0 | 268 | 58.0 | 303 |

¹ Several of these activities are cross-cutting.

² Premarket review accounts for all premarket-related activities.

COST OF RELOCATING TO THE NEW FDA HEADQUARTERS

Question. The fiscal year 2002 budget requests an additional \$6 million to equip and occupy a new laboratory for the Center for Drug Evaluation and Research as part of the agency's long-range move a consolidated headquarters in Maryland. Please identify each of the costs, by fiscal year, associated with FDA long-range move to its consolidated headquarters.

Answer. FDA is currently in the process of developing long-range estimates of expenses associated with the move to the new consolidated headquarters in Maryland. The fiscal year 2002 Budget includes \$9 million in GSA funding for additional planning for the consolidated facilities at White Oak. We will have a better idea of long-range estimates for the move to consolidated facilities in White Oak after the completion of the fiscal year 2003 Budget process.

FINANCIAL MANAGEMENT SYSTEM

Question. The fiscal year 2002 budget requests an increase of \$8.3 million to allow FDA to begin the development of an advanced financial management system as part of the Department of Health and Human Services' effort to replace its existing systems. Does the \$8.3 million requested represent the full cost of "developing" this system?

Answer. The Joint Financial Management Improvement Program, JFMIP, guidelines require that FDA purchase an off-the-shelf financial system that is fully developed. In addition to purchasing the software, FDA will need to acquire the computer hardware, perform training for staff, develop various interfaces to other HHS systems such as payroll, develop a security plan for the new system, perform data conversion and migration from the old systems and acquire contractor support to assist FDA in the implementation. The fiscal year 2002 Budget request of \$8.3 million will begin initial acquisition and implementation of the new financial management system. Funding to complete the project will be requested in subsequent fiscal years.

Question. What is the total cost of this effort? Please identify the investment which will be required in each future fiscal year.

Answer. Estimates of future funding requests for the cost of the new financial management system are currently under development. Funding to complete the project will be requested in subsequent fiscal years.

Question. Is FDA's investment contingent on the funding provided to other Department of Health and Human Services' agencies for this new system?

Answer. No. FDA's investment is not contingent on the funding of other HHS agencies. However, FDA is working in cooperation with HHS and other agencies in

the selection and implementation of the FDA's new financial system in order that HHS has a unified and/or integrated financial system.

QUESTIONS SUBMITTED BY SENATOR CHRISTOPHER S. BOND

USE OF SINGLE RH USE MEDICAL DEVICES

Single use medical devices designed—manufactured and FDA approved for use on one patient in one procedure—are misused every day in this country. Rather than being discarded after use in one patient, many of these devices are subjected to under-regulated and inadequate cleaning procedures and are then used on other patients. Single use medical devices are bound to fail and compromise patient safety when stretched beyond the limits of their design by reprocessing. Such medical device misuse has already led to serious health quality issues including blindness, thermal burns, infections, and heart complications. Each of these medical errors was preventable. Had the disposable medical devices used on these patients been discarded after their first use, these injuries would not have occurred.

Despite its review of numerous scientific studies demonstrating the serious risks associated with reprocessing, including several studies conducted by the Agency itself, FDA has failed to meaningfully enforce key patient safety provisions of the Food, Drug, and Cosmetic Act (FDCA) and, as a result, has failed to prevent foreseeable medical errors. In response to substantial Congressional and public pressure (including an August 2000 Senate Labor Committee hearing, and a February 2000 House Commerce Committee oversight hearing), FDA has recently published enforcement guidance on the regulation of single use device reprocessing. This guidance, while a step in the right direction, continues to permit the use of many unsafe reprocessed devices on American patients for example, the reuse of biopsy forceps (devices inserted into the body and through the colon to obtain tissue samples) developed and approved by FDA for single use only continues to go unregulated. To ensure patient safety, FDA must fully enforce both the letter and spirit of the law.

Question. Dr. Schwetz, can you please comment on FDA's progress in implementing its strategy to regulate the practice of reprocessing and reusing medical devices that are labeled and approved by FDA for single use only?

Answer. On August 14, 2000, FDA issued a guidance document entitled Enforcement Priorities for Single-Use Devices Reprocessed by Third Parties and Hospitals. This guidance finalizes FDA's policy on how it intends to regulate entities that reprocess single-use devices for reuse and sets forth the Agency's priorities for enforcing these requirements.

On February 14, 2001, FDA began enforcing premarket submission requirements for all Class III single-use devices that are reused. Beginning on August 14, 2001, FDA intends to enforce premarket submission requirements for all non-exempt Class II devices. Beginning on February 14, 2002, FDA intends to enforce premarket submission requirements for all non-exempt Class I single-use devices that are reused.

In addition to the premarket requirements, third party reproducers have always been subject to Agency requirements for: Registration and Device Listing; Medical Device Reporting; Medical Device Tracking; Medical Device Corrections and Removals; Quality System Regulation; and Labeling. Beginning on August 14, 2001, FDA intends to enforce these requirements for all hospitals that reprocess single use devices.

FDA is conducting extensive outreach to inform entities, such as hospitals, of the Agency's reuse policy. We have met many times with third party reproducers and other interested parties to discuss this policy. On December 13, 2000, the Agency sponsored an interactive satellite teleconference entitled Reprocessing Single-Use Devices in Hospitals: A Primer on FDA Requirements. One of the main purposes of the teleconference was to describe FDA's regulatory requirements in plain language for hospital reproducers. Examples of what the Agency has done in the past year to implement the reuse policy are provided for the record.

[The information follows:]

Agency Examples of Reuse Policy

Pilot training program to inspect hospital reproducers.—We have developed a 2-day pilot program to train a cadre of experienced FDA field investigators to inspect hospitals that reprocess single-use devices. This pilot program will form the basis for the formal training program that is scheduled for fall 2001 for 40 to 50 FDA investigators.

—Pilot GMP inspection program for hospital reproducers.—We have developed a pilot Good Manufacturing Practice (GMP) inspection program for hospitals that re-

process single-use devices. The primary purpose of the pilot inspection is to provide hospital inspection training for FDA field investigators. Hospitals also may benefit because they will be given feedback on their facility's current "state of compliance" with FDA's requirements for device manufacturers. The Agency issued a letter seeking volunteers from the hospital community. Among the organizations that were invited to participate are the American Hospital Association, the Joint Commission on the Accreditation of Healthcare Organizations, ECRI (a technology assessment firm that services thousands of hospital clients), and the International Association of Healthcare Central Service Material Management. We are waiting for responses. We expect to begin a regular inspection program in October 2001 and will use information from FDA's registration and listing database to schedule these inspections.

Federal Register notice on proposed voluntary survey of hospitals.—On April 30, 2001, FDA published a notice in the Federal Register seeking public comment on the Agency's proposed voluntary survey of hospitals to collect information on the extent and nature of current practice of reprocessing single-use devices in these institutions. The notice has a 60-day comment period.

Letter to hospitals on FDA's reuse policy.—We issued a second letter, the first letter was mailed in fall 2000, to U.S. hospitals reminding them of the Agency's intent to actively regulate hospitals that reprocess single-use devices as manufacturers. The letter also provided a timetable of when we intend to begin enforcing the requirements and informed hospitals of regulatory actions that we may take against non-compliant hospitals.

Guidance on reporting adverse events as device manufacturers.—FDA issued a document entitled "Guidance on Adverse Event Reporting for Hospitals that Reprocess Devices Intended by the Original Equipment Manufacturer for Single Use." This guidance document describes the Medical Device Reporting, MDR, requirements for hospital reprocessors of single-use devices and provides guidance on how to complete the Mandatory MedWatch report form 3500A as device manufacturers.

Premarket applications for reprocessed single-use devices.—In keeping with the enforcement timetable FDA established in its guidance, on February 14, 2001, the Agency received several premarket applications, PMAs, from third party reprocessors to reprocess cardiac ablation catheters, devices are used to treat certain cardiac conditions. The applications are currently undergoing review. We anticipate rendering final decisions on the applications by August 14, 2001.

Inspections of third party reprocessors.—The Agency is on schedule in its efforts to inspect all third party reprocessors in the U.S. this year. The main focus of these inspections will be manufacturing/reprocessing controls that are required to be in place in accordance with FDA's Quality System Regulation. We intend to pursue enforcement action, as appropriate, against any reprocessor that continues to distribute reprocessed Class III devices that are not the subject of a pending or approved premarket application.

Outreach program.—We continue to support an extensive outreach program to inform hospitals and health care providers of the Agency's reuse policy. For example, in the past year the Agency accepted over 25 invitations to speak at professional association meetings on the Agency's reuse policy. FDA also sponsored two 2-day workshops for hospital and third party reprocessors on FDA's reuse policy in May 2001.

Meetings with single-use device reprocessors.—FDA has held numerous meetings with representatives of reprocessing companies to discuss premarket requirements for used single-use devices.

Question. There is one category of products in particular that generated the Senate's interest in this issue—specifically the reuse of biopsy forceps. In FDA's original guidance, the Agency classified the reuse of these products as "high risk" because of concerns that they could not be adequately reprocessed without significant risk to patients for infections, and significant concerns with respect to the effectiveness of the products after multiple uses. What specific steps has FDA taken to ensure that the public is being protected from the reuse of biopsy forceps? Since the Agency has stated that the reuse of biopsy forceps is a "high risk," why hasn't FDA required premarket submissions to ensure that reprocessed forceps are in fact safe for patients?

Answer. In accordance with the device classification scheme established in section 513 of the Federal Food, Drug and Cosmetic Act, non-electric biopsy forceps intended for use in gastrointestinal and urological procedures are classified as class I devices, per 21 CFR § 876.1075(b)(2). As such, they are subject to a wide range of general controls designed to ensure safety and effectiveness, including registration, listing, medical device reporting, tracking, corrections and removals, quality systems, and labeling. All manufacturers, including reprocessors, are subject to these requirements, which can be enforced through warning letters, seizures, injunctions, civil

money penalties, recalls, and even criminal prosecutions. FDA's August 22, 2000 guidance document entitled Enforcement Priorities for Single-Use Devices Reprocessed by Third Parties and Hospitals, reemphasized that, like other manufacturers, third party reprocessors are subject to these requirements, and announced FDA's intent to phase in over one year active enforcement of these general controls for hospital reprocessors, against whom FDA has not historically pursued active enforcement. In accordance with these legal authorities, FDA has inspected a major third-party reprocessor of non-electric biopsy forceps and is working to resolve problems found in its cleaning and sterilization processes. FDA will inspect all third-party reprocessors this fiscal year. FDA is and has been committed to enforcing the statutory safeguards to minimize potential risk. At this time, we are not aware of any data that link the reprocessing of non-electric biopsy forceps to specific adverse events in patients.

Non-electric biopsy forceps, like the majority of class I devices, are exempt from the premarket notification requirements of section 510(k) of the act, subject to the limitations in 21 CFR §876.9. FDA is currently considering a citizen's petition requesting the Agency to amend its regulation so as to limit the exemption to forceps that are produced by an original equipment manufacturer for single use or are originally labeled and designed for multiple uses. We are presently considering the petition. Among the factors we will consider are the risks presented by the device, and what regulatory controls will most appropriately ensure the safety and effectiveness of the device.

PMA STATISTICS

Question. According to FDA's enforcement guidance for single use device reprocessing, reprocessors were required to submit PMAs for Class III devices by February 14, 2001. How many reprocessor PMAs has FDA received? How many were considered sufficiently complete to proceed to substantive review? What devices are covered by those PMAs? Has FDA approved any reprocessor PMAs?

Answer. As of May 24, 2001, the Center for Devices and Radiological Health, CDRH has received five PMAs for reprocessed devices. All five PMAs were for Cardiac Ablation Catheters. Four of these five PMAs were filed. One of the four PMAs is under review and we have asked questions of the other three applicants and are waiting on that additional information. None has been approved at this time.

ENFORCEMENT ISSUES

Question. Now that the premarket enforcement period for single use device reprocessing has begun, what activity has FDA undertaken to find and stop the reprocessing of Class III devices absent a filed PMA?

Answer. FDA intends to inspect all third-party reprocessors this fiscal year. A multi-district assignment issued on December 21, 2000 identified eight firms to be inspected. A second multi-district assignment to inspect additional firms will be issued shortly.

FDA will begin inspecting hospitals after August 14, 2001, to evaluate their compliance with premarket submission requirements and the requirements of the Quality System regulation.

Several PMAs have been received from third-party reprocessors, and reviews are underway. One PMA was not filed because it did not meet our threshold review requirements. We notified the firm whose PMA was not filed that it cannot legally introduce these devices into interstate commerce until such time as they are the subject of an approved PMA or an approved investigational device exemption application and that marketing these devices without such approvals could result in enforcement action.

REVIEWER GUIDANCE

Question. According to the enforcement guidance on single use device reprocessing, reprocessor PMA's for Class III devices were to have been filed by February 14, 2001. I understand that FDA's planned guidance document for reviewers and industry regarding the unique features that must be included in a reprocessor 510(k)/PMA has been delayed. When will the guidance be issued? In the absence of the guidance document, what standards are FDA reviewers using to review reprocessor PMA's.

Answer. The draft guidance document for reviewers and industry was posted on the CDRH web site on May 24, 2001. Although FDA is giving the public 90 days to comment on the draft, the guidance reflects current policies and recommendations on premarket regulatory and technical issues. The overriding principle of the guidance is that FDA intends to treat OEMs and reprocessors in the same way with re-

spect to meeting premarket requirements. Most of the standards and guidance documents referred to in the draft guidance are already available to FDA reviewers and the public through FDA's Reuse Web Site.

APPROVAL STANDARD

Question. FDA has been accused of lowering the data standard for medical devices entering the U.S. market so that reprocessing of single use devices can continue. My understanding is that the legal minimum for 510(k) clearance of a device is that the device be at least as safe and effective as a legally marketed device. With respect to reprocessed single use devices, my understanding is that FDA has declared that these devices should be "as safe and effective as possible." Has the FDA established two different standards? If so, why?

Answer. FDA has not changed the review standard for a 510(k) clearance. Devices cleared for market through the premarket notification 510(k) process must be as safe and effective as a legally marketed device. There are no additional regulatory requirements for reprocessed single use devices, or SUD, submissions, nor are there special allowances for these submissions.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

RESEARCH/REGULATORY FUNDING PRIORITIES

Question. As I'm sure you are aware, the President's fiscal year 2002 budget requests an increase of \$2.75 billion, or 13.5 percent, for the National Institutes of Health. This is the fourth installment of a five-year plan to double the NIH budget. Private pharmaceutical companies invested nearly \$50 billion in research and development in fiscal year 2001, and the trend continues to rise. As the Agency charged with reviewing these new products to determine whether they are safe for public consumption and use, you have and will continue to face great pressure to work expeditiously, making new and improved drugs and medical devices available to the public as quickly as possible.

In view of the FDA budget request, do the substantial increases in funds for basic research conflict with the government's ability to approve the products that will result from that research in a timely manner?

Answer. As new products are generated by the academic and industry research, fueled by NIH, they must be evaluated by FDA staff with the scientific expertise to assess their benefits and risks. We want to ensure that FDA will not become a bottleneck in getting safe and effective products and therapies to the public. The number and complexity of products and issues coming before FDA demand that the agency have the very best scientific capability to evaluate them. FDA must have a critical mass of top-notch scientific and medical expertise to assess these products and answer new questions.

Question. Do you work with the NIH to streamline the process between the development of new drugs and your responsibility to approve and monitor them?

Answer. We frequently discuss preclinical toxicology requirements, general concepts of clinical development plan design, and new endpoints pertinent to new classes of drugs with various institutes at NIH.

Question. Please summarize the actions being taken to ensure that FDA will be prepared when all of the R&D research pays off.

Answer. Although we are aware that there is an increase in research and development for new drugs that may lead to new technologies, it is difficult to predict the submission rates for new drug applications. However, we continue to streamline our process to meet our review goals as we have in the past. FDA has been actively working on streamlining our internal policies and procedures by moving to a paperless environment. Examples of some of our accomplishments are provided for the record.

[The information follows:]

Expanded the Electronic Document Room to manage the receipt and handling of full electronic new drug applications. Slightly over 50 percent of original new drug applications received in CDER now include sections that are submitted electronically. In fiscal year 2000, CDER received over 500 electronic submissions, including full new drug applications, supplemental new drug applications, and amendments. There has been a 50 percent decrease in the average number of paper volumes per new drug application submission since the start of electronic submissions in 1997.

Drafted guidance on Providing Regulatory Submissions in Electronic Format—Abreviated New Drug Applications, ANDA. Developed software to convert proprietary formats to XML so submissions can be archived.

Published final guidance Providing Regulatory Submissions in Electronic Format—Prescription Drug Advertising and Promotional Labeling in January 2001.

Drafting guidances on Providing Regulatory Submissions in Electronic Format—Postmarketing Expedited Safety Reports; Providing Regulatory Submissions in Electronic Format—Annual reports; Providing Regulatory Submissions in Electronic Format—IND and Providing Regulatory Submissions in Electronic Format—Annual reports.

Drafting guidance on Providing Regulatory Submissions in Electronic Format—Drug Registration and Listing. This project involves the collection of information using a web-based system. In addition, a proposed rule is being drafted that would require the submission of this information in electronic format.

Finalizing a proposed rule that would require sponsors to submit certain labeling content electronically to the Agency for review. Interested parties will have an opportunity to comment.

Receiving electronic postmarketing adverse event reports under a pilot submission program. A number of sponsors have successfully sent reports electronically that have been directly transferred to a database. The agency is also preparing regulations to require all adverse event reports from industry to be submitted electronically.

IMPORT INSPECTIONS

Question. Global trade has more than tripled the number of shipments of FDA regulated imports from about 1.5 million in 1992 to six million in 2000. However, according to your own reports, FDA only has the ability to sample less than one percent of all regulated products offered for imports.

How many products should be inspected for it to be an acceptable amount?

Answer. The Agency is currently in the process of determining the amount of samples necessary in various product categories to determine whether we have a sufficient and acceptable statistical sample of products. The estimates will include: a range of the estimated number of products, assumptions in predicting the number of anticipated products being imported into the U.S., and caveats that indicate what types of uncertainties or changes would alter the estimates.

Question. How much money would be necessary to ensure this is possible?

Answer. Once FDA calculates an estimated number of samples necessary to determine whether it has a sufficient and acceptable statistical sample of imported products, the Agency will then attempt to determine the additional cost to the existing import program. The estimates will include: a range of the estimated estimated resources, assumptions in determining the cost estimate, and caveats that indicate what types of uncertainties or changes would alter the estimates.

MAD COW DISEASE

Question. As I'm sure you know, over the past several years, "mad cow disease" has infected more than 180,000 cattle in Europe and parts of Asia. With animal diseases such as this occurring, it seems that sampling less than one percent of all imports leaves a large gap through which BSE infected animal feed or other products could enter the U.S.

While I applaud FDA for its increased investment in preventing BSE from entering the United States, what is being done to prevent BSE from entering the United States via banned animal protein that has been diverted from its originating country to a third-party country we do not currently consider a threat?

Answer. The regulations governing products of animal origin which pose a risk of harboring disease agents are primarily enforced by the U.S. Department of Agriculture, USDA. In cooperation with USDA, FDA has directed its field personnel to be alert to the potential importation of BSE material and to provide entry notification to local USDA officials. If a product moves from its country of origin, through a second country and is relabeled as a product of the second country, without any processing occurring in the second country, that is a violation of U.S. Customs Country of Origin rules. If the product is processed in the second country, not only is it proper to be declared as a product of the second country, but generally speaking, U.S. Customs Service regulations require such a declaration.

FDA is currently developing a proposed rule to amend FDA regulations to prohibit the use of materials derived from ruminant animals in FDA regulated products. The proposed prohibition will apply to the use of materials derived from ruminant animals born, raised, or slaughtered in certain countries and to the use of materials that have been processed or manufactured in a facility where materials derived from ruminant animals born, raised, or slaughtered in certain countries are also processed or manufactured. The proposed rule will require manufacturers of drugs and

biological products for human and animal use and medical devices, to certify regarding the use of materials derived from ruminant animals in the manufacture of their products.

Question. Is FDA currently working to identify any third-party countries that may be importing materials containing BSE received from a prohibited country?

Answer. FDA has not identified any specific third party countries that may be importing materials containing BSE received from a prohibited country at this time. Currently, efforts have focused on products from the BSE affected or at-risk countries identified by U.S. Department of Agriculture's Animal Plant Health Inspection Service, APHIS. Should FDA become aware of such practices, we may consider expanding current import alerts and bulletins dealing with BSE to these countries or firms in other countries as well.

The FDA Office of Criminal Investigations, OCI, is on the record with written communication exchanged with the Federal Bureau of Investigation, FBI, U.S. Customs Service, Interpol, and the U.S. Department of Agriculture, Office of the Inspector General, requesting immediate notification of any information received suggesting prohibited BSE ruminant material may make its way into U.S. commerce by any means. OCI is an active participant in the USDA law enforcement working group on foreign animal diseases. OCI is also an active member of the Permanent Forum on International Pharmaceutical Crime, PFIPC. Some of the European members of PFIPC have responsibilities extending to foods and are heavily involved in BSE issues at this time. They have been asked to advise OCI immediately on receipt of any information indicating contaminated material may be finding its way to the U.S. OCI provides follow up on any allegations of a criminal nature. Plans are underway to obtain direct access to classified channels of communication to augment our other sources.

Question. If not, are there plans to do so? If so, what communications are taking place to ensure these products do not enter the U.S. market?

Answer. FDA has been communicating extensively with the U.S. Department of Agriculture, USDA, the Food Safety Inspection Service, FSIS, the Department of Defense, DOD and the Animal Plant and Health Inspection Service, APHIS, regarding BSE issues. On March 12, 2001 a meeting was held with USDA, FDA, and the Center for Disease Control, CDC. One of issues discussed regarding imports was third country movements. Most, if not all countries, have recognized the threat from bovine materials contaminated with the BSE agent and have instituted import restrictions. Coupled with the extraordinary actions taken by the European Union, EU to identify and destroy BSE-contaminated animals, the importation and transshipment of contaminated products while still a risk, is a low one.

FDA has issued import alerts and bulletins to review all bulk and finished products that contain bovine risk material from BSE-identified countries and to refer those imports to APHIS for disposition and prevent them from entering the U.S.

No warning letters have been issued in connection with possible shipments of ruminant material from BSE at-risk countries. When FDA determines that a product offered for import into the U.S. appears to be adulterated or misbranded the usual course of action is Refusal of Admission per section 801 of the Food, Drug and Cosmetic Act, rather than issuance of a Warning Letter. In the case of products with the potential for BSE contamination for which both agencies have jurisdiction, FDA's cooperative enforcement program with APHIS calls for FDA to back-up APHIS's initial manifest review, and to coordinate regulatory action with APHIS on any products which may contain ruminant material from BSE at-risk countries. To date, no such refusals have been issued.

FDA STAFFING LEVELS

Question. I mentioned earlier that over the past eight years, FDA has had to absorb \$284 million for mandatory cost-of-living and pay-related increases for FDA employees. This has resulted in a ten percent decrease in staffing levels in program areas not funded by user fees.

Please describe to this Subcommittee the effect this shortage of funds has had on FDA's ability to fulfill its mission, and give specific examples.

Answer. In order to fulfill our mission, we need a workforce able to meet our needs in any given situation. The Agency has achieved efficiencies by reducing non-payroll operating costs as much as possible, limiting travel, supplies, and equipment. The Agency has also reduced extramural research and methods development projects. From fiscal year 1995 through fiscal year 2000, non user-fee full time employees have declined from about 8,800 to 7,900.

Question. Will the \$40 million increase in the President's budget to help pay for cost-of-living increases allow FDA to replace any of the staff it has lost over the past decade?

Answer. Since 1993 the Agency has lost 1,000 non-user fee positions. These will not be recovered with this pay increase. The \$40 million will, however, allow FDA to maintain the same staffing levels in fiscal year 2002 as fiscal year 2001.

Question. How much money is necessary to bring staffing levels up to an amount that enables FDA to reach its peak performance, especially in light of the increases in applications to come?

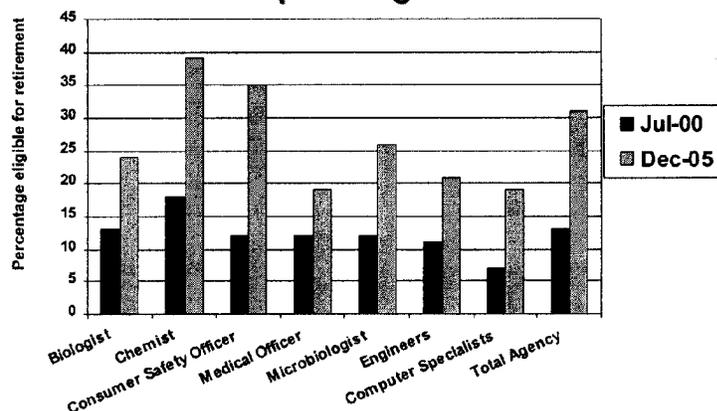

Answer. The Agency is currently in the process of developing long-range estimates for resource needs associated with closing the gap between current performance and meeting statutory requirements as well as other high priority areas at the Agency where FDA is not reaching peak performance. The estimates will include: a range of estimated resources, assumptions in determining the estimate, and caveats that indicate what types of uncertainties or changes would alter the estimates.

Question. To what extent does the number of FDA personnel approaching retirement age pose a threat to the agency's ability to continue its mission?

Answer. The FDA is facing a challenging pattern of workforce change and turnover. The U.S. Office of Personnel Management, OPM projects that about 293,000 full-time, executive branch employees, or 19.2 percent of the civil service workforce will retire through 2005. FDA's recent workforce planning report indicates more than 30 percent of agency personnel will be retirement eligible by December 2005. The percentages for chemists, almost 40 percent, and consumer safety officers, 35 percent, are significant. FDA has been working for the last year and a half on developing a strategic workforce plan that addresses how to fill the void resulting from anticipated retirements through succession planning, development of leadership skills, and recruitment of critical occupations. Provided for the record is a graphic of this information.

[The information follows:]

Given near-term retirement patterns, there are tremendous advantages to expanding the focus on succession planning and related issues

This chart projects FDA voluntary retirement eligibility. Historically, in HHS, 25% of those eligible to retire do so within 14 months of eligibility. 50% do so within 3 years.

Developing the FDA Workforce to Strengthen Science for a Healthy World

8

Question. How is FDA conducting recruitment to attract new employees?

Answer. In March 2000 FDA formed a Recruiting Council comprised of representatives from all FDA centers and offices. The council members have been provided training on recruiting and pay incentives such as, Recruitment, Retention, and Relocation bonus incentives; Student Loan Repayment Program; Special Salary Rates; hiring at above-the-minimum-rate; and many other pay benefits. They have also been trained on all aspects of benefits and in Quality of Work Life issues such as

flexiplace, flexible tours of duty, transit subsidy and childcare subsidy. Special training has been provided for appointing authorities in Titles 5, 38, and 42, including Special Appointing Authorities, Career Intern Appointing Authorities, Presidential Management Intern authorities, and many other topics. They have also been given Diversity Recruiting Training. On-line job fairs have been initiated. Attendance at local job fairs has been shared and resources utilized well. In addition, the Council consolidates advertising and recruitment efforts to maximize opportunities for the FDA. As a result, the agency is hiring more well-qualified employees. In addition FDA plans to develop a resume database of employees and external experts in key skill areas, including those who are available on a part time, temporary, or contract basis. A list of other FDA plans is provided for the record.

[The information follows]

Other FDA Plans for Hiring Staff

Utilize internships as a way to introduce new ideas and perspectives;

Expand and further promote developmental opportunities and incentives such as tuition reimbursement and payment of college loans;

Create an emergency preparedness staffing model to fund special recruiting efforts;

Adopt a "life event" recruiting strategy, focusing on attracting potential employees during natural transitions, such as recent college graduates and private sector retirees, and,

Develop innovative ways to speed up the FDA hiring and decision-making process.

Question. Are there any FDA employment policies, such as mandatory weekend employment, that might serve as discouragement to new employees?

Answer. No, there are currently no policies of this type. We are very employee oriented in FDA and have developed many family friendly policies designed to help employees balance work and home life. We believe these policies encourage employees to work at FDA. However, there are some job requirements that may result in changes to our work policies in the future. For example, fresh seafood and produce are entering our major ports 7 days a week, 24 hours a day. The agency's responsibility to the public is to accomplish inspections that ensure a healthy food supply while handling perishable products as quickly as possible. Unnecessary delays resulting from the inspection process would impede commercial distribution and add to deterioration of perishables or other possible health hazards. Our goal, to the extent of our resource limitations, is to protect the public health while not impeding commerce and distribution of products throughout the U.S. To accomplish this goal we need the availability of laboratory staffs to receive and analyze samples. Since these imports arrive on a 24/7 schedule we are required to have a corresponding presence at import sites similar to U.S. Customs Service and USDA. We have been able to partially cover these requirements by asking for volunteers and paying overtime for the work. Unfortunately, the need for this type of coverage will grow. We will no longer be able to provide overtime. In those situations we may have to extend the workweek and include weekend and/or evening work schedules. We are currently discussing extending the workweek hours to address this growing operational need with the National Treasury Employees Union.

MILK PROTEIN CONCENTRATES

Question. As you know, I along with other Members of Congress last year requested the General Accounting Office to do an investigation and provide a report to Congress on the issue of milk protein concentrate importation and use in this country. One of the things highlighted by that report was the degree to which FDA is not enforcing the current standards of identity for cheese. This is very troubling to me and begs the question of what other regulations FDA is choosing not to enforce.

First, is this a question of having adequate resources or are you making a policy decision to ignore these standards.

Answer. FDA does not focus resources specifically on illegal use of Milk Protein Concentrates, MPC's. Use of MPC's would be dealt with during routine firm inspections under one of the compliance programs covering food composition, standards, labeling, or economics. Current priorities are focused on food safety. The use of MPC's in cheese is a labeling and composition matter that is not a high priority unless it could be linked to food safety. FDA devotes about one FTE to cheese standards of identity.

Question. Can you tell this Subcommittee to what extend you are currently inspecting plants for illegal use of MPC? What are you findings?

Answer. FDA does not focus resources specifically on illegal use of MPC's. Use of MPC's would be dealt with during routine firm inspections under one of the compliance programs covering food composition, standards, labeling or economics.

Question. What plans do you have to adequately enforce these important standards?

Answer. FDA is presently considering whether further resources might be devoted to ascertaining whether domestic or imported MPC's are being used in the manufacture of standardized products where such usage would not be permitted by the appropriate standards. However, use of MPC's is not considered a food safety issue. FDA resources currently focus on firms that manufacture products at high risk of contamination with foodborne pathogens.

PRESCRIPTION DRUGS

Question. Please summarize the type of activities FDA is engaging in, such as accelerating the approval of generic drugs, to contain the costs of prescription drugs.

Answer. We continue to refine the review process to increase efficiency. We are able to accept more electronic submissions to streamline the review process. The number of new staff hired in the last fiscal year are now fully trained and are demonstrating high levels of productivity. We continue to examine every aspect of the review process to try to identify problem areas to be addressed. We also plan to revise the current system for amendment designation, major versus minor, to improve total review times. While FDA does not have the responsibility to contain costs of drugs, we are doing everything to get generics to the market quicker. Other changes are also being explored.

COMBINATION PRODUCTS

Question. It is suggested that many developing products will fall into this category, which are products that are both a device and a drug or biologic.

Does FDA have a process in place for timely review of these applications?

Answer. Yes, FDA does have processes in place for the timely review of product applications for combination products.

Question. How do the various centers coordinate review of these products?

Answer. There are intercenter agreements for determining which Center has primary jurisdiction over particular types of combination products. For example, the Center for Biologics Evaluation and Research, CBER, has a number of standard operating procedures and policies, SOPPs, pertaining to various aspects of combination-product license applications processing. The SOPP subjects range from the administrative processing of license applications to the review and issuance of license-application action letters. One of CBER's SOPP's outlines the procedures for inter-office license application review consultation. The procedures outlined in that SOPP apply to intercenter consultation of combination-product license applications.

PREMARKET APPLICATION REVIEWS

Question. What level of resources would be needed for FDA to meet statutory deadlines for third party review for premarket applications?

Answer. FDA expects to expend the same level of funding in fiscal year 2002 as in fiscal year 2001 for third party review reviews of medical devices, plus corresponding pay increases in fiscal year 2002 associated with this function. The Agency is currently in the process of developing long range estimates for resource needs associated with medical device reviews. The estimates will include a range of estimated resources, assumptions in predicting the number of third party reviews, and caveats that indicate what types of uncertainties or changes would alter the estimates.

FDA is working with the medical device industry to increase industry's use of third parties to review premarket applications for low to moderate-risk devices. FDA has accredited twelve third parties, seven of which have reviewed three or more 510(k)s. The program now has 674 eligible devices. This represents a 300 percent increase in the number of eligible devices, and includes all Class I and Class II devices regulated by the Agency that meet the statutory criteria for review by Accredited Persons. In fiscal year 2000, FDA received 47 510(k)s with a third-party review compared to 32 510(k)s received in fiscal year 1999. This increase represents only 3 to 4 percent of 510(k)s that were eligible for review. FDA anticipates that the expansion will generate wider use of the third party review program in fiscal year 2001.

Question. Is FDA contracting out the review of applications?

Answer. When funding levels and circumstances permit, FDA uses its authority to contract with outside technical expertise when such expertise was needed. For ex-

ample, in fiscal year 2000, FDA hired 70 Special Government Employees to participate on the medical devices advisory committees. FDA has also contracted with the Oak Ridge Institute for Science and Education fellowship program to recruit experts to participate in reviews. FDA continues to contract with other experts when the need arises.

IMPORT USER FEE PROPOSAL

Question. Would the import user fee proposal affect the ability of U.S. device manufacturers to have ready access to bulk supplies and biomaterials procured from foreign sources? To what extent?

Answer. No, the import user fee will not affect the ability of U.S. device manufacturers to have ready access to bulk supplies and biomaterials procured from foreign sources.

WHITE OAK RELOCATION

Question. Was a cost comparison conducted to determine if FDA space could be located from the private sector at a lower cost than through GSA?

Answer. The General Services Administration, GSA, prepared a report to the House Economic Development, Public Buildings, Hazardous Materials and Pipeline Transportation Subcommittee. The report provided background information on the project as well as a comparison between the cost of leasing to the cost of government construction. Over a 30-year period the analysis shows a cost advantage for Government construction. For FDA, however, there are other benefits to capital funding for government construction.

A large portion of the Agency's space is constructed as laboratory space. As highly specialized space, laboratories require significant investment in capital improvements to the space for scientific and life-safety purposes. The capital investment in the laboratory areas drives the cost of the space much higher than standard office space. Because of this additional investment in the space the longer the government stays in its space the more cost effective it becomes. Competition in contracting requires that the Government recompetes its leases periodically and this can result in the relocation from its facilities before its investment is fully amortized.

In addition, administrative budget guidelines calls for up front scoring of major lease acquisitions. The high cost of laboratory space would result in a lease that would score as capital authority. In the past the Office of Management and Budget has not approved capital lease authority, because it results in the government essentially paying for assets through a lease.

Question. What are the conditions of current FDA locations that would be relocated to White Oak?

Answer. FDA Headquarters is located in 40 buildings in 18 locations. While the Agency has managed to improve the quality of many of its offices, its laboratories are still in need of improvement. The Centers to be located in Prince George's County are effectively consolidated or construction is underway to replace their laboratories. Of the remaining Centers to be located in Montgomery County, CBER laboratories are housed on the National Institutes of Health campus and a private sector leased building and CDRH laboratories are located in approximately five buildings that are closely grouped in the Parklawn building vicinity. For the record I will provide the problems with these buildings.

[The information follows:]

Flexibility

Lab buildings, with the exception of MOD 1 in the Beltsville/Laurel facility, are unable to respond quickly or economically to changing programs/priorities or scientific/technical changes.

Modularity and a correspondingly flexible utility distribution network that permits maximum adaptability is non-existent in all older buildings.

Mechanical and electrical systems in older buildings cannot accommodate increased demands posed by modern laboratory operations and provide no capacity or flexibility for future loads.

Older buildings cannot be renovated or upgraded efficiently or economically.

Health And Safety

Overcrowding in laboratories present a definite safety hazard.

Poor ventilation in several of the buildings presents potential health or safety problems and may jeopardize animal health and hence compromise experiments.

Renovation of some buildings to bring them up to current codes and standards is not possible because of inherent design deficiencies. Health and Safety upgrades

generally are constrained by building layouts that are not designed for FDA's complex, modern laboratory requirements.

Quality of Environment

Overcrowded conditions are a major detractor to a quality workplace.

Location of buildings does not foster the proper opportunities for communication between colleagues or disciplines.

HVAC systems in many lab buildings are marginal or totally inadequate, resulting in poor ventilation, inadequate filtration of incoming air and the short circuiting between building exhausts and air supply intakes.

ANTIMICROBIAL RESISTANCE

Question. Please provide an update on the activities of the National Antimicrobial Resistance Monitoring System and include any observations regarding the problems of antimicrobial resistance and a public health issue as related both to animal drug use and human drug use.

Answer. The National Antimicrobial Resistance Monitoring System, or NARMS, monitors development of antimicrobial resistance of zoonotic enteric pathogens, or bacteria, from human and animal clinical specimens, healthy farm animals, and carcasses of food-producing animals at slaughter. Its purpose is to prospectively monitor the antimicrobial resistance of human, animal, and animal product isolates of selected enteric bacteria. Both human and animal isolates are tested since antimicrobial resistance is a food safety and human public health issue. The food safety hazard derives from the fact that if resistant enteric bacteria are present on the food, there is the possibility that people will become ill from those bacteria and any needed treatment may be difficult or protracted due to the resistance to selected antibiotic. The public health hazard derives from the misuse and overuse of antimicrobials leading to the emergence of drug-resistant bacterial strains. The continuing emergence of difficult to treat or untreatable secondary infections acquired in the hospital threaten the lives of hospitalized individuals and those with chronic conditions, as well as adding considerably to health care costs. The NARMS program is designed to identify trends over time in antimicrobial susceptibility and to identify areas for further investigation.

NARMS is expanding greatly in fiscal year 2001. Improvements to NARMS will enhance FDA's ability to protect public health, as well as provide the animal drug industry a source of baseline data for pre-approval studies on resistance. Enhancements to NARMS include the addition of new sources and increased numbers of isolates, expansion of new veterinary sentinel sites to ten and inclusion of retail food samples to increase the geographic distribution of the samples. In addition, FoodNet sites and ten State public health laboratories participating in NARMS will also receive increased funding to submit isolates, and an additional nine Food Net sites will begin to participate in NARMS in late 2001. FoodNet is a surveillance system that provides a network for responding to new and emerging foodborne disease outbreaks of national importance, monitoring the burden of foodborne diseases, and identifying the sources of specific foodborne diseases.

Each NARMS testing site will have the expertise of a molecular biologist to facilitate associated analytical microbiological research on the NARMS isolates, including molecular characterization. We also plan to expand the list of pathogens to be monitored by means of increased funding to the States and adding retail food sample collection. Moreover, the expansion and visibility of the NARMS program have increased both the demand for and the complexity of reporting results in a timely manner. To accommodate this demand, FDA has increased the resources provided to each testing site to facilitate efficient database management, increased frequency of reporting, and timely report generation. The expansion of NARMS has also identified the need to add a third testing site in order to handle the increased number of isolates. This requires that the exact same testing methods and isolate handling procedures be used as currently is done at the CDC and USDA facilities. Because of this, FDA's Center for Veterinary Medicine, Office of Research microbiology facility has been selected to isolate, identify, and susceptibility test the retail food samples. In addition, in fiscal year 2002 we plan to expand the collection and testing of retail food, which began in fiscal year 2001 as a pilot project.

FDA plans to enhance our collaboration with international surveillance sites. On the international side, FDA continues to support a similar system to NARMS in Mexico. In fiscal year 2000, FDA began a pilot study with Mexico on a monitoring system for antimicrobial resistance in Salmonella. Preliminary findings from the pilot study indicate a moderate carriage rate of Salmonella among healthy children in Mexico, but the isolates tend to be sensitive to all antibiotics tested. Veterinary schools in three Mexican States desire to join the project. As a first step veterinar-

ians are now in training at the hospitals to develop expertise in isolation and identification procedures. FDA is also supporting a World Health Organization training course on the surveillance of Salmonella and antimicrobial resistance in foodborne pathogens to be held July 2–13, 2001 in Merida, Mexico. Representatives from human and veterinary hospitals from 11 countries from Mexico, Central, and South America will receive training in standardized laboratory methods for the isolation, identification and antimicrobial susceptibility testing of foodborne Salmonella and the interpretation of results. The long-term objective of the course is to lay the foundation for participation in a regional laboratory network for the surveillance of foodborne disease and antimicrobial resistance in foodborne bacteria.

NARMS data was used in the development of FDA's Campylobacter risk assessment as revised January 5, 2001. Based partly on the results of the Campylobacter risk assessment, FDA's Center for Veterinary Medicine proposed to withdraw approval of the new animal drug application for use of the fluoroquinolone antimicrobial drug enrofloxacin in poultry. CVM has determined that the drug is not been shown to be safe under its approved conditions of use. The proposed withdrawal is based on several determinations. First, that the use of fluoroquinolones in poultry causes the development of fluoroquinolone-resistant Campylobacter in poultry. Second, that this fluoroquinolone-resistant Campylobacter is transferred to humans and is a significant cause of the development of fluoroquinolone-resistant Campylobacter infections in humans. Finally, that fluoroquinolone-resistant Campylobacter infections are a hazard to human health.

CONSUMER SAFETY

Question. Please provide an update on the activities of the Patient Safety Task Force and include incidents of suspected product adverse reactions and preventable medical errors.

Answer. Preventable patient deaths and injuries associated with the use of medical products are an important public health concern. A summary of actions is provided for the record.

The Final Summary of Food and Drug Administration Action Items: Doing What Counts for Patient Safety: Federal Actions to Reduce Medical Errors and Their Impact exemplifies FDA's dedication to preventing patient harm and improving patient safety. For fiscal year 2000, approximately 275,000 suspected product adverse reactions were reported to the Center for Drug Evaluation and Research's, CDER's Adverse Events Reporting System, AERS. Of the 275,000, 2800 were reports of medication errors. Since 1994, CDER has received approximately 15,000 reports of medication errors. Approximately 50 percent of these reports were related to the naming, labeling and/or packaging of drug products. There is a 69 percent morbidity rate, including a 10 percent fatality rate associated with these preventable medication errors.

[The information follows:]

Patient Safety Task Force Activities

National Summit on Drug Safety and Other National Meetings; Report to the Public on the Safety of Drugs, Devices, and Biologics; Expand Mandatory Reporting of Errors to All Registered Blood Establishments; Initiate Programs to Develop Additional Standards for Drug Names; Initiate Development of Packaging Standards to Prevent Dosing and Drug Mix-ups; Develop New Label Standards for Drugs to Address Errors Related to Medications; Implement Phase II of MeDSuN; Intensify Efforts to Ensure Manufacturers Follow Standards; Provide Access to Databases Linked to Healthcare Systems; Complete Online Adverse Drug Event Reporting System; Strengthen FDA's Analytic and Investigative Capacity; and, Strengthen FDA's Outreach Activities and Collaboration with Federal Agencies.

Question. Please provide an update on activities related to the 1988 Clinical Laboratory Improvement Amendments.

Answer. FDA has been responsible for determining the appropriate test complexity categorization of commercially-available test systems since January 2000, when this function was transferred to the agency from the Centers for Disease Control and Prevention, CDC. To date, we have completed more than 1,000 categorizations. These have included more than 150 waiver determinations. Waived tests are simple, and have an insignificant risk of an erroneous result. Although the vast majority of these waiver assignments have represented additions to waiver test categories already introduced by the CDC, several high profile new analytes have been waived, including two immunoassays for direct detection of influenza virus and a test for alanine amino transferase, or ALT.

The agency has sponsored a public workshop seeking input on the waiver process and has issued a draft guidance for public comment which is available on the CDRH

website. FDA has presented guidance on recommended new directions at the February 2001 Clinical Laboratory Improvement Amendments Committee, or CLIAC, meeting and hopes to finalize this guidance this summer.

AGRO-TERRORISM

Question. If an outbreak of BSE or Foot and Mouth Disease were to occur in the United States, it would be devastating to my State, and the economy of the entire country would suffer greatly. Recent news reports have cited how easily one of these animal diseases could be intentionally introduced into the country.

Please explain what the possibility is of someone intentionally introducing an animal disease in this country that could devastate the U.S. economy or have serious public health implications.

Answer. There is a real danger from the intended introduction of Bovine Spongiform Encephalopathy, or BSE, and Foot and Mouth Disease, or FMD, or other animal diseases into the United States. We acknowledge that the possibility that these and other foreign diseases would be devastating to U.S. agriculture and the economy if introduced into the U.S. due to the number of travelers returning from abroad, or visiting the U.S. each day. In addition, because of the volume of imported products, and the limited resources available for inspection, there are many possible ways for the intentional introduction of these diseases into the U.S.

Question. What actions are being taken by FDA to ensure that this does not happen? Please provide specific examples, including weaknesses of current preventive programs.

Answer. FDA works closely with the United States Department of Agriculture, or USDA, and State agricultural and veterinary agencies on implementation of the Bovine Spongiform Encephalopathy, or BSE, regulation and on controlling imported products that might introduce BSE into the U.S. FDA issues import alerts and bulletins, carries out import inspections at the border and airports, and inspects domestic manufacturers. The Agency also contracts with the States, who have conducted approximately 80 percent of the domestic inspections under the BSE regulation. FDA worked closely with the USDA in developing the import alerts and bulletins issued by FDA to ensure all animal products that might contain the BSE agent are identified and listed in the alerts or bulletins and are prevented from entering the U.S.

FDA is also a member of domestic and international working groups, and chairs the Senior Executive Interagency Steering Committee. A major goal of these groups is to ensure that imports of products potentially contaminated with BSE do not get into the U.S. The Senior Executive Interagency Steering Committee assures coordination among agencies, especially in three main areas: integrated contingency planning in case BSE or variant Creutzfeldt-Jakob Disease, or vCJD, disease is found in the U.S.; identification of and response to potential vulnerabilities in the U.S. to BSE and vCJD; and coordination of risk communication plans by the various agencies. For the record we are providing a list of organizations that participate in the Senior Executive Interagency Steering Committee.

A Tri-country group of officials from the U.S., Canada, and Mexico has been meeting for three years on this issue. The U.S. hosted the first meeting in 1998 and is scheduled to host the meeting this year. The Tri-country group is comprised of technically trained individuals who know the day-in and day-out workings of the programs of their agencies. The group has been successful in harmonizing import policies and each member has implemented the last two import bans issued by the USDA.

An interagency working group on BSE started in 1996 is comprised of representatives from USDA's APHIS, FSIS, Agricultural Research Service, or ARS, FDA, NIH, CDC, and DOD. This group shares information, evaluates ideas and issues, and makes recommendations to participating agencies. Although import issues have long been addressed in the interagency working group and agencies have coordinated actions on import issues, to further strengthen coordination of import issues, an import subgroup to the interagency workgroup was formed to investigate and make recommendations relating to import issues. On January 17, 2001, FDA attended the initial meeting of the import subgroup, which consists of representatives from APHIS, FDA and Customs, to enhance joint procedures to prevent the importation of BSE material into the U.S.

FDA reviews entries of FDA-regulated products that consist of, or may contain, BSE risk products of animal origin and works with APHIS to ensure that such products do not enter the U.S. FDA is continuing to review its own admissibility requirements for FDA-regulated products that could pose a BSE-related risk.

FDA coordinates activities among Customs, USDA, APHIS and FDA, and is leading the efforts for developing procedures for multi-agency operations. FDA has provided FDA-product codes used in OASIS entry screening, to APHIS for their review, and has facilitated APHIS review of Customs HTS codes, used in Customs entry screening, which resulted in Customs issuing a directive to Customs field personnel on January 4, 2000, identifying specific HTS codes for products subject to the APHIS prohibition.

FDA, APHIS, and Customs have coordinated their response to the potential importation of BSE-related products. After APHIS issued their prohibition on the importation of BSE materials on December 7, 2000, FDA issued Import Bulletin 71B-02 requesting that FDA's field offices notify their local APHIS offices of any import suspected of containing BSE material. FDA issued a new Import alert on January 20, 2001, and a new Import Bulletin on March 1, 2001. These new import documents provide a detailed system for identifying at the ports products about which FDA has potential BSE concerns.

In addition, FDA has conducted two conference calls open to all 50 States including State veterinary and agricultural agencies in January and April to discuss the BSE issue. Both FDA and USDA participated in the call. FDA has met with the National Association of State Departments of Agriculture and American Association of Feed Control Officials to discuss the FDA regulation on prohibited materials and BSE, other Transmissible Spongiform Encephalopathies, and Foot and Mouth Disease. The FDA is also conducting two seminars on feed contamination issues including BSE during the week of May 1st in Texas and May 14th in Minnesota. Over 100 feed control officials from all 50 States attended.

It is important to note the FDA, as well as Customs and APHIS, are dependent upon the import community, which includes brokers, importers, and shippers, for the entry and manifest data with which to identify products consisting of, or containing, materials of concern from BSE and BSE-high-risk countries. A weakness in the system is that products which are not declared correctly or are described by importers or brokers so as to hide their animal origin or country of origin may not be detected though FDA import screening. Furthermore, the sheer volume of imported FDA-regulated products precludes the Agency from physically examining every entry into the U.S.

FDA will continue to aggressively enforce its regulations and work closely with those in the cattle and feed industries to minimize the risk of BSE introduction or spread in U.S. cattle herds. FDA will develop new guidance and regulations as the scientific knowledge about BSE expands. Working together with many counterpart agencies in the United States and around the world and with various industry and consumer groups, FDA will continue to protect the health of Americans and American cattle herds.

[The information follows]

Participates of the Senior Executive Interagency Steering Committee

The Department of Health and Human Service's Assistant Secretary for Science Policy; FDA; Centers for Disease Control and Prevention; National Institutes of Health, NIH; USDA's Animal Plant Health Inspection Service, APHIS; Foreign Agricultural Service; Food Safety and Inspection Service, FSIS; White House Office of Science and Technology Policy; U.S. Trade Representative; U.S. Customs; Department of State; Department of Defense; National Association of States Departments of Agriculture; National Association of Chief Livestock Health Officials; and Association of American Feed Control Officials.

LATEX ALLERGY

Question. It has been brought to my attention that as many as 18 million Americans suffer from a latex allergy, and workers in environments where latex gloves are commonly used are at a higher risk for developing a latex allergy. It has also been brought to my attention that latex proteins may be transferred onto food products when food handlers wear latex gloves.

Does the use of disposable latex gloves in food preparation and handling violate Section 402(a)(1) of the FDA Food Regulations? Please explain your conclusion?

Answer. Natural rubber latex (NRL) is approved for use in food contact situations. Therefore, the use of NRL gloves does not presently cause a food to be adulterated under section 402(a)(1). Nevertheless, we are concerned with reports from latex-sensitive individuals reporting adverse physical reactions from consuming food that has been in contact with gloves made from NRL. FDA is collecting additional information on this and is actively reviewing its policy on the use of disposable NRL gloves in food operations. In the meantime, FDA has advised the food industry to consider this information when deciding whether to use NRL gloves in food preparation.

As background, the Food and Drug Administration has jurisdiction over the use of NRL in food contact situations under the food additive provisions in section 409 of the Federal Food, Drug, and Cosmetic Act, FFDCA. Under section 201(s) of the FFDCA, components of food-contact articles are considered food additives if they migrate or are reasonably expected to migrate to food as a result of their intended use. The use of a food additive, like NRL in the production of food service gloves, must be determined to be safe by the FDA before it may be used in food, or become a part of food from processing, packaging, transporting or holding the food.

The food additive regulations describing the conditions under which NRL may be safely used, are found in 21 CFR 177.2600 Rubber articles intended for repeated use. This regulation, listing "natural rubber," was promulgated on February 1, 1963 in accordance with section 409 of the Federal Food, Drug and Cosmetic Act, FFDCA. It has been FDA's position over the years that, provided the compositional requirements of the regulation are met, the use of natural rubber as a component of food service gloves is in conformity with 21 CFR 177.2600, and is not an unsafe food additive. Nevertheless, as we evaluate the reports of adverse reactions from latex-sensitive individuals as noted above, we will also consider the relevance of that information to the safe use of the food additive.

Question. What steps has the FDA Center for Devices and Radiological Health taken to determine that the proposed maximum levels for medical glove powder and extractable latex proteins retained in medical gloves are safe for patients and workers?

Answer. The recommended limits of extractable protein and glove powder set forth in FDA proposed rule are not intended to be viewed as safe levels for all individuals in all circumstances. Rather, the recommended limits were meant to provide a way to indicate the level of protein and powder, allowing the consumer to make informed decisions. These recommended limits reflected the premise that lower protein and lower powder levels would reduce adverse health effects and state-of-technology considerations affecting glove properties, such as shelf life and strength, market availability, and cost.

We know of no way, with current scientific knowledge, to determine a protein threshold level that would be safe for all users and would not trigger any allergic reactions. Based on known mechanisms of allergy induction, allergy development is recognized as a gradual process and the response is considered dose-dependent. A large body of published literature demonstrates a correlation of the duration and intensity of exposure to natural rubber latex, NRL and the prevalence of NRL sensitivity. We have concluded that scientific knowledge does adequately show reduced exposure to NRL allergens would benefit users, minimizing the risk of sensitization and allergic reactions in sensitized individuals.

Cornstarch, which meets the specification for absorbable dusting powder in the United States Pharmacopoeia, is probably the most common lubricant for medical gloves. Cornstarch alone is not known to be a common allergen. However, cornstarch can adsorb some soluble proteins during the processing of gloves. The amount of protein binding has been shown to decrease with decreasing quantities of soluble protein and powder present. For this reason, FDA is encouraging glove manufacturers to reduce the amount of protein and powder remaining on medical gloves.

FDA also recognizes that glove powder is composed of particles that may cause foreign body reactions. Published studies and case reports identify adhesion and granuloma formation as a recognized complication associated with the introduction of glove powders into body cavities and suggest that clinically significant complications may not be rare. For this reason, FDA is encouraging glove manufacturers to reduce the amount of powder remaining on medical gloves.

We are now preparing a final regulation, which will reflect our response to comments received on the proposed rule, and our review of recently-adopted standards, such as ASTM D-3577, Standard Specification for Rubber Surgical Gloves, and ASTM D-3578, Standard Specification for Rubber Examination Gloves.

Question. Please provide me with an update on all activities taken by FDA to study safety issues associated with latex, including disposable latex glove use in food handling and preparation and the medical field.

Answer. FDA's Center for Food Safety and Applied Nutrition, CFSAN, is actively reviewing its policy on the use of disposable NRL gloves in food operations. CFSAN has received anecdotal information from latex-sensitive individuals reporting adverse physical reactions after consuming food that may have been in contact with NRL gloves. CFSAN has acted on this public health concern and added a caution in the model guidelines for retail food service operations—the 1999 Food Code—that says "This information should be taken into consideration when deciding whether single-use gloves made of latex will be used during food preparation."

“Healthy People 2010,” the Surgeon General’s national initiative that outlines a comprehensive nationwide health promotion and disease prevention agenda, has also addressed this concern. FDA led the development of the food safety objectives for the initiative, and specifically mentioned allergy risks associated with food, including the use of latex gloves.

To gain additional information regarding allergic reactions possibly due to the ingestion of food contaminated by NRL protein in retail settings, CFSAN has been collecting reports of such reactions from consumers who have contacted the Agency. CFSAN has contacted one of the latex allergy consumer interest groups, Latex Allergy Support Team and Information Coalition, Inc., to obtain its recommendations. CFSAN has also contacted Health Canada and the European Union to learn how they are dealing with NRL glove use in food operations. We are continuing to review research data.

Regarding the use of NRL gloves as medical devices, the Agency has conducted its own research; alerted the medical community; collaborated with manufacturers and private standards groups in lowering the level of latex proteins in medical device products; published a final rule requiring labeling of medical devices containing latex; and published a proposed rule reclassifying surgeon’s and patient examination gloves. FDA has also encouraged companies to manufacture latex products containing the lowest possible protein levels, and to indicate these lower levels as established by a test developed by the American Society of Testing and Materials. With respect to concerns that FDA might ban powdered natural rubber latex, NRL, surgical and examination gloves, the risks posed by them do not meet the legal standard for banning a medical device. While FDA encourages the development of suitable substitutes, with effective barrier properties for NRL medical gloves, FDA recognizes that NRL affords a combination of qualities difficult to duplicate in a synthetic material. This combination of qualities supports the continued availability and selection of NRL medical gloves by users and purchasers as appropriate for their needs.

A large body of data has been generated through years of NRL glove use demonstrating their performance. With new synthetic materials, the data are limited. The Agency also recognizes that substitutes for NRL possess positive and negative attributes.

FDA is currently participating in a multi-center study, part of which will assess the effects of, various conditions of storage, materials with which gloves may come into contact, and fatigue and abrasion on medical gloves. The results of this study should provide additional information on the performance characteristics of both NRL and synthetic medical gloves.

QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

DRUG IMPORTATION LAW

Question. As you know, Congress last year overwhelmingly passed the Medicine Equity and Drug Safety Act (MEDSA), which would allow United States pharmacists and wholesalers to import FDA-approved medicines from other countries at lower prices and pass the savings along to their customers. Congress also at that time appropriated FDA \$23 million in fiscal year 2001 for beginning to carry out this law.

I understand the Secretary of Health and Human Services has not yet made a decision about implementing this new law. Is that still the case?

Answer. Yes, this is still the case. Before the Secretary of Health and Human Services makes a recommendation to the President about implementing the human drug importation program, he needs to have a complete and thorough analysis of both the health safety and cost-saving components of program. Those analyses are on-going.

Question. Last year, the FDA estimated that the second year (fiscal year 2002) cost of implementing MEDSA to be \$22.5 million. Yet the President’s fiscal year 2002 budget provides only \$2.95 million for MEDSA implementation. Should the HHS Secretary decide to move forward with implementation of MEDSA, would FDA have the resources it needs for an importation program?

Answer. The Secretary expects to advise the Administration on recommendations for addressing MEDSA soon. The nature of this recommendation will dictate the resources involved. Once this decision is made, we will be in a better position to determine the resources involved in a reimportation program.

DRUG IMPORTATION BY DRUG COMPANIES

Question. In 1999, Americans consumed \$13.1 billion in pharmaceutical products imported by drug companies. These prescription drugs and other medicines came from countries ranging from Canada (\$697 million) and the United Kingdom (\$2.2 billion) to China (\$391 million), Japan (\$1.3 billion), and Mexico (\$222 million).

Given that some FDA officials apparently have concerns that these same drugs imported by U.S. pharmacists and wholesalers would be unsafe, would the FDA support changing current law to also prevent pharmaceutical companies from importing medications? Or at the very least, should pharmaceutical companies be required to meet the same stringent record-keeping and testing requirements that U.S. pharmacists and wholesalers would be required to meet under MEDSA?

Answer. Currently, section 801(d)(1) of the Federal Food, Drug, and Cosmetic Act prohibits the importation, by anyone other than the manufacturer, of prescription drugs and insulin manufactured in the United States and exported. Thus, reimportation, other than as stated above, is not legal. Congress enacted this law to protect the public from prescription drugs that may have been improperly stored and handled abroad and to reduce opportunities for importation of counterfeit and unapproved prescription drugs. Some imported medications, even though they bear the name of a U.S. approved product, may, in fact, be counterfeit versions that are unsafe or even completely ineffective. FDA would support the law as enacted by Congress, however, appropriate resources would be required to effectively implement the law.

INSPECTION/TESTING OF IMPORTS

Question. I see that according to the FDA's fiscal year 2002 Budget Overview, the FDA inspects less than 1 percent of all imported products (food, medicine, medical devices, and other products under its jurisdiction) brought into the U.S., and I understand that your sampling and end-point product testing is also minimal.

It is my understanding that the cost estimate provided to the Appropriations Committee last year by the FDA assumes 100 percent review of the documentation for prescription drugs imported under MEDSA and authenticity/counterfeit testing on 10 percent of imported medicines, just to name a few of the assumptions behind the safeguards in MEDSA. It appears that these requirements are more stringent than those for other imported products.

You raised concern in your testimony that the FDA has a "seriously impaired capacity" to conduct inspections and testing on imported products. Given that medicines imported under MEDSA would receive considerably more oversight, couldn't American consumers have more confidence in the safety of products imported under MEDSA than they do in the safety of other products imported under the FDA's oversight?

Answer. The provisions of MEDSA call for safeguards to be in place that coincide with existing regulations, specifically sections 501, 502, and 505 of the FFD&C Act. In addition to these measures, MEDSA calls for pedigree documentation and testing in attempt to ensure the safety and effectiveness of imported pharmaceuticals. These proposed actions are more stringent, in some cases, than current surveillance practices for some FDA products, but the nature of the product is warranted under these circumstances. FDA believes that current Good Manufacturing Practices—GMPs—are the best way to help assure the quality and safety of FDA approved products, and the Agency cannot assure compliance with GMPs under this system. Sampling and testing a pharmaceutical product alone will not provide the assurance that a product is safe and effective. Either way, the Secretary of Health and Human Services has yet to make a final decision as to whether the implementation of MEDSA will "pose no additional risk to the public's health and safety."

VIOLATIONS OF THE PRESCRIPTION DRUG MARKETING ACT

Question. I've been told by the FDA in the past that the Prescription Drug Marketing Act prohibits the re-importation of a prescription drug or insulin that was manufactured in the United States except by the manufacturer. It has come to my attention that a number of foreign-based organizations have begun targeting U.S. medical professionals (doctors, pharmacists, etc.) to have them purchase prescription medicines from Canada on their patients' behalf. See attachments

Does this kind of effort violate the Prescription Drug Marketing Act? If yes, what steps is the FDA taking to stop this practice? If not, how is this practice different than what would be allowed under the Medicine Equity and Drug Safety Act (other than the fact that there are none of the safeguards that MEDSA contains)? How

can the FDA allow this practice to continue and at the same time maintain that importation of prescription drugs by pharmacists under MEDSA would be unsafe?

Answer. This is a very complex legal question. If the prescription drugs or the insulin are manufactured overseas, and covered by an approved NDA, importation into the U.S. would not violate PDMA. Such importation may, however, violate other provisions of the Food, Drug and Cosmetic Act, FD&C. Only drugs manufactured in the U.S., exported, and then offered for reimportation are prohibited from entry in the U.S. except in the case of a medical emergency and with the permission of the FDA.

MEDSA would have permitted the entry of U.S. manufactured prescription drugs back into the U.S. provided the drugs were approved for marketing in the U.S., in addition to other testing and documentation requirements. If the drugs are manufactured domestically and shipped to Canada, it would be a violation for anyone, doctor or patient, to reimport these drugs, absent implementation of MEDSA. Furthermore, in most cases, drugs under this scenario would not meet all of the prongs of the personal importation policy, such as no foreign versions of FDA approved drugs.

The targeting of U.S. physicians to purchase Rx drugs from Canada for use by the physicians' patients would be prohibited by 801(d) of the FD&C Act if the drugs are of U.S. origin and there is no documented medical emergency or if they are unapproved drugs being imported into the U.S.

GLOBAL TRADE/HARMONIZATION

Question. I was pleased to read in your testimony about the progress that the FDA has made towards harmonizing drug safety regulations, which will help to facilitate global trade.

While I'm glad that FDA is working towards harmonization that will ultimately make the global market work better for drug companies and make the FDA's regulatory job easier, how would harmonization ultimately benefit consumers if they continue to be denied access to lower priced pharmaceuticals from other countries?

Answer. Global harmonization of regulatory requirements should make drug development more efficient for drug companies, resulting in more drugs available, faster approvals, and possibly lower costs for United States consumers. However, harmonization does not directly address the reasons for differences in drug prices in different countries.

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

GENE THERAPY INDIVIDUAL TRACKING SYSTEM

Question. FDA after 7 years has not yet complied with Congress' direction to set up an individual gene therapy tracking system, can the agency explain this delay?

Answer. No existing system satisfied the requirements of the gene therapy database. Therefore, a new system must be developed. Since FDA shares with NIH, through the Office of Biotechnology Activities, OBA, the responsibility for oversight and safety of gene transfer research, FDA has been working closely with NIH to develop and implement a common database. This collaboration will result in a system that meets the needs of both NIH and FDA. Development of a new system is complex, and system development coordination between two agencies lengthens the development process. A joint system will save resources. Also, Secretary Thompson is committed to coordinating information technology throughout HHS to gain efficiencies and avoid redundancy.

Question. When is FDA planning on modifying their proposal so that it meets the congressional intent of tracking patients rather than merely being an adverse events monitoring system?

Answer. The gene therapy database will support collection of data on gene therapy product that can be analyzed for safety trends. Consideration of the appropriate information to be collected in long-term follow-up and how to facilitate collection of this information, is still underway. FDA sought the guidance of the Biological Response Modifiers Advisory Committee, BRMAC, on these issues in November 2000, and will seek further guidance on the revised proposal for long-term follow-up with the BRMAC. Data collection and submission will be the responsibility of sponsors of gene therapy trials who have applications with the FDA, and of investigators and institutions that the NIH oversees through the NIH Guidelines. Guidance is being developed to facilitate submission of data in an appropriate format and it is anticipated that investigators at the clinical site will be able to enter data directly into the database.

Question. Given the death of Jesse Gelsinger and the myriad of problems that have been found with gene therapy trials, shouldn't this be getting priority treatment from FDA and shouldn't the agency be meeting the congressionally mandated time-frames?

Answer. FDA does take very seriously our regulation of gene therapy clinical trials, as well as all clinical trials. The events associated with the death of Jesse Gelsinger did receive priority treatment within FDA. We believe we already do have a sound regulatory system in place for monitoring gene therapy clinical trials and clinical trials for other regulated products. Substantial progress has already been made on the development of a database and plans are proceeding under the direction of a steering committee involving both agencies, including individuals experienced with the Adverse Event Expedited Reporting System, AdeERS, and the National Xenotransplantation Database, NXD efforts.

Question. When can the committee expect that FDA will actually provide us with a full budget and detailed implementation plan for the gene therapy individual patient tracking system?

Answer. A preliminary report was submitted on March 31, 2001. An amended report, including a cost estimate and development schedule is currently under review within the Administration and is expected to be submitted shortly.

REUSE OF MEDICAL DEVICES PICKED OUT OF MEDICAL TRASH CANS

Question. I understand that most single use devices reprocessors set up bins in operating/procedure rooms for collection of contaminated devices. Hospital personnel then place certain used devices in these bins for reprocessing. However, I have recently heard, that at least one reprocessor has rented space in a medical waste facility where reprocessor employees open used sharps containers and waste bins to sort for devices to reprocess.

Is FDA aware of this practice? Does the agency think it is acceptable that anyone would be digging through medical waste to pick out medical equipment for recycling?

Answer. FDA is not aware of any commercial reprocessor, that is a third party reprocessor, currently renting space in a medical waste facility where employees open used sharps containers and waste bins to sort for devices to reprocess. We are, however, aware that in 1999, Alliance Medical Corporation, a commercial reprocessor, maintained a decontamination station in Apopka, Florida, where employees opened sharps containers to collect devices for reprocessing and reuse. These devices were sorted and cleaned at the Apopka facility and then were sent to Alliance's Phoenix, AZ facility for further processing.

When we learned of the activity occurring at Apopka, we immediately inspected the facility on November 17–19, 1999. Apparently, Alliance leased a room within the facilities of Stericycle/BFI Waste Systems where sharps containers were collected from local hospitals. The investigator determined that two Alliance personnel were assigned to sort and clean medical devices collected in disposable sharps containers. While performing these tasks, the employees were required to wear protective clothing, including surgical masks, safety goggles, latex gloves, heavy-duty gloves, gowns, foot covers, and hair covers. The devices were placed into two piles—one pile for devices found to be acceptable for reprocessing by Alliance and the second pile for devices unacceptable for reprocessing. The devices in the acceptable pile were cleaned and shipped to Alliance's Phoenix site for further processing. Devices in the unacceptable pile and the emptied disposable sharps containers were given to Stericycle/BFI to destroy by incineration.

At the conclusion of the inspection, FDA issued a list of Inspectional Observations that noted seven serious violations. As a result of the inspection, FDA issued a Warning Letter, dated December 23, 1999 to Alliance Medical. In a follow up inspection of the facility, on January 27, 2000, we determined that the objectionable conditions were corrected, however, Alliance Medical closed their Apopka facility last year.

Question. If not, what is the agency doing to stop this activity?

Answer. When we learned of the activity, like the one which occurred at Apopka, we immediately inspected the facility and issued a list of Inspectional Observations that noted seven serious violations. Further, as a result of the inspection, FDA issued a Warning Letter citing these violations. A followup inspection was then conducted to see if the objectionable conditions were corrected.

THE DANGERS OF CONTAMINATED BIOPSY FORCEPS

Question. FDA has previously described single use biopsy forceps as a device that is "high risk to reprocess." Nonetheless, reprocessed biopsy forceps have not been

required to demonstrate that they are indeed safe and clean after reprocessing. Recognizing the potential harm from unclean forceps, FDA stated that it would consider regulation of such devices on a case-by-case basis. Over seven months ago, a citizen petition was filed requesting that FDA better regulate reprocessed biopsy forceps.

Has FDA responded to this petition?

Answer. FDA is currently considering, and has not yet responded to, the citizen petition requesting a change in the exemption status for non-electric biopsy forceps.

Question. Will FDA require premarket submissions to show the safety of reprocessed single use biopsy forceps?

Answer. FDA is currently considering the citizen petition addressing this issue, and has not yet decided how this issue should be resolved. We will be pleased to provide an update on this matter once we have responded to the petition.

SCIENCE USED TO REVIEW THE SAFETY OF REUSED MEDICAL DEVICES

Question. The medical device trade press reported that one single use device reprocessor submitted an application for approval for a reprocessed Class III device which relied on 13 year old medical literature for its clinical studies.

Is this type of literature typically considered acceptable for original device premarket approvals?

Answer. Premarket approval, or PMA, applications must contain valid scientific evidence that supports the safety and effectiveness of the device. Valid scientific evidence includes scientific literature applicable to the device under review. FDA has received PMAs that contain literature as the primary valid scientific evidence to demonstrate reasonable assurance of the safety and effectiveness of the device. However, for most PMAs, prospective clinical information is necessary to determine the safety and effectiveness of devices and we expect that PMAs for reprocessed devices to meet the same data requirement as the original devices.

Question. Will it be considered acceptable for reprocessed device premarket approvals?

Answer. PMAs for reprocessed devices are subject to the same data requirements as the original devices. The specific data requirements will vary, depending on the device and the risks it presents.

TESTING FOR CJD

Question. Several news articles have reported deaths from CJD that may be tied to contaminated surgical instruments. One such article was from March last year, reporting out of Denver, Colorado. Another was in October last year in New Orleans.

What is the FDA doing to ensure that all reused medical devices are sterilized in a manner that would eliminate potential CJD contamination?

Answer. At this time, there is no scientific consensus that there is a proven method to decontaminate and sterilize medical devices and absolutely ensure total elimination of the CJD prion under all circumstances. The best available evidence at this time indicates CJD prions on medical devices can be inactivated if rigorous procedures are followed. The World Health Organization, or WHO, recommends, for example, that the device be immersed in sodium hydroxide and heated in a gravity displacement autoclave at 121 °C for 30 minutes; cleaned; rinsed in water, and subjected to routine sterilization. Not all devices can withstand this treatment.

FDA shares Senator's concern regarding potential exposure of patients to Creutzfeldt-Jakob disease, or CJD, as a result of inadequate or improper decontamination and sterilization of medical devices. However, we wish to emphasize that our concern is not limited to the reuse of single use devices but also extends to reusable, multiple use, medical devices. We are most concerned about medical devices that are used on known or suspected CJD patients that come in contact with high infectivity tissues such as brain, spinal cord, and eyes. It appears that the highest risk medical devices are surgical instruments used in neurosurgery and in ophthalmology procedures.

FDA has convened a work group to identify medical devices that are high risk for transmission of the CJD prion and to evaluate the adequacy of existing CJD guidelines for decontaminating and sterilizing medical devices. The work group includes representatives from other FDA centers as well as from the Centers for Disease Control and Prevention. The work group has identified infection control guidelines for handling CJD contaminated devices published by the WHO, draft guidelines published by Canada's Laboratory Center for Disease Control, and other guidance published by various professional associations. While there are many similar recommendations in these guidelines, there also are some conflicting recommendations. The majority of the CJD guidelines recommend disposing any CJD contami-

nated medical device whose materials or other characteristics prevent it from undergoing the above procedure.

One of the most critical factors in preventing CJD transmission among patients is the hospital's access to, and proper use of, appropriate autoclaving equipment.

Question. Does the agency have confidence in the ability of reproprocessors to eliminate prions through such sterilization?

Answer. FDA is reasonably confident that any commercial reproprocessor who passes FDA's good manufacturing practice inspection should be able to follow the World Health Organization recommendations for decontaminating devices, or similar guidelines. This does not necessarily ensure that all prions will be eliminated, because at this time, there is no scientific consensus that there is a proven method to decontaminate and sterilize medical devices and absolutely ensure total elimination of the CJD prion under all circumstances.

STANDARDS FOR DEMONSTRATING SAFETY AND EFFICACY OF REUSED DEVICES

Question. The general principle behind this requirement was that a reused device should meet the same standards that a new device is required to meet. The public expects that all medical devices that they may be subjected to would meet the same high FDA standard for safety and efficacy.

I have recently been troubled by reports that the FDA may not require reproprocessor's PMAs to be of the same high standard as innovators' PMAs. The trade press has been suggesting that FDA may allow reproprocessors to submit one application for a wide variety of devices within a certain category. As the agency, I am sure is aware, small changes in a device may alter its properties including its ability to be safely cleaned substantially.

Will the FDA require a PMA for each different model of reprocessed device?

Answer. FDA will consider each type of reprocessed device on an individual basis. Some models of devices are so similar that these can be combined in a single PMA. Only closely related variations of the same type of device should be grouped in one submission or application. FDA advises reproprocessors to examine device groupings that original equipment manufacturer's have developed in previous submissions as models that may be useful in considering the groupings of reprocessed single use devices. In these situations, data and information in the submission or application must support the safety and effectiveness of the entire group of devices in a PMA submission.

Question. Will the standards be identical to those required for OEMs?

Answer. Yes, the scientific standards for approval or clearance of a reprocessed single-use device will be the same as those for an Original Equipment Manufacturer, OEM. Any person who engages in activities triggering the Act's premarket requirements must comply with all applicable provisions of the Act. When a reproprocessor, whether a third party or a hospital engages in reprocessing of a single-use device, it is responsible for submitting premarket submissions and proposed labeling, if applicable, to the FDA. FDA will review these submissions on the same basis, and using the same criteria, that would apply if the reproprocessor were an OEM.

ORPHAN DRUGS

Question. This grants program is really the only hope for those Americans who suffer from one of the many rare diseases. Many of these diseases are fatal.

With the completion of the genome project, it must be expected that the Orphan drug program will receive a lot of new applications. Since by definition these diseases are rare, they are unlikely to have a lot of corporate sponsorship and therefore, the orphan drug product grants are very important to encourage development of cures for rare diseases.

Given the expectation of increased numbers of applications, has the FDA increased the level of funding in their budget request over and above last year's \$12.54 million.

Answer. The funding level of the Orphan Grants Program increased in 2001 by \$1 million for a total of \$12.5 million. In fiscal year 2001, the Agency will award \$12,514,000 for orphan product grants. No additional increases are planned in fiscal year 2002.

Currently, the orphan drug product grant money is only available to researchers after they have received approval for their investigational new drug. This can act as a barrier to some researchers because they do not have funding for the research necessary for the initial submission.

Question. Would FDA support legislative changes that would allow grant money to also be used to develop the new IND?

Answer. Under the orphan products grant program, funding is presently limited to human clinical studies under a valid Investigation New Drug exemption. This has served and continues to serve a critical need in orphan product development. Appropriations for this FDA program are limited and not all meritorious applications can be funded. We do not believe that broadening eligibility for these funds to drugs that are not yet being investigated under a valid IND is appropriate at this time.

GENERIC DRUGS

The Drug Price Competition and Patent Term Restoration Act of 1984, commonly known as Hatch-Waxman lay the ground work for encouraging the availability of lower-cost generic drugs. One of its provisions encouraged would be generic manufacturers to challenge the validity, enforceability or infringement of a patent on a drug by providing the generic challenger 180-days of marketing exclusivity. This provision has been gutted by an agency interpretation of the “pediatric exclusivity” provisions of the Food and Drug Administration Modernization Act of 1997 (FDAMA), which allows for the generic’s exclusivity to run concurrently with an innovator’s pediatric exclusivity rather than consecutively. The 1984 law at 21 U.S.C. 355(j)(5)(b)(iv) reads, “if the application contains a certification described in subclause (IV) of paragraph 2(A)(viii) and is for a drug for which a previous application has been submitted under this subsection concerning such a certification, the application shall be made effective not earlier than one hundred eighty days after—

—The date the Secretary receives notice from the applicant under the previous application of the first commercial marketing of the drug under the previous application

—The date of a decision of a court in an action described in clause (iii) holding the patent which is subject of the certification invalid or not infringed”.

Question. Given the use of the words “not earlier than” above, would not a reasonable interpretation be that the agency has discretion to allow for the 180 days to start later i.e., after the pediatric exclusivity has expired?

Answer. To date, FDA has not encountered a situation where pediatric exclusivity and 180-day generic exclusivity have actually overlapped. FDA has, however, received numerous comments from members of Congress, industry, and the general public, opining on the proper interpretation of the intersection of these two provisions should such a situation arise. In response to the widespread public interest in this subject, FDA opened a public docket to receive comments on the intersection of pediatric exclusivity and 180 day exclusivity and more particularly on the question of whether the two provisions should run concurrently or consecutively. When the docket closes, FDA will consider the letters, comments, statute, legislative history, and relevant court cases to develop an agency position on this complex question of statutory interpretation.

TISSUE SAFETY

Question. How much have you set aside in this budget request for the implementation of the new tissue rules?

Answer. In fiscal year 2002, FDA estimates the Agency will dedicate \$4.35 million to the regulation of human tissue. The funds include costs associated with field inspections, medical device and biologics’ expenditures, and systems costs. The majority of this money will be used to implement the new tissue rules. This is part of the President’s fiscal year 2002 budget request for FDA.

FDA published three proposed rules to implement the proposed approach that included requirements for establishment registration and product listing; donor suitability determination; and good tissue practices. FDA issued the final rule for establishment registration and product listing on January 19, 2001. Under the final rule, establishments involving conventional tissues, such as bone, sin and corneas were required to register and list their products by May 4, 2001, and new establishments must register and list within 5 days after beginning operations. Establishments that manufacture non-conventional tissue, such as hematopoietic stem cells, are required to register and list beginning January 19, 2003. The proposed rules for the donor suitability determination and good tissue practice have not been finalized.

Question. I sent a letter asking for this budget information in January, when do you think FDA is likely to respond?

Answer. The Agency’s response to your letter of January 9, 2001 to Dr. Henney requesting information on the cost to the FDA of fully implementing regulations regarding human cellular and tissue-based products will be forwarded soon. We apologize for the delay in responding.

It has come to my attention, that one tissue processing company is engaged in the practice of pooling multiple samples of tissue from multiple donors. This may

be extremely hazardous and could transmit disease to a large number of individuals. The tissue processing company, RTI received a waiver from New York to continue this practice.

Question. Does the FDA agree that it would be very unwise to allow any waivers to tissue processors to allow them to pool samples from many different individuals? I hope that FDA can firmly commit to avoiding such an approach.

Answer. FDA has concerns about the practice of pooling tissues from multiple donors during processing. In general, FDA believes that the risks associated with pooling tissues from multiple donors appear to far outweigh any identified medical benefits. Risks include exposure and possible cross-contamination from one tissue to another tissue of such infectious disease agents as viruses, enveloped and non-enveloped, bacteria, fungi, and prions, including known and emerging infectious agents. This could result in exposure of many more recipients than would occur from a single contaminated donation. Additionally, pool processing of tissues would make it difficult or impossible to investigate a problem with donated tissues based on an adverse reaction in a recipient because the investigation would need to deal with a large number of donations and a large number of other recipients. Due to these considerations, FDA's January 8, 2001, proposed rule Current Good Tissue Practice for Manufacturing of Human Cellular Tissue-Based Products; Inspection and Enforcement, provides that human cells and tissue shall not be pooled, that is, placed in physical contact or mixed in a single receptacle, during manufacturing. However, the proposed rule would permit an establishment to request an exemption or alternative from any donor suitability or good tissue practice requirement. FDA's Director of the Center for Biologics, Evaluation and Research, CBER, would have the discretion to grant an exemption or alternative based on a finding that such action is consistent with the goals of preventing the introduction, transmission, and spread of communicable disease and that scientific supporting documentation justifies the exemption and the proposed alternative satisfies the purpose of the requirement. FDA currently is reviewing comments to this proposed rule.

LATEX ALLERGIES

Question. Latex allergies have been on the increase over the past few years. Deaths associated with latex allergies have been reported to FDA.

It has recently been found that when food handlers use latex gloves and in particular powdered gloves that some of the latex proteins can contaminate the food. This is very problematic for someone who is highly allergic to latex.

Arizona is the first State to modify their food code to prohibit the use of latex gloves by food handlers. The State did an economic analysis of the alternatives to latex gloves including vinyl gloves and found that restaurants and other establishments would not have their expenses increased by moving to vinyl rather than latex gloves. Rhode Island and Michigan are now considering following Arizona's lead.

Is FDA aware of the increasing problem of latex allergies and the problems suffered by those who are exposed to latex due to food handlers wearing latex gloves?

Answer. Yes, FDA is aware that NRL gloves have been reported to cause allergic reactions in some individuals who wear latex gloves during food preparation and even in individuals eating food prepared by food employees wearing latex gloves. In the latter group, three reports suggest a severe reaction. FDA has received newspaper and journal articles, anecdotes from latex-sensitive people, government pamphlets, and other information on the emerging health problem of latex allergies. We are aware of experimental and clinical data that demonstrate: natural latex proteins can be allergenic; natural latex proteins bind to cornstarch; and, aerosolized powder from NRL gloves is allergenic and can cause respiratory allergic reactions. Published studies indicate that airborne glove powder may be an agent for sensitizing non-allergic individuals. In general, prolonged, chronic exposure is required to become sensitized to NRL, although genetic predisposition plays a role. One literature report concludes that NRL proteins may be rapidly transferred to objects by contact with powdered latex gloves.

The occurrence of allergic reactions to latex proteins through prolonged and repeated exposure to the skin, and through repeated inhalation, is well documented. While the majority of published reports in the peer-reviewed medical literature describe allergic reactions to NRL, the Agency is aware of three published reports that describe serious allergic reactions in persons following the consumption of food allegedly contaminated with NRL protein. We are currently gathering and evaluating reports of allergic reactions to food that has been in contact with latex products and plan to report the status of that investigation at the 2002 Conference for Food Protection.

Question. Is FDA aware that Arizona has now banned the use of latex gloves by food handlers?

Answer. Yes. A press release from Arizona announcing the approval of its new food safety requirements was issued on April 23, 2001. The new rules will become effective on October 3, 2001 and are the first update in 25 years to the Arizona requirements for food safety in restaurants and other food establishments. The new rules are a result of a three-year collaborative effort between government agencies, including FDA, food service industry representatives, school districts, and other concerned parties.

The new Arizona food service regulation requires people in food establishments handling foods that are ready-to-eat without additional cooking must use utensils or non-latex gloves when touching the food to prevent contamination.

Question. What is FDA doing to solve this problem nationwide?

Answer. FDA has acted on the public health concerns regarding the use of latex gloves by alerting the food service industry through Food Code activities, of the potential for serious adverse reactions in latex-sensitive individuals. As background, FDA has provided for over 50 years assistance to local, State, tribal, and federal jurisdictions that directly regulate food establishments at the retail level. One of the important ways the FDA, along with the Food Safety Inspection Service and the Centers for Disease Control and Prevention, performs that function is through the development of the Food Code. The Food Code consists of model requirements for safeguarding public health and ensuring food is unadulterated and honestly presented when offered to the consumer.

Regarding activities taken by FDA to study safety issues associated with latex, including disposable latex glove use in food handling and preparation, FDA's Center for Food Safety and Applied Nutrition, CFSAN, is actively reviewing its policy on the use of disposable NRL gloves in food operations. A thorough examination of the use of disposable natural rubber latex gloves will be conducted as a part of this review.

"Healthy People 2010," the Surgeon General's national initiative that outlines a comprehensive nationwide health promotion and disease prevention agenda, has also addressed this concern. FDA led the development of the food safety objectives for the initiative, and specifically mentioned allergy risks associated with food, including the use of latex gloves.

In April 2000, safety concerns of the use of latex gloves was an agenda item at the Conference for Food Protection, CFP. The Conference holds a biennial meeting of Federal, State, industry, consumer, and academia representatives who strive to assure the adoption of science-based criteria for the preparation, service, or sale of safe food at the retail level.

A request was brought forth to the 2000 Conference to ban the use of latex gloves in retail food facilities. CFSAN representatives suggested that food facilities consider supplying gloves made of alternative materials for use by their food workers to protect food workers themselves from possible latex sensitivity, and to prevent the possible transmission of latex proteins via food to latex-sensitive consumers. The CFP final recommendation was for FDA to find out more information on the use of latex gloves in the retail food setting and report back to the Conference at its 2002 meeting. The FDA plans to report the status of its policy review at that meeting.

Question. Does FDA have the authority to ban the use of latex gloves by food processors and food handlers including those in restaurants?

Answer. Natural rubber latex (NRL) is an approved food additive under 21 CFR 177.2600 Rubber articles intended for repeat use. As such, NRL may be used in the manufacture of gloves used by food processors and food handlers, including those in restaurants. If FDA had a basis for concluding that the natural rubber latex in the gloves was not a safe food additive, it could propose the issuance of a regulation amending or repealing the regulation, in whole or in part. If FDA repealed the food additive regulation related to the use of NRL in the manufacture of gloves used by food processors and food handlers under section 409 of the Federal Food Drug and Cosmetic Act (21 U.S.C. 348), the use of NRL for such purpose would be deemed to be unsafe, and thus, unlawful under the Act.

The agency is examining available information on potential risks of allergic responses to NRL from use in latex gloves worn by food service workers. To date the agency does not have sufficient evidence to propose to repeal the regulation in 21 CFR 177.2600 as to such use nor has anyone petitioned the agency to take such action. The agency has added a caution in the model guidelines for retail food service operations—the 1999 Food Code.

GENETICALLY MODIFIED ORGANISMS

Question. What is FDA doing to go beyond its current regulatory proposal for the regulation of genetically engineered crops to prepare for the arrival of more complex biotech foods? Some examples of these are: genetically engineered salmon; modified farm animals like pigs or cows; or foods engineered to produce drugs, or high dosages of vitamins.

Answer. Biotechnology researchers and companies are turning to animals to be both the manufacturing sites for biotechnology products and the recipients of biotechnology-derived products. Both areas are on the upswing and FDA has been working with a fledgling industry providing up-to-date communications to a concerned public.

Genetically engineered animals contain new animal drugs. Under the Federal Food, Drug and Cosmetic Act, FFDC, a "drug" includes "articles . . . intended to affect the structure or any function of the body of man or other animals". Because an introduced genetic construct will of necessity "affect the structure or . . . function" of a genetically engineered animal, the genetic construct is a "drug." The genetic construct may also produce a protein that is a drug. Use of a new animal drug is considered "unsafe" under the FFDC unless the FDA has approved an application for that particular use. Thus, unlike genetically engineered crops, genetically engineered animals are subject to the new animal drug approval process. This process requires that sponsors demonstrate the safety of the new animal drug to both the animal and, for food-producing animals, to humans who eat the animal.

The use of animals from food-producing species in the production of diagnostic kits and other biomedical products includes a special responsibility to plan for the ultimate disposition of culled animals. If animals are milked or they produce offspring, the planning should address safe disposition of the milk and offspring as well. Even though these animals are food species and are sometimes being grown in a farm-like setting, they may not be suitable for use as human food or to be rendered and processed into an animal feed component.

Ag-Biotech animals and products are coming closer to commercial feasibility and there has been a corresponding need by FDA to identify and to assist developers through the regulatory process. The public is becoming increasingly aware of these products as well, and FDA has given large numbers of presentations to scientific and industry associations and the press in the past year. Perhaps the best known example of a developing ag-biotech product is the growth hormone-enhanced Atlantic salmon, currently under review at FDA. There is similar research ongoing in other fish species, invertebrates, chickens, pigs, goats, and cattle worldwide. There are corresponding increases in inquiries at the FDA for investigational applications and increased outreach to researchers who may not be aware of the need to obtain pre-market approval for their genetically engineered animals.

FDA is requiring that the company proposing to market the genetically engineered salmon provide data that its salmon is safe for human consumption, and safe for the environment. FDA is contracting with the National Academy of Sciences/National Research Council to examine risks and risk assessment methods for animal biotechnology products. An expert committee of the National Research Council's Standing Committee on Biotechnology, Food and Fiber Production and the Environment will meet three times and include a public meeting to gather information and then prepare a brief consensus report identifying risk issues concerning products of animal biotechnology. The committee will probably include a review of animal cloning, use of viral vectors in genetically engineered animals, and other pressing scientific issues in animal biotechnology.

Question. Does the agency have resources adequate to the task as these foods begin to approach market?

Answer. The Animal Drugs and Feeds requested increase of \$200,000 in animal biotechnology for fiscal year 2002 will resource the first step in a program as these foods begin to approach market. With funds requested in fiscal year 2002, we will prepare guidances for industry explaining that animal biotechnology products are subject to premarket approval as new animal drugs and describing the information required to show safety and effectiveness for this class of products. In addition, as part of our surveillance efforts, FDA plans to develop an inventory of firms that are developing products derived from bioengineered animals.

As more steps are taken, we will evaluate our need for additional resources. Additional steps needed as product lines begin to develop could include research and the development of guidance on whether various lines of transgenic animals can be safely crossbred and if so, how these crosses will be tracked; detection of unapproved transgenes in imported foods derived from animals, including seafood; evaluation of

and monitoring of the effectiveness of various environmental containment strategies for genetically engineered fish and shellfish, birds, etc., that could become feral and become established in the environment.

Biotechnology products in animals are diverse and currently mostly in the concept phase. The Animal Drugs and Feeds Program is currently spending, and will continue to need to spend, resources working with these entrepreneurs and scientists to address food safety, public health and environmental safety as these new companies and product lines are born.

MAD COW DISEASE/BSE

Question. As you know, I announced last month that I will be introducing legislation soon to strengthen our national defenses against the possible introduction of BSE (mad cow disease). One question that arises in preparing the bill is this:

Given the need for coordination of our programs at the border, at feed mills and farms, and with our surveillance efforts, is there a need to identify a single, lead agency on mad cow issues?

Answer. No, the current comprehensive effort is working well, with FDA continuing to work closely with USDA, State agricultural and other State agencies on implementation of the BSE regulation and on controlling imported products that might introduce BSE into the U.S. The Agency also contracts with the States, who have conducted approximately 80 percent of the inspections under the BSE regulation. FDA worked closely with USDA in developing the import alerts and bulletins issued by FDA, to ensure all animal products that might contain the BSE agent are identified and listed in the alerts and bulletins and are prevented from entering the U.S.

FDA is also a member of domestic and international working groups, and chairs the Senior Executive Interagency Steering Committee. A major goal of these groups is to ensure that imports of products potentially contaminated with BSE do not get into the U.S. The Senior Executive Interagency Steering Committee assures coordination among agencies, especially in three main areas: integrated contingency planning in case BSE or variant Creutzfeldt-Jakob Disease, or vCJD, disease is found in the U.S.; identification of and response to potential vulnerabilities in the U.S. to BSE and vCJD; and coordination of risk communication plans by the various agencies. The following organizations participate in the Senior Executive Interagency Steering Committee: Department of Health and Human Services Assistant Secretary for Science, FDA, CDC, NIH, USDA's APHIS, Foreign Agricultural Service, FSIS, White House Office of Science and Technology Policy, U.S. Trade Representative, U.S. Customs, Department of State, DOD, National Association of States Departments of Agriculture, National Association of Chief Livestock Health Officials, Association of American Feed Control Officials.

An interagency working group on BSE started in 1996 with USDA's APHIS, FSIS and Agricultural Research Service, or ARS, FDA, NIH, CDC, and DOD represented. The purpose of the group is to share information, evaluate ideas and issues, and take suggestions back to participating agencies.

FDA continues to coordinate activities among U.S. Customs, USDA/APHIS and FDA, and is leading the efforts for developing procedures for multi-agency operations. From our experience the level of communication among these groups is excellent. A single, lead agency is not necessary.

Question. And if so, which agency should that be?

Answer. Although we believe a single lead agency is not necessary, if one is to be formed, it should be an agency that already deals with public health matters such as one of the agencies most experienced in these matters in DHHS.

NATIONAL CENTER FOR FOOD SAFETY & TECHNOLOGY

Question. FDA provides scientific and administrative personnel, laboratory and pilot plant equipment, and funding to the National Center for Food Safety and Technology (NCFST) located near Chicago, Illinois. NCFST is a unique research consortium of scientists from academia, FDA, and food related industries. Funds to run the Center are also provided by the Illinois Institute of Technology.

How much of your propose budget is to be designated for NCFST? How does that compare to previous funding levels?

Answer. In fiscal year 2002, FDA plans to expend \$3,000,000 in support of the National Center for Food Safety and Technology's—NCFST—collaborative research activities. This collaborative research effort between government, academia, and private industry studies the food safety implications of emerging technology in food processing, packaging, and biotechnology. The NCFST is a cost effective resource for developing and exploring new technologies. By spreading the cost and risk of doing

research, companies can control their costs while putting themselves on the cutting edge of new technology developments.

NCFST's Internet web-site includes an announcement, "Hire Our Graduates." The Master of Science degree program in food safety and technology or food process engineering educates students to be food safety experts for the private sector and for Federal and State regulatory agencies.

Question. How many of NCFST's graduates are electing public service careers?

Answer. The NCFST Masters Degree programs in Food Safety and Technology and in Food Process Engineering are relatively new. To date there have been two major categories of graduates from the programs: foreign students and part-time students already employed by industry. Most of the foreign students have returned to their native countries where they are putting the food safety training gained in the graduate program to use enhancing technological development in and safety of their countries' food supplies and exports. Part-time students have all been employed while participating in the graduate program; most in the food industry. Thus, NCFST has had no graduates available for placement with either FDA or USDA. They are in the process of stepping up recruitment of new students, particularly students that will feed into the U.S. job market, including FDA.

Question. Are FDA's salaries competitive to attract these highly skilled graduates to the Federal workforce?

Answer. We have no information on salaries earned by students returning to their native countries or by students already employed in the food industry that might be useful in determining salary comparability of the graduates to the Federal workforce.

TOBACCO

Question. I am disturbed by reports that two tobacco companies are preparing to market a new tobacco product that they are calling a cigarette. It is basically candy a mint-flavored tobacco lozenge packed with nicotine. The companies are making health claims about this product-containing it is a reduced-risk alternative to traditional cigarettes.

These are excerpts from a press release on Star Scientific's web site:

ARIVA(TM) also is directed to conventional smokeless product users who want the option of choosing a smokeless tobacco product that contains less cancer-causing toxins (TSNAs) than conventional products, while avoiding the need to expectorate."

"Mr. Perito added that several highly respected independent scientific and public health consultants, as well as members of the company's Scientific Advisory Board, had urged Star to accelerate the development of non-combustible tobacco products so as to provide adult tobacco users smokeless tobacco product choices that significantly reduce exposure to the cancer-causing toxins that are delivered in all conventional cigarette products (TSNAs).

Are you familiar with this product? Will the FDA assert its jurisdiction under the Food, Drug and Cosmetic Act?

Answer. While FDA has limited information about the product ARIVA obtained from news sources and Star Scientific's web site, the agency has asked the company to provide more. A company official has assured FDA that Star Scientific will provide the agency the requested information before the company test markets the product. The official declined to provide the information immediately but indicated that he would do so six to eight weeks before test marketing commences latter this year. The agency will carefully review the information it receives and determine whether it has jurisdiction over this product.

As we all now know, the tobacco industry has repeatedly made claims of reduced risk that later proved to be unfounded, deceptive and, in far too many cases, lethal. "Light" cigarettes that boasted lower levels of tar in cigarette smoke were introduced in the 1960's with claims of less risk to smokers. In fact, the introduction of "lights" did not improve public health and may in fact have resulted in an increase in the incidence of disease.

Today we face an increase in an entire new generation of products that promise to give smokers a safer alternative to quitting or not starting. In light of the IOM report, we know there is inadequate evidence to support these conclusions.

Question. What actions is the FDA taking to protect Americans against new deceptions that could cost even more lives?

Answer. In *Brown and Williamson v. FDA*, the Supreme Court limited FDA's ability to take action regarding tobacco products. As pointed out in the recent IOM report, A Blowing Smoke, a great deal more information is needed to determine the scientific validity of the reduced risk claims that appear on certain products being

introduced to the market. The agency would take appropriate action if we determine that any such products fall under our jurisdiction.

QUESTIONS SUBMITTED BY SENATOR TIM JOHNSON

FDA'S OFFICE OF GENERIC DRUGS

Question. How do you anticipate the Office of Generic Drugs managing the prospect of a significant influx of abbreviated new drug applications, and has the administration requested an increase in resources to meet this demand?

Answer. It is difficult to predict the submission rates for Abbreviated New Drug Applications, ANDA's. Currently, there is no expectation for a substantial increase in submission of ANDA's. However, we continue to streamline our processes to enhance the generic drug review process. We are able to accept more electronic submissions to streamline the review process. The new staff hired in the last fiscal year are now fully trained and are demonstrating high levels of productivity. We continue to examine every aspect of the review process to try to identify problem areas to be addressed. We also plan to revise the current system for amendment designation, major versus minor, to improve total review times. Other changes are also being explored.

Question. Furthermore, does the administration plan on investing in a consumer education program designed to increase the awareness and safety of FDA approved generic drugs?

Answer. In fiscal year 2001 we have embarked on several information campaigns directed at consumers and the pharmacy community. There is a belief among segments of the patient population that generic drugs are not as good as innovator products. In order for consumers to understand how we approve generic drugs, we need to provide more information so they understand the scientific basis behind our decisions. We want consumers to know that we stand behind the generic drugs that we approve and that they are pharmaceutically equivalent to the innovator product.

FDA EFFORTS TO PREVENT BSE OR "MAD COW" DISEASE

Question. First, can you or Dr. Sundlof provide the subcommittee with an update on the compliance rate of U.S. feed mills and renderers w/the FDA feed mixing ban?

Answer. As of May 23, 2001 the out-of-compliance rate is 24 percent for those firms known to be handling prohibited material as of their last inspection. These include renderers, feed mills and protein blenders.

Question. What steps is FDA willing to take if any feed mill or rendering plant does not meet your September 30, 2001 deadline for compliance with the FDA "feed mixing ban?"

Answer. FDA's goal is to inspect 100 percent of renderers, protein blenders and feeds mills and to inspect as many ruminant feeders as possible. We hope to realize 100 percent compliance with the 1997 feed rule. FDA is prepared to initiate enforcement action as appropriate under the Federal Food, Drug and Cosmetic Act, to ensure compliance with the feed rule. Actions will be taken at a level that corresponds to the risk to public health, and may include issuance of warning letters, product seizure, injunctions, or prosecution, in addition to firm-initiated recalls to remove adulterated or misbranded products from the market. The States also may initiate enforcement actions, and FDA will work in cooperating with its State counterparts.

Question. Will the re-programmed funds (\$2.4 M in fiscal year 2001) within FDA's Center for Veterinary Medicine be sufficient to handle the inspections and reinspection?

Answer. In fiscal year 2001, FDA has planned on spending approximately \$3.8 million, but given the recent events related to BSE in Europe, FDA has adjusted its plan. FDA has internally shifted resources from lower priority programs to cover domestic inspections, import entry review, and import label examinations. In fiscal year 2001 FDA also tapped into the Contingency Fund for one-time funds of \$2.4 million to support usual costs of BSE-related activities. These funds covered additional State contracts for domestic inspections, training for FDA employees, and importers, scientific equipment for laboratory analysis, methods development and validation, IT enhancements, market studies to identify food and cosmetic products containing specific risk products, and overtime and travel costs incurred by the field. FDA believes the total fiscal year 2001 spending for BSE activities will be approximately \$14.0 million. We expect this will be sufficient to complete 100 percent inspection of all feed mills, renderers and protein blenders by the end of fiscal year 2001 as well as re-inspection of facilities found non-compliant with the 1997 feed regulation.

The Agency has requested an additional \$15.0 million for fiscal year 2002 for BSE activities. With \$13.100 million requested by the Animal Drugs and Feeds program.

FDA ADVISORY COMMITTEES' "CONFLICT OF INTEREST"

Question. In the testimony you have submitted to the subcommittee, you stated that, "Research expenditures by the pharmaceutical industry alone have tripled since 1990. More and more complex products, which arrive at FDA's gate for pre-clinical and clinical studies design consultation, for marketing application review, and, for post-approval continuing reassessment are products of the growing NIH research budget and of academic and industry research fueled by NIH. We will ensure that FDA will not become a bottleneck in getting these public health breakthroughs to the public while serving as the trusted, independent, efficient gatekeeper it is now." However, in recent years, concerns have been raised about the truly "independent" nature of the activities of FDA Advisory Committees. In fact, the Los Angeles Times did a series of articles on FDA advisory committees and the conflicts-of-interest that are pervasive among members of the committees. The findings included that some FDA advisory committee members are allowed to remain as consultants or researchers for the same companies whose products they are evaluating. In the case of Rezulin (rez-uh-lin), which was pulled from the market last March due to its alleged connection with nearly 400 deaths, it was noted that FDA officials collaborated closely with the makers of the drug, providing "inside information and favors at critical moments throughout the development and marketing of Rezulin." To the agency's credit, FDA released an internal report acknowledging that the agency committed "possible missteps" in its handling of this case.

However, what assurances can you give this subcommittee that your budget request will help FDA address these apparent conflicts of interest in the drug approval process so that we can be assured that the public's trust is not being violated, nor their health jeopardized, by these advisory committees?

Answer. All government advisory committees are regulated by the Federal Advisory Committee Act of 1972. FDA adheres to a comprehensive and detailed program with multiple levels of review to ensure that the agency receives up-to-date, unbiased opinions from its advisory committee members. FDA engages in a vetting process that takes action on every reported financial interest. The majority of conflict of interest waivers are granted for relatively minor financial interests often unrelated to the matter before the committee. Whenever a conflict of interest waiver is granted, it is publicly announced at the beginning of the meeting and becomes part of the official record. In addition, the screening process and the criteria used to determine if a waiver should be granted are documents that can be publicly released. Members with conflicts of interest that exceed the agency guidelines do not participate in the advisory committee meeting.

FDA's conflict of interest program for advisory committee members is subject to review by the Department of Health and Human Services and the United States Office of Government Ethics, OGE. During the most recent audit of our conflict of interest program, OGE reported that not only is FDA's program a sound one that met all requirements, but that it should be regarded as a model for other Federal agencies. Finally, it should be noted that the opinions of the advisory committees are not binding on the agency, and the final decision whether to approve a drug or not lies with FDA.

Question. And, in your opinion, what can FDA do to increase transparency in the drug approval process to ensure that FDA continues to be the independent, efficient gatekeeper that you perceive it to be?

Answer. We believe that FDA has already made progress in increasing the transparency in the drug approval process. The advisory committee procedures for the Center for Drug Evaluation and Research, CDER are designed to facilitate public participation at open advisory committee meetings. For example, unless it is otherwise exempt from disclosure under applicable laws, written information provided to members of an advisory committee in connection with an open advisory committee meeting convened by CDER is made available for public inspection and copying before or at the time of that meeting. CDER currently discloses these documents on the FDA Home Page at the following address: www.fda.gov/ohrms/dockets/ac/acmenu.htm. In addition, we also attempt to publicize on our internet site all relevant information about drug approvals. This may include information directed to the consumer in plain language or directed to health care providers. FDA also continues to invest resources in public information efforts with the goal of providing complete and accurate information to the American public in as timely a manner as possible.

FLU VACCINE

Question. In recent months, I, along with Senator Wyden and several colleagues in the House of Representatives, requested the GAO to conduct a study on the most recent shortage of influenza vaccine during the 2000–2001 flu season. This report is due to be released shortly and I hope that it will provide some insight as to what improvements can be made and what lessons can be learned from the experiences of the past year.

Fortunately, in SD, we were spared a large-scale epidemic but the shortage of influenza vaccine left many high risk individuals without any access to vaccine. In fact, several health care facilities that deal almost entirely with high risk individuals reported to my office of having to pay as much as 3 to 10 times higher prices per dose through secondary distribution channels in order to have any supply at all.

When looking into the challenges of last year, it appears that there was little communication between agencies and jurisdictions, including the FDA, CDC, and State health officials, on what contingencies were in place to deal with a shortage as large as the one experienced last year.

Can you offer any insights as to what role the FDA can and is playing in the development of an action plan to deal with possible future shortages of this and other vaccines, many of which have a tremendous impact on the health outcomes of our nation's most vulnerable populations?

Answer. The demand for influenza vaccines has been increased by the general acceptance that inactivated influenza vaccines are safe and effective, by the recognition that increased risk for complications from influenza infection is related to both age and underlying medical conditions, and by the implementation of federal reimbursement for vaccine for Medicare beneficiaries. The supply of vaccine is dependent upon, among other things, the capacity and interest of pharmaceutical companies to manufacture the vaccines. The supply has increased from approximately 20 million doses per year in the mid 1980's to approximately 80 million doses per year by the late 1990's. Production of the vaccines is unique among vaccine products in that the viruses in the influenza vaccine are changed on a frequent basis and the time for making each year's new vaccine and distributing the vaccine for use is fixed at 6–8 months. Influenza viruses are constantly evolving to escape immunologic inhibition, which requires change in the vaccine to ensure vaccine effectiveness. Each change in vaccine virus means that manufacturers must work rapidly to determine how to optimize yield of the new virus. In addition, the Center for Biologics Evaluation and Research must make reagents to permit standardization of the potency of the vaccines.

This past year, one of the influenza vaccine manufacturers, Parkedale, stopped producing and marketing vaccine; this was, presumably, a business decision. We will provide for the record a list of those actions being taken to ensure against a possible future shortage of the flu vaccine as well as other vaccines.

[The information follows:]

Actions Being Taken to Ensure Against Future Vaccine Shortages

Advise national and international public health groups such as the World Health Organization WHO, the Centers for Disease Control and Prevention, CDC, the National Institutes of Health, and the National Vaccine Program Office for the purpose of selecting new influenza viruses to be used in vaccine manufacturing. Every year in January, CBER's Vaccines and Related Biological Products Advisory Committee meets to make United States Public Health Service recommendations for the strains to be used in making vaccines and inform manufacturers of the choices;

Perform serologic testing to determine whether current vaccines produce antibodies that can inhibit the new influenza viruses considered for use in vaccines;

Work with manufacturers throughout the year to collect information on the capability of new influenza viruses to be used for large-scale production of influenza virus vaccines;

Perform applied research to develop reassortant influenza viruses adapted to grow better in eggs than the naturally occurring viruses. The high growth reassortants help to increase the yield influenza virus in each batch produced and reduce the time required for large-scale manufacturing;

Produce, calibrate, and distribute reagents to be used in determining the potency of vaccines. For each new virus included in vaccine, the reagents include a virus-specific preparation of influenza antigens and a virus specific antiserum. CBER also provides the antiserum to CDC and WHO for national and international surveillance of influenza viruses;

Test on all influenza vaccines used in the United States. The testing is emphasized during early production steps to avoid later rejections of material. All manu-

facturers' working seed viruses are tested by CBER to ensure that the antigenic characteristics of the viral hemagglutinin match the recommended reference virus. Approved seed viruses are used to produce monovalent components of the trivalent vaccine. Monovalent vaccines are tested by the manufacturers and CBER for potency, and the results from both are used to assign a potency value to each monovalent component for use in formulation of trivalent vaccine;

Conduct complete reviews of all lot-release submissions for the influenza virus vaccines;

Work with manufacturers of virus vaccines to develop additional vaccines that may be used in the future such as live-attenuated influenza virus vaccine and purified protein hemagglutinin vaccine produced by recombinant DNA technology; and,

Facilitate manufacturing changes that increase vaccine production.

DIRECT TO CONSUMER ADVERTISING

Question. A New York Times article from earlier this week cited a study by the National Institute for Health Care Management that spending on prescription drugs increased by almost 19 percent last year, to \$132 billion. This study further noted that, "the recent rise in pharmaceutical spending is due, in large measure, to the growth in sales of a relatively small number of medicines. Most of these drugs are blockbusters many Americans have come to know by name and see advertised more and more."

As you well know, due to FDA's rule change on direct-to-consumer advertising approximately four years ago, television ads for prescription drugs are now very common. In fact, pharmaceutical companies spent an estimated \$1.7 billion on TV ads in 2000, 50 percent more than what they spent in 1999, more than double the 1998 amount. Interestingly, the United States is only one of two countries (New Zealand is the other) where prescription drugs are aired during prime time television hours. Proponents of the FDA's policy shift say it creates a more informed patient because viewers see the ads, then have an intelligent give-and-take with a doctor. Critics say the shift creates more business for pharmaceutical companies by encouraging patients to seek out expensive, potentially dangerous drugs that they know little about.

In fact, of the estimated 200 television drug spots aired since the 1997 FDA rule change, the agency has cited 32 for non-compliance and has asked the companies to change all or part of the ads.

In your testimony, you stated that, ". . . it has become increasingly clear that FDA's eye must be equally focused on the full life cycle of all the products that we (FDA) regulate—post market as well as pre-market activities and developments".

Therefore, what assurances can you give us that the FDA is monitoring direct to consumer advertising of prescription drugs?

Answer. Since issuing the 1997 draft guidance on broadcast, TV, radio, and telephone advertisements, the Division of Drug Marketing, Advertising and Communications, DDMAC, has had in place a process that alerts reviewers to submission of broadcast advertisements, and prioritizes and expedites their review. In addition, most product sponsors voluntarily submit their broadcast advertisements for review and comment prior to using them. Thus, there are relatively few product-claim TV and radio advertisements that DDMAC has not seen and commented on at some point in their production. We believe that the high degree of use of this voluntary, prior-review system, together with our prioritizing review of mandatory submissions, assures us of a highly effective level of monitoring of broadcast advertisements.

Question. Furthermore, is the FDA completing any analysis or study of the impact the 1997 rule change has had on prescription drug prices and spending?

Answer. In 1997 FDA published a draft guidance, not a rule change. In the final guidance we stated that we would assess the impact on the public health. Since FDA does not regulate pricing, our surveys will not measure this factor.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

Question. User Fees The President's budget includes an increase in current user fees to enhance the review process for new human drugs and biological products, and an increase in existing fees for applications, drug producers, establishments, and approved products.

What enhancements will be made to the review process, and what effect will these enhancements have on the length of time it takes for review and approval?

Answer. The agency is committed to performance goals for fiscal year 2002 that are detailed in an attachment to a November 12, 1997 letter from the Secretary of

Health and Human Services and referred to in the legislation that reauthorized PDUFA. Those goals include the review of 90 percent of priority applications within 6 months, 90 percent of standard applications within 10 months, and 90 percent of manufacturing supplements requiring prior approval in 4 months.

Question. What effect will increased user fees have on the cost of the approved products?

Answer. These increased fees are not expected to have any impact on the cost of approved products. The value of FDA review activities to industry far weighs the cost of the fees. According to the most recent data, for 1998, reported by the Pharmaceutical Research and Manufacturers Association, PhRMA, in its Pharmaceutical Industry 2000 Profile, 4.4 percent of total spending on U.S. industry R&D was allocated to "Regulatory: IND and NDA". This corresponds to a total of \$757.79 million, out of a total of \$17.22 billion in U.S. industry R & D spending that year. PDUFA fees paid by industry in 1998 totaled \$117.12 million, about 15 percent of the amount industry attributes to "Regulatory: IND and NDA", and less than 1 percent, 0.006, of U.S. industry spending on drug R&D. Fee collections in fiscal year 2000 totaled \$145.98 million, and this again represents less than 1 percent of the PhRMA estimated spending of \$22.48 billion by U.S. industry in 2000. Despite the fact that user fees represent only a tiny fraction of R & D costs, the PDUFA program is a significant factor in increasing R & D cost-efficiency. Industry researchers have cited the FDA review processes and efficiency as the world benchmark. According to the Outlook 2001 report published by the Tufts Center for the Study of Drug Development, focused consultation with the FDA during the drug development process has been shown to help shorten clinical development times. The value to industry is reflected in the volume of company requests for meetings for consultation with FDA during drug development. Approximately 1,500 such meetings were requested and scheduled in fiscal year 1999 and more than 1,100 meetings were requested and scheduled in fiscal year 2000. The FDA reviewers' preparations and follow-up to these meetings are performed in addition to the work performed for review of submitted applications.

FOOD IRRADIATION

Question. The Food and Drug Administration has been identified as the government agency, in the United States, with the responsibility of reviewing a proposed revision to food irradiation standards put forth by the Codex Alimentarius Commission's Committee on Food Additives and Contaminants. Concern has been expressed to me that the proposed revisions may undermine food safety in the United States.

What efforts is the FDA undertaking to ensure that food safety standards in the United States will not be compromised because of international agreements?

Answer. FDA undertakes a variety of efforts to ensure that food safety standards in the United States will not be compromised because of international agreements. These efforts include the Agency's active participation in relevant international standard setting organizations such as the Codex Alimentarius Commission. FDA's decision to participate in these types of organizations is based on the assumption that there exists a unique opportunity for the United States to join the international community in formulating and harmonizing food standards and ensuring their global implementation. FDA's participation, in the Codex for example, also allows the Agency to play a role in the development of codes governing hygienic processing practices and recommendations relating to compliance with those standards.

FDA also believes that activities aimed at improving foreign food and cosmetic regulatory systems and product safety can also improve the agency's ability to fulfill its public health mission and statutory obligations here in the United States. FDA intends to play an active role in appropriate international forums and to strike a balance between its public health mandate and other international issues identified by FDA's stakeholders. FDA's participation in the international arena has had and continues to have a very positive impact on the ability of FDA to protect the health of American consumers. The Agency's regulatory and scientific expertise has been instrumental in enhancing the strength of international standards for foods and cosmetics and in improving the foreign regulatory systems that oversee the production and safety of products exported to the United States.

The FDA will continue to implement the food safety standard established by the Federal Food, Drug, and Cosmetic Act. A food that has been intentionally subjected to radiation is not allowed for sale in the United States unless the use of radiation was in conformance to an authorizing regulation issued by the FDA. The FDA only issues such regulations if evidence shows that the use of radiation is safe.

The Sanitary and Phytosanitary Agreement, SPS Agreement, of the GATT encourages WTO member states to base their sanitary and phytosanitary measures for

food safety on standards developed by the Codex Alimentarius Commission. This agreement, however, does not require countries to change their level of protection for human health. In sum, Codex Standards are non-binding international guidelines that WTO member states should consider when maintaining or establishing measures to protect public health.

The current Codex Standard for Irradiated Foods, adopted in 1983, recommends approval of foods irradiated to an average dose of 10 kGy. Current FDA regulations on irradiated food generally allow a dose less than that of the Codex Standard although FDA allows a higher dose for spices and for meats consumed in the NASA space flight program. The 32nd and 33rd sessions, 2000 and 2001, of the Codex Committee on Food Additives and Contaminants, CCFAC, discussed proposed draft revisions to the Codex General Standard for Irradiated Foods. The proposed revisions would remove the restriction on the maximum dose, based on a 1997 report of an expert panel convened by the World Health Organization. FDA scientists have participated in those discussions. The 33rd CCFAC agreed to forward amended revisions to the 24th session of the Codex Alimentarius Commission for preliminary adoption at Step 5 in the 8 step Codex standard elaboration process. The current draft revision of this standard is contained in the report of the 33rd Session of the CCFAC, ALINORM 01/12A, Appendix VII, which is available from the Codex Alimentarius Website, <http://www.codexalimentarius.net/>.

FDA supports the Codex goal of developing international standards and participates in discussions to ensure that standards are science-based. While considering Codex Standards, FDA will continue to implement the food safety standard established by the Federal Food, Drug, and Cosmetic Act.

FOOD SAFETY

Question. I am concerned that the FDA reports that microbial food-borne disease causes approximately 76 million illnesses, 325,000 hospitalizations, and 5,000 deaths each year. Despite these figures, the number of inspections that the FDA performs has fallen steadily during the last 25 years. The President's budget request would only allow inspection at ninety-five percent of domestic firms.

What level of funding would allow the FDA to perform inspections at all domestic firms?

Answer. FDA is currently in the process of developing long range estimates for resource needs associated with the inspection of all domestic food establishments. The estimates will include a range of estimated resources needed to conduct the inspections, assumptions in determining the cost estimate, and caveats that indicate what types of uncertainties or changes would alter the estimates.

Question. How does the FDA justify a request that intentionally falls short of inspecting all domestic firms?

Answer. FDA believes that food safety funding needs to continue to be a multi-year effort. FDA's request recognizes that finite resources are available and focuses on highest risk. This budget is needed to maintain that focus. As resources permit, we can inspect medium/low risk establishments with greater frequency.

Inspections, while important, need to be viewed within a broader food safety program. We complement our inspection coverage with surveillance activities, research and risk assessment, and educational activities at all levels, consumers, industry, manufacturers, and processors, to provide a complete food safety program to ensure the U.S. food supply remains the safest in the world.

CONCLUSION OF HEARINGS

Senator COCHRAN. This concludes today's hearing. Additional hearings are scheduled by the subcommittee. Our next hearing will be on Thursday, May 17, at 10 o'clock in the morning, here in room 138 of the Dirksen Senate Office Building. At that time, we will hear from Federal, industry, and local witnesses on the subject of market concentration in agriculture. Until then, the subcommittee stands in recess.

[Whereupon, at 11:07 a.m., Thursday, May 10, the hearings were concluded, and the subcommittee was recessed, to reconvene to the call of the Chair.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2002

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR FORMAL HEARINGS

[CLERK'S NOTE.—The following agencies of the Department of Agriculture did not appear before the subcommittee this year. Chairman Cochran requested these agencies to submit testimony in support of their fiscal year 2002 budget request. Those statements follow:]

DEPARTMENT OF AGRICULTURE

RURAL UTILITIES SERVICE

PREPARED STATEMENTS OF BLAINE D. STOCKTON, ACTING ADMINISTRATOR

Mr. Chairman, Members of the Committee, it is a pleasure to present to you the President's fiscal year 2002 Budget request for the Rural Development Mission Area of USDA.

The Rural Development Mission area was established in 1994 by the Federal Crop Insurance Reform and Department of Agriculture Reorganization Act. The mission area consists of three agencies, the Rural Business-Cooperative Service (RBS), the Rural Housing Service (RHS), and the Rural Utilities Service (RUS). These agencies are responsible for delivering programs authorized by the Consolidated Farm and Rural Development Act, the Farm Security Act of 1985, the Rural Electrification Administration Act of 1936, the Cooperative Marketing Act of 1926, the Agricultural Marketing Act of 1946, the Housing Act of 1949, and the Rural Economic Development Act of 1990, as amended. The mission area also administers the rural portion of the Empowerment Zones and Enterprise Communities (EZ/EC) Initiative and the National Rural Development Partnership, a nationwide network of rural development leaders and officials. This listing of responsibilities is suggestive of the remarkably wide variety of responsibilities in Rural Development's purview, to improve the quality of life for rural Americans.

Rural Development assists rural individuals, communities, and businesses obtain the financial and technical assistance needed to address their diverse and unique needs. This financial and technical assistance may come solely from Rural Development or be combined with assistance from one of the numerous public and private organizations involved in the development of rural communities. Rural Development agencies deliver over 40 different loan, loan guarantee, and grant programs in the areas of business development, cooperative development housing, community facilities, water supply, waste disposal, electric power, and telecommunications, including distance learning and telemedicine. Rural Development staff also provide technical assistance to rural families and community leaders to ensure success of those projects it has financed. In addition to their loan-making responsibilities, Rural Development staff are also responsible for the servicing and collection of a loan portfolio that exceeds \$80 billion.

Rural Development's impressive aggregate statistics display one dimension of the successes of the program funding the Committee has provided. However, statistics do not reveal the human side of these successes. Later, in testimony from the agencies, you will hear clearly how the program funding the Committee provides dramatically improves the lives of rural Americans. These success stories are remarkable.

RURAL DEVELOPMENT BUDGET REQUEST

Mr. Chairman, the President's commitment to improving rural America is reflected in the budget request for fiscal year 2002. The Rural Development budget request for program level is \$12.4 billion, supported by budget authority of \$2.4 billion. This reflects the commitment to maintain program performance at current levels. Special one-time supplemental funding provided last year is not requested, nor is continuation of several small pilot projects, since they generally can be funded under existing authorities. I will now discuss the requests for specific programs.

RURAL HOUSING SERVICE

The budget request for the programs administered by the Rural Housing Service (RHS) totals \$5.8 billion. This commitment will improve housing conditions in rural areas, and in particular improve homeownership opportunities. The request for single family direct and guaranteed homeownership loans totals \$4.2 billion, which will assist 55,800 households who are unable to obtain credit elsewhere to purchase a home of their own. This level of construction activity will stimulate almost 36,000 jobs in rural areas. The RHS request includes \$32 million for housing repair loans and almost \$30 million for housing repair grants, which will be used to improve 12,000 existing single family houses, mostly occupied by low income elderly residents.

We are proposing a multi-family housing request of \$114 million for direct loans, almost \$100 million for guaranteed loans, \$43 million for farm labor housing loans and grants, and about \$694 million in rental assistance. These program levels support construction of new units and rehabilitation of existing units, many of which are occupied by female heads of households, generally elderly females or single mothers, with annual incomes averaging under \$8,000. In addition, the budget includes \$694 million for rural Rental Assistance payments. These payments are used to reduce the rent in rural rental housing projects, to no more than 30 percent of the income of very low-income families. This level of funding will provide rental assistance to approximately 43,000 households, most of which would be used for renewing expired contracts in existing projects.

The request for community facilities funding totals almost \$250 million for direct loans, \$210 million for guaranteed loans, almost \$13 million for grants, and just under \$6 million to continue the Rural Community Development Initiative (RCDI). Community facilities programs finance rural health facilities, child care facilities, fire and safety facilities, jails, education facilities, and almost any other type of essential community facility needed in rural America. These funds will support 4,000 beds in new or improved elder care facilities, 180 new or improved health care facilities, 170 new or improved fire and rescue facilities, 90 new or improved child care centers, and 70 new or improved schools.

RURAL BUSINESS-COOPERATIVE SERVICES

One key to creating economic opportunity in rural areas is the development of new business and employment opportunities. But, local lending institutions frequently do not have the capacity or capital needed to sustain local businesses and generate new growth in rural areas. Rural Business-Cooperative Services (RBS) programs, particularly the Business and Industry (B&I) loan guarantee program, were enacted to supplement the efforts of local lending institutions in providing the capital.

Based on recent experiences, we expect that every dollar of Rural Business Enterprise Grant funding will be leveraged with \$2.40 of funding from other sources, while each dollar of Intermediary Relending Program funds will be leveraged with \$3.76 from other sources.

The RBS budget request for fiscal year 2002 totals just over \$1.1 billion, the bulk of which represents \$1 billion for the B&I loan guarantee program. This level of funding for the B&I program alone will create or save over 28,000 jobs in rural America. Almost \$41 million is requested for the Rural Business Enterprise Grant program, \$3 million for the Rural Business Opportunity Grant program, \$38 million for the Intermediary Relending Program, almost \$15 million for Rural Economic Development loans, over \$6 million for Rural Cooperative Development Grants, and

just under \$15 million for Empowerment Zone and Enterprise Community Grants, for communities designated in the second round of this program. In total, this program level should create or save over 71,000 rural jobs.

RURAL UTILITIES SERVICE

The Rural Utilities Service (RUS) provides financing for electric, telecommunications, and water and waste disposal services that are essential for economic development in rural areas. The level requested for programs administered by the RUS is \$4.9 billion, which is comprised of \$2.6 billion for electric loan programs, \$495 million for rural telecommunication loans, \$300 million for Distance Learning and Telemedicine loans, \$27 million for Distance Learning and Telemedicine grants, \$884 million for direct and guaranteed Water and Waste Disposal loans, and \$529 million for Water and Waste Disposal Grants, and \$4 million for Solid Waste Management Grants.

Contingent upon the enactment of authorizing legislation, approximately \$2 million may be available for a loan and grant program to finance broadband transmission and local dial-up Internet service in rural areas. This will improve access to high speed, high capacity data transmission to under-served rural areas. It is estimated that about 10 percent of rural areas lack local Internet service.

The Electric program funding will benefit about 2.8 million consumers from systems improvement, through upgrading almost 190 rural electric systems. Approximately 60,000 jobs will be created as a result of facilities constructed with Electric program funds. Almost 50,000 new subscribers will receive telecommunications service, over 200,000 existing subscribers will receive improved service, and about 16,000 jobs will be generated as a result of facilities constructed with Telecommunications funds. Under the Distance Learning and Telemedicine programs, approximately 300 schools will receive distance learning facilities and 150 health care providers will receive telemedicine facilities. Over 42,000 jobs will be generated as a result of facilities constructed with water and waste disposal program funds, as 600 rural water systems and about 330 rural waste systems are developed or expanded in compliance with the Safe Drinking Water Act and Federal and State environmental standards.

The Rural Telephone Bank (RTB) was established in 1972 to provide a supplemental source of credit to help establish rural telephone companies. This has proved to be remarkably successful, and efforts have been underway to privatize the bank. In 1996, the RTB began repurchasing Class "A" stock from the Federal government, thereby beginning the process of transformation from a Federally-funded organization to a fully privatized banking institution. The fiscal year 2002 budget reflects the Administration's commitment to a fully privatized RTB that does not require Federal funds to finance the loans it makes. The 2002 Budget does however, include administrative funds for developing a detailed plan for privatization for legal support and to administer the existing loan portfolio.

ADMINISTRATIVE EXPENSES

These requested program levels provide ambitious targets for accomplishments, for which the Committee will be proud. However, delivering these programs to the remote, isolated, and low income areas of rural America requires administrative expenses sufficient to the task. Over the last several years, Rural Development has administered growing program levels, and new programs, with a stable level of Salary and Expense (S&E) funding. From fiscal year 1996 through fiscal year 2000 Rural Development's annual program levels increased by 43 percent. Over that same period Rural Development's S&E appropriation increased 1.4 percent. Although no Reductions in Force were implemented, Rural Development curtailed employment, and Full Time Equivalent (FTE) staffing fell 15 percent. But, in spite of lower employment, salary and benefits requirements took a larger and larger share of the total S&E available. In 1996, salary and benefits for employees took 70 percent of the total S&E. By 2000, with 1,168 fewer FTEs used, salary and benefits took 78 percent of S&E. With S&E rising only 1.4 percent, less was available for everything else, including travel, training, supplies, etc., to support loan underwriting; and servicing and automated systems development.

For all these reasons, we urge the committee to fund the President's fiscal year 2002 requested for S&E of \$596 million. Rural Development is very appreciative of the funding provided in the fiscal year 2001 appropriation for automated financial systems development, and funding the President's requests will allow Rural Development to continue to support the development of systems for guaranteed loans, multi-family housing loans, Rural Utilities Service systems modernization, and the Program Funds Control System. This funding will allow Rural Development to con-

tinue to address long delayed automated systems development needs, but these are major projects and will not be completed in one year. Rural Development's loan portfolio exceeds \$80 billion and funding is a joint venture requiring both adequate program and administrative funding. One cannot be achieved without the other.

Mr. Chairman, Members of the Committee, this concludes my formal statement. The Acting Administrators and I would be glad to answer any questions you may have. Thank you for the opportunity to appear before you to discuss the Rural Development budget request.

Mr. Chairman, Members of the Subcommittee, thank you for the opportunity to present the President's fiscal year 2002 budget for the Rural Utilities Service (RUS). We appreciate the work and support you and the other members of this subcommittee have provided for a strong, dependable infrastructure in the rural United States.

All aspects of a rural society work together to make a strong nation. Safe, affordable, modern utility infrastructure is an investment in economic competitiveness and serves as a fundamental building block of economic development. Technology, regulatory, and market structure changes, combined with an aging utility infrastructure are occurring in the electric, telecommunications, and water sectors. Without the help of USDA through the RUS programs, the citizens of rural communities will have a more difficult time-sharing in the basic quality of life.

The nearly \$42 billion RUS loan portfolio includes investments in approximately 2,000 electric and telecommunications systems and 7,500 small community and rural water and waste disposal systems serving rural America. This local/Federal partnership is an ongoing success story. Eighty percent of the Nation's landmass continues to be rural, encompassing 25 percent of the population. In a fragile economy, this infrastructure investment spurs economic growth, creates jobs and improves the quality of life in Rural America.

RESPONSIVE AND RESPONSIBLE

The proposed budget will enable RUS to continue to respond to the demand in rural America to meet the needs brought on by the rapidly changing markets and technologies. The ability of borrowers to respond quickly to changing conditions is a key to the public-private partnership between RUS and its borrowers. RUS continues to streamline policies and offer borrowers more flexibility in financing, while ensuring safe, reliable modern utility service to rural Americans.

ELECTRIC PROGRAM

The RUS Electric Program budget proposes \$3.7 billion in budget authority to support a program level of \$2.62 billion. The President's Budget requests \$3.6 billion in budget authority for a hardship program level of \$121.1 million. The budget proposal provides a \$294 million funding level for the municipal rate loans, a \$500 million funding level for Treasury rate loans, and \$1.6 billion funding level for guaranteed loans through the Federal Financing Bank, which do not require any subsidy budget authority. In addition, the budget proposal provides \$80,000 in budget authority for a \$100 million loan guarantee program for private sector loan guarantees. To more effectively manage both the telecommunications and electric programs and to respond to borrower needs, we are requesting the budget authority be provided in a single, unrestricted amount for electric and telecommunications programs.

RUS is also working with power supply borrowers to secure badly needed peak power and transmission needs. As you each are aware, our demand for generation and transmission has outgrown capacity.

A good example of how RUS electric programs can affect the quality of rural communities is in Douglassville, Texas. Bowie-Cass Electric Cooperative of Douglassville developed a construction work plan totaling \$17,872,000 to construct new facilities, extend service to approximately 3,800 new customers and improve existing facilities. Of this, RUS electric program loan funds will provide financing in the amount of \$6,300,000, which will leverage \$2,700,000 of supplemental financing, \$72,000 in aid to construction contribution and \$8,800,000 of the Cooperative's generated funds. A portion of these funds will be used to extend service to a new Skills Center in the State that will employ 10-15 people. This center will work with local colleges to produce the highly skilled technicians the employers of the area require. Without this type of training, employers in this rural area would be faced with employee shortages and might be forced to relocate.

FACILITATING ADVANCED TELECOMMUNICATIONS IN RURAL AMERICA

The uniform deployment of advanced telecommunication technologies in urban and rural areas alike has been recognized as a must if the nation is to achieve the greatest return on its infrastructure investment. In 1993, Congress passed the Rural Electrification Loan Restructuring Act (RELRA), which mandated that all future RUS financed telecommunications infrastructure be capable of supporting data transmission at a minimum rate of one megabit-per-second—or at broadband service levels. As a result, RUS financing provided since the passage of that important act has resulted in increased investment in advanced technologies for rural areas served by RUS borrowers. Since receiving this mandate:

- The deployment by RUS borrowers of fiber optic cable has doubled, representing one in every ten miles of cable in rural local loops financed by RUS.
- RUS has financed \$1.5 billion in fiber optic facilities and \$1.1 billion in digital switching systems and enhanced feature software.
- And today, RUS financed borrowers provide 99 percent digital switching.

RUS will continue to finance only telecommunications plants that can be characterized as “no roadblocks to broadband” and, as such, is compatible with the Telecommunications Act of 1996, especially the universal service principles of Section 254 and the encouragement for broadband of Section 706. While significant progress is being made in the deployment of advanced telecommunications technologies in rural areas, RUS will continue to focus on the challenges remaining in providing rural access to the digital economy and its benefits:

- serving the unserved and underserved;
- keeping pace with new industry changes in a competitive market; and
- addressing special needs of economically distressed regions and those areas with limited resources, such as our Native American communities.

WATER AND ENVIRONMENTAL PROGRAMS

This budget seeks \$530 million in budget authority for Water and Waste Disposal (WWD) grants; \$3.5 million in budget authority for solid waste management grants; and \$56 million in budget authority to support over \$809 million in WWD direct loans and \$75 million in guaranteed loans.

The budget request earmarks \$20 million for Colonias along the U.S.-Mexico border, \$16.2 million for technical assistance and training grants, \$9.5 million for the circuit rider technical assistance program, \$20 million for rural Alaskan villages, and \$27 million in budget authority for loans and grants in Federally designated Empowerment Zones and Enterprise Communities. Our budget request will also allow third-party service providers such as rural water circuit riders to make over 56,000 water and wastewater system contacts to communities needing technical assistance and, through a clearinghouse effort, take more than 20,000 telephone calls and an estimated 11,000 electronic bulletin board and web site contacts.

As a result of WWD strong technical assistance efforts, both from staff and third-party service providers/contractors, loan delinquency and loan losses will remain low. Currently, only 1 percent of approximately 7,600 borrowers are delinquent. Since the inception of the water and waste disposal program, less than 0.1 percent of the amount loaned has been written off.

WWD programs improve the quality of life and health of an estimated 1.4 million Americans in needy communities each year by providing access to clean, safe drinking water. In addition, new or improved waste disposal facilities are provided to an estimated 500,000 people living in rural areas. A field network of Rural Development employees deliver the program through “hands-on” technical and financial assistance under the Rural Community Advancement Program.

A project funded in Columbus, New Mexico illustrates the kind of impact the program can have. Columbus is a small-incorporated community on the border with Mexico in Southern Luna County, which had no existing wastewater treatment infrastructure. The low-income (MHI = \$10,781) predominately Hispanic population was served by septic tanks, cesspools, and in some cases privies. Ground water contamination was a major concern. The Village owns a small industrial park, which is largely empty, but does house US Customs and a 24-unit Multi-Family Housing project funded by RHS/USDA. It was served by a small-dilapidated lagoon sewer plant. EPA found it in non-compliance and was threatening large daily fines. RUS provided two Section 306C Colonias grants totaling \$1,936,600 which were combined with a \$300,000 Community Development Block Grant to build a gravity flow sewer collection system along with a lagoon wastewater treatment facility serving the Village. A small part of the project upgraded and expanded the plant at the industrial park, providing safe wastewater treatment to the RHS apartment complex along with others. Part of the new system plant included constructive wetlands, which

provide a safe haven for waterfowl and migrating birds. As an unforeseen benefit, a small rowboat provided through the project ended up being used during severe flooding conditions to rescue families from their flooded properties, one of which had 12 family members stranded on the roof of their mobile home. Columbus has recently received additional CDBG funds and is now expanding the collection system to serve the fringe areas of the community.

The Water and Waste Disposal program has been very successful since its inception over 60 years ago. A total of over \$25 billion in financial assistance has been provided, about 70 percent of that in the form of loans; approximately 45 percent of the total has been provided during the past 10 years. Indications suggest, however, that needs for water and waste disposal systems are still significant and are likely to grow as a result of expanding population in rural areas, changes to water quality standards, drought conditions, and similar factors. The application backlog for assistance continues to total about \$3 billion each year. Over the last three years RUS has assisted 1,124 borrowers in moving up to commercial credit in accordance with its graduation requirement. The loans paid off as a result of this effort totaled nearly \$680 million.

OUTREACH TO THE NEEDEST PEOPLE

RUS strives to increase its program outreach, participation, and delivery to the most needy rural people. This goal addresses the heart of our mission. We combine our technical and financial resources to reach out and assist those communities, tribes and other groups with limited resources. The RUS outreach efforts have touched the vast expanse of our country—from rural Alaskan Villages to Colonias along the U.S.-Mexico border communities in the Mississippi Delta and the great needs of Native Americans.

Since the earliest days of rural electrification, this agency has focused special attention on tribal communities. One of our earliest electric borrowers was the Navajo Nation. In telecommunications, five out of the seven tribally owned telephone companies are RUS borrowers. The significant RUS investments in utilities in Alaska provide service to some of the most remote native Alaskan villages.

RUS investments in drinking water and wastewater projects serving tribal and rural Alaskan communities have increased by nearly 400 percent since fiscal year 1993, and continue to grow. RUS is uniquely dedicated to helping unserved and under-served communities. Nearly sixteen million dollars were earmarked in fiscal year 2001 to benefit Native Americans. For fiscal year 2002, the President's proposed budget earmarks \$24 million for Native Americans, of which \$15.75 million is proposed to be used for water and waste disposal loans and grants. Additionally, we are intensifying coordination of funds with the Indian Health Service and State and other Federal agencies.

TELECOMMUNICATIONS BUDGET

This year's budget proposes \$300 million in Treasury rate loans and \$120 million in loan guarantee authority. This \$420 million in loans can be provided for a minimal subsidy cost of \$300,000. In addition, the budget proposes \$1.7 million in budget authority to support \$75 million in hardship loans to the poorest, neediest, and highest cost to serve areas.

The budget also reflects the Administration's commitment to privatize the Rural Telephone Bank and therefore, does not request any budget authority to support lending for fiscal year 2002. This will result in a \$3.8 million savings in budget authority. Today, the bank operates as a supplemental lender to entities eligible to borrow funds from the RUS program. A privatized bank would be able to expand or tailor its lending practices to go beyond the current limitations imposed as a government lender, as well as use its substantial loan portfolio and cash reserves to extend favorable credit and terms to smaller, rural companies. Privatization, therefore, should be pursued in a manner consistent with the bank's enabling legislation so that it continues as a private lender that helps meet the growing capital demands of the rural telecommunications industry.

DISTANCE LEARNING AND TELEMEDICINE

Distance learning and telemedicine technologies are having a profound impact on the lives of rural residents. The Distance Learning and Telemedicine (DLT) program administered by RUS is helping to facilitate the deployment of advanced technologies to our rural schools and health care centers. By assisting rural schools and learning centers in gaining access to improved educational resources over advanced broadband networks rural students and teachers have access to educational opportunities not available before. And by assisting rural hospitals and health care cen-

ters in gaining access to improved medical care by linking to urban medical centers for clinical interactive video consultation, distance training of rural health care providers, management and transport of patient information, and access to medical expertise and library resources health care in rural areas takes on a whole new dimension. Building on advanced telecommunications infrastructure, distance learning and telemedicine initiatives are not only improving the quality of life in rural areas, but are making direct contributions to promoting electronic commerce in rural areas. Telemedicine projects are providing new and improved health care services and benefits to rural residents, many in medically under-served areas. Distance learning projects provide funding for computers and Internet hookups in schools and libraries and promote confidence in, and understanding of, the world-wide-web and its benefits to students and young entrepreneurs. Since this program's inception in 1990, nearly \$94 million in grants and over \$12 million in loans have been made in 383 projects across the US, from rural Upstate New York to the Mississippi Delta, and from the Great Plains to the isolated valleys of California. Projects have been funded in 44 states and three territories, including 49 projects totaling nearly \$14.5 million that benefit Native Americans and their tribal communities.

Maverick County is one of the poorest counties in Texas and the nation. The hospital district does not have enough beds for the demands of the community and there is a severe shortage of nurses to staff more patient beds. Ninety percent of the clinic patients have household incomes below poverty level. Grant funds—in the amount of \$326 thousand—provided by RUS have provided telemedicine and distance learning capabilities between Fort Duncan Medical Center and the new Rosita Valley Clinic serving the colonias in Maverick County and the Traditional Kickapoo Tribe of Texas. As a result, the project expects to complete 1,200 interactive telemedicine consults annually and to increase the number of patients receiving specialized medical care by 25 percent. A second grant has also been awarded in the amount of \$348 thousand to expand the project. This second phase will provide additional personnel and equipment to include the communities of Eagle Pass, Quamado, Seco Mines, El Indio, and the Kickapoo Indian Reservation. Over 36,000 residents will benefit!

For the DLT program, the budget proposes \$300 million in Treasury rate loans, at a zero subsidy cost, and \$24.945 million in grants.

GRANTS AND LOANS TO PROVIDE RURAL TOWNS WITH BROADBAND SERVICES

Through a one-year pilot program, Congress made \$2 million in grants and \$100 million in treasury rate loan funds available to encourage telecommunications carriers to provide broadband service, and local dial-up Internet Service to rural consumers where such service does not currently exist. This program will provide grants and loan funds, on an expedited basis, to communities of up to 20,000 inhabitants. Loans are made at the Treasury rate of interest for a period equivalent to the life of the financed assets, not to exceed 10 years.

Due to the need for this program, the budget includes \$2 million in grants and \$100 million in lending authority, at zero subsidy costs, to implement permanent authority. Broadband networks in small, rural towns will facilitate economic growth and provide the backbone for the delivery of increased educational opportunities over state-of-the-art telecommunications networks.

In the rural Mississippi counties of Okibbeha and Winston, there were no prospects for the delivery of broadband communications services until an RUS loan—in the amount of \$3.3 million from the Broadband pilot program—was approved for Wireless Land Technologies, Inc. Funds are being used to provide broadband data services over a wireless network connection to the local communities, benefiting over 3,000 subscribers in the first two years. In addition, the technology provides the platform for the delivery of telemedicine services. Four medical centers in the service area will operate on a Virtual Private Network and connect to other health care and medical institutions. Through this network, these medical centers will share resources and medical expertise in administering patient care. As an added benefit, local businesses requiring secure data connections may also use this type of network.

AGRICULTURAL RESEARCH SERVICE

PREPARED STATEMENT OF DR. FLOYD P. HORN, ADMINISTRATOR

Mr. Chairman, and members of the Subcommittee, I appreciate the opportunity to represent the Agricultural Research Service (ARS) and to present our budget for fiscal year 2002. As you know, Mr. Chairman, as the principle intramural scientific

research agency of the U.S. Department of Agriculture, our mission is to develop new knowledge and technology, and disseminate information essential to solving agricultural problems that are broad in scope and have a high national priority. ARS is a problem-solving agency, dedicated to sustaining a viable food and agricultural economy; preserving our environment; enhancing human health and nutrition; and ensuring affordable, abundant, high quality food and fiber for the American consumer. ARS helps ensure that our farmers and ranchers and the agricultural industry overall, remain competitive in both domestic and world markets. In addition, ARS conducts research to support Federal action and regulatory agencies and provides scientific expertise and resources to the Executive Branch and Congress. The fiscal year 2002 budget is responsive to this mission.

FISCAL YEAR 2002 BUDGET RECOMMENDATIONS

Let me now turn to our budget recommendations for fiscal year 2002. The President's budget for ARS research is \$915,591,000, an increase of \$18,756,000 over fiscal year 2001. The Budget also proposes a fiscal year 2002 funding level for the ARS Buildings and Facilities account of \$30,462,000.

Mr. Chairman, as in previous years, this budget proposes the termination of prior year earmarked research projects which will enable the redirection of resources to higher priority research initiatives. The Administration believes that taxpayers' dollars must be spent on the highest priority needs of national significance. The savings achieved through the proposed terminations, \$34,282,000, will be applied to the agricultural research initiatives recommended by the President. The initiatives proposed in this budget include:

- Emerging and Exotic Diseases and Pests of Plants and Animals
- Agricultural Genomes/Bioinformatic Tools
- Invasive Species (Weeds/Pests)
- Biotechnology Risk Assessment
- Biobased Products and Bioenergy

Emerging and Exotic Diseases and Pests of Animals (\$5,000,000)

Emerging diseases are caused by previously unidentified pathogens or new manifestations of "old" diseases that appear in animal populations. Reemergence of known diseases often occur after long quiescent periods or upon introduction of a new pathogen into a native animal population in a new geographical area. Microbial pathogens are continually adapting to new ecological niches. Exotic pathogens and pests, once introduced into a new geographic area, can explode into an epidemic due to the absence of effective control measures such as vaccines, drugs, lack of resistance in host animals, and limited resources to effectively manage the spread of these pathogens.

The globalization of trade, increased international travel of people and movement of goods, and changing weather patterns provide new opportunities for the emergence and spread of infectious diseases such as bovine spongiform encephalopathy (BSE), also referred to as "mad cow disease" in Europe. BSE outbreaks in the United Kingdom and Europe have required the destruction of huge numbers of animals to control the disease outbreaks, and have caused billions of dollars of economic loss due to domestic and international trade embargoes. The human form of mad-cow disease, Creutzfeldt-Jakob disease, has claimed a number of lives. Research to improve methods of rapid and accurate detection, and new means to control emerging and or exotic pathogen threats are urgently needed to prevent economic losses and maintain animal well-being.

Specific program thrusts to be undertaken with the proposed funds include investigations to determine the nature and transmission of the BSE agent; the detection and diagnosis of BSE in live animals; and methods to develop environmentally friendly and inexpensive but safe disposal of carcasses and feedstuffs.

Emerging and Exotic Diseases and Pests of Plants (\$1,782,000)

Emerging and exotic plant diseases are increasingly becoming a serious problem in the United States. Their emergence or re-emergence is attributed to the introduction of pathogens into new geographic regions, modifications of environments that favor disease, changes in crop management practices, and genetic shifts in pathogen populations.

Effective plant disease control depends on accurate and timely detection and identification of new pathogens. Preventing the introduction of exotic pathogens and controlling existing ones will not only safeguard the nation's crops but preserve the U.S.' export markets.

ARS will use the proposed increase to develop more sensitive and accurate biological methods to rapidly identify and control plant pathogens, such as plum pox,

Pierce's disease, and karnal bunt. The Agency will also conduct research to improve plants' genetic resistance by incorporating that resistance into the plant through conventional breeding and genetic engineering.

Biotechnology Risk Assessment (\$3,000,000)

Last year, the National Academy of Sciences issued a report which raised some concerns regarding pest resistant crops, particularly genetically-engineered ones. What are the long-term ecological impacts of genetically-engineered crops? What are the effects of pest protected transgenic crops on nontarget species? How can the buildup of resistant pest populations be prevented?

With the proposed increase, ARS scientists will identify the potential risks of biotech crops. The research will reduce the risks associated with gene transfer from biotech crops to other species and the buildup of resistant pest populations. In addition, allergenic proteins in vegetables will be reduced, and the nutritional qualities of biotech food products will be improved.

Bioinformatic Tools to Support Agricultural Genomics (\$4,500,000)

U.S. agriculture faces formidable challenges, from emerging and exotic diseases and pests, water and soil pollution and degradation, new environmental regulations, climatic extremes, to the extinction or inaccessibility of genetic resources. These challenges must be met by harnessing the inherent potential of genetic resources.

More rapid and efficient methods are needed to manipulate the useful properties of genes and genomes. Current methods rely on ever more accurate and comprehensive knowledge of genomic organization to efficiently characterize genes and elucidate their function. Genomics and biotechnology are vital for increasing the quality and safety of food products, developing improved crops and production efficiency, improving the accuracy of genetic selection, and identifying the genes responsible for disease and parasite resistance in animals and plants.

With the proposed increase, the agency will develop bioinformatic tools and provide database support for all of ARS' animal, and plant, and microbial research programs. The bioinformatic tools will be used to analyze information from different databases and compare information within and across species. The large quantity of data that will be stored in databases will represent a quantum leap in developing technologies and information needed to address present and future agricultural problems.

Invasive Species (\$5,000,000)

Invasive weeds and pests cost the United States a staggering \$122 billion per year. Weeds reduce crop yields by about 12 percent and forage yields by 20 percent. Nearly half of the threatened and endangered plant species in the U.S. are at risk because of invasive weeds. Arthropod (insects and mites) pests destroy 13 percent of crop production.

ARS will use the proposed increase to develop classical and augmentative biological control approaches, and areawide integrated pest management pilot tests for controlling invasive weeds and arthropod pests. In addition, the agency will conduct explorations in Europe, Africa, South America, Asia, and Australia to find natural enemies of particularly troublesome arthropod pests (e.g., Asian longhorned beetle, glassy-winged sharpshooter, pink hibiscus, mealybug, and imported fire ant) and weeds (e.g., leafy spurge, saltcedar, water hyacinth, kudzu, and melaleuca).

Also with the proposed increase, an Internet-based information management system will be established with connections to the eight Federal agencies responsible for controlling invasive species. This system will facilitate program coordination and implementation of the National Invasive Species Management Plan which was recently adopted by the eight agencies through the National Invasive Species Council. The National Agricultural Library houses the national website and will assist with managing this information flow between cooperators.

Biobased Products and Bioenergy (\$15,000,000)

Development of biobased industries that use trees, crops, agriculture, and aquatic resources to make commercial products including fuels, electricity, chemicals, adhesives, lubricants, composites, and building materials is a priority for the 21st century.

By expanding the development of biobased products and bioenergy, the demand for agricultural commodities will be increased which in turn will strengthen farm product prices and raise farm income. The products will generate new opportunities for business development and employment in rural America. Air pollution and greenhouse gas emissions will decrease. And U.S. dependence on imported oil will be reduced.

ARS will use the proposed increase to improve the conversion of agricultural materials and wastes to biofuels. Converting agricultural materials and wastes to biofuels and coproducts will be improved by developing processing technologies needed to create 21st century bio-refineries. Improvements in fundamental biochemical knowledge and technology breakthroughs will broaden the range of useful agricultural feedstocks from which bio-refineries can produce inexpensive biofuels and viable biobased products.

Researchers will also develop new technologies to produce biobased products from agricultural commodities and byproducts. Through fundamental breakthroughs in biocatalysis, fermentation, biotechnology, and separation processes, new biobased products will be developed having novel functional properties for applications previously unattainable or met only by petroleum-derived or other nonbiobased products. New biobased products include biodegradable polymers, absorbents, coatings, lubricants, and imported gum substitutes.

Proposed fiscal year 2002 Pay Costs

The President is proposing an increase of \$18,756,000 for the anticipated fiscal year 2002 pay raise. These funds are critical for the agency to conduct an effective and responsive research program. Absorption of these costs would lead to reductions in the number of scientists and support personnel, and in equipment and supplies essential to carrying out the country's agricultural research priorities.

Proposed fiscal year 2002 Program Decreases

The President is proposing the elimination of a number of research projects totaling \$34,282,000 which were added to the fiscal year 2001 appropriation bill. Taxpayer dollars should be used for the highest priority programs that meet critical national needs. The programs being proposed for elimination, while useful, do not meet these criteria. The savings achieved from the eliminated projects will be redirected to finance the high priority research initiatives recommended in the President's budget.

PROPOSED FISCAL YEAR 2002 BUILDINGS AND FACILITIES INCREASES

In order to attract and retain top scientists, solve the Nation's most critical agricultural problems, and address the research needs and priorities of the 21st century, ARS must have modern, state-of-the-art laboratories and facilities. Outdated, deteriorating laboratories adversely impact the quality of the research conducted. Many of the agency's laboratories were constructed half a century ago. Some are much older. They are in immediate need of major repair, renovation, or modernization. As part of its modernization program, ARS is requesting a total of \$30,462,000. These funds will be used for the following facilities:

Plum Island Animal Disease Center, Greenport, New York (\$3,762,000)

Plum Island is the only site in the United States where research can be carried out on highly contagious animal diseases, such as foot and mouth disease. The center is also used by APHIS, which performs diagnostic work on foreign animal diseases that are an ongoing threat to U.S. livestock. In 1989, ARS and APHIS began to develop a long range plan for the modernization of their facilities at Plum Island. As part of the ongoing modernization program, ARS is requesting \$3,762,000 for construction of coastal erosion control measures, improvements to the potable water distribution system, and clean-up of a construction debris site.

Regional Research Centers (\$15,300,000)

ARS' regional research centers were built in the 1930s. Investment in these centers is essential for ARS' scientists to conduct research which leads to a safer food supply, and new agricultural products and new uses for agricultural commodities.

—*Western Regional Research Center (WRRC), Albany, California (\$3,800,000).*—In fiscal year 2002, ARS is requesting \$3.8 million for Phase 2 construction of the Research and Development Facility. Phase 2 will consist of renovation of interior space, and plumbing systems.

—*National Center for Agricultural Utilization Research (NCAUR), Peoria, Illinois (\$6,500,000).*—In fiscal year 2002, \$6.5 million for Phase 1 construction is requested. Work will include an upgrade of HVAC and electrical systems, installation of a sprinkler system, and a stairway. Initially, bays on the west end of the Central Wing will be renovated and designed for expansion and tie-in with subsequent bays to minimize disruption of research during construction.

—*Eastern Regional Research Center (ERRC), Wyndmoor, Pennsylvania (\$5,000,000).*—In fiscal year 2002, ARS is requesting \$5 million for construction of Phase 7 (Chemical Wing) and design of Phases 8 and 9 (Power Plant and

Engineering Research Laboratory). Construction of Phase 7 will include renovation of interior space, and replacement of mechanical, electrical and plumbing systems.

Abraham Lincoln National Agricultural Library (\$1,800,000)

The National Agricultural Library is one of four national libraries in the United States and the largest agricultural library in the world. In 1991, the Library completed a comprehensive facility condition study which identified a number of building deficiencies. To continue the repair and modernization of the Library, ARS is requesting \$1,800,000 to upgrade major electrical distribution deficiencies.

U.S. National Arboretum (\$4,600,000)

The Arboretum was established by an Act of Congress in 1927 as a center for research and education in the plant sciences. Since 1958, the Arboretum has been open to the public. Many of the Arboretum's building systems have reached or passed their useful life expectancy. As part of the modernization of the Arboretum, ARS is requesting \$4,600,000 for continuation of the greenhouse complex renovation, design of a new main entrance, and design of the administration building modernization.

Western Human Nutrition Research Center, Davis, California (\$5,000,000)

In 1996, ARS decided to move its Western Human Nutrition Research Center to the campus of the University of California at Davis. The purpose of the move was to link ARS' nutrition research with the University's Departments of Nutrition and Food Science and Technology, its College of Agricultural and Environmental Sciences, and its Schools of Medicine and Veterinary Medicine. To date, the Congress has appropriated \$20,350,000 for the new center. Since the original cost estimates were developed, construction costs have escalated beyond the anticipated rate of inflation. ARS is requesting an additional \$5,000,000 to complete the center as originally planned.

SUMMARY

I believe the fiscal year 2002 budget the President is recommending will address many of this Nation's most critical agricultural research priorities. There is no question as to the growing importance of ARS' research programs—in the face of increased concerns over the safety of our food supply; and the emergence or re-emergence of mad-cow disease, foot-and-mouth disease, and other highly infectious animal and plant diseases. And other concerns, such as how to increase production without harming the environment, or how to revitalize rural America—agricultural research is at the threshold of providing solutions. I believe, as I'm sure this Committee believes, that agricultural research is vitally important to our Nation's well-being today more than ever before.

RURAL BUSINESS-COOPERATIVE SERVICE

PREPARED STATEMENT OF WILLIAM F. HAGY III, ACTING ADMINISTRATOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today to present the Administration's fiscal year 2002 Budget for the Rural Business-Cooperative Service (RBS).

Mr. Chairman, the programs and services of RBS, in partnership with other public and private sectors, continue to improve the economic climate of rural areas through the creation or preservation of sustainable business opportunities and jobs in rural America. RBS continues to target its resources to farmers and to the underserved rural areas and populations. RBS programs fall into two broad categories; loan and grant programs to assist rural businesses, and programs of assistance to farmers and other rural residents organized on a cooperative basis.

The programs of RBS help close the gap in opportunity for these under-served rural areas and populations, bringing them closer to sharing fully in the nation's economic growth. The \$1.1 billion requested in this budget for RBS programs will assist in creating or saving about 71,600 jobs and providing financial assistance to more than 2,700 businesses.

The functions of our cooperative programs are authorized under both the Cooperative Marketing Act of 1926 and the Agricultural Marketing Act of 1946. Our programs serve as the focal point of national activity to help farmers help themselves by providing the necessary advice and assistance. Examples of recent research and technical assistance include:

- Equity Management Options for Midwest Dairy Cooperatives with Aging Membership.*—This project addresses the concern of Midwest dairy cooperatives that their aging dairy farmer membership were expected to retire from dairying and would take their cooperative equity with them at rates that would exceed the cooperatives' ability to replace that equity. The study identifies 12 options on a continuum toward permanent equity programs, including transitional options that would allow for gradual equity program changes.
- Pork America.*—Cooperative Services has provided technical assistance to Pork America since their formation a year ago. The organization is attempting to supply pork to several under-served value-added markets and is investigating the acquisition of a processing plant.

BUSINESS AND INDUSTRY GUARANTEED LOAN PROGRAM

For the Business and Industry (B&I) Program, the fiscal year 2002 budget includes \$27.4 million in budget authority to support \$1.0 billion in Guaranteed Loans. This is an increase in budget authority compared to last year. To offset some of the increase in loan subsidy necessary to support the \$1.0 billion program funding level, an increase in guarantee fees from 2 percent to an equivalent of 3.25 percent is included as part of this request.

We are again making available \$200 million for financing for cooperative businesses. Priority will continue to be given to projects involving farmer-owned, value-added cooperatives. This provides a means of helping farmers keep more of the income generated by their product. In addition, this financing is available for guarantees of individual farmer's purchase of cooperative stock in a start-up cooperative established for value-added processing of an agricultural commodity raised by the individual farmer stockholders. With the proposed level of funding of \$1.0 billion, we estimate that this program will create or save about 28,400 jobs; but, equally as important under this guaranteed loan program, we are able to partner with local lenders in providing financing for rural businesses and thus contribute to the building of community economic stability. This program allows lenders to better meet the needs of rural businesses. Through the lender's reduced exposure on guaranteed loans, they are able to meet the needs of more businesses at rates and terms the businesses can afford.

To illustrate how this program has improved the economic climate in an under-served area of rural America, I would like to share a success story from Missoula, Montana. RBS issued a Business and Industry loan guarantee, totaling \$2,104,340, to Valley Bank of Belgrade, Montana, to assist American Eagle Instruments, Inc., and American Eagle Properties, LLC, (American Eagle) of Missoula, Montana. American Eagle used the financial assistance to expand their business for the development and sale of high tech lubricants, cleaners, and anti-microbial products used in the dental industry. As a result of the financing, American Eagle increased employment to 90 full-time employees, up from 70 full-time employees. The wages received by the employees, in addition, exceed the State average. American Eagle has expanded to be the fastest growing hand dental instrument business in the world, performing in the top 5 percent of the dental industry. This business has expanded through the United States and 40 major foreign countries.

BUSINESS AND INDUSTRY DIRECT LOAN PROGRAM

The fiscal year 2002 budget does not include funding for the B&I Direct Loan Program. This program has been authorized at \$50 million each fiscal year since fiscal year 1997, but has yet to utilize the full amount of the authorization. Furthermore, the subsidy rate in fiscal year 1997 through fiscal year 2000 was a negative subsidy. Starting in fiscal year 2001, a positive subsidy rate of 6 percent was due to a larger than anticipated default rate. The projected subsidy rate for fiscal year 2002 was calculated to be 28 percent, due to substantially higher than anticipated default rates. It was concluded that the program should not be funded in fiscal year 2002, since the higher default rate indicated that the program was not meeting the intended purpose of providing long-term, stable jobs in rural America.

INTERMEDIARY RELENDING PROGRAM

The fiscal year 2002 Budget also includes \$16.5 million in budget authority to support over \$38 million in loans under the Intermediary Relending Program (IRP). The initial investment of this proposed level of funding will create or save an estimated 8,600 jobs, but, because these funds, over the 30-year loan term, are re-loaned three or four times by the intermediary, we estimate that over 29,200 jobs will eventually be created or saved.

The President's Budget also provides that \$4.0 million in requests for IRP loans shall be for Native Americans and \$8 million for IRP loans for the Mississippi Delta region.

The IRP regulation was revised in 1998 and is now more user-friendly. It authorizes the Rural Development State Offices to process applications at the State level rather than submitting them to the National Office for processing. This change has accelerated the application process and allows State Offices to provide immediate feedback to borrowers concerning their applications. Participation by other private credit funding sources is encouraged in this program, since this program requires the intermediary to provide, at a minimum, 25 percent in matching funds. The demand for this program continues to be strong. To illustrate the benefits IRP provides to rural America, I would like to share with you a success story from Humboldt County, Illinois.

Corn Belt Power Cooperative, a generation and transmission cooperative for 10 rural electric cooperatives, applied for funds to establish a revolving loan fund to assist with job creation and community development in north central Iowa. The initial lending of \$1 million (\$800,000 IRP funds and \$200,000 matching funds) was disbursed to six projects within 12 months of closing. Loan funds were used for the purchase of new equipment, construction of a new building for a business start-up, expansion of an existing building to accommodate a growing company, community infrastructure needs, and an assisted living facility. The IRP funds were leveraged with public and private sector funds and owner equity to make each project happen. The projects were located in five different communities in the intermediary's service territory. As a result of this relending activity, 16 jobs have been created and 35 jobs were saved.

RURAL BUSINESS ENTERPRISE GRANT PROGRAM

For the Rural Business Enterprise Grant (RBEG) Program, the fiscal year 2002 Budget includes almost \$41 million. We anticipate that this level of funding will create or save over 11,100 jobs. The purpose of this program is to assist small and emerging businesses. The small amount of funds we typically invest in a project, on a dollar-for-dollar basis, on an average, generates another \$2.40 in private capital. Among the many eligible grant purposes under this program is the establishment of a revolving loan fund by the grantee to support small and emerging business development in rural areas.

For example, a \$715,360 RBEG was awarded to the Rosedale-Bolivar County Port Commission in Rosedale, Mississippi. The Commission operates a publicly owned river-port terminal, created to allow many smaller companies to utilize water transportation that cannot afford either the large capital expenditures for marine facilities or do not move enough tonnage for a dedicated specialized terminal. The RBEG was leveraged with \$718,840 of other capital. RBEG funds were used for enhancement to the port, including construction of a dry bulk unloading facility, rehabilitation of an elevated water tank, and for purchase of a 30,000 pound forklift in an effort to attract new small emerging businesses to this economically depressed area. This port is located in the Mississippi Delta and is a part of the Mid-Delta Empowerment Zone Alliance (MDEZA).

As a result of this grant, 38 jobs were created at the Rosedale-Bolivar Port. With improvements in place, the Bolivar County Board of Supervisors has approved leases for two additional small businesses which will create an additional 70 to 75 jobs. Both of these two new businesses are female, minority-owned.

RURAL ECONOMIC DEVELOPMENT LOAN PROGRAM

The fiscal year 2002 Budget requests almost \$15 million in Rural Economic Development Loans. This program represents a unique partnership, since it directly involves the rural electric and telecommunications borrowers in community and economic development projects. These borrowers are the intermediaries through which the funds are invested locally. In fiscal year 2000, each dollar invested through these programs attracted an additional \$4.56 in other capital. This loan program, primarily used for economic development activities, provides a zero-interest loan to the cooperative, which guarantees repayment of the loan to the Government.

To illustrate the benefits of this program, I would like to share with you a success story from New England, North Dakota. A \$400,000 zero-interest 10-year loan was provided to Slope Electric Cooperative, Inc. (Slope), in New England, North Dakota. Slope, in turn, relents the loan at zero-interest for a 10-year period to the City of Hettinger, in Adams County, to assist in constructing a building and purchasing equipment to be leased to Killdeer Mountain Manufacturing (KMM).

KMM is a successful company headquartered in Killdeer, North Dakota, approximately 100 miles north of Hettinger, that employs 90 people in manufacturing high performance electronic assemblies. Utilizing the building and equipment provided by the City of Hettinger, KMM will establish a satellite location in Hettinger that will be used for light contract manufacturing work. This satellite location, currently under construction, will create 35 new full-time job opportunities for Hettinger and Adams County residents. Adams County is located in the South West Rural Economic Area Partnership (REAP) Zone.

RURAL BUSINESS OPPORTUNITY GRANT PROGRAM

The fiscal year 2002 budget includes almost \$3 million for Rural Business Opportunity Grants to provide much-needed technical assistance and capacity building in rural areas. One of the most significant non-capital needs in most rural areas is the capacity to develop the economic and community development strategies necessary to attract private investment capital and Federal and State assistance. The vast majority of rural communities are served by part-time officials who do not have the time or necessary training to compete with large communities for funding that may be available to them. The funds requested under this program will aid in providing that invaluable assistance to allow communities to take the first step in assisting themselves.

To illustrate this, grant assistance under this program, in the amount of \$114,600, was provided to the Southernmost Illinois Delta Empowerment Zone, Inc., located in Ullin, Illinois. This area has experienced the loss of over 150 jobs in the last 3 years. The Rural Business Opportunity Grant funds are being used to provide credit counseling, revolving loan fund financial assistance and administration, development of training programs, and to identify potential business and economic development opportunities in the Empowerment Zone area. Rural Cooperative Development Grant Program for the Rural Cooperative Development Grants (RCDG) Program, the fiscal year 2002 budget requests \$4.5 million. Included in this amount, over \$1.5 million would be used for projects which focus on assistance to small minority producers through their cooperative businesses.

This program complements our internal National and State Office technical assistance efforts by encouraging the establishment of centers for cooperative development. They provide expertise for conducting feasibility analysis, outreach, and other forms of technical assistance for new developing cooperatives.

An example of an RCDG is the Ala-Tom RC&D in Alabama. Four new, limited resource, and minority farmers' cooperatives were formed and continue to receive technical assistance in marketing techniques, governance structure, and cost-reduction strategies. They are the Southern Beef Growers' Cooperative, Southeastern Rabbit Cooperative, West Alabama Retail Cooperative, and West Alabama Farmers' Cooperative. Membership in these new cooperatives ranges from 30 to 100 farmers each.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS PROGRAM

The Appropriate Technology Transfer for Rural Areas (ATTRA) program provides technical information to producers and their advisors on the best sustainable production practices. A budget request of almost \$2 million is requested. This funding would support direct responses to over 16,000 inquiries from agricultural producers, extension personnel, and others on sustainable practices that reduce dependence on chemicals and is more environmentally friendly. ATTRA funding also provides support for a website that provides such information.

RURAL EMPOWERMENT ZONES AND ENTERPRISE COMMUNITIES GRANTS

For the Rural Empowerment Zones and Enterprise Communities, the President's fiscal year 2002 Budget requests almost \$15 million to provide grants to the 5 Rural Empowerment Zones and 20 Rural Enterprise Communities delegated under Round II of this initiative. The purpose of the initiative is to target Federal, State, and local resources to low-income rural areas to demonstrate that innovative, comprehensive, and strategic alliances between private, public, and non-profit entities can work in concert to improve the economic strength of rural communities.

SALARIES AND EXPENSES

Before closing, I would like to urge the Committee to provide the requested funding for Rural Development Salaries and Expenses. Managing a \$5.1 billion portfolio and providing service-oriented cooperative program of research or technical assist-

ance is a joint venture requiring both adequate program and Administrative funding. One cannot be achieved without the other.

Mr. Chairman, this concludes my formal statement on the fiscal year 2002 Budget. I would be happy to respond to any questions the Subcommittee may have regarding the Rural Business-Cooperative Service programs of the Rural Development mission area.

NATURAL RESOURCES CONSERVATION SERVICE

PREPARED STATEMENT OF PEARLIE S. REED, CHIEF

Thank you Mr. Chairman and members of the Committee for the opportunity to provide a summary of our 2002 budget request. Conservation is important to me. I've spent most of my life and my professional career devoted to addressing environmental problems and helping farmers and ranchers get sound conservation on the ground. The dedicated employees of the Natural Resources Conservation Service have made and continue to make a significant contribution in helping our Nation's land stewards conserve our vital resources.

I want to thank the Committee members for your support during the fiscal year 2001 appropriations process. I promise you that I will do my best to make sure NRCS effectively and efficiently delivers the conservation programs and projects we have been directed to implement. Your support means a healthier land and cleaner water for people all across America. Through conservation technical assistance we have been able to help land owners and operators install waste management systems and conservation buffers; improve irrigation efficiencies; enhance nutrient and pest management; control erosion; reduce salinity in the soil and water; and increase wetlands and wildlife habitats across this country.

Mr. Chairman, the fiscal year 2002 President's budget maintains or increases funding for most NRCS discretionary conservation programs, eliminates funding for conservation programs that have reached their statutory limitations, and proposes funding emergency programs from the President's National Emergency Reserve when natural disasters or emergencies occur.

DISCRETIONARY FUNDING

Overall, NRCS discretionary conservation programs reflect:

- Increased funding for mandatory pay raises of \$21.7 million;
- Increased funding of \$44 million for conservation technical assistance in support of the Conservation Reserve Program previously reimbursed through the Commodity Credit Corporation (CCC);
- Decreased funding of \$109.8 million for Emergency Watershed Protection Program typically funded by supplemental funding;
- Decreased funding of \$6.3 million for the elimination of funding for the Forestry Incentives Program; and,
- Decreased funding of \$2.3 million for the elimination of funding for American Heritage Rivers and Urban Resources Partnership.

Mr. Chairman, the budget details for the NRCS discretionary conservation programs are as follows.

Conservation Operations

The fiscal year 2002 budget request proposes a net increase of \$60.9 million from the fiscal year 2001 adjusted appropriations level of \$712.5 million. This increase is essential for NRCS to keep our field employees on board.

Specifically, the budget includes a \$44 million increase for providing technical assistance for Conservation Reserve Program participants. This technical assistance was previously reimbursed from the Commodity Credit Corporation (CCC). The budget also includes an additional \$19.1 million for mandatory pay increases. These increases are partially offset by a one-time decrease of \$2.2 million for termination of agency activities supporting the Urban Resources Partnership effort and American Heritage Rivers Initiative.

The \$44 million proposed for technical assistance funding in support of the Conservation Reserve Program will enable the enrollment of 2.24 million acres in CRP under a general signup, the farmable wetlands pilot, and continuous signup activities. The funding change is needed because there are insufficient funds under the CCC Section 11 funding cap and Congress has had to provide supplemental funding for several years to fund this important workload.

The budget proposes to continue performing work at the fiscal year 2001 level for Animal Feeding Operations (AFO) related workload. The NRCS workload analysis

reports show that there are approximately 272,500 AFOs in this country that need to develop or revise their waste management plans. NRCS is providing leadership and technical assistance in addressing the AFO related environmental concerns. Specifically, NRCS has helped to establish the nutrient management technical standards, developed the standards for the comprehensive nutrient management plans needed for AFO and is helping producers implement components of the plans. In fiscal year 2002, the AFO related workload will focus on the direct planning and application stage.

In fiscal year 2001, Congress provided \$18 million for the Grazing Land Conservation Initiative, a \$1 million increase in funding from past years. The fiscal year 2002 budget proposes to continue funding at that level. With the \$18 million level, NRCS is able to maintain staff needed to provide only priority technical assistance to private grazing landowners and managers.

In recent years, public concern for the environment and demand for NRCS technical assistance has grown significantly. The public concerns have included such issues as: pollutants from animal feeding operations; improper application of pesticides and fertilizers; inadequate nutrient management; agricultural air quality; continued excessive soil erosion on some lands and the resulting sedimentation; non-point sources of water quality degradation; the loss of prime and important farmlands; and invasive species on agricultural lands.

Few farmers and ranchers are able to respond to these public concerns without technical assistance from their local NRCS field office. Conservation Operations funding provided through the conservation technical assistance, soil survey, snow survey and water supply forecasting, and plant materials programs directly support local level technical assistance. We are able to provide one-on-one assistance with private land owners, farmers, ranchers and operators using up-to-date scientific information and techniques, detailed conservation plans, soils information, water supply information and plant science technology.

Mr. Chairman, NRCS would be able to continue this valuable assistance under the President's budget proposal.

Watershed and Flood Prevention Operations

For fiscal year 2002, the proposed budget provides approximately \$10 million for Flood Prevention Operations under the Public Law 534 authorities and \$90 million for Small Watershed Operations under Public Law 566 authorities. The proposal represents an increase of \$1.2 million for pay costs, offset by a decrease of approximately \$110 million for no new funding for the Emergency Watershed Protection Program (EWP).

Public Law 534 Flood Prevention Operations. Activities in this funding category are authorized in 11 specific flood prevention projects covering approximately 35 million acres. Under the fiscal year 2002 budget proposal, \$10 million will be provided for eligible high priority subwatershed projects that contribute to solving water quality and other environmental problems.

Public Law 566 Small Watershed Operations. In cooperation with local sponsoring organizations, State and other public agencies, NRCS provides technical and financial assistance to voluntarily plan and install watershed-based projects on private lands. Under the fiscal year 2002 budget proposal, \$90 million will be used to implement a watershed approach to a broad range of conservation issues, including water quality improvement, wetland restoration, agricultural water management, stream restoration, fish and wildlife habitat improvement and soil quality improvement. During fiscal year 2002, we estimate that over 500 projects will remain active and a minimum of eight new projects will be approved.

Emergency Watershed Protection.—After the government wide rescission was applied, EWP was funded in the amount of \$109.758 million for fiscal year 2001. Of this amount \$21.952 million is for technical assistance, \$52.883 million for financial assistance, and \$34.923 million for the purchase of floodplain easements. The fiscal year 2002 Budget proposes to fund any assistance needed through the National Emergency Reserve.

Of all EWP funds available, including carry over funds, in fiscal year 2001 to repair damages to waterways and watersheds resulting from natural disasters, NRCS has committed over \$170 million to all 50 states, Puerto Rico and the Pacific Basin. There are currently 104 ongoing projects in 40 states. NRCS has exhausted available funds for any new disaster or emergency activity in fiscal year 2001.

Aging Watershed Infrastructure.—The fiscal year 2000 and fiscal year 2001 appropriations bills included authorization to use \$8 million each year of EWP funds for pilot rehabilitation projects in Ohio, New Mexico, Mississippi, and Wisconsin. Fifteen dams in 10 watershed projects were selected in these four States to demonstrate the variety of alternatives that will be involved and issues that will be en-

countered with rehabilitation, as well as the many benefits. The planning is complete on all projects, designs are in progress, and implementation should begin this summer.

Watershed Surveys and Planning

The President's fiscal year 2002 budget proposal would essentially continue activities at a slightly increased level of \$116 thousand over the adjusted fiscal year 2001 appropriated level of \$10.844 million. This represents an increase for mandatory pay increases partially offset by a one-time decrease for technical assistance activities associated with the American Heritage Rivers Initiative. As in fiscal year 2001, these funds will be used to make cooperative river basin studies, floodplain management studies, floodplain insurance studies, and provide assistance to sponsoring local organizations in developing plans on watersheds.

Resource Conservation and Development (RC&D)

Mr. Chairman, the RC&D program plays a vital role in rural communities. NRCS works in partnership with local volunteers organized as Resource Conservation and Development Councils representing multi-county areas. Council members consist of public and private sector sponsors and other local organizations. The RC&D program was established to encourage and improve the capability of State and local units of government and local nonprofit organizations in rural areas to plan, develop, and implement programs for resource conservation and development. RC&D areas are sponsored by Council members who carry out the goals of the RC&D area plans.

Currently, 348 USDA designated RC&Ds serve 2,492 counties in all fifty States, the Caribbean, and the Pacific Basin. This represents an increase of 33 new councils from fiscal year 2000. Designated areas serve approximately 82 percent of the counties in the United States. In addition, NRCS currently has 27 application areas awaiting funding or designation.

In fiscal year 2001, NRCS received \$41.923 million in direct appropriation including the government wide rescission impact and \$1 million from the Fund for Rural America for a total program level of \$42.923 million. The President's budget proposes an increase of \$1 million to support mandatory pay increases.

COMMODITY CREDIT CORPORATION FUNDED CONSERVATION PROGRAMS

Several of the conservation programs funded from the Commodity Credit Corporation will have reached their fully authorized levels by the end of fiscal year 2001. They include the Wetlands Reserve Program, Wildlife Habitat Incentives Program, Farmland Protection Program, and Soil and Water Conservation Assistance. The President's budget does not include any proposal to extend those programs, the Administration will be working closely with congress throughout the next Farm Bill's development to reauthorize high priority conservation programs. While the following highlights the fiscal year 2002 budget proposals and recent program accomplishments for the CCC funded conservation programs.

Environmental Quality Incentives Program

In fiscal year 2001, EQIP received \$174 million from the Agriculture Appropriations Act and \$26 million, in supplemental appropriations, from the Omnibus Appropriations Act. EQIP funding provided by the Omnibus Appropriations Act were subject to the rescission, so the total funding available for EQIP in fiscal year 2001, is approximately \$199.943 million.

The fiscal year 2002 funding request of \$174 million reflects the same level of funding provided by the Agricultural Appropriations Act of 2001.

Since inception in 1997, over 2,150 conservation priority areas have been nominated and over 1,350 priority areas have received funding in at least one of the last four years. Over 180,000 contracts have been entered into EQIP, providing important conservation measures on over 34 million acres across this country.

During the past four years, almost \$597 million was obligated to producers as financial assistance to install conservation systems and practices to address locally identified resource issues. Of this amount, approximately \$300 million went to assist with animal waste management, grazing management, and irrigation water management. These funds have helped farmers and ranchers install waste storage systems, waste management systems and nutrient management practices on over 16 million acres. Grazing lands resource concerns were addressed with cost-share assistance on 84 million feet of fencing, 1.2 million acres of pasture and hay planting, and almost 1.7 million acres of brush management. Additionally, EQIP assisted farmers and ranchers throughout the country with upgrading irrigation systems and the establishment of irrigation water management to reduce drain on water sup-

plies, reduce salinity load in the Colorado River Basin and improve farming operations. The remaining \$297 million was used to address a variety of locally identified resource issues and concerns including soil erosion control which benefits water quality and sustained soil productivity; forest land and forest fire fuel management, upland and wetland wildlife management, habitat restoration and improvement and farmland protection.

The budget proposal would continue to address these important conservation concerns.

Wetlands Reserve Program

The Wetlands Reserve Program (WRP), originally authorized by the Food Security Act of 1985 and subsequently amended by the 1990 and 1996 Farm Bills, is a voluntary program that provides technical and financial assistance to eligible landowners to address wetland, wildlife habitat, soil, water, and related natural resource concerns on private lands in an environmentally beneficial and cost effective manner.

The fiscal year 2001 Appropriations Act increased the maximum number of authorized enrollment acres for the program by 100,000 acres to 1,075,000 acres. By the end of fiscal year 2001, program activity will have reached this limitation.

Landowners are provided three program participation options: (1) short-term 10-year cost-share agreement restorations; (2) mid-term 30-year conservation easement restorations; and (3) permanent easement based restorations. Financial assistance in the form of easement payments and restoration cost-share assistance is included. Technical restoration and management assistance is also provided.

Mr. Chairman, in fiscal year 2001, NRCS anticipates enrolling 140,000 acres into WRP using \$181.8 million for financial and technical assistance. The President's budget request does not include a request to increase acreage enrollment at this time, but this will be included in the upcoming farm bill debate.

Agricultural Management Assistance Program

The Agricultural Management Assistance Program (AMA) is authorized by the agriculture Risk Protection Act of 2000 (ARPA). The program provides cost-share assistance to producers to construct or improve water management structures or irrigation structures; plant trees for windbreaks or improve water quality; and mitigate crop failure risks through production diversification or resource conservation practices, including soil erosion control, integrated pest management, or transition to organic farming. AMA also provides cost-share assistance to producers to enter into futures, hedging, or options contracts in a manner designed to help reduce production, price, or revenue risk; and enter into agricultural trade options as a hedging transaction to reduce production, price, or revenue risk.

ARPA provides \$10 million annually through the CCC for AMA cost-share assistance in 10–15 States, as determined by the Secretary, in which participation in the Federal Crop Insurance Program is historically low. The fifteen states selected by the Secretary to participate in the program are Connecticut, Delaware, Maine, Maryland, Massachusetts, Nevada, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Utah, Vermont, West Virginia, and Wyoming. In 2001, NRCS will receive \$6 million in AMA funding with the balance going to Risk Management Agency and Agricultural Marketing Service.

The President's budget assumes continuation of the program into fiscal year 2002 as authorized by law. The distribution of these funds will be determined by the Secretary at a later time.

One-time fiscal year Funding

The Agriculture Risk Protection Act of 2000, as amended by the Agriculture Appropriations Act, 2001 and Omnibus Appropriations Act, 2001, provided new funding for Soil and Water Conservation Assistance (SWCA) and additional funding for the Wildlife Habitat Incentives Program (WHIP) and Farmland Protection Program (FPP) in fiscal year 2001.

WHIP provides cost-sharing for landowners to apply an array of wildlife practices to develop habitat that will support upland wildlife, wetland wildlife, threatened and endangered species, fisheries, and other types of wildlife. In fiscal year 2001, additional WHIP funding includes \$664,875 paid from carryover balances and \$12.5 million from ARPA. It is anticipated the NRCS will enroll 365,000 acres in long-term wildlife habitat agreements that provide benefits to upland acres, wetland acres, and acreage being threatened or with endangered species.

FPP provides cost-share for acquiring conservation easements or other interests to limit conservation of agricultural lands to non-agricultural uses. FPP acquires perpetual conservation easements on a voluntary basis on lands with prime, unique, or other productive soil that presents the most social, economic, and environmental

benefit. NRCS has received 100 proposals covering 778 farms and 174,800 acres with a total easement value of \$303 million. Requests for Federal dollars have exceeded \$116 million. While no decisions have been made to date, NRCS anticipates obligating all of the \$17.5 million available for FPP by the end of fiscal year 2001.

SWCA provides cost-share and incentive payments to farmers and ranchers to address threats to soil, water, and related natural resources in areas not designated as national conservation priority areas. These voluntary efforts provide proven soil and water conservation practices on farms and ranches with an emphasis on conserving water or improving water quality. The program will provide \$20 million in fiscal year 2001 for cost-share and incentive payments to farmers and ranchers. Signup activities are expected to be completed in fiscal year 2001.

The President's budget does not propose additional funding for these programs.

CONSERVATION THROUGH PARTNERSHIPS

Mr. Chairman, as you know, NRCS has operated since its creation through voluntary cooperative partnerships with individuals, state and local governments, and other Federal agencies. That partnership is as important today as it ever was. In fact, it may be even more important, if we are to meet the challenging conservation problems facing our Nation's farmers and ranchers.

NRCS has worked with more than 5 million farmers, ranchers, producers, operators, and private landowners as well as local communities to help them conserve their natural resources by gaining knowledge about new conservation problems and solutions, by providing guidance and advice, and by developing and helping implement conservation plans. NRCS does this by working with nearly 3,000 local conservation districts that have been established by state law and with American Indian Tribes and Alaska Native Governments.

State and local governments contribute substantially to the conservation effort, with both people and funding to complement NRCS technical and financial assistance. Approximately 7,400 FTE of assistance is provided annually by NRCS partners and volunteers. In addition, state and local governments match dollar for dollar, for every one Federal dollar provided for conservation. And Americans have generously given their time to volunteer with NRCS as part of the Earth Team Volunteers effort. In fiscal year 2000, approximately 38,000 people volunteered their time locally, working approximately 430 FTE.

And we work closely with other Federal agencies such as our sister agencies in the Department of Agriculture, the Forest Service, Farm Service Agency, and Rural Development, as well as Agricultural Research Service, Cooperative State Research, Education and Extension Service and other Departments, including the Environmental Protection Agency.

Good conservation doesn't just happen. It takes all of us, including Congress, working together to make it happen. This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

OFFICE OF COMMUNICATIONS

PREPARED STATEMENT OF KEVIN HERGLOTZ, ACTING DIRECTOR OF COMMUNICATIONS

Mr. Chairman and members of the Subcommittee, I am pleased to discuss the fiscal year—fiscal year 2002 budget request for the Department of Agriculture's Office of Communications.

When Congress wrote the law establishing the U.S. Department of Agriculture in 1862, it said the department's "general designs and duties shall be to acquire and to diffuse among the people of the United States useful information on subjects connected with agriculture in the most general and comprehensive sense of the word." The Office of Communications coordinates the implementation of that original mandate.

The Office of Communications coordinates communications with the public about USDA's programs, functions, and initiatives. It is a crucial link in the Department's efforts to protect and inform consumers by providing information on a broad range of topics such as food safety and issues that may affect consumer confidence or cause concern such as Foot and Mouth Disease (FMD) and bovine spongiform encephalopathy (BSE). It also coordinates the communications activities of USDA's seven major mission areas in their efforts to provide timely and accurate information to the general public and the Department's other constituencies, and provides leadership for communications within the Department to USDA's employees.

The Office of Communications is adopting new technologies to meet the increased demands for information. Using the Internet's world wide web, radio, television and

teleconference facilities, we are able to ensure that the millions of Americans whose lives are affected by USDA's programs receive the latest and most complete information. The Office of Communications' 5-year strategic goal is:

To support the Department in creating a full awareness among the American public about USDA's major initiatives and services. This is essential to providing effective information services and efficient program delivery and should result in more citizens-especially those in under served communities and geographic areas-availing themselves of helpful USDA services and information.

The Office of Communications will continue to take an active part in policy and program management discussions by coordinating the public communication of USDA initiatives. We will continue to provide centralized operations for the production, review, and distribution of USDA messages to its customers and the general public. We will also monitor and evaluate the results of these communications. Staff will be instructed in using the most effective and efficient communications technology, methods, and standards in carrying out communications plans.

We intend to improve communications with USDA employees, especially those away from headquarters. This will enhance their understanding of USDA's general goals and policy priorities, programs and services, and cross-cutting initiatives.

Our office will also work hard to meet our performance goals and objectives. We will work to communicate updated USDA regulations and guidelines, conduct regular training sessions for USDA communications staffs about using communication technologies and processes to enhance public service, foster accountability for communications management performance throughout USDA, and continue to work to create a more efficient, effective and centralized Office of Communications. Increasing availability of USDA information and products to under served communities and geographic areas through USDA's outreach efforts is integral to our performance efforts. The Office of Communications will also provide equal opportunity for employment and promote an atmosphere that values individual differences.

FISCAL YEAR 2002 BUDGET REQUEST

The Office of Communications is requesting a budget of \$8,894,000. This is a net increase of \$290,000 over our fiscal year 2001 budget. The net increase includes \$72,000 for annualization of the fiscal year 2001 pay raise and \$218,000 for the anticipated fiscal year 2002 pay raise.

Our central task is to ensure the development of communications strategies which are vital to the overall formation, awareness and acceptance of USDA programs and policies. Since more than 91 percent of the Office of Communications' obligations are for salaries and benefits, this increase is vital to support and maintain staffing levels for current and projected demands for our products and services. Since our current budget leaves little flexibility for absorbing increased costs, the Office of Communications cannot absorb these additional salary costs without placing severe constraints on daily operations. This could result in an unacceptable decrease in the Office of Communications' ability to support the Secretary in providing timely and accurate information to the public, the media, business and other constituencies. When dealing with issues such as Foot and Mouth Disease (FMD), bovine spongiform encephalopathy (BSE), forest fires, floods or issues of food safety, the Secretary needs every available resource to communicate with the media, the Department's constituencies and our international partners. Reductions in OC's capabilities caused by a loss of the proposed salary costs would diminish the Secretary's ability to respond to the local, national and international issues that confront the Department today and directly affect significant portions of the American public.

This concludes my statement, Mr. Chairman. I will be pleased to respond to any questions.

OFFICE OF THE GENERAL COUNSEL

PREPARED STATEMENT OF JAMES MICHAEL KELLY, ACTING GENERAL COUNSEL

INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am pleased to have this opportunity to provide you with an overview of our agency and to address some of the current activities and issues facing the Department.

MISSION

The Office of the General Counsel (OGC) is the law office for the Department. As an independent, central agency within the Department, OGC provides legal advice

and services to the Secretary of Agriculture and other officials of the Department of Agriculture with respect to all USDA programs and activities.

ORGANIZATION

OGC's services are provided through 12 Divisions in Washington and 18 field locations. The headquarters for OGC is located in Washington, D.C. The Office is directed by a General Counsel, a Deputy General Counsel, a Director for Administration and Resource Management, and six Associate General Counsels. The attorneys located in headquarters are generally grouped in relation to the agency or agencies served. Our field structure consists of five regional offices, each headed by a Regional Attorney, and 13 branch offices. The field offices typically provide legal services to USDA officials in regional, State, or local offices.

CURRENT ACTIVITIES AND ISSUES

INTERNATIONAL AFFAIRS AND COMMODITY PROGRAMS

During this past year, OGC has provided significant legal assistance to officials of numerous offices in the Department regarding domestic commodity programs and international affairs matters affecting agriculture. Primarily, these officials are from the Farm Service Agency (FSA) and the Foreign Agricultural Service (FAS). For FSA, OGC has provided significant assistance with respect to income, commodity, conservation and disaster assistance programs. These activities involved the clearance of approximately 50 regulations supporting programs that have expenditures of approximately \$10 billion. These diverse programs included assistance for producers of tobacco, cotton, cranberries, apples, potatoes, livestock, dairy products and honey. OGC attorneys devoted significant resources in dealing with numerous Commodity Credit Corporation (CCC) activities. This included: (1) the establishment of a payment-in-kind land diversion program involving CCC inventories of sugar; (2) a bio-fuel program to encourage the additional use of agricultural commodities in the production of fuel additives; and (3) a pilot program which permits the nation's elderly low-income population to purchase fresh fruits and vegetables at farmers' markets.

OGC has supported the work of FAS in the implementation of a number of major international trade and foreign assistance initiatives. Our involvement in the international trade area includes enforcement of the commitments received in the Uruguay Round Agreements and preparations for a new round of World Trade Organization (WTO) negotiations to strengthen international trading rules and address specific issues such as credit and credit guarantees and expanded free trade in the Americas. During fiscal year 2001, OGC was involved in the current round of WTO Agriculture Agreement negotiations. In addition, OGC was and will continue to be involved in negotiations to create a Free Trade Area of the Americas. OGC also continued its work with USDA agencies on issues arising in connection with the revised International Plant Protection Convention, a multilateral convention aimed at promoting international cooperation to control and prevent the spread of harmful plant pests.

OGC will continue to be actively involved in the enforcement and application of present international trading rules. During the past year, OGC participated in WTO consultations, panel consideration, appeals, and arbitrations involving various trade disputes. These included: (1) Japanese phytosanitary issues; (2) Canadian dairy export subsidies; (3) ensuring the European Union's compliance with the WTO decision striking the ban on imports of meat produced with growth-promoting hormones; (4) access to South Korean markets for U.S. beef; (5) defending U.S. safeguard actions on lamb meat and wheat gluten; (6) Canadian antidumping and countervailing duty actions against U.S. corn; (7) the imposition of countervailing duties by Chile on U.S. milk powder; and (8) consultations with Mexico on access for avocados.

OGC is extensively involved in providing legal advice for the export credit, supplier credit, and facilities guarantee programs. OGC continues to be extensively involved in negotiations on export credits and credit guarantees in agriculture taking place under the auspices of the Organization for Economic Cooperation and Development. OGC also provides extensive legal advice and review for the International Cooperation and Development Division of FAS regarding their international agricultural cooperative efforts and arrangements.

During the past year, OGC has been involved in the implementation of a large number of foreign assistance agreements donating agricultural commodities, including surplus commodities acquired by CCC. These agreements are under Title I of Public Law 83-480, section 416(b) of the Agricultural Act of 1949, and the Food for Progress Act. The implementation of these agreements involves extensive review of

draft agreements, commodity procurement, ocean transportation issues, and cargo loss and damage claims. In connection with these assistance programs, OGC extensively participated in developing the framework for instituting the Global Food for Education Initiative involving the donation of CCC stocks of agricultural commodities abroad. We expect the demand for legal services in connection with FSA, FAS, and CCC activities to increase in fiscal year 2002, especially in the preparation for new omnibus farm legislation.

FOOD AND NUTRITION DIVISION

With respect to USDA's domestic food assistance programs, OGC has been heavily involved in efforts related to the review of proposed legislation and the implementation and enforcement of new legislation aimed at welfare reform and other program improvements, as well as the ongoing program integrity and compliance initiatives. We expect the demand for legal services in connection with these activities to remain constant in fiscal year 2001 and 2002.

More specifically, during this past year, OGC attorneys worked closely with the Food and Nutrition Service (FNS) to implement the provisions of the Agriculture Research, Extension, and Education Reform Act of 1998 (AREERA), Public Law 105-185; the William F. Goodling Child Nutrition Reauthorization Act of 1998 (Goodling Act), Public Law 105-336; the Balanced Budget Act of 1997 (BBA), Public Law 105-33; and the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 (Immigration Reform Act), Division C of Public Law 104-208, the Electronic Benefit Transfer Interoperability and Portability Act of 2000 (Public Law 106-171), the Agricultural Risk Protection Act of 2000 (Public Law 106-224), and the Grain Standards and Warehouse Improvement Act of 2000 (Public Law 106-472). OGC provided assistance in connection with the implementation of the food stamp administrative payment reduction and alien eligibility provisions of AREERA, the legislative changes to the Child Nutrition Programs intended to ensure integrity in program administration brought about by the Goodling Act, and continuing assistance with implementation of BBA provisions regarding funding of food stamp education and training activities.

In connection with the Immigration Reform Act, OGC is representing USDA's interests in ongoing inter-agency discussions aimed at providing a uniform and predictable test for determining when the receipt of benefits renders an alien deportable, inadmissible or ineligible for adjustment of alien status as a result of being likely to become a public charge. OGC provided counsel on proposed legislation to provide capped Federal funding for State costs incurred for switching and settling interstate transactions under the requirement that electronic food stamp benefits be interoperable among States by October 1, 2002. OGC assisted in the formulation of legislation which enhances the exchange of information regarding participants in the National School Lunch Program (NSLP) with State health officials for the purpose of identifying children eligible for State children's health insurance programs.

OGC assisted in the development of legislative proposals to provide additional commodities to schools under the NSLP, to provide new administrative review procedures for institutions suspended from participation in the Child and Adult Care Food Program (CACFP), and to establish standards for proof of residency for individuals living in remote Indian or Native villages under the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). OGC also provided counsel with regard to a Department of Defense legislative proposal to create a subsistence benefit program to replace food stamp benefits for military personnel.

During fiscal year 2001, OGC assisted in the defense of Food Stamp Program litigation challenges raised by potential food stamp participants concerning State implementation of certain welfare reform provisions initiated by the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA), Public Law 104-193. These issues concerned State food stamp policies with respect to applicant awareness and access to the Food Stamp Program. OGC is also assisting in the defense of a class action lawsuit in New York State which challenges the implementation of the Debt Collection Improvement Act with regard to food stamp recipients. With respect to the Child and Adult Care Food Program, OGC has been working with counsel for several States in pursuing Federal and State administrative claims arising from audits performed by the Department's Office of Inspector General.

The implementation of the alien provisions of the PRWORA continues to generate litigation in several States. These lawsuits have, thus far, been successfully defended in the lower courts. Several cases are currently pending before appellate courts and the first petition for certiorari has been filed with the United States Supreme Court. These include: (1) a challenge to the constitutionality of a statutory provision which makes convicted drug felons ineligible for benefits under the Food

Stamp Program; (2) a favorable decision upholding the award of a \$1.3 million False Claims Act (FCA) judgement against a retail food store owner who had previously been convicted of trafficking in food stamps and who claimed that the FCA judgement, on top of the criminal sanctions, violated the double jeopardy and excessive fines clauses of the U.S. Constitution; (3) a favorable appellate court decision upholding the Secretary's formula for calculating civil money penalties against retail food stores that violate Food Stamp Program rules in the face of arguments that the formula violated the Administrative Procedure Act and the due process clause of the Constitution; (4) a decision upholding a statutory provision that makes suspension of retail food stores effective upon receipt of the notice of disqualification and provides immunity from damage actions based on losses sustained during administrative review in instances where the disqualification is reversed; and (5) the use of a cy-pres fund, a little used legal mechanism under which a fund is created to benefit a class of plaintiffs, in general, to avoid the necessity of determining claim amounts on an individual basis, in the settlement of a case in which \$2.3 million was made available to public and private food banks to purchase commodities for the hungry.

OGC reviewed an extensive revision of the Food Stamp Program regulations related to the attribution of the income of sponsors to sponsored aliens and an exhaustive revision of the Program's new application processing rules required by the implementation of the PRWORA. OGC reviewed and assisted in the development of new provisions regulating the participation of vendors in the WIC program, including provisions requiring more frequent State review of vendor compliance and the identification of vendors representing a high risk for program violations. OGC provided counsel on the availability of a portion of the Federal funds (provided in connection with meals) for use by sponsors of child care centers to recover their administrative costs in the CACFP. OGC provided assistance to the Office of Inspector General in developing an audit regarding a major CACFP day care sponsor in order to simplify the audit findings and respond to issues likely to be raised in anticipated litigation arising out of the audit. OGC also provided assistance to USDA and Food and Drug Administration officials in developing a consistent approach to the safety issues inherent in the use of banked human breast milk and to determine when and how such milk may be used in the WIC program. OGC continued to address numerous issues arising from the nationwide rollout of electronic benefit transfer (EBT) in the Food Stamp Program and demonstrations of the use of EBT in other food assistance programs. OGC also reviewed proposed legislation to require interoperability of EBT cards among States implementing EBT systems.

REGULATORY AND MARKETING PROGRAMS

Providing strong legal support to the Department's food safety and inspection programs has been and will continue to be one of OGC's top priorities. We continue to work closely with Food Safety and Inspection Service (FSIS) on the implementation of the Hazard Analysis and Critical Control Points (HACCP)/Pathogen Reduction rule and on the HACCP-based pilot programs to test new inspection models that the agency believes will lead to more effective inspection and better use of scarce resources. In that regard, we worked with the Department of Justice, on a remand from the Court of Appeals, to successfully defend the validity of the HACCP rules and FSIS' authority to test redesigned inspection models in a case brought by the American Federation of Government Employees, the Community Nutrition Institute, and several FSIS meat inspectors. In a decision issued on January 17, 2001, the District Court found that the modified inspection procedures satisfied the Federal Meat Inspection Act and the Poultry Products Inspection Act.

We also provide comprehensive legal support to FSIS' rulemaking activities. In the recent past, we have worked with FSIS staff on the residue policy regarding carcass disposition; the policy regarding E.coli 0157:H7 contamination of beef products; shell egg and egg products inspection regulations; performance standards for online antimicrobial reprocessing; sharing recall information with state and other federal agencies; and regulations governing retained water in meat and poultry products.

In the past year, OGC has provided extensive legal services to the Agricultural Marketing Services (AMS) in various matters and will continue to work closely with AMS in the year ahead. OGC continues to provide assistance in the reform and consolidation of federal dairy marketing orders. A proposed rule on Class III and IV pricing was issued in May 2000. AMS issued an interim final rule in November 2000. OGC continues to work on litigation on these pricing regulations and it is anticipated that a final rule will be issued in January 2002.

The organic standards program continued to be an OGC priority. We provided extensive legal services working with AMS officials as they developed a final rule im-

plementing the Organic Foods Production Act of 1990. On December 21, 2000, a final rule was published that would establish a National Organic Program under that Act. Currently, we are working with the organic program staff in connection with a variety of issues relating to implementation of the program. We will continue to work with AMS as this program is further implemented.

The Commodity Promotion, Research, and Information Act of 1996 provides general authority for the Secretary to issue orders establishing new research and promotion programs. Prior to enactment of this statute, research and promotion programs were authorized under individual statutory authorities. The 1996 Act provides authority to tailor a program according to the individual needs of an industry. We are currently providing legal services to AMS in connection with industry-funded promotion, research and information programs implemented under this Act. To date programs for blueberries and peanuts have been established. Further, representatives of the apple, mango, and sweet corn industries have expressed interest in establishing programs. We will continue to work with AMS as these new research and promotion programs are proposed. We have continued to provide extensive legal services to AMS in connection with changes to the honey program as a result of the 1998 amendments to the Honey Research Promotion and Consumer Information Act and proposed changes to the watermelon program under the Watermelon Research and Promotion Act. OGC also is working with AMS in the development of a research and promotion program under the recently enacted Haas Avocado Promotion, Research and Information Act 2000.

OGC provided extensive legal services to AMS in connection with implementation of the Livestock Mandatory Reporting Act of 1999. OGC assisted AMS staff in drafting a proposed rule that would establish a mandatory program of reporting market information regarding the marketing of cattle, swine, lambs, and products of such livestock. A final rule was published in the Federal Register on December 1, 2000. This program provides information on pricing, contracting for purchase, and supply and demand conditions for livestock, livestock production, and livestock products. OGC also worked extensively with AMS in the development of a new inspection and certification program for equipment used in the slaughter, processing, and packaging of livestock and poultry products. A final rule concerning this program was published in the Federal Register on January 5, 2001.

Safeguarding the animal and plant health of the United States is a matter of paramount importance to the Department. OGC has partnered effectively with the Animal and Plant Health Inspection Service (APHIS) for many years in carrying out these program responsibilities and will continue to do so in the future. APHIS' responsibilities have become vastly more complex, requiring not just effective safeguarding measures, but programs to ensure the safe and smooth entry of people and goods into the United States, and the facilitation of agricultural trade in compliance with our international obligations. Similarly, OGC's responsibilities and the demands for timely and effective legal support of APHIS inspection and regulatory activities have increased as well. A new Plant Protection Act was passed in June, 2000. We worked very diligently with APHIS as the bill moved through the legislative process, and our attorneys are working just as hard in assisting APHIS with implementation of the new law. In addition, we have been extensively involved in APHIS' response to the Safeguarding review of its Plant Protection and Quarantine activities conducted by the National Plant Board. This has entailed detailed analysis of and responses to over 320 recommendations regarding APHIS' activities and how they are performed.

We have an exceptional relationship with APHIS program officials and with their regulation development staff, and we have worked very closely with them in connection with an array of rulemaking activities that included rules for the movement of certain land tortoises with ticks that are vectors of Heartwater disease, the regulation of sheep and goats for scrapie, and rules dealing with bovine tuberculosis and pseudorabies in swine. On the plant side, we have assisted with regulations for Plum Pox in Pennsylvania, citrus canker in Florida, noxious weeds, and the glassy winged sharpshooter. With our help, APHIS developed an advance notice of proposed rulemaking concerning regulation of horses due to Equine Viral Arteritis under the animal quarantine laws. In connection with the facilitation of international trade, our attorneys provided very effective support for APHIS activities related to the development of rules that will allow new commodities to enter U.S. markets while ensuring that America's agricultural resources are not impaired and that plant and animal health in the U.S. are not compromised. These regulations have included requirements for an array of commodities ranging from fruits and vegetables to animals and animal products. They include the regulation of animals and animal products due to bovine spongiform encephalopathy (BSE) or Mad Cow Disease, Regionalization of the European Union due to Classical Swine Fever, citrus

from Argentina, the regulation of solid wood packing material, the importation of artificially dwarfed plants, invasive species, and accreditation of laboratories for certification of seed for export.

Our attorneys have also dedicated substantial resources to defending APHIS program activities and regulations in the federal courts, including a challenge to the Department's authority to order disposal of sheep in Vermont which were diagnosed with a transmissible spongiform encephalopathy (TSE), and a challenge to APHIS regulations allowing the importation of citrus from Argentina. We also handled a variety of administrative cases on behalf of APHIS to enforce its regulations. These cases have included prosecutions for violations of the standards for accredited veterinarians, the illegal importation of plant and animal products, violations of the regulations governing the interstate movement of various plants, animals and plant and animal products, and the falsification of phytosanitary certificates.

During fiscal year 2001, OGC anticipates expending substantial resources in connection with the Horse Protection Act Program. OGC attorneys serve as agency counsel in administrative enforcement actions brought under this statute, and in fiscal year 2000, OGC initiated 17 enforcement cases. We anticipate that the number of enforcement actions will increase in fiscal year 2001. In addition, OGC anticipates providing assistance and counsel to APHIS in connection with the training of Veterinary Medical officers working in the Horse Protection Program, and in the drafting, implementation and legal defense of APHIS's annual Operating Plan for the horse show season.

OGC provided substantial legal resources to APHIS in connection with enforcement of the Animal Welfare Act. In fiscal year 2000, OGC initiated 42 administrative enforcement cases. We expect that the number of enforcement cases will not diminish in fiscal year 2001. We also provided drafting assistance to APHIS in a number of rulemaking dockets concerning marine mammals held in captivity, confiscation of suffering animals, and licensing requirements for applicants.

In the Trade Practices area, we provide legal services under the Packers and Stockyards Act (P&S Act), the Perishable Agricultural Commodities Act (PACA), and the Capper Volstead Act and serve as the liaison for the Department under the Memorandum of Understanding between the Department, the Federal Trade Commission and the Department of Justice. Of special note this year under the P&S Act, we are litigating two enforcement cases against large packers alleging violations of the Act. Our complaint against Excel Corporation alleges that the packer engaged in an unfair practice when it changed the formula by which it calculated lean percent in slaughter hogs, a calculation that directly affected the price the packer paid to producers, without telling producers of the change. As a result of the change, the packer paid lower prices for 80 percent of the hogs it purchased. In the second case, the complaint alleges that Farmland National Beef Packing Company (Farmland) subjected a feedlot to an unreasonable prejudice or disadvantage by retaliating, changing its buying practices (and failing to buy at all) after the feedlot manager criticized the packer in a letter to a farm journal. The hearing in the Excel case has been completed and the briefing will be completed by September 2001; the Farmland hearing will be completed sometime this summer. In addition, we are assisting the Packers and Stockyards Programs (P&SP) of the Grain Inspection, Packers and Stockyards Administration (GIPSA) in its regulatory initiatives, including a series of regulations to clarify the requirements of the Packers and Stockyards Act with regard to recordkeeping and contract disclosure. OGC also referred a case against Perdue, Inc. to the Department of Justice alleging that Perdue had violated the P&S Act by its actions regarding the placement of producers on a rider production contract without meeting the contractual conditions precedent to the use of that contract. DOJ filed the complaint in that case and the case was settled with Perdue's agreement to clarify the conditions under which the rider contract would be used and the meaning of the terms the contract employs. As a result of last year's General Accounting Office report recommending changes in P&SP's investigation procedures in competition cases, OGC has agreed to work closely with P&SP on the process by which its investigations are planned and implemented and to assign attorneys to work with agency investigators in the initial stages of case development and investigation. Congress provided additional resources to OGC for the staffing necessary to provide these additional legal services, and OGC's participation in the early stages of P&SP's case investigation is now beginning.

OGC has provided significant legal resources to the PACA program this year, with a special emphasis on cases arising out of Operation Forbidden Fruit, the investigation and indictment of a number of federal inspectors and produce wholesalers for altering inspection documents as a result of bribes. A large number of reparation cases, cases between private parties that are determined by the Secretary, have been filed seeking damages as a result of the altered inspection documents. Again

this year, we have provided significant legal resources in the preparation of cases alleging that produce companies have misrepresented the kind or quality of produce they are selling. In one case, the Department alleges that an apple distributor misrepresented the variety of apple it shipped to retailers in more than two hundred transactions.

Also of significance in the Trade Practices area this year, OGC continues to act as liaison to the Department of Justice and the Federal Trade Commission on competition issues, pursuant to the Memorandum of Understanding between the three agencies. OGC expedites the provision of data or expertise to the Department of Justice (DOJ) on agricultural issues as DOJ or the FTC investigates firms or reviews mergers or acquisitions of agricultural businesses. OGC is also working closely with the FTC and DOJ to train investigators and economists of the Department's Packers and Stockyards Programs (P&SP) in investigative techniques and case preparation as recommended by the September GAO report on P&SP's investigation of competition cases.

RURAL DEVELOPMENT

OGC also provides legal services to USDA agencies which manage some of America's largest loan portfolios. OGC continues to be heavily involved in debt collection and farm foreclosure actions with many debts going back to the emergency loan program of the 1980's. OGC continues to defend several lawsuits involving hundreds of multifamily housing projects whose owners want to prepay their loans and thereby remove a significant number of low income housing units from rural America. We continue to provide assistance to the Farm Service Agency and other agencies within the Rural Development mission area in implementing the Debt Collection Improvement Act of 1996, specifically involving credit reporting, electronic transfer of funds, offset, and cross servicing. OGC continues to work with the Rural Business-Cooperative Service (RBS) in reviewing most of their cooperative agreements and in improving their cooperative agreement process. We have also been working with RBS' Office of Community Development in the designations of Empowerment Zones and Communities. We are working to resolve an increasing number of major defaults on Business and Industry loans. We also are now working with the Rural Housing Service (RHS) in implementing the Housing Administration Grant Program for Agriculture and Seafood Processor Workers authorized under Public Law 106-387.

Also in the Rural Development area, OGC successfully assisted RHS, which worked in conjunction with the Department of Housing and Urban Development and the Department of Veterans Affairs to streamline the housing loan application process for Native American borrowers on Indian Reservations.

Implementation of the Agriculture Risk Protection Act of 2000 has increased the responsibilities of the Risk Management Agency. Compliance efforts will be enhanced, requiring extensive legal service to develop administrative cases against producers, agents, loss adjusters, and reinsured companies. Millions of dollars are now available for contracting and reimbursement, all of which will require a significant time for legal review. RMA continues to implement new risk management programs developed by the private industry to expand the number of producers covered under that safety net.

We continue to work with Department officials to reduce regulatory burdens, eliminate obsolete or unnecessary regulatory requirements, and streamline regulations, particularly in the areas of rural, farm and utility lending. For example, OGC has worked extensively with FSA over the past year to rewrite all of their Farm Loan Programs loan making and servicing regulations to reduce regulatory burdens where possible and to clearly state agency policy. We are assisting RHS in streamlining and rewriting loan making and servicing regulations for their multiple family housing loan program and their environmental regulations. Our efforts on these long-range projects will continue into fiscal year 2002.

The need for legal services by the rural utility programs of the Rural Utilities Service (RUS) and the Rural Telephone Bank (RTB) increased significantly during fiscal year 2000 as RUS made significant changes in existing financing programs and implemented a number of new programs. The changes included development of regulations changing the basic lending policies in the telecommunications program, the development of fast track financing for certain categories of new generation facilities, the implementation of a loan and grant pilot programs for funding broadband telecommunications facilities in rural areas, and the implementation of a fundamentally new treasury rate loan program. In addition, RUS experienced dramatic growth in its existing lending programs, with the electric program experi-

encing an increase of over a \$1 billion targeted to financing new generation capacity.

Substantial legal services continued to be required in the documentation of RUS loans and grants, in servicing and collection issues associated with the \$38 billion RUS electric and telecommunications loan portfolio, and with a series of projects that responded to the dynamic changes occurring in the electric and telecommunications industries. The demands for legal services from RUS's power supply financing program have been particularly dramatic as OGC and RUS worked on financing requests for some 25 power supply projects totaling in excess of \$2.5 billion. To respond to this growth, OGC helped RUS and a private market lender develop fast track financing for combustion turbines. OGC played a key role in developing the agreement, implementing documents and a programmatic environmental analysis for combustion turbines that will greatly streamline the environmental procedures.

OGC worked closely with RUS on a number of complex projects reflecting the changing electric industry including mergers and alliances, corporate reorganizations, the unbundling of transmission, generation, and distribution services, the restructuring of existing power supply arrangements and the development of the new power marketing arrangements. These projects frequently involve RUS loans and guarantees or lien accommodations of hundreds of millions of dollars and require the development of complex new contractual and security arrangements.

Legal services were required to implement a newly authorized treasury rate loan program targeted to distribution borrowers and to advise and assist RUS on a series of distribution projects reflecting the changing electric industry. Borrowers in a number of states have been undertaking to restructure and rationalize their retail operations through the sale or exchange of facilities and service territory. Among other matters, the projects often required substantial revision in the terms of the RUS required wholesale power contracts, in the security arrangements for RUS loans, and in the governing structure of the surviving entity.

In the area of loan collection activities, OGC provided legal support for a number of projects involving financially troubled borrowers. OGC worked closely with RUS to develop both a corporate and financial restructuring of the borrowers that protected the government's financial and programmatic interests. State retail competition legislation has made this project particularly problematic.

In the RUS telecommunications program, OGC worked closely in the development of a series of new policies and regulations addressing many industry changes including, for example, the definition of adequate telecommunications service, the convergence of technology, and the new structures for delivering telecommunications services. New programs requiring the development of procedures and implementing documents included the weather radio grant program, and the broadband loan and grant pilot program. OGC also provided legal services in connection with the operations of RTB on a range of matters including the privatization of the RTB and the capital structure and the rights of certain classes of stockholders of RTB.

In the RUS water and waste program, legal services were required in connection with a number of cases in litigation in which municipalities and other public bodies seek to condemn or otherwise take water and waste systems financed by RUS notwithstanding federal statutory protections afforded those systems.

NATURAL RESOURCES

In the natural resources area, the Natural Resources Division and OGC Field Offices have been involved in a number of extremely significant undertakings concerning national forest management and natural resources conservation programs. We also assisted two of our client agencies, the Forest Service and the Natural Resources Conservation Service, daily in support of their program missions.

We have provided assistance nationally to the Natural Resources Conservation Service (NRCS) in administering a number of conservation programs, on private or other non-Federal farm, pasture and non-industrial forest lands, including the Highly Erodible Land and Wetland Conservation Programs, Environmental Quality Incentives Program, Wetland Reserve Program, Farmland Protection Program, and the Emergency Watershed Protection Program.

OGC also continues to provide legal counsel to NRCS in the enforcement of the highly erodible land and wetland conservation compliance provisions of the Food Security Act of 1985. OGC assists NRCS in determinations for enforcement and for granting statutorily-authorized variances. OGC defended the agency in administrative appeals and lawsuits challenging the implementation of the conservation provision of the Food Security Act.

Additionally, OGC continues to provide legal services in support of the Wetlands Reserve Program (WRP). As of the end of fiscal year 2000, that program has ac-

quired easements on 935,001 acres. OGC reviews titles for easement acquisitions, as well as restoration contracts.

OGC provided legal counsel to the NRCS in promulgating the agricultural pollution and natural resources conservation elements of the President's Clean Water Action Plan, including the joint EPA/USDA Strategy for Animal Feeding Operations, and in defending those elements in litigation. OGC also assisted NRCS and the Forest Service in reviewing the regulations promulgated by the Environmental Protection Agency under the Clean Water Act for total maximum daily loads of pollutants. The increasing concern and focus on water quality matters, particularly regarding non-point sources of pollution, have required a substantial increase in the level of legal services that we provide to the Forest Service and the Natural Resources Conservation Service.

In the forest management program area, OGC provided litigation support to the Department of Justice in collecting millions of dollars in damages owed the government by defaulting timber sale purchasers. OGC provided assistance to the Department of Justice in the second trial of a case concerning the collection of millions of dollars in damages owed the government. OGC also assisted in limiting contractual damages payable by the client agency for environmentally protective actions. OGC provided legal assistance on the defense of approximately 35 lawsuits challenging timber sale suspensions, modifications and cancellations and alleging the right to takings compensation pursuant to the Fifth Amendment to the U.S. Constitution. OGC provided legal assistance on two matters involving the Sustained Yield Management Act of 1944, a statute that provides the authority for the Secretary to establish sustained yield units on national forest land for the continuous supply of timber and forest products in order to provide for community stability.

The nationally controversial timber sale program in Alaska continues to require significant legal services. Attorneys in both the Washington office and the Juneau field office are assisting with litigation claims of \$1.5 billion arising from denial of contract claims on the Alaska Pulp Corporation (APC) 50-year timber sale contract on the Tongass National Forest. APC's aggressive litigation stance required the commitment of significant OGC time and resources to defend against its \$1.5 billion claim and the related massive discovery effort. Expert discovery on damages issues is scheduled to begin on June 1, 2001. It is expected that the damages phase of the litigation will be as time/resource-intensive as the liability phase.

OGC provided legal advice and assistance to the Forest Service regarding implementation of stewardship contract pilot projects aimed at harvesting timber while simultaneously advancing forest resource management objectives. Under these stewardship contracts, timber is harvested and contractors provide services designed to achieve land management goals, including road & trail maintenance, watershed restoration and restoration of wildlife habitat.

OGC advised on planning issues with respect to those forest plans currently undergoing revision. The number of revisions should increase. Compliance with the Quincy Library Group pilot project (section 401 of the fiscal year 1999 Interior Appropriations Act, Public Law 105-277) and Sierra Nevada framework also requires continuing OGC advice. OGC also provided and will continue to provide substantial assistance to the Department and the Forest Service related to revision and implementation of the land and resource management planning regulations and various transportation and roads initiatives. In addition, providing preventive law advice to harmonize Endangered Species Act (ESA) compliance with the procedural requirements of the National Environmental Policy Act (NEPA) and the National Forest Management Act (NFMA) requires continued OGC attention, particularly with respect to taking into account new information and coordinating management decisions for wide-ranging species such as salmon, Indiana bats and lynx. OGC continues to advise on interagency efforts, such as streamlining ESA and NEPA compliance, wildland fire management, and the application of the Migratory Bird Treaty Act. Approximately 100 cases are pending challenging Forest Service decisions on NEPA, NFMA and ESA grounds, and the current trend of increased litigation is expected to continue. OGC assistance is also provided for project administrative appeals, hundreds of which are filed each year.

In real property matters, OGC provides extensive legal assistance to the Forest Service and the Natural Resources Conservation Service. In fiscal year 2000, over \$300 million was appropriated to USDA agencies for the acquisition of lands and interests in lands. These land transactions involve considerable legal involvement in contracting, title work and closing. Additionally, legal counsel is provided for the entire spectrum of real estate matters related to the National Forest System including title claims, trespass, appraisal, survey, special use authorizations and similar issues.

OGC provides legal services regarding land title claims involving private parties, Indian tribes and pueblos, and state and local governments. These claims arise variously under treaties, Spanish land grants, and statutory grants by Congress. Last year, OGC participated in the successful settlement of land claims of the Pueblo of Santo Domingo through enactment of Public Law 106-425. Other settlements are in active negotiation.

In July, 2000, the Forest Service completed the single largest land acquisition ever undertaken with funds appropriated from the Land and Water Conservation Fund. The Baca Ranch in the State of New Mexico was acquired for \$101 million and designated by Congress as the Valles Caldera National Preserve. The Preserve is a 97,000 acre area surrounded by the Santa Fe National Forest and contains nationally significant scenic, geologic and wildlife resources. OGC handled the complex contractual elements of the acquisition as well as providing counsel for the authorizing legislation. OGC will continue to provide legal advice and assistance to the Valles Caldera Trust related to management of the Preserve.

Additionally, OGC has provided an increasing amount of advice to the Forest Service in its activities related to hydro power projects, in part due to the approximately 200 relicensing proceedings before the Federal Energy Regulatory Commission (FERC) occurring in the next 10 years for projects located on National Forest System (NFS) lands. OGC is assisting the Forest Service in its efforts to obtain fair market value for the use of national forest lands for these hydro power projects.

In the minerals area, OGC provided extensive legal services to the Forest Service in identifying needed changes to the regulations governing the mining of metals on the tens of millions of acres of land administered by that agency which are subject to the United States mining laws. OGC also continued to devote significant resources to defending an administrative challenge to the validity of numerous mining claims in a National Recreation Area (NRA) and to defending a related lawsuit alleging that a statute effected a taking of related mining claims in the NRA. OGC also furnished substantial assistance on issues pertaining to the United States mining and mineral leasing laws arising from a rule which would bar the construction or reconstruction of roads in inventoried roadless areas.

In Congressional matters, OGC provided extensive assistance in drafting legislation relating to the Administration's fiscal year 2001 budget for the Forest Service, including the HIRE proposal to establish a mandatory appropriation to fund ecosystem restoration projects and to create jobs for local workers. OGC reviewed and analyzed numerous provisions of the 2001 Department of the Interior and Related Agencies Appropriations Act, including Title IV funding for hazardous fuel reduction activities. OGC furnished substantial legal assistance in drafting, reviewing, and implementing legislation stabilizing payments to states by decoupling them from forest receipts.

In the recreation area, OGC continued to provide extensive assistance to the Department of Justice in the successful defense of the Forest Service's noncommercial group use regulation. Nine federal district courts and four federal courts of appeals have upheld the constitutionality of the regulation under the First Amendment. OGC also provided legal assistance in the development of a final cost recovery rule for the special uses program. Additionally, OGC analyzed the treatment of broadcasting revenue associated with the use of NFS lands for the 2002 Winter Olympics under the new Ski Area Permit Fee Act; developed a policy for authorizing target ranges on NFS lands that addresses public safety and resource protection; and crafted national agency policy on indemnification, insurance, and other liability issues arising in connection with the special uses program. OGC is also coordinating all types of legal issues and litigation pertaining to management of off-highway vehicle use on NFS lands.

OGC provided substantial assistance to the Department on issues relating to compliance with applicable pollution control laws. In particular, OGC assisted the USDA Hazardous Materials Policy Council and the USDA Hazardous Materials Management Group in carrying out the hazardous materials management program. In addition, OGC provided assistance and advice to the Department and the Forest Service on the cleanup of hazardous materials sites on NFS lands. OGC represented the Forest Service, along with the Department of Justice, in negotiations with non-federal parties responsible for the cleanup of contamination on National Forest System lands. OGC also played a substantial role in advising the Department on compliance with applicable pollution control standards, including negotiating compliance agreements with the United States Environmental Protection Agency (EPA) and State environmental enforcement agencies. OGC also provided the Department with advice to protect the Department's interests regarding hazardous materials issues which arose in the context of land transfers and acquisitions. Finally, OGC provided

significant legal services in connection with pollution control legislative proposals, including Superfund Reauthorization.

GENERAL LAW DIVISION

The General Law Division (GLD) provided extensive legal services to the FS in determining the consistency of mineral development with statutes governing millions of acres of land acquired under New Deal programs, successfully challenging the validity of mining claims for more than 1,000 acres of land in a National Recreation Area, and in determining a company's right to dispose of mining waste on NFS lands.

As the new Administration and Congress engage in new initiatives to make the delivery of services more efficient, streamlined, and customer friendly, we anticipate greater demands in the division. These range from providing legal services regarding personnel and labor matters, the Freedom of Information Act and the Privacy Act, and debt collection initiatives; to providing legal support for creative approaches for conducting Department activities. GLD has been called upon with increasing frequency, to address, a number of issues relating to the time availability of funds, augmentation of appropriations, compliance with the Antideficiency Act, and the transfer of appropriations. At the same time, GLD is fielding a steady stream of requests for legal advice in such fiscal matters as the use of appropriated funds for travel; leasing of real property; advisory and assistance services; personal services; and meals, refreshments, and miscellaneous items. GLD will continue to advise USDA agencies on the proper use of instruments (contracts, grants, cooperative agreements, and memoranda of understanding), and the terms and conditions necessary to document agency transactions and fiscal obligations.

We anticipate additional demand on GLD resources arising out of requests to assist USDA agencies, especially the research agencies, in working with the Congress on the upcoming Farm Bill. In addition, GLD will provide assistance to the Office of the Chief Financial Officer on its implementation of the Federal Activities Inventory Reform Act of 1999, in the performance of reviews of Government activities under OMB Circular A-76, and in the implementation of the Federal Financial Assistance Management Improvement Act of 1999. GLD also will continue to assist the Office of Inspector General (OIG) and USDA program agencies in resolving legal issues arising out of OIG audits and investigations.

With regard to the procurement of property and services, GLD will devote substantial resources to assist the Chief Information Officer to improve information technology management in the Department, with some emphasis in the areas of computer privacy and cyber-security. GLD will continue to provide legal support to all USDA agencies in procurement and property matters such as complying with the numerous socioeconomic policies and the competition requirements applicable to orders against other agency or government-wide contracts. GLD will work with contracting officials to support the research, development, acquisition and use of bio-based products, including alternative fuels. Also, GLD will continue to provide an enhanced level of legal representation of USDA agencies in protests filed with the General Accounting Office. GLD also will continue to represent USDA agencies in contract claims brought before the Agriculture Board of Contract Appeals and serve as agency counsel assisting the Department of Justice in contract claims before Federal courts. In property matters, there has been an increase in the requests for GLD assistance concerning the responsibilities and costs to the Department for the operation and maintenance of its facilities, security issues, workplace violence, and bioterrorism and other emergency preparedness plans.

GLD will continue to provide a sustained rate of legal services to the National Appeals Division (NAD) regarding procedural, Equal Access to Justice Act (EAJA) and general administrative law matters. It provides information to the field and coordination of OGC litigation nationwide and assists the Department of Justice in cases seeking judicial review of NAD decisions in Federal courts. Legal issues include those arising from the NAD organic statute and NAD regulations, such as exhaustion of administrative remedies, jurisdiction of the district courts, implementation and effective dates of NAD determinations, and applicability of other laws, such as EAJA and the Administrative Procedure Act, to NAD proceedings.

GLD will continue to provide ongoing advice to the research, education, and economics (REE) agencies of USDA with respect to the implementation and administration of their programs and activities, including both competitive and non-competitive assistance programs. This will involve the review of Federal Register notices, grant solicitations, and rulemakings, as well as the issuance of legal opinions on such issues as the scope of statutory authorities and eligibility requirements. GLD will

also assist REE with intellectual property issues associated with bringing the benefits of research results to the public.

GLD will continue to provide advice to USDA agencies regarding affirmative action and minority preference programs as the law and Government regulations, particularly in the procurement sector, continue to evolve in this area. It also will continue to provide advice relating to outreach to disaffected groups, particularly the outreach to socially disadvantaged farmers.

With regard to general litigation, GLD anticipates that more reverse Freedom of Information Act (FOIA) cases involving exemption b(6) will be filed. GLD has defended several suits in which the Department is sued in one jurisdiction to prevent the release of information claimed to be exempt as privacy-protected while at the same time the Department is sued, or is under threat of a suit, in another jurisdiction for failing to release the same or similar information. GLD is also defending increasing numbers of FOIA suits in which there has been no response to an initial FOIA request or there has been no response to a FOIA appeal. These suits are difficult because of the need to gather and review documents which have not been reviewed by GLD at an earlier stage and to do so within the time constraints imposed by litigation. GLD anticipates that these trends will continue and significant legal resources will be required to defend these suits.

GLD will continue to advise agencies regarding ethics, personnel, benefits, and other matters. However, we anticipate devoting more legal resources to these areas in the next year to assist new appointees in the Department.

LEGISLATION DIVISION

OGC continues to provide legislative drafting and related assistance to the Department and Congress on major legislative activities that involve the Department and its programs. Extensive assistance was provided to Departmental policy officials and Congressional staffs in drafting and analyzing various legislative proposals recently enacted by Congress, including crop insurance reform and plant protection legislation enacted as part of the Agricultural Risk Protection Act (Public Law 106-224) and disaster relief for farmers and appropriations provisions contained in Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations Act, 2001 (Public Law 106-387) and in the Consolidated Appropriations Act, 2001 (Public Law 106-554). In addition, we are planning to participate in the preparation of legislation in support of the President's fiscal year 2002 budget request for the Department.

LITIGATION DIVISION

Litigation Division attorneys, in cooperation with attorneys from DOJ and other divisions in OGC, presented USDA's position in appellate courts. These efforts led to the D.C. Circuit Court upholding a decision of the Secretary to revoke a license issued under the Perishable Agricultural Commodities Act after the licensee engaged in commercial bribery. The Fifth Circuit Court, sitting en banc, found that a district court exceeded its jurisdiction by entertaining a generalized challenge to management practices in four National Forests. The D.C. Circuit held that the Forest Service could impose conditions on a hydroelectric power license issued by the Federal Energy Regulatory Commission which included a plan to promote the growth of wild rice in lakes in a National Forest. The U.S. Supreme Court is hearing a case challenging assessments charged against mushroom producers which fund an advertising program designed to increase consumption of mushrooms.

CIVIL RIGHTS

The Secretary wants to ensure that all of our customers and employees are treated with dignity and respect, and are afforded equal employment opportunity (EEO) and equal access to all USDA programs. Critical to the achievement of these goals was the creation, in 1998, of the Civil Rights Division (CRD) within OGC. Staffed with attorneys with specialized expertise in civil rights and EEO law, CRD is charged with providing legal services to the Secretary and all agencies of the Department on civil rights and EEO issues.

CRD has maintained a stellar litigation record while also providing prompt and sound legal advice to our client agencies. However, as CRD's reputation continues to improve, the demands on the office only increase. CRD's litigation duties currently include 7 program class actions and 10 employment class actions, each at different stages in the litigation process. The requested damages in these class actions could cost USDA upwards of \$21.0 billion.

CRD represents USDA in the defense of six class action program complaints currently pending in Federal district court. CRD also played a critical role in the settle-

ment of the Pigford/Brewington litigation. The settlement helped the Department to reinvigorate its efforts to become a Federal civil rights leader in the 21st century. CRD has taken the leading role in ensuring that USDA meets its commitments under the Pigford/Brewington consent decree, particularly with respect to the production of relevant documents and necessary legal analyses related to each claim filed pursuant to the consent decree, as well as ensuring the Department's compliance with adjudicator and arbitrator decisions. CRD is working with FSA and DOJ to develop timely and appropriate Government responses to claims filed by eligible farmers.

Key to settlement of the Pigford and Brewington cases was the 1998 enactment of the waiver of various statutes of limitations, that allows farmers with long-standing discrimination complaints to have their claims finally heard. CRD and OGC field offices are representing the Department in the 60 cases in which a hearing has been requested. With respect to farmer discrimination claims not covered by the Pigford and Brewington settlement, CRD works with the USDA Office of Civil Rights (CR) to ensure that all claims receive expeditious and fair consideration, within the bounds set by applicable law.

With respect to the ongoing implementation of the Pigford consent decree, we anticipate that several thousand additional Track A claims will be filed. CRD attorneys must review the agency response on each claim prior to submission to the adjudicator. In addition, several hundred more Track B hearings will take place. CRD attorneys must assist the Department of Justice (DOJ) attorneys in their representation of the agency; including assisting DOJ with document discovery, identification of similarly situated white farmers, and responses to interrogatories. Furthermore, CRD will have the primary Departmental role in the Monitor review process. All claimants can petition the Monitor to reevaluate their claims and CRD will need to file a response to each petition. We anticipate that most of the roughly 8,000 claimants whose claims were denied may seek Monitor review. Thus, CRD will need to file a written response to each of these petitions. In addition, for cases in which the government seeks Monitor review of a claim, CRD will prepare the Government's petitions for Monitor review. We anticipate several hundred individual petitions may be filed by the Government.

CRD also represents USDA in the defense of six class action employment complaints pending before the Equal Employment Opportunity Commission (EEOC). To date, only one of these complaints has been certified by EEOC to proceed as a class action. In addition, CRD is representing USDA in the defense of two additional class action employment complaints currently on appeal before EEOC's Office of Federal Operations. In recent years, CRD has settled two employment class action complaints under which individual complainants are currently pursuing their claims.

Recent years have seen a drastic increase in the demand for CRD's litigation services in a number of formal individual complaints filed by USDA employees with the EEOC. For example, 783 formal complaints were filed with USDA during fiscal year 2000, and there are nearly 1,872 active EEO cases pending throughout USDA. CRD continues to carry a full workload of complex and politically sensitive individual EEO cases involving either issues of first impression or disputes over positions at the highest levels within USDA. CRD litigates these cases on behalf of the Department without the assistance of DOJ. These individual cases require constant attention, travel across the country, and interaction with senior management officials throughout USDA.

In addition to its primary litigation responsibilities, CRD continues to assist DOJ in the litigation of numerous individual civil rights cases in both the employment and program areas pending in Federal district court. The Assistant U.S. Attorneys (AUSAs) and/or DOJ attorneys serve as lead counsel, but they are requiring an ever-increasing amount of litigation support from CRD, including draft answers, full litigation reports, dispositive motions, discovery responses, witness preparation, and deposition and trial participation.

To address other employment issues, CRD will intensify its efforts to provide training and technical assistance to OGC field attorneys and to Department officials, civil rights directors, and employee relations specialists. The goal is to identify and address EEO obstacles before they elevate into litigation. Where issues are identified, CRD will bring the concerns to the attention of appropriate Department officials, with legal analysis and recommendations for resolution.

FISCAL YEAR 2002 BUDGET REQUEST

For fiscal year 2002, OGC is requesting an increase of \$1,116,000 is for the anticipated fiscal year 2002 pay raise. This critically important increase is needed to support and maintain current staffing levels to meet the current and projected in-

creased demand in delivering legal advice, training, appeal and litigation legal services to agencies. Approximately 92 percent of OGC's budget is in support of personnel compensation, which leaves no flexibility for absorbing pay cost increases. Unlike large program agencies which have more flexibility concerning budget implementation, OGC can only absorb this increase by reducing staff.

CLOSING

That concludes my statement. We very much appreciate the support this Subcommittee has given us in the past. Thank You.

OFFICE OF THE CHIEF FINANCIAL OFFICER

PREPARED STATEMENT OF PATRICIA E. HEALY, ACTING CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the Subcommittee, I am pleased to present the fiscal year 2002 budget request for the Office of the Chief Financial Officer (OCFO) and the Department's Working Capital Fund (WCF).

OCFO includes a headquarters staff responsible for leadership and oversight of USDA financial management, and a staff in New Orleans, Louisiana, which processes payroll and administrative data for more than 40 departments, independent agencies, and congressional entities and provides the record-keeping services for the Government-wide Thrift Savings Plan (TSP).

Throughout fiscal years 2000 and 2001, USDA has continued to make significant progress towards improving its financial credibility and accountability. The following examples give you a glimpse of our progress:

Financial Statements.—For the second consecutive year, USDA submitted its consolidated financial statements to the Office of Management and Budget (OMB) by the March 1 deadline. We have also been working on automating the statement preparation process to improve efficiency and consistency of data processing. USDA has six stand-alone audits, three of which—the Food and Nutrition Service (FNS); the Rural Telephone Bank; and the Federal Crop Insurance Corporation—received unqualified or “clean” audit opinions. Of the remaining three stand-alone audits—Rural Development (RD), the Forest Service (FS), and Commodity Credit Corporation (CCC)—significant progress has been made in improving their audit results. OCFO is working closely with RD, Farm Service Agency (FSA) and CCC on a credit reform working group, comprised of these agencies, the Office of Inspector General, and the General Accounting Office (GAO) as an advisor, to address the credit reform issues keeping these agencies from a clean opinion. We are also working closely with the Forest Service on its plans for financial management improvements. We are hopeful that these efforts will result in an improved USDA consolidated financial statement audit opinion for fiscal year 2001.

Debt Collection.—USDA debt constitutes about 37 percent of all non-tax debt owed to the Federal Government. The \$104.8 billion portfolio includes loans for rural housing units, rural utilities, farm operating and disaster assistance, international export and development, and rural business enterprises. During fiscal year 2000, USDA collected \$188.0 million in delinquent debt through Treasury's Administrative Offset Program and other debt collection tools. This figure represents a 38 percent increase over the \$136.2 million collected in fiscal year 1999, a 100 percent increase over the \$93.9 million collected in fiscal year 1998, and a 163 percent increase over the \$71.5 million collected in fiscal year 1997. In addition, the fiscal year 2000 delinquent receivables totaled \$6.3 billion, a decrease of nearly 16 percent from the \$7.5 billion collected in fiscal year 1997. Collections of delinquent USDA debt have almost tripled (from \$63.2 million to \$188.0 million) since 1996 as a result of the Debt Collection Improvement Act of 1996 (DCIA) and a greater reliance on referring debts for Treasury offset, cross-servicing, Internal Revenue Service (IRS) 1099 reporting, and internal/external offset programs.

Integrated Financial Management System.—USDA continues to make significant progress in implementing the Foundation Financial Information System (FFIS), the cornerstone of financial management and administrative systems improvements at USDA. The success of USDA in implementing the system according to the aggressive schedule that we committed to in fiscal year 1999 led us to accelerate the implementation schedule for fiscal year 2000. As a result, four major agencies, the Animal and Plant Health Inspection Service (APHIS), the Rural Development (RD) agencies, the Farm Service Agency (FSA) and the Natural Resources Conservation Service (NRCS), were all implemented on October 1, 2000. Three of these agencies were implemented ahead of schedule. Work is on schedule to implement eight agencies on October 1, 2001. These are: Agricultural Research Service (ARS); Coopera-

tive State Research, Education, and Extension Service (CSREES); Economic Research Service (ERS); National Agricultural Statistics Service (NASS); Agricultural Marketing Service (AMS); Food and Nutrition Service (FNS); the Office of the Inspector General (OIG); and Departmental Administration (DA) and Staff Offices, including the Working Capital Fund (WCF). Currently 78 percent of the USDA workforce is served by FFIS. Final implementation will occur on October 1, 2002 with Grain Inspection, Packers & Stockyards Administration (GIPSA) and Foreign Agricultural Service (FAS).

Government Performance and Results Act (GPRA).—In fiscal year 2000, USDA issued a restructured strategic plan for fiscal year 2000–2005 focused on five overall USDA goals that cross organizational lines in the Department. The OCFO led the Department-wide Planning Team that developed the new plan using a corporate management approach to strategic planning. As a result, the previous strategic plan, which consisted of 30 different agency plans, has been replaced by a streamlined plan written in plain language. The strategic plan, as well as the fiscal year 2002 performance plan, reflect a corporate approach to performance management.

National Finance Center.—The OCFO's National Finance Center (NFC) in New Orleans processes payroll for approximately 460,000 employees in the Federal civilian workforce and provides record-keeping services for the \$92 billion Thrift Savings Plan, a 401(k) type plan, for 2.5 million Federal employees. NFC is currently working with the Federal Retirement Thrift Investment Board to add the Small Capitalization Stock Investment (S) Fund and the International Stock Investment (I) Fund to the current record-keeping system, maintained by NFC, effective May 1, 2001.

These examples represent progress that will continue only if we receive the necessary resources to establish the framework in which we will lead, direct, and coordinate USDA's financial management priorities to satisfy congressional mandates and provide the Secretary, the Congress, and program managers with credible financial information on which they can base decisions.

FISCAL YEAR 2002 BUDGET REQUEST

Mr. Chairman, OCFO is requesting a fiscal year 2002 budget of \$5,335,000, an increase of \$175,000 over fiscal year 2001. The OCFO staff funded through the appropriation has little flexibility to absorb pay and other cost increases. The requested pay cost increase of \$175,000 is needed to maintain the current staff level for leadership and oversight of financial management at USDA. The maintenance of this budget level is critical if we are to devote the necessary staff and resources to work on the following priorities:

Lead the Corporate Administrative/Financial Systems Strategy Implementation.—In fiscal year 2000, the Chief Financial Officer, working with the Chief Information Officer and Assistant Secretary for Administration, led the Corporate Administrative Systems Executive Committee tasked with developing a corporate strategy for administrative/financial systems. The Committee met extensively over a six-month period to examine the eight corporate systems identified as most critical for the successful operation of USDA. The Committee evaluated each system component, the criticality of the system to the Department's overall administrative/financial operations, and the urgency of the need to have the functionality implemented. The systems in the corporate strategy and their priorities for implementation are: accounting/budget execution, telecommunications infrastructure/security, procurement; payroll, human resources, travel, property, and budget formulation.

These systems require the OCFO to work with the agencies to review their current business practices to ensure that these systems will produce accurate, timely and reliable data. Currently, program managers, policy officials, members of Congress, and other stakeholders do not always have the reliable and timely information needed to support essential program and financial management decisions, as well as develop, monitor, and report on performance plans and their goals and objectives, as required by GPRA.

The fundamental objective is to complete the necessary implementation of these systems within five years. A constraint in our ability to implement the corporate strategy has been the availability of funding. We are grateful to the Appropriations Committees of the Senate and House for the language provided in last year's bill allowing the Secretary of Agriculture, with the Committees' approval, to transfer unobligated balances of appropriated funds to the Working Capital Fund for the acquisition of plant and capital equipment necessary for the delivery of financial, administrative, and information technology services of primary benefit to the agencies of the Department of Agriculture. We will be providing a plan to the Committees shortly to seek this approval. This plan will address our resource requirements for the corporate strategy.

Implement Information Infrastructure.—Consistent with the corporate systems strategy, OCFO will successfully complete the implementation of the Foundation Financial Information System (FFIS) on schedule. As its name implies, FFIS is intended to be the foundation for all the corporate systems initiatives. When FFIS is linked to other critical corporate systems, USDA will be able to obtain the corporate information required to more effectively manage operations. When fully implemented, FFIS will include integrated budget execution and accounting as well as a financial data warehouse with a powerful reporting capability. It will also include a tool to help the Department reconcile its cash accounts to Treasury records, a major audit finding. The reliable, accurate data provided in FFIS records, coupled with the powerful reporting tool, will increase USDA's ability to monitor operations and report results.

Improving the USDA Audit Opinion.—In order to lead USDA to a clean opinion, we intend to focus our efforts on the USDA component agencies' audit opinions on their stand-alone statements. In addition, OCFO will work with all USDA agencies to ensure they address overall improvements in financial management and data integrity. We will continue to focus on improvements in four areas—implementation of the Federal Credit Reform Act of 1990, reconciling Fund Balances with Treasury accounts, addressing weaknesses in the Forest Service's financial accounting and reporting, and correcting material internal control weaknesses as outlined in auditors' reports. USDA has made significant progress in these areas in the past two years. With sufficient resources and focus by all management layers throughout USDA, we expect to see the results in improved and sustainable financial management processes with, as a by-product, an improved audit opinion.

Enhancing and Improving NFC Operations.—The National Finance Center (NFC) is a centralized administrative/financial processing and automated information systems operation supporting USDA and Government-wide operations. In both fiscal year 2001 and fiscal year 2002, NFC will expand its role in support of the Federal Retirement Thrift Investment Board with the introduction of additional investment options and the implementation of the military into the Thrift Savings Plan. Additionally, NFC has been selected to develop and pilot a reconciliation process for the Office of Personnel Management to reconcile Federal employee health benefits subscriptions.

In fiscal year 2002, NFC will transition to support the implementation of the USDA's FFIS, while using activity-based costing as a mechanism for developing a new process for direct billings to clients. Additionally, the NFC will continue to stabilize the processes implemented to support cash reconciliation and strengthen its capabilities in that area. These initiatives will provide streamlining of processes and will institutionalize improved financial management practices to ensure that the OCFO's NFC operation meets the challenges of Government financial management in the 21st century.

WORKING CAPITAL FUND

As we have noted in the past for the Committee, the Working Capital Fund serves as the Department's primary financing mechanism for centrally managed financial, administrative, and information technology services. It supports more than 20 distinct activity centers across five Department-level organizations, and does so effectively and efficiently as evidenced by the volume of service we provide to our USDA agencies and the high demand for our WCF services from agencies outside of USDA. As mentioned previously, the Congress provided the WCF with increased flexibility as part of the fiscal year 2001 appropriations legislation enacted last fall. The Secretary was granted the authority to transfer unobligated fund balances for the purpose of funding through the WCF, acquisition of plant and capital equipment necessary for the delivery of financial, administrative, and information technology services. No funds will be transferred under this authority until a proposal is presented to and approval granted by both Committees on Appropriations. We are working to prepare a comprehensive proposal to use funds under this authority and look forward to discussing the issue further with you and your staffs.

The Congress has provided us the means to address other needs in the corporate area as well. Fiscal year 2001 appropriations language granted USDA the authority to use proceeds from purchase card rebates to invest in systems and processes of general benefit to the Department. We are using this authority to reinvest in procurement and related systems. In fiscal year 2002, pilot projects to determine the best approach and system to employ for procurement services will be partially funded through these rebates. While the rebates will only fund part of our needs (approximately \$3 million in fiscal year 2001), we appreciate the cooperation of the Congress in using these rebates, which arise from the use of the procurement credit

card, to fund our investment efforts, especially those of the procurement system. I hope that the Congress will renew both the language to allow transfers of unobligated balances and the language to allow transfers of rebate proceeds so that we may continue to invest in these financial and administrative systems which are so critical to USDA operations in the future.

Concerning our recurring operations, I am pleased to report that we are continuing to deliver timely, quality service to our USDA agencies and non-USDA clients in a cost-effective manner. We are especially proud of the cooperative efforts of WCF management, activity managers, and agencies represented on our WCF Executive Committee in holding down costs of service.

Mr. Chairman, we have a shared responsibility to ensure that we can meet the needs of our agencies as they address the needs of the American farmer and agricultural community, and ensure financial accountability and effectiveness. I look forward to working with you and the members of this Committee to ensure that those needs are met. The resource estimate that I have presented to you is our commitment to fulfilling our responsibilities. Thank you, Mr. Chairman. I welcome any questions the Committee might have.

NATIONAL AGRICULTURAL STATISTICS SERVICE

PREPARED STATEMENT OF R. RONALD BOSECKER, ADMINISTRATOR

Mr. Chairman and members of the Committee, I appreciate the opportunity to submit a statement for this Committee's consideration in support of the fiscal year 2002 budget request for the National Agricultural Statistics Service (NASS). This Agency now conducts the Census of Agriculture which was begun in 1840, and the agricultural statistics program created in 1842. Both programs support the basic mission of NASS, which is to provide factual information for and about the Nation's food and agricultural industry.

As American farms and ranches have progressed to making greater use of agricultural science and technology, the need for more detailed information has increased. The periodic surveys and censuses conducted by NASS contribute significantly to the overall information base for agricultural producers, handlers, processors, wholesalers, retailers, and ultimately, consumers. Voids in relevant, timely, accurate data contribute to wasteful inefficiencies throughout the entire production and marketing system.

The most critical complaints received by NASS occur when there is an absence or shortage of official data available for a commodity, and therefore that segment of agriculture is forced to operate with insufficient information. Recent energy crises have focused immediate attention on the need for additional energy costs and supply data to measure the effect, and potential effect, on agriculture. NASS is cooperating with the Office of Energy and New Uses (USDA, Office of the Chief Economist) and the Energy Information Agency (U.S. Department of Energy) to collect data related to the energy supply and price problems and the effect on agricultural production and costs. Environmental concerns have meant that entirely new surveys are needed to accurately measure the chemicals used by the food and fiber industry. The globalization of agricultural commodity markets also increases the demand for relevant, accurate, timely, and impartial statistical information to assist those who sell U.S. agricultural commodities worldwide. For example, information concerning genetically engineered crops and crop varieties will enable the United States to better compete in the world market.

The crop, livestock, and other related statistics are provided by NASS throughout the year, in cooperation with each State Department of Agriculture. This program, which began in 1917, has served the agricultural industry well and is often cited by others as an excellent model of successful State-Federal cooperation. The addition of the Census of Agriculture has strengthened NASS's partnership with its State co-operators. This joint State-Federal program helps meet State and national data needs while minimizing overall costs by consolidating both staff and resources, eliminating duplication of effort, and reducing the reporting burden on the Nation's farm and ranch operators. The success of this partnership was demonstrated when NASS, through its State-Federal cooperation, was able to complete the 1997 Census of Agriculture in almost half the time of previous censuses, increase the total response, and, through the use of a toll-free number, better respond to questions from farmers and ranchers completing the census questionnaires. NASS's 46 field offices, which cover all 50 States (New England States are combined) and Puerto Rico, support the five goals and outcomes in the Research, Education, and Economics (REE)

mission area strategic plan by providing statistical information that serves national, State, and local data needs.

NASS statistics contribute to providing fair markets where buyers and sellers alike have access to the same official statistics. This prevents markets from being unduly influenced by "inside" information which might unfairly affect market prices for the gain of an individual market participant.

With the enactment of the Federal Agriculture Improvement and Reform Act of 1996 and the pending work on the farm bill, the demand for agricultural statistics has increased as producers rely heavily on market information to make production decisions. Empirical evidence indicates that an increase in information improves the efficiency of commodity markets. Information on the competitiveness of our Nation's agricultural industry will become increasingly important as producers rely more on the world market for their income.

NASS's agricultural statistics are used throughout the agricultural sector to evaluate supplies and determine competitive prices for world marketing of U.S. commodities, which directly supports Goal 1 of the REE Strategic Plan: Ensure Americans an agricultural system that is highly competitive in the global market.

Through new technology, the products produced in the United States are changing rapidly. This also means that the agricultural statistics program must be dynamic and able to respond to the demand for coverage of newly emerging products. For example, genetic engineering technology is producing new commodity varieties, such as BT corn and cotton, and Roundup Ready soybeans. NASS has responded to data user requests for information on genetically modified crops to help assess the magnitude and impact of these new varieties.

Not only are NASS statistical reports important to assess the current supply of and demand for agricultural commodities, but they are also extremely valuable to farm organizations, commodity groups, and public officials who analyze agricultural policy, foreign trade, construction, and environmental programs, research, rural development, and many other activities. NASS numbers are scrutinized very closely by producers, agribusinesses, industry analysts, economists, investors, as well as government policy makers. As a result of their analysis, major decisions are made that affect the Nation's agricultural economy.

All reports issued by NASS's Agricultural Statistics Board are made available to the public at previously announced release times to ensure that everyone is given equal access to the information. NASS has been a leader among Federal agencies in providing electronic access to information. All of NASS's national statistical reports and data products, including graphics, are available on the Internet, as well as in printed form. Customers are able to electronically subscribe to NASS reports by clicking on the appropriate release. A summary of NASS and other USDA statistical data are produced annually in USDA's Agricultural Statistics, available on the Internet through the NASS Home Page, on CD-ROM disc, or in hard copy. Each of NASS's 46 field offices have Home Pages on the Internet, which provide access to special statistical reports and information on current local commodity conditions and production.

Beginning in fiscal year 1997, NASS received funding directly for the Census of Agriculture which is conducted every 5 years. The transfer of the responsibility for the Census of Agriculture to USDA streamlines Federal agricultural data collection activities and has improved the efficiency, timeliness, and quality of the census data.

Statistical research is conducted to improve methods and techniques used in collecting and processing agricultural data. This research is directed toward providing higher quality census and survey data with less burden to respondents, producing more accurate and timely statistics to data users, and increasing the efficiency of the entire process. For example, NASS has been a leader in the research and development of satellite imagery to improve agricultural statistics. The NASS statistical research program strives to improve methods and techniques for obtaining agricultural statistics with an acceptable level of accuracy. The growing diversity and specialization of the Nation's farm operations have greatly complicated procedures for producing accurate agricultural statistics. Development of new sampling and survey methodology, along with intensive use of telephone and face-to-face contacts and computer technology enable NASS to keep pace with an increasingly complex agricultural industry. Considerable new research will be directed at improving the 2002 Census of Agriculture.

Major Activities of the National Agricultural Statistics Service (NASS) The primary activities of NASS are to conduct periodic surveys each year and the Census of Agriculture every 5 years to meet the current data needs of the agricultural industry. The periodic surveys include the collection, summarization, analysis, and publication of reliable agricultural forecasts and estimates. Farmers, ranchers, and

agribusinesses voluntarily respond to a series of nationwide surveys about crops, livestock, prices, chemical use and other agricultural activities each year. Periodic surveys are conducted during the growing season to measure the impact weather, pests, and other factors have on crop production. Frequent surveys are also needed for food products that are perishable. Many crop surveys are supplemented by actual field observations in which various plant counts and measurements are made. Administrative data from other State and USDA agencies, as well as data on imports and exports, are thoroughly analyzed and utilized as appropriate. NASS prepares estimates for over 120 crops and 45 livestock items which are published annually in almost 400 separate reports.

The Census of Agriculture provides national, State, and county data for the United States on the agricultural economy every 5 years, including: number of farms, land use, production expenses, farm product values, value of land and buildings, farm size and characteristics of farm operators, market value of agricultural production sold, acreage of major crops, inventory of livestock and poultry, and farm irrigation practices. The Census of Agriculture is the only source for this information on a local level which is extremely important to the agricultural community. Detailed information at the county level helps agricultural organizations, suppliers, handlers, processors, and wholesalers and retailers better plan their operations. Important demographic information supplied by the Census of Agriculture also provides a very valuable data base for developing public policy for rural areas.

Nearly two-thirds of NASS's staff are located in the 46 field offices; 25 of these offices are collocated with State Departments of Agriculture or land-grant universities. NASS's State Statistical Offices issue approximately 9,000 different reports each year and maintain Internet Home Pages to electronically provide their State information to the public.

NASS has developed a broad environmental statistics program under the Department's water quality and food safety programs. Until 1991, there was a complete void in the availability of reliable pesticide usage data. Therefore, in 1991 NASS cooperated with other USDA agencies, the Environmental Protection Agency (EPA), and the Food and Drug Administration, to implement comprehensive chemical usage surveys that collect data on certain crops in selected States. EPA uses the state and national level actual survey chemical data, rather than worst case scenarios, in the quantitative usage analysis for a chemical product's risk assessment. Beginning in fiscal year 1997, NASS also began survey programs to acquire more information on Integrated Pest Management (IPM), additional farm pesticide uses, and post-harvest application of pesticides and other chemicals applied to commodities after leaving the farm. These programs have resulted in significant new chemical use data, which are important additions to the data base. Surveys conducted in cooperation with the Economic Research Service also collect detailed economic and farming practice information to analyze the productivity and the profitability of different levels of chemical use. American farms and ranches manage half the land mass in the United States, underscoring the value of complete and accurate statistics on chemical use and farming practices to effectively address public concerns about the environmental effects of agricultural production. NASS's chemical use survey programs support both Goals 2 and 4 of the REE Strategic Plan which relate to ensuring an adequate food and fiber supply and the promotion of food safety, and enhancing the quality of the environment.

NASS conducts a number of special surveys as well as provides consulting services for many USDA agencies and other Federal, State, and private agencies or organizations on a cost-reimbursable basis. Consulting services include assistance with survey methodology, questionnaire and sample design, information resource management, and statistical analysis. NASS has been very active in assisting USDA agencies in programs that monitor nutrition, food safety, environmental quality, and customer satisfaction. In cooperation with State Departments of Agriculture, land-grant universities, and industry groups, NASS conducted 111 special surveys in fiscal year 2000 covering a wide range of issues such as farm injury, nursery and horticulture, farm finance, fruits and nuts, vegetables, and cropping practices.

NASS provides technical assistance and training to improve agricultural survey programs in other countries in cooperation with other Government agencies on a cost-reimbursable basis. NASS's international programs focus on developing countries, such as those in Asia, Africa, and Central and South America, as well as emerging market countries in Eastern Europe. Accurate information is essential in these countries for the orderly marketing of farm products. NASS works directly with countries undergoing the transition from centrally-planned to market economies by assisting them in applying modern statistical methodology, including sample survey techniques. This past year, NASS provided assistance to China, Ecuador, Ethiopia, Kazakhstan, Mexico, Nicaragua, Russia, South Africa, Ukraine, and Ven-

ezuela and received approximately \$1.1 million in reimbursements for these services.

NASS annually seeks input on improvements and priorities from the public through: displays at major commodity meetings, data user meetings with representatives from agribusinesses and commodity groups, special briefings for agricultural leaders during the release of major reports, and through numerous individual contacts, especially those made at the grass roots level through NASS's 46 field offices. As a result of these activities, the Agency has made adjustments to its agricultural statistics program, published reports, and electronic access capabilities to better meet the statistical needs of customers and stakeholders.

FISCAL YEAR 2002 PLANS

The fiscal year 2002 budget request is for \$113,786,000. This is a net increase of \$13,236,000 from the fiscal year 2001 current estimate.

The fiscal year 2002 request includes increases for cyclical activities associated with the Census of Agriculture (\$10,000,000), improvements to computer security to assure the integrity of market sensitive data prior to official release (\$500,000), and funding for increased pay costs (\$2,736,000).

A net increase of \$10,000,000 and 51 staff-years for the Census of Agriculture.

The 2002 Census of Agriculture budget request is for \$25,000,000. This includes an increase of \$10,000,000 and 51 staff-years for increased activities associated with the 2002 Census of Agriculture. The funding increase addresses necessary preparations for the 2002 Census of Agriculture, which will be mailed in December 2002. This is the third year in a five-year funding cycle for the 2002 Census. Preparations include specific list building activities; formulation of data collection plans targeted for American Indian and minority farm operators; equipment installation and testing; census mail list development; printing over three million questionnaires, letters, and reference materials; completion of final specifications, development, and testing procedures for data collection, processing, and analysis phases of the census; completion of publicity and outreach plans and printing of materials; and determination of final census data products design, mix, and production schedules. NASS will also work to improve information technology infrastructure for the field offices to ensure maximum efficiency.

An increase of \$500,000 is requested for continued development of NASS Computer Security Architecture.

There is a growing need for cyber-security given the increased incidences and threats of the loss, misuse, unauthorized access to, or modification of information on computer systems. The level of sophistication displayed by hackers and others also supports the need for security reforms, such as the implementation of early warning systems for attacks, intrusions, and viruses. Intrusion detection and monitoring software would allow NASS security staff to review access attempts, create audit trails, and monitor system connection for validity. Continued progress in critical cyber-security issues would also ultimately lead to reduced time associated with system access for both the end users and security administrators. Cyber-security has replaced Year 2000 as the top priority in the information technology community. Information security is of vital importance to maintain NASS's credibility given the market sensitivity of the reports released as well as the confidential nature of the data collected by NASS from the Nation's farmers, ranchers, and agribusinesses.

This concludes my statement, Mr. Chairman. Thank you for the opportunity to submit this for the record.

AGRICULTURAL MARKETING SERVICE

PREPARED STATEMENT OF KENNETH C. CLAYTON, ACTING ADMINISTRATOR

Mr. Chairman and Members of the Committee, I am pleased to have this opportunity to represent the Agricultural Marketing Service in presenting our fiscal year 2002 budget proposal.

MISSION

AMS activities are an integral component of USDA-wide efforts to assist the U.S. agricultural industry in marketing their products and in finding ways to improve their profitability. AMS' mission is to facilitate the marketing of agricultural products in the domestic and international marketplaces, ensure fair trading practices, and promote a competitive and efficient marketplace to the benefit of producers, traders, and consumers of U.S. food and fiber products. We accomplish this mission

through a variety of activities funded from appropriations and from fees charged for services. In providing services such as market reporting and grading, we are able to maintain close contact with our customers, making us aware of their concerns. Furthermore, since most of our user-funded services are voluntary, we must remain conscious of cost while being responsive to customer needs.

To improve marketing and better serve the needs of farmers and producers in 2002, we are proposing to initiate two new activities. The first initiative will allow AMS to support the international marketing of agricultural products through greater participation in the development of international standards. The second initiative addresses the effect of bioengineering on the domestic and international marketing of food, fiber and seed. However, before I discuss our proposed increases for fiscal year 2002 in more detail, I would like to briefly describe some of the marketing issues facing U.S. farmers and a few of AMS' recent and very significant accomplishments in fiscal year 2001.

AGRICULTURAL MARKETING

U.S. agriculture is facing continual and rapid changes in the structure of the industry, domestic and international consumer preferences, the types of support programs being offered by the government, new production methods, and greater dependence on export markets. The trend toward consolidation in some industries, and contracted production in others, threatens market competition. Farmers, particularly small, limited resource farmers, need more marketing-related assistance as Federal price supports decline. Consumer preferences and concerns affect the sales of food and fiber products. Recently, consumers have become increasingly concerned over the implications of bio-engineered agricultural products. Although global marketing offers new opportunities for American agricultural producers, those opportunities may be burdened by new requirements and restrictions.

MANDATORY MARKET NEWS

Concern about livestock industry concentration and price discovery in the marketplace led to the Livestock Mandatory Reporting Act in October 1999. AMS began implementing the Mandatory Market News Program on April 2. This program directly supports agricultural trading by requiring large packers and importers to report to AMS the details of their transactions involving purchases of livestock, as well as sales of boxed beef, boxed lamb, lamb carcasses, and imported boxed lamb cuts. We estimate that 80 to 90 percent of the volume of all cattle, boxed beef, slaughter hogs, sheep, lamb meat, and imported lamb traded will be covered by the mandatory market reporting program. Implementation of a reporting program of this size required development of a new electronic collection and report generating system. We developed and tested this electronic reporting system with industry participation. Since this is the first regulation that requires the industry to electronically report proprietary information on daily market transactions, we have conducted informational meetings for packers to provide instructions and training on the electronic data transfer process.

NATIONAL ORGANIC PROGRAM

The implementation phase of the National Organic Program is now underway. The organic industry, State governments, and consumers urged passage of the Organic Foods Production Act. The purpose of the Act is to establish a national standard for organic production and handling, to assure consumers that standards are met, and to facilitate trade. AMS published the final rule for the program in December and the program's 18-month implementation period began April 21. During the next 18 months, program staff will develop training materials, assist the National Organic Standards Board in reviewing additional allowed and prohibited substances for inclusion on the National List, and begin the process of accrediting the certifying agents. Program employees are conducting accreditation workshops to train State and private certifying agents on the requirements for accreditation under the National Organic Program. After the certifying agents submit their applications and the program completes its acceptance process, AMS will announce the first accreditations in late April 2002. AMS expects to accredit 40 certifying agents in April 2002 and a total of 59 agents by the end of the implementation period. After the implementation period, these accredited certifying agents will be required to follow the national organic standard and related procedures.

We are preparing the administrative procedures to distribute the certification cost share funding provided under the Agricultural Risk Protection Act of 2000 through agreements with the 15 States targeted for the program. These funds, intended to defray some of the certification costs, will be distributed to organic producers in the

targeted States who request cost share reimbursement and whose production operations are inspected and certified between December 2000 and October 2002 by an approved certifier. All of the payments are to be made by November 2002.

MICROBIOLOGICAL DATA PROGRAM

The new Microbiological Data Program—MDP—responds to consumer concerns by ensuring the quality and wholesomeness of the food supply in the United States. The program provides information about microbial pathogens and indicator organisms on fresh fruits and vegetables. The data will be provided to the Centers for Disease Control, Food and Drug Administration, USDA's Agricultural Research Service, and State Departments of Agriculture. Collection and testing of produce samples began in April. During 2001, the program will test samples of lettuce, tomatoes and celery for *E.coli*, *Salmonella*, and *Listeria monocytogenes*. Other commodities and organisms will be tested in rotation. State inspectors who collect samples for the Pesticide Data Program also collect samples for the MDP. The collection sites are the same for both programs—large distribution centers and terminal markets. State inspectors from California, Colorado, Florida, Maryland, Michigan, New York, Ohio, Texas, Washington, and Wisconsin will collect a total of 62 samples per commodity per month. For quality assurance, the MDP staff is developing and implementing a program that monitors operating procedures, methods performance, verification procedures and the proficiency of check samples. Test results from the eight participating State laboratories and the AMS laboratory will be analyzed, summarized, and reported by AMS. If necessary, the laboratories will provide immediate notification to CDC and FDA.

PESTICIDE DATA PROGRAM

In support of the Food Quality Protection Act, AMS' Pesticide Data Program began its new Water Monitoring Survey in March. The Pesticide Data Program—PDP—generates data on dietary exposure to pesticide residues on foods to verify and assure the consumer of wholesomeness. Water survey data is needed by EPA to estimate dietary exposure to pesticides through drinking water. To gather the data needed, the program will collect and analyze drinking water samples from municipal water treatment facilities. This year, finished drinking water samples are being collected from community water systems in New York and California by the United States Geological Survey—USGS. USGS will collect approximately two samples per month at each of 11 sites in New York State and 10 sites in the San Francisco area. Sampling may be increased to weekly during months when agricultural use of pesticides is high and reduced to monthly when pesticide use is low. AMS will provide the data to EPA for risk assessments on safety and regulatory decisions about pesticides. The program will implement quality assurance and quality control measures to verify analytical results and capture as much data as possible on the target pesticides identified by EPA. The testing laboratories will send the water data to PDP headquarters, which will annually release the collected data in a summary report.

FEDERAL-STATE MARKETING IMPROVEMENT PROGRAM

The Federal-State Marketing Improvement Program—FSMIP—increased its support of small, limited-resource farmers this year. Small farmers need increased help in developing their marketing opportunities. The FSMIP program offers matching grants funding to States to stimulate innovative product development and marketing approaches, and an opportunity to disseminate those results quickly. The additional grants funding provided in 2001 is being made available to States for projects that focus on identifying direct marketing opportunities for small farmers and agribusiness, export-oriented research and technical assistance to small farmers, and sustainable agricultural production and marketing and increased utilization of bio-based industrial products.

BUDGET PROPOSAL

For fiscal year 2002, we are requesting a total budget increase of \$5 million for our two new marketing initiatives—Global Market Expansion and Biotechnology.

Global Market Expansion

An additional \$1 million for an AMS Global Market Expansion program will allow AMS to strengthen export opportunities for U.S. producers by expanding our participation in international standards development. Agricultural product standards provide the commercial language upon which trade is based. These standards can facilitate trade within and among countries if properly and fairly developed, but may be

used as non-tariff trade barriers when other forms of trade protection come under close scrutiny. We propose to increase our involvement in standards activities at the fundamental development stage to ensure that U.S. interests are considered before final standards are established. Due to our technical expertise, AMS has been asked to assist U.S. producers, the Foreign Agricultural Service, the Food and Drug Administration, and other agencies in addressing agricultural product standards issues. The standards developed through the various international standards setting organizations typically find wide commercial application and provide the basis for dispute settlement at the World Trade Organization.

The agency has participated in standards setting meetings as resources have allowed. We have also made efforts to engage industry sectors in this work, including meeting preparation and attendance. While we have achieved success in several commodity areas, much work remains to be done. This initiative will allow AMS technical experts to participate in the full range of standards setting forums that require U.S. attention.

Increased participation will result in additional opportunities to influence the content of international standards so they are inclusive of, and even favorable to, U.S. products and production methods. This initiative will also allow AMS to cooperate with the domestic industry in studies and projects aimed at better identifying the types and content of product standards that would be most useful in supporting export trade.

One international forum is the United States Organization for Economic Cooperation and Development Seed Schemes, which is the critical body for the development and maintenance of genetic purity and quality standards for the certification of seed in international trade. An interagency task force proposed that AMS increase its participation in Seed Schemes meetings by serving as the U.S. Designated Authority and by administering the program. This initiative provides the resources needed by AMS to function in this expanded capacity.

This budget request does not duplicate, but complements, the programs and responsibilities of the Foreign Agriculture Service and other Federal agencies. AMS provides unique technical expertise concerning the development and maintenance of agricultural product standards. Our participation supports the foreign market promotion and policy responsibilities of other agencies. AMS' program will be staffed in the United States and will not require any overseas personnel assignments.

In summary, this initiative will strengthen export opportunities for U.S. producers through increased AMS participation in international standards. It will result in better representation of U.S. agricultural interests in international standards and help to avoid non-tariff trade barriers and enhance FAS' marketing efforts on behalf of U.S. agriculture.

Biotechnology

Our \$4 million request for Biotechnology would allow us to address the rapidly increasing importance of genetically modified organisms in agriculture. Consumer preferences—both domestic and foreign—are requiring commodity firms and food companies to preserve the identity and voluntarily label non-bio-engineered crops and foods. Some countries have instituted labeling requirements for biotech foods. To meet the industry's need to differentiate bio-engineered from conventional crops, AMS proposes to capitalize on agency expertise to provide biotech/non-biotech verification and quality assurance services for the seed, fruit and vegetable industries. The Federal Seed Act protects the interests of growers by regulating the labeling of seed in interstate commerce. To meet the regulatory requirements of the Act, which require that we ensure that seed varieties are correctly labeled, AMS must develop the program's capacity to verify biotech and non-biotech properties in seed. We propose to expand our laboratory and field programs to enable us to test seed varieties for claims of bio-engineered or non-bio-engineered properties. Once seed testing procedures have been established, we will conduct training workshops for seed analysts in state laboratories throughout the United States on the testing procedures. The response to a recent request for public comment indicated a strong industry interest in seed testing using DNA-based technology to identifying genetically engineered seeds.

For fruits, vegetables and nuts, we propose to implement a voluntary, audit-based quality assurance service designed to verify that farms or processing facilities meet accepted standards for excluding the presence of genetically modified organisms. This program will allow certified participants to meet non-modified organism requirements in the U.S. and abroad. AMS will develop guides and training materials on genetically modified and non-modified organisms for growers, processors, and other interested parties.

We also propose to establish a laboratory testing program that will focus on biotech methods development and laboratory accreditation services to support verification of biotech and non-biotech claims for fruits, vegetables and nuts. We will coordinate this laboratory program with GIPSA's biotech activities for grain.

For this initiative, AMS will require appropriated funding to set up and start the program. Once the quality assurance service and laboratory functions are fully established, AMS may be able to recover a portion of the costs through user fees. Regulatory activities under the Federal Seed Act would continue under appropriated funding.

BUDGET REQUEST SUMMARY

That concludes our budget presentation for fiscal year 2002. By fund, our total budget includes \$71.4 million for Marketing Services, a program increase of \$5 million above current services funding, \$1.3 million for FSMIP grants under Payments to States, and \$23.7 million in Section 32 Administrative funds. Our budget request includes a pay cost increase of \$1.2 million for Marketing Services.

This request will allow AMS to build on its strengths to assist the agricultural industry by facilitating domestic and international marketing.

Thank you for this opportunity to present our budget proposal.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

PREPARED STATEMENT OF DR. CRAIG A. REED, ADMINISTRATOR

Mr. Chairman and members of the Committee, "Protecting American Agriculture" is APHIS' motto. It also succinctly and accurately describes our mission. American farms and related agricultural industries are the healthiest and most productive in the world. As a result, all Americans—urban, suburban, and rural—enjoy an abundant and affordable food supply filled with a wide variety of products. Agriculture provides an enormous contribution to the U.S. economy. USDA economists calculate that each dollar earned from agriculture exports, stimulates another \$1.32 in business activity for the economy. In all, more than 23 million jobs—17 percent of the civilian workforce in America—are involved in some phase of growing and distributing food and clothing world-wide. The United States agricultural industry dominates national markets, and those found abroad. We help to maintain this advantage by:

- Safeguarding animal and plant resources from exotic invasive pests and diseases,
 - Monitoring and managing agricultural pests and diseases existing in the United States,
 - Resolving and managing trade issues related to animal or plant health, and
 - Ensuring the humane care and treatment of animals.
- We remain steadfast in our efforts to provide the Nation with safe and affordable food and fiber. Without APHIS protecting America's animal and plant resources from agricultural pests and diseases, threats to our food supply could be devastating. For example, left unchecked, Mediterranean fruit fly and foot-and-mouth disease—two major agricultural health threats—would cause production and marketing losses of several billions of dollars annually in this country. These and other threats are real. In fiscal year 2000, under the authority provided by the Congress, the Secretary transferred \$220 million to APHIS for emergency programs. The experience of fiscal year 2000 alone shows us that failing to invest in a comprehensive safeguarding system will inevitably lead to large Federal expenditures and devastating losses for American farmers.

In recent years, the scope of APHIS' function of protecting U.S. agriculture has expanded beyond pest and disease management. Because of our technical expertise in assessing and regulating the risks associated with agricultural imports, APHIS has assumed a new trade support role. Now the agency must respond to other countries—animal and plant health import requirements and negotiate science-based standards to ensure that America's agricultural access to foreign markets, worth over \$50 billion annually, is protected from unjustified trade restrictions. The American people and the Congress, have directed us to expand our protection role to include wildlife damage management, the welfare of animals, human health and safety, and ecosystems vulnerable to invasive pests and pathogens. In carrying out our diverse protection responsibilities, we make every effort to address the needs of all those involved in the U.S. agricultural sector, especially small farms. Congress has passed several laws that give APHIS the authority to implement our safeguarding mission. In 2000 the Plant Protection Act, as part of the Agriculture Risk Protection

Act, expanded and consolidated various plant protection activities, widening the scope for APHIS' involvement in plant health. The Act gives USDA the authority to establish more effective deterrents against smuggling. It puts real teeth in our enforcement efforts program. We will be able to assess larger fines, secure subpoenas, and prosecute serious offenders in Federal Court.

To respond to the threats to U.S. agriculture, both newly emerging and ongoing, APHIS applies a variety of strategies toward five goals. This statement addresses the five APHIS goals and examines the programs we use to complete our mission. It provides recent activities, accomplishments, and challenges for the programs.

Goal 1.—To safeguard U.S. animal and plant resources against introductions of exotic invasive pests and diseases, while meeting international trade obligations.

Keeping agricultural pests and diseases out of this country is the linchpin for a healthy and productive farm and agricultural industry related economy. We have inspectors at foreign locations and at our borders vigilantly watching for pest and disease intrusions. We also work closely with stakeholders and producers to keep exotic pests and diseases out.

In October 2000, APHIS began reviewing recommendations from a National Plant Board Safeguarding Report. These recommendations recognize that globalization has increased APHIS' challenges in safeguarding America's agriculture resources. The report covered the collection and use of international information, potential risk pathways, and areas where we need to improve our risk mitigation efforts. In fiscal year 2001, we will continue to review recommendations for implementation. APHIS animal health officials are currently conducting a similar study to identify the needs and directions of the Agency's animal health efforts.

One strategy we employ to safeguard against the introduction of foreign diseases and pests is to help identify, control, or eradicate exotic agricultural health threats where they originate—outside the United States. APHIS has made several improvements in the past year. The foreign animal disease (FAD)/foot-and-mouth disease (FMD) program has expanded its scope from the traditional role of preventing FMD outbreaks overseas. We are improving surveillance of other FADs to ensure that the U.S. is prepared to address the threat of disease entry into the U.S. We are working with officials in Central and South America as well as in Asia, Europe, and Africa, where increased international trade presents new threats of introduction of FADs. APHIS officials are attempting to improve the infrastructure in these regions to allow them to respond quickly to outbreaks of FADs and manage them where international trade is involved. As of April 12, 2001, 70 Federal and State veterinarians and two animal health technicians have been deployed to the UK to provide technical assistance to their FMD eradication efforts. To intensify our efforts to keep FMD out of the U.S., our Agricultural Quarantine Inspection—User Fee program has increased international passenger arrival inspections using an additional \$13.5 million in fiscal year 2001 and an estimated \$18.6 in fiscal year 2002 from available user fee collections to fund additional inspection personnel and detector dog teams. The cattle tick program is a specific example of our efforts to safeguard against incoming animal disease threats. The program's focus is to identify tick incursions and quickly prevent their spread. In the past year, the program had to rapidly react to incursions from Mexico into Texas caused by low water levels in the Rio Grande. APHIS placed 45 premises under quarantine in fiscal year 2000 to prevent the spread of the tick.

Perhaps our most impressive effort to prevent the entry of an animal health threat is the screwworm program, which has successfully driven the pest seven countries south of the U.S. border. In the past year, Costa Rica has been declared as screwworm-free. The program there as well as in Nicaragua is now shifting toward monitoring and surveillance for screwworms and other FADs. The focus of the screwworm program is now in Panama, where the Joint U.S.-Panama Commission for the Eradication of Screwworm is actively releasing sterile flies throughout the entire country, with great progress toward eradication. The program will eventually establish a screwworm barrier in Panama, at the continent's narrowest point, where it is most cost-effective. To this end, the Joint Commission plans to build a new sterile screwworm facility in Panama and is currently engaged in securing financing.

APHIS also has important plant health programs in other countries, which prevent the introductions of pests and diseases that would threaten the fruit and vegetable markets in the U.S. The fruit fly exclusion and detection (FFED) program currently has an enormous effort ongoing in Mexico and Guatemala to reduce the Mediterranean fruit fly (Medfly) outbreaks that have threatened the U.S. citrus and other industries with billions of dollars in damage since 1998. The program has relied on emergency fund transfers to re-establish a Medfly barrier in Guatemala at a more sustainable location. We have increased sterile Medfly production and are using a variety of methods to deal with the threat in the long run. This program

provides significant protection for the citrus industry in Florida and California, where APHIS and the States have faced emergency situations. We are working within our borders as well. One example is the Medfly Preventative Release Program and detection efforts in California. APHIS will continue to use sterile flies in fiscal year 2001 to prevent the establishment of most wild fly introductions and to allow us to more easily manage smaller scale outbreaks. The FFED program has effectively used more environmentally friendly organic baits in large-scale operations in Guatemala, and has been trying the new methods in our domestic operations.

Another strategy APHIS uses to safeguard against introductions of pests and diseases from overseas is to ensure a high rate of compliance with APHIS quarantine regulations. The responsibility of the agricultural quarantine and inspection (AQI) program, which protects U.S. agriculture at the borders, has increased with the expansion of international trade and travel. We expect to add more inspectors in fiscal year 2001. To pay for these anticipated staff increases beyond that reflected by volume of traffic, APHIS adjusted the AQI user fee schedule to reflect the increasing need. For the part of the program not funded by user fees, we are using the increased appropriation the Committee provided for fiscal year 2001. We have begun using a more scientific staffing model, which focuses more on risk level and less on port volume. Using this staffing model, which has received considerable industry support, we can better ensure that we have our people strategically positioned to prevent the entry of restricted products. We now staff bridges at most U.S.-Mexico ports of entry 18 hours a day, with at least 3 shifts every day. The next major step we must take is to more vigorously pursue violators of the quarantine regulations. Static funding from fiscal year 1992 to fiscal year 2001 in our animal and plant health regulatory enforcement program has eroded our ability to keep up with violations. The time needed to complete investigations has more than doubled in the past eight years. Even so, APHIS conducted 938 investigations involving plant quarantine violations in fiscal year 2000, resulting in \$325,000 in fines. We anticipate this will increase in fiscal year 2001 with passage of the Plant Protection Act. In addition, we continue to investigate animal health and animal care program violations. The addition of animal care inspectors will undoubtedly increase the number of violations we detect and should pursue.

A pending issue that may be detrimental to APHIS' quarantine activities is the reduction in production of methyl bromide under new EPA regulations. We require some imports to undergo methyl bromide treatment before entering the U.S. While quarantine activities should be exempt from the production restrictions, the EPA has not published regulations allowing for the extra production. Without adequate supply, ports will have to turn away agricultural products at the border or destroy them. These actions could damage trade relations with our partners.

Another strategy we employ to meet our safeguarding goal is to foster a trade environment that allows for a common understanding of international agricultural health standards, a free flow of risk-assessment information, and quick resolution of technical trade barrier issues. The trade issues resolution and management program, formerly the sanitary/phytosanitary program, resolves import and export trade issues involving the health of U.S. agriculture. APHIS officials overseas participate in negotiations that ensure market access for U.S. products that may face restrictions for sanitary and phytosanitary reasons, as well as ensure that imports from other countries do not threaten the health of U.S. agriculture. More often, as international agreements have removed traditional barriers to trade, countries rely on sanitary or phytosanitary restrictions to prevent free access to competing products. These health measures may be arbitrary and not science-based, so APHIS' technical experts must be involved in trade negotiations to assure that U.S. agricultural products receive fair consideration. In the past year, our officials played key roles in advancing U.S. strategic interests regarding the development of standards for genetically modified organisms and wood packing materials, among other issues, with the International Plant Protection Convention, which sets international standards for plant health. APHIS officials also worked with the Office International des Epizooties, the recognized international standard-setting body for animal health, to develop standards on diseases such as bluetongue and bovine spongiform encephalopathy, as well as setting international guidelines for regionalizing diseases for trade purposes. APHIS officials also played key roles in bilateral negotiations that opened up market access for several U.S. commodities, including peaches, nectarines, and plums in Mexico, and nectarines in Japan. We successfully negotiated with China to open its tobacco market, while other U.S. industries began to export to that enormous potential market in fiscal year 2000. All of this new trade presents challenges and opportunities for APHIS. APHIS, under the U.S.'s World Trade Organization obligations, is also responsible for quickly evaluating requests for agricul-

tural imports. We currently have over 200 requests pending. Also, to prevent disease incursions into the U.S., our officials will continue to work in fiscal year 2001 with foreign agriculture officials to determine the presence of pests and diseases, enabling us to make accurate assessments of the risks of certain products from trade partners.

The Import Export program also fulfills our obligation to facilitate trade while ensuring that we protect U.S. livestock, poultry, and wildlife from incursions of exotic pests and diseases. Through bilateral negotiations, APHIS officials expanded markets for certain animal products to China, Mongolia, Lebanon, and Australia in fiscal year 2000, and are currently negotiating with Brazil and Argentina to revise export protocols. The Import/Export program officers also reviewed requests for import of avians, as well as livestock. Cattle imports into the U.S. nearly doubled in fiscal year 2000. The program restricted imports from the UK following an outbreak of Classical Swine Fever there in fiscal year 2000. With regard to the foot-and-mouth disease (FMD) threat, effective January 15, 2001, we removed the UK from the list of FMD-free countries. As of April 13, 2001, we began requiring that used farm equipment be certified free of all dirt and other particulate matter. In December 2000, we prohibited all imports of rendered animal protein products, regardless of species, from Europe. This decision followed the recent determination by the European Union that feed of non-ruminant origin was potentially cross-contaminated with the bovine spongiform encephalopathy agent.

APHIS is trying to facilitate animal trade through a veterinary equivalency agreement with the European Union (EU). Since signing a Red-Meat Agreement in 1992, the two parties have been attempting to further ease trade restrictions by recognizing equivalency between EU and U.S. sanitary measures. We completed a risk assessment to address EU concerns about recognizing the status of their states separately, rather than as a single unit, when disease may not be present in every state. This year, we are completing a supplemental risk assessment, based on industry comments and concerns over disease potential.

Goal 2.—To minimize agricultural production losses and export market disruptions by quickly detecting and responding to new invasive agricultural pests and diseases or other emerging agricultural health situations.

Exotic agricultural pest and disease incursions can cause significant damage initially, but also can cause catastrophic damage if left undetected very long. Our program priorities include early detection activities and accelerated eradication when there are emergency outbreaks.

APHIS strategies to achieve this goal revolve around a cooperative relationship with States, academe, animal and plant industry stakeholders, and international organizations. On the plant side, APHIS—Pest Detection program works toward quick detection and mitigation of exotic plant pests through the Cooperative Agricultural Pest Survey. The survey is a partnership with States to coordinate data collection on incipient infestations of exotic plant pests with the potential to cause economic losses. The program's database system helps the participants to track the spread of pests and plan their control. The Pest Detection program detected 459 new plant pests in fiscal year 2000, up from 334 in fiscal year 1999, yielding valuable information for the control of emerging pest threats in the U.S. APHIS also controls plant pest threats through the aforementioned Fruit Fly Exclusion and Detection program, which partners with States to control incursions of fruit flies into the U.S.

APHIS addresses animal pests and diseases through the Animal Health Monitoring and Surveillance program. In fiscal year 2000, we increased our investigations of suspected foreign animal diseases from 336 to 385. The Agency also participated in 18 state level test exercises to improve responses to disease incursions, conducted training for veterinarians to recognize foreign animal diseases, and provided technical assistance to various countries and states dealing with animal disease outbreaks. This included an outbreak of tropical bont tick in St. Croix and an outbreak of rabbit calicivirus disease in Iowa. In November 2000, APHIS officials and their counterparts in Canada and Mexico participated in a tripartite exercise simulating an FMD outbreak. This exercise tested APHIS' ability to share critical disease—related information with their North American partners and evaluated the Agency's emergency response plans as they relate to activating the FMD vaccine bank. APHIS led efforts to control the West Nile Virus outbreak among U.S. livestock and responded quickly to the detection of a screwworm positive horse in Florida. The National Animal Health Monitoring System delivered objective information addressing animal health as it pertains to U.S. trade, agricultural productivity, public health, and on-farm quality assurance. The program provided studies or risk assessments to commodity groups, state governments, academic institutions, and other federal agencies for equine diseases, possible diseases in eggs, and completed the first phase of a swine study in fiscal year 2000. The program conducted studies on

Johne's Disease, brucellosis, and tuberculosis, as well as various poultry diseases. Our fiscal year 2001 plans include expanding the Johne's disease program by including a quality surveillance and certification program as well as continued pseudorabies surveillance.

Another strategy to achieve this goal is to partner with States and industry stakeholders to develop an appropriate, measured response capability for outbreaks of invasive pests and diseases in the United States. Through the Emergency Management System, APHIS tries to improve the ability of the U.S. to handle animal health emergencies, from natural disasters, and accidental or deliberate introductions of FADs. In fiscal year 2000, APHIS held two workshops for private and state veterinarians on animal health emergencies and diseases. We also drafted measures for state participants in responding to an animal health emergency. In fiscal year 2001, our plans include entering into cooperative agreements for emergency management activities, placing emergency managers in the field, training, and providing technical assistance to foreign countries currently battling foreign animal diseases such as FMD.

In fiscal year 2000, we responded to several emergency situations that arose in the U.S. The Asian Longhorned Beetle entered the U.S. through wood packing materials from China, and soon spread throughout several locations from New York and Chicago. The pest threatens \$41 billion dollars of trees and thousands of acres of forest land in the U.S. So far, we can control it only by removing and destroying infested trees, but with our colleagues in ARS we have been concentrating on developing new methods. In fiscal year 2001, we received \$49.6 million in emergency funding transfer from the Commodity Credit Corporation to continue these efforts. We also responded to an outbreak of Plum Pox virus, in several peach orchards in Pennsylvania. USDA declared an emergency, and APHIS moved quickly to eradicate the disease and monitor for its possible spread before it could damage the entire U.S. stone fruit industry. We will continue national survey and tree removal activities in fiscal year 2001. We also worked with the State of Florida to control an outbreak of Citrus Canker, a devastating disease which spreads rapidly and reduces the fruit production of citrus trees. APHIS provided technical assistance and conducted regulatory, survey, and planning activities. With additional emergency funding, we will continue these cooperative activities in fiscal year 2001. Left unchecked, losses from citrus canker in Florida could total \$200 million per year.

Another example of APHIS' quick response to potential threats in fiscal year 2000 involved the discovery of six sheep in Vermont which tested positive or suspect for the transmissible spongiform encephalopathy (TSE) marker. TSEs are chronic, fatal diseases affecting the central nervous system of certain mammalian species. TSEs are found in sheep and goats as scrapie, in deer and elk as chronic wasting disease, and in cattle as bovine spongiform encephalopathy (BSE). We moved quickly to dispose of the positive/suspect animals. In addition, we offered to purchase and dispose of the remaining sheep in the affected flocks to minimize the risk of disease spread. The flocks had been imported from Belgium before we imposed restrictions of animal imports from Europe in response to BSE outbreaks. In March 2001, under authority of the U.S. District Court, we removed 360 quarantined sheep from two private Vermont farms. The sheep were transported to our National Veterinary Services Laboratories in Ames, Iowa, where they were humanely euthanized. Tissue samples will be collected from the sheep for diagnostic testing. The owners will be compensated for the fair market value of the sheep.

Goal 3.—To minimize risks to agricultural production, natural resources, and human health and safety by effectively managing existing agricultural pests and diseases and wildlife damage in the United States.

We have been fighting agricultural pests and diseases in this country for a long time. While some programs are ultimately successful, it is arduous to achieve complete eradication. Nevertheless, the economic benefits accrued to producers and less dependence on environmentally invasive chemicals makes eradication worthwhile. Managing wildlife conflicts also has significant economic and human health and safety benefits.

One strategy to achieve this goal is to conduct cooperative programs for control or eradication of ongoing regional and national agricultural health problems. We have several ongoing programs to manage the spread of selected agricultural pests and diseases, many of which have plagued American farmers for a century or longer. The Boll Weevil Eradication Program (BWEP) aims to eradicate the pest from all cotton-growing areas of the U.S. and Northern Mexico by 2004. In fiscal year 2000 the program added the Rolling Plains region of Texas to the list of 12 eradicated areas since 1983. Surveillance activities continued in these areas while other programs in the Southeast and Southwest progressed. The BWEP began with cotton grower foundations, States, and other non-Federal sources contributing 70

percent of the total cost per year and APHIS contributing the remaining 30 percent. Contributions from non-Federal sources increased to 87 percent in fiscal year 1998 and to 96 percent in fiscal year 2000. The program expects to spend about \$274 million in fiscal year 2001, and APHIS' cost share will increase to about 26 percent because of the \$64 million increase in the program's appropriation. We will use these additional funds to retire debt and increase our cost share with eight States, largely in Texas and Mississippi.

Pseudorabies, a serious swine disease, costs pork producers nationwide over \$30 million annually and poses a constant threat to the \$30 billion pork industry. APHIS began a cooperative State-Federal pseudorabies eradication program in 1989. From 1992 to the end of 1998, the number of infected herds dropped from approximately 8,000 to just over 1,000. At that time, APHIS was struggling to make further progress against pseudorabies, and producers were suffering the effects not only of the disease, but also of record low market prices. As a result, in January 1999, the Secretary transferred emergency funding to APHIS to establish the Accelerated Pseudorabies Eradication Program (APEP). APEP has substantially furthered the goal of eradicating this serious disease from the Nation's swine population. Under APEP, over 1,000 infected herds—or about 1.2 million swine—have been depopulated in 18 months, with more than \$80 million in indemnity paid to affected producers. As of April 1, 2001 there were only 95 infected herds in the U.S., and only Iowa faces major infection at this time.

Bovine tuberculosis (TB) is a contagious, infectious, and communicable disease that can be fatal in both animals and humans. APHIS has been working to eradicate it since 1917. We still face three major obstacles to lowering the incidence of new infection in domestic cattle herds. These are undetected infected captive cervid (deer) herds; persistent infections in El Paso dairies; and infected wild deer in Michigan that are the probable source of TB transmission to domestic livestock. In recent years, we have worked successfully to include captive cervids in the TB eradication program through regulatory amendments. APHIS is working with the State of Texas and the El Paso milk producers to build a buffer zone between the U.S. and Mexico in the El Paso region. To eliminate the last vestiges of the disease, we are working with Michigan in order to identify and eradicate TB from all domestic species and assisting the state in the eradication from wild deer populations. If we had not acted, these reservoirs of TB inevitably would have led to reinfection in other states.

I am pleased to report tremendous success with the brucellosis eradication program. We are on the brink of victory in a battle that has lasted for seven decades. Over the past century, brucellosis caused abortions, infertility, and lowered milk production in cattle and bison, and resulted in devastating losses to U.S. farmers. Now, thanks to an enhanced cooperative Federal-State-industry effort, we are eliminating the last pockets of infection. With Oklahoma joining Class Free status, there are 47 States enjoying this designation. For the first time, there are no known infected herds in the United States. Brucellosis has a variable, sometimes quite lengthy incubation period, and it would not be too surprising if we eventually find another infected herd. We are prepared to aggressively pursue any newly infected herds to eliminate the disease as quickly as possible. We cannot declare the United States officially brucellosis free until all States reach Class Free status. States must go a full year without disclosing any newly infected herds, and must also meet certain surveillance criteria to meet the standards for Class Free Status. Once the remaining States—Florida, Missouri, and Texas—reach Class Free status, we will officially declare the U.S. free of brucellosis. To ensure there is no reoccurrence, we will continue surveillance for 5–10 years.

While we have made great strides in eradicating boll weevils, cotton growers face other threats. The goal of the pink bollworm program is to contain the pest to the southwestern portion of the Cotton Belt (Texas, Oklahoma, and the States to the west), while rearing and releasing sterile moths to prevent the pest from becoming established in the San Joaquin Valley of California. APHIS produced approximately 867 million sterile moths at the Phoenix, Arizona, rearing facility for incremental releases in the San Joaquin Valley. The program continued to improve rearing efficiency and maintained production using less diet material, thereby reducing cost. In addition, program cooperators monitored over 13,200 traps in the San Joaquin Valley to detect any new introductions of pink bollworm. In fiscal year 2001, we will continue sterile moth releases to prevent native moths, which migrate into the San Joaquin Valley from the South, from mating successfully. This prevents the pest from becoming established in nearly one million acres of high yielding cotton.

Another tool in protecting American agriculture is Federal leadership in managing problems caused by wildlife—to reduce damage caused by wildlife to the lowest possible levels, while, at the same time, reducing wildlife mortality. Aquaculture,

the farming of fish, shellfish, and plants, is a nearly \$1 billion industry in the United States. U.S. aquaculture accounts for more than 180,000 jobs and has an economic impact of more than \$5.5 billion annually. APHIS continues efforts to reduce fish-eating bird damage by providing assistance, loaning damage abatement equipment, and conducting wildlife damage assessments for aquaculture producers including catfish and bait fish farmers. Also, with an organized roost dispersal effort, we reduced the estimated 70,000 cormorants in the Delta catfish production region by approximately 70 percent in fiscal year 2000. In fiscal year 2001, we will continue telemetry studies on depredating species of wildlife in the Southeast.

By its very nature, wildlife is highly dynamic and mobile and can damage agricultural and industrial resources. It poses risks to human health and safety and affects other natural resources. The wildlife services operations program resolves problems that occur when human activity and wildlife conflict with one another. For example, blackbirds migrating through the Great Plains cause several millions of dollars of damage every year to grain crops and livestock feed. They destroy nearly \$10 million in sunflower crops alone, mostly in South Dakota and North Dakota. APHIS has been providing assistance in the form of dispersal techniques and habitat management. Wildlife also spread rabies, which poses a serious threat to livestock, wildlife, and pets, as well as human health. APHIS has been cooperating with the State of Texas since 1995 to stop the spread of rabies in coyotes and gray foxes. Since 1997, we have worked with the States of Ohio, Vermont, and New York to prevent the spread of rabies in raccoons. In addition to appropriated funding, APHIS recently received \$4.2 million in emergency funding transferred from the Commodity Credit Corporation to reestablish barriers that have broken down and to expand those that are inadequate. This funding will provide only temporary action; a long term commitment is required if we are to control the spread of rabies.

The U.S. Fish and Wildlife Service has been reintroducing gray wolves, as a federally listed threatened species, into areas where their populations were depleted, including the Yellowstone ecosystem and central Idaho. Also, naturally occurring gray wolf populations in the Great Lakes region have been expanding southward through Minnesota and into Wisconsin and Michigan. Environmental groups are pushing to reintroduce wolves into additional locations, including the southern Rocky Mountain region and the New York/New England area. These expanding populations have had an impact on livestock with an increasing number of depredations from wolves. Since the gray wolf is a protected threatened species Federal law limits producers in the methods they may use to control predation. They must rely on Federal entities such as APHIS to assist them in implementing wildlife damage control activities. The requests for assistance in managing wildlife hazards at airports and military air bases also continue to increase. Airports report approximately 3,600 wildlife strikes to civil aircraft each year, and the U.S. Air Force alone reports more than 2,500 strikes. In fiscal year 2000, APHIS personnel provided wildlife hazard management assistance to 418 airports and military air bases.

Goal 4.—To ensure the humane care and treatment of animals covered under the Animal Welfare Act and various laws protecting horses.

The public is concerned about the health and well-being of animals held in captivity. Our response is to establish minimum standards for the humane care and treatment of animals used for research or exhibition purposes, sold as pets at the wholesale level, or transported by common carrier, and to carry out inspections to ensure high levels of compliance with those standards. We continue to focus resources on conducting quality inspections under the AWA at USDA licensed and registered facilities. The animal welfare program uses a risk based inspection system that concentrates activities on facilities where animal welfare concerns are the greatest. With the funding increase in fiscal year 2000, APHIS hired and began training eight new animal care inspectors. We anticipate adding at least eight more inspectors in fiscal year 2001.

There is an increase in public concern regarding the pain and distress experienced by animals used in research facilities, an issue which could greatly impact the biomedical research community. The AWA requires research facilities to report annually to the Secretary information on procedures likely to produce pain or distress in any animal which we report in our Annual Report to Congress. In the past, reporting has focused on painful procedures and largely ignored distressful procedures, despite the equal emphasis for both in the Act and regulations. Additionally, the current reporting categories are based on the use, or non-use, of pain relieving medications rather than on the actual level of pain or distress perceived by the animals. To better clarify the expectations for minimizing distress as well as pain, we have sought public input and received approximately 2,800 comments from interested groups, the general public, biomedical researchers, and interested parties

internationally. We now must evaluate the comments before deciding on whether or not to initiate a rulemaking change.

The humane care and treatment of elephants is receiving growing focus from animal concern groups and the media. APHIS has settled several high profile cases involving the care and treatment of elephants in Oregon and El Paso zoos as well as with a circus. APHIS received over 230 comments in response to a draft Policy on Training and Handling of Elephants and Other Potentially Dangerous Animals. While the policy is technically an internal document for APHIS use, the issue is of sufficient public interest and importance to warrant public input. We are currently reviewing the comments to determine whether there are any valid scientific or other reasons to modify the proposed policies and expect to publish a final version in the summer of 2001.

We also establish and monitor compliance with standards protecting horses being exhibited in shows or transported to slaughter and educate regulated entities and individuals to encourage compliance with animal welfare regulations in our horse protection program. The Horse Protection Act (HPA) originally enacted by Congress in 1970, is intended to eliminate "soring," the practice of inflicting injury on a horse's front feet for the purpose of accentuating a high stepping gait. Since 1996, APHIS has worked with the horse industry organizations certified under the HPA to develop a partnership whereby they can assume greater responsibility for self-regulation. APHIS has developed a multi-year plan beginning with the 2001 horse show season. However, we are concerned that several horse industry organizations will not agree with the plan. Also, we are now faced with a legal challenge to the plan from the American Horse Protection Association regarding APHIS' authority to delegate enforcement functions to the industry groups. Such ongoing controversy has made our job more difficult, but we remain committed to working with the industry to enforce the HPA.

Goal 5.—To develop and apply scientific methods that benefit agricultural producers and consumers, protect the health of American animal and plant resources, and sustain agricultural ecosystems. APHIS has established laboratories and applied science and technology centers to achieve this goal and to help achieve the other APHIS Goals.

Good science must be the strong base of everything we do in APHIS. We provide diagnostic services, products, and training to support animal disease surveillance, prevention, control, and eradication programs. Our veterinary diagnostics program provides assistance to State and other Federal agencies and laboratories, educational institutions, and foreign governments in the diagnosis of animal diseases. In fiscal year 2000, our National Veterinary Services Laboratories (NVSL) in Ames, Iowa, diagnosed cases of equine encephalitis during the West Nile virus outbreak in the northeastern United States. NVSL also diagnosed rabbit calicivirus during an outbreak in Iowa, the first time that disease had been identified in the United States. Also, NVSL developed a panel of over 25 defined sheep sera used to control quality and validate serodiagnostic methods for ovine Johne's serodiagnosis. Previously, the United States had no tested battery of defined sheep antisera for the standardization of Johne's Disease (paratuberculosis) testing in sheep. All told, NVSL received and tested 69,736 diagnostic submissions in fiscal year 2000, including 5,526 for import/export testing and 3,500 for avian influenza surveillance. NVSL also received 7,649 dip vat samples tested for pesticide concentration in support of the cattle tick program. In addition, NVSL received 2,303 brains to test for bovine spongiform encephalopathy (BSE) in support of BSE surveillance, which is the largest single-year total since surveillance began in 1990. This allowed NVSL to confirm to the U.S. public and trading partners that the United States is BSE-free. This function has become increasingly important as information and misinformation about BSE becomes widespread.

During fiscal year 2000, NVSL's Foreign Animal Disease Diagnostic Laboratory at Plum Island, New York, received and tested 724 diagnostic submissions. These represented 120 suspect foreign animal disease investigations; 38 import tests; 7 safety tests; 9 reference cases, including materials received from the Agricultural Research Service, foreign countries, and collaborative projects; and 550 classical swine fever surveillance (CSF) submissions. As risk of introduction of CSF remains high with uncontrolled outbreaks in the Caribbean and other areas, NVSL surveillance activities have shown that the United States is still free from this disease.

We provide new tools and technologies to improve wildlife damage management through our Wildlife Services Methods Development program. The National Wildlife Research Center (NWRC) is the only research facility in the world specifically designed for developing and implementing methods to resolve wildlife conflicts with humans and agriculture. The NWRC dedicates 75 percent of its budget to developing nonlethal methods for effective, practical, and socially-acceptable methods of

wildlife damage management. This helps ensure that high-quality technical and scientific information on wildlife damage management is available for the protection of crops, livestock, natural resources, property, and public health and safety. NWRC researchers conduct numerous activities, including the improvement and maintenance of current pesticide registrations, and researching new or improved methods for more effective management of wildlife damage.

NWRC, through an agreement with the General Services Administration and funding received in fiscal year 1999, is continuing construction of its state-of-the-art wildlife management research facility and national headquarters on the Foothills Campus of Colorado State University in Fort Collins, Colorado. APHIS is completing design work on a new Support Wing, an addition to the existing indoor Animal Research Building, which will be ready for occupancy in fiscal year 2002.

During fiscal year 2000, NWRC, through additional field and laboratory data, increased the APHIS Emergency Use Permit registration for acetaminophen as a toxicant for brown tree snake control on Guam from 300 to 2,000 baits per night. Researchers continued to make progress toward development of contraceptives for non-lethal wildlife damage management. Researchers are testing single shot PZP and GnRH immunocontraceptive vaccines in white-tailed deer at Pennsylvania State University. During fiscal year 2000, NWRC began research on nicarbazin, a potential contraceptive for controlling Canada goose populations where they are causing safety, health, or nuisance problems. Based on the preliminary successes observed in multiple laboratory and field studies, NWRC will conduct additional studies. Scientists continued the development of selective, humane wildlife capture devices to increase efficiency and reduce animal injuries associated with capture and restraint of coyotes. NWRC has continued experiments with tastes, odors, and physical or visual cues to improve coyote attraction to baits and delivery devices for chemical agents, and to identify potential chemical repellents and other predation deterrents. The Center has recently established a genetics laboratory to examine genetic relationships among individual coyotes.

NWRC works hand in hand with the wildlife services operations program by continuing to expand its research efforts to develop and improve methods for managing blackbird damage to rice and sunflowers. Biologists are cooperating with agricultural industry groups to determine the effects of blackbird control methods on the environment, including non-target species. Also, NWRC has undertaken multi-year research projects at various airports in the United States to reduce the threat to human safety occurring when wildlife collide with aircraft or are pulled into jet engines. Scientists have researched turf management, nonlethal repellents, and dispersal techniques to minimize strikes by gulls, waterfowl, turkey vultures, hawks, and other species that threaten aviation safety.

Another strategy is to facilitate, monitor, and regulate environmentally responsible development of biotechnology-derived products for the benefit of agricultural producers and consumers. Within the last decade, we have seen incredible advances in many scientific areas. Some of the most visible of these advances occurred in the realm of agricultural biotechnology. Along with the Internet and the mapping of the human genome, the introduction of genetically engineered fruits and vegetables was one of the most significant scientific stories of the 1990's. APHIS, the Environmental Protection Agency (EPA), and the Food and Drug Administration (FDA) are responsible for regulating agricultural biotechnology in the United States. APHIS regulates the development and field testing of certain genetically engineered organisms, primarily new plants and plant products, to ensure that they are as safe to use in agriculture as traditional varieties. Since 1987, we have overseen more than 7,000 field trials of new, biotechnology-derived plant varieties at 35,000 sites. Since 1993, APHIS' through our biotechnology regulations—has ensured the safe development, testing, and subsequent regulatory release of more than 50 new genetically engineered plants, including chicory, corn, potatoes, soybeans, and tomatoes. Along with the EPA and FDA, APHIS has ensured that these products—many of which are engineered for herbicide tolerance, insect-resistance, or disease-resistance—will not harm agriculture, the environment, or human health. For example, APHIS was involved in the issue concerning the production of Starlink, a strain of corn genetically engineered to have pesticide properties. We deregulated Starlink before the EPA restricted its use to animals due to possible allergenic properties to humans. Whether the Starlink Cry9C protein is a potential allergen requires additional research. To allay public concern both domestically and internationally about Cry9C in this year's hybrid seed corn, we assisted other Departmental agencies in the disposal of the seed corn by environmentally friendly means. Our officials have met the challenges posed by rapidly evolving technology and consistently base their regulatory decisions on the most current scientific information. To obtain the best independent, technical, and scientific data pertaining to biotechnology, APHIS officials

have consulted with scientists and regulators both in the United States and abroad. They have also performed extensive searches of a wide variety of scientific literature and participated in biosafety workshops and international symposia.

We comply with environmental analysis and reporting requirements and institutionalize a responsible environmental ethic in APHIS programs. In the environmental protection area, our National Monitoring and Residue Analysis Laboratory (NMRAL) in Gulfport, Mississippi, continued to support boll weevil, citrus canker, Asian longhorned beetle, Oriental Fruit Fly, MFF, and Medfly programs in fiscal year 2000. NMRAL provided sampling and analysis of worker exposure to chemicals both at the laboratory and at port facilities and laboratory analysis for pesticide residues and for industrial chemicals, and analysis for pesticide residues in food commodities for the Agricultural Marketing Service's Pesticide Data Program. NMRAL conducted 5,987 analyses in fiscal year 2000, of which slightly more than half, or 3,094, supported APHIS programs; the remainder we performed for other agencies on a reimbursable basis. APHIS manages and coordinates the preparation of environmental assessments (EA), environmental impact statements (EIS), environmental analyses, biological consultations, and related technical documents for operational programs. In fiscal year 2000, we completed 30 EAs, 28 biological consultations, and 1 EIS, in compliance with the requirements of the National Environmental Policy Act and other Federal environmental laws, regulations, and executive orders.

We also protect animal health by ensuring the purity, potency, safety, and efficacy of veterinary biological products. Veterinary biologics program activities include licensing veterinary biological products, inspecting licensed manufacturing facilities, testing samples of licensed products, and issuing permits for product importation. For example, we issued 3,843 official certificates in fiscal year 2000 that indicate licensed production and testing facilities and products have met or exceeded marketing requirements. The regulated industry used these certificates to register their products for sale in foreign countries. The confidence that foreign regulators have in the U.S. veterinary biologics licensing, testing, and inspection system is reflected in their readiness to accept our products. APHIS continued efforts to reduce trade barriers that limit the sale of veterinary biological products overseas. Officials continued discussions with representatives of the European and U.S. biologics industries and with regulatory officials from the European Union regarding a Mutual Recognition Agreement concerning the marketing of veterinary biologics. Interaction with Canadian regulatory officials continued under the Canada-United States Trade Agreement and the North American Free Trade Agreement. We held meetings with regulatory officials from Australia, the European Union, and Germany to facilitate exchange of information and encourage discussion of regulatory issues. Such discussions led to Brazil lifting a temporary suspension of trade in U.S. ostriches and horses because of West Nile virus in the U.S. Other negotiations achieved a memorandum of understanding with Chile on imports of U.S. fish eggs early in fiscal year 2000.

OUR BUDGET REQUEST

With the tremendous expansion of travel and trade, we must make every effort to keep exotic pests and diseases from entering the United States. Pest and disease threats are always looming. These threats become more real with the actual foot-and-mouth disease outbreaks in the United Kingdom and elsewhere. In our Agricultural Quarantine Inspection—appropriated program, an increase of \$5.6 million will increase inspections for high-risk Canadian border ports, pre-departure activities in Hawaii, and expanded border activities in Laredo and Pharr, Texas. An increase of \$2.5 million in our trade issues resolution and management program will help resolve overseas barriers to trade and participate in international standard-setting activities. We also will use the increase to conduct import and export risk assessments to protect U.S. animal agriculture from pest and disease threats caused by imports and to support U.S. export requests.

We are requesting a \$196.8 million increase to continue eradication efforts in programs that were initially funded from the Commodity Credit Corporation (CCC). These eradication programs include—Mediterranean fruit fly in Mexico with an increase of \$23.2 million in our fruit fly exclusion and detection program; an increase of \$37 million for citrus canker, an increase of \$49.7 million for Asian long-horned beetle, an increase of \$4 million for Pierce's disease, and an increase of \$5.1 million for plum pox virus, all requested in our emerging plant pest program; an increase of \$30.4 million for pseudorabies; an increase of \$17.9 million for scrapie; an increase of \$12.9 million for tuberculosis; and an increase of \$16.5 million for rabies requested in our wildlife services operations program. We did not feel it was appro-

appropriate to continue to rely on CCC funding when it became apparent that these programs would require more than 2 years to complete. The use of CCC emergency funding is appropriate for unexpected events, when other budgetary tools cannot meet emergency needs within critical time frames. However, in cases in which the eradication of a particular infestation will take several years, and funding needs can be anticipated and planned for, the use of emergency funds for future years is no longer appropriate.

Our budget also requests an increase of \$15.4 million for pay costs. This increase will enable us to maintain current staffing levels. Our staffing is what allows us to continue our exclusion, monitoring, scientific, animal care, and wildlife activities that help protect our American agriculture.

CONCLUSION

Emerging animal and plant health issues, and their real or perceived impacts on public health and American economic interests, will require increasingly sophisticated and appropriate scientific expertise. Before we can control outbreaks of foreign pests and diseases such as citrus canker, Asian longhorned beetle, and West Nile virus, we must understand the biology underlying them. New emergency management responsibilities, threats from bioterrorism, and pressures against use of biotechnology-derived products require new decision models based on assessment of risk. APHIS must develop and use the latest scientific methods and technologies and work closely with scientists around the world to anticipate and understand the nature of emerging health threats to agriculture, wildlife, and people.

“Globalization” will continue to challenge APHIS—capacity to carry out its mission. Implementing and complying with new rules of trade (e.g., scientific risk assessments, equivalency, transparency, regionalization, and dispute settlement) create new responsibilities and demands for services that threaten to outstrip APHIS’ current resources. Improved transportation technologies increase the movement of animal and plant pests and diseases. Dramatic increases in international travel, trade, and containerized cargo make total reliance on traditional inspection procedures impractical. We must continue to update detection methods, prevention strategies, monitoring systems, and response actions.

American society’s expectations of the Federal Government and APHIS’ role create many management challenges. Demands for our services continue to rise. Some are demanding that APHIS become involved in new issues beyond the scope of our traditional mandate. For example, the agency is now being asked to address general animal welfare issues (beyond those authorized under current legislation) and to develop nonlethal wildlife control methods, as more people move into rural areas. At the same time, Americans are looking for a balance between pragmatic solutions to problems and the protection of the environment and the welfare of animals. APHIS will continue to update strategies and methods to ensure that programs are practical, timely, environmentally sound, humane, and socially acceptable.

The Internet and other advances in communication technologies have increased the public’s expectations for information. Everyone demands quick access to information about APHIS’ services, technical assistance, and regulations. At the same time, there is a growing distance between much of the general public and the agriculture community. As our society moves further away from its agrarian roots, there is a corresponding decrease in the understanding of, and appreciation for, the basic APHIS mission of protecting and promoting animal and plant health. Education and public awareness become increasingly important as APHIS builds support for its programs.

I will be happy to answer any questions.

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF ROGER C. VIADERO, INSPECTOR GENERAL

INTRODUCTION AND OVERVIEW

Good morning, Mr. Chairman and members of the Committee. I am pleased to have this opportunity to visit with you today to discuss the activities of the Office of Inspector General (OIG) and to provide you with information on our audits and investigations of some of the major programs and operations of the U.S. Department of Agriculture (USDA).

Before I begin, I would like to introduce the members of my staff who are here with me today: Jim Ebbitt, Assistant Inspector General for Audit; Greg Seybold, Assistant Inspector General for Investigations; and Del Thornsby, Director of our

Resources Management Division. I also want to thank the Committee for its support during my tenure as Inspector General. We have tried to work closely with you, and I hope we have been able to address some of your concerns.

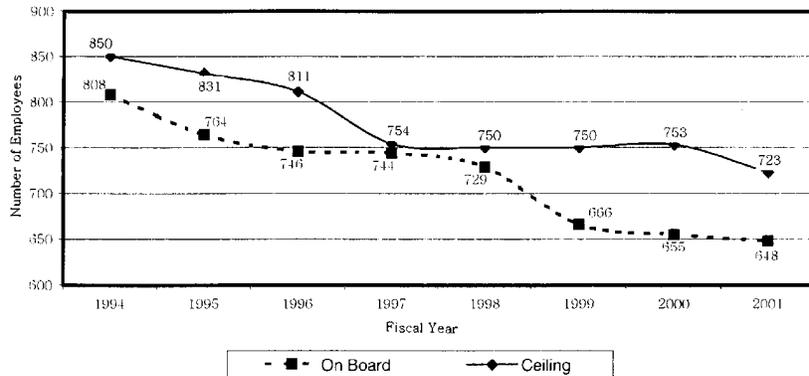

I am proud to say that, in fiscal year 2000, we continued to more than pay our own way. In the audit arena, we issued 110 audit reports and obtained management's agreement on 743 recommendations. Our audits resulted in questioned costs of nearly \$95 million. Of this, management agreed to recover more than \$47 million. In addition, management agreed to put another \$268 million to better use. Equally as important, implementation of our recommendations by USDA managers will result in more efficient and effective operations of USDA programs.

OIG investigations resulted in \$175.9 million in fines, restitutions, other recoveries, and penalties during the year. Our investigative staff completed 553 investigations, obtained 481 indictments and 459 convictions, and made 2,616 arrests.

While I am very proud of the accomplishments of this organization over the past year, I must add that our results could be much more dramatic. Although I am very appreciative for the increase we received this fiscal year, the overall continuous erosion of our budget in the past 7 years in constant dollars continues to severely limit what we can accomplish. During this time, we have had to decrease our staff by over 150 positions—approximately 20 percent—to offset this erosion. Such a decrease in OIG's audit and investigative staffs results in a decline in our ability to ensure that the taxpayers' dollars, which you appropriate for the Department of Agriculture, are protected from external criminal enterprises, internal corruption, and improper stewardship.

Adequate funding and staffing for our office make good sense and are very cost effective in view of the money we save the taxpayers. While I recognize there is a fierce competition for the Government's limited resources, I believe OIG must be viewed differently from the program delivery missions, in that we are often the last line of defense against compromise of the Department's program delivery and are a significant contributor to the creation of a Government that is accountable and productive. Every OIG special agent and auditor who cannot be hired as a result of the constant erosion of our budget results in "one less cop on the beat" in every agriculture neighborhood across this country. This makes for tough decisions on my part. Which agriculture neighborhood should we leave vulnerable to criminal victimization by shifting our thin line of law enforcement resources to only the highest agricultural priorities? This is a real choice I am forced to make daily because I simply do not have sufficient resources to cover the entire agriculture community. As such, I request that our proposed funding level be approved without reduction.

OFFICE OF INSPECTOR GENERAL
Employment History: Actual On Board vs. Ceiling
FY 1994 - FY 2001

We work closely with the Department's agencies through our audit work and criminal investigative efforts to ensure that appropriated funds are used efficiently and effectively and program benefit dollars go to those recipients intended by Congress. Generally, we audit and investigate the largest dollar fraud cases since our staffing levels will not allow us to do more. This means there are usually a large number of fraud cases we do not have the staffing to address and which, therefore, must be referred to the agencies to pursue through administrative remedies. However, the agencies do not have resources to address all of these cases, and even more

importantly, many of them should not be handled administratively since they involve fraud. Thus, the underlying result is that a significant amount of criminal activity is not being addressed. This makes it very difficult to turn the tide of fraud in any particular program area. Additionally, in our most recent audit planning seminar, we identified 30 staff-years of work in high priority areas we had to drop from our audit program because we did not have staff available to perform the work. Similarly, we continue to carry a backlog of nearly 750 pending, inactive investigative cases—nearly 30 percent of our total caseload—which we cannot address in addition to our normal caseload of approximately 2,000 active cases.

Our current staffing level also restricts our ability to pursue criminal investigations proactively, generally limiting us to one or two program areas of proactive work per fiscal year. Nevertheless, we continue to work closely with USDA agency officials to address key issues and expand joint operations with other Federal, State, and local law enforcement and audit agencies to broaden the impact of our work. Working together, our staffs identify program weaknesses and program violators.

In my testimony today, I will address the most crucial issues facing the Department and why it is essential that OIG be funded at the level requested.

The safety and wholesomeness of agricultural products provided to the public is our primary concern. OIG is committed to ensuring the health and safety of the American consumer as it relates to agricultural products. Additionally, we will focus our efforts on employee integrity, financial integrity, and information technology and computer security issues, including new statutory requirements such as the Government Information Security Reform Act. That legislation requires annual reviews, beginning in fiscal year 2001, of the Department's information security program, most notably an evaluation of the effectiveness of security control techniques for a sample of the systems. We need the necessary resources to broaden our scope of work in these areas and pursue an audit and investigative enforcement strategy resulting in the greatest impact on these critical programs.

AUDIT AND INVESTIGATIONS ACTIVITIES

HEALTH AND SAFETY

Our audits and investigations continue to identify problems in domestically produced foods including contaminated food, misbranded products, and uninspected meat or other products. We also are seeing an increase in problems in imported food products or other commercial shipments legally imported into the United States, as well as shipments smuggled into the United States containing banned products and, frequently, dangerous pests. OIG's resources, especially our investigative resources, are increasingly overextended. OIG is often required to pull its special agents from current investigations of large dollar frauds in USDA's benefits and loan programs to investigate criminal activity that threatens the health and safety of the public.

We must also address domestic and international criminal terrorist threats to the security of our Nation's food supply. This problem has been recognized as a major concern by the Department of Justice (DOJ) and Congress, as well as OIG. Threats of intentional biological contamination of food products for extortion or ideological motives victimize and disrupt the food production and distribution systems of this country. Immediate response to emergency situations impacting USDA personnel, programs, and operations, as well as regulated industries, requires the specific, unique law enforcement expertise of USDA OIG.

Recently, successful prosecutions of criminal enterprises have included a multi-agency sting operation in San Francisco, which netted three importers who attempted to bribe a Government official to expedite the entry of their food shipments from Hong Kong into the United States without the required inspections. The other two importers pled guilty, one to receipt of adulterated food in interstate commerce and the other to importing adulterated product and bribery. A Federal jury found the third importer guilty of bribery, money laundering, smuggling, entry of adulterated foodstuffs, and conspiracy. He was the leader and organizer of this criminal activity and had obstructed justice by providing false testimony at his trial. Because of the serious risk to public health and safety caused by the smuggling of salmonella-laden seafood into the country, the judge also granted the Government's motion for upward departure from sentencing guidelines. This case resulted from work initiated by the San Francisco Interagency Import Task Force, which has been targeting firms involved in illegally importing plants and animals that may present a threat to America's food supply. This investigation alone cost OIG approximately \$350,000 in personnel, travel, and equipment costs.

Based on notification by the California Department of Food and Agriculture that a Los Angeles agricultural products import firm may have smuggled tons of Mexican sweet limes into the United States, we initiated a joint criminal investigation with

the U.S. Customs Service. In June 2000, a 27-count indictment was filed, charging three individuals and two firms with conspiracy, smuggling, and aiding and abetting. Two of the three indicted subjects have been arrested, with one awaiting trial and one convicted on charges relating to the transport of various agricultural products, including Mexican sweet limes, into California from Mexico. Laboratory examination showed that a substantial portion of the illegally imported Mexican sweet limes was infested with Mexican fruit fly larvae.

We are also concerned with the large number of repeat offenders that USDA and State regulatory agencies have to deal with on a regular basis. Civil fines and administrative sanctions have simply become an additional "cost of doing business" for those repeat offenders who seek to skirt the dedicated efforts of the Department's regulatory agencies. These cases involve the smuggling of agricultural products, illegal meat processing operations, the deliberate introduction or threatened introduction of biological agents to attack this Nation's food supply, and assaults on employees in the Department's regulatory agencies as they carry out their official duties.

For example, in one recent ongoing investigation, an anonymous letter containing an unknown powder alleged to be anthrax was sent to the owner of a federally inspected meat plant. Fortunately, the powdery substance was benign; however, it caused great concern for those plant employees who were exposed to the substance. It also caused economic disruption to the operation of the plant, which was forced to close for a half day until the identity of the substance could be determined through laboratory testing and the meat plant could be properly decontaminated. This hoax cost the plant thousands of dollars in lost production, hospital costs, and destroyed product. We cannot put a price tag on the anxiety caused to the plant employees while they wondered if they had been truly exposed to anthrax.

In another recently completed investigation, we identified a corporation smuggling prohibited uninspected meat products into the United States. The foreign country where these meat products originated is prohibited from exporting them into the United States due to numerous livestock diseases, such as foot-and-mouth disease, and sanitation concerns in their manufacturing plants. Such products pose a serious health hazard to the general public and livestock industry in America. On five previous occasions, the company had been caught by two separate USDA regulatory agencies smuggling these illegal meat products into the United States. On each of these occasions, the products were destroyed, and the company received a small fine. Recently, my office received information that the corporation was again importing these illegal, dangerous products. We have initiated a criminal investigation with DOJ to put an end to this flagrant skirting of the USDA regulatory process and ensure the protection of the public's health.

While we continue to respond as quickly as we can, I am concerned that our efforts to respond to these incidents are severely hampered by a lack of personnel; proper protective equipment, such as biohazard suits and breathing equipment to ensure the health and safety of our staff, and specialized forensic equipment to gather evidence samples; and funding for specialized training on how to recognize and properly handle biohazardous materials.

In addition to our investigative work, we have completed a series of audits to determine if the Food Safety and Inspection Service (FSIS) has successfully implemented the new science-based Hazard Analysis and Critical Control Point (HACCP) system for inspecting meat and poultry in the United States. Our initial review included the implementation of HACCP, laboratory analyses, foreign imports, and the compliance program that carried over from the previous system. We found that while FSIS had taken positive steps to secure the safety of meat and poultry products, more needs to be done in all four areas reviewed. Overall, we concluded FSIS had reduced its oversight to less than what is prudent and necessary for the protection of the consumer.

Based on these findings, we made numerous recommendations to FSIS for program improvement, and it has agreed to implement those recommendations. However, because FSIS' record in fulfilling promises of implementation is weak, we need a continued audit presence to monitor and ensure implementation of the recommendations. In addition, we are expanding our audit review of FSIS' program on meat and poultry products imported to the United States. We are also performing additional work to assess the equivalency determinations FSIS makes of foreign countries' inspection systems and to determine if FSIS' reinspection of foreign imports is working as intended. Even as we begin this work, we are worried that we will be unable to complete both this new audit and monitor implementation of the earlier recommendations with current staffing levels. We are concerned that if we are not able to do adequate monitoring and FSIS does not implement these recommendations, the U.S. food supply will be at risk.

Antismuggling Program

The escalation of smuggling activity involving food products has forced us to shift our resources to this arena. Such smuggling brings high dollars in underground “black market” commerce and is an increasingly serious problem to the Nation and especially to the economy of many agricultural States. Smuggling can and has resulted in the introduction of harmful exotic plant and animal pests, diseases, and invasive species which harm America’s crops, forests, food supply, livestock, wildlife, and domestic animals, as well as the health of the American consumer. Such illegal activity can cost billions of dollars in destroyed crops and undermined agricultural markets—both foreign and domestic—and result in lost jobs, as well as create a serious health threat to the American consumer.

To combat the ever-increasing smuggling activities, OIG has developed a three-pronged strategic approach which relies heavily on an expanded relationship with State, local, and Federal agriculture and law enforcement agencies. However, our antismuggling program has been limited due to our lack of resources, which I have described previously. Additional staffing is needed for these proactive initiatives, along with the necessary specialized law enforcement equipment.

We also audited APHIS’ Plant Protection and Quarantine (PPQ) practices for inspecting air and ship cargos and passengers arriving at the Miami and Ft. Lauderdale, Florida, ports. We identified vulnerabilities and weaknesses which increased the risk of prohibited products and pests entering the United States. OIG observed that PPQ inspectors did not inspect cargo ships upon arrival; did not inspect the baggage of 75 percent of arriving international airline passengers and 99 percent of cruise ship passengers arriving from foreign locations; did not assess fines as a deterrent against airline and cruise ship passengers found to have prohibited agricultural items in their possession when entering the United States; did not select samples of perishable cargo for inspection but, instead, allowed brokers to select the samples; nor did they ensure that caterers met all foreign arriving aircraft immediately upon arrival to remove, in seal-proof containers, any food or nonfood garbage.

We recommended that APHIS assess penalties when warranted and determine if higher inspection fee rates were necessary to provide for sufficient resources. We recognize, as does APHIS, that inspections are resource-intensive, and that risks need to be assessed to determine where scarce resources should be directed. APHIS believes that airports handling international passengers pose the greatest risk. However, it has not presented OIG with a risk assessment that supports that contention, nor has it presented an assessment indicating additional staffing is needed because risks are inherent at both airports and seaports.

Because of this audit and our concern with the smuggling into the United States of prohibited products, we have begun a broad-based review, evaluating APHIS’ policies and procedures for identifying and assessing risk among the various agricultural goods imported into the United States. We also are reviewing the interaction between APHIS and the U.S. Customs Service to review the measures employed to detect pests that may enter the United States in both agricultural and non-agricultural related products. Our goal is to make recommendations that will help APHIS do its job better.

EMPLOYEE INTEGRITY

A continuing priority for OIG is the investigation of criminal acts committed by USDA employees. We have identified approximately 55,000 USDA employees whose positions place them in direct contact with the public on a regular basis, doing everything from inspecting meat and grading produce to providing loans and other program benefits. The only way to maintain the confidence of the taxpayers, consumers, and producers who use or rely on the Department’s services is to know that USDA has a trusted and dedicated work force. And, while we want to emphasize that the evidence shows, and we firmly believe, that the highest percentages of these employees do their job with the utmost integrity, to maintain that trust, internal controls must be in place and operating. To quote a great American, Dwight D. Eisenhower, “the unaudited deteriorates.”

One case that demonstrates a situation where those controls broke down is our continuing investigation of the scheme by which Agricultural Marketing Service (AMS) graders accepted bribes from produce wholesalers at the Hunts Point Market in New York City in return for downgrading produce. It also graphically demonstrates how corruption can have a major impact on the daily commerce of this country. This kind of investigation is very staff intensive and requires the use of specialized technical equipment, such as listening devices that are wired into the electrical system for long distance coverage. We currently have a significant number

of corruption investigations similar to this one. This is an area where we must be ever vigilant, and where we simply must have the right tools and sufficient staffing to stop corrupt USDA employees from continuing their criminal activities.

FINANCIAL INTEGRITY

While some of the Department's agencies have achieved success with their financial systems and received clean financial opinions, other major systems have not. The Food and Nutrition Service (FNS), the Risk Management Agency (RMA), and the Rural Telephone Bank received unqualified opinions in fiscal year 2000, which means their financial statements fairly presented their financial position. But the Forest Service (FS) and the Commodity Credit Corporation (CCC) were unable to complete their financial statements in time for us to audit them by the legislatively mandated timeframe of March 1. Also, Rural Development has not been able to properly determine the cost of their loan programs. Thus, it received a qualified opinion.

The individual conditions of the agencies when taken together mean that for the past 7 fiscal years—1994 through 1999 and in our just released audit for 2000—we have issued a disclaimer of opinion on the Department's consolidated financial statement. This disclaimer means that the Department overall does not know whether it correctly reports all collected monies, the cost of its operations, or other meaningful measures of financial performance. Most importantly, some USDA managers do not have reliable financial information regarding how much has been spent on the cost of program operations and are being forced to make decisions "in the dark" without solid financial data. Not only can flawed decisions result, but the integrity of program dollars is put at risk of misuse or theft. Given USDA's annual budget authority of about \$82 billion dollars in fiscal year 2001, the importance of having a strong financial reporting capability cannot be overstated.

The main problems that USDA has to solve to improve its financial accounting which will result in improved opinions on these financial statements include: FS needs to improve its accountability and evaluation of its assets; Rural Development, CCC, and the Farm Service Agency (FSA) need to perfect models and gather the necessary data to support implementation of the model that will accurately reflect the costs of their loan programs; and the Department needs to complete implementation of its new accounting system—the Foundation Financial Information System.

These major problems contribute to conditions that keep the Department from achieving a clean audit opinion. For example, we have been unable to substantiate the Department's fund balance with the Department of Treasury reported at over \$38 billion. This account represents monies that can be spent in the future for authorized transactions. Last year we reported that Treasury records and the Department's records were out of balance by \$5 billion. At the close of fiscal year 2000, the difference had been reduced to about \$450 million. In other words, the Department still has reported differences with Treasury of this amount, \$450 million, and does not know the reason why. Think of this in terms of your personal checking account. Your check register says one thing but the bank says you spent a higher amount, and you cannot figure out the difference.

FS has been impaired by a lack of accountability over its assets. Historically, it has not been able to develop a meaningful asset valuation because it did not know what assets had been acquired, when the assets were obtained, or how much they cost. While FS has improved in recording assets, asset valuation continues to be a problem. To overcome this problem, FS needs to undertake an extraordinary level of effort to establish accountability and develop acceptable accounting records in order for agency management to fulfill its financial management and stewardship responsibilities.

While the Department is working toward overcoming past encumbrances to an unqualified audit opinion, aggressive action is still needed to foster meaningful financial management as soon as possible. All of this activity significantly impacts OIG's resources. We have had to devote far more effort to the legislatively mandated audits of financial statements than envisioned by Congress because of the systemic weaknesses that have generated unauditible statements. While it may seem paradoxical, the demand on our resources will actually increase—not abate—as the Department moves closer to auditability because we will have much more to audit than we have had in the past. For the fiscal year 2000 financial statement audits, we scheduled more than 70 auditors—over one-third of our audit staff—full time, for these audits. We estimate that the workload demands will require us to increase our financial staff to 90 auditors—about 40 percent of our audit staff—as we begin the fiscal year 2001 financial audits. In the absence of additional staff, critical program activity will go unaudited as we fulfill our statutory financial audit require-

ments. Additionally, these audits require the use of specialized data-mining software along with expert training for the auditors who use it. If these critical resource issues are not addressed, our ability to complete the statutory financial statement audits will erode, and we will not be able to audit other high-priority areas.

INFORMATION RESOURCES MANAGEMENT

Computer Security

Our fourth area of major concern is securing the availability, accuracy, and privacy of information in the Department's information technology systems. This remains a significant challenge for the Department. USDA agencies continue to expand their use of the Internet to provide services and information to the public, commonly referred to as "e-government." E-government offers extensive possibilities for the Department to improve its delivery of services, collect information, and manage its operations. USDA has numerous information assets that include market-sensitive data on the agricultural economy and commodities, signup and participation data for programs, personal information on customers and employees, and accounting data. These information and related systems face unprecedented levels of risk from intentional or accidental disruption, disclosure, damage, or manipulation.

Based on our audits, we believe significantly more action is needed to strengthen departmentwide information security. While the Department has been responsive to our recommendations, initiating prompt fixes to the vulnerabilities we have reported, additional work must be done. We have only been able to look at a few of the hundreds of systems within the Department. Information in USDA databases is market sensitive and, if misused, could cause economic chaos and harm prices farmers receive. USDA also operates the National Finance Center (NFC) in New Orleans. NFC pays salaries and other expenses exceeding \$23 billion each year. It also houses the database for the Thrift Savings Program, which has assets of over \$100 billion. We must ensure all of these assets are safeguarded and information is protected.

The demands on OIG's resources in this area are increasing significantly. As I mentioned earlier, Congress passed the Government Information Security Reform Act, requiring annual reviews beginning this year of the Department's information security program. Each review must include an evaluation of the effectiveness of security control techniques for a sample of the Department's systems. These audits are extremely complex and costly because the auditors need specialized training and sophisticated software to perform them. At current funding levels, OIG will be hard-pressed to fulfill this legislative mandate.

When we have been able to do work "up front" on computer systems, it has resulted in a success for the agencies developing the systems. We did this with FNS and the States as they were implementing Electronic Benefits Transfer (EBT) systems in the Food Stamp Program (FSP) and, as a result, EBT is a success for us and FNS as well as the States. It is now much easier to detect retailers who harm the program by buying benefits at half their cost or less, rather than selling food. With EBT, you can more readily pinpoint when and where this happens.

Currently, 41 States and the District of Columbia use EBT systems. Thirty-seven of the systems have been implemented statewide, and approximately 74 percent of food stamp benefits, estimated at \$12.6 billion for fiscal year 2001, are issued through such systems. During fiscal year 2000, we completed reviews in Florida, Louisiana, North Dakota, South Dakota, and Utah and found all systems have been successfully implemented.

All EBT systems to issue food stamp benefits must be in place by October 2002. To date, one-quarter of the benefits are not under an EBT system, and some States are either only partially under EBT or are in the process of converting. Some, such as California, Michigan, Mississippi, New York, and Virginia, have significant case-loads which will greatly affect their conversion. Thus, we must remain proactive in our approach to reviewing systems as they are implemented when adjustments and changes are more easily addressed.

OTHER MAJOR CHALLENGES FACING USDA

Food, Nutrition, and Consumer Services

The national food stamp certification error rate for fiscal year 1999, the last year completed, stands at 9.9 percent; while lower than in 1998, it still accounts for dollar-issuance errors of about \$1.6 billion, with overissuances being \$1.1 billion of that amount. Yet, the number of dollars issued and participating households are going down. School districts are also finding high rates of error in households certifying their eligibility for free or reduced-price lunches. Recent statistics assembled by FNS for some selected States showed an error rate of about 20 percent. In Illinois alone,

OIG found this accounted for excess program outlays of about \$31 million in 1 school year. Other U.S. departments, such as Education and Health and Human Services, also use the school lunch data as a basis for distributing program funds, so the impact goes far beyond USDA. These areas need our attention, but we simply do not have the resources necessary to address this issue now.

Operation Talon

For more than 3 years, OIG has coordinated a nationwide law enforcement initiative dubbed “Operation Talon,” which has resulted in the arrest of over 7,000 fugitive felons. This initiative, which has been carried out in conjunction with other law enforcement agencies and State social service agencies across the country, was designed to identify, locate, and apprehend dangerous and violent fugitive felons who may also be illegally receiving benefits through FSP. Operation Talon has grown into a nationwide dragnet, currently encompassing fugitives wanted in 29 States, as well as Federal fugitives sought by the U.S. Marshals Service. The more serious offenses for which Operation Talon fugitive arrests have been made include 32 arrests for homicide; 48 for sex offenses, including rape and child molestation; 15 for kidnapping/abduction; 390 for assault; 213 for robbery; and 1,604 for drug/narcotic offenses. A number of States are removing arrested fugitives from their food stamp rolls, resulting in an estimated average savings to FSP of over \$12.6 million. We have managed to leverage our success through the use of targeted asset forfeiture funds to pay for overtime costs and special equipment needs of the State and local law enforcement agencies participating in Operation Talon. However, since its inception 3 years ago, this program has cost OIG over \$4.3 million in direct appropriated funds to spearhead Operation Talon in neighborhoods across America.

CROP INSURANCE

Based on our prior audit efforts, we believe the management of the Department’s crop insurance programs will continue to provide challenges. Congress recognized the need for Federal Crop Insurance Program reform when it passed the Agricultural Risk Protection Act of 2000 (ARPA). This Act requires the Secretary to reduce the potential for fraud, waste, and abuse in the program by mandating the exchange and comparison of relevant information received by RMA and FSA in the conduct of their respective production agriculture programs. Our audits have indicated weaknesses in the research and development of new types of crop insurance policies; conflicts of interest involving the insureds, insurance agents, and the loss adjusters; noncompliance with loss claim procedures by the loss adjusters; and inadequate quality control reviews by the insurance companies.

To meet that congressional mandate, RMA and FSA have established working groups to implement the provisions of ARPA, including data reconciliation, FSA assistance in monitoring crop insurance programs, and RMA consultation with State FSA committees in formulating crop insurance policies and plans of insurance. Currently, OIG is assisting these working groups as they develop the framework to implement the congressional mandate. As RMA and FSA implement these controls, we will need to monitor and test them to ensure they are adequate and functioning as intended and provide timely feedback to RMA and FSA. We believe this proactive approach and working with the agencies early on will be more effective and result in greater cost savings to the Government than trying to recover incorrect payments.

BUSINESS AND INDUSTRY LOAN PROGRAM

In fiscal year 2000, delinquency rates rose sharply in the Rural Business-Cooperative Service’s Business and Industry (B&I) guaranteed loan program. Fiscal year 2001 funding in this program increased to over \$3 billion, tripling fiscal year 2000 levels. We believe the Department is facing the possibility of a dramatic increase in financial losses to the Government in this area. Factors, such as the growing presence of unregulated financial organizations—or nontraditional banks—with unorthodox financing and servicing arrangements that can mask delinquencies until a total financial failure occurs, make some of these loans even riskier to the Department.

Ongoing nationwide audit work in this area is disclosing significant problems. We are expanding our efforts into a special initiative to assess the extent of this burgeoning problem and will make appropriate recommendations for needed legal, regulatory, and administrative changes.

In prior years, we audited defaulted B&I loans whenever the loss to the Government exceeded \$3 million. Frequently, these audits prevented USDA from paying fraudulent claims. However, staffing shortages now prevent our audit of all but the

most egregious loss claims. Additional resources would allow more audits in this high-risk area and identify potentially fraudulent and abusive loss claims, resulting in the prevention of substantial funds from ever leaving the Department in payment of fraudulent claims.

RURAL HOUSING PROGRAM

The Department's Rural Housing Program is another effort which will continue to need attention by the Department. The American Homeownership and Economic Opportunity Act of 2000 was signed into law on December 27, 2000. It strengthened the ability of Rural Development to seek prosecution of individuals, both civilly and criminally, who abuse and defraud the Multi-Family Housing Program. Many of the reforms enacted will directly address the problems found in our nationwide initiative with the Rural Housing Service that identified and documented significant abuse and fraud in the Multi-Family Housing Program.

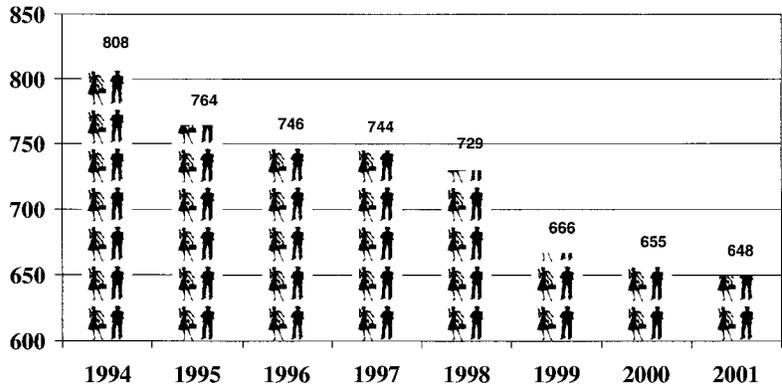

We are continuing substantial audit and investigative efforts in this area to include cooperative efforts with DOJ to encourage acceptance of these cases for prosecution. The passage of the new legislative authority significantly increases the chances for successful prosecution.

CONCLUSION

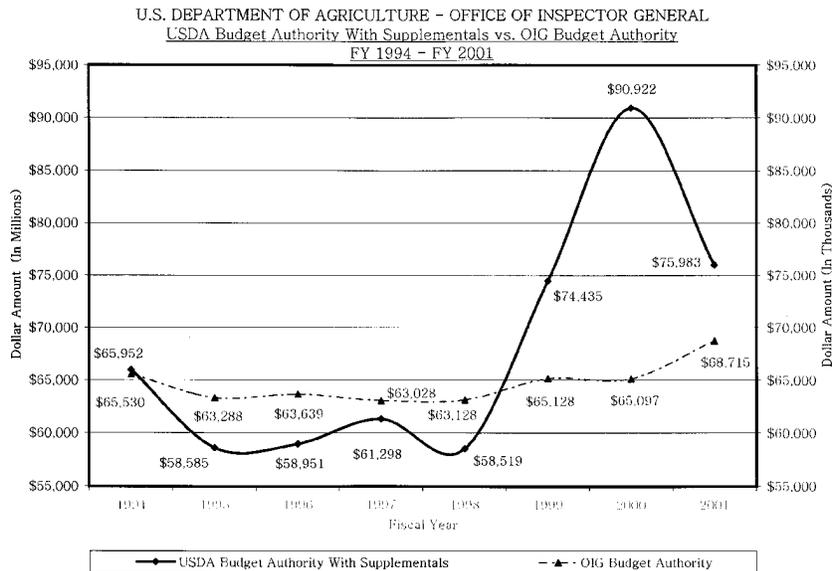

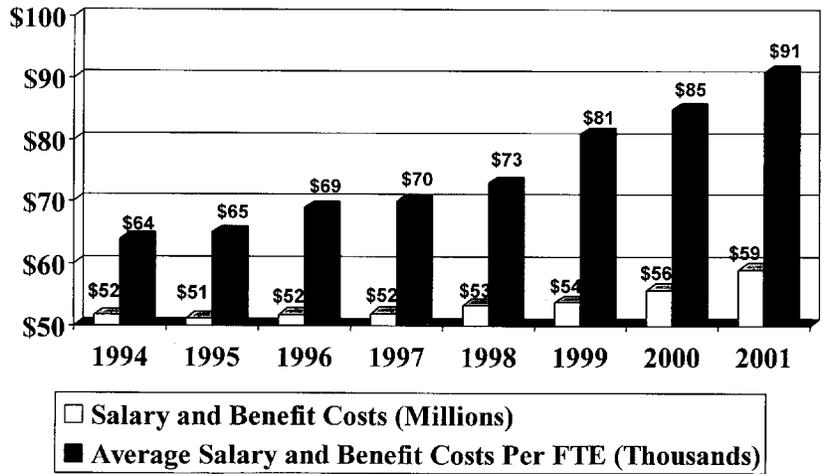

We are proud of our record and accomplishments at OIG. We continually assess where the risks for waste, fraud, and abuse are in the Department and direct our limited resources to those we judge to be at the highest risk. The question is, do we have sufficient resources to address all or even the majority of those area that are vulnerable and at risk? As I have indicated today, the answer is clearly, no.

This concludes my statement, Mr. Chairman. I appreciate the opportunity to appear before you today and would be pleased to respond to any questions you may have at this time.

FOOD SAFETY AND INSPECTION SERVICE

PREPARED STATEMENT OF THOMAS J. BILLY, ADMINISTRATOR

Mr. Chairman and Members of the Subcommittee, I am pleased to have the opportunity to submit a statement for the record on the current status of Food Safety and Inspection Service (FSIS) programs and on the fiscal year 2002 budget for food safety within the U.S. Department of Agriculture.

Let me begin by saying that the risk-based modernization of the meat, poultry, and egg products inspection programs begun in 1996 has resulted in significant food safety improvements. Reductions in the prevalence of many microbiological contaminants, such as Salmonella, have occurred across all categories of meat and poultry products, and these have been accompanied by reductions in foodborne illness. These improvements would not have been possible without the consistent support of you, Mr. Chairman, and the Members of the Subcommittee. This support has enabled FSIS to complete implementation of the Pathogen Reduction/Hazard Analysis and Critical Control Points (HACCP) Systems rule and to consolidate the resulting gains into a sound plan for the future.

With HACCP in place, FSIS now has two major goals—first, to determine how we can assist in improving the quality and effectiveness of industry food safety programs, including HACCP, and second, to determine how FSIS can improve its effectiveness as a public health regulatory agency. We've identified five major areas of focus related to these goals.

The first area involves the Agency's infrastructure and resources. FSIS' infrastructure needs to be improved to allow its workforce to carry out its regulatory responsibilities more effectively and efficiently. This is a very broad area that encompasses the assignment of work, increasing expertise and training, and enhancing data analysis and decision-making, communication, and workplace environment. Making these improvements requires a reevaluation of where and how the Agency executes its programs and utilizes its resources. This assessment is underway, and I will elaborate on its details later on in this statement.

The second area of focus supporting our future goals is in the design and effectiveness of a risk-based food safety and inspection program. This area includes aspects of our modernization strategy that have been on a slower track due to our intensive focus on HACCP and Pathogen Reduction implementation. Regulatory reform, in-plant staffing patterns, residue control in a HACCP environment, and overall improvements in the Agency's ability to respond to future food safety problems will receive considerable attention as we move forward.

Third, the Agency is committed to improving the workplace environment for its employees. This includes improvements in worker safety, quality of work life, and workforce diversity.

Fourth, FSIS must focus its training and education needs on the scientific rationale for regulatory decisions and commit to whatever means are necessary within available resources to make training and education available to all employees.

And finally, we will focus on improving how we communicate within the Agency and with the regulated industry. FSIS needs to ensure that its rules, procedures, and other regulatory information are clear, complete, easily understood, and accurate.

This gives you a brief synopsis of our recent successes and thoughts on the Agency's future. I will elaborate on our future plans later in my statement, but before I do, let me first provide some context to the importance of these plans by briefly reviewing the mission and history of FSIS.

FSIS OVERVIEW

The mission of FSIS is to ensure that the Nation's commercial supply of meat, poultry, and egg products is safe, wholesome, and correctly labeled and packaged, as required by the Agency's authorizing statutes. The FSIS Strategic Plan for 2000–2005 calls for a further 25 percent reduction in the number of foodborne illnesses resulting from consumption of products the Agency regulates. Although existing public health data make it difficult to isolate specific contributions to achieving an overall reduction in foodborne illness, we can and do take specific action to control and monitor the prevalence of the foodborne hazards that can cause illness. Our goal is therefore to protect the public health by significantly reducing the prevalence of foodborne hazards in meat, poultry, and egg products.

FSIS has a long, proud history of protecting the public health. Although the Agency under the current name was established by the Secretary of Agriculture on June 17, 1981, its history dates back to 1906.

In 1890, the U.S. passed a meat inspection law to assure European markets that meat from the United States was safe. However, the Meat Inspection Act of 1906 signaled the real beginning of domestic inspection in the United States. A year earlier, Upton Sinclair published his book, *The Jungle*, portraying unsanitary conditions in Chicago slaughterhouses. The book caused a public and political outcry. Meat sales around the country dropped nearly a third. With the 1906 Act began a system of continuous daily inspection in slaughterhouses using organoleptic (sight, smell, touch) inspection to detect unsanitary conditions and adulterated products. Poultry inspection began in 1926, on a voluntary basis, and in 1957, Congress passed the Poultry Products Inspection Act, which established mandatory, daily, continuous inspection of poultry products. Since 1994, FSIS has had additional food safety responsibilities under the Egg Products Inspection Act.

FSIS published the landmark Pathogen Reduction/Hazard Analysis and Critical Control Point (HACCP) Systems rule on July 25, 1996. The rule addresses the limitations of the original organoleptic inspection system in dealing with the problem of pathogenic microorganisms (harmful bacteria) on meat and poultry products. The rule clarifies the respective roles of government and industry in food safety, and therein makes better use of government resources in addressing food safety risks. Industry is accountable for producing safe food. Government is responsible for setting appropriate food safety standards, maintaining vigorous inspection to ensure those standards are met, and maintaining a strong enforcement program to deal with plants that do not meet regulatory standards.

INFRASTRUCTURE

With HACCP in place, FSIS has reached a major milestone in the evolution of the Nation's food safety and inspection program. The HACCP rule is not simply a new regulation, but a new way of doing business that enables FSIS to focus its attention and resources on the most significant food safety hazards. It serves to prevent food safety hazards rather than catching them after the fact. And HACCP never goes out of date, because it can be adapted as new scientific information comes along. Thus, HACCP serves as a foundation for continual improvement.

As I mentioned earlier, one major area for improvement is to strengthen the FSIS infrastructure to better support HACCP. This is necessary in order to ensure that we focus our inspection efforts on those aspects of meat, poultry, and egg product production that present the greatest food safety concern. This requires FSIS to rethink its approaches to both slaughter and processing inspection. The Agency has launched a number of initiatives to do so. Before I describe them, let me first briefly review with you the major functions of USDA's food safety program. Each of these functions bears further elaboration, which I will do later as I describe current and planned initiatives associated with each.

Meat, Poultry, and Egg Inspection Activities

As you know, FSIS is a large agency, with approximately 10,000 employees. This includes more than 7,600 inspection personnel stationed in approximately 6,000 meat and poultry plants who inspect more than 8.5 billions birds, 133 million head of livestock, and 3.5 million pounds of liquid egg products annually. In fiscal year 2000, FSIS facilitated the export of an estimated 10 billion pounds of meat and poultry to approximately 100 countries throughout the world and began work on a new system to automate the certification of meat and poultry exports. Agency personnel also inspected 3.7 billion pounds of imported meat and poultry from 31 countries, of which 9 million pounds were refused entry into the United States. Eight million pounds of egg products were imported from Canada, of which 423 pounds were refused entry. Canada, and The Netherlands, remain the only countries certified to export egg products to the United States, and The Netherlands exported no egg products to this country last year. Mexico applied for export eligibility in fiscal year 2000.

To ensure the safety of imported products, FSIS maintains a comprehensive system of import inspection, linking all U.S. ports of entry through a central computer system. This allows FSIS to establish compliance histories for countries and plants exporting to the U.S. and to communicate instantly among ports when problems are found at any individual port of entry. This system is one part of FSIS' efforts to verify the effectiveness of foreign inspection systems and also to support our sister agency, the Animal and Plant Health Inspection Service (APHIS) in preventing the entry of meat or poultry products that present an animal disease threat to U.S. livestock.

In light of recent events in Europe, the manner in which FSIS certifies foreign programs as possessing public health safeguards that are "equivalent" to the U.S. program is a subject of heightened interest. Annually, we review all foreign inspec-

tion systems in countries eligible to export meat and poultry to the U.S. In fiscal year 2000, FSIS reviewed the documentation of and performed on-site audits in 31 countries exporting meat and poultry products to the United States and was satisfied that each country had implemented Sanitation Standard Operating Procedures (SSOPs), HACCP systems, and Salmonella testing programs.

FSIS is also responsible for assessing State inspection programs that regulate meat and poultry products that may be sold only within the State in which they were produced. The 1967 Wholesome Meat Act and the 1968 Wholesome Poultry Products Act require State inspection programs to be "at least equal to" the Federal inspection program. If a State chooses to end its inspection program or cannot maintain the "at least equal to" standard, FSIS must assume responsibility for inspection. There are currently 27 states that have a state meat or poultry inspection program and operate under cooperative agreements with FSIS. In these states, Federal funding is provided for up to one-half of the state's cooperative inspection program as long as the State maintains a program "at least equal to" the Federal program.

In the past few years, some states have decided to re-establish inspection programs. Minnesota established a state inspection program on October 1, 1998, followed by North Dakota on October 1, 2000, and Missouri on January 1, 2001. The only state to terminate its inspection program in recent years was Alaska, which ended its state program on July 30, 1999. In fiscal year 2000, FSIS reviewed 87 state-inspected establishments in 13 states.

Another part of the FSIS food safety program involves our three multidisciplinary laboratories, which conduct laboratory testing for microbiological contamination, chemical and antibiotic residues, pathological conditions, processed product composition, and economic adulteration. FSIS performed tests on more than 371,000 product samples in fiscal year 2000.

FSIS also conducts compliance and enforcement activities to address situations where unsafe, unwholesome, or inaccurately labeled products have been produced or shipped. The objective of these activities is two-fold—one, to make a critical appraisal of compliance with meat and poultry regulations, and two, as a result of certain critical appraisals, to take enforcement action where necessary. In fiscal year 2000, more than 50,000 compliance reviews were conducted. As a result of these reviews and other activities, approximately 28 million pounds of meat, poultry, and egg products were detained for noncompliance with the respective laws, and eight criminal convictions were obtained against firms and individuals for violations of the meat and poultry inspection laws. In addition, industry voluntarily recalled more than 5 million pounds of meat, poultry, and egg products.

With the shift in recent years toward greater mass production and distribution of food, and greater globalization in food trade, the identification and tracking of potential food hazards has become a much more complex activity. In response, FSIS has developed strong partnerships with state, local, and foreign public health agencies and stakeholders to better coordinate the investigation of and response to food safety hazards and outbreaks of foodborne illness. These partnerships are vital to FSIS' ability to effectively perform its public health mission.

Given the strength of the economy in recent years, and commensurate increases in industry growth, FSIS has been challenged in its ability to hire and train enough qualified personnel to meet growing demands for in-plant inspectors, while at the same time ensuring a full conversion of all plants to HACCP-based operations. We are grateful, Mr. Chairman, that in fiscal year 2000, Congress provided FSIS with an additional \$11 million, which we used to hire 203 new, permanent, full-time (PFT) inspectors in meat and poultry slaughter plants. This funding also enabled us to add other-than-permanent staff years to the inspection work force in order to provide plants with relief personnel on an as-needed basis. This additional hiring activity enabled FSIS to meet its targeted inplant employment level of 7,610 in fiscal year 2000—a minimum level that the Agency, within current baseline funding, plans to maintain to satisfy industry's expected demand for increased inspection services throughout fiscal year 2001 and fiscal year 2002. I would like to point out, Mr. Chairman, that as of March 31—the end of the second quarter of fiscal year 2001—FSIS in-plant employment had reached 7,630.

Field Automation

The Agency's Field Automation and Information Management (FAIM) initiative is the major vehicle by which FSIS is providing its workforce with the technology tools to support HACCP-based regulatory determinations and actions in the field.

The end of fiscal year 2000 represented a milestone for the Field Automation and Information Management (FAIM) initiative. FSIS completed implementation of the Federal FAIM initiative on schedule and under budget. In fiscal year 2001, FAIM

is beginning a cycle of replenishing original equipment. That cycle will continue in fiscal year 2002.

In its first five years, FAIM distributed more than 4,200 desktop and notebook computers and trained more than 5,400 FSIS inspection personnel. An automation program of this scope demands ongoing support activities to realize gains from the initial investment. Each FAIM user must be provided with technical support, hardware maintenance, telecommunications, supplies, and an expanded collection of software applications and computer-based training. Employee turnover means training new people.

The replenishment cycle includes replacing hardware and peripherals that were purchased five years ago. While the recommended replacement schedule for office computers is every three years, FAIM has stretched its cycle to five years. For FSIS inspection personnel to continue running standard operating systems and software applications, their systems must be replaced with newer equipment.

New Statutory Requirements

As part of the fiscal year 2001 Appropriations Act, FSIS acquired additional regulatory responsibilities in the form of mandatory ratite and squab inspection. The Agency has begun the process of converting the current voluntary program to a mandatory one. An interim final rule is being developed to ensure that appropriate regulations are in place on April 26, 2001, the statutorily established date of enactment.

TARGETING RISK IN THE FOOD SAFETY AND INSPECTION PROGRAM

A key component of FSIS' effort to increase the resources available to support HACCP is the implementation of the HACCP-based Inspection Models Project, or HIMP. As the Committee may know, HACCP alone does not change the role of the slaughter inspector. Under HIMP, FSIS has been developing new models for slaughter inspection that better define what FSIS inspection personnel and industry should do under the HACCP-based system. For the past two years, volunteer plants are extending their HACCP and other process control systems to cover certain sorting activities that had been done by FSIS inspectors. Plants having such systems in place to prevent meat and poultry products that are unsafe or unwholesome from entering the food supply are also required to meet FSIS performance standards for food safety and other consumer protections and carry out these activities under FSIS inspection and verification. Based on preliminary data, this system of establishment controls and Agency inspection shows great promise for increased food safety. The new system, which the HIMP project is intended to test, allows slaughter establishments greater flexibility in meeting their responsibilities under the Pathogen Reduction/HACCP regulations and permits FSIS to deploy its inspectors more effectively.

To begin the process of better defining what inspection personnel and industry should do under HACCP, on June 10, 1997, FSIS published a Federal Register notice explaining the HIMP project and soliciting public input. Four public meetings have since been held to obtain feedback on draft inspection models, review diseases and conditions identified by the Agency as posing food safety risks, clarify new inspection procedures and performance standards developed through the project, and review preliminary industry performance data.

As the Subcommittee members are aware, a group of FSIS inspectors, their union, the American Federation of Government Employees (AFGE), and a consumer group filed a lawsuit challenging the HIMP project. On June 30, 2000, the District of Columbia Circuit Court of Appeals ruled that the type of "oversight inspection" performed by Federal government inspectors in HIMP plants violated the FMIA and PPIA.

Following the Court of Appeals' ruling, FSIS, in September 2000, redesigned the HIMP project to position an FSIS carcass inspector in a fixed location on each slaughter line. The most recent court decision, in January 2001, found that the redesigned HIMP inspection model met statutory requirements. The union has appealed this latest decision, but plants continue to operate under the HIMP pilot.

As the redesigned inspection models run in HIMP plants, the Agency is collecting data to determine HIMP's achievements. FSIS will evaluate the models to ensure that the modification to include a stationary carcass inspector has been effective.

Results to date are encouraging. In the 16 plants counted in the agency's baseline plant performance review, the traditional system achieved a 0.1 percent rate for infectious conditions and a 1.5 percent rate for fecal contamination. Under the Models Project, in which plant sorters address these defects with FSIS verification inspection, those numbers have been reduced to an average of nearly zero and 0.2 percent respectively. In every category, important food safety gains have been achieved.

If data continue to show food safety gains, the Agency plans to continue the HIMP project and expects to amend its regulations on inspection of young chickens to incorporate the model system of inspection. Should this system prove successful, we will investigate similar changes in the inspection of the slaughter of other species based on the results of the model.

As for processing inspection, traditionally, the Agency made assignments of processing inspectors based on factors such as the physical size of the establishment, the volume of production, and the complexity of the processing operation—complexity referring to the level of technology involved with or overall sophistication of a process, rather than the relative level of food safety hazard it presented.

FSIS believes that its efforts could be more effective and efficient if assignments were based on a risk analysis system. FSIS is exploring ways to link the degree of risk presented by products produced by an establishment to the frequency and intensity of inspection that establishment would receive. Under a risk-based system, an establishment's compliance history could also play a role in determining inspectors' assignments.

FSIS is in the early stages of developing such a system and is committed to deal with this issue through a public process over the course of the next year. As directed in the fiscal year 2001 Appropriations Act conference report, the Agency developed and submitted to Congress on March 5, 2001, a report on its efforts to evaluate opportunities for greater flexibility in the allocation of processing inspection resources. Additionally, a public meeting is planned for June to discuss this project in the broader context of FSIS' efforts to establish improved approaches to regulation.

Regulatory Reform

The Agency's evaluation of HACCP also includes an ongoing effort to review existing regulations. During the last several years, FSIS has been reviewing its regulations to eliminate duplication and inconsistency with its own and other agencies' regulations, and to revise its numerous "command-and-control" regulations. The review effort is targeted at improving the consistency of the regulations with the July 25, 1996, Pathogen Reduction/HACCP rule.

Since 1995, FSIS has published a series of final rules that contributes to the accomplishment of regulatory reform by: removing command-and-control requirements for label approval; eliminating requirements for partial quality control programs; consolidating the listings of food ingredients permitted for use in meat and poultry products and expanding the permitted uses of food irradiation; consolidating, streamlining, and reducing to performance standards the sanitation requirements for meat and poultry establishments; replacing with performance standards the command-and-control requirements for processing certain meat and poultry products; eliminating required prior approval of blueprints and equipment for meat and poultry establishments; prescribing a single set of rules of practice governing Agency enforcement actions under the Federal Meat Inspection Act and the Poultry Products Inspection Act; and eliminating remaining requirements for partial quality control (PQC) programs in meat and poultry processing plants.

In the fiscal year 2001 Appropriations Act conference report, Congress directed FSIS to report on a variety of topics related to its regulatory reform and rulemaking activities, as well as matters involving in-plant staffing, workforce training, and the role of microbiological criteria in the production and regulation of meat and poultry products. FSIS has completed, or is nearing completion, most of these reports and many have already been submitted to Congress.

Residue and Microbiological Testing

Integral to both efforts to build a HACCP-based infrastructure and design an improved food safety program are initiatives that enhance the FSIS science program—particularly the risk assessment, analytical, and laboratory support activities that form its core. The information obtained from these activities provides an indispensable framework within which the Agency controls and reduces the incidence of foodborne illness in the United States.

While FSIS' HACCP regulations list chemical contamination, pesticides, and drug residues as sources of food safety hazards, the Agency did not change its approach to residues with the implementation of HACCP. Bringing residue control under HACCP has the potential to provide even more public health protection than the current approach. Under HACCP, it is the establishment that assesses the hazards and decides how it will control them. FSIS will be responsible for verifying that the plant's controls are working.

FSIS began the process of bringing residue control under HACCP with a public meeting held last December. The meeting highlighted a number of advantages of

such a change, but it also raised a number of questions that the Agency will have to consider in deciding how to proceed.

Another priority for our residue control program is implementing changes that bring it into compliance with European Union (EU) residue testing requirements for exporting meat products to EU member countries. During fiscal year 2000, FSIS began a major effort in this regard, and further work is planned in fiscal year 2002 to complete the process. I will discuss this initiative later in my statement when I review the increases requested in the proposed fiscal year 2002 FSIS budget.

In the area of microbiology, we are doing sampling as a means of verifying the effectiveness of plants' HACCP plans. FSIS has established performance standards for Salmonella to measure whether plants are successful under HACCP in controlling pathogens. Recent data for large, small, and very small meat and poultry slaughter plants show a significant decrease in the prevalence of Salmonella as compared to pre-HACCP baseline data.

The establishment of baseline profiles for meat and poultry will provide a yardstick for measuring the effectiveness of changes over time. In fiscal year 2000, we finished baseline testing for *Campylobacter* testing in raw chicken carcasses.

The members of the Subcommittee are well acquainted with the lawsuit filed by Supreme Beef Processors (Supreme) in November 1999. This lawsuit was filed to enjoin USDA from suspending inspection services at Supreme's operations after the company failed the Salmonella performance standard for the third consecutive time. Under the Pathogen Reduction/HACCP rule, three consecutive failures to meet the performance standard constitutes failure to maintain sanitary conditions and results in the suspension of inspection services.

Following the issuance of a temporary restraining order and a preliminary injunction prohibiting USDA from suspending inspection services, the Court issued a decision on May 25, 2000. The Court held that USDA exceeded its statutory authority in issuing and seeking to enforce the Salmonella performance standard. The Court found that, under 21 U.S.C. 601 (m)(4), meat is adulterated only when USDA finds that the conditions of the establishment are insanitary. However, the presence of Salmonella on the end product cannot be used to determine whether the establishment is insanitary because the presence of Salmonella is not "solely—or even substantially—dependent upon the sanitation in a grinder's establishment." The Court rejected USDA's argument that controls over incoming raw products are important sanitation measures, and that the lack of adequate controls constitutes insanitary conditions. USDA appealed the decision on September 9, 2000. On September 26, 2000, Supreme filed a voluntary Chapter 11 bankruptcy petition in the United States Bankruptcy Court for the Eastern District of Texas. The Court of Appeals immediately issued an order staying the appeal due to Supreme's bankruptcy petition. The parties filed briefs and the Court of Appeals subsequently lifted the stay. FSIS' reply to the initial filing of briefs will be issued shortly.

WORKPLACE ENVIRONMENT

As mentioned earlier in this statement, the Agency is working on improving the workplace environment, most importantly its safety, and establishing a common civil rights understanding among all employees. In October 2000, FSIS completed the mandatory civil rights training of all its employees. As of September, all non-inplant employees had completed sexual harassment training delivered over the Internet. By the end of the current fiscal year, our non-inplant employees will have completed special emphasis training on the unique concerns of women, minorities and persons with disabilities in the same manner. We also have identified and are now addressing workplace issues that contribute to employee dissatisfaction and lower productivity, including issues of workplace violence which, this past year, manifested themselves in a most tragic manner for the Agency and have created an intensified focus on the safety and health of the FSIS workforce.

On June 21, 2000, two FSIS compliance officers and a California Department of Food and Agriculture investigator were shot and killed in a San Leandro, California, sausage-processing plant. Another California inspector escaped with his life. These officials were conducting a joint review of the plant because it was suspected of violating both Federal and state meat inspection laws. In response to this tragedy, FSIS has formed an internal task force of employees from throughout the Agency to make recommendations for preventing violence in the plants we regulate. Additionally, the Milbank Memorial Fund is studying, under cooperative agreement with the Agency, the causes of violence and conflict in the food safety workplace. The Fund is bringing together leaders from industry, consumer groups, FSIS, labor, and employee organizations to examine how these groups can better relate to one another given the respective and sometimes competing roles they play in the food safe-

ty environment. A report of the Fund's findings is expected to be released in the next few weeks.

UPGRADING EDUCATION, TRAINING AND PROFESSIONAL SKILLS IN THE WORKFORCE

Another way in which FSIS seeks to maximize its effectiveness as a regulatory public health agency is by increasing the scientific expertise of its workforce. Since the implementation of the Pathogen Reduction/HACCP rule, the Agency's frontline workforce needs a broader scientific and analytical background in order to verify Pathogen Reduction/HACCP requirements and deal more effectively with high priority and emerging food safety hazards.

To assess the knowledge and training requirements of our future workforce, FSIS formed the Workforce of the Future Steering Committee in July 1999 to oversee our workforce planning activities and to guide this transition of the workforce. We established the FSIS Training and Education Committee for 2001 and Beyond (TEC 2001) to examine our current education and training activities, conduct an assessment of Agency needs, develop an education vision for the Agency, and develop a strategy for educating and training our employees for the 21st century. TEC 2001 is focusing education and training on the scientific and legal basis for making regulatory determinations and implementing statutory authorities. In addition, TEC 2001 is exploring partnerships with stakeholder groups such as industry, international trading partners, state and local agriculture and public health agencies, and academia to provide for shared food safety education opportunities.

One of FSIS' workforce initiatives is the Consumer Safety Officer (CSO). The CSO is a professional position requiring a general scientific background. FSIS believes that introducing into the frontline workforce CSOs with scientific and analytical skills will improve our ability to fully modernize our inspection system. We are grateful for your allowing us the opportunity to begin introducing CSOs into meat and poultry plants in fiscal year 2001. Our goal is to position 35 CSOs in in-plant settings by the end of the fiscal year.

By way of review, CSOs will support in-plant inspection personnel in verifying HACCP system adequacy; facilitate industry innovation, outbreak prevention and containment; apply risk analysis; improve compliance through effective communication with industry; and address unique problems that require a comprehensive, interdisciplinary approach. Additionally, CSOs focus particular attention on assisting small and very small plants in the design and implementation of HACCP plans, Sanitation SOPs, E.coli monitoring plans, and microbiological control strategies. In doing so, CSOs help FSIS comply with the Small Business Regulatory Enforcement Flexibility Act (SBREFA), which requires that Federal agencies act to mitigate the adverse impact of new regulations on small business by providing them assistance and guidance.

In February 2000, FSIS provided a report to Congress on its plans to introduce the CSO occupation into the Agency much more gradually than originally planned, to minimize relocation and other costs. In February of this year, the Agency completed a survey of inspection personnel and has determined how many of these and other employees now satisfy the educational requirement for the CSO occupation.

COMMUNICATION WITH STAKEHOLDERS

I've discussed the "regulatory" part of our activities, but our "public health" role also includes extensive communication with stakeholder groups. Our communication programs seek to increase understanding by these groups of our mission, authority, regulations, and procedures.

Consumer and Food Safety Education

Primary among our stakeholders are consumers. FSIS education programs are designed to prevent foodborne illness. We develop outreach materials and activities based on current scientific and consumer research, social marketing, and educational research. Some programs target consumers who are at greatest risk from foodborne illness—the very young, the elderly, pregnant women, people who have chronic diseases, and people with compromised immune systems.

Among these activities, the USDA Meat and Poultry Hotline has for 15 years provided a toll-free national service to consumers, information multipliers and professionals with questions about safe preparation of meat, poultry, and other foods, and foodborne illness prevention. In fiscal year 2000, the Hotline handled more than 86,000 calls.

We also reach out to consumers and others with food safety education campaigns. In May 2000, we launched the Thermo™ campaign to promote the use of food thermometers in the home. Millions of consumers already have seen the message. Part-

nerships are being developed to put Thermy™ on point-of-purchase packages and exhibits. Several large grocery store chains launched their own thermometer promotions during fiscal year 2000.

Another highly successful campaign, Fight BAC™, has reached millions and shows no signs of slowing. The Partnership for Food Safety Education, made up of Federal agencies, industry organizations, and consumer groups, combined resources for this campaign. The Partnership formed an alliance with Wal-Mart to launch a promotion in approximately 800 Wal-Mart Stores across the country on September 9, 2000.

We strive to reach not only consumers, but also health professionals. One achievement of which we are extremely proud is the publication of *Diagnosis and Management of Foodborne Illnesses, A Primer for Physicians*. This set of publications was produced in cooperation with the American Medical Association (AMA), the Centers for Disease Control and Prevention (CDC), and the Food and Drug Administration (FDA), and provides physicians with information on diagnosing, treating, and reporting diarrheal foodborne illness. Physicians can earn three hours of continuing medical education credit with this primer. Response to the primer's release in January 2001 was enthusiastic. All three agencies and the AMA have received thousands of requests for it.

Federal, State, and Industry Partnerships

FSIS works closely with State and local public health and food safety authorities, as well as with sister Federal agencies, such as FDA and the CDC, to coordinate food safety strategies and emergency response activities.

Nationwide surveillance of foodborne illness outbreaks is a long-standing example of interstate cooperation that is coordinated by FSIS and CDC. Under an agreement between the two agencies, CDC conducts active population-based surveillance of foodborne diseases. This involves the on-going and systematic collection of foodborne illness data to detect outbreaks and monitor disease trends and patterns. Data collected are used to determine the need for public health emergency response and to assess the effectiveness of efforts to prevent foodborne disease and outbreaks over time.

In fiscal year 2000, the Foodborne Diseases Active Surveillance Network (FoodNet) grew to nine states with the addition of Colorado. Approximately 28 million Americans are now covered by the system. A companion system, the PulseNet computerized database, matches the DNA fingerprint of foodborne diseases and accelerates the traceback process to the source of the contamination. PulseNet has been especially successful in identifying dispersed illnesses with potentially common sources of implicated product and alerting the regulatory agencies so that they can take appropriate action.

FSIS also participates each year in the Conference for Food Protection (CFP). The CFP provides a bi-annual forum for Federal, State, and local government representatives to meet with industry, academia, and consumers on recommended changes to the Food Code. FSIS collaborates with FDA on publication of the Code in order to provide Federal guidance to the States and others with regulatory responsibility for retail food safety. Adoption of the Code increases uniformity of food safety regulation among jurisdictions, which benefits both commerce and consumers.

To augment its sponsorship of the Food Code, FSIS has partnered with the Association of Food and Drug Officials (AFDO) and the University of Florida to develop and pilot a train-the-trainer course on safe meat and poultry processing at retail. Because the increasing amount of processed meat and poultry produced at retail is exempt from Federal inspection, State and local agencies must ensure food safety in retail environments. Until recently, however, little or no training was available to State and local inspectors who oversee retail activity. Beginning in fiscal year 2001, AFDO is offering the course nationwide through its network of regional affiliates with a goal of training as many as possible in the elements of HACCP-based safe meat and poultry processing.

Another established FSIS partnership is that which it maintains with animal producer groups at the State level. The Animal and Egg Production Food Safety (AEPFS) program is a non-regulatory program whose principal purpose is to: (1) educate producers about the impact of the farm-to-table initiatives of the Pathogen Reduction/HACCP regulation and, (2) coordinate efforts to identify and encourage the adoption of practices that reduce or prevent human pathogens from developing in or on animals and eggs submitted for processing.

AEPFS carries out its mission through the use of cooperative agreements, contracts, interagency task groups, external cooperative activities, guidance materials, and speeches. Its funding is used to develop animal and egg production food safety partnerships in cooperation with state animal health officials, FDA, and the Animal

and Plant Health Inspection Service Partnerships are in place with 24 states in such areas as quality assurance, residue avoidance, animal waste management, records management, managed culling practices, herd health hygiene, biosecurity, and proper sanitation in the production, transportation, and marketing of food animals.

AEPFS is working with its counterparts in USDA's APHIS to develop the role of FSIS veterinarians in performing surveillance for foreign animal diseases, including Bovine Spongiform Encephalopathy (BSE) and Foot and Mouth Disease (FMD). The program is also focusing on improved coordination with other Federal, State, and foreign veterinary and public health agencies to ensure that both disease threats do not affect domestic food animal populations.

Codex Alimentarius Commission (Codex)

FSIS also plays a leading role in the United States' participation in global dialogue on the setting of international food safety standards. The GATT Uruguay Round Agreements Act designated USDA as the lead agency for U.S. participation in the sanitary and phyto-sanitary standard setting activities of the Codex Alimentarius Commission. FSIS coordinates USDA's participation in these activities. Through notices published in the Federal Register, FSIS advises the public of the standard-setting activities of the Commission, as well as of the dates and agendas of its meetings.

Codex plays an important role in FSIS' ability to fulfill its mission. First, its sanitary and phytosanitary standard-setting activities protect consumers by improving food safety. Second, these activities help ensure that sound science is the basis for establishing international food safety standards. In this way, Codex helps facilitate fair trade in agricultural products.

Codex has grown in importance since it was designated as one of the three international standard-setting organizations whose health and safety standards serve as key reference points in settling trade disputes under the Agreement on Sanitary and Phytosanitary Measures. Currently, 165 nations, representing 98 percent of the world's population, are members of Codex.

As an active member of Codex, the United States has the opportunity to make the international food safety standard setting process work better. We have taken the position that Codex is the existing organization that the world's governments should use to discuss food safety issues and especially to set standards. We have also proposed changes in many areas where we believe that progress is needed. As chairman of Codex, I have proposed five major priorities for improving the Codex process.

First, is the fundamental importance of science-based decision making. Codex health and safety standards must continue to be based on sound science and risk analysis.

Second, we need to improve the efficiency and speed of the Codex process.

Third, we must ensure that Codex has adequate technical and financial support from its parent organizations—the World Health Organization (WHO) and Food and Agricultural Organization (FAO).

Fourth, is the importance of increasing and strengthening the participation of developing countries in Codex.

Finally, Codex should work toward achieving broader participation by non-governmental organizations (NGOs) in order to ensure that Codex positions have the broadest possible support and acceptance.

Codex received an additional \$1 million in funding in fiscal year 2001, for which I again wish to thank the Subcommittee. The U.S. Codex Office has designated these funds for three types of activities:

(1) Outreach: The U.S. frequently finds itself taking positions on issues that are directly in conflict with the positions that have been taken by other government groups. The voting system in Codex assigns one vote per country, regardless of size. We believe that if other countries, especially developing countries and countries in this hemisphere, understood the technical reasons for the U.S. positions, we would be able to count on more allies in the Codex sessions. Therefore, we are using these funds to increase our contacts and activities with these countries.

(2) U.S. Hosted Meetings: In the past, the U.S. Codex Office has had to approach various U.S. agencies, on an ad hoc basis before each meeting, to ask for the necessary funds to conduct the meeting.

(3) Delegate Training: U.S. delegates and alternates to Codex meetings are generally technical experts who are highly regarded in their fields, but who have little experience in international diplomacy and cross-cultural interactions. A third portion of the budget is being used to conduct training sessions for U.S. delegates that will enable them to be more effective representatives of the U.S. position.

Mr. Chairman, this Committee's support of Codex and FSIS' role in it has made a tremendous difference in the credibility of U.S. leadership in the setting of worldwide food safety standards. I thank you for that support and assure you that it will be instrumental in accomplishing the goals I've outlined above for the future of the organization. These action items will be discussed later this year at the 24th Session of the Codex Alimentarius Commission, scheduled for July 2-7 in Geneva, Switzerland, and at the first Global Forum of Food Safety Regulators, taking place in October in Bangkok, Thailand. For this Global Forum, the FAO and WHO have proposed four possible agenda items: experiences in the reduction of foodborne hazards; global food safety emergency communications; precaution in risk management; and consumer information and participation.

Response to Office of Inspector General (OIG) Findings

Before I move on to the Agency's budget request for fiscal year 2002, I want to make you aware of the FSIS responses to reports and an investigation by USDA's Office of Inspector General.

During fiscal year 2000, USDA's Office of Inspector General initiated a series of audits of FSIS to determine whether the Agency's meat and poultry inspection program remains effective under HACCP. These audits covered HACCP in general, the laboratory program, import inspection and foreign program reviews, and compliance activities.

With respect to the FSIS laboratory and quality assurance program, OIG's report was generally complimentary of the timeliness and accuracy of FSIS' testing for pathogens, residues, food chemistry, and species identification on meat and poultry product samples. However, the report recommended that FSIS institute stronger procedures and controls to ensure that all regulated meat and poultry establishments are subject to product testing, and that the Agency work to improve the response of inspection personnel to requests for product samples from inspected establishments. Additionally, it stated that FSIS should strengthen its quality assurance programs to ensure that all FSIS and accredited laboratories used by the Agency are in full compliance with applicable standards and are producing valid and supportable analytical results.

FSIS generally concurs with the findings and recommendations made by the Inspector General with respect to its laboratory and quality assurance operations, but has communicated to OIG that its report prematurely uses the International Organization for Standardization (ISO) Guide 17025 as a standard for FSIS laboratories, and that the Agency's current standards are valid and are still being met. However, to maintain high laboratory standards and as part of its effort to expand and upgrade its laboratory capacity in response to European Union requirements, FSIS has initiated the ISO 17025 accreditation process. This effort, which comprises a major portion of our fiscal year 2002 budget request, will, upon completion, address most of the issues identified by the OIG in its report.

Second, FSIS is reviewing several federally-inspected establishments in New York and New Jersey to ensure that meat and poultry products produced in those establishments are safe and wholesome. These reviews support an ongoing investigation by the USDA Office of Inspector General regarding allegations of plants operating without proper inspection. The OIG is also investigating whether the Agency took proper safeguards last summer during a lengthy refrigeration failure at a plant in New York City. The FSIS reviews will focus on examining HACCP systems and Sanitation Standard Operating Procedures to determine whether each facility has a HACCP and SSOP plan in place that is effective and ensures the production of safe food for consumers. This review involves establishments in the New York metropolitan area. I believe that the FSIS workforce and the vast majority of the plants we inspect work very hard to ensure the safest meat and poultry products possible for the American public.

FISCAL YEAR 2002 BUDGET REQUEST

The FSIS budget request for fiscal year 2002 supports the Agency's goals for the HACCP food safety environment. It provides us with the resources needed to improve the quality of industry food safety programs, while also not imposing user fees of any kind. This budget request helps us complete the transition to a modern, public health regulatory agency.

For fiscal year 2002, FSIS is requesting \$715.5 million, a net increase in appropriated funds of \$20.3 million. Of the \$20.3 million proposed increase in the budget, \$18.4 million is for pay and benefit increases. FSIS employee salary, benefits, and inspector travel between plants takes up nearly 90 percent of the FSIS budget. Federal and State pay raises, benefits, and increases in health insurance and retire-

ment benefit costs have a serious effect on our ability to staff plants if not fully funded.

FSIS' fiscal year 2002 budget also includes a request for \$875,000 for the Grants-to-States program, primarily for increased pay costs at the state level. It is imperative that states are fully funded for their share of the cooperative programs to permit continued cooperation with the states toward a more closely coordinated national food safety program.

Earlier I mentioned concerns about the safety of imported meat and poultry. These concerns accompany increased requests by foreign countries to export meat and poultry products to the United States. Because of this, we are requesting an increase of \$699,000 and three staff years in fiscal year 2002 to bolster our efforts to assure the continuing equivalence of foreign inspection systems. FSIS has a fundamental statutory responsibility to assure the equivalence of foreign production systems for all imported meat, poultry, and egg products entering commercial channels of distribution. Increased comprehensive reviews of foreign inspection programs will verify system equivalence and provide opportunities to reinforce HACCP requirements through the outreach and education element of the reviews. The requested resources are necessary to adequately staff our annual program of comprehensive foreign program reviews and to meet the growing need for more complex initial eligibility reviews.

In fiscal year 2000, the Agency completed routine audits of establishments, laboratories conducting residue and microbiological analyses, and government inspection systems in 31 countries. In addition, an initial verification audit was performed in one country requesting equivalence status. To assess the equivalence of the systems, reviews focused on five risk areas: sanitation, animal disease, residue controls, slaughter/processed product controls, and enforcement controls. In addition, for each audit, we evaluated HACCP programs, Sanitation SOPs, and generic *E. coli* and *Salmonella* testing procedures. FSIS also conducted Canadian audits under the United States and Canada Free Trade Agreement (CFTA).

While FSIS conducts a residue monitoring program for meat and poultry produced in the United States, the EU requires additional residue testing for certain hormones, animal drugs, and other compounds in meat that it imports. Currently, there are no Federal or private laboratories in the U.S. that have on-going residue testing programs or capacity to meet the EU requirements. We are therefore also requesting an increase of \$4,301,000 and 13 staff years to expand residue testing of meat products to meet the EU requirements.

In recent years, the EU has attempted to stop the import of U.S. meat products because FSIS does not maintain a mechanism for permanent, uninterrupted testing and analysis of some chemical compounds. Additionally, since 1990, the EU has blocked the importation of most U.S. beef products because they might contain hormone residues. During the past three years, meat exports to Europe; primarily pork, horsemeat, and non-hormone treated beef; have decreased. These exports decreased by almost 20 percent from 2000 to 2001 alone. Future exports are in further jeopardy, due to EU assessments of the inadequacy of the FSIS National Residue Program (NRP). In the last three years, we have increased significantly the number of compounds tested in the NRP. However, we have also prioritized and rotated the sampling and analysis of some chemical compounds that we judge to have important public health significance. For example, several EU-required compounds are ranked as high-priority compounds in FSIS' ranking profile, but FSIS lacks the capacity to permanently incorporate regular testing of these substances into the NRP. Other compounds that the EU requires testing for, such as Nitroimidazoles, are not considered by FSIS to be high food safety priorities. In other cases, FSIS plans to test for EU—required compounds, but at sample volumes insufficient to satisfy EU requirements.

FSIS does not presently have the laboratory capacity to test for the compounds prescribed in EU Council Directive 96/23/EC Annex I (Groups A and B). This directive prescribes the compounds for which testing must be conducted in order to export meat products to Europe. FSIS has assured that U.S. product can still be exported to the EU, and is in compliance with EU requirements, by making arrangements for residue testing of U.S. products at independent laboratories in the Netherlands and Canada.

Laboratory capacity is the NRP's chief limiting factor in testing for these compounds on a permanent basis. To immediately carry out the additional testing needed to satisfy EU requirements, we must modify FSIS laboratories. Currently, unusable space can be modified to house additional equipment, provide needed storage and refrigeration space, and to provide space for the additional chemists required to supplement the NRP's existing analytical methods expertise. The NRP needs additional analytical methods and equipment, such as more sophisticated mass spec-

trometers, extraction manifolds, gas- and liquid-chromatographs, graphite and muffle furnaces, a drying oven, and an acid fume hood, to comply with EU requirements. We also need to add chemists and laboratory support specialists, as well as a chemical engineer, to the NRP's current staff.

An essential element of expanding the NRP to meet EU requirements, as well as meeting Agency needs for a credible laboratory program, is the accreditation of FSIS laboratories under International Standards Organization (ISO) Standard 17025. This accreditation will demonstrate and document the competency and credibility of the NRP according to internationally recognized standards. FSIS began the ISO accreditation process in late 1997 and anticipates its completion in fiscal year 2002. Expansion of the NRP to comply with EU requirements increases the scope of activities to be certified as part of the Agency's ISO accreditation process. As a result, this request also includes funding to complete ISO accreditation and to fund the extensive audits required to finalize certification.

CONCLUSION

Mr. Chairman, this concludes my prepared statement. Thank you for your continued support. Thank you also for the opportunity to submit testimony to the Subcommittee on how FSIS is working with Congress and other partners to become a risk-based regulatory public health agency that can better assure the safety of meat, poultry, and egg products for American consumers.

FOOD AND NUTRITION SERVICE

PREPARED STATEMENT OF GEORGE A. BRALEY, ACTING ADMINISTRATOR

Thank you, Mr. Chairman and members of this Subcommittee, I am George Braley, the Acting Administrator of the Food and Nutrition Service (FNS). In my normal role as the Associate Administrator for the Food and Nutrition Service, I have, from time to time, appeared before the Subcommittee. I wish to thank you and the other Subcommittee members for the opportunity to submit my witness statement which will address the key aspects of the fiscal year 2002 budget request for FNS.

2002 BUDGET REQUEST

FNS requests \$36.6 billion in new budget authority for fiscal year 2002, a level that will maintain the Nation's nutrition assistance safety net. The nutrition assistance programs are essential to fighting hunger and improving nutrition for children and low-income people. The request meets the priorities described in both USDA's strategic plan 2000-2005, and Fiscal Year 2002 Annual Performance Plan. These plans focus the programs on results—results in improving food security and nutrition for the people they serve, and results in providing strong stewardship for the taxpayer investment in nutrition assistance.

The fiscal year 2002 request includes funds to fully support all of the FNS Federal nutrition assistance programs.

FOOD STAMP PROGRAM

The Food Stamp Program continues to serve the Nation as the primary source of nutrition assistance for low-income Americans. The program's mission is to ensure that low-income Americans have access to a nutritious, healthful diet. By providing nutrition assistance and promoting healthy food choices, the Food Stamp Program can improve the nutritional status of low-income individuals, protect their health, and strengthen the food and agricultural economy.

We are requesting \$22.0 billion for the Food Stamp Program in fiscal year 2002. This request is sufficient to serve an average of 18.4 million people each month with an average monthly benefit of \$78.35 per person. The cost of the Thrifty Food Plan—the basis for determining food stamp benefits—is projected to rise about 3.1 percent from fiscal year 2001 to fiscal year 2002. Participation is projected to rise by about 805,000 people, reflecting a slight increase in projected unemployment rates (an indicator of the population eligible for benefits). The projected increase in participation, coupled with the projected increase in average monthly benefits (from \$74.88 in fiscal year 2001), results in a \$1 billion increase in benefit costs above the current estimate for fiscal year 2001.

The projections are based on current economic forecasts from the Office of Management and Budget. To guard against unforeseen changes in economic conditions, our request includes a benefit reserve of \$1 billion, a \$900 million increase over fis-

cal year 2001. This benefit reserve will ensure that funds are quickly available if participation increases faster than expected, thereby ensuring the program's ability to get food to people who need it.

Also included under the Food Stamp account is \$100 million authorized for the purchase of commodities for The Emergency Food Assistance Program and \$1.3 billion to fund the Nutrition Assistance Program for Puerto Rico. Our request also includes \$72.8 million for the Food Distribution Program on Indian Reservations (FDPIR), a slight reduction from fiscal year 2001 reflecting a decline in inventory purchases and non-continuation of a one-time \$3 million bison purchase made in fiscal year 2001. The FDPIR provides benefits to eligible needy persons living on or near Indian reservations and is authorized by the Food Stamp Act. The budget estimates that participation in the program during fiscal year 2002 will average 120,360 persons monthly, a slight increase from fiscal year 2001.

CHILD NUTRITION PROGRAMS

The purpose of the Child Nutrition Programs is to assist State and local governments in providing healthful, nutritious meals to children in public and nonprofit private schools, child care institutions, including family day care homes and summer recreation programs. FNS is requesting \$10.1 billion—a 5.7 percent increase above the fiscal year 2001 estimate. We estimate that in fiscal year 2002, the requested funds, plus about \$344 million in projected carryover funds available from fiscal year 2001, will support:

- 4.7 billion meals in the School Lunch Program;
- 282 million snacks in the After School Snack Program;
- 1.4 billion meals in the School Breakfast Program;
- 1.8 billion meals in Child Care Centers and Day Care Homes;
- 152 million meals in the Summer Food Program; and
- 120 million half pints of milk in the Special Milk Program.

Due to predicted increases in school enrollment in fiscal year 2002, average daily participation in both the National School Lunch Program (NSLP) and the School Breakfast Program (SBP) are projected to be somewhat higher than in fiscal year 2001—an increase estimated to be 1.4 percent in the NSLP and about 3.7 percent in the SBP. The combination of increased meal reimbursements and the projected growth will require a fiscal year 2002 increase of \$382 million over fiscal year 2001.

In the Child and Adult Care Food Program, we project a 3.3 percent increase (59 million) in meals served over fiscal year 2001. The increase in the per meal subsidy and the projected growth in participation will require an additional \$112.4 million in fiscal year 2002 over fiscal year 2001.

Included as part of our child nutrition request is \$2 million for a school lunch integrity program that will (1) examine the current application and application verification processes for school meals programs and (2) explore potential alternatives to the current process.

SCHOOL MEALS INITIATIVE AND TEAM NUTRITION

The School Meals Initiative for Healthy Children regulation updated the nutrition standards for school meals and recognized the importance of training and technical assistance for school food service professionals and nutrition education for students. To implement this regulation, the Food and Nutrition Service established the Team Nutrition Initiative, a comprehensive, structured plan for improving the nutritional standards of school meals as well as creating an environment in the school cafeteria, in the classroom and in the community that fosters good dietary practices among children and their families. This initiative involves schools, parents and the community in efforts to continuously improve school meals and to promote the health and education of about 50 million school children in more than 97,000 schools Nationwide. Team Nutrition works to change current behaviors to be more supportive of healthy eating and physical activity through (1) training and technical assistance for school food service professionals, (2) interactive nutrition education for children and their parents and (3) support for school and community leaders. These strategies are accomplished through direct Federal operations as well as grants to State agencies. In fiscal year 2002, we are requesting a total of \$10 million for Team Nutrition, the same level appropriated for fiscal year 2001.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

The purpose of the WIC Program is to improve the health of low-income nutritionally at-risk, pregnant, breastfeeding and postpartum women, infants and children up to their fifth birthday. WIC participants receive three primary benefits: nutri-

tious food packages designed to supplement their diets; nutrition education intended to improve their nutrition practices; and referrals to other critical health and social services.

We are requesting \$4.1 billion in fiscal year 2002, an increase of \$94 million over fiscal year 2001, to provide nutrition education and food benefits to a monthly average of 7.25 million needy women, infants and children.

WIC ELECTRONIC BENEFIT TRANSFER (EBT)

FNS is engaging in activities complementary to the Food Stamp Program to advance EBT and Electronic Service Delivery (ESD) system development to improve program benefit delivery and client services for the WIC Program. Our WIC Program request for fiscal year 2002 includes \$6 million which will be dedicated to EBT development. Our goal is to successfully implement EBT/ESD in States that have embarked on planning/pilot testing and eventually expand EBT/ESD development to additional States. The following describes some of the progress in each of the projects:

Michigan is in the final stages of its contract negotiations with its contractor, Citibank, for an 18-month pilot which will demonstrate a new hybrid approach for WIC electronic service delivery. System testing is expected to occur sometime toward the end of 2001.

New Jersey continues to plan for an ESD pilot which will include partnerships with managed care providers, HMO's and other entities. A final Request for Proposal for EBT services is expected to be released in 2001.

New Mexico and Texas have completed a joint procurement for WIC EBT services. New Mexico plans to launch their pilot in August 2001, and Texas in February 2002. Texas and New Mexico have chosen an alternative strategy for development, which includes in-house development for EBT processing, supported by EBT contracted services.

Ohio launched its off-line, smartcard EBT pilot in the Dayton, Ohio area on October 16, 2000, in conjunction with existing off-line chip card technology already in place for the Ohio Food Stamp Program. The WIC pilot is expected to run through July 2001, at which time Ohio may continue current pilot operations or expand the pilot beyond the Dayton area.

PARTNERS (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut) continues planning a multi-State, multi-program procurement for pilots in all six States. PARTNERS plans to utilize hybrid card technology (on-line magnetic stripe and off-line integrated circuit chip/smart card) to deliver WIC food benefits as well as maintain and exchange health services information in partnerships with a variety of health service providers. The next step is to procure the services of a contractor for the design, development, and implementation of the pilots, and to procure a contractor for an independent evaluation of the pilot projects.

Wyoming EBT includes WIC and Food Stamps sharing the same electronic service delivery smartcard and retailer platform. Food Stamps is 100 percent rolled out with WIC at about 80 percent. WIC expects to complete its roll-out of the system in the fall of 2001. Wyoming WIC is also seeking partnerships with other health agencies for cost containment purposes.

Nevada, Wyoming and North Dakota (Health Passport Project)—This is a field demonstration project of the Western Governor's Association to demonstrate the use of an individual, secure portable electronic health record using smartcard technology. Seventeen programs (including WIC) are linked through an application program interface to manage the 500 "common data" elements across programs in a smartcard.

WIC FARMERS' MARKET NUTRITION PROGRAM

The WIC Farmers' Market Nutrition Program (FMNP) provides WIC participants access to fresh fruits and vegetables while also expanding the awareness and use of farmers' markets by consumers. The requested level of \$20 million for fiscal year 2002 is the same as the fiscal year 2001 level. In fiscal year 2001, three new State agencies were approved to participate in the FMNP. Currently 41 State agencies are participating in the program.

COMMODITY ASSISTANCE PROGRAMS

The Commodity Assistance Programs include funding for the Commodity Supplemental Food Program (CSFP) and administrative funding for The Emergency Food Assistance Program (TEFAP). Our budget request for fiscal year 2002 includes:

—\$95.0 million for the women, infants, and children and elderly caseload in CSFP; and

—\$45 million for TEFAP State and local agency administrative expenses in addition to the \$100 million for commodity purchases available in the Food Stamp account providing for a total program of \$145 million.

The CSFP level requested for fiscal year 2002 will support projected average monthly participation of 94,400 women, infants and children as well as a projected average monthly participation of 355,600 elderly. The request of \$95.0 million (the same as appropriated in fiscal year 2001), in conjunction with use of about \$4 million in inventory, will allow for a total program of about \$99 million in fiscal year 2002 which will support the increase in participation of about 23,000 participants per month. Any unobligated balances at the end of the current fiscal year will, at the beginning of fiscal year 2002, be subject to rescission.

NUTRITION PROGRAM FOR THE ELDERLY

Our request for the Nutrition Program for the Elderly (NPE) is \$149.7 million, the same as the fiscal year 2001 level. Public Law 106-501, the Older Americans Act of 2000 enacted November 13, 2000, required that each grantee or State receive a proportion of available funds equal to the proportion of meals served by that grantee or State in the preceding fiscal year. In previous fiscal years (prior to fiscal year 2001), NPE was funded on a payment per meal basis. The requested level will support in fiscal year 2002 about the same number of meals served in fiscal year 2001.

FOOD PROGRAM ADMINISTRATION

Our Food Program Administration (FPA) request for fiscal year 2002 is \$127.5 million—an increase of \$8 million over fiscal year 2001. Almost \$4 million of the requested increase is to provide for pay costs of the agency staff and management personnel funded from this account. Additionally, we are requesting an increase of \$1.8 million with which to improve FNS' information technology capacity. We expect the majority of States—perhaps as many as 75 percent—to begin to replace or update the large automated systems which are critical to the successful delivery of agency programs. Each year, FNS provides upwards of \$300 million in support of State systems. This requested increase will provide for a needed increase in agency oversight and review of State agency documentation activities and expenditures.

Also requested as part of the increase is \$200,000 for support of improved work force diversity and succession planning. FNS sorely needs these resources to support implementation of a human capital management strategy that addresses serious leadership, retention and succession concerns. Agency projections are that about 80 percent of the career senior leaders and about 30 percent of the total work force could retire within five years. FNS must address this serious challenge.

Since FNS is the most appropriate agency to perform program and performance assessments that respond directly to the needs of agency program policy makers and managers, our request includes \$3 million of the overall \$12 million USDA nutrition research request. Such assessments are essential to ensuring that the FNS programs achieve their missions effectively. These operational assessments provide the foundation for strategic planning, program outcome measurement and program innovation needed to respond to emerging issues and problems and support effective stewardship of the substantial taxpayer investment in nutrition assistance.

CONCLUSION

The mission of FNS is to increase food security and reduce hunger in partnership with cooperating organizations by providing children and low-income people access to food, a healthful diet, and nutrition education in a manner that supports American agriculture and inspires public confidence. This fiscal year 2002 budget request reflects our commitment to the achievement of this mission. We also believe that our request for \$36.6 billion is crucial to continue efficient program operations. Mr. Chairman, this summarizes the FNS fiscal year 2002 budget request. I will be happy to answer questions that you or other members of the Subcommittee may have.

NATIONAL APPEALS DIVISION

PREPARED STATEMENT OF NORMAN G. COOPER, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you to discuss the fiscal year 2002 budget request for the National Appeals Division.

INTRODUCTION

The National Appeals Division (NAD) was established by the Secretary of Agriculture pursuant to the Reorganization Act of 1994. The Act consolidated the appellate functions and staffs of several USDA agencies under a single administrative appeals organization. NAD appeals involve program decisions of the Farm Service Agency, the Risk Management Agency, the Natural Resources Conservation Service, and Rural Development agencies. In addition, in states covered by the United States Court of Appeals for the Eighth Circuit, NAD Hearing Officers adjudicate and the Director makes final determinations on applications for fees under the Equal Access to Justice Act (EAJA). NAD is headquartered in Alexandria, Virginia, and has regional offices located in Indianapolis, Indiana; Memphis, Tennessee; and Lakewood, Colorado. NAD's staff of 133 includes 75 hearing officers.

MISSION

Our mission is to conduct evidentiary administrative appeals hearings and reviews arising out of program decisions of certain USDA agencies. Our strategic goal is to conduct independent evidentiary hearings and issue timely and well-reasoned determinations which correctly apply USDA laws and regulations. NAD's mission is statutorily specific, but its operation is dynamic and challenging, given the complexities of changing laws, regulations and policies affecting USDA program decisions.

We are also requesting \$372,000 for pay costs in order to maintain current staffing levels. There is little flexibility for absorbing additional costs. NAD would be adversely impacted in its ability to execute its mission without the increase for pay costs.

That concludes my statement, and I look forward to working with the Committee on the 2002 National Appeals Division budget.

ECONOMIC RESEARCH SERVICE

PREPARED STATEMENT OF SUSAN E. OFFUTT, ADMINISTRATOR

Mr. Chairman and members of the Committee, I am pleased to have the opportunity to present the proposed fiscal year 2002 budget for the Economic Research Service (ERS).

MISSION

The Economic Research Service provides economic and other social science research and analysis on efficiency, efficacy, and equity issues related to agriculture, food, natural resources, and rural development to improve public and private decision making.

BUDGET

The Agency's request for 2002 is \$67.2 million, a net increase of \$1.3 million from the 2001 appropriation. The net increase consists of four parts: a \$1.2 million increase for the purchase and dissemination of retail meat prices; a \$6 million increase for economic analysis and expert witness litigation support for the Pigford Consent Decree; a \$1.5 million increase for pay costs; and a \$2 million decrease for performance and program assessments related to the administrative responsibilities of running the food assistance programs. Funding for these performance and program assessments in 2002 is included in the Food and Nutrition Service (FNS) budget.

ERS CONTRIBUTIONS TO MISSION AREA GOALS

ERS shares five general goals with its fellow agencies in the Research, Education, and Economics (REE) mission area: (1) a highly competitive agricultural production system, (2) a safe and secure food supply, (3) a healthy and well nourished population, (4) harmony between agriculture and the environment, and (5) enhanced economic opportunity and quality of life for all Americans. These goals are fully consistent with the U.S. Department of Agriculture mission.

Goal I: The agricultural production system is highly competitive in the global economy

ERS helps the U.S. food and agriculture sector effectively adapt to changing market structure and post-WTO and post-NAFTA trade conditions by analyzing the linkages between domestic and global food and commodity markets and the implica-

tions of alternative domestic and international policies on competitiveness. ERS economists analyze factors that drive change in the structure and performance of domestic and global food and agriculture markets; provide economic assessments of structural change and competition in the food industry; analyze how global environmental change, international trade agreements, and foreign trade restrictions affect U.S. agricultural production, exports, imports, and income; and provide economic analyses that determine how fundamental commodity market relationships are adjusting to changing trade, domestic policy, and structural conditions.

ERS will continue to work closely with the World Agricultural Outlook Board and USDA agencies to provide short- and long-term projections of U.S. and world agricultural production, consumption, and trade. Cooperative efforts will seek to understand how commodity price and farm income variability affect market performance and interact with Federal policies and programs. ERS has sustained the frequency of reporting on commodities' outlooks, while strengthening the analysis that leads to a better understanding of reported observations and improving access to timely information through the use of the ERS Web site. ERS has established quarterly meetings with commodity groups and is now expanding the roundtables to include a wider spectrum of customers to provide feedback on the ERS market analysis and outlook program.

In addition, ERS will continue to work closely with the Foreign Agricultural Service and the Office of the U.S. Trade Representative to ensure that negotiations under the auspices of the World Trade Organization and regional trade agreements are successful and advantageous for U.S. agriculture. Research will target options and prospects for further liberalization in global markets, building on recent ERS findings such as empirical evidence that tariffs on food and agricultural products constitute the most significant barrier to increased market access for U.S. products. ERS' January 2001 publication, *Profiles of Tariffs in Global Agricultural Markets*, demonstrates the Agency's ability to provide critical information on the levels of protection in food and agricultural markets, and also on the variations across countries and commodities that may be critical to understanding the benefits and costs of alternative negotiating proposals. ERS will also continue to conduct and build upon research designed to significantly improve understanding among decision makers of the changing structure of the food marketing chain (for example, the implications for producers of the increasing replacement of open markets by contractual arrangements and vertical integration). *Understanding the Dynamics of Produce Markets*, published in August 2000, and *U.S. Fresh Fruit and Vegetable Marketing*, published in January 2001, demonstrate the expertise that ERS has built in explaining and analyzing critical changes in vertical relationships in the food system, and the implications for producers and others throughout the supply chain.

ERS analyses can help guide and evaluate resource allocation and management of public sector agricultural research—a key to maintaining increases in productivity that underlie a strong competitive position for U.S. farmers. ERS economists track and seek to understand the determinants of public and private spending on agricultural R&D; evaluate the returns from those expenditures; and consider the most effective roles for public and private sector research entities. *Economic Issues in Agricultural Biotechnology*, released in March 2001, demonstrates ERS' understanding of and ability to communicate the role of biotechnology and intellectual property rights in reshaping the public-private balance and partnerships in agricultural research.

Purchase and Dissemination of Retail Meat Prices

The request for an increase of \$1,197,000 in fiscal year 2002 is necessary to meet the requirements imposed by the Mandatory Livestock Price Reporting Act of 1999 which seeks to improve the price reporting of meat products. The funding will be used to purchase retail price and volume data from retailers and to aggregate the data. The data will be maintained in a database and will permit the monthly electronic publication of retail sales quantity, value and average price at the national level for the major meats, such as beef, pork and chicken; and for other meats, such as turkey, veal and lamb. This initiative will enhance transparency of pricing systems in livestock and meat markets. It will also provide a foundation for continuing analysis of rapid structural changes in food and agricultural markets to aid in policy decisions related to market regulation, competition, information services, consumer demand, and rural development.

Goal 2: The food production system is safe and secure

ERS focuses on improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food by analyzing the benefits of safer food and the costs of food safety policies; efficient and cost-effective ap-

proaches to promote food safety; and how agricultural production and processing practices affect food safety, resource quality, and farm workers' safety. This research helps government officials design more efficient and cost-effective approaches to promoting food safety. For example, ERS works closely with various USDA agencies and the Centers for Disease Control and Prevention (CDC) on pathogen reduction efforts, including Hazard Analysis and Critical Control Points (HACCP). The ERS research program provides detailed and up-to-date appraisals of the benefits of safer food, such as reducing direct medical costs and indirect costs associated with productivity losses from foodborne illnesses caused by microbial pathogens. Tracing the Costs and Benefits of Improvements in Food Safety, published in October 2000, provided policymakers with information about who ultimately benefits from reduced foodborne illnesses and who ultimately pays the costs of food safety regulations. ERS received increased funding for work under Goal 2 in fiscal year 1999 and fiscal year 2000. Using this funding ERS administered a competitive process through which several grants were awarded. The projects, for which results are expected in 2002, are applying state-of-the-art valuation methodologies to measure consumers' willingness to pay for reductions in food safety risks from microbial pathogens in foods.

Understanding how food prices are determined is increasingly important in responding to domestic and international market events and opportunities that promote the security of the U.S. food supply. As the farm share of the food dollar declines, accurate retail price forecasts depend more heavily on understanding the marketing system beyond the farmgate. ERS systematically examines the factors that help set retail prices, including an assessment of the roles of the transportation, processing, manufacturing, wholesaling and retailing sectors; the impact of imports and exports; and linkages to the total economy.

Goal 3: The nation's population is healthy and well-nourished

ERS helps identify efficient and effective public policies that promote consumers' access to a wide variety of high-quality foods at affordable prices. ERS economists analyze factors affecting dietary changes as well as trends in America's eating habits; assess impacts of nutrition assessments and the implications for the individual, society and agriculture; and provide economic evaluations of food nutrition and assistance programs, such as factors determining changes in Food Stamp program participation. In 2000 ERS published *The Decline in the Food Stamp Program Participation in the 1990s*, which detailed and analyzed the decline in participation from 27.5 million participants in 1994 to 18.2 million in 1999.

Analysis of nutrition education efforts considers what kinds of information motivate changes in consumer behavior, the food cost of healthy diets, the influence of food assistance programs on nutrition, and the implications of healthy diets for the structure of the food system. In 2000, ERS released the study, *WIC and the Nutrient Intake of Children*, which found that participation in the WIC program had a significant positive effect on children's intake of several nutrients, including iron. The finding regarding iron was especially useful since low intake of iron, which may lead to anemia, is considered to be an important public health issue.

Through the Food Assistance and Nutrition Research Program (FANRP), ERS will continue to conduct studies and evaluations of the Nation's food assistance programs. FANRP research is designed to meet the critical needs of USDA, Congress, program managers, policy officials, USDA program clients, the research community, and the public at large in relation to the design and effectiveness of food assistance programs, diet quality, and nutrition education. FANRP research is conducted through internal research at ERS and through a portfolio of external research. Through partnerships with other agencies and organizations, FANRP is enhancing national surveys by adding a food assistance dimension. FANRP's long-term research themes are dietary and nutritional outcomes, food program targeting and delivery, and program dynamics and administration.

Goal 4: Agriculture and the Environment are in Harmony

In this area, ERS research and analytical efforts in cooperation with the Natural Resource Conservation Service (NRCS) support development of Federal farm, natural resource, and rural policies and programs. Such efforts promote long-term sustainability goals, improved agricultural competitiveness, and economic growth. This effort requires analyses of the profitability and environmental impacts of alternative production management systems in addition to the cost-effectiveness and equity of public sector conservation policies and programs. ERS analysts focus on evaluating the benefits and costs of alternative agricultural and environmental policies and programs in order to assess the relationship between improvements in environmental quality and increases in agricultural competitiveness. For example, in its

January 2001 publication *Agri-Environmental Policy at the Crossroads: Guideposts on a Changing Landscape*, ERS focused on the issues and tradeoffs that policymakers would face in designing a program of agri-environmental payments. ERS is continuing to work with NRCS to provide a combination of economic, farm structural, and geographic information to inform ongoing decision making about the design of conservation programs and the regulation of animal waste.

ERS is seeing the payoff of its having put increasing emphasis on understanding and analyzing trends in adoption of genetically modified crops and the emergence of markets for both genetically modified and non-genetically modified commodities—becoming a leader in the public sector in releasing new and timely information on this topic. In 2000, *Genetically Engineered Crops for Pest Management in U.S. Agriculture* reported that adoption of genetically engineered (GE) crops with traits for pest management has risen dramatically since their commercial introduction in the mid-1990s. The research provided important new understanding of the impacts of adopting GE crops on crop yields, net returns, and pesticide use.

Goal 5: Enhanced economic opportunity and quality of life for rural Americans

The ERS contribution to this goal is based on analysis that identifies how investment, technology, employment opportunities and job training, Federal policies, and demographic trends affect rural America's capacity to prosper in the global marketplace. ERS economists analyze rural financial markets and how the availability of credit (particularly Federal credit) and public spending, taxes, and regulations influence rural economic development. ERS analyzes the changing size and characteristics of rural and farm populations and the implications of these changes on the performance of rural economies. In addition, ERS studies the economic structure and performance of non-farm economic activities in rural areas, including the rebound in population growth in non-metropolitan counties.

ERS also monitors rural earnings and labor market trends with emphasis on regional and other disaggregations in order to provide insight into the determinants of variation in trends among rural counties. Such work yields a better understanding of the factors that promote rural vitality and the opportunities for effective public sector intervention.

An ERS study currently underway will identify and analyze factors affecting growth in remote rural areas. This study is part of a multi-country international project conducted under the auspices of the Organization for Economic Cooperation and Development. Other studies are investigating the effects of various policy scenarios, including increases in the minimum wage and the Earned Income Tax Credit, on the poverty and employment status of rural welfare recipients. ERS researchers are also examining Federal credit and tax policies to assess their impact on farm families and the intergenerational transfer of farm assets. Researchers are also assessing the impacts of structural and policy changes on the costs and availability of electric, telecommunications, and financial services in rural America.

ERS continues to monitor the financial situation of the farm sector through establishing farm business organization and performance benchmarks. This task includes study of the financial position of farmers who employ technological advances and innovative risk management strategies in their businesses, compared with the financial position of farmers who use more traditional approaches.

ERS has developed and widely disseminated a new farm typology that goes beyond the traditional classification of farms by sales class alone to a grouping that is much more reflective of operators' expectations from farming, stage in their life cycle, and dependence on agriculture for household income. Continued applications of the typology are bringing new understanding about the diversity of the U.S. farm community, factors that can enhance success among small and minority-owned farms, and the implications for the different types of farms of alternative approaches to providing safety nets for farm households. In October 2000 ERS published *A Safety Net for Farm Households*, which applies the typology to four scenarios for government assistance to agriculture based on the concept of ensuring some minimum standard of living.

ECONOMIC ANALYSIS AND EXPERT WITNESS SUPPORT FOR THE PIGFORD CONSENT DECREE

The request for an increase of \$600,000 is for costs associated with economic analysis and expert witness litigation support for the Pigford Consent Decree which is from a class action lawsuit that alleges racial discrimination in the administration of USDA farm loan and benefit programs. The USDA and the Department of Justice (DOJ) determined that it was critical that expert economic analysis be made available to support DOJ work. ERS's role is to generate an objective estimate of eco-

conomic damages in each particular case using a consistent, understandable, and defensible methodology that is based on standardized farm accounting procedures.

CUSTOMERS, PARTNERS, AND STAKEHOLDERS

The ultimate beneficiaries of ERS's program are the American people whose well-being is improved by informed public and private decisionmaking leading to more effective resource allocation. ERS shapes its program and products principally to serve key decision makers who routinely make or influence public policy and program decisions. This clientele includes White House and USDA policy officials and program administrators/managers; the U.S. Congress; other Federal agencies and State and local government officials; and domestic and international environmental, consumer, and other public organizations, including farm and industry groups interested in public policy issues.

ERS depends heavily on working relationships with other organizations and individuals to accomplish its mission. Key partners include: the National Agricultural Statistics Service for primary data collection; universities for research collaboration; the media as disseminators of ERS analyses; and other government agencies and departments for data information and services.

CLOSING REMARKS

I appreciate the support that this Committee has given ERS in the past and look forward to continue working with you and your staff to ensure that ERS makes the most effective and appropriate use of the public resources. Thank you.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

PREPARED STATEMENT OF DR. COLIEN HEFFERAN, ADMINISTRATOR

Mr. Chairman and Members of the Committee, I appreciate the opportunity to submit the proposed fiscal year 2002 budget for the Cooperative State Research, Education, and Extension Service (CSREES), one of four agencies in the Research, Education, and Economics (REE) mission area of the United States Department of Agriculture (USDA). I am especially honored as this is my first opportunity to submit testimony to this Committee as the Administrator of CSREES.

CSREES works in partnership with the land-grant university system, other colleges and universities, and public and private research and education organizations, in concert with the Secretary of Agriculture and the intent of Congress, to initiate and develop agricultural research, extension and higher education programs. This partnership has a breadth of expertise that is ready to deliver solutions to problems facing U.S. agriculture today. For example, University of California scientists are developing a foot-and-mouth disease transmission model to simulate a wide range of possible epidemic patterns and identify eradication strategies for each. The model will ultimately be used to address important questions about foot-and-mouth disease eradication and is expected to be a useful tool for veterinary decision-makers, when and if the disease returns to the United States. Through extension and education activities, the system will be able to mobilize personnel to inform and assist producers and the public on technological advances about this and other agricultural problems.

The broad portfolio of CSREES programs has supported scientific discovery from conception to application. Formula funds have leveraged dollars from other sources, provided the start-up funds needed for an investigator to establish a research program and build the capacity to compete successfully in a competitive program, and allowed for a rapid response to an emerging problem. Competitively funded research from the National Research Initiative (NRI) has supported individual investigators undertaking basic research aimed at generating new knowledge. Research results are applied to real life problems through the Cooperative Extension System's outreach efforts. All of these efforts are undertaken in an environment that prepares students to meet the ongoing needs of agriculture, the environment, individuals and communities.

It is this coordinated, continuum of science—discovery to application—that has strengthened U.S. agriculture and has made the U.S. the world leader in science. For example, in 1998, scientists at Iowa State University received an NRI award for \$130,000 entitled, "Optimizing Marker-assisted Selection for Genetic Improvement of Livestock." The primary goal of this award was to develop advanced mathematical methods for selection and breeding strategies needed to achieve superior livestock. A subsequent Initiative for Future Agriculture and Food Systems award

entitled, "Mapping and Use of QTL for Marker-assisted Improvement of Meat Quality in Pigs," made to the same scientists in 2000 for \$587,722, built on work supported by the NRI award and was the first extended, large-scale study to identify desirable pork quality traits in commercial breeds. The results of this study will be accessible by interested stakeholders for industry implementation.

CSREES continues to strive to meet the recurring challenge of ensuring that its programs are flexible and responsive to national needs, as expressed by stakeholders and as reflected in Department and Administration priorities. In a recent speech, Secretary Veneman identified research and development as the way to find new solutions for issues related to energy, biotechnology, food safety, and the environment. CSREES-supported research and education are meeting these challenges.

Work is being conducted under the National Research Initiative and formula programs on biobased products to address energy and other needs that will generate information and tools for farmers to grow, harvest, and process alternative crops, and for manufacturers to convert renewable, raw materials to useful products for industry and/or consumers. For example, Smith-Lever formula funding has helped Colorado extension alternative crops specialists study three fiber crops—Kenaf, sunn hemp and sesbania—that can be processed into particle board, paper, and even lumber. These products could provide the public with an excellent alternative to wood products, the demand for which continues to climb.

The use and impact of biotechnology is transforming many sectors, including agriculture. CSREES-supported biotechnology research funded through formula funds and competitive grants not only has the potential to facilitate the development of enhanced foods and new food products, but also new non-food products, including lubricants, oils, and plastics.

The CSREES integrated research, extension and education Food Safety Program is supporting research to reduce the risk of drug residues in food products as well as the level of microbial resistance to antibiotics. This cutting edge research will greatly improve the safety and quality of the Nation's food supply, and also will contribute to reducing the chance of microbes causing illness that is not treatable in the human population.

In a Nation that values the environment—clean air and water, unique ecosystems, and pristine land—we must ensure that our production practices, as well as our public policies and programs affecting these practices, are consistent with the dual objectives of promoting competitiveness while preserving natural resources and environmental quality. To achieve these goals, a better understanding of the complex interactions between agricultural production and the environment is needed. Scientists in Missouri, supported by Hatch Act funds, have developed new methods of capturing nutrients in swine waste for crops, reducing fertilizer costs by \$1,700 to \$6,500 for each of the state's family-operated swine farms, at the same time reducing nitrogen in water. High phosphorus concentrations in the soil from poultry litter were troublesome until Delaware scientists, supported by Hatch Act funds, helped to develop new feed programs that allow chickens to digest phosphorus more efficiently. Phosphorus in poultry litter has been reduced by as much as 80 percent, helping protect water in poultry production areas nationwide. California extension personnel helped reduce sediment that was trapping 1,300 pounds of pesticide residues in the ecosystem and harming river wildlife in the San Joaquin River and Sacramento Delta. Approximately 68 percent of the farmland in the area is under management systems that have kept tons of sediment out of rivers, lakes, and streams.

CSREES is committed to seven overarching themes in its fiscal year 2002 budget and proposes sustained funding at the fiscal year 2001 level for:

- Competitively awarded grant programs such as the NRI and the Initiative for Future Agriculture and Food Systems;
- Funding for targeted areas, including Pest Control Related, Food Safety, and other national priority issues;
- Integrated research, extension, and education activities, as evidenced by continued support at the \$41.8 million level for the Integrated Activities Account;
- A balanced program portfolio, as evidenced by sustained support at the fiscal year 2001 level for all formula programs;
- Continued support for partnerships to reach diverse audiences through funding for the 1890 and 1994 land-grant institutions, Alaska Native-Serving and Native Hawaiian-Serving Institutions, and for Hispanic-Serving Institutions;
- Development of human capacity to address the need for a highly trained cadre of quality scientists, engineers, managers, and technical specialists in the food and fiber systems through funding the Higher Education Programs; and
- Streamlined management and improved accountability of CSREES programs through sustained support for the Research, Education, and Economics Information System, and through the integration of research, extension, and education

under certain programs as intended in the Agricultural Research, Extension, and Education Reform Act of 1998.

FISCAL YEAR 2002 BUDGET HIGHLIGHTS

The CSREES budget proposal, which totals nearly \$1 billion, provides funding for ongoing programs, and key provisions of the Agricultural Research, Extension and Education Reform Act of 1998. The fiscal year 2002 budget proposes to fund most programs at the fiscal year 2001 level, with the exception of about \$118 million for earmarked projects, which are proposed for elimination. Programs receiving continued support in fiscal year 2002 include:

Research and extension formula programs proposed for funding at the fiscal year 2001 appropriated level of \$544 million. CSREES works closely with partner institutions through the annual planning process and other means to target funds to priority issues facing agricultural producers, natural resource managers, and rural residents. The fiscal year 2002 budget proposes \$106 million for the NRI to fund grants that address key problems of national scope through research in the biological, physical and social sciences as related to agriculture. The program provides the critical agricultural knowledge base needed to solve immediate and future agricultural problems; it is the seed needed to assure continuing scientific advancement in agriculture. NRI is a unique program within CSREES that complements, but does not duplicate, the Integrated Research, Education, and Extension (Integrated) programs and the Initiative for Future Agriculture and Food Systems program.

One of the most crucial variables in the food and fiber system is scientific and professional human capital. The research and education agenda of the future depends on a highly trained cadre of qualified scientists, engineers, managers, and technical specialists. The budget funds CSREES Higher Education Programs at about \$35 million, including \$7.1 million to be added to the principal of the Native American Institutions Endowment Fund to improve the education capacity at Tribal colleges. The types of activities that can be supported with the interest derived from the endowment funds recently have been expanded to include facility renovation and construction projects. The budget also includes \$3 million for a program initiated in fiscal year 2001 for Alaska Native-serving and Native Hawaiian-serving Institutions.

Americans recognize that their quality of life depends largely on economic, physical, and institutional factors affecting their families, businesses, and communities. The fast pace of changes in these factors, and their increasingly complex interactions, present a growing challenge. CSREES, in partnership with the land-grant university system, enhances the capabilities of individuals, families, and communities to improve their quality of life. The fiscal year 2002 budget proposes continued support for programs such as Expanded Food and Nutrition Education Program, Children, Youth and Families, and Youth Farm Safety Education and Certification.

The fiscal year 2002 budget provides \$38 million for Food Quality Protection Act (FQPA) related pest control activities, the same as the fiscal year 2001 level. Emphasis is placed on developing alternatives to replace chemical pest controls that are at-risk of being taken off the market due to the stricter pesticide registration requirements resulting from the implementation of FQPA. The FQPA Risk Mitigation Program aims to establish longer-term pest control alternatives for major crops while the Crops at Risk Program supports projects to develop intermediate term alternatives in place of pesticides used on fruit and vegetable crops.

The Administration has proposed not to continue funding for program earmarks. We believe that competitive, peer-reviewed programs that respond to nationwide issues and have national application, and formula programs represent a higher priority use of taxpayer dollars.

MANDATORY PROGRAMS

The fiscal year 2002 budget proposes funding for the Fund for Rural America (Fund) program. As determined by the Secretary, funding supports competitive grants for research, education, and extension. Projects under the Fund are for national, regional and multistate system level approaches to strengthen international competitiveness, productivity, efficiency and profitability; to enhance natural resource management and environmental stewardship; and to strengthen rural communities. The fiscal year 2002 budget proposes \$120 million for the Initiative for Future Agriculture and Food Systems (IFAFS) program, which focuses on research that is cutting-edge, multi-institutional and directly linked to producer and consumer issues through extension or education programs. In fiscal year 2000, the agency received almost 1,000 proposals for the IFAFS program, 25 percent of which were rated highly meritorious by peer reviewers; the agency was able to fund fewer

than 9 percent of these proposals. The budget also proposes funding for the Community Food Projects grants program at \$2.5 million (supported with mandatory funds provided by the Food and Nutrition Service's Food Stamp Program).

SUMMARY

The broad portfolio of CSREES programs, including both formula based and competitively-awarded funds, ensures that research extends the transfer and implementation of practical outcomes. With this broad portfolio as a base, the strong Federal, State, and university partnership has supported great successes that have far reaching impacts on the food we eat, the environment in which we live, human health, and the quality of life of our citizens.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

PREPARED STATEMENT OF DAVID R. SHIPMAN, ACTING ADMINISTRATOR

Mr. Chairman and members of the Committee, I am pleased to highlight the accomplishments of the Grain Inspection, Packers and Stockyards Administration, and to submit our fiscal year 2002 budget proposal.

GIPSA is part of USDA's Marketing and Regulatory Programs, which works to ensure a productive and competitive global marketplace for U.S. agricultural products. Our mission is to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers and American agriculture.

GIPSA has both regulatory and service roles. Our Packers and Stockyards Programs (P&S) ensure open and competitive markets for livestock, meat, and poultry while providing financial protection to livestock producers. The Agency's Federal Grain Inspection Service (FGIS) provides the U.S. grain market with Federal quality standards and a uniform system for applying them. It also provides impartial, accurate measurements of grain quality to promote an equitable and efficient U.S. grain marketing system. GIPSA helps ensure fair and competitive marketing systems for all involved in the merchandising of livestock, meat, and poultry, and grain and related products.

ORGANIZATION

We are headquartered in Washington, DC. Our P&S program area has 180 employees and three regional offices. The Atlanta Regional Office is responsible for national issues relating to poultry production and processing; the Denver office for livestock concerns; and the Des Moines office focuses on swine production and processing. Legal, financial, and economics experts from the various locations work together to address national issues and more effectively monitor emerging technology, evolving marketing strategies, and other issues affecting the industries and the constituencies served by the Agency.

Federal grain personnel work as part of a unique public-private partnership with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis across the Nation. Federal inspectors service 38 export elevators in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. Eight delegated States provide service at an additional 19 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. In Canada, official service on U.S. grain transported through Canadian ports is provided under a cooperative agreement by the Canadian Grain Commission with GIPSA oversight at 7 locations. Fifty-nine (59) designated agencies service the domestic market under GIPSA supervision. In fiscal year 2000, this unique mix of Federal, State, and private inspection agencies provided nearly 2 million inspections on over 238 million metric tons of grains and oilseeds; weighed over 105 million metric tons of grain; and issued more than 89,000 official weight certificates.

Our Technical Center in Kansas City, Missouri, is GIPSA's central laboratory for technical leadership and support for the official inspection system and U.S. grain industry. The Center is home to the GIPSA Biotechnology Reference Laboratory, which accredits private testing labs conducting DNA-based testing for biotechnology derived grains and verifies the performance of rapid tests for biotechnology derived grains.

GIPSA'S PACKERS AND STOCKYARDS PROGRAMS (P&S)

The P&S Program fosters fair competition, and guards against deceptive and fraudulent practices affecting the movement and price of meat animals and their products. The production and marketing of livestock, meat and poultry are an important part of American agriculture and the Nation's economy.

With only 180 employees, P&S monitors the livestock, meat, and poultry industries, estimated by the Department of Commerce in fiscal year 2000 to have an annual wholesale value of \$142 billion. At the close of 2000 there were 1,318 stockyards; 6,195 market agencies and dealers, 2,039 packer buyers registered with GIPSA. An estimated 6,000 slaughtering and processing packers are subject to the Act. In fiscal year 2000, 266 slaughtering packers, each of whom purchased over \$500,000 of livestock in 1999, were required to be bonded and file reports with GIPSA. In addition, there were 205 poultry firms and a significant number of meat distributors, brokers, and dealers subject to the Act.

Last year, GIPSA conducted over 1,800 investigations, a 33 percent increase over the previous year. Most violations were corrected voluntarily, with several resulting in livestock and poultry producers receiving additional funds for the sale of their products. During fiscal year 2000, 17 administrative or justice complaints were issued (a net increase of 5 over the previous year) to bring subject firms into compliance with the Act. In addition, USDA issued 13 decisions and orders against 21 individuals or firms for violating the Act.

GIPSA continues to provide payment protection to livestock and poultry producers. Financial investigations during last year resulted in \$5.9 million being restored to custodial accounts established and maintained for the benefit of livestock sellers. This is more than double fiscal year 1999 restoration figures of \$2.7 million. Since the 1976 amendments to the P&S Act, livestock sellers have been paid \$59.7 million under the statutory trust provision. In 2000, one poultry trust complaint received by GIPSA that resulted in payment of \$250,000 to live poultry growers. By comparison, there were none in 1999. During fiscal year 2000, 192 insolvent dealers and market agencies corrected or reduced their insolvencies by \$6.7 million, an increase of more than \$2 million from the previous year. Insolvent packers corrected or reduced the insolvencies by \$2.2 million.

Many producers and growers are not adequately aware of the protections provided under the P&S Act. In the past 2 years, GIPSA stepped up outreach activities to better educate the industry about the Act and GIPSA's regulatory role in the market. GIPSA held a series of town hall meetings to discuss salient issues with many different segments of the poultry and swine industries. In fiscal year 2000, GIPSA held 12 outreach programs in the major U.S. poultry producing areas. Participants agreed that the poultry industry has a greater awareness of GIPSA's authority under the Act and regulations because of these efforts. As a result of participation in the town hall meetings, grower-oriented organizations and integrators have invited GIPSA to attend industry meetings and conferences. GIPSA plans to participate in another series of meetings with beef and sheep industry representatives.

In addition to the town hall meetings, GIPSA sponsored a Millennium Conference to better understand the issues facing our constituencies and to honor millennium farmers. We also sponsored a series of regional meetings with States Attorneys Generals, and Agricultural Commissioners and Secretaries to help us develop stronger strategic alliances in serving the agricultural community. We recognize the importance of staying in touch with growers, producers, and federal and state representatives to understand, stay abreast, and anticipate issues confronting the industry. GIPSA has actively cultivated a broader base of understanding with growers and producers through public outreach. We anticipate continuing this effort.

Our regulatory responsibilities are at the heart of our mission. To this end, GIPSA closely monitors practices that may impede the free trade of livestock, meat, and poultry. A high priority is placed on investigating all complaints and further developing information received concerning allegations of anticompetitive, unjustly discriminatory, or unfair behavior in the livestock, meat, and poultry industries. Appropriate corrective action is initiated when evidence of these practices is discovered.

Rapid Response teams continue to address urgent industry issues and are deployed when a situation warrants immediate attention or action. The ability of these teams to respond within 36-48 hours of being notified of a crisis provides the public with more immediate notification of fiduciary problems with a stockyard or market agency. Last fiscal year, 15 teams were deployed to investigate cases in 9 states. Teams helped recover more than \$3 million for growers and producers. The Agency also provides a hotline (1-800-998-3447) on which constituents may anonymously

voice their concerns. GIPSA responds to and investigates all issues addressed by the callers. Last year the Agency responded to 140 calls, compared to 126 in 1999.

GIPSA also is strengthening investigations and assessments of competitive implications of structural changes in the livestock, meatpacking, and poultry industries. To further this initiative, GIPSA entered into five cooperative research agreements in fiscal year 1999. Two examine competitive conditions in the beef markets, two address competitive issues and compensation methods used in the broiler production, and the final project examines bidding behavior in a laboratory setting to gain insights into expected behavior in actual markets. These projects will be completed in fiscal year 2001 and fiscal year 2002.

GIPSA also has made arrangements to obtain special procurement information annually from the Nation's top 15 steer and heifer slaughter firms. This information is related to livestock purchased through contracts, packer feeding arrangements, or marketing and formula-priced transactions. Much more work is needed to determine the effects of these captive supplies in both the beef and pork industries.

Currently, GIPSA is litigating two major cases against two of the largest packers in the Nation. The first involves a firm alleged to have violated the Act by failing to notify sellers that it had changed its equation for estimating the lean percent of animals purchased on a carcass merit basis. It is alleged that the company underpaid more than 1,250 farmers by about \$1.8 million. The second case, and the complaint filed, alleges that a company retaliated against a producer by failing to bid or purchase his or her animals. GIPSA has incurred major expenses and resources preparing for each of these cases. As an example, in the first instance, we spent almost a \$½ million in litigating this case.

In addition to normal regulatory duties, GIPSA has been tasked with four Congressional Mandates, which will impact the Agency next year, and in subsequent years. They are the Swine Contract Library, Captive Supply Study, annual Assessment the Cattle and Hog Industries, and the Agency's implementation of the GAO Report.

The first mandate, the Swine Contract Library, was contained in the Agricultural Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act of 2000 (Public Law 106-78), signed into law on October 22, 1999. It amended the P&S Act to require GIPSA to establish and maintain a library of contract provisions offered by packers to swine producers for the purchase of swine and to make these provisions available to the public. The swine contract library must include swine packing plants with a slaughter capacity of 100,000 swine or more per year; this includes approximately 50 plants owned by 29 packers which account for over 95 percent of the market. These 29 packers are required to provide monthly reports to GIPSA specifying the number of swine committed and the maximum number of swine to be delivered over the next six to twelve months by contract type.

GIPSA published a Notice of Proposed Rulemaking on September 5, 2000 and is drafting the final rule. In addition to the rulemaking process, GIPSA has devoted resources to implement the actual contract library, involving computer hardware and software development, and data collection forms. The library will use a Web-based system facilitating data input from swine packers and data access by the public.

The second mandate is a study directed by a Conference Report (House Report No. 106-948) for GIPSA to complete a comprehensive study on the issue of Captive Supply by September 30, 2001. As mandated, the report will examine and report on whether or not cattle that are procured pursuant to a captive supply arrangement by a packer's non-reporting subsidiary, affiliate and owners, officers and employees are being included in the percentages as captive supply. Additionally, the report will include the rationale for differences in captive supplies reported in the P&S Annual Statistical Report and those reported by other entities.

The third mandate requires the Agency to submit an annual report to Congress that assesses the cattle and hog industries. The Packers and Stockyards Act was amended in the Grain Standards and Warehouse Improvement Act of 2000 (Public Law 106-472) to require the Agency to submit an Annual Report Assessing the Cattle and Hog Industries. The report will include an assessment of the general economic state of the cattle and hog industries, changing business practices in these industries and areas of concern under the P&S Act. It is estimated that 2,000 staff hours and \$72,000 were spent in compiling this report for 2000.

The final mandate began with the General Accounting Office's (GAO) Report to Congress, issued in September 2000, "Actions Needed to Improve Investigations of Competitive Practices." The Grain Standards and Warehouse Improvement Act of 2000 (Public Law 106-472) required implementation of the recommendations in the GAO Report as well as a report describing the actions taken to improve investiga-

tions of competitive practices by November 9, 2001. The report and the actions needed to improve investigations are concomitantly moving forward.

The GAO report addressed actions to improve GIPSA's ability to investigate complex issues. The report suggests that the Secretary of Agriculture develop a team-work approach with GIPSA economists and Office of General Counsel (OGC) attorneys for complex investigations. We began implementing this recommendation a month after the September report with combined competition training for legal specialists, economists and OGC attorneys. GIPSA now has two legal specialists in each regional office. We have formalized procedures within P&S Programs by instituting investigation reviews by senior management when cases involve issues of competition, are deemed to be complex, are considered to be a large investigation, involve more than one unit (financial, competition, trade practices) in the investigation, when more than one region is involved, or when unusual amounts of resources are required. The regional attorneys review each case before they are submitted for consideration to senior management. Once senior management has reviewed each case the investigation proceeds, and each case is monitored throughout the investigation. OGC has been asked to review the investigation plans prior to commencement of the investigation and thus has been integrated into the investigative process of complex cases at their initiation.

The GAO report recommended that GIPSA improve its competitive investigations by adopting methods and guidance similar to those used by the Department of Justice (DOJ) and the Federal Trade Commission (FTC). GIPSA, working through the Department's Office of the General Counsel, is reviewing DOJ and FTC investigative procedures.

The GAO report recommended that the Secretary modify the grade structure for economists. The process of upgrading economists' and legal specialists' positions is underway and will hopefully allow GIPSA to hire and retain well-qualified individuals. We have reviewed and instituted procedures that will better use the legal expertise of our legal specialists in each regional office. The advice and critical legal review of the cases should improve the process and allow GIPSA to operate more effectively.

The GAO report also suggests that GIPSA provide industry participants and Congress with clarifications of the Agency's views on competitive activities by reporting changing business practices in the cattle and hog industries and identifying market operations or activities which raise concerns. We were mandated to provide an annual report assessing the cattle and hog industries, and to conduct a study on the issue of captive supplies. We have also taken action to hire an outreach coordinator to improve our communication with Congress and the public we serve. We also anticipate using the knowledge gained in broad-based investigations by communicating that intelligence to the industry or industries that it addresses.

In addition to the Congressional mandates, GIPSA will be participating in a GAO review initiated by Senator Daschle to examine our economic models. He has asked the GAO to "assess the extent to which these models may be understating the effects of imports, market concentration, and the use of marketing agreements and forward contracts on domestic cattle prices." Senator Daschle has also requested that GAO provide recommendations on how our models could be "improved or revised, to provide the most comprehensive analysis possible of the impact of certain factors on prices at the producer level, including: import volumes and competition; increasing use of marketing agreements and forward contracts; and increasing consolidation in the processing, wholesaling and retail distribution sectors." We fully expect GAO to review the 1996 packer concentration study, the follow-up cooperative agreements with universities that examined concentration and captive supplies, and other activities relating to concentration and captive supplies. GAO expects to complete its investigation within one year.

While working to be wholly responsive to Congressional mandates and to provide timely and insightful information to GAO, GIPSA has initiated the development of rules to help us better serve our various constituencies. The rules will support our enforcement of the Act by defining requirements needed for our investigations of violations of the Act. We are currently working on six rulemaking initiatives. They are, in priority order based on program needs and the least number of steps for completion and implementation: swine contract library, packer record keeping, contract disclosure, non-reporting of price, premiums and discounts, and string sales.

Swine Contract Library.—GIPSA is drafting a final rule for the Swine Contract Library. The proposed rule would require certain packers to file swine marketing or purchase contracts with GIPSA and would require GIPSA to publish monthly reports about available swine marketing contracts.

We hope to move all of the proposed regulations forward in the next year.

During fiscal year 2000, GIPSA amended existing scales and weighing regulations under the Act. The feed weighing regulation now includes a requirement of weighing feed whenever the weight of feed is a factor in determining payment or settlement under a livestock or poultry growing arrangement.

Mr. Chairman and members of the Committee, GIPSA teams of legal, financial, economic specialists will be addressing 8 cases scheduled for hearing, including reparations; 14 cases pending review in the Agency, and 50 cases pending review in the OGC (this number includes referrals, docketed complaints and reparations).

GIPSA will actively seek to serve the industry by: providing payment protection to livestock and poultry producers; increasing the number of competitive investigations of potential violations of the Act; pursuing voluntary corrections of violations of the Act which will likely result in livestock and poultry producers receiving additional funds; continuing to reach out to both educate and inform constituencies served by the agency of the benefits and protections offered to livestock and poultry producers; monitoring and responding rapidly to complaints of anticompetitive, unjustly discriminatory or unfair behavior in the livestock, meat and poultry industries; pursuing cooperative agreements which contribute valuable information to GIPSA's economic understanding of the industries; facing off with industry giants and expending resources to address violations of the Act; responding thoroughly and responsibly to all governmental inquiries and Congressional mandates; pursuing rulemaking which enhances GIPSA's ability investigate and litigate violations of the Act.

GIPSA'S FEDERAL GRAIN INSPECTION SERVICE

GIPSA's grain inspection program facilitates the marketing of U.S. grain and related commodities under the authority of the U.S. Grain Standards Act (USGSA) and the Agricultural Marketing Act of 1946 (AMA). GIPSA provides the market with descriptions (grades) and testing methodologies to measure the quality and quantity of grain, rice, edible beans, and related commodities; provides an array of inspection and weighing services, on a fee basis, through a unique partnership of Federal, State, and private laboratories; and ensures that the standards are applied and the weights recorded fairly and accurately. As an impartial, third-party in the market, we advance the orderly and efficient marketing and effective distribution of U.S. grain and other assigned commodities from the Nation's farms to domestic and international buyers.

For an average cost of 23 cents per metric ton of grain in fiscal year 2000, exporters received USDA export certificates from GIPSA which they used to market over \$20 billion worth of cereals and oilseeds. Likewise, here at home, buyers and handlers requested over 1.9 million domestic inspections that facilitated the trading of 128 million metric tons of cereals and oilseeds.

To date, the official grain inspection system has operated in a supply driven food chain. Grain was produced, delivered to the elevator and marketed as a commodity with limited concern about specific consumer quality preferences. Buyers relied on the grades and standards to describe the general quality needed to produce a quality product and provide the ultimate consumer with abundant and wholesome food.

Today, the need for more efficient processing and the demands of consumers are rewriting the rules. Growth in specialty grain markets and the controversy over biotechnology-derived crops are forcing the U.S. grain production and marketing system to examine how it will handle volumes of large specialty (non-commodity) products. This transition will likely result on greater reliance on contracting, alliances, vertical integration, and other coordinated mechanisms. It also will drive the industry, from producer to processor, to establish quality assurance systems to meet tougher and more demanding quality specifications while retaining, as much as possible, the inherent benefits of the current grain production, handling, and processing system.

GIPSA's role in this new and evolving marketplace involves providing reliable and practical methods to measure the end-use quality attributes of commodities and specialty products (including non-biotech-derived crops) at the earliest stage of the marketing system. The fair and orderly marketing of grain depends on all in the marketing chain having access to information on the true value of grain. GIPSA must also work with the industry from producer to processor to facilitate the development of quality assurance systems that compliment or, in some incidences reduce the frequency of, product testing while ensuring quality and capturing the benefits of the current marketing system.

The need for increased segregation in production and marketing will increase costs by hampering certain inherent economies of scales and efficiencies provided in the current commodity market. Consequently, industry members will strive to real-

ize greater internal efficiencies through such processes as e-commerce. The official inspection system must understand and respond to these market needs.

To address the greater need of providing all players in the market with the information they need to effectively market biotech and non-biotech grains, in fiscal year 2001, GIPSA opened a biotechnology reference laboratory. The lab provides standardization for the sampling, reference methodologies, and rapid tests for biotech grains. GIPSA's laboratory certifies the performance of rapid tests for the analysis of biotech events, and will accredit independent laboratories using DNA-based testing to determine the presence of modified DNA in grain. Through this laboratory, GIPSA is responding to the market's need for independent sources to verify the reliability and credibility of biotech analyses that differentiate non-biotech from biotech grains and oilseeds. This facilitates information exchange, which, in turn, decreases transaction costs and increases overall market efficiency.

During fiscal year 2001, GIPSA has been instrumental in the Department's efforts to ensure StarLink™ corn is used for only approved feed and non-food industrial uses. StarLink™, developed by Aventis CropScience, is the trade-name for corn genetically modified to be pest resistant by producing a protein called Cry9C. The Environmental Protection Agency registered StarLink™ corn for domestic feed and non-food industrial uses only. In October 2000, Aventis requested voluntary cancellation of its StarLink™ registration, after the variety was found in the human food chain.

GIPSA's biotech reference lab has validated seven rapid test kits for the analysis of Cry9C in corn. These kits are used by all segments of the grain industry to detect Cry9C in corn and to market such corn to only approved uses. We are also using this technology to provide official USDA testing and certification services for the presence of StarLink™ corn under the authority of the United States Grain Standards Act.

In the international arena, GIPSA, working with the Foreign Agricultural Service, was instrumental in developing and then updating a protocol addressing Japan's concerns with food corn imports that may contain low levels of StarLink™ corn. StarLink™ is not approved for food or feed use in Japan. The protocol provides for a practical quality assurance process to meet the Government of Japan's regulatory requirements for StarLink™ corn. The protocol provided a framework from which the industry has developed processes to meet the requirements of other importers of U.S. corn.

Finally, GIPSA is in the midst of a rulemaking undertaken to improve consumer access to information on biotechnology. GIPSA, in conjunction with the Agricultural Marketing Service, published an advance notice of proposed rulemaking (ANPR) seeking public comment on USDA's role in facilitating the marketing of grains, oilseeds, fruits, vegetables, and nuts in today's marketplace with biotech and non-biotech crops. The ANPR was published in the Federal Register on November 30, 2000, with a comment period closing February 28, 2001. In response to public requests, GIPSA reopened and extended the comment period until April 16, 2001. To date, GIPSA has received almost 2,900 comments, the majority of which call for the labeling of biotech foods.

Our efforts to respond to the market's needs for services to facilitate the marketing of biotech and non-biotech grains have been substantial. But a great deal of activity has been underway in other areas as well.

GIPSA evaluates and implements new technology in the official inspection system in response to market needs. Further, the performance of existing official inspection methods is routinely evaluated and improvements are developed as needed. Official inspection methods (including calibration equations) are made available to commercial inspection users to enhance consistency between official and commercial grain inspection results. We are in the process of implementing several types of new technology for grain inspection:

- Digital imaging is being piloted to certify the percentage of broken kernels in milled rice. This new technology could greatly improve the accuracy, consistency, and objectivity of inspection and grading. GIPSA also is using digital imaging to measure the vitreousness of Hard Red Spring and Durum wheats. Finally, we are exploring using digital imaging to help inspectors better interpret and grade difficult or unusual grain characteristics, facilitate training for inspectors, and convey to customers visual information on grain condition.
- GIPSA's work on mycotoxin analysis continues to expand. In addition to establishing aflatoxin testing and reference methods, GIPSA developed and validated a fumonisin reference method, which allowed us to initiate evaluation of fumonisin test kits for use in the official inspection system.
- We are working with the North American Export Grain Association to develop an automated grain inspection system for use at export elevators. An automated

system will provide export elevators with constantly updated grain inspection information five times faster than present manual methods, and may reduce costs to the industry and enhance GIPSA's efficiency.

- GIPSA is working with researchers from academia and the USDA Agricultural Research Service to define wheat protein quality and to develop practical, rapid methods for assessing wheat protein quality in marketing channels.
- We continue to cooperate with entities from Canada, Australia, and several European countries to develop and test a "global" near-infrared transmission (NIRT) calibration to measure the quantity of protein in wheat and barley protein testing. The calibration, based on tests of nearly 40,000 samples of wheat and barley, uses artificial neural network technology to achieve excellent accuracy for very diverse grain types.
- GIPSA is working to develop an NIRT calibration for extractable corn starch. This initiative responds to the needs of suppliers of corn to the corn wet milling industry, who require a quick method to determine the extractable starch present in corn.

GIPSA also is keeping pace with the grain industry's move from paper to e-commerce to streamline, automate, and improve business transactions. Recent advances in information technology have provided the U.S. grain marketing system with tools to provide instantaneous exchange of electronic documents and data among all parties in the trade chain. Electronic commerce companies and business-to-business ventures focused on local, regional, national, and international grain sales are emerging at a record pace, and are resulting in new alliances within the grain industry. Electronic commerce is improving market efficiency, facilitating transparent pricing, offering new price risk management tools to producers, and providing more seamless transactions.

GIPSA is keeping pace with our customers' migration toward this marketing process. We are taking part in pilot tests and demonstrations with electronic commerce vendors, and adopting the latest hardware, software, and available technology so that we are prepared to enter and participate in the electronic commerce arena. GIPSA is actively involved in developing a system to send inspection information generated at multiple locations directly to a customer. We also are prepared to submit electronic inspection information into a vendor's document handling system at the request of applicants. Finally, GIPSA also is pilot testing a computer generated inspection certificate for export cargoes. The pilot will assess global bank and importer acceptance of the new documents.

All of our efforts to improve and streamline our programs and services are paying off for our customers, both in terms of their bottom lines and in greater customer satisfaction. GIPSA's service delivery costs (adjusted for inflation), decreased from \$0.27 per metric ton in fiscal year 1994 to \$0.23 per metric ton in fiscal year 2000, saving American agriculture over \$5 million in fiscal year 2000 alone. These savings in inspection service costs pale in comparison to the savings achieved by the industry through improved productivity.

We are an integral part of America's grain handling infrastructure—a superior infrastructure of storage facilities, rail lines, and waterways that makes American agriculture preeminently successful in the global marketplace. We recognize our role and will continue to provide all members of the U.S. grain handling system with the innovative, high-quality official inspection services they need to efficiently and effectively meet the challenges of a changing marketing environment.

Our outreach and educational efforts to our international customers are maintaining strong open markets for America's grains and oilseeds. One indicator is the number of foreign complaints lodged with GIPSA regarding the quality or quantity of U.S. grain exports. In fiscal year 2000, the number of complaints from importers decreased by 35 percent from fiscal year 1999 levels. GIPSA received 13 quality and quantity complaints from importers on grains inspected under the U.S. Grain Standards Act, involving 355,853 metric tons, or about 0.3 percent by weight, of the total amount of grain exported during the year. This compares to 20 quality and 2 quantity complaints received in fiscal year 1999, representing about 1.4 percent of grain exports by weight.

In fiscal year 2000, GIPSA also responded to customers' needs for technical assistance overseas. Exporters, importers, and end users of U.S. grains and oilseeds, as well as other USDA agencies, USDA cooperator organizations, and other governments, frequently ask for GIPSA expertise, thus requiring personnel to travel overseas. Overseas activities include representing the Agency at grain marketing and grain grading seminars, meeting with foreign governments and grain industry representatives to resolve grain quality and weight discrepancies, helping other countries develop domestic grain and commodity standards and marketing infrastructures, assisting importers with quality specifications, and training local inspectors

in U.S. inspection methods and procedures. Last year, GIPSA received 19 requests for technical assistance overseas.

Our efforts to facilitate the trade of U.S. grains include direct efforts to remove trade barriers. In fiscal year 2000, GIPSA played an integral role in ensuring open markets for America's products by working with APPAMEX, a Mexican grain importers association, to address Mexican importers' grain quality concerns. GIPSA inspectors conducted two sets of seminars in Mexico to explain U.S. sampling and inspection method. In fiscal year 2001, GIPSA will hold additional seminars, conduct two monitoring experiments, and work with officials of Mexico's Ministry of Trade and Ministry of Agriculture to help develop a national inspection system in Mexico patterned after GIPSA's.

Also in fiscal year 2000, GIPSA resolved prior weight complaints from the Philippine Association of Flour Millers (PAFMIL). Thanks to a collaborative cargo monitoring program initiated by GIPSA, and the efforts of a U.S. team of government and industry representatives who reviewed the grain handling, scales, and weighing systems at each of PAFMIL's four flour mills, PAFMIL implemented various improvements to their weighing and handling systems which resolved their concerns.

Finally, GIPSA developed and implemented TCK smut certification procedures to facilitate the marketing of U.S. wheat to China and India in light of their concerns about TCK smut in imported U.S. wheat shipments. GIPSA's procedures helped enable the United States to reach a trade agreement with China.

At home, GIPSA regularly holds seminars and meetings to educate foreign visitors and customers about the quality and value of U.S. grain exports. In fiscal year 2000, GIPSA representatives met in the United States with 89 teams from 50 countries to provide information, technical guidance, and educational seminars. These international outreach efforts help promote greater harmony between U.S. and international standards, and foster a better understanding of the U.S. grain marketing system, the official U.S. grain standards, the national inspection system. This, in turn, reduces the risk of new barriers in today's open and freer global marketplace, enhances purchasers' confidence in U.S. grain, and facilitates the export of U.S. agricultural products.

The grain program will continue to work to ensure our relevance and value to American agriculture. We are reaffirming our commitment to facilitating the marketing of U.S. grain by responding to our customers' needs and providing the highest quality grain inspection and weighing services to all whom we serve.

FISCAL YEAR 2002 BUDGET REQUEST

GIPSA's budget request for fiscal year 2002 is \$32.9 million under current law for salaries and expenses and \$42.5 million for our Inspection and Weighing Services. GIPSA also is submitting legislation to collect \$3.8 million in new user fees in fiscal year 2002.

The President's fiscal year 2002 budget proposes a current law request for grain inspection of \$15.1 million. There are proposed increases of \$200,000 to support GIPSA's increased role in international trade services and trade activities, \$500,000 to develop an ISO-9000 certification program, \$100,000 to process comments on a biotechnology rule, and \$400,000 to develop and refine technology to detect the presence of biotechnology derived grain and genetic traits expressed in grain. Proposed legislation of \$3.8 million in new user fees to cover the costs of grain standardization activities also is being submitted. The budget also proposes a request of \$17.8 million for the Agency's P&S Programs. The budget includes an increase of \$756,000 for pay costs.

The \$200,000 increase would allow GIPSA to strengthen its role international trade services and activities. In the post-GATT environment of the World Trade Organization (WTO) and the North American Free Trade Agreement (NAFTA), the liberalizing trade requirements have prompted some grain and oilseed importing countries to create other barriers to limit or restrict market access. GIPSA has become increasingly involved in addressing international grain trade issues such as emerging sanitary and phytosanitary (SPS) issues and other technical barriers to trade.

Other significant international activities underway include working with our Mexican counterparts to develop a centralized grain grading system and internal quality control program similar to that used in the United States; and a bilateral exchange with China to share information and expertise on our respective grain grading systems.

Our trading partners also are beginning to formulate domestic policies on agricultural biotechnology which will have far reaching implications. In June 2000, at the request of the Foreign Agricultural Service, GIPSA took part in a four-country fact finding mission in Asia to share information on the practical implications of imple-

menting laws or regulations requiring testing and labeling of grains developed through modern biotechnology. These types of exchanges will become increasingly important as countries consider new policies to address consumers' "right to know" or perceived food safety concerns.

The requested additional funding for fiscal year 2002 will be used for salary and benefits for one additional staff person, plus travel and related expenses while on long-term temporary overseas assignments.

The \$500,000 increase is to develop an ISO-9000 certification. ISO 9000 is a quality assurance system standard established by the International Organization for Standardization (ISO). The standard establishes a quality management system that assures the quality of a service or a product through internal process controls. ISO 9000 is globally recognized and accepted as a standard designed to produce consistent and reliable quality outputs. Through documentation, training, quality control measurements, audits, and customer feedback, ISO 9000 has become an international industry standard for producing quality services and products.

The U.S. grain industry is experiencing extraordinary and rapid changes in the grain marketing structure. Bioengineering and advances in information technology serve as a catalyst for this change. New value-added products, such as high oil corn, nutritionally dense corn, etc., are emerging onto the market at exceptional rates. These new value-added products provide producers an opportunity to produce grain products at lower costs. Further, information technology advances, such as web-based marketing companies, allow the producer to deal directly with buyers.

GIPSA recognizes the changing market will place severe demands on the official grain inspection program to properly label and identify these various value-added products. In response to these demands, GIPSA believes the implementation of an ISO-9000-based program will facilitate the marketing of grains and provide producers the opportunity to enjoy financial benefits while maintaining minimal Federal involvement in the process. Therefore, GIPSA seeks funding to develop an ISO-9000 certification program where GIPSA is recognized as an ISO certifier.

GIPSA shall initiate the multi-year process to obtain full national accreditation as an ISO-9000 certifier of segmented grain industry accreditation entities. Once this goal is achieved, the American public and grain industry, in particular, will benefit from increased sales due to greater world recognition and confidence in buying U.S. grain products that are produced and marketed under the same international standards as used in the rest of the world.

On May 3, 2000, a series of initiatives was announced to strengthen the science-based regulations for biotechnology and to improve consumer access to information on biotechnology. One specific initiative calls for USDA to publish an advance notice of proposed rulemaking (ANPR) in the Federal Register to seek input from producers, consumers, industry, scientists, and other interested persons on how USDA can best facilitate the marketing of grains, oilseeds, fruits, vegetables, and nuts in a market that includes both crops derived from biotechnology and other crops. At the request of the Department, GIPSA took the lead on this initiative, and the ANPR was published on November 30, 2000.

The ANPR seeks comment in 2 broad areas: (1) current market needs and practices and the costs and benefits associated with those practices; and (2) the feasibility of and need for, USDA's involvement in quality assurance or other programs to facilitate the marketing of these products in today's evolving market place. If the majority of commentators recommend that USDA has a role to play in offering or overseeing quality assurance or other programs, GIPSA will publish a subsequent proposed rule and final rule. Publication of the proposed rule with comment period should occur in fiscal year 2001. Comment analysis and preparation of a final rule will occur in fiscal year 2002.

This rulemaking is being carried out via a web-based system for public submission and review of comments. This system provides the public with the flexibility to submit comments via the Internet, e-mail, mail, and fax. All comments received are posted to the website and are searchable.

Maintaining the web structure, and processing and analyzing numerous comments will require substantial staff commitment. The requested additional funding for fiscal year 2002 will be used for salary and benefits, maintaining the web structure, analysis of the proposed rule comments, and preparation of a final rule.

The comments may also identify a need for further studies or research prior to publishing a proposed rule. The current commodity market is evolving due to biotechnology and ready solutions may not be apparent without further study.

The budget proposes a \$400,000 increase for developing and refining technology to detect the presence of biotechnology derived grain and genetic traits expressed in grain.

Although GIPSA does not regulate biotechnology, the Agency must respond to the accelerated rate at which new crops are entering the market due to advances in biotechnology. GIPSA's role is to facilitate the marketing of grain and provide grain markets with standardized analytical procedures to better assess the value of grain for end use and pricing purposes. GIPSA will continue to provide method standards and improve the biotechnology reference center designed to assist in standardizing the analytical procedures for assessing biotechnology derived grains. The fair and orderly marketing of grain is dependent upon all in the marketing chain having access to information on the true value of grain. It is essential that GIPSA be funded with the additional resources for the program to continue. Funds will be allocated for proper staffing and purchase of advanced technology for the measurement of transgenic material in grain.

Additionally, there is a proposed decrease of \$599,000 for the development of a biotechnology reference facility. The fiscal year 2001 Appropriation included a one-time only increase of \$600,000 (less 0.22 percent rescission) for the development of a biotechnology reference facility to provide standardized methodologies and rapid assessments used to test bioengineered grains. Development and construction of the facility has been completed. The Agency started offering services during the first half of fiscal year 2001.

CONCLUSION

Mr. Chairman, this concludes my statement. I appreciate the opportunity to testify on behalf of the Grain Inspection, Packers and Stockyards Administration (GIPSA). I will be happy to answer any questions the Committee may have.

OFFICE OF THE CHIEF INFORMATION OFFICER

PREPARED STATEMENT OF IRA L. HOBBS, ACTING CHIEF INFORMATION OFFICER

Mr. Chairman and members of the Subcommittee, the Department of Agriculture appreciates this opportunity to share with you our progress, and the challenges we continue to face, as we utilize information technology—IT—resources to improve services and program delivery to the American people.

The Office of the Chief Information Officer—OCIO—provides USDA agencies with IT policy guidance and oversight, data center and telecommunications operational support services, and desktop support for the Office of the Secretary and the USDA National Appeals Division. In line with the Clinger Cohen Act, Policy, operational guidance, and oversight are provided in areas such as capital planning and investment control, information security, privacy, information technology architecture, telecommunications, information management and collection, and, most recently, electronic government.

The OCIO also manages the USDA National Information Technology Center—NITC—headquartered in Kansas City, Missouri, with a software development facility in Ft. Collins, Colorado and a support office in Washington, D.C. The NITC, with a \$52 million budget funded by USDA's Working Capital Fund, provides innovative, cost-effective and secure information technology solutions to support the specific missions of USDA's agencies. NITC also provides computer services to the Federal Aviation Administration, the General Services Administration, and other government clients on a reimbursable basis.

OCIO's goal is to enhance USDA's corporate stewardship of the information technology resources that Congress provides. OCIO is working in partnership with USDA agencies to address the challenges that all institutions face in a rapidly changing information technology environment, as well as specific issues facing USDA because of its varied missions. Over the past year, we have made measurable progress in specific areas, which I will discuss in greater detail later. They include:

- Providing effective leadership and oversight to the Department's Service Center Modernization Initiative—SCMI;
- Enhancing the security of our financial and information assets and protecting the privacy of our customers;
- Promoting the development of e-Government at USDA;
- Improving the management of the Department's telecommunications resources; and
- Strengthening the management of our human and capital IT assets.

USDA'S FISCAL YEAR 2002 INFORMATION TECHNOLOGY BUDGET SUMMARY

The Department's overall budget request for information technology in fiscal year 2002 totals almost \$1.5 billion in budget authority. This is higher than the \$1.4 billion budget for fiscal year 2001. This amount funds staff, hardware/software purchases and support, contractor services, telecommunications, and other infrastructure expenditures. Almost thirty percent of the total IT spending, approximately \$440 million, funds entitlements which are distributed to the states in support of the Food Stamp and the Women, Infants and Children programs—this includes Advanced Planning Documents and Electronic Benefits Transfer Grants to States. The IT budgets for the county-based support agencies, which include the Farm Service Agency—FSA, the Natural Resources Conservation Service—NRCS, and the Rural Development Mission Area—RD—agencies, total approximately \$370 million or 25 percent of the USDA total IT budget. The USDA Forest Service's IT budget of about \$315 million comprises another 21 percent of the Department's total. Thus 76 percent of the Department's \$1.5 billion in IT spending is spread across just three mission areas.

For fiscal year 2002, we estimate that almost forty percent of the Department's IT budget will be devoted to infrastructure and office automation in support of all program mission areas, while the remaining sixty percent will be in direct support of USDA's primary program delivery systems.

To improve the overall corporate management of USDA's IT resources, and to take advantage of economies of scale when purchasing IT products and support, OCIO has established a Department-wide IT Asset Management Team to investigate opportunities for enterprise software licensing to improve methods for managing capital asset inventories, and to develop USDA IT policy recommendations and guidelines. Through the Team's efforts during the past year, several agencies acquired ad hoc query and report generation tools and selected software using enterprise-wide licensing methods; achieving significant cost savings in the process, thereby allowing funds to be used elsewhere by the agencies. This demonstrates the possibilities for economies of scale when USDA agencies work effectively together to find common solutions. These efforts will continue and expand in the foreseeable future.

SERVICE CENTER MODERNIZATION INITIATIVE—INFORMATION TECHNOLOGY

Mr. Chairman, the Service Center Modernization Initiative remains among USDA's highest priorities. This initiative, which includes the Common Computing Environment—CCE, is a major cornerstone of our modernization and technology improvement efforts. In March 2000, the Deputy Secretary modified the OCIO's role from one of oversight only to direct management of IT resources provided by Congress for this initiative. In response, OCIO established a new structure for managing the Service Center Modernization Initiative-Information Technology—SCMI-IT. This structure relies heavily on the three partner agency chief information officers—CIOs—and interagency technical teams working with the OCIO project management staff to resolve technical issues and manage the nine projects that are crucial to the modernization. The Executive Officer of the National Food and Agriculture Council is included to maintain coordination with other SCMI activities. OCIO also moved forward to fully involve employee unions and associations and USDA conservation partners in this structure.

The scope of this initiative includes the program services of the Farm Service Agency, the Natural Resources Conservation Service, and the Rural Development Mission Area. These county-based agencies delivered about \$55 billion in farm, conservation and rural development programs and services during fiscal year 2000. These services are provided through a network of over 5600 county level offices at 2,500 co-located sites, and a field workforce of 36,000 Federal and FSA county employees working with an additional 7,000 conservation district employees and 8,000 volunteers. The CCE, together with reengineered business processes, will enable USDA customers to do business with the Department electronically, maximize data sharing between agencies, increase staff efficiencies and provide many other direct customer benefits.

When the SCMI-IT started in 1996/97, IT equipment and systems at the Service Centers consisted largely of 1980's and early 1990's technology that had been only minimally enhanced. These legacy IT systems were acquired and developed independently by each of the three Service Center agencies prior to office collocations. Collocation was implemented but the necessary funding to ensure that all IT systems could be properly integrated under a common IT infrastructure was not provided. Nor was a common management structure put into place. Instead, Service Centers had to rely on an ad-hoc assortment of separate IT systems that could often

not be connected. Telephone systems were separated, Internet access was limited, multiple word-processing and spreadsheet software packages were in use, and data transmission capabilities were limited. This “stove-piping” of systems prohibited information sharing among agencies, employees and customers, and had a direct impact on the service that employees could deliver to customers.

From fiscal year 1997-fiscal year 2000, significant progress was made in addressing portions of the “stove-pipe” technology issue. An initial shared telecommunications system was installed; about 35,000 identical workstations with common office automation software and over 7,500 shareable printers were acquired, as were a small number of other devices such as digital cameras, scanners and Global Positioning System—GPS—units. Additionally, FSA acquired a legacy system connectivity solution. More recently, progress has been made in the following key areas:

- The OCIO Project Management Office working with the Service Center agencies facilitated the development of an integrated operating budget for fiscal year 2001 SCMI-IT activities. The process included the identification of specific activities for each of nine SCMI-IT teams, prioritization of each activity, development of alternatives and presentation and justification to decision makers.
- USDA communicated an overall plan for SCMI-IT in a new document entitled “Service Center Modernization Initiative—Information Technology Blueprint.” The Blueprint provides a clear vision and plan for the IT component of the SCMI. It describes what is being done, why it is being done and how the SCMI-IT will benefit employees and customers.
- In November 2000, OCIO awarded a contract for network servers for state and field offices of the county-based agencies. The network servers are a linchpin of the CCE and will tie together the nearly 35,000 CCE workstations that have been purchased over the past two years. The servers enable us to manage these workstations from a central location, provide a common e-mail and messaging system, support initial reengineered processes, and provide additional security and remote management tools.
- To meet the initial requirements of the Freedom to E-file Act and the Government Paperwork Elimination Act—GPEA, two e-Government mandates which require online access to farm and other programs by June 2002 and October 2003 respectively, USDA invested \$1.3 million in fiscal year 2000 in the Electronic Access Initiative (EAI). The EAI is designed to establish the technological infrastructure needed to support the first phase of providing electronic access for customers. Three mirror image Web farms were put in place during the first quarter of fiscal year 2001. A comprehensive security plan was also developed to guide the implementation activities to ensure safe, secure and reliable access. This infrastructure was used by the agencies to make 52 agency forms available on-line by December 18, 2000, in order to meet the initial requirements of the Freedom to E-File legislation. Currently, over 200 of the Service Center agencies’ most widely used forms are now available for farmers and rural customers to access and download via the Internet. Additional forms are being added as they are converted and cleared through the Office of Management and Budget—OMB.

Major activities this calendar year include the deployment of the network servers that were procured in the first quarter. Also, an additional \$2 million capital investment is planned for the EAI this year: about \$1 million to build the basic infrastructure capacity and \$1 million for digital signature and other security-related solutions necessary to implement the phased requirements of the Freedom to E-File legislation. Other initiatives include updating integrated project plans; continuing to strengthen overall project management; finalization of all CCE architecture components; continued upgrading of CCE workstations; providing adequate training for Service Center employees; and upgrading of the Geographical Information Systems strategy for Service Center agencies.

One of the major challenges remaining for SCMI-IT is to ensure that affordable telecommunications capacity is available for rapidly expanding online services. The Freedom to E-File Act, GPEA, and the movement of the agencies to more Web based applications are increasing the required telecommunications “pipe size” or “bandwidth”. The SCMI-IT Telecommunications team is developing a strategic telecommunications plan that identifies current and future bandwidth requirements and pilot tests technical alternatives, such as virtual private networks and satellite communications, to meet these requirements.

The SCMI-IT Security Team is also developing a comprehensive security assessment and plan for the full CCE environment. The plan will identify security problems and risks and the actions needed to address the risks. Additionally, security monitoring and audit tools will be acquired, and a security response team will be established and trained over the remainder of fiscal year 2001.

Two significant and positive changes that have facilitated progress in the CCE initiative were (1) OCIO's increased management role over the IT portion of SCMI and (2) the new direct appropriations that Congress provided for CCE capital investments.

By the end of this calendar year, all SCMI agencies' employees should have access to modern and compatible workstations, the agencies will be on a common robust e-mail system, agencies will be able to electronically share information among themselves and with customers and fully utilize the Internet, and they will be able to reduce the technology administration burden on the field through central remote management of the systems.

Your continued support of this effort is essential for completion of the CCE and the timely high-quality program services it will bring to USDA customers. For fiscal year 2002, \$59.4 million, the same as the fiscal year 2001 appropriation, is requested to continue the CCE implementation. These funds will be used to:

- Upgrade the telecommunications capacity to support e-Government and Web based internal applications—\$15 million;
- Acquire and deploy large capacity applications servers needed to implement geographic information system—GIS—applications—\$32.4 million;
- Purchase long term GIS software licenses for all Service Center agencies—\$5.0 million;
- Complete the EAI Web farm initiative—\$1.0 million;
- Provide training in the technologies—\$3.0 million;
- Support technical architecture, project operations, and computer security improvements—\$3.0 million.

The fiscal year 2002 investments will complete the major server and software components of the CCE.

As you know, the President's fiscal year 2002 budget mentions that USDA will merge the IT staff of the three county-based service center agencies into one IT service organization. To properly operate and maintain the new shared CCE technology, we believe common support is both logical and necessary. The details of how to establish this IT support have not been worked out. As we look at options for providing this support we will work with Congress and other appropriate parties.

COMPUTER (CYBER) SYSTEMS SECURITY

We are also continuing to focus on cyber-security. We appreciate the funding which the Congress made available in the OCIO fiscal year 2000 and fiscal year 2001 appropriations to strengthen our Cyber-Security program. With these funds, we have started to build a modern cyber-security program equipped with the staff expertise and management to identify and address security vulnerabilities across the Department's many different agencies, platforms, and networks. Given the pervasive and growing nature of the cyber-security threat to all organizations, we will continue to implement the cyber-security plan we developed in August 1999. The fiscal year 2002 budget request maintains funding for the Cyber-Security program at \$4.5 million.

As we have noted in past testimony, the information that USDA agencies manage affects both the financial markets and lives of individuals. The National Finance Center—NFC—in New Orleans processes payroll and administers the Thrift Savings Plan for Federal employees. Rural Development's loan portfolio exceeds \$80 billion. The data collected by the National Agricultural Statistical Service—NASS—is vital to the health of our nation's financial markets. Our systems have personal and financial information on millions of customers and on each of our employees. Even more, USDA is increasingly using the Internet to provide customers information about programs and services, and will eventually use it to empower them to transact business with the Department online. With annual payments totaling billions of dollars, we must take prompt and comprehensive action to mitigate what is now an unacceptable high risk of data and potential financial losses.

To implement the Security Action Plan, OCIO has been systematically building a USDA Cyber-Security Program. To lead this program, an Associate CIO for Cyber-Security was appointed in March 2000. Along with acquiring staff and contractor expertise, the OCIO Cyber-Security program has actively engaged USDA's agencies in identifying and addressing urgent weaknesses in policies and procedures, training, day-to-day network management, and monitoring and reporting while developing more detailed implementation plans. In addition, an advisory council consisting of senior executive program officials and IT personnel from across the Department has now officially been chartered to provide broad input into all aspects of cyber-security program and policy development and implementation.

Over the past year, important progress has been made in several areas. For example, the Cyber-Security program is:

- Continuing to obtain staff expertise to supplement resources already on board. Specialists in Physical Security, Configuration Management, and Access Control have recently been hired. These specialists have already begun to conduct oversight activities, while also providing hands on problem solving, training, and promoting awareness in these specialties. Staff soon to be on board will include two Security Engineers, Telecommunications Specialists, and Security Specialists, as well as an Information Survivability Manager, a Policy Analyst, and a Privacy Analyst.
- Working closely with the USDA agency IT community to revise existing security policies and procedures, draft new ones, and develop implementation plans to mitigate problems and systematically improve security practices. These include policies on firewalls, reporting, configuration management, unauthorized access, and others.
- Providing training for USDA security personnel to implement the Department's revised security policies, share best practices, and to address specific problems as they arise continues to be a critical activity for the Cyber-Security program. Training has been conducted in areas such as configuration management, incident response, risk assessment, risk analysis, and Disaster Recovery and Contingency Planning.
- Conducting onsite reviews at critical facilities, including the National Finance Center and the National Information Technology Center. The reviews are designed to determine if security measures, both in place and planned, are adequate to protect the integrity, availability and safety of information resources.
- Making risk assessments an integral part of USDA's security program by using industry expertise to develop comprehensive methodologies that will provide agencies with standardized tools and techniques for performing assessments.
- Employing contract expertise to assist with the definition of USDA security architecture requirements, establishment of the Department's security baseline and the development of a security architecture methodology.

These activities, as well as the policy changes noted before, have already yielded noticeable results. Through implementing the technical and procedural changes mandated by the firewall and server guidance, the Department has in effect started the process of "tightening" its networks and "hardening" its computers so they are less susceptible to intrusion and exploitation. USDA has changed its approach to cyber-security management and operation. Instead of permitting all electronic data and flows to enter our networks and run on our systems, we now permit access only to authorized services related to USDA business needs. This represents a fundamental, 180-degree paradigm shift in USDA's computer security framework.

These initiatives are focused on strengthening information security management at the corporate level. However, while we strengthen the Department's perimeter, individual agencies are also deploying a wide range of security mechanisms. These are critical, as the Department is only as secure as its weakest link. The NFC, the NASS, the Agricultural Marketing Service, and other agencies are continuing to protect the valuable information assets that they manage by deploying firewalls, intrusion detection systems, and public key infrastructures.

Each of these agency-specific efforts is important; however, I must reiterate that USDA is only as secure as its weakest link. When fully implemented, the plan we have developed will ensure that USDA implements comprehensive security practices, while increasing our ability to materially enhance our security in an environment where the challenges will continue to grow exponentially.

E-GOVERNMENT

Strengthening cyber-security is even more critical as the Department increasingly makes programs and services available online in response to public expectations, and legislative and Administration mandates. In addition, GPEA, the Freedom to E-file Act, the Office of Management and Budget—OMB—Performance Goals and Management Initiatives for the fiscal year 2002 Budget, and other mandates all stress the President's vision of a government that has a citizen-based focus, is results-oriented, and, where practicable, market-driven. OMB notes that expanding the application of online procurement and other e-Government services and information is one of five major reform initiatives highlighted by the President.

E-Government represents a fundamental change in the way USDA agencies deliver programs and services, as well as how we process administrative functions. Most USDA agencies are continuing to expand the amount of information available to customers and employees online. During the past year the county-based agencies,

working with OCIO, agreed upon and began implementing a common Web farm infrastructure to forge a more consistent approach to placing farm programs online. Other important applications, for instance are the export/import licenses managed by the Animal and Plant Health Inspection Service, and financial disclosure forms that some USDA employees are required to complete, are also now available online.

Notwithstanding these and other successes, coordinating and directing this process across the Department presents significant challenges for USDA's programmatic leaders, as well as the information technology community. In most cases, the host of Web sites run by USDA agencies are supported by scores of servers, and other technology, which is decentralized and often redundant across agencies. Web enabled applications are often developed without adequate consideration of the impact on the Department's telecommunications network, and in an environment where we cannot effectively leverage each agency's initiatives across the Department. More efforts need to be made to share solutions and best practices across agencies.

In addition to improving coordination across USDA, program and IT leaders are faced with other critical challenges. These include:

- Managing the change to e-Government while maintaining existing program models;
- Prioritizing e-Government initiatives;
- Reengineering USDA's business processes to be customer-centered and optimized for the Internet;
- Funding e-Government initiatives within existing budgets; and
- Building a secure, reliable, technical infrastructure capable of delivering programs and information 24 hours a day, 7 days a week, 365 days a year.

The Department has taken initial steps towards developing a coordinated management framework to guide USDA's transition to electronic government. The Chief Information Officer has been charged with coordinating Department-wide e-Government planning and implementation. A senior management position, the e-Business Executive, was established within the OCIO to lead the effort. Further, each mission area has appointed a Senior Executive Program Leader to serve on an Executive e-Government Council and work with the e-Business Executive to develop plans to implement GPEA, Freedom to E-file and other e-Government initiatives. USDA's initial GPEA plans were submitted to OMB on October 31, 2000. The Executive Council will develop and articulate USDA's corporate vision for e-Government and be responsible for the ongoing planning and implementation of e-Government initiatives. Key tasks for implementing e-Government at USDA include:

- Developing a Department-wide strategy and standards, and determining baselines and performance metrics, as required by Presidential Memorandum, to move towards a digital Department;
- Identifying innovative e-Government and e-Business applications within the private sector and other federal agencies, and sharing best practices with USDA agencies, focusing on mitigating risks;
- Ensuring that USDA's e-Government initiatives meet customer needs through outreach and other customer assessment initiatives;
- Analyzing e-Government applications within USDA agencies, determining where possible linkages exist, and, where practical, leveraging successes across the Department;
- Improving coordination and developing standardized approaches to cross-cutting issues, including: use of the Internet, Intranet, and Extranet, data warehousing, data mining, electronic mail and other electronic directories, online forms, privacy, and training our IT staff to integrate Web-based applications into the Department's technical infrastructure; and
- Working with state and local partners, and other agencies, to develop applications that utilize the Internet to actually conduct e-Business from a customer-centric perspective.

These tasks will demand a tremendous amount of time and resources from USDA agencies. The Department is developing a corporate strategy for e-Government to ensure that we maximize the resources that are being devoted to this effort. In this effort, our emphasis is on leveraging solutions and capitalizing on lessons learned across USDA.

ENTERPRISE NETWORK INITIATIVE

The diverse set of programs that USDA supports require substantial telecommunications resources. As noted earlier, the Service Center modernization efforts, and especially e-Government initiatives, are also rapidly creating additional requirements for the increased bandwidth services and telecommunications equipment necessary to operate effectively and securely in an online environment.

The Department's telecommunications networks can be compared to the nation's highway system. Many local and State roads and highways feed into the Interstate system—an enterprise network of sorts that allows high volume traffic to flow across the country. The enterprise telecommunications backbone consists of a corporate network (interstate highway) with feeder networks (primary and secondary roads) managed at the agency level.

Our vision is to develop a modern and efficient enterprise/corporate network. During the past year, the Department forged a significant agreement towards realizing this vision. For the first time, and after considerable effort by OCIO, several USDA agency Chief Information Officers (including those serving the county-based agencies, the food and nutrition programs, and the Forest Service) have agreed to and signed off on the fundamental vision for developing and operating a shared corporate telecommunications network consistent with the Department's integrated information technology architecture. As envisioned, the Universal Telecommunications Network (UTN) will provide:

- a robust corporate telecommunications network that meets agency/Department business requirements;
- a stable technical architecture which efficiently integrates telecommunications and security components and is flexible to changes in requirements;
- cost-effective, secure, and reliable services twenty-four hours a day, seven days a week (24x7);
- the full range of network management functions (i.e., network coordination and monitoring, and fault, performance, accounting, configuration, and security management); and,
- Service Level Agreements (SLAs) to ensure that services are delivered consistent with mutually agreed-upon performance metrics.

The collective endorsement of the UTN is a significant milestone towards our ongoing efforts to improve management of USDA's telecommunications networks. The UTN will allow USDA to take advantage of economies of scale and provide the potential to acquire best value telecommunications services by maximizing our collective buying power. This includes obtaining the lowest possible price to design and deploy new telecommunications technology across the Department.

STRENGTHENING INFORMATION TECHNOLOGY MANAGEMENT

Also critical to our ability to improve management of USDA's information technology resources are our ongoing efforts to utilize capital planning and investment controls, establish our architecture, and implement other aspects of the Clinger-Cohen Act. These will continue to be high priority activities for us in fiscal year 2002.

The Capital Planning Investment and Control or CPIC process is key to our capacity to strengthen the corporate management of the Department's IT resources. The goal of CPIC is to help agencies better plan for, acquire, and implement information systems to improve their operating performance. CPIC permits the Department to make more informed and intelligent investment decisions regarding IT capital acquisitions. Through USDA's Capital Planning Process, the Executive Information Technology Investment Review Board—EITIRB, which is chaired by the Deputy Secretary, reviews, monitors and approves the Department-wide information technology investments in support of USDA business objectives. The EITIRB's review ensures that the Department's major IT investments are fully aligned with its business processes and architecture, and that the corporate impacts of these investments have been fully considered.

Major capital investments in the Department's fiscal year 2002 IT investment portfolio continue to include: the Service Center Modernization Initiative; the Forest Service 615 Project, which has replaced old Data General hardware and software throughout the agency; and the ongoing deployment of the Foundation Financial Information System, the core accounting software designed to consolidate over 100 separate financial reporting systems and help USDA conform to the requirements of the Federal Financial Manager's Integrity Act.

The CPIC procedure for major systems is supplemented by a moratorium on all "significant" IT acquisitions that has been in place since November 12, 1996. No significant IT acquisitions are to be made unless the CIO issues a waiver from the moratorium. Since the beginning of the moratorium, more than 700 acquisitions have been approved through this waiver process.

USDA has also standardized the means by which project managers report information on investments. All USDA agencies are using the Information Technology Investment Portfolio System (I-TIPS), an enterprise-wide, automated system for inventorying, documenting, prioritizing, tracking and evaluating potential IT invest-

ments. USDA's entire IT portfolio—comprising approximately 600 investments—is currently in I-TIPS. With I-TIPS in place, USDA agencies now have a convenient tool for capturing baseline information and tracking current updates on projects' costs, schedules, risks and benefits.

USDA ARCHITECTURE

In September 2000, USDA issued Version 2 of its “USDA Enterprise Architecture”—EA, which provides the vision, principles, standards, concepts, methods, and governance framework for an enterprise-centric approach for information and information technology architecture. EA Version 2:

- Contains a high-level description of USDA's current enterprise architecture;
- Establishes a future architecture direction that supports USDA's vision of electronic government;
- Lays out the concepts underlying the implementation of the EA;
- Sets forth principles and technical standards guiding future investments; and
- Documents the transition to a more enterprise-centric environment through an established governance system that will guide the EA implementation process.

WORKFORCE PLANNING

Last, but perhaps most important, is the issue of workforce planning. Effectively managing its IT resources requires USDA and other Federal departments to recruit and retain highly skilled information technology employees trained in Federal IT management. We also face the challenge of competing with the private sector to recruit and retain skilled IT professionals. Towards this end, we are working with USDA's human resources community to implement a professional development strategy that includes the recruitment and retention of IT professionals across the Department.

In November 2000, OCIO released a comprehensive report, Analysis of USDA's IT Workforce, which was presented to the USDA community. The report analyzed the seven major IT job series represented in the USDA workforce from 1996 to 2000. It used computer modeling based on various assumptions about future hiring and retirement patterns to forecast workforce trends through 2005. The report concluded that USDA faces the following three major IT workforce challenges: 1) growing retirement eligibility, 2) high turnover rates at lower grade levels, and 3) rising average grade levels, leading to a reduced number of employees in the IT developmental pipeline.

To develop strategies to address these issues, OCIO, together with the USDA Office of Human Resources Management, is overseeing the Department-wide IT-Human Resources—HR—Workforce Planning and Development Working Group. The working group is comprised of HR and IT specialists from various agencies. They are focusing on major hurdles identified by the agencies such as pay differentials between government and private industry, the need for stronger IT management by IT and non-IT managers throughout the Department, more IT training opportunities within the Department, the need for a more thorough exit interview process, institution of retention bonuses such as transport incentives, and the need for closer IT-HR collaboration in order to improve the recruitment and retention of IT personnel. The Group serves a critical role in the Department-wide development and implementation of IT skills assessments and training delivery.

OCIO also continues to play an active role in addressing IT workforce issues at the Federal level. I serve as co-chair of the Federal CIO Council IT Workforce Committee. This has resulted in a very active and visible role for USDA in the government's IT workforce improvement agenda. USDA's staff is particularly involved in two of the Committee's major agenda items, government-wide implementation of the Clinger-Cohen core competencies and implementation of recommendations cited in the CIO Council's report, Meeting the Federal IT Workforce Challenge (June, 1999).

USDA is also engaged in successful collaboration and partnership with the Office of Personnel Management—OPM, a necessary step for improving the Department's IT workforce. Two USDA agencies are participating in OPM's ongoing IT jobs pilot program, which uses a competency-based approach to human resources management. USDA has also supported the following OPM activities: revision of the classification and qualification standards for IT occupations, development of new IT parenthetical specialty titles, and contracting with the National Academy of Public Administration to conduct a Comparative Study of IT Pay Systems, which will make recommendations on how the federal government can better compete for IT talent. Additionally, USDA supported OPM in its approval of a government-wide special salary rate for certain IT employees that went into effect in January 2001.

CONCLUSION

Mr. Chairman, members of the Committee, the Department of Agriculture faces critical challenges as it transitions into this new e-Government era of providing services to our customers online. To meet these challenges, we are strengthening our Cyber-Security program to better protect our growing information assets; we are designing a telecommunications network capable of supporting the increased online demands we all expect; and we are coordinating a Department-wide e-Government effort to ensure customers and staff can easily access and use these new Internet-based services.

We are also focusing on the Service Center Modernization Initiative, which will bring USDA's county offices into the 21st century while reducing the burden on our customers. The Common Computing Environment is key to effectively modernizing the services we deliver to farmers, ranchers, and other customers of our county-based agencies. This effort continues to be among the Department's highest information technology priorities.

Finally, by strengthening the overall management of USDA's IT resources through our maturing capital planning investment and control process and our IT workforce initiatives, we are well on our way to realizing the benefits envisioned in the Clinger-Cohen Act.

We ask for your support for these initiatives, and look forward to working with you in the Congress to achieve these important objectives.

DEPARTMENTAL ADMINISTRATIONPREPARED STATEMENT OF PAUL W. FIDDICK, ASSISTANT SECRETARY FOR
ADMINISTRATION

Mr. Chairman and members of the Subcommittee, I want to thank you for the opportunity to submit this statement supporting the President's budget proposal for fiscal year 2002 for USDA Departmental Administration. As you are aware, Departmental Administration takes in a wide range of activities and responsibilities. Our mission is to provide leadership in administrative areas and to provide those services that make the farm and other programs of the Department work better. Today, I want to report to you on some of our activities over the last year and indicate some of the administrative challenges facing the Department.

CIVIL RIGHTS

The Office of Civil Rights provides overall leadership and direction to USDA agencies to ensure enforcement and compliance with civil rights laws, rules and regulations in employment and program delivery; and to ensure that all USDA customers and employees are treated fairly with dignity and respect. Where necessary, the Office of Civil Rights (CR) mandates corrective action to make sure these standards are maintained.

Major activities include policy development, education and technical assistance, analysis and evaluation of USDA programs and activities to ensure equal access and participation, and resolution of employment and program discrimination complaints.

Civil Rights Impact Analyses have been conducted on 100 percent of new and revised significant USDA regulations to ensure that USDA program policies and procedures comply with applicable statutes and regulations.

As of March 2001, a total of 85,061 USDA employees had completed civil rights training since January 1, 2000. The training was made available in both Spanish and English, and in alternative formats such as large print and Braille. Fifty-four percent of the trainees completed the training online, the first effort of this magnitude in the Federal Government. Beginning in summer 2000, diversity training has been provided for managers and supervisors in the Washington, D.C. area. Training will be completed in May 2001. In addition, training is being provided as a result of recommendations from several USDA employee listening sessions in the summer of 2000 to train all USDA managers and supervisors on employment-related areas including conflict management and effective communication with employees.

With regard to complaints processing, of the 1,088 program complaints in the backlog as of January 1997, all but two cases have been resolved. During the period of October 1999 to January 31, 2001, the number of open program discrimination complaints was reduced from 1,248 to 508, a 60 percent reduction. During that same period, the average processing time for program cases was reduced by 12 days.

An analysis of employment complaint filing trends in the current USDA employment caseload shows that a substantial number of the complaints were filed by a few employees who file multiple complaints. Of the 1,870 employment cases being processed as of January 31, 2001, 749 were filed by just 235 employees. These numbers show that two-tenths of one percent of USDA's workforce accounts for 40 percent of all employment complaints in the system. USDA is using several methods to resolve and reduce the number of discrimination complaints: early intervention, mediation, and various alternative dispute resolution methods.

OUTREACH

During fiscal year 2001, Office of Outreach's priority is to identify a measure for minority participation in USDA programs and identify effective outreach measures. Using agency outreach plans and census data, barriers to participation of underserved groups and the means to overcome the barriers will be identified.

The Outreach for Socially Disadvantaged Farmers grants ("2501" Program) provides training and technical assistance to underserved groups of farmers and ranchers. The President's Budget requests that the program be maintained at the fiscal year 2001 appropriated level of \$3 million.

SMALL AND DISADVANTAGED BUSINESS UTILIZATION

During fiscal year 2000, the Office of Small and Disadvantaged Business Utilization (OSDBU), cosponsored with USDA's Rural Business-Cooperative Service and the University of Nebraska, a symposium on "Innovative Strategies for Small and Limited Resource Agricultural Producers." This symposium brought together a number of the nation's leading figures in small farm innovations and as a result of the symposium, several of the participants initiated projects in future agriculture and food systems.

Also in fiscal year 2000, OSDBU led two projects addressing small business capabilities and barriers to dealing with e-Commerce and e-Government for Native American and Hispanic-owned businesses. Iowa State University is currently conducting a survey of Native American business in the twelve states in the North Central Plains; and Southwest Texas State University is surveying Hispanic businesses on a nationwide basis. The results of these studies will be used to help direct effective USDA-sponsored technical and other program assistance to these groups.

During fiscal year 2001, OSDBU has also been working collaboratively with the Department's Rural Development agencies, the Agricultural Marketing Service, the Farm Service Agency, and the Department of Defense (DOD) to develop a USDA Mentor-Protégé Program based on the DOD model. The proposed program would provide incentives for USDA prime contractors in food manufacturing to help small disadvantaged businesses and women-owned small businesses develop technical and business capabilities.

CONFLICT PREVENTION AND RESOLUTION

Since 1998, the Conflict Prevention and Resolution Center has led the Department's conflict prevention and resolution activities, focusing especially on the use of Alternative Dispute Resolution (ADR). This office has provided agencies with guidance and assistance that has led to the development of new ADR programs and expansion and improvement of others. In fiscal year 2000, an ADR policy was established that encouraged the use of ADR in workplace and program disputes. There was a 40 per cent increase in the use of ADR to resolve workplace disputes over fiscal year 1999. Also in fiscal year 2000, a video was created to help employees understand mediation, and the first-ever National Mediator Training Conference was held for employees who mediate workplace disputes. The Center developed a model conflict management-training package, and trained managers in Departmental Administration.

In fiscal year 2001, Departmental Administration will issue new policy for using ADR to resolve disputes in the EEO complaint process, and will expand its ADR policy for other types of disputes. The Center and the Office of Civil Rights are working collaboratively to ensure that ADR is more widely used to resolve EEO complaints. Also, a Guide explaining the many options available to employees to resolve workplace conflict has been published and is being distributed to USDA employees nationwide. The Center will be actively promoting greater use of ADR and other collaborative processes to resolve program disputes, and will continue to promote conflict management and ADR training for employees and managers. Finally, the Center is developing a tracking system to monitor conflict prevention and resolution activity.

CRISIS PLANNING AND MANAGEMENT

In October 1998, the Department was directed to develop contingency plans to ensure the continuity of operations during a full range of potential emergencies, including the potential for terrorist use of weapons of mass destruction. Departmental Administration was assigned the lead responsibility for the development of the USDA Headquarters Continuity of Operations (COOP) Plan. It covers the essential functions of USDA agencies located in 18 buildings in the National Capital Region, and includes provisions for: lines of succession; emergency delegations of authority, where permissible and in accordance with law; the safekeeping of vital resources, facilities, and records; emergency acquisition of resources to reestablish essential functions; and the identification of emergency relocation sites.

Three exercises were conducted in the late summer and early fall of 1999 to test and fine-tune the COOP Plan. Throughout fiscal year 2000 we continued these efforts by conducting a formal assessment with FEMA; adding a Family Assistance annex to assist USDA employees in better preparing for a COOP emergency; and updating COOP emergency relocation site planning. In fiscal year 2000, we also prepared for the Y2K Millennium rollover and assisted in the disaster response and recovery efforts resulting from Hurricane Floyd.

In December 2000, the Office of Crisis Planning and Management (OCPM) was created. In addition to its other functions, OCPM coordinates activities among USDA agencies and other Federal entities in response to potential domestic outbreak of foreign animal diseases.

FEDERAL EXCESS PERSONAL PROPERTY PROGRAM

Section 923 of the Federal Agriculture Improvement and Reform Act (FAIR) of 1996, authorized the Secretary of Agriculture to acquire and transfer excess Federal personal property to any of the 1994 Tribal Institutions, Hispanic-Serving Institutions, and the 1890 colleges and universities, including Tuskegee University. In fiscal year 2000, the Office of Procurement and Property Management (OPPM) transferred \$3.2 million worth of personal property under the program, bringing the total to greater than \$7.7 million since the program began in fiscal year 1999. This program provides much needed property and equipment to institutions that otherwise would not be able to acquire property due to limited funds and will improve the institutions' capability in the areas of research, educational, technical, and scientific activities.

In May 2000, OPPM also published a Federal Excess Personal Property handbook that was distributed to eligible Institutions to provide a clear understanding of how the program works, what it takes to get started, and key points of contact. This handbook is also available on the Internet. We continue our efforts to inform the eligible institutions on this program.

BIOBASED PRODUCTS AND BIOENERGY

The Department's support and promotion of biobased products and bioenergy in fiscal year 2000 resulted in an estimated 100,000 gallons of biodiesel fuel being used in USDA vehicles and equipment. The Agricultural Research Service Center in Beltsville, Maryland has taken the lead in biodiesel use. This winter, a biodiesel heating oil blend was used to heat twelve buildings at the site on a demonstration basis.

Based on USDA's experience, other Federal agencies such as the Department of Energy and the Department of Interior's National Park Service, have begun purchasing biodiesel for their fleets as part of the overall federal petroleum reduction strategy.

PROCUREMENT POLICY

During fiscal year 2001, USDA will be implementing FedBizOpps to electronically advertise our contracting opportunities and furnish solicitation copies via the Internet and will work to increase the use of Performance Based Service Contracting (PBSC). In fiscal year 2000, use of PBSC contracts increased slightly, but much more needs to be done. We are setting a very ambitious target for fiscal year 2002 and developing a strategic plan to deal with the barriers to increasing PBSC contract use.

HUMAN RESOURCES MANAGEMENT

The Office of Human Resources Management (OHRM) is providing leadership and oversight for the workforce planning process by providing assistance to attract, develop, and retain the quality and representative workforce USDA agencies and staff

offices need to accomplish their missions. Workforce planning is critical for the effective and efficient use of human resources to ensure optimal alignment with the budget and program planning processes.

Downsizing has resulted in serious skills mix issues, an aging workforce, and training deficiencies in the Federal workforce. As a result, the General Accounting Office has recently put human capital management on the list of Federal programs and operations that it considers to be "high risk." That designation, coupled with the very real challenges that USDA and other agencies face in rebuilding talented workforces after several years of downsizing, should result in much greater emphasis on workforce planning, recruitment and retention strategies, and succession planning.

As USDA agency workforces decline and the demand for workplace personnel flexibility increases, it will be imperative that we be able to track and manage human resources management information. The current personnel systems cannot meet the future needs of workforce management. To bring this capability up to the level needed to support critical program missions, we are working to replace the outdated administrative systems with systems based on newer technology.

OPM has changed its regulations governing performance appraisal in the Senior Executive Service. These changes include the incorporation of balanced measures in evaluating executive performance. USDA is required to evaluate executive performance starting in October 2001 using measures that balance organizational results with customer satisfaction, employee perspectives and other measures that are appropriate. OHRM has established a departmentwide task group that will develop a plan to implement the requirements and draft a new SES performance plan that incorporates balanced measures.

GOVERNMENT ETHICS PROGRAM

The Office of Ethics will enter its third year commencing in fiscal year 2002. It has quickly established itself to service directly all non-career appointees and all senior executive throughout the Department and to provide ethics policy and training for all USDA staff. In order to reach all USDA staff, stationed all over the world, the office employed an Internet Web Site as its principal tool for training and financial disclosure reporting. The success of this approach has attracted many other Federal Departments and Agencies also to employ the USDA ethics web site as their vehicle for training and reporting. This informal and gratis cross servicing has saved many thousands of dollars in what would be duplicative development work within the Executive Branch.

AGRICULTURE BUILDINGS AND FACILITIES

The Fiscal Year 2002 Budget requests \$188 million for Agriculture Buildings and Facilities and Rental Payments. This amount includes an increase of \$5 million for rental payments to the General Services Administration and continues to fund renovation of the South Building. The building is 10 years older than the Pentagon and is in dire need of repair and renovation to make it safe, efficient, and functional. The required renovation work includes fire protection systems, abatement of hazardous materials, and replacement of over-aged and inefficient utility systems. Phase 1 of the renovation is complete and Wing 3 has been reoccupied. We are expecting to begin Phase 2 construction later this year and complete the detailed design of Phase 3 so that construction contracts will be ready for procurement in fiscal year 2002.

HAZARDOUS MATERIALS MANAGEMENT

The Hazardous Materials Management Program is needed to meet USDA compliance responsibilities under the Comprehensive Environmental Response, Compensation and Liability Act, the Resource Conservation and Recovery Act, and related state and local laws and regulations and to meet the USDA goal of completion of all cleanup actions by the year 2045. Activities supported by this program contribute directly to USDA's strategic goal of maintaining and enhancing the Nation's natural resources and environment.

We must cleanup and restore lands and facilities currently and formerly under USDA jurisdiction, custody, and control and ensure responsible management in the use, storage, and disposal of hazardous materials and waste. USDA cleaned up 29 sites in fiscal year 2000, plans to cleanup 61 sites in fiscal year 2001, and since 1987, has cleaned up over 2,200 sites resulting from USDA activities or activities attributed to non-USDA parties. However, the cleanup of environmentally damaged sites is becoming more challenging as the smaller, less complex sites have already been dealt with.

DIRECT APPROPRIATION

For the direct Departmental Administration appropriation, the Budget requests \$37 million. This amount is \$1 million above the fiscal year 2001 appropriation level providing for the mandatory pay cost increases. The increase is needed in this relatively small organization to avoid the erosion of critical operational and support capabilities.

CONCLUSION

Mr. Chairman and members of the Subcommittee, this concludes my statement on the Departmental Administration budget for fiscal year 2002. I want to reiterate our appreciation for the strong support which this Subcommittee has given us.

RURAL HOUSING SERVICE

PREPARED STATEMENT OF JAMES C. ALSOP, ACTING ADMINISTRATOR

Mr. Chairman and members of the Committee, thank you for this opportunity to testify on the Rural Housing Service's fiscal year 2002 Budget Proposal.

The Department of Agriculture's Rural Housing Service (RHS) assists rural America in a variety of ways. Our loan and grant programs promote healthy rural communities by helping to provide decent and affordable housing as well as essential community services, such as fire protection, health care centers, and childcare centers. Through partnerships with the private, public, and nonprofit sectors, RHS provides financial and technical assistance to low-income families and rural communities. RHS helps those who do not have effective access to credit because of the isolated nature or small scale of rural markets. We also provide credit to low-income families and communities that otherwise could not afford mortgage or other debt service payments.

With the \$5.8 billion program funding for fiscal year 2002, RHS will provide assistance to more than 67,000 households for single-family housing homeownership or repairs, construct more than 5,200 new rental-housing units, and provide rental assistance to more than 42,000 very low-income rural renters. Additionally, the fiscal year 2002 budget will provide support for more than 170 new or improved health care facilities, more than 150 new or improved fire and rescue facilities, and more than 80 new or improved childcare facilities. It also will create or preserve more than 40,000 jobs in rural America and serve more than 13 million rural Americans.

In this era of unprecedented economic prosperity, RHS programs ensure that some of rural America's most vulnerable members, including low-income elderly, children, farm workers, and Native Americans, share in our Nation's good fortune. Let me show you some examples of how we have assisted rural America.

RHS HOMEOWNERSHIP PROGRAMS REACH THE UNDERSERVED

In fiscal year 2000, RHS celebrated the 50th anniversary of the Section 502 direct loan homeownership program. During the past 50 years, the program has made tremendous strides in improving the overall quality and affordability of the Nation's rural housing stock. Our customers are happy with their homes. According to a recent Economic Research Service (ERS) report titled Meeting the Housing Needs of Rural Residents, 90 percent of recent Section 502 direct loan borrowers think that their current home is better than their last one. These same satisfied customers are people whom the private market has difficulty serving. Ninety percent say that without assistance from us it would have taken them more than two years to purchase a comparable home, and 44 percent believe they could never have purchased a home without the Section 502 direct loan program. Twenty-nine percent of RHS borrowers are members of minority groups as compared to 15 percent of all recent low-income homeowners, and 32 percent of our customers are female single parents, as compared to 12 percent of all recent low-income homeowners. In addition, 15 percent of Section 502 households have at least one member with a disability. Almost three-quarters of the borrowers surveyed were first-time homeowners. The typical Section 502 financed house is a six-year old, detached single-family dwelling with three bedrooms and one bathroom. The median purchase price was about \$64,900.

In Cantril, Iowa, a single mother with four children was sent to RHS by the local bank to see about getting a repair loan for her dilapidated home, which had bad wiring and an unsafe furnace. An inspection of the home showed it to be uneconomical to repair. However, the local Rural Development office found the applicant qualified for a Section 502 direct loan to buy or build a house. Because the old house is located on a double lot, there is space to build the new house alongside the old

one. The family will move into the new home and the old one will be demolished. Not only will the family have greatly improved housing conditions, but the community will benefit by the replacement of a deteriorated house with a modern, attractive home.

In fiscal year 2002, the Budget proposes to direct just over \$1 billion through the Section 502 direct loan program to low- and very-low income residents who have no other hope of achieving homeownership. These funds will enable more than 15,500 low-income rural Americans to become homeowners. An additional \$3.1 billion in the Guaranteed Section 502 program will help about 40,000 low- and moderate-income rural households become homeowners. In fact, 30 percent of the loans made in the Guaranteed Loan program were made to low-income rural residents. That helped stretch the Agency's 502 Direct loan funds and reinforced the critical role Rural Development plays in housing rural residents. Based on the estimates used by the National Association of Home Builders, the fiscal year 2002 budget will help create about 36,000 jobs through the construction of new homes.

The proposed fiscal year 2002 Self-Help Housing Technical Assistance Grants program has a funding level of nearly \$34 million. By allowing families to earn "sweat equity" by helping to build their own homes, the Self-Help program makes housing affordable for many hard-working, very low-income families who otherwise would never be able to own their own homes. About half of the program's participants are members of minority groups, and a significant portion is farmworkers. The program requirements are tough: participants must contribute 65 percent of the labor towards construction of their homes. Because owning a home is so important to them, these families are willing to work at their regular jobs and then put in as much as 35 hours a week building their houses. We anticipate that the fiscal year 2002 budget will allow RHS to gain approximately 20 new technical assistance grants in those areas that currently do not have Self-Help programs. This, in turn, will enable more than 1,500 families to build their own homes.

The Pine Ridge Indian Reservation in South Dakota, the second largest reservation in the Nation, desperately needs inexpensive housing. RHS has funded a number of different housing developments on the reservation. One of these is a unique self-help housing program. Self-help housing is natural for Native Americans who are accustomed to helping family and neighbors build their homes. The Oglala Sioux Tribe Partnership for Housing worked with RHS to tailor the program to the needs of Native Americans. Floor plans are designed with input from the program participants. Homebuyer education is offered to participants to assist them in buying and maintaining their homes. Instead of being located in one development, the homes are built by the self-help participants in a construction yard and then moved to individual sites on land already owned by the various families throughout the reservation. This allows the participants to live near their extended families. In addition to funding the self-help program, RHS provides mortgage assistance to many of the homebuilders.

RHS PARTNERS WITH PRIVATE AND NONPROFIT ORGANIZATIONS TO INCREASE HOMEOWNERSHIP OPPORTUNITIES

Homeownership can have a tremendous impact on families' lives and on the strength of rural communities. However, RHS cannot address this issue alone. We must work with partners. Leveraging has become an integral part of how we do business. RHS is collaborating with a number of private and public partners to meet the housing needs of low-income families and individuals.

RHS originally established the Rural Home Loan Partnership (RHLP) as a pilot project initiated with the Federal Home Loan Bank System (FHLB) and the Rural Local Initiatives Support Corporation. Now, RHS has expanded the RHLP to include other partners. In the RHLP, a local nonprofit or community development corporation partners with a local lender and RHS provide homeownership education and single-family mortgages to very-low- and low-income rural residents. In fiscal year 2000, the RHLP produced 1,334 new homeowners using \$76 million in RHS loans and grants and \$27.6 million from other lenders. For every dollar RHS invests in affordable housing, an RHLP partner contributes another 36 cents. The first year's success began with 10 local partnerships; the pilot has expanded each year to its current level of 263 partners.

In Batavia, New York, the RHLP Program helped a family of three teenagers and their mother buy a home. RHS partnered with Rural Opportunities, Inc., (ROI) and the Bank of Castile to create the loan package for this family. The borrower attended the homebuyer education class presented by ROI, which helped her understand the loan application process as well as budgeting and figuring what loan pay-

ments she could afford. The end result was an affordable home for the family. In fiscal year 2000, RHS partnered with ROI on 22 RHLPL loans.

RHS RENTAL PROGRAMS SERVE THE MOST VULNERABLE RURAL AMERICANS

Although RHS housing programs have been successful, many rural residents still live in substandard housing. According to the Housing Assistance Council's recent report titled *The State of Rural Rental Housing*, more than 900,000 rural rental households, 10.4 percent, live in either severely or moderately inadequate housing. More than one million rural renter households are "worst case needs" households, which the Department of Housing and Urban Development defines as having an income below 50 percent of the area median household income, being extremely cost-burdened or inadequately housed, and receiving no Federal housing assistance. Of those rural renters with worst case needs, 92 percent pay more than one-half of their income, about \$6,000, for housing.

Together, the RHS Section 515 Rural Rental Housing program and the Section 521 Rental Assistance (RA) program provide decent, safe, and affordable housing to those families who need it most. The Section 515 program provides loans at an interest rate of 1 percent to build affordable housing, while the Rental Assistance program ensures that tenants pay no more than 30 percent of their income for rent.

The average annual income of our Section 515 tenants is just under \$7,700. Forty-two percent of our 432,000 tenant householders are elderly, 14 percent have a handicap or disability, 25 percent are members of minority groups, and 72 percent are women. The fiscal year 2002 budget of \$114.3 million for the Section 515 housing will help build more than 1,700 much-needed new Section 515 units, repair or rehabilitate another 4,000 units, and keep another 1,000 units in the program.

The \$688 million fiscal year 2002 funding for the Section 521 program is essential to ensuring the integrity and financial stability of our Section 515 and Section 514/516 loan and grant programs. Well over 93 percent of our RA budget will be used to ensure that more than 42,000 RA contracts are renewed and that the people living in these units can remain in affordable housing. The remainder of the RA funding will be used for newly constructed units and to keep rent affordable when repair and rehabilitation are needed for existing units.

In Warrenton, Missouri, low-income senior citizens who are no longer able to maintain their own homes have the option of living at Meadow Wood Apartments. This apartment complex for seniors and handicapped individuals was financed through an RHS Section 515 loan. RHS also provides qualifying tenants with rental assistance, so that they pay no more than 30 percent of their income for rent. There are 16 one-bedroom apartments in four brick buildings at Meadow Wood. They are all on a single floor, so residents have no stairs to climb. A communal laundry facility is at the center of the complex. A month after the complex opened, all but three apartments were occupied.

RHS has been working diligently to improve the integrity of its Rural Rental Housing program. RHS is working with the Office of Inspector General (OIG) to identify and correct any fraud or abuse. We have also implemented a new internal tracking system to better monitor and manage our \$11.9 billion rental portfolio. We are also working to improve coordination with other agencies and departments that are involved in the fraud, waste, and abuse detection and enforcement process.

RHS PROVIDES ESSENTIAL FACILITIES TO DISTRESSED RURAL COMMUNITIES

Along with decent and affordable housing, many communities also lack essential community facilities such as childcare centers, fire stations, and health care centers. This shortage not only impacts the quality of life for community residents but also makes it more difficult for communities to attract and retain businesses. Fortunately, our Community Facilities (CF) direct and guaranteed loan and grant programs provide funding for these essential facilities.

In Mississippi's Delta region, the Aaron E. Henry Community Health Services is providing an unusual service to residents of Coahoma, Panola, Quitman, and Tallahatchie counties. With funding provided by RHS Community Facilities, the center purchased 15-passenger vans and bus shelters to provide low-income residents with transportation to appointments at health centers or to get prescriptions filled at local shopping centers. RHS also provided the funding for the new Aaron E. Henry Community Health Services Center in Clarksdale.

The \$478 million for Community Facilities programs for fiscal year 2002 will allow us to continue our commitment to childcare, which is especially important in rural areas. A staggering 24 percent of rural America's children live in poverty. Research by USDA's Economic Research Service suggests that young rural children are more likely to live in poverty than older children because rural areas lack the

childcare facilities that enable parents to go to work. Without adequate childcare facilities, many rural parents face a tough choice: go to work to increase their family's income but worry about whether their children are safe and well cared for, or live in poverty in order to stay home to take good care of their kids. The high-quality childcare centers financed by the Community Facilities program allow parents to go to work with peace of mind. Not only that, they help address the larger problem of rural child poverty.

In Dallas, Pennsylvania, RHS helped fund the Little Meadows Learning Center, owned by Ecumenical Enterprises, Inc. The center was created to complement a geriatric campus, consisting of a nursing center, an assisted living center, and two apartment complexes, already operated by Ecumenical Enterprises. The childcare center provides work site childcare for employees of the geriatric campus as well as quality childcare for the local community. Daycare is provided for children from infants through pre-school. An after-school program is available for older children. The Little Meadows Learning Center offers childhood educational programs and intergenerational programs with residents of the geriatric campus. The need for childcare in the community was clearly demonstrated when the center, with 115 spaces for children, reached 90 percent occupancy within a few months of opening.

Fiscal Year 2002 Community Facilities budget includes nearly \$6 million to continue the Rural Community Development Initiative that Congress funded for the first time in fiscal year 2000. This initiative will help build the capacity of rural organizations to undertake essential housing and economic development projects in their communities. There is a great need in rural America for technical assistance to foster leadership development, organizational capacity, program initiatives, and the adoption of new technology. This is especially true in remote and isolated rural areas.

I have discussed the funding for the major RHS programs. Now, let me take a moment to show you how the budget will help some of our most vulnerable rural citizens: the elderly, farm workers, and Native Americans.

RHS PROVIDES RURAL AMERICA'S ELDERLY WITH SAFE, AFFORDABLE HOUSING AND ESSENTIAL COMMUNITY FACILITIES

Elderly rural Americans face critical housing and long-term care challenges. Although only 28 percent of all elderly households reside in rural areas, 39 percent of elderly households living in moderately or severely inadequate housing reside in rural areas. Many live in housing that they cannot reasonably afford. Over 50 percent of the elderly renters living in rural areas spend at least 30 percent of their income on housing.

RHS programs ensure that these financially overburdened rural elderly can live in good and affordable housing. Currently, our Section 515 rural rental-housing program is providing maintenance-free, accessible homes to more than 200,000 elderly households who can no longer handle the burdens of homeownership. For elderly rural people who want to remain in the homes they own, we provide the Section 504 loan and grant programs. These programs make substandard homes safe and decent by financing such things as indoor plumbing, electric heating and cooling systems, safe wiring, roof and floor repair, and the installation of features to accommodate disabilities. In fiscal year 2000, \$58.9 million in loan and grant money was used to repair more than 11,000 homes under the Section 504 program. The fiscal year 2002 budget includes nearly \$30 million for the Section 504 grant program, which serves very low-income seniors, and \$32 million for the Section 504 loan program in which about half of the beneficiaries are elderly. With this money, RHS can help make about 12,000 substandard homes safe and decent.

In McHenry, Kentucky, a rural coal mining area, RHS helped a 91-year-old widow make her home liveable. With only Social Security and Black Lung benefits, she could not afford the necessary repairs to her home. The leaking roof had severely damaged the ceilings, walls and eaves of the house. In her bedroom, the ceiling and walls had separated far enough that daylight showed through. In the winter, the bedroom was unusable because of the cold drafts and had to be sealed off from the rest of the house. There were no storm windows on the house. The RHS Section 504 loan and grant programs provided funds to repair the house, making it warm and secure during cold, rainy weather.

The RHS Community Facilities program finances a range of service centers for elderly people, including nursing homes, boarding care facilities, assisted care, adult day care, and intergenerational care centers that serve both elderly people and children at the same time. Since its inception in 1974, the Community Facilities program has invested \$688 million in centers that directly benefit seniors and millions more in health care services that serve both seniors and the general population.

RHS PROGRAMS SERVE AMERICA'S FARM WORKERS

Although the housing needs of the elderly are a severe problem, their situation is not the worst in rural America. Farm workers and Native Americans are the two most poorly housed groups in America. Farm workers enable America to maintain its agriculture production levels and compete in world markets, yet they are the lowest-paid group of workers in the nation. While their labor ensures food security through the successful production and distribution of our nation's agricultural crops, farm workers live in substandard housing, sometimes without basic sanitary facilities, safe heating and cooking equipment, and a supply of clean water.

RHS provides housing to farm workers primarily through two programs: the Mutual Self-Help program, which I have already described, and the Section 514/516 Farm Labor Housing program, which is the only national source of farm labor housing construction funds. Participants in either of these programs must be permanent residents or U.S. citizens. Tenants in our farm labor housing must earn a substantial portion of their income through farm work. Eighty-nine percent of tenants in RHS-financed farm labor housing are minorities, primarily Latino and African-American.

Fiscal Year 2000, RHS used \$49.5 million to build 818 farm labor-housing units. The fiscal year 2002 budget of \$43.4 million for the Farm Labor Housing program will enable us to finance construction of approximately 700 new units as well as address our anticipated need to rehabilitate and repair about 500 existing units. It will also allow us to provide childcare facilities as a part of some complexes. This funding will be highly leveraged because RHS partners with other public and private funding organizations in the vast majority of the projects it finances.

Housing costs in California are high and there is a severe shortage of affordable housing. Thousands of low-income year-round farm workers live in substandard mobile home parks, campers and crude shelters. In Riverside County, lucky farm workers live in Desert Garden Apartments in Indio. This complex, built by the Coachella Valley Housing Coalition, and funded primarily through the RHS Farm Labor Housing Program, offers many special features, including energy-efficient housing, a childcare center, an after-school program with computers, a community garden, and a resident community council.

A grant from the U.S. Department of Housing and Urban Development provides funding to counsel residents on homeownership, financial planning, and credit management. Other classes for adults include creative writing (through interactive software), English as a Second Language, and employment and leadership training programs.

In addition to providing farm workers with housing, RHS also provides them with essential community facilities, such as childcare and health care centers. The CF program has also been successful in meeting the needs of migrant farm workers, who are difficult to serve because of the transient nature of their work. In conjunction with the Department of Health and Human Services, we have funded a number of migrant health care clinics and migrant Head Start centers.

NATIVE AMERICANS BENEFIT FROM RHS ASSISTANCE

In rural areas, Native Americans suffer from some of the worst poverty levels, housing, and access to basic community and health services in the country. RHS continues its extensive outreach to Native Americans by working to overcome barriers to lending on trust land and by providing grant funds whenever possible.

The Section 504 housing repair loan and grant programs are often the first RHS programs to be used on a reservation. Section 504 loans are especially easy to use because if the loan is less than \$2,500, no real estate security is needed. Thus, the problem of lending on trust land is avoided.

Last year, Rural Development in Wisconsin approved their first Guaranteed Rural Housing loan to Native Americans on tribal trust land. This loan, under the Rural Housing Native American Pilot initiative, enabled the parents and two teenage children to have a three-bedroom manufactured home built in Keshena, on the Menominee Indian Reservation. The tribe helped the family by paying for the well, septic system and water system hookups. A successful collaboration between the Rural Housing Service, the Indian tribe, the local bank, and Bureau of Indian Affairs, and the manufactured home dealer/contractor made it possible for this family to have a new home.

RHS has worked hard to increase its investments in Indian Country. We have financed numerous Section 515 multi-family housing complexes across the nation. We typically provide about 10 percent of our Housing Preservation Grant funds to organizations that serve Native Americans. Through small Section 525 Technical Assistance Grants to non-profit organizations, we fund credit counseling and homebuyer

education to Native Americans to help them qualify for RHS single family housing loans and become successful homeowners.

Assistance for Native Americans has been a Community Facilities priority for a number of years. Native American communities, especially those on reservations, have many needs beyond housing—needs such as medical centers, libraries, community centers, childcare centers, Head Start facilities, and fire stations and trucks. In addition to these needs, the CF program funds a variety of buildings for tribal colleges, including housing for teachers in isolated areas.

In Montana, RHS works with tribes on the reservations in various ways. On the Fort Belknap Indian Reservation, housing is in short supply. RHS is funding two multi-family housing projects for the reservation. The homes are doublewide mobile homes, which can accommodate large families. Because of their low incomes, occupants will receive rental assistance from RHS. In Browning Montana, on the Blackfeet Reservation, the Community Facilities program funded a new multi-use student center, which includes a bookstore, classrooms, offices and library for Blackfeet Community College. CF funds are also being used to equip an early-childhood center on the reservation, which offers prenatal care and daycare for up to 150 children.

RHS MOVES EMPLOYEES FROM WELFARE TO WORK AT THE CENTRALIZED SERVICING CENTER

RHS's commitment to helping people become self-sufficient extends to its employees. Since 1997, the USDA Centralized Servicing Center (CSC) in St. Louis, Missouri, has worked with the St. Louis Transitional Hope House and the American Red Cross to employ former welfare recipients. The CSC has selected a total of 24 employees referred through the partnership with Hope House. Starting as worker trainees, 14 of these employees have since moved into permanent loan processor positions. In May 2000, the CSC received a USDA Secretary's Honor Award for training and ongoing support of its Welfare-to-Work employees.

Welfare-to-Work employees are initially hired to work as Customer Service Representatives. This helps the trainees because (1) they receive in-depth training on all areas of the CSC; (2) they can take advantage of flexible scheduling; and (3) there is a special supervisory team to give them individual support and training. Once they make the transition to a working environment, they may apply for other positions. Long-term employees assist the new employees in meeting the obligations of the jobs.

Success gives our employees the courage to continue their growth. One employee, who started in the Welfare-to-Work program, now is enrolled in college pursuing a degree in accounting. She manages to maintain her family, work, and school obligations and continues to work toward improving her future.

I hope I have illustrated for you the many ways that RHS programs improve life in rural areas. We have great opportunities to assist rural people and their communities in becoming self-sufficient. I have mentioned only a few examples of how RHS makes a difference in the lives of so many rural Americans.

Through our partnerships and leveraging efforts, we can expand the reach of our resources even further. The funds in the fiscal year 2002 budget will enable us to continue reaching underserved people in rural areas where our help is needed the most.

Mr. Chairman and members of the Committee, with your continued support, RHS looks forward to improving the quality of life in rural America by helping to build competitive, active rural communities through our Community Facilities and housing programs.

FARM SERVICE AGENCY

PREPARED STATEMENT OF JAMES R. LITTLE, ACTING ADMINISTRATOR

Mr. Chairman and Members of the Subcommittee, I appreciate the opportunity to present the fiscal year 2002 budget for the Farm Service Agency (FSA). Our proposals are based on existing legislative authorities and assume the expiration of current ad hoc disaster and emergency provisions. I would like to highlight the proposals for FSA's various activities: the commodity and conservation programs funded by the Commodity Credit Corporation (CCC); the farm loan programs of the Agricultural Credit Insurance Fund; and our other appropriated programs. I will also summarize our request for administrative support.

COMMODITY CREDIT CORPORATION

Domestic farm commodity price and income support programs are administered by the Farm Service Agency and financed through the CCC, a government corporation for which FSA provides operating personnel. Commodity support operations, handled primarily through loans, payment programs, and some limited purchase programs, currently include those for corn, barley, oats, grain sorghum, wheat and wheat products, soybeans, minor oilseed crops, cotton (upland and extra long staple), rice, tobacco, milk and milk products, peanuts, and sugar.

The CCC is also the source of funding for the Conservation Reserve Program (CRP) administered by FSA, as well as many of the conservation programs administered by the Natural Resources Conservation Service. In addition, CCC funds many of the export programs administered by the Foreign Agricultural Service. When called upon, CCC also finances various disaster assistance programs authorized by Congress. The Corporation is authorized to borrow funds from the Treasury to finance CCC programs on an on-going basis, and repays these borrowings, with interest, from program receipts and from appropriations provided by Congress for reimbursement of net realized losses.

Program Outlays

The current 2002 budget estimates largely reflect supply and demand assumptions for the 2001 crop, based on October 2000 data. CCC net expenditures for fiscal year 2002 are estimated at \$13.1 billion, down nearly \$7.5 billion from a level of \$20.5 billion in fiscal year 2001, and \$19.2 billion below the record high of \$32.3 billion in fiscal year 2000.

The net decrease in projected fiscal year 2002 CCC expenditures primarily reflects the expiration of \$4.5 billion in 2001 emergency and market loss assistance authorized by the Agricultural Risk Protection Act and the 2001 Agriculture Appropriations Act. Other components include decreases of about \$1.4 billion in loan deficiency payments, nearly \$300 million in Section 416 ocean transportation, and about \$120 million in production flexibility contract payments. Also, no CCC expenditures will take place in fiscal year 2002 for computer equipment or related services due to the limits placed on such expenditures in the 1996 Farm Bill and subsequent legislation.

The CCC budget includes two General Provision proposals for this appropriations bill: to cap the fiscal year 2002 Environmental Quality Incentives Program at \$174 million and to prohibit implementation of the Conservation Farm Option Program in fiscal year 2002. These actions would reduce fiscal year 2002 CCC expenditures by \$5.5 million and \$2.1 million, respectively.

Reimbursement for Realized Losses

The fiscal year 2001 appropriations act authorizes CCC to replenish its borrowing authority as needed from Treasury, up to the amount of realized losses recorded in CCC's financial statements at the end of the preceding fiscal year. Under this authority, we are projecting that in fiscal year 2001 CCC will draw approximately \$24.0 billion for fiscal year 2000 losses. In addition, nearly \$1.3 billion in fiscal year 2001 net realized losses has already been reimbursed to CCC during the first quarter of this fiscal year as authorized by the Agricultural Risk Protection Act of 2000 to cover emergency provisions of that act. Without this reimbursement, CCC's ability to continue to assist farmers would have been jeopardized.

The fiscal year 2002 budget proposes to revise the provision of the current appropriations that confines reimbursement for realized losses to those recorded at the end of the preceding year. Our request would provide a current, indefinite appropriation to reimburse the Corporation for all actual net realized losses, including those recorded in the current fiscal year. This would provide CCC added flexibility to avert a possible funding shortfall during periods of imminent borrowing authority depletion, without emergency action on the part of Congress.

Conservation Reserve Program

The CRP, administered by FSA, is USDA's largest conservation/environmental program. It is designed to cost-effectively assist farm owners and operators in conserving and improving soil, water, air, and wildlife resources by converting highly erodible and other environmentally sensitive acreage from the production of agricultural commodities to a long-term resource-conserving cover. CRP participants enter into contracts for periods of 10 to 15 years in exchange for annual rental payments, along with cost-share and technical assistance for installing approved conservation practices. The authorizing legislation currently allows enrollment of up to 36.4 million acres.

In fiscal year 2000, a general CRP signup (signup 20) was held from January 18, 2000, through February 11, 2000. Of the 3.5 million acres offered, 2.3 million were approved for enrollment, with contracts beginning in fiscal year 2001 and rental payments beginning in fiscal year 2002. The fiscal year 2002 budget assumes that no general signup will be held in fiscal year 2001; however, a 1-year extension opportunity was announced in January 2001 for contracts that are scheduled to expire in September 2001 with an original duration of less than 15 years. Additional acres will also be accepted into the CRP during fiscal year 2001 through continuous signup, the Conservation Reserve Enhancement Program, and the Farmable Wetlands Pilot Program.

In fiscal year 2001, CCC will pay approximately \$1.54 billion for rental costs and about \$127 million for sharing the cost of establishing permanent cover on the enrolled acreage. The bulk of the rental payments, covering acres enrolled in regular signups, were issued early in the fiscal year. For fiscal year 2002, the budget projects a general signup of 1.36 million acres and CCC program costs of approximately \$1.79 billion, consisting of \$1.68 billion for rental payments on previously enrolled and extended acres, and \$111 million for cost-share assistance.

FARM LOAN PROGRAMS

The loan programs funded through the Agricultural Credit Insurance Fund provide a variety of loans and loan guarantees to farm families who would otherwise be unable to obtain credit. Access to adequate farm credit is often the only way for some farmers to continue their operations.

As a result of the weakness in much of today's farm economy, the demand for FSA loans and loan guarantees remains high in fiscal year 2001. Activity is expected to be particularly heavy in direct farm ownership loans and guaranteed farm operating loans with interest assistance. The fiscal year 2002 budget, anticipating a continued high demand, proposes a total program level of about \$3.86 billion in loans and guarantees, an increase of \$764 million over fiscal year 2001. The largest segment of FSA lending is carried out in cooperation with private lenders through the guarantee programs. This budget continues strong support for guaranteed loans, with a proposed program level of \$3 billion.

For direct farm ownership loans we are requesting a loan level of \$128 million, an increase of \$278 thousand over the fiscal year 2001 appropriated level. The proposed program level would enable FSA to extend credit to about 1,100 small and beginning farmers to purchase or maintain a family farm. As required by law, the agency has established annual county-by-county participation targets for members of socially disadvantaged groups, based on demographic data. Also, 70 percent of direct farm ownership loans are reserved for beginning farmers and about 35 percent are made at a reduced interest rate to limited resource borrowers, who may also be beginning farmers. For direct farm operating loans we are requesting a program level of \$600 million, \$76 million above the fiscal year 2001 level, to provide nearly 12,250 loans to family farmers.

For guaranteed farm ownership loans in fiscal year 2002, we are requesting a loan level of \$1 billion, an increase of \$132 million over 2001. This program level will give approximately 4,000 farmers the opportunity to either acquire their own farm or to save an existing one. One critical use of guaranteed farm ownership loans is to allow real estate equity to be used to restructure short-term debt into more favorable long-term rates. For guaranteed farm operating loans we propose an fiscal year 2002 program level of \$2 billion, compared to \$1.4 billion in 2001. This level will enable over 12,500 producers to finance their farming operations in the face of continued poor economic conditions. This program enables commercial lenders to continue to extend credit to farm customers who, under current adverse circumstances, have become an increased credit risk. Without this backing, those farmers would be forced to seek direct loans from FSA.

The Budget also proposes \$25 million in emergency disaster loans in fiscal year 2002, sufficient to provide close to 400 low-interest loans to producers whose farming operations have been damaged by natural disasters. In addition, our budget proposes \$2 million for Indian tribe land acquisition loans and \$100 million for boll weevil eradication loans.

OTHER APPROPRIATED PROGRAMS
