manufacturing facilities as a whole and not subdivide this sector. Therefore, Table AB-2 lists data for selected parameters from facilities in the industrial and commercial machinery and transportation equipment manufacturing sector. These data

include the eight pollutants that all facilities were required to monitor for under Form 2F, as well as any additional pollutants with median concentrations higher than the benchmarks.

TABLE AB-2.—STATISTICS FOR SELECTED POLLUTANTS REPORTED BY INDUSTRIAL AND COMMERCIAL MACHINERY AND TRANSPORTATION EQUIPMENT MANUFACTURING FACILITIES SUBMITTING PART II SAMPLING DATA<sup>i</sup> (mg/L)

Pollutant Sample type	No. of facilities		No. of samples		Mean		Minimum		Maximum		Median		95th percentile		99th percentile

<sup>i</sup> Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics. Values reported as nondetect or below detection limit were assumed to be 0.

<sup>ii</sup> Composite samples.

3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act (Best Available Technology (BAT) and Best Conventional Technology). The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this sections for storm water discharges associated with industrial activity from facilities which manufacture transportation equipment, industrial or commercial machinery to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site-specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing

pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and

type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with transportation equipment, industrial or commercial machinery manufacturers.

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. Less than 25 percent of the sampling subgroup reported that they store some materials indoors; less than 10 percent cover loading areas, dumpsters, drums, or above ground tanks; less than 5 percent of the representative facilities utilize waste minimization practices (e.g., recycling or reusing materials).<sup>101</sup> Because BMPs described in part 1 data are limited, the following table is provided to identify BMPs that should be considered at facilities which manufacture transportation equipment, industrial or commercial machinery.

TABLE AB-3.—GENERAL STORM WATER BMPs FOR FACILITIES WHICH MANUFACTURE TRANSPORTATION EQUIPMENT, INDUSTRIAL, OR COMMERCIAL MACHINERY

Activity	Best management practices (BMPs)
Outdoor Unloading and Loading .....	Confine loading/unloading activities to a designated area. Consider performing loading/unloading activities indoors or in a covered area. Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps). Close storm drains during loading/unloading activities in surrounding areas. Avoid loading/unloading materials in the rain. Inspect the unloading/loading areas to detect problems before they occur. Inspect all containers prior to loading/unloading of any raw or spent materials. Consider berming, curbing, or diking loading/unloading areas. Use dry clean-up methods instead of washing the areas down. Train employees on proper loading/unloading techniques.
Outdoor Material Storage (including waste, and particulate emission management).	Confine storage of materials, parts, and equipment to designated areas.

<sup>101</sup> These percentages were based on the information reported in the Part 1 group applications. However, some facilities which utilize

these BMPs as part of their daily activities may not recognize these practices as BMPs and as a result did not report this information in their applications.

TABLE AB-3.—GENERAL STORM WATER BMPs FOR FACILITIES WHICH MANUFACTURE TRANSPORTATION EQUIPMENT, INDUSTRIAL, OR COMMERCIAL MACHINERY—Continued

Activity	Best management practices (BMPs)
	Consider curbing, berming, or diking all liquid storage areas. Train employees on proper waste control and disposal. Consider covering tanks. Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed). Wash and rinse containers indoors before storing them outdoors. If outside or in covered areas, minimize runoff of storm water by grading the land to divert flow away from containers. Inventory all raw and spent materials. Clean around vents and stacks. Place tubs around vents and stacks to collect particulate. Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary. Store wastes in covered, leak proof containers (e.g., dumpsters, drums). Consider shipping all wastes to offsite landfills or treatment facilities. Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.

4. Special Conditions

There are no additional requirements under this section other than those stated in Part III of today's permit .

5. Storm Water Pollution Prevention Plan Requirements

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from facilities which manufacture transportation equipment, industrial or commercial machinery. The requirements included in the pollution prevention plans provide a flexible framework for the development and implementation of site-specific controls to minimize the pollutants in storm water discharges. This flexibility is necessary because each facility is unique in that the source, type, and volume of contaminated storm water discharge will vary from site to site.

Under today's permit, all facilities must prepare and implement a storm water pollution prevention plan. The pollution prevention plan requirement reflects EPA's decision to allow operators of transportation equipment, industrial or commercial machinery manufacturing facilities to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section.

There are two major objectives of a pollution prevention plan: 1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and 2) to describe and ensure implementation of practices to minimize and control pollutants in

storm water discharges associated with industrial activity from a facility.

Specific requirements for a pollution prevention plan for transportation equipment, industrial or commercial machinery manufacturing facilities are described below. These requirements must be implemented in addition to the common pollution prevention plan provisions discussed in section VI.C. of today's fact sheet.

a. *Contents of the Plan.* Storm water pollution prevention plans are intended to aid operators of transportation equipment, industrial or commercial machinery manufacturing facilities to evaluate all potential prevention sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control, the discharge of pollutants in storm water runoff. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," EPA, 1992, (EPA 832-R-92-006) to assist permittees in developing and implementing pollution prevention measures.

(1) *Description of Potential Pollutant Sources.* Each storm water pollution prevention plan must describe activities, materials, and physical features of the facility that may contribute pollutants to storm water runoff or, during periods of dry weather, result in dry weather flows. This assessment of potential storm water pollutant source will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid

in the selection of appropriate structural and nonstructural control techniques. Plans must describe the following elements:

(a) *Site Map*—The plan must contain a map of the site that shows the pattern of storm water drainage, structural and nonstructural features that control pollutants in storm water runoff and process wastewater discharges, surface water bodies (including wetlands), places where significant materials<sup>102</sup> are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. The map must also indicate the direction of storm water flow. An outline of the drainage area for each outfall must be provided; and the location of each outfall and monitoring points must be indicated. An estimate of the total site acreage utilized for each industrial activity (e.g., storage of raw materials, waste materials, and used equipment) must be provided. These areas include liquid storage tanks, stockpiles, holding bins, used equipment, and empty drum storage.

<sup>102</sup> Significant materials include, "\* \* \* but [are] not limited to: raw materials, fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; \* \* \* hazardous substances designated under section 101(14) of CERCLA; any Chemical facilities are required to report pursuant to section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharge." (40 CFR 122.26(b)(12)). Significant materials commonly found at transportation equipment, industrial or commercial machinery manufacturing facilities include raw and scrap metals; solvents; used equipment; petroleum based products; waste materials or by-products used or created by the facility.

These areas are considered to be significant potential sources of pollutants at facilities which manufacture transportation equipment, industrial or commercial machinery. The site map must also indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls (e.g. storm water and air conditioner condensate). In order to increase the readability of the map, the inventory of the types of discharges contained in each outfall may be kept as an attachment to the site map.

*(b) Inventory of Exposed Materials*—Facility operators are required to carefully conduct an inspection of the site to identify significant materials that are or may be exposed to storm water discharges. The inventory must address materials that within 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with precipitation and runoff; existing structural and nonstructural controls that reduce pollutants in storm water; existing structural controls that limit process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or through a separate storm sewer system. The description must be updated whenever there is a significant change in the type or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

*(c) Significant Spills and Leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of reportable quantities under Section 311 of CWA (see 40 CFR Section 110.10 and Section 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR Section 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

*(d) Non-storm Water Discharges*—Each pollution prevention plan must include a certification, signed by an authorized individual, that discharges from the site have been tested or evaluated for the presence of non-storm water, the results of any test and/or evaluation conducted to detect such discharges, the test method or evaluation criteria used, the dates on which tests or evaluations were performed, and the onsite drainage points directly observed during the test or evaluation. Pollution prevention plans must identify and ensure the implementation of appropriate pollution prevention measures for any non-storm water discharges.

*(e) Sampling Data*—Any existing data describing the quality or quantity of storm water discharges from the facility must be summarized in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

*(f) Summary of Potential Pollutant Sources*—The description of potential pollutant sources should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: raw materials (liquid storage tanks, stockpiles, holding bins), waste materials (empty drum storage), and used equipment storage areas. The assessment must list any significant pollutant parameter(s) (i.e., total suspended solids, oil and grease, etc.) associated with each source.

*(2) Measures and Controls*. Permittees must select, describe, and evaluate the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. Source reduction measures include preventive maintenance, spill prevention, good housekeeping, training, and proper materials management. If source reduction is not an option, EPA supports the use of source control measures. These include BMPs such as material covering, water diversion, and dust control. If source reduction or source control are not available, then recycling or waste treatment are other alternatives. Recycling allows the reuse of storm water, while treatment lowers pollutant concentrations prior to discharge. Since the majority of transportation equipment, industrial or

commercial machinery manufacturing occurs indoors, the BMPs identified above are geared towards only those activities occurring outdoors or otherwise have a potential to contribute pollutants to storm water discharges.

Pollution prevention plans must discuss the reasons each selected control or practice is appropriate for the facility and how each of the potential pollutant sources will be addressed. Plans must identify the time during which controls or practices will be implemented, as well as the effect the controls or practices will have on storm water discharges from the site. At a minimum, the measures and controls must address the following components:

*(a) Good Housekeeping*—Permittees must describe protocols established to reduce the possibility of mishandling chemicals or equipment and training employees in good housekeeping techniques. Specifics of this plan must be communicated to appropriate plant personnel.

*(b) Preventive Maintenance*—Permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. Inspections should assess the effectiveness of the storm water pollution prevention plan. They allow facility personnel to monitor the components of the plan on a regular basis. The use of a checklist is encouraged, as it will ensure that all of the appropriate areas are inspected and provide documentation for recordkeeping purposes.

*(c) Spill Prevention and Response Procedures*—Permittees are required to identify proper material handling procedures, storage requirements, containment or diversion equipment, and spill removal procedures to reduce exposure of spills to storm water discharges. Areas and activities which are high risks for spills at transportation equipment, industrial or commercial machinery manufacturing facilities include raw material unloading and product loading areas, material storage areas, and waste management areas. These activities and areas and their drainage points must be described in the plan.

*(d) Inspections*—Qualified personnel must inspect designated equipment and areas of the facility at the proper intervals specified in the plan. The plan should identify areas which have the potential to pollute storm water for periodic inspections. Records of inspections must be maintained onsite.

*(e) Employee Training*—Permittees must describe a program for informing and educating personnel at all levels of

responsibility of the components and goals of the storm water pollution prevention plan. A schedule for conducting this training should be provided in the plan. Where appropriate, contractor personnel must also be trained in relevant aspects of storm water pollution prevention. Topics for employee training should include good housekeeping, materials management, and spill response procedures. EPA recommends that facilities conduct training annually at a minimum. However, more frequent training may be necessary at facilities with high turnover of employees or where employee participation is essential to the storm water pollution prevention plan.

(f) *Recordkeeping and Internal Reporting Procedures*—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. This includes the success and failure of BMPs implemented at the facility.

(g) *Sediment and Erosion Control*—Permittees must identify areas, due to topography, activities, soils, cover materials, or other factors that have a high potential for soil erosion. Measures to eliminate erosion must be identified in the plan.

(h) *Management of Runoff*—Permittees must provide an assessment of traditional storm water management practices that divert, infiltrate, reuse, or otherwise manage storm water so as to reduce the discharge of pollutants. Based on this assessment, practices to control runoff from these areas must be identified and implemented as required by the plan.

(3) *Comprehensive Site Compliance Evaluation*. The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) Confirm the accuracy of the description of potential sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of this section.

Comprehensive site compliance evaluations must be conducted once a year for transportation equipment, industrial or commercial machinery manufacturing facilities. The individual(s) who will conduct the evaluations must be identified in the plan and should be members of the pollution prevention team. Evaluation reports must be retained for at least 3 years after the date of the evaluation.

Based on the results of each evaluation, the description of potential pollution sources, and measures and controls, the plan must be revised as

appropriate within 2 weeks after each evaluation. Changes in the measures and controls must be implemented on the site in a timely manner, never more than 12 weeks after completion of the evaluation.

#### 6. Numeric Effluent Limitation

There are no additional numeric effluent limitations under this section other than those included in part V.B of the permit.

#### 7. Monitoring and Reporting Requirements

a. *Monitoring Requirements*. The regulatory modifications at 40 CFR 122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities that manufacture transportation equipment, industrial, or commercial machinery. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual examinations of storm water discharges will help to ensure storm water contamination is minimized. Under the Storm Water Regulations at 40 CFR 122.26(b)(14), EPA defined "storm water discharge associated with industrial activity". The focus of today's permit is to address the presence of pollutants that are associated with the industrial activities identified in this definition and that might be found in storm water discharges. Under the methodology for determining analytical monitoring requirements, described in section VI.E.1 of this fact sheet, zinc is above the bench mark concentrations for the industrial and commercial machinery and transportation equipment sector. After a review of the nature of industrial activities and the significant materials exposed to storm water described by facilities in this sector, EPA has determined that the higher concentrations of zinc are not likely to be caused by the industrial activity, but may be primarily due to non-industrial activities on-site. Today's permit does not require industrial and commercial machinery and transportation equipment facilities to conduct analytical monitoring for this parameter. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and

implementing the pollution prevention plan.

Quarterly visual examinations of a storm water discharge from each outfall are required at transportation equipment, industrial, or commercial machinery manufacturing facilities. The examination must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The examinations must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: January through March; April through June; July through September; October through December. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff begins discharging. Reports of the visual include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual examination reports must be maintained onsite with the pollution prevention plan.

EPA realizes that if a facility is inactive and unstaffed it may be difficult to collect storm water discharge samples when a qualifying event occurs. Today's final permit has been revised so that inactive, unstaffed facilities can exercise a waiver of the requirement to conduct quarterly visual examination.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual examination will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective

action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the examinations. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on examination will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for facilities that manufacture transportation equipment, industrial, or commercial machinery. EPA believes that between quarterly visual examinations and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

*AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods*

1. Discharges Covered Under This Section

This sector covers storm water discharges associated with industrial activity from electronic and electrical equipment manufacturing facilities (SIC major group 36); measuring, analyzing, and controlling instruments, photographic, medical and optical goods, and watches and clocks manufacturing facilities (SIC major group 38); and computer and office equipment manufacturing facilities (SIC 357).

More specifically, the group of electronic and electrical equipment and

components manufacturers includes manufacturers of electricity distribution equipment such as transformers and switch-gear, electrical industrial equipment such as motors and generators, household appliances, electric lighting and wiring equipment such as light bulbs and lighting fixtures, and audio and video equipment including phonograph records and audio tapes and disks. Also included are manufacturers of communication equipment including telephone and telegraph equipment, radio and television equipment, electronic components such as printed circuit boards and semiconductors and related devices, and miscellaneous electrical items such as batteries and electrical equipment for automobiles.

The group of analyzing, and controlling instruments, photographic, medical and optical goods, and watches and clocks manufacturers includes facilities which manufacture search, detection, navigation, or guidance systems such as radar and sonar equipment, measurement and control instruments and laboratory apparatus, surgical, medical and dental instruments and supplies, photographic equipment and supplies, and watches and clocks.

The computer and office equipment manufacturers group includes manufacturers of computers, computer storage devices, and peripheral equipment for computers such as printers and plotters. Manufacturers of miscellaneous office machines are also included in this group.

The SIC codes of the facilities covered by this section are in category (xi) of the definition of storm water discharges associated with industrial activity. Storm water discharges from facilities in this category are only regulated where precipitation and storm water runoff come into contact with areas associated with industrial activities, and significant materials. Significant materials include, but are not limited to, raw materials, waste products, fuels, finished products, intermediate products, by-products, and other materials associated with industrial activities.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution

prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Pollutants Found in Storm Water Discharges

*a. Sources of Pollutants.* As noted in the preamble to the final storm water application regulations of November 16, 1990, most of the actual manufacturing and processing activity at these types of facilities normally occurs indoors (55 FR 48008).

Additional information concerning these manufacturing processes and the industrial sector itself can be found in the following documents: "Development Document for Effluent Limitations Guidelines and Standards for the Electrical and Electronics Components Point Source Category, Phase I," EPA 440/1-83/075; "Development Document for Effluent Limitations Guidelines and Standards for the Electrical and Electronic Components Point Source Category, Phase II," EPA 440/1-84/075; "Development Document for Existing Source Pretreatment Standards for the Electroplating Point Source Category," EPA 440/1-79/003; and "Development Document for Effluent Limitations Guidelines and Standards for the Metal Finishing Point Source Category," EPA 440/1-83/091.

The types of activities at these facilities where exposure to storm water may occur consist primarily of loading/unloading activities, and the storage and handling of raw materials, by-products, final products or waste products. A wide variety of materials are used at these facilities including metals, acids used for chemical etching, alkaline solutions, solvents, various oils and fuels and miscellaneous chemicals. Tanks or drums of these materials may be exposed to storm water during loading/un-loading operations, or through outdoor storage or handling at some facilities.

Liquid wastes which may be exposed at least temporarily include spent solvents and acids, miscellaneous chemicals and oily wastes. These wastes may be contaminated with a variety of heavy metals and chlorinated hydrocarbons. Used equipment, scrap metal and wire, soiled rags and sanding materials may also be exposed to storm water and constitute a potential source of pollutants. In addition, some facilities reported that dumpsters containing non-

hazardous wastes or manufacturing debris may be exposed to storm water.

Table AC-1 lists potential pollutant sources from activities that commonly take place at facilities which

manufacture electronic and electrical equipment and components, photographic and optical goods.

TABLE AC-1.—COMMON POLLUTANT SOURCES

Activity	Pollutant source	Pollutants
Outdoor Material Loading/Unloading .....	Wooden pallets, spills/leaks from material handling equipment, raw materials, finished products, solvents.	TSS, oil and grease, organics.
Outdoor Material and Equipment Storage .....	Sulfuric acid, alkaline solutions, solvents miscellaneous chemicals, oily wastes, lead, silver, copper, zinc, spent solvents and acids, scrap metal and wire, oily rags.	Organics, oil and grease, acids, alkalinity, heavy metals.

b. *Storm Water Sampling Results.* Based on the similarities of the facilities included in this sector in terms of industrial activities and significant materials, EPA believes it is appropriate to discuss the potential pollutants at electronic and electric equipment and photographic and optical goods manufacturing facilities as a whole and not subdivide this sector. Therefore, Table AC-2 lists data for selected parameters from facilities in the electronic and electric equipment and photographic and optical goods manufacturing sector. This data includes the eight pollutants which all facilities were required to monitor for under Form 2F, as well as the pollutants that EPA has determined may merit further monitoring.

<sup>i</sup> Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics. Values reported as non-detect or below detection limit were assumed to be 0.

<sup>ii</sup> Composite samples.

### 3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act [Best Available Technology (BAT) and Best Conventional Technology]. The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from facilities which manufacture electronic and electrical equipment and components, and photographic and optical goods to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site-specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of

pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with manufacturers of electronic and electrical equipment and components, and photographic and optical goods.

Part 1 group application data indicated that the most widely implemented BMPs are spill prevention and response techniques (used by approximately 68 percent of the sampling facilities) and waste minimization practices (employed by approximately 54 percent of the sampling facilities). However, less than

30 percent of the sampling subgroup reported that they use covering; approximately 3 percent have roofs over their raw materials; and less than 3 percent store raw materials indoors.<sup>103</sup> Because BMPs described in part 1 data are generally limited, Table AC-3 is provided to identify BMPs associated with activities that routinely occur at manufacturers of electronic and electrical equipment and components, and photographic and optical goods.

TABLE AC-3.—GENERAL STORM WATER BMPs FOR MANUFACTURERS OF ELECTRONIC AND ELECTRICAL EQUIPMENT AND COMPONENTS, PHOTOGRAPHIC AND OPTICAL GOODS

Activity	Best management practices (BMPs)
Outdoor Unloading and Loading .....	Confine loading/unloading activities to a designated area. Consider performing loading/unloading activities indoors or in a covered area. Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps). Close storm drains during loading/unloading activities in surrounding areas. Avoid loading/unloading materials in the rain. Inspect the unloading/loading areas to detect problems before they occur. Inspect all containers prior to loading/unloading of any raw or spent materials. Consider berming, curbing, or diking loading/unloading areas. Dead-end sump where spilled materials could be directed. Drip pans under hoses. Use dry clean-up methods instead of washing the areas down. Train employees on proper loading/unloading techniques and spill prevention and response.
Outdoor Material Storage (including waste, and particulate emission management).	Confine storage of materials, parts, and equipment to designated areas.  Consider secondary containment using curbing, berming, or diking all liquid storage areas. Train employees in spill prevention and response techniques. Train employees on proper waste control and disposal. Consider covering tanks. Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed). Wash and rinse containers indoors before storing them outdoors If outside or in covered areas, minimize runoff of storm water by grading the land to divert flow away from containers. Leak detection and container integrity testing. Direct runoff to onsite retention pond. Inventory all raw and spent materials. Clean around vents and stacks. Place tubs around vents and stacks to collect particulate. Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary. Store wastes in covered, leak proof containers (e.g., dumpsters, drums). Consider shipping all wastes to offsite landfills or treatment facilities. Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements.

Sources: NPDES Storm Water Group Applications—Part 1. Received by EPA, March 18, 1991, through December 31, 1992. EPA, Office of Water, September 1992. "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices." EPA 832-R-92-006.

4. Special Conditions

There are no additional requirements under this section other than those stated in Part VI.B of this fact sheet.

5. Storm Water Pollution Prevention Plan Requirements

There are no additional requirements beyond those described in Part VI.C. of this fact sheet.

6. Numeric Effluent Limitations

No numeric effluent limitations are included for facilities in this sector, beyond those described in Part V.B. of today's permit.

7. Monitoring and Reporting Requirements

*a. Monitoring Requirements.* The regulatory modifications at 40 CFR 122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities that manufacture electronic and electrical equipment and components, photographic, and optical goods. Under the Storm Water Regulations at 40 CFR 122.26(b)(14), EPA defined "storm water

discharge associated with industrial activity". The focus of today's permit is to address the presence of pollutants that are associated with the industrial activities identified in this definition and that might be found in storm water discharges. Under the methodology for determining analytical monitoring requirements, described in section VI.E.1 of this fact sheet, aluminum and zinc are above the benchmark concentrations for the electronic, electric, photographic and optical goods sector. After a review of the nature of industrial activities and the significant materials exposed to storm water described by facilities in this sector, EPA has determined that the higher concentrations of aluminum and zinc

<sup>103</sup> These percentages were based on the information reported in the Part 1 group applications. However, some facilities which utilize

these BMPs as part of their daily activities may not recognize these practices as BMPs and as a result did not report this information in their applications.

are not likely to be caused by the industrial activity, but may be primarily due to non-industrial activities on-site. Today's permit does not require electronic, electric, photographic and optical goods facilities to conduct analytical monitoring for these parameters.

Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual examinations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct analytical monitoring, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual examination of a storm water discharge from each outfall are required. The examination must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. Whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: January through March; April through June; July through September; October through December. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff begins discharging. Reports of the visual examination include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual examination reports must be maintained onsite with the pollution prevention plan.

EPA realizes that if a facility is inactive and unstaffed it may be difficult to collect storm water discharge samples when a qualifying event occurs. Today's final permit has been revised so

that inactive, unstaffed facilities can exercise a waiver of the requirement to conduct quarterly visual examination.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on examination will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that analytical monitoring is necessary for facilities that manufacture electronic and electrical equipment and components, photographic, and optical goods. EPA believes that between quarterly visual examinations and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

#### IX. Paperwork Reduction Act

EPA has reviewed the requirements imposed on regulated facilities in this proposed multi-sector general permit

under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 et seq. The information collection requirements in today's permit have already been approved by the Office of Management and Budget (OMB) in previous submissions made for the NPDES permit program under the provisions of the Clean Water Act.

#### X. 401 Certification

Section 401 of the CWA provides that no Federal license or permit, including NPDES permits, to conduct any activity that may result in any discharge into navigable waters, shall be granted until the State in which the discharge originates certifies that the discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA. The Section 401 certification process has been completed for all States, Indian lands, and Federal facilities covered by today's general permit. The following summary indicates where additional permit requirements have been added as a result of the certification process and also provides a more detailed discussion of additional requirements for the District of Columbia, Louisiana, New Mexico, Oklahoma, Texas, Arizona, and Washington State.

##### *Region I*

Connecticut: Indian lands only, no 401 conditions.  
 Maine: No 401 conditions.  
 Maine Indian lands: No 401 conditions.  
 Massachusetts: No 401 conditions.  
 Massachusetts: Indian lands only, no 401 conditions.  
 New Hampshire: no 401 conditions.  
 New Hampshire: Indian lands only, no 401 conditions.  
 Rhode Island: Indian lands only, no 401 conditions.  
 Vermont: Indian lands only, no 401 conditions.  
 Vermont: Federal facilities only, no 401 conditions.

##### *Region II*

Puerto Rico: no 401 conditions.  
 Puerto Rico: Federal facilities only, no 401 conditions.

##### *Region III*

District of Columbia: see the following and Part XII of the permit for 401 conditions.

The District of Columbia has added the following permit conditions in order to protect water quality in the District. A copy of all storm water pollution prevention plans required under the permit shall be submitted to the District of Columbia's Department of Consumer and Regulatory Affairs, Environmental

Regulation Administration, for review and approval.

District of Columbia: Federal facilities only, see the following and Part XII for 401 conditions.

The District of Columbia has added the following permit conditions for Federal facilities in order to protect the quality of waters in the District and surrounding areas including the Chesapeake Bay. Any Federal facility regulated by this permit shall include in its storm water management plan required by this permit the following additional items: current nitrogen and phosphorus loads, current fertilizer usage, current exterior pesticide usage, and current urea for deicing usage; volume of any storm water diverted to the sanitary sewer from roof leaders or other connections and the volume of any ground water diverted to the sanitary sewer; proposed reductions in nutrient and pesticides loads in accordance with the Chesapeake Bay Restoration goals; any Federal facility regulated by this permit, which manages significant quantities of animals or animal wastes, shall provide in the storm water management plan an accounting of these animal wastes, and nutrient control measures for avoiding, reducing, or eliminating runoff of these animal wastes; and any Federal facility regulated by this permit whose storm water discharges to a combined sewer shall study, or contribute to any joint study, the impact of its storm water discharge(s) on combined sewer overflows, and address potential solution(s) to avoid, reduce, or eliminate the combined sewer overflows caused by its storm water discharge(s). In addition, a copy of all storm water pollution prevention plans required under the permit shall be submitted to the District of Columbia's Department of Consumer and Regulatory Affairs, Environmental Regulation Administration, for review and approval.

Delaware: Federal facilities only, no 401 conditions.

*Region IV*

Florida: no 401 conditions.

*Region VI*

Louisiana: see the following and Part XII of the permit for 401 conditions.

In accordance with the Louisiana Coastal Zone Management Program (LRS 49:214), all facilities whose activities occur in, or have an effect on, the designated costal zone of Louisiana, must obtain an individual coastal zone consistency concurrence, permit, or waiver from the Coastal Management Division of the Louisiana Department of

Natural Resources. These facilities are provided with an address to help in determining if they have responsibilities for obtaining clearance from the Louisiana Department of Natural Resources. These facilities cannot be eligible for coverage under this NPDES permit unless they have fulfilled their responsibilities under the Louisiana Coastal Zone Management Program. This is a condition of certification from the State of Louisiana (letter June 29, 1995).

As a condition for certification under Section 401 of the CWA, the State of Louisiana (letter dated February 1, 1995) required inclusion of the following limitations necessary to insure compliance with State water quality standards. These limitations are required under Louisiana Annotated Code 33:IX.708 (LAC 33:IX.708).

(1) General Limitations become effective on the effective date of the permit.

Parameter	Daily maximum (mg/l)
Total Organic Carbon (TOC) .....	50
Oil & Grease .....	15

(2) Oil & Gas Exploration and Production Facility requirements become effective on the effective date of the permit.

Parameter	Daily maximum (mg/l)
Chemical Oxygen Demand (COD)	100
Total Organic Carbon (TOC) .....	50
Oil & Grease .....	15

Chlorides: (a) Maximum chloride concentration of the discharge shall not exceed two times the ambient concentration of the receiving water in brackish marsh areas.

(b) Maximum chloride concentration of the discharge shall not exceed 500 mg/l in freshwater or intermediate marsh areas and upland areas.

Monitoring requirements for Total Organic Carbon (TOC) and Oil and Grease have been added to all facilities required to monitor annually or semi-annually. Facilities without monitoring requirements must insure the pollution prevention plan will insure compliance with these effluent limitations. The definitions of brackish marsh, freshwater marsh, intermediate marsh, upland area, and saline marsh at LAC 33:IX.708 have been included in Part X. of the permit.

Louisiana: Federal Indian Reservations only, no 401 conditions.

New Mexico: see the following and Part XII of the permit for 401 conditions.

As a condition for certification under Section 401 of the CWA, the State of New Mexico required inclusion of the following conditions necessary to insure compliance with State water quality standards (letter dated June 16, 1995). These conditions apply to permittees with facilities discharging into waters of the State of New Mexico. This testing requirement is in addition to any other monitoring required under the permit.

Results of the testing requirement is to be reported only to the State of New Mexico at the address given in the permit. A copy of the data shall be kept with the Pollution Prevention Plan.

New Mexico: Federal Indian Reservations only, no 401 conditions.

Oklahoma: see the following and Part XII of the permit for 401 conditions.

Under section 301 of the CWA and 40 CFR 122.44, EPA is required to include permit conditions necessary to insure compliance with more stringent conditions of State law. The proposed permit included requirements based on the 1988 Oklahoma Water Quality Standards, prohibiting new point source discharges to several classes of high quality waterbodies of the State. The final permit conditions reflect the requirements of Oklahoma Annotated Code Title 785, chapter 45 (OAC 785:45-5-25), effective June 25, 1992.

In order to comply with OAC 785:45-5-25, the permit will not authorize any new point source discharge of storm water associated with industrial activity to "new" point source discharges of storm water associated with industrial activity (those commencing after the June 25, 1992, effective date of the Oklahoma Water Quality Standards—OAC 785:45) to the following waters:

- (i) Waterbodies designated as "outstanding Resource Waters" and/or "Scenic Rivers" in appendix A of the Oklahoma Water Quality Standards;
- (ii) Oklahoma waterbodies located within the watersheds of waterbodies designated as "Scenic Rivers" in appendix A of the Oklahoma Water Quality Standards; and
- (iii) Waterbodies located within the boundaries of Oklahoma Water Quality Standards appendix B areas which are specifically designated as "Outstanding Resource Waters" in appendix A of the Oklahoma Water Quality Standards.

In addition to this general permit exclusion on coverage, the Agency would like to emphasize the OAC 785:45-5-25 also prohibits the issuance of any NPDES discharge permit (other than for storm water runoff from temporary construction activity) for new point source discharges to ORWs or

Scenic Rivers, that commences after June 25, 1992.

Outstanding Resource Waters and Scenic Rivers are located in the following river basins identified in Oklahoma Water Quality Standards.

Basin 1—Middle Arkansas River: Barren Fork and certain listed tributaries; and the Upper Illinois River above Barren Fork confluence and certain listed tributaries.

Basin 2—Lower Arkansas River: Lee Creek and certain listed tributaries.

Basin 4—Lower Red River: Upper Mountain Fork River and certain listed tributaries.

For specific applicability, or a complete listing of affected waterbodies, permittees should refer to the Oklahoma Water Quality Standards, appendices A and B, or contact the Oklahoma Water Resources Board.

Oklahoma: Federal Indian Reservations only, no 401 conditions.

Texas: see the following and Part XII of the permit for 401 conditions.

As a condition for certification under section 401 of the CWA, the State of Texas required inclusion of the following conditions necessary to insure compliance with State water quality standards.

The following effluent limitations are required under the Texas Water Quality Standards (31 TAC 319.22 and 319.23). All pollution prevention plans developed pursuant to this permit must enable the discharger to comply with the limitations listed below.

All Discharges to Inland Waters

The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to inland waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.05	0.1	0.2
Chromium .....	0.5	1.0	5.0
Copper .....	0.5	1.0	2.0
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.05	0.1	0.2
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

All Discharges to Tidal Waters

The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to tidal waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.1	0.2	0.3
Chromium .....	0.5	1.0	5.0
Copper .....	0.5	1.0	2.0
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.1	0.2	0.3
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

The definitions of "inland" and "tidal" waters has been included in part XI.E of the Texas permit. Inland waters are those not defined as tidal waters. Tidal waters include those waters of the Gulf of Mexico within the jurisdiction of the State of Texas, bays and estuaries thereto, and those portions of the river systems which are subject to the ebb and flow of the tides, and to the intrusion of marine waters.

All facilities that have demonstrated significant lethality, which has not been controlled, shall continue to perform WET testing in accordance with the State specified requirements. The Texas Surface Water Quality Standards

contain a whole effluent toxicity standard requiring discharges to exhibit greater than 50% survival of the appropriate test organisms in 100% effluent for a 24-hour period (i.e., 24-hr LC50 > 100%). As a condition for certification, the State required modification of the toxicity test protocol contained in the permit to conform to that specified to demonstrate compliance with the State standard. The results of the toxicity testing will be used to insure that facilities which have exhibited toxicity in the past will be required to continue monitoring for whole effluent toxicity and identify discharges that will require more

stringent pollution prevention plans and/or individual or alternative general permit coverage.

Texas: Federal Indian Reservations only, no 401 conditions.

Region IX

Arizona: see the following and Part XII of the permit for 401 conditions.

Arizona: Federal facilities only, see the following and Part XII of the permit for 401 conditions.

In order to ensure compliance with the requirements of the State of Arizona, discharges authorized by this permit shall not cause or contribute to a violation of any applicable water quality

standard of the State of Arizona (Arizona Administrative Code, Title 18, Chapter 11). Notices of Intent, Notices of Termination, and for those facilities subject to monitoring and reporting requirements, Discharge Monitoring Report Form(s) and other required monitoring information shall be submitted to the State of Arizona Department of Environmental Quality at the following address: Storm Water Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue, Phoenix, Arizona 85012.

NOIs submitted to the State of Arizona shall include the well registration number if storm water associated with industrial activity is discharged to a dry well or an injection well.

SARA Section 313 (Community Right to Know) Facilities are subject to the following additional requirement: liquid storage areas for Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 chemicals. Appropriate measures to minimize discharges of Section 313 chemicals shall include secondary containment provided for at least the entire contents of the largest tank plus sufficient freeboard to allow for the 25-year, 24-hour precipitation event, a strong spill contingency and integrity testing plan, and/or other equivalent measures.

All facilities with any portion of the facility that is located at or below the Base Elevation shall delineate on the site map those portions of the facility that are located at or below the Base Elevation.

The following definitions are added to Part X of the permit:

“Significant Sources of Non-Storm Water”—includes, but is not limited to discharges which could cause or contribute to violations of water quality standards of the State of Arizona, and discharges which could include releases of oil or hazardous substances in excess of reportable quantities under Section 311 of the Clean Water Act (see 40 CFR 110.10 and CFR 117.21) or Section 102 of CERCLA (see CFR 302.4).

“Base Elevation”—elevation of a surface waterbody having a one percent chance of being equaled or exceeded during any given year.

Arizona: Federal Indian Reservations only (including those portions of the Navajo Reservation located outside Arizona), no 401 conditions.

California: Federal Indian Reservations only, no 401 conditions.

Nevada: Federal Indian Reservations only (including those portions of the Duck Valley, Fort McDermitt, and

Goshute Reservations located outside Nevada), no 401 conditions.

Johnston Atoll: no 401 conditions.  
Johnston Atoll: Federal facilities only, no 401 conditions.

Midway and Wake Island: no 401 conditions.

Midway and Wake Island: Federal facilities only, no 401 conditions.

#### Region X

Alaska: Federal Indian Reservations only, no 401 conditions.

Idaho: no 401 conditions.

Idaho: Federal Indian Reservations only (except the Duck Valley Reservation lands which are handled by Region IX), no 401 conditions.

Idaho: Federal facilities only, no 401 conditions.

Oregon: Federal Indian Reservations only, no 401 conditions.

Washington: Federal Indian Reservations only, no 401 conditions.

Washington: Federal facilities only, see the following and Part XII of the permit for 401 conditions.

In order to ensure compliance with the requirements of the State of Washington, discharges authorized by this permit shall not cause or contribute to a violation of any applicable water quality standard of the State of Washington, specifically Chapter 173–201A WAC Surface Water Quality Standards, Chapter 173–204 WAC Sediment Standards, and the National Toxics Rule for human health related to water quality standards.

#### XI. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., EPA is required to prepare a Regulatory Flexibility Analysis to assess the impact of rules on small entities. Under 5 U.S.C. 605(b), no Regulatory Flexibility Analysis is required where the head of the Agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.

Today's permit will provide any small entity the opportunity to obtain storm water permit coverage as a result of the group application process. Group applications provided small entities a mechanism to reduce their permit application burden by grouping together with other industrial facilities and submitting a common permit application with reduced monitoring requirements and shared costs. The group application information submitted to EPA provided a basis for the development of storm water permit conditions tailored specifically for each industry. The permit requirements have been designed to minimize significant administrative and economic impacts

on small entities and should not have a significant impact on industry in general. Moreover, the permit reduces a significant burden on regulated sources of applying for individual permits.

Accordingly, I hereby certify pursuant to 5 U.S.C. 605(b) that this permit will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 U.S.C. 1251 et seq.

#### XII. Unfunded Mandates Reform Act

Under section 202 of the Unfunded Mandates Reform Act of 1995 (“Unfunded Mandates Act”), which was signed into law on March 22, 1995, EPA must prepare a written statement to accompany any rules with Federal mandates that may result in estimated costs to State, local, or tribal governments in the aggregate, or to the private sector, of \$100 million or more in any one year. When such a statement is required for EPA rules, under section 205 of the Unfunded Mandates Act, EPA must identify and consider alternatives, including the least costly, most cost-effective or least burdensome alternative that achieves the objective of such a rule. EPA must select that alternative, unless the Administrator explains in the final rule why it was not selected or it is inconsistent with law. Before EPA establishes regulatory requirements that significantly or uniquely affect small governments, including tribal governments, it must develop under section 203 of the Unfunded Mandates Act a small government agency plan. The plan must provide for meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising them on compliance with the regulatory requirements.

In response to the requirements of the Unfunded Mandates Act, the Act generally excludes from the definition of a “Federal intergovernmental mandate” (in sections 202, 203, and 205) duties that arise from participation in a voluntary Federal program. A municipal discharger of storm water associated with industrial activity may voluntarily elect to seek coverage under today's multi-sector general permit rather than obtain an individual permit or coverage under a baseline general permit. Coverage under today's permit, therefore, is voluntary in that the permit does not automatically apply to any particular entity. Thus, it imposes no Federal intergovernmental mandate within the meaning of the Act.

Small government agency plans under section 203, on the other hand, are required when small governments may

be significantly or uniquely affected by regulatory requirements. "Regulatory requirements" arguably include the requirements of this permit should a municipality seek to be covered under the permit. EPA envisions that some municipalities may elect to seek coverage under this permit for certain storm water discharges, for example, from the following types of industrial activity: hazardous waste treatment, storage, and disposal; industrial landfills, land application sites and open dumps; scrap and waste material recycling; steam electric power generation; ground transportation (local and suburban transit, interurban highway passenger transportation, including railroads, petroleum bulk stations, and motor freight transportation); air transportation; domestic waste water treatment; and water transportation. Any such permit requirements, however, do not significantly affect small governments because they are subject to the same requirements as other entities whose duties result from today's rule. Permit requirements also do not uniquely affect small governments because compliance with the permit's conditions affects small governments in the same manner as other entities seeking coverage under the permit. Thus, any applicable requirements of section 203 have been satisfied.

The regulated community that may seek coverage under this general permit, including small governments, have been involved in the development of this permit and, therefore, have had notice of the requirements that they may incur under this permit. EPA has prepared permit Fact Sheets to accompany this permit in order to inform and educate permit applicants about how to comply with the terms of the permit. EPA has already published instructional guidance: Developing Pollution Prevention Plans for Construction and (other) Industrial Activity (1992), NPDES Storm Water Sampling Guidance Document, 833/B-92-001 (July 1992), and Guidance for the Preparation of Discharge Monitoring Reports: Facilities required to Report Semi-annual Monitoring Results Under NPDES Storm Water General Permits, 833/B-93-002 (rev. April 1994). Therefore, EPA encourages any small governments that may seek coverage under this multi-sector general permit to refer to that instructional guidance, as well as contact EPA Regional storm water coordinators listed in the Permit Fact Sheet for any additional assistance such small governments may require.

Accordingly, I hereby certify pursuant to the provisions of the Regulatory

Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: August 29, 1995.

Marley Laing,

*Acting Regional Administrator, Region I.*

Accordingly, I hereby certify pursuant to the provisions of the Regulatory Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: August 16, 1995.

Jeanne M. Fox,

*Regional Administrator, Region II.*

Accordingly, I hereby certify pursuant to the provisions of the Regulatory Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: September 11, 1995.

Stanley L. Laskowski,

*Acting Regional Administrator, Region III.*

Accordingly, I hereby certify pursuant to the provisions of the Regulatory Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: September 11, 1995.

Patrick M. Tobin,

*Acting Regional Administrator, Region IV.*

Accordingly, I hereby certify pursuant to the provisions of the Regulatory Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: September 12, 1995.

William G. Laxton,

*Acting Regional Administrator, Region VI.*

Accordingly, I hereby certify pursuant to the provisions of the Regulatory Flexibility Act, that these permits will not have a significant impact on a substantial number of small entities.

Authority: Clean Water Act, 33 USC 1251 *et seq.*

Dated: August 24, 1995.

Alexis Strauss,

*Acting Regional Administrator, Region 9.*

Accordingly, I hereby certify pursuant to 5 U.S.C. 605(b) that this permit will not have a significant impact on a substantial number of small entities.

Dated: September 11, 1995.

Chuck Clarke,

*Regional Administrator, Region 10.*

Appendix A—Summary of Responses to Public Comments on the November 19, 1993, Proposed Draft Multi-Sector Storm Water General Permit

The following discussion is a summary of the major issues identified by EPA that were raised regarding the storm water multi-sector industrial general permit during the public comment period, along with EPA's response to each major issue. This summary aggregates comments by similarity of the issues and does not discuss each and every public comment that was received on the proposed permit. A comprehensive discussion of each comment that was raised is provided in a separate detailed response to comment document which is maintained by EPA as a part of the record for this permit issuance action. The first part of this appendix responds to the major issues raised by commenters during the comment period and the second part responds to key industry-specific issues.

#### Eligibility of Non-Group Members

As proposed, the multi-sector storm water general permit may provide discharge authorization for any industrial activity described in the coverage sections of the twenty-nine industrial sectors that have point source discharges of storm water to waters of the United States or to a municipal separate storm sewer system and which meet the general eligibility provisions of the permit. Coverage under the permit, as proposed, was allowed for owners and operators of these types of industrial activities regardless of whether or not they participated in a group application. Several commenters expressed concern that owners/operators of facilities which did not participate in the group application process will be eligible for coverage under the multi-sector general permit, and suggested that only those facilities that participated in the group process be allowed coverage under the permit.

EPA set forth the storm water permit application process (including group applications) in the storm water regulations published in November, 1990 (55 FR 47990). EPA's strategy, as stated in this notice, was to regulate storm water discharges from industrial activity by promulgating a baseline general permit for most industrial dischargers (Tier 1), and then to develop more specific industry and/or watershed general permits (Tiers 2 & 3). An integral part of the process to develop

the multi-sector storm water general permit, which is similar to a Tier 3 permit (industry-specific), was the assimilation of the industry-specific data gathered from the group applications. It was always EPA's intention to utilize this information in the development of permits to cover all applicable facilities, and to provide the resulting permit as a model to States for use in State permitting programs. In the preamble to these regulations on pages 48027 and 48028, EPA made it clear that the group application process would lead to either general permits for large groups of similar discharges or to individual permits for individual facilities. EPA did not commit to issue permits that were open only to group members. The concept of the general permit implies wide-ranging issuance to all eligible facilities.

Given the large number of group applications and the similarity between groups, EPA chose to develop and propose one general permit with twenty-nine different industry sectors covering all the industries represented in the group applications, rather than issue twenty-nine separate sector general permits, one by one, to each and every group. Likewise, EPA chose not to issue a separate and distinct "group" permit to each and every group because of the similarity between groups, in the industrial activities, significant materials stored exposed to storm water and the material management practices employed, as reported in the group application information. Given the similarity of the industrial activities represented in the group applications, twenty-nine sectors represented were determined by EPA as a reasonable grouping of the industries that participated in the group process. EPA further believes that the use of the twenty-nine sectors provides a fair and reasonable method for permitting each industry group that participated in the group application process.

To make the best use of the proposed multi-sector general permit, EPA chose not to limit coverage under this general permit to those facilities that only participated in the group process. The application information provided by the groups was extremely valuable in preparing the permit and has resulted in an accurate and more applicable industrial permit for the types of facilities represented in the applications. EPA is not precluded or restricted from utilizing information gathered from particular types of applications submitted to the Agency during the application process, and accordingly, coverage under today's general permit will remain available to

all industrial facilities that meet the eligibility criteria of the permit, whether or not they participated in a group application.

#### Choice Between Baseline and Multi-Sector Permit

In the fact sheet for the proposed multi-sector general permit, EPA stated that group applicants could seek coverage under the baseline general permit rather than under this multi-sector general permit, but noted that certain deadlines for pollution prevention plan preparation and implementation had already expired for existing facilities under the baseline permit. Commenters supported the option that group applicants be allowed to choose coverage under either the multi-sector general permit or the baseline general permit once the multi-sector permit is issued in final. In addition, commenters requested that group applicants choosing to obtain coverage under the baseline general permit not be required to prepare a pollution prevention plan prior to submitting an NOI. These comments raise two issues: (1) Should group applicants be allowed to apply for coverage under the baseline general permit after the permit's October 1, 1992 deadline for existing facilities to apply for coverage; and (2) should the deadlines in the baseline general permit for pollution prevention plan preparation and implementation, sampling, etc. be waived for facilities filing for coverage after the October 1, 1992 deadline.

EPA will allow group applicants to submit an NOI for coverage under either today's multi-sector general permit or the baseline general permit. Although Part II.A.6 of the baseline general permit currently allows existing facilities to submit an NOI for coverage after October 1, 1992, the Agency reserves the right to limit coverage under the baseline general permit at a later date.

EPA will not, however, extend compliance deadlines in the baseline general permit for facilities that participated in the group application process. Group applicants had the opportunity to apply for the baseline general permit in a timely manner. It would be inappropriate for EPA to favor group applicants over facilities that complied with the baseline general permit by allowing them more time to come into compliance. Additionally, extending the baseline permit deadlines would require a modification of the baseline general permit, which is beyond the scope of today's final rule.

#### Consolidation of the Group Applications Into 29 Industry Sectors

Over 1,200 group applications were submitted to EPA pursuant to the group application option contained in 40 CFR 122.26(c)(2). As the group application option progressed, many of the groups dropped out leaving approximately 700 groups. Based on the similarity of many of the groups, and to maintain a manageable number of permits to be issued, EPA consolidated the approximately 700 groups into 29 industrial sectors, and developed BMP and monitoring requirements for each sector.

EPA received 50 comments regarding the consolidation of group applications. Thirty-eight comments objected to consolidation, while 12 comments expressed support. Another 38 comments suggested that the 29 industrial sectors should be divided into additional subsectors. Some commenters that objected to consolidation suggested that the use of SIC codes as one of the underpinnings for consolidation was inappropriate because SIC codes are based on economic activity, and are not meant to be indicative of an industry sector's affect on the quality of storm water runoff. Some commenters suggested that the consolidation process failed to take into account the climatic variations of different geographic regions across the country. Other commenters objected to the consolidation process on the basis that it represented a significant departure from the group application process as described in the preamble to the storm water permit application regulations published on November 16, 1990 (55 FR 48024). Some comments expressed disappointment that the group applications were not handled in a more "individualized" manner, and one comment suggested that the group application consolidation process violated the Administrative Procedure Act (APA).

Many of the commenters that expressed objections to the consolidation of the group applications offered alternative suggestions. Most recommended that additional sectors or subsectors be established, and it was also suggested that the general permit include a provision allowing industries the option of petitioning for the creation of subsectors during the term of the permit. Other suggestions included establishing minimum activity requirements that trigger monitoring requirements, or deleting the priority/nonpriority monitoring structure altogether.

For the final general permit, EPA has retained the 29 industrial sectors as listed in the proposed rule, with the addition of supplementary subsectors that establish specific monitoring requirements for different types of facilities within industrial sectors. In response to comments expressing concern over monitoring requirements that apply to all facilities within the priority sectors, the Agency re-evaluated the monitoring data submitted by facilities in the 29 industrial sectors, and modified the methodology for determining the types of facilities that are required to conduct storm water monitoring. Accordingly, the final general permit has been changed to focus monitoring requirements on industrial sub-sectors which, according to the submitted monitoring data, pose the greatest potential risk to storm water runoff quality. The final permit also provides the opportunity for facilities in sub-sectors that are subject to storm water monitoring to apply the alternative certification provisions (see section VI.E.3 of the Fact Sheet). The alternative certification provisions provide facilities an opportunity to reduce or avoid storm water monitoring requirements under certain circumstances and is discussed in more detail below.

As noted above, some commenters questioned whether the consolidation process was consistent with NPDES and APA regulations. EPA conducted a thorough review of the consolidation process for consistency with the NPDES regulations. Section 122.28(a)(2)(i) allows EPA to issue general permits for "storm water point sources;" this section does not in any way limit or qualify the types of sources subject to regulation. EPA also has broad regulatory discretion regarding geographic boundaries pursuant to section 122.28(a)(1). In developing the general permit, the Agency attempted to strike a balance between recognizing the variety of facilities that comprise the group applicants and developing a permitting process that could be administered without an undue expenditure of Agency resources. In summary, all actions taken by EPA, including the consolidation process, are also within the discretion accorded to the Agency under the Clean Water Act and NPDES regulations.

In regards to consistency with the APA, Section 553 of the APA requires that public notice and opportunity for public comment be provided for all rulemakings. EPA published the proposed NPDES General Permit for Storm Water Discharges From Industrial Activities in the Federal Register and

provided a 90-day comment period on November 19, 1993 (58 FR 61146). Public hearings were also held in the EPA Regions. Furthermore, EPA invited comment on the 29 sector consolidation. These efforts by the Agency are consistent with the provisions of the APA.

As noted earlier, some commenters suggested that the use of SIC codes were inappropriate as a basis for consolidating industrial facilities into 29 industrial sectors. EPA notes that the nature of the industrial activities, as described in the group application information, in conjunction with SIC codes are an appropriate basis for sector consolidation. Although SIC codes are used to categorize industries based on economic activities, these codes are generally grouped together based on similar industrial activities. In addition, EPA was aware of the differences and similarities among the facilities included in a particular sector based upon the group application data that was submitted by the participants. Using this information in conjunction with the activity descriptors in the SIC codes, EPA was able to appropriately group similar industrial activities into the 29 sectors.

#### Credit for Group Members

EPA requested and received 75 comments that addressed the issue of whether EPA should grant some form of credit for facilities that participated in the group application process. Specifically, these commenters objected to EPA developing a permit that applies not only to group applicants but also to facilities that did not participate in the group application process. Thus, many of these commenters are seeking credit for the costs they incurred in the preparation of group permit applications.

A majority of the commenters expressed a desire for reduced monitoring as compensation for completing the sampling requirements and submitting the data for Part 1 and Part 2 of the application process. Specific suggestions included exemptions from one of the four samples taken during the first year, from the second year of monitoring, or from the first five years of monitoring. Other commenters suggested that EPA allow the monitoring requirements to be left to the discretion of the States and that civil fines be waived for inadvertent non-compliance of group members. In response to these comments, EPA wants to clarify that it is not allowing exemptions from monitoring requirements based on whether a facility participated in the group

application process. EPA based the monitoring requirements in the permit on data submitted during the application process and does not intend to allow those facilities to conduct less frequent monitoring because of their participation in the group application process. Rather, facilities that participated in the group application process are actually in a position to benefit from the permit in the sense that this permit is tailored directly to their industrial sector and is based specifically on information provided in their group application. Facilities that did not participate in group applications will be required to comply with the permit conditions regardless of their site-specific circumstances.

Many commenters also expressed concern that the multi-sector permit would be available to non-group members. Although EPA regrets that the group application process did not produce the results that some participants hoped for, it would be a misuse of tax dollars to limit coverage under the multi-sector permit to group members and then develop another permit for non-group members. However, EPA would like to point out that facilities that participated in the group application process are in compliance with the permit application requirements under the storm water program, whereas facilities that did not participate in a group application and that are not covered under another permit are not in compliance and remain subject to enforcement action until covered by a permit.

Several other commenters suggested providing compensation for group members by waiving permit fees equal to the amount spent on data collection fees. In response, EPA is unable to devise an equitable manner for credit to be provided in this way.

Finally, some commenters advocated that group members be either exempted from the NOI submittal requirement or allowed to at least submit one NOI for the group. Other commenters suggested that the dates for submitting NOIs be extended for group members and that previously submitted NOIs be accepted. In today's general permit requirements, EPA requires each facility seeking coverage under the permit to submit their own NOI form. This requirement allows EPA to successfully track every facility covered by the permit. It will also increase the likelihood that facility operators will read the permit and makes enforcement actions easier to implement. EPA believes this is a justifiable requirement because the NOI form is a simple one-page form that requires little effort to complete.

In summary, EPA believes that credit has been provided to the group application members through the group application process. This included a reduced burden in submitting a permit application over the individual application option and reduced storm water sampling requirements for the application. With industry-specific information upon which to base the proposed multi-sector storm water permit, group applicants will be issued a more applicable and tailored storm water discharge permit which better takes into account the characteristics of each industry sector.

#### Storm Water Runon

The owner or operator of a regulated industrial facility with point source discharges of storm water is responsible for the storm water discharges that leave its property and enter waters of the U.S. or a municipal separate storm sewer system. There are instances, however, whereby the storm water that is discharged at least partially consists of storm water flowing onto the facility from a nearby facility or property (referred to here as "runon").

Commenters have requested clarification of the permit language on the issue of runon. One commenter asked for a provision to be added to the permit that would relieve facilities from any responsibility for pollutants present in storm water runon which is eventually discharged from their property. The commenter also indicated that runon from adjacent sites cannot always be separated from onsite discharges.

Today's general permit does not change the provisions related to runon. Facilities that discharge point sources of storm water associated with industrial activity, even if it includes offsite runon, remain responsible for the permitting of those discharges. Such facilities which seek coverage under today's permit must address storm water runon in their storm water pollution prevention plan (storm water pollution prevention plan). If a facility cannot effectively address the runon problem in their storm water pollution prevention plan, then the facility should contact their NPDES permitting authority for assistance on how to deal with the runon problem. In addition, the facility may choose to monitor the runon to document that the source of pollutants is offsite. By doing so, a facility with a runon problem may be better able to show that the pollutant source is offsite and that their pollution prevention plan is adequately addressing all onsite sources. Offsite facilities which are the source of the contaminated runon could

be designated by the permitting authority as a co-permittee with the adjacent facility and jointly develop a storm water pollution prevention plan, and perform any monitoring which may be required to address the situation. They may also be designated as a separate permittee by the permitting authority.

#### Acceptance of Group Application in Lieu of an NOI

A number of commenters suggest EPA exempt members of approved group applications from the Notice of Intent (NOI) submittal requirements. The commenters indicate these facilities should automatically be covered under today's permit because they have already satisfied the NPDES storm water application requirements.

EPA cannot exempt members of the approved group application from the NOI submittal requirements. Federal regulations under 40 CFR 122.28(b)(2) require an NOI for all NPDES general permits for the discharge of storm water associated with industrial activity. EPA cannot assume that all members of the approved group applications wish to be covered by today's permit, or that they satisfy the eligibility provisions of the permit.

#### Encourage NPDES States To Accept Group Applications

Several commenters requested that EPA require or encourage NPDES-authorized States to accept the group applications and/or issue permits based on the multi-sector model.

EPA has, and continues, to encourage States to make use of the multi-sector general permit for permitting industrial activities. EPA has encouraged States by sending them the original permit and fact sheet and by supporting them with additional information necessary to issue the permit within their States. EPA has also given NPDES States databases of the group application members which allows each State to identify group applicants within their States. EPA will make available to all NPDES authorized States a copy of the final multi-sector general permit. In addition, EPA will make available group application information to any NPDES States that request it. However, EPA cannot require NPDES-authorized States to accept group applications and to utilize the multi-sector permit as a model for developing a State permit. This would be inconsistent with previously stated EPA position. The response to comments for the final storm water regulations (55 CFR 48028) specifically noted that NPDES-authorized States were free to adopt the

group application process, " \* \* \* but is not required to." EPA also recommended that "(b)efore submitting a group application, facilities should ascertain from the State permitting authority whether that State intends to issue permits based on a group application \* \* \*." The Agency believes general permits offer an efficient means of providing discharge permit coverage to a large number of facilities and that the multi-sector general permit represents an appropriate permit for the industries that were members of group applications. However, once the NPDES program is approved for a State, basic permitting decisions lie with the State.

#### Co-Located Industrial Activities

A number of commenters expressed concern over the conditions in the permit which require facilities with multiple "co-located" industrial activities to comply with all industry sector requirements that are applicable to one or more of the industrial activities on their site. Commenters argue that given the large number of industry sectors and the complexity of the eligibility requirements, it will be difficult for facilities to determine which industry sector requirements apply. Commenters expressed concern that a permittee could unknowingly violate the permit conditions by failing to recognize that a portion of his/her facility is subject to another industry sector requirements. Commenters also stated that the cumulative burden of the monitoring and pollution prevention plan requirements for facilities with a number of industrial activities would be excessive.

In response to these concerns, EPA has modified those sections of today's permit addressing co-located activities to reduce confusion that could arise from the co-located conditions as proposed. However, under today's permit facilities with multiple industrial activities are still required to prepare and implement a pollution prevention plan which addresses the requirements of all the applicable industry sector requirements. These facilities are also required to comply with the industry sector monitoring requirements on an outfall by outfall basis. The intent of today's permit remains the same, which was to require pollution prevention plan measures and storm water monitoring which specifically addresses the pollutant sources at the permitted industry facility. Operators of facilities with multiple industrial activities will need to carefully and completely review the permit and fact sheet to determine all necessary applicable terms and

conditions. EPA believes the sector descriptions are clear. Application of the sector descriptions to co-located activities is within the scope of responsibilities of a permittee under the NPDES program and does not place an undue burden on the facility operator. For clarification, with co-located industrial activities, still only one storm water pollution prevention plan is required for the facility. Monitoring requirements for each outfall will not be duplicative but will be complementary. If the same pollutant is required to be monitored in two different sectors for industrial activities found on the site, if the industrial activities drain to the same storm water outfall, only one sample and analytical measurement for that pollutant is necessary.

#### Notice of Intent Submission Requirements

A number of commenters expressed concern over the requirement in the proposed permit for submission of a Notice of Intent (NOI) when there is a change in the operator of the facility. The proposed permit required the new operator to submit an NOI 2 days prior to the transfer of operations. The commenters opposed this time frame for submittal of the NOI, stating that the purchaser of an industrial activity will not be able to complete the NOI or prepare a Storm Water Pollution Prevention Plan in advance of the property transfer. The commenters suggested different time frames for submittal of an NOI which ranged from 30 to 120 days after the transfer of operations.

Today's permit retains the requirement that new operators notify EPA at least 2 days in advance of a transfer of operator responsibility for an industrial activity. EPA believes that the simple information required for completion of the NOI can easily be obtained by the purchaser in advance of the actual property transfer. Operators of recently purchased facilities which discharge storm water associated with industrial activity without an NPDES permit would be in violation of the Clean Water Act.

In addition to submitting the NOI two days prior, new operators which assume ownership of an industrial facility without a break in operations must continue to implement the Storm Water Pollution Prevention Plan prepared by the previous operator, otherwise failure to do so would constitute a violation of the NPDES storm water general permit conditions. These facilities may subsequently modify the storm water pollution prevention plan to accommodate any changes in operation

which they choose to make, provided the storm water pollution prevention plan still meets all requirements of the permit.

#### Submission of a Copy of the Notice of Intent (NOI) to the Operator of the Municipal Separate Storm Sewer

Several commenters opposed the requirement for facilities which discharge to Municipal Separate Storm Sewers (MS4) to submit a copy of the NOI to the operator of the MS4. The commenters argue that submitting the notice places an additional paperwork burden upon the facilities. Others argue that the submission is unnecessary because all industrial activities discharging to MS4's were required to notify their municipalities prior to May 15, 1991. Finally one commenter stated that there would be no benefit from facilities covered under this permit notifying municipalities since facilities covered under other general permits or individual permits would not be required to notify the MS4 operator.

Today's permit retains the requirement for facilities which discharge to a MS4 to send a copy of the NOI to the operator of the MS4. This requirement is retained as a provision to assist municipalities comply with the anticipated requirements of their NPDES permits. This will be a key piece of information for municipalities to identify industrial discharges to their MS4s as required under 40 CFR 122.26. Through submittal of the NOI to the MS4, municipalities can keep an up-to-date inventory of storm water discharges associated with industrial activity that discharge to the system. From this inventory, municipalities may (as a part of their storm water management plan activities) review industrial pollution prevention plans of the industries which discharge to their system. EPA does not believe this requirement presents a significant paperwork burden for the facility since the facility is simply required to make an additional copy of the one page NOI form, which they send to EPA, and send that copy to the operator of the MS4. This requirement is a provision of EPA's baseline general permit and is also a requirement of most individual permits issued to industrial dischargers where the permitting authority determines it is necessary. Making use of information from a previous notification done in 1991 would not allow the municipality to keep their industrial inventory up-to-date.

#### Prohibition of Non-Storm Water Discharges

A number of the comments received discussed the prohibition of non-storm water discharges contained in the permit. The multi-sector permit authorizes some non-storm water discharges. These discharges include those from firefighting activities; firehydrant flushings; irrigation drainage; lawn watering; routine external building washdown without detergents; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; springs; uncontaminated ground water; and foundation or footing drains where flows are not contaminated with process materials such as solvents that are combined with storm water discharges associated with industrial activity. The non-storm water discharges must be identified within the storm water pollution prevention plan to be authorized under this permit. All other non-storm water discharges including vehicle and equipment wash water, boiler blow down, and steam condensate are excluded from coverage under today's permit and must be covered under a separate NPDES permit. Today's permit requires that a facility certify that the presence of non-storm water discharges has been tested for at its outfalls and that an inventory of the locations of the outfalls with non-storm water discharges has been conducted.

EPA received several comments requesting that additional non-storm water discharges be authorized by the multi-sector permit. These discharges included those from vehicle washing that did not use detergents, air compressor condensate, discharges from drinking fountains and clean water discharges from holding tanks. EPA has reviewed the requests for additional allowable non-storm water discharges and determined that air compressor condensate and drinking fountain water are not expected to contain pollutants and will be added to the list of allowable non-storm water discharges covered by today's permit. Other non-storm water discharges such as vehicle wash waters, regardless of detergent usage, and holding tank discharges are not covered by today's permit since there is a significant potential for these types of discharges to be contaminated. Such non-storm water discharges should be authorized under another NPDES permit.

Several commenters also requested modification to the requirement that

building and pavement wash water discharge only be allowed under the permit where there has been no past spill or leaks or where all spilled material has been removed. The commenters indicated that it was not reasonable to require all residue to be removed. Commenters requested a more reasonable cleanup standard. EPA has not modified this provision in today's permit. The non-storm water discharges covered by today's permit are eligible because EPA believes these discharges will not contain contamination. To the contrary, there is a significant possibility that pavement or building wash water from an area in which a pollutant residue remains will contain pollutants which would then be discharged. Such discharges, if they are not completely cleaned up, are required to be permitted, but under a separate NPDES permit. If such discharges are numerous at a facility, the operator of the facility may find it advantageous to apply for an individual NPDES permit which could cover these types of discharges in addition to the storm water and process discharges that may be present. Under any permitting scenario, however, the preferential environmental result is to remove the residual contamination and prevent the contamination of storm water runoff.

#### Releases in Excess of Reportable Quantities

Under the proposed permit permittees were required to report releases of hazardous substances as required under 40 CFR 117 and 40 CFR 302 that exceed a reportable quantity (RQ). If the spill exceeds the RQ the facility must report the spill to the National Response Center, modify the storm water pollution prevention plan, and notify EPA in writing of the nature of the spill. The permit further required facilities to minimize the discharges of these substances in storm water through the implementation of applicable best management practices. When releases do occur, the facilities are required to submit a written report which outlines the steps to be taken to reduce the chance of further spills in the future. Commenters were concerned about how to interpret the reporting requirements for RQ releases. For instance, at an airport, if individual airlines release ethylene glycol at levels below the RQ, then is the combined discharge from several airlines considered reportable? Commenters also wanted clarification on what constituted a significant spill or leak. Is the spillage of two cups of oil significant if it causes a visible sheen?

Today's permit requires each individual permittee to report spills

equal to or exceeding the RQ levels specified at 40 CFR 110, 117, and 302. If an airport authority is the sole permittee, then the sum total of all spills at the airport would be assessed against the RQ. If the airport authority is a co-permittee with other permittees at the airport, such as numerous different airlines, the assessed amount would be the summation of all spills by each co-permittee. If separate, distinct individual permittees exist at the airport, then the amount spilled by each separate permittee is the assessed amount for RQ determination. These facilities must follow the necessary procedures for reporting spills or leaks equal to or exceeding the RQ level. Where a sole permittee is identified, this permittee would report. Where co-permittees are present, the co-permittees should identify in their pollution prevention plan for the airport who the responsible party is for reporting purposes, otherwise all co-permittees are responsible. In relation to the RQ for oil, quantity does not necessarily matter. The oil RQ is a visible sheen or slick and if such is produced by a spill of oil then the RQ has been exceeded.

#### Non-Storm Water Discharge Certification

Many commenters felt that the storm water pollution prevention plans should not include an inventory of non-storm water discharges or the NPDES permit numbers that cover those discharges. Today's permit does not require the permittee to list the NPDES permit numbers for the separately permitted non-storm water discharges, however, the permit does require that facilities identify the potential sources of the non-storm water discharges. The list of potential sources will assist the operator in efforts to eliminate or redirect non-storm water discharges.

#### Deadlines for Preparation, Implementation and Revisions to the Storm Water Pollution Prevention Plan

The proposed multi-sector permit currently requires that all facilities certify that they have prepared and implemented a storm water pollution prevention plan in accordance with part IV of the permit. For existing facilities, the storm water pollution prevention plan must be prepared and implemented within 270 days after permit issuance. New facilities must have prepared and implemented the storm water pollution prevention plan prior to submitting the NOI. Where construction is necessary to implement the plan, the facility should complete construction as soon as possible, but has up to a maximum of 3 years to comply

with the plan. There is also a provision for an extension of the deadline for implementation of the storm water pollution prevention plan where the Director may establish a later date for compliance with the plan where a facility can show good cause.

Oil and gas facilities which have discharges of reportable quantities of oil or a hazardous substance will be required to develop and implement a plan on or before 60 days after first knowledge of a release. EPA requested comment as to whether the multi-sector permit should require all permittees to submit certification that the storm water pollution prevention plan has been prepared and implemented in accordance with the terms and conditions of the permit. The proposed permit also would have required any needed revisions of the plan to be developed within 2 weeks of the Comprehensive Site Compliance Evaluation and implemented no more than 12 weeks after the inspection.

In general, commenters indicated that they needed more time to develop and implement the storm water pollution prevention plan properly because of the complexity and resources involved. These commenters were commenting on both new and existing facility requirements. Five commenters did not like the deadlines for development and implementation of a storm water pollution prevention plan in the multi-sector permit because these deadlines were inconsistent with EPA's baseline storm water general permit. They argued that the multi-sector permit should allow the same time frame of 6 months from the effective date of the permit to develop the plan with 360 days for implementation. Four commenters argued that new facilities should not have to certify that their storm water pollution prevention plan is complete at the time of NOI submittal. They felt that new facilities should be afforded the same compliance deadline as the existing facilities which are given 270 days. One commenter suggested that a more reasonable cut-off time be established for new facilities when the storm water pollution prevention plan would be required to be developed and implemented prior to the NOI. Another commenter argued that new facilities should be given 6 months after submittal of the NOI to develop and implement the plan to allow for the evaluation of plan needs while the facility is in operation. One commenter felt that a minimum of 90 days would be needed for smaller facilities for internal development and training under the storm water pollution prevention plan. Another commenter

argued that in order to develop an appropriate and effective storm water pollution prevention plan it is necessary to evaluate the facility while in operation. This commenter therefore suggested that new facilities be allowed six months to develop a storm water pollution prevention plan. One commenter stated that large waste water treatment plants need more than 270 days just to prepare the storm water pollution prevention plan and to get additional funding for the non-storm water discharge certification provisions. In addition, some commenters did not agree that the plan should be implemented within the same time frame as it is developed. They suggested a year for implementation. Another commenter would prefer a deadline of 14 months to develop and implement a storm water pollution prevention plan, arguing that companies that have many facilities, such as the freight industry, may be required to develop and implement upwards of 500 plans in the 270 days. Scrap processing and recycling facilities want longer than the 270 days (such as three years) for the implementation of treatment BMPs exceeding \$10,000 in cost, otherwise they argued that financial hardships would result. One commenter argued that facilities originally part of the group application process, who will now be submitting an NOI to be covered under the baseline general permit, should be given the same 180 to 270 days to develop and implement the storm water pollution prevention plan as those who will submit NOI's for coverage under the multi-sector permit.

A few commenters commented upon the 3-year time frame to implement BMPs requiring construction. One commenter suggested 5 years to construct storm water control measures with 50% construction at 2 years, 75% at 3 years and 100% at 5 years. One commenter also commented that 3 years was not enough time to construct controls under the storm water pollution prevention plan for federal facilities. At federal facilities funding for construction is awarded in a 5-year process. Two organizations commented on the time frames for modifications to the storm water pollution prevention plan after the site compliance evaluation. They argue that 12 weeks for implementation of necessary changes is not practical because they may require engineering design and construction. One commenter suggested that a period of 1 year be allowed for changes requiring facility modification.

EPA does not agree with the numerous comments on the deadlines for development and implementation of

a pollution prevention plan, and has decided to maintain the deadlines as proposed in the multi-sector permit for the development, implementation, and modification of the storm water pollution prevention plan. EPA believes that 9 months is adequate time for facilities to develop and implement storm water BMPs that do not require construction and for those that do, up to 3 years is sufficient. EPA has issued guidance on developing storm water pollution prevention plans for industrial activities, and this guidance is readily available. In addition, the multi-sector permit fact sheet provides an extensive amount of information on the types of industry-specific BMPs that can be implemented by facilities in each of the 29 sectors. Those facilities that cannot meet those deadlines may apply, on a case-by-case basis for an extension of the timeframes as specified in the permit.

Most new facilities should have no problem developing and implementing their storm water pollution prevention plans prior to the submittal of their NOI and the start of operations. Subsequent site compliance evaluations may show that modifications are needed based on operations at the new facility, however, they will have the additional 12 weeks after the inspection to implement the needed changes.

#### Certification of the Storm Water Pollution Prevention Plan

The proposed multi-sector permit requests comment on requiring all permittees to submit a certification to EPA upon completion and implementation of the storm water pollution prevention plan. Most commenters were against submitting a certification statement confirming the completion of the storm water pollution prevention plan. Comments indicated that the certification statement would put an unnecessary burden on the facilities. Commenters felt that when the NOI is signed and submitted, the permittee is certifying that he/she will comply with all applicable permit conditions including the development and implementation of a storm water pollution prevention plan. However, some commenters felt that submitting the certification would help facilities effectively plan the development of their storm water pollution prevention plans.

Today's permit does not require all facilities under the multi-sector permit to provide a certification upon implementation of their storm water pollution prevention plans. EPA agrees with the commenters that by signing the NOI form, permittees are agreeing to

comply with all permit conditions within the specified deadlines of the permit. This includes developing and implementing a storm water pollution prevention plan within 270 days after permit finalization for pre-existing facilities or prior to operation for new facilities. EPA reserves the right to request a copy of the completed storm water pollution prevention plan at any time and failure to comply would be a permit violation. EPA also notes that under CWA Section 402(j), permit applications and permits must be available to the public. Because the storm water pollution prevention plan constitutes a portion of the permit, such plans must be publicly available. Accordingly, EPA will contact permittees as necessary to make such plans available.

#### Identification of Outfall and Sampling Locations, and Types of Discharges Contained in Outfalls

The pollution prevention plan requirements under the proposed multi-sector permit includes the development of a site map. This site map must denote certain site characteristics, such as the pattern of storm water drainage, structural features that control pollutants in runoff, and places where significant materials are exposed to storm water. EPA requested comment as to whether the final permit should require that the site map indicate the outfall locations, sampling locations, and types of discharges contained in the outfalls.

A slim majority of the comments received indicate that the additional requirements should not be included in the final permit. Commenters believed the requirements, if adopted, could confuse users by cluttering the map, and would be a duplication of information that is required under other sections of the pollution prevention plan. In addition, several commenters stated that sampling locations may vary, depending upon factors such as the amount of rain, safety considerations, and activities occurring at the facility. Commenters argued that to continually revise the map to include these changes would place an unnecessary burden on the facility.

Commenters in favor of the additional requirements stated that the information will assist users that did not participate in the development of the site map. In addition, the map would be a good tool for training new employees. Commenters note that these requirements should be limited to outfalls covered under this permit, not others, such as those discharging to POTWs or those covered under separate

NPDES permits. Also, it may be more efficient to document some of the information on a key to the map or in a separate attachment. This would make the map easier to read and avoid the problem of clutter.

Today's permit requires permittees to indicate, on the site map, the location of all outfalls covered under the final permit. In addition, the facility must prepare an inventory of the types of discharges contained in each outfall (e.g., storm water and air conditioner condensate). This inventory, however, may be kept as an attachment to the site map. Basic information on the discharge points that are to be covered under the permit should be readily accessible. EPA believes that denoting the location of the outfalls is important to the permittee and will assist in determining potential pollutant sources for each outfall. EPA believes the benefit of doing so outweighs the problems pointed out by the commenters.

#### Inventory of Significant Materials and Significant Spills and Leaks Within the Past Three Years

The proposed multi-sector permit required that facilities prepare an inventory of significant materials that are or have been exposed to storm water discharges within the past three years. Facilities were also required to provide a list of significant spills and/or leaks within the past three years. Both these items must be included within the storm water pollution prevention plan with a description of the BMPs used to prevent exposure of such leaks or spills to storm water discharges.

Commenters stated that such inventories would be burdensome to compile. Commenters felt that facilities would not have this information readily available, especially recently acquired facilities. In lieu of preparing the inventories to cover activities within the past three years, commenters wanted inventories to be prepared from the effective date of the permit.

Residuals from the leaks and spills may be a major source of contamination of storm water discharges. EPA believes that it is important for facilities to develop inventories of significant materials and past significant spills and leaks. These inventories will help facilities identify the areas where best management practices should be implemented and is an integral part of storm water pollution prevention. EPA believes that this information is available to facilities and can be readily compiled from existing records. EPA does not believe this requirement represents an undue burden upon the permittee. In addition, this requirement

is commonly included within other issued NPDES storm water permits, therefore EPA is retaining this requirement in the final multi-sector storm water general permit.

#### Employee Training Requirements

The proposed multi-sector permit requested comment on whether a minimum training frequency of once per year should be specified for all industry sectors. Employee training is an effective tool in prevention pollution of storm water discharges. Employees that have been taught the importance of the pollution prevention plan measures and controls are more likely to thoroughly implement and continually maintain them. The training program is required to be described within the facility's pollution prevention plan and is applicable to all employees (including contractor personnel where relevant). Typical topics to be addressed include good housekeeping, materials management, and spill response procedures.

Many commenters supported the annual training requirement offered by EPA and one commenter felt that the training requirements were too high. However, most comments indicated that the training requirements should be more flexible. For instance, training should be based on the industrial activity and the complexity of the storm water pollution prevention plan which will affect how often an employee training program is necessary. This flexibility will ensure that training occurs only when necessary and may lessen the burden on those facilities that find training to be too burdensome.

To provide additional flexibility as the commenters suggested, today's permit includes training requirements that are sector-specific depending upon the needs assessed for each industry sector. Sectors with industrial activities that have a significant potential for storm water contamination to occur for reasons such as; operator error, lack of understanding of the operation of storm water controls, the need for frequent routine maintenance, the frequent changing of processes conducted outdoors, etc., will warrant some frequency of training. These types of facilities must conduct employee training at appropriate intervals which they determine necessary based upon these factors and others such as the number of employees, the complexity and types of pollution prevention measures and the rate of employee turnover.

#### Guidance for Storm Water Pollution Prevention Plan Development

Several commenters requested guidance on how to develop storm water pollution prevention plans and how to educate employees on storm water pollution prevention plan implementation. This information has already been prepared by EPA and is readily available. EPA published a guidance manual for storm water pollution prevention plan development and implementation in September 1992. The guidance manual, Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices (EPA 832/R-92-006), was written to provide guidance for those facilities covered under the baseline general permit. However, the storm water pollution prevention plan requirements are similar and the manual is applicable for those who will be covered under the multi-sector permit. EPA also prepared a companion guidance document for construction activities, entitled Storm Water Management for Construction Activities, Developing Pollution Prevention Plans and Best Management Practices (EPA 832/R-92-005). This document is also available from EPA.

#### Monitoring Requirements

##### *Benchmarks*

The proposed multi-sector permit describes "pollutant benchmark values" (See Table 7, 58 FR 61169) which were used by EPA to determine the analytical monitoring conditions in the proposed permit. The benchmarks are also to be used by permittees who are required to conduct monitoring for comparison to determine if they qualify for the low concentration waiver. The standards are based primarily upon EPA Recommended Ambient Water Quality Criteria (Gold Book) values for toxic pollutants, and certain others, and NURP median concentrations for most conventional pollutants.

The benchmark values were used in two ways in the proposed permit. First, they were used as a standard of comparison against the median industry concentration for each pollutant that was sampled during the application process. If a median pollutant concentration in the sampling data for an industry sector was above the benchmark values it was considered a pollutant of concern for the industry sector. Under the proposed permit, when five or more median pollutant concentrations were higher than the benchmark values, the industry sector was required to perform analytical

monitoring under the terms of the proposed permit.

Second, the benchmark values were used as a standard of comparison for an individual permitted facility that wishes to qualify for the low concentration waiver to be relieved from monitoring in the fourth year of the permit (monitoring cut-off values). The permittee would conduct storm water sampling as required under the permit in the second year of coverage. From this data, the permittee would average the pollutant concentrations for each monitored pollutant and would then compare these averages against the monitoring cut-off values. If the average concentrations were below the cut-off values then the permittee would be relieved from monitoring in the fourth year of the permit on the conclusion that the pollution prevention plan was effective in controlling the discharge of the storm water pollutants of concern.

Although most commenters favored the concept of an incentive approach to monitoring, if monitoring had to be required, a significant number of commenters indicated that the benchmark concentrations/monitoring cut-off values were inappropriate. Reasons given for this comment include the following: (1) The use of water quality criteria is an inappropriate comparison for discharge data, because it does not consider dilution of the discharge in the receiving water; (2) benchmarks should be determined based upon local conditions not by using national standards; (3) EPA should not use NURP median concentrations as benchmark values. These values have no bearing to industrial storm water discharge or to water quality; (4) several of the benchmark values are below the method detection limit (e.g., arsenic) and would therefore be impossible to achieve; (5) other benchmark values are far too stringent, (some are even lower than drinking water standards) and runoff from industrial areas would not meet these benchmarks; (6) many of the commenters were concerned that the benchmark concentrations are, or will become storm water effluent limitations.

Under today's final permit, EPA continues to use benchmark concentrations as a means for selecting priority industries for analytical monitoring and as a means for determining if the facility is eligible for a sampling waiver in the fourth year of permit coverage. However, because of the comments received, the basis for development of the benchmarks/monitoring cut-off values has been re-evaluated by EPA.

The revised benchmarks/monitoring cut-off values and the basis for these are presented in the Fact Sheet to today's permit. Changes made to the benchmarks/monitoring cut-off values to address the concerns expressed in the comments are summarized below.

**Conventional Pollutants:** NURP median data for conventionals have been replaced as benchmark values and monitoring cut-off values for all conventional pollutants except TSS and nitrate plus nitrite nitrogen. The replacement conventional benchmarks are based upon pollutant concentration levels required under the secondary treatment regulations, North Carolina water quality standards and existing storm water effluent guidelines. In most cases, the final benchmarks for conventionals/monitoring cut-off values are at higher concentration levels than the benchmarks in the proposed permit.

**Non-Conventional-Inorganic:** Acute water quality criteria based upon human consumption (where acute values do not exist) will be retained as benchmarks and monitoring cut-off concentrations for parameters if the values are not lower than method detection limits. Where the values are lower than the method detection limits, the benchmark has been replaced by the minimum level. A minimum level for such a pollutant is the method detection level multiplied by a factor of 3.18. The factor of 3.18 has been determined by EPA to be the most appropriate level above the detection level (for most pollutants) at which reliable quantitation of the pollutant can be analytically accomplished.

**Non-Conventional-Organic:** Water quality criteria values based on human consumption values are now used as benchmarks. Acute water quality criteria for these pollutants are generally too high to be used as benchmark values.

EPA believes that the revised pollutant benchmarks represent a reasonable standard of comparison for industrial storm water discharges for the two principle purposes described above. All levels are above the method detection limits for the respective parameters and provide a reasonable target for controlling storm water contamination by pollution prevention plans.

EPA emphasizes that the pollutant benchmark concentrations are not storm water effluent limitations, they are simply standards of comparison or targets by which EPA determined if discharges from an industry sector or facility merit monitoring under the terms of the permit. Facilities are not required to meet these concentrations as

effluent limitations in their discharges. The benchmarks are designed to assist facility operators in determining if their pollution prevention plans are reducing pollutant concentrations to below levels of concern. Given the purpose of these benchmarks/monitoring cut-off values, EPA does not believe that dilution or background concentrations of each pollutant need to be considered. The monitoring benchmark cutoff values are not effluent limitations. For this same reason, local conditions do not need to be considered.

Facilities wishing to obtain a permit which considers their local conditions have the option of not seeking coverage under this multi-sector general permit but may submit an individual permit application to their applicable EPA permitting authority.

*Minimum Required Data Needed for Pollutants To Be Analyzed for Monitoring*

When determining industry-specific monitoring requirements for facilities under the multi-sector permit, EPA performed statistical analyses on pollutant data submitted in the group applications. For pollutants of potential concern, (those with at least three observations (outfall samples) within an industrial sector), EPA compared the median values to the benchmark values to determine a potential pollutant for monitoring.

Commenters felt that three observations of a parameter per sector was not a fair minimum representation for the facilities within a sector since the pollutants may all be showing up at three outfalls at only one facility and this facility may not be representative of an entire industry sector. Commenters argued that a parameter should only be considered as a pollutant of concern if it is observed at some significant percentage of the sites sampled within the sector. Other commenters stated that the minimum should be based upon at least three separate facilities instead of outfalls. An entire sector should not be required to monitor based upon the information received from one facility that sampled three outfalls.

EPA agrees with the commenters and the methodology for developing monitoring requirements for today's permit has been revised. In the methodology used for the monitoring provisions for the final permit, EPA only considers a pollutant to be of concern where 3 separate facilities submitted data within a subsector or sector.

Under the methodology for the proposed permit it was possible for an entire sector to be required to monitor

based upon the data submitted by one facility with three outfalls and EPA agrees that one facility should not be considered necessarily representative of an entire industry sector for the purposes of determining the need to monitor. If three facilities which discharge a pollutant, however, the pollutant is not unique to a particular facility and is indicative of the industrial activities conducted in the industry sector or subsector. EPA conducted the monitoring evaluation assuming both a normal distribution and a lognormal distribution of the data set. The results were not significantly different.

#### *Quality of the Part II Database*

The Part 2 group application database includes Part 2 monitoring data from participants which participated in the group application process. Statistical analyses (e.g., mean, median, 95th percentile, and 99th percentile values) of this data was conducted for each parameter within every industrial sector. These analyses were conducted assuming both a normal distribution to the data and a lognormal distribution. The results of the analyses were used in the methodology to determine the proposed monitoring requirements.

Several commenters stated that the database, which only included monitoring data received prior to January 1, 1993, was incomplete and/or contained errors. The commenters stated that the database should be expanded to include all the group application data, as well as further reviewed to eliminate duplications and inaccuracies. Other commenters requested that the methods used to develop the statistical evaluation of the data be revamped (e.g., use a lognormal distribution of the data). In addition, a few commenters stated that the analysis did not properly consider facilities which did not submit data for a pollutant listed in Part C of the Form 2F since these facilities had no reason to believe the pollutant was present in their discharge. Therefore, the commenters argued, EPA's analysis should assume that the discharge concentration of these pollutants is zero.

EPA has again reviewed and double-checked the monitoring data analyzed for the development of the permit. EPA concludes that the monitoring data analyzed is representative of the industries evaluated. EPA analyzed data which was submitted months after the application deadline for the purpose of identifying pollutants of concern and developing monitoring requirements. In addition, on a sector-by-sector basis, EPA reviewed data that was submitted

late to determine if the additional data was consistent with what had already been evaluated. Given this extra level of effort to analyze and consider all submitted data, even though some data was not loaded into the database that was publicly distributed, EPA believes that the analyses performed on the group application sampling data, and the results that were derived, are valid and reasonable.

EPA also believes that the concerns raised by commenters about the number of duplications and errors contained in the database which was distributed, is no longer warranted in that as errors were noted, EPA further screened and corrected the database. In response to the recommendation from commenters that a zero concentration value should be entered into the database every time a facility did not sample for a given pollutant because they did not believe it was present on their site, EPA does not agree. Obviously, assuming zero concentrations for these facilities would significantly reduce the mean and median concentrations. This would be imposing a major, unsupported assumption into the database. It cannot be assumed that facilities which did not submit data for a part B or C pollutant have a discharge concentration of zero for that pollutant. Facilities which did not sample for a pollutant because they did not believe it was present, may not have adequately considered all potential sources of these pollutants. In addition, facilities that did sample were supposed to be representative of the entire group in which they were located. This was a process determined by the group applicants themselves, with approval from EPA. Therefore, where facilities did sample and report for a given pollutant, and other facilities in the group did not, it could be assumed that the pollutant really was present at all other facilities. To be more accurate and unbiased in the analyses of the data, EPA chose not to assume either a zero value or an extrapolated value for pollutants that were not analyzed for by some facilities within a sector. EPA analyzed only actual data points that were submitted. Where a pollutant was tested for, and the result was below detection levels, EPA assumed these data points to be zero values for the pollutant.

#### *Establishing Priority Monitoring Sectors*

The multi-sector permit requires analytical monitoring only for 'priority' sectors. A sector was considered a 'priority' if, based on the Part II data for the sector, five or more pollutants sampled for had median concentrations above benchmark values. If the sector

had median values greater than benchmark values for four or less parameters, only visual examinations would need to be conducted.

Several commenters stated that the methodology employed for establishing priority sectors was arbitrary and/or flawed (i.e. there is no basis for choosing five as the number of parameters needed to be above benchmark levels to trigger sampling). Others indicated that the approach did not consider the relative impacts (e.g., toxicity) of the pollutants on receiving waters. Commenters also indicated that it was inappropriate to group together a wide range of industrial activity discharge data into one industry sector, and to use that data as a basis for comparison.

In response to these comments, EPA has revised the methodology for selecting which industries must conduct analytical monitoring. EPA reviewed the grouping of industries into sectors for statistical analysis. It was determined that in some cases a sector contained a grouping of industrial activities which may have different storm water discharges. In these cases EPA modified its analysis to statistically summarize the industry by subsectors. Division into industry sub-sectors was prepared in most cases based upon the three digit SIC codes provided by the group participants in their group application information. The results of the subsector analysis of the data were then used for comparison to the revised benchmarks (discussed above).

Today's permit also eliminates the five pollutant threshold for determining if a sector merited monitoring. For each subsector (or sector where it was not possible to further divide the sector into subsectors) EPA compared, on a pollutant by pollutant basis, the median concentration to the benchmark. Where the median concentration for a pollutant is higher than the benchmark, where there are likely sources of the pollutant associated with the industrial activity, and where the concentrations are high enough so as not to be due to "background" or natural sources, the subsector (or sector) is required to conduct analytical monitoring for the listed pollutant. This methodology is pollutant-specific and addresses the concerns that some commenters had that some industries within a sector may be inherently clean compared to other industries in the same sector. In addition, this approach is more environmentally protective in that the number of different pollutants in a discharge does not necessarily increase the risk posed by that discharge. It is possible that a receiving water may be significantly impacted by a discharge

containing a high concentration of just one pollutant and therefore monitoring should be conducted to determine if controls are adequately reducing the levels of the discharge.

*Selection of Additional High Priority Sectors Based Upon Factors Other Than Sampling Data*

When determining industry-specific monitoring requirements for facilities under the multi-sector permit, EPA identified three additional industry sectors based upon a review of the degree of exposure, types of materials exposed, and the need for more sampling data than what was submitted in the group application. The industry sectors identified are hazardous waste treatment, storage and disposal facilities (TSDFs), auto salvage yards and airports.

Commenters felt that selection of these industries as priority sectors was arbitrary, particularly for those sectors where it was determined that the monitoring data submitted was not adequate (automobile salvage yards and airports). Under today's permit EPA is continuing to require monitoring for these three sectors which were selected based upon criteria other than the methodology employing the part 2 sampling data. It is EPA's best professional judgement that these industries merit further monitoring based on anticipated presence of significant pollutants. The data submitted was insufficient to disprove the EPA conclusion that these types of facilities have a significant potential to discharge contaminants. EPA believes the data submitted for these industries is insufficient and not representative of the discharges from the facilities and therefore additional data should be collected.

*Should the Multi-Sector Permit Require Facilities That Must Monitor for Total Recoverable Metals To Also Monitor for pH?*

Not all sectors of the proposed multi-sector permit require facilities that must monitor for total recoverable metals to also monitor for pH. Because it is known that the toxicity of metals is affected in part by pH, EPA requested comment as to whether to add pH to the list of parameters to be monitored in those sectors where total recoverable metals are also being chemically monitored.

Several commenters agreed with the addition of pH as a parameter that should be measured for all sectors where monitoring of a total recoverable metal is required. These commenters argued that it is not an expensive

burden, requires little effort, and the data is needed to evaluate the impact of metals in the storm water discharge. One commenter stated that monitoring of pH would be appropriate since the pH of local rainfalls varies by the particular region where a facility is located. One commenter supported the use of this parameter only if toxicity changes in the metals could be demonstrated to occur at pH values presented in the group data. Several commenters stated that rather than the pH of the discharge being monitored that it is the pH of the receiving stream that is of critical concern. One commenter supported the monitoring of this parameter only if the EPA granted facilities the option of monitoring for other total recoverable metals or dissolved metals.

One commenter stated that monitoring of pH would only be necessary if pH in the receiving water is a problem and should be considered only after the total loading of an entire watershed is established showing that fluctuations in pH are not the result of pollutants from industrial activities, but are from sources such as acid rain. One commenter stated that they have performed studies which show that pH is not a concern for the food and kindred products sector.

The majority of the commenters were opposed to the blanket requirement to monitor pH whenever total recoverable metals were required to be monitored. The opposition was mainly due to the inherent problems associated with acid rain and in evaluating and linking the cause of toxicity to industrial activities and the associated storm water discharge. Several commenters strongly opposed a requirement to monitor pH believing it to be unnecessary. Many of those opposed felt the analysis should be left to the discretion of the facility in the development of their storm water pollution prevention plan.

EPA will not require facilities to also monitor pH for every sector that must monitor total recoverable metals. Rather, the decision will be left to the discretion of the facility or will be specifically required within a sector for other reasons. Monitoring the pH of the storm water may not provide an indication of the effectiveness of the storm water pollution prevention plan because of the influences of factors other than the facility's industrial activities on the pH of the discharge (i.e., acid rain). Allowing the facility to evaluate the effectiveness of the measurement of pH for each particular facility will alleviate the misinterpretation of the data that may result. This may be particularly

true for extreme pH values beyond those normally anticipated with acid rain.

*Support or Opposition to Baseline Monitoring Requirements*

In the proposed multi-sector permit, EPA modified some sector monitoring requirements based upon the group application data submitted. EPA requested comment for each industrial sector on the changed requirements from the 1992 baseline general permit that were proposed in the multi-sector permit. Fifteen of the sixteen commenters that commented on this issue were opposed to the monitoring requirements in the baseline permit. Several supported the deviations from the baseline permit which they claimed was based only on theoretical and potential discharges, whereas the monitoring requirements for the multi-sector permit were based on actual storm water discharge data from the industries. A couple of commenters stated that the use of the baseline monitoring requirements would defeat the purpose of the money and effort spent on collecting data for the application process.

One commenter, while still opposed to any monitoring requirements for the fiberglass and aluminum boat builders, supported the monitoring parameters in section IX.R.8 of the multi-sector permit in lieu of the baseline permit. Two commenters supported the change from the baseline permit requirements, which triggered monitoring at 50,000 flight operations per year, for airports. One commenter in the rubber and miscellaneous sector was concerned that any analytical monitoring was being associated with the sector because they do not have any outside storage.

Another commenter supported the changes in the requirements for the Glass, Clay, Cement, Concrete, and Gypsum product sector where only the ready-mix concrete plants must monitor because visual monitoring is more appropriate for determining whether BMPs are effective. One commenter from the steam electric group felt that the monitoring requirements from the baseline permit were more appropriate, particularly the annual monitoring, compared to the monthly visual observations and quarterly chemical monitoring in the multi-sector permit. The commenter stated that pollutants in their storm water discharge are essentially unvarying and that the original list of pollutants in the baseline general permit provided a more appropriate set of indicators of storm water contamination from their site.

EPA has reviewed both sets of monitoring requirements and as a result

will not incorporate the monitoring conditions from the baseline general permit into the final multi-sector permit. EPA believes that the monitoring requirements in the baseline permit are designed primarily to characterize pollutants in storm water discharges from those facilities seeking coverage under the permit. For the most part, this characterization effort has already been accomplished through the group application sampling. Whereas, the multi-sector general permit monitoring strategy has been designed primarily to provide information on the effectiveness of the storm water pollution prevention plan.

#### *Visual Examinations of Storm Water Discharges*

The multi-sector permit includes requirements for facilities to perform visual examinations of storm water discharges. "High risk" industry sectors were required to perform visual examinations of storm water samples on a monthly basis. "Low risk" sectors were required to perform the exam on a quarterly basis.

EPA received a large number of comments on the proposed visual examination requirements, both in support and in opposition. The majority of comments were in reference to the frequency of visual examinations. Others commented that the costs/requirements of the visual exams were too burdensome, and some facilities wanted no visual exams at all. Other comments included requests for: clarification of language requiring visual examinations; more specific criteria for when to conduct a visual examination; provision of a checklist for performing visual exams; and criteria for examining snow melt runoff.

Commenters who opposed the requirements did so because; visual exams are too burdensome for facilities with many outfalls; conducting visual exams is too time consuming; the logistics associated with performing visual exams are too difficult for the average worker to understand; the results of the exam will be of no value; and the visual exam requirements are too frequent and will encourage fraudulent submissions.

Some commenters were opposed to the visual monitoring requirements stating that it is not as effective as examining the equipment installed to accomplish pollution prevention. They suggested that if the requirement is retained, the idea of comparing the visual observation to a baseline be addressed because the use of the same site personnel over time is not viable due to continuous rotation of personnel.

Other commenters were opposed to the burden that would result from the support documentation needed to meet the 72 hour dry weather and 0.1 inch rainfall requirements. These commenters felt this would require constant monitoring of the weather, recordkeeping, and the development of monthly visual observation reports which would be costly for small companies.

Numerous commenters supported the use of visual examinations to monitor the effectiveness of the pollution prevention plan and the implemented BMPs. These commenters stated that visual examinations can be an effective tool and would allow easy detection of suspended and settled solids, oil sheen and other obvious indicators. Some commenters that favored visual monitoring suggested this be done in lieu of any chemical analyses.

EPA believes that the visual examinations will provide permittees a quick and inexpensive assessment of the effectiveness of the facility's pollution prevention plan on a more frequent basis, but at a more cursory level, than just analytical chemical monitoring. The examinations are intended to be conducted by the company's pollution prevention team, or someone who will be familiar with storm water management at the facility. The team may be able to identify sources of contamination in the storm water discharge given their knowledge of the industrial activities conducted at the facility and the materials stored exposed to storm water. From these observations, the team may be able to identify additional BMPs that can be implemented to control the contaminant sources, or ways to improve the efficiency of existing BMPs. EPA will retain the requirement to perform a visual examination of the storm water discharge in today's multi-sector permit. EPA believes the visual examination of the discharge will become an important part of an active facility's overall effort to control storm water contamination. EPA maintains that the visual examination of the storm water discharges will allow a quick and simple assessment of the quality of the storm water runoff which can then be used to help assess the effectiveness of a facility's pollution prevention plan at very little cost. The results of the visual examination should be used in conjunction with the results from the comprehensive site compliance evaluation, analytical monitoring, if required, and sector-specific inspections to determine if appropriate BMP's have been implemented.

Today's permit and fact sheet include more detailed language which elaborates on the description of the visual exam requirements. Additionally, the frequency for visual examination for all applicable industry sectors will be quarterly under today's permit. This responds to a majority of the commenters by reducing the burden placed upon facilities, and allows a more reasonable amount of time for a representative storm event to occur. The information from visual monitoring is intended to be used by the facility as a quick and simple means of determining any obvious changes in the quality of storm water runoff from the site when the discharges are occurring. EPA understands that there is a measure of uncertainty and subjectivity in performing visual exams, but believes this will not adversely affect the purpose of the examinations. In summary, visual examinations of the storm water discharges provide a low cost means for the facility operator to routinely assess storm water problems at a facility and will provide an indication of major problems with the effectiveness of the storm water pollution prevention plan.

#### *Alternative Monitoring Provisions*

In the proposed permit, EPA requested comment on alternative monitoring and reporting requirements in lieu of the proposed requirements. Most of the commenters were opposed to the alternative monitoring requirements. Some commenters believed the alternative monitoring requirements would focus too much attention on sampling and not enough on pollution prevention plans. Some commenters did not think the whole effluent toxicity testing, where it was proposed in the alternative requirements in certain sectors, would be appropriate for storm water evaluations also stating that they are too expensive and complicated. Some commenters supported the proposed alternative monitoring requirements stating that the alternative requirements should be kept as an option assuming there is appropriate data demonstrating the need for this monitoring.

In response to the comments concerning the alternative monitoring provisions discussed in the fact sheet of the proposed permit, EPA is not incorporating these monitoring requirements into the final permit. Rather, as explained above, EPA has reconsidered the entire monitoring strategy as proposed in the permit and has developed a new monitoring strategy based upon a sub-sector analyses of the data to be responsive to

the majority of concerns regarding storm water monitoring in the proposed permit.

#### Signatory Requirements

The multi-sector permit requires that all Notices of Intent (NOI), Notices of Termination (NOT), storm water pollution prevention plans, reports, certifications or other information, either to be submitted, or to be maintained by the permittee, be signed in accordance with the requirements in 40 CFR Part 122.22.

One commenter stated that the NOI certification is significantly different than the wording in the September 9, 1992 baseline general permit. Another commenter stated that the signatory requirements should be similar to those required by the national pretreatment program to maintain consistency and to avoid confusion. One commenter stated that the signatory requirements were appropriate for the NOI and the NOT, however, were not appropriate for the storm water pollution prevention plan and other such documents because they are excessive when compared to similar programs. This commenter suggested that an appropriate company representative such as those outlined in VII.G.2 would be more appropriate to provide a signature because they are more familiar with the regulations and the operations of the industrial facility. One commenter requested that a member of the storm water pollution prevention plan team be allowed to sign the site compliance report.

EPA will maintain the signature requirements as proposed in the multi-sector permit which requires that all NOIs, NOTs, storm water pollution prevention plans, reports, certifications or information either to be submitted to the Director, or that are required to be retained by the permit, be signed by a responsible corporate officer. The certification and signature requirements in the multi-sector permit are the same requirements as those used in other areas of the NPDES program and the pretreatment program and have not been changed from the September 1992 baseline general permit. Furthermore, the requirements allow authorized representatives to be appointed for signature authority. Therefore, if a facility feels it is more appropriate for a member of the storm water pollution prevention plan team to sign the documentation, that option is available under the permit.

#### Miscellaneous Inspection Requirements

EPA received comments on inspection requirements, recordkeeping requirements, and reporting

requirements from 24 commenters. Most of these stated that the proposed requirements are too burdensome and suggested ways to scale down this burden, with suggestions ranging from decreasing inspection schedules to requiring less paperwork. A few commenters opposed the frequency of inspections required in several of the sectors of the proposed permit. Specifically, two commenters stated that monthly inspections of designated equipment and areas of the facility are unnecessary and inappropriate.

EPA has established visual and other inspection requirements tailored to each industrial sector based on conditions specific to each sector. Where appropriate, today's permit contains daily, weekly, monthly, or less frequent inspections of various important facility areas and activities. EPA believes the frequencies in the permit are necessary to ensure that storm water runoff from these key areas does not cause significant discharges of pollutants.

#### Retention of Records

Seven commenters stated that the requirement that records be retained for 6 or more years (three years after the permit expires) is excessive. One commenter suggested that a more discrete time period be specified for records retention, so as to eliminate the undesirable result of inadvertently requiring facilities to retain records indefinitely if a permit is continually extended. Five commenters suggested that a three-year retention period is adequate and consistent with other NPDES permits. Another commenter suggested that records be retained for a maximum of one year after the inspection or monitoring occurs. Two other commenters stated that the documentation and recordkeeping requirements are too elaborate and could require excessive resources from small businesses. Four other commenters stated that the reporting requirements are unnecessary and unduly burdensome.

EPA has retained all recordkeeping requirements from the proposed permit. However, in response to commenters' concerns about inconsistent timeframes, the Agency has standardized the retention period for all records to be the minimum period allowed under 40 CFR 122.41(j). Thus, today's permit requires permittees to retain all records (those from inspections as well as monitoring data) for a minimum of three years from the date of the inspection, sampling, or measurement. In addition, to help reduce the amount of reports permittees may be required to generate during a permit term, EPA has reduced some of

the inspection and examination requirements for some industrial sectors. For example, the requirement for visual examinations of discharges has been changed to quarterly for all sectors (except air transportation) and pollutant-by-pollutant no exposure certifications are now allowed. EPA believes these changes, and others in today's permit, will decrease the recordkeeping burden on many facilities, including small businesses.

#### Special Requirements for Facilities Subject to Reporting Requirements Under EPCRA 313

EPA received a number of comments that addressed the proposed special requirements for facilities subject to the EPCRA Section 313 reporting requirements. Specifically, 52 of these comments addressed the proposed requirement for a certification of the storm water pollution prevention plan for an EPCRA 313 facility by a Professional Engineer (PE), of which 50 opposed such certification and two favored it. Thirty-one of the commenters opposed to the certification indicated that other categories of professionals with knowledge of pollution prevention, including hydrologists and certified hazardous materials managers, would be more appropriate than a PE to review the plan. Most indicated that someone very familiar with the facility would be the most appropriate person to make the certification. Other commenters noted that the facility manager is legally responsible and should be responsible for certifying or selecting the certifying party. A few commenters stated that the PE provision would be unnecessarily costly, particularly for small facilities. One commenter added that the frequency of certification should be reduced to once every five years.

In response to these commenters, EPA has removed the requirement for PE certification from the permit as well as the requirement to certify the plan every three years. The permit now requires facilities subject to the EPCRA Section 313 requirements to conduct the same storm water pollution prevention plan certification procedures as facilities not subject to EPCRA Section 313. Thus, facilities subject to EPCRA Section 313 requirements need only certify their pollution prevention plan when it is developed or when revisions or changes are made and does not include a PE certification.

EPA also received numerous comments that opposed the extension of special requirements for EPCRA Section 313 facilities to all facilities with above-ground storage tanks and/or exposed handling of liquid chemicals. About half

of these commenters stated that there was no basis for extending these specific Best Management Practices (BMP) to facilities that already have BMPs under the EPCRA program. The other half indicated that these special provisions were redundant with requirements in other programs, such as RCRA. Two commenters also stated that such an extension of requirements associated with EPCRA to all facilities covered by the multi-sector permit would be inappropriate regulatory duplication. Based on these comments and further review, EPA is not extending the Section 313 requirements to additional facilities.

In addition to these specific comments, EPA received 25 comments opposed to the special storm water pollution prevention plan requirements for EPCRA Section 313 facilities. These commenters objected that there are a variety of burdensome aspects of the prescribed practices. Sixteen of these commenters suggested that the special requirements are redundant with those imposed by other programs and/or are inappropriate given the data presented in the notice on the presence of pollutants in storm water from EPCRA Section 313 facilities and non-313 facilities. They indicated that the data show no distinguishable differences between storm water pollution from these two categories. Other commenters stated that the costs of complying with the special provisions for Section 313 facilities are excessive. With the exception of the PE certification, EPA is not reducing the special pollution prevention plan requirements for facilities subject to EPCRA Section 313 requirements. The Agency is leaving them in place because of the nature of the industrial activities and chemicals handled at such facilities. These controls are necessary to ensure that storm water runoff does not become contaminated with EPCRA Section 313 water priority chemicals. The use of these controls represents an established level of technology-based controls that are already being implemented at many of these types of facilities and EPA believes this level of technological control should be maintained.

On January 12, 1994, EPA proposed to add 313 new chemicals to the EPCRA Section 313 list of chemicals found at 40 CFR 372.65. On November 30, 1994, EPA published a final notice in the Federal Register adding 286 chemicals to the list. A Section 313 water priority chemical is defined as a chemical or chemical categories which are: 1) are listed at 40 CFR 372.65 pursuant to Section 313 of the Emergency Planning and Community Right-to-Know Act

(EPCRA) (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986); 2) are present at or above threshold levels at a facility subject to EPCRA Section 313 reporting requirements; and 3) that meet at least one of the following criteria: (i) Are listed in Appendix D of 40 CFR 122 on either Table II (organic priority pollutants), Table III (certain metals, cyanides, and phenols) or Table V (certain toxic pollutants and hazardous substances); (ii) are listed as a hazardous substance pursuant to section 311(b)(2)(A) of the CWA at 40 CFR 116.4; or (iii) are pollutants for which EPA has published acute or chronic water quality criteria.

In response to this rulemaking, EPA analyzed the list of Section 313 water priority chemicals in the proposed multi-sector general permit by comparing these 286 new chemicals against Tables II, III, and V of Appendix D of 40 CFR 122, the list of hazardous substances listed at 40 CFR 116.4, and the list of pollutants for which EPA has published acute or chronic water quality criteria. Based on this analysis, EPA is adding 44 of the 286 new chemicals or chemical categories to the list of Section 313 water priority chemicals which is an appendix to today's permit. In developing the original definition of Section 313 water priority chemicals, EPA included a reference to the EPCRA 313 chemical listing and noted that future additions to the list could occur and that these would automatically expand the storm water EPCRA 313 water priority chemical list used in the industrial storm water general permits. In addition, the proposed regulation to expand the EPCRA 313 list notified the public that with an expansion of the list, other programs, such as the storm water permitting program that incorporated the EPCRA 313 listing, would also be similarly affected.

By adding these new chemicals to the water priority chemical list, potentially more facilities will be required to implement the EPCRA 313 special pollution prevention plan requirements. However, EPA believes that the additional water priority chemicals will not have a significant impact on the cost of compliance by any individual facility. Facilities already implementing these provisions may have additional chemicals to address in their plans beyond those they already consider, but EPA believes many of the BMPs and pollution prevention measures already being implemented will be applicable to the new chemicals. EPA re-examined the estimated upper range of cost of compliance by a facility required to implement the special EPCRA water

priority chemical pollution prevention plan requirements, and has determined that the added chemicals will not cause this range to be exceeded.

#### Cost of Compliance

EPA received several comments concerning cost estimates for the permit requirements, many of which offer similar viewpoints. EPA provided estimates of the cost of compliance in the fact sheet to the proposed permit. These costs covered a range of costs, from low to high, that may be necessary to implement a storm water pollution prevention plan at the wide range of types of facilities that will be covered under this permit. Twenty-eight commenters stated that the estimated cost for industry to comply with the multi-sector permit is too high. In response to these comments, EPA re-examined its cost estimates to ensure that they were accurate and to ensure that the range, as estimated, adequately covered all anticipated circumstances. From this re-evaluation, EPA believes that the costs of compliance, which includes preparing and implementing a pollution prevention plan during the term of the permit, are accurate and adequately cover the range of anticipated costs for facilities that will be covered under this permit. In addition, EPA believes the cost of compliance is not high when compared to the potential site-specific requirements that may be imposed in order to comply with an individual permit. Therefore this multi-sector general permit represents a significant cost savings over the individual permit option.

Six of these commenters also cited the high end of the EPA cost estimates as being too high for small businesses. In response to this, EPA wants to clarify that the high-end cost estimates will mostly, if not entirely, apply to larger, more complex facilities with more potential sources of pollutants and therefore a more comprehensive storm water pollution prevention plan. In deriving the cost ranges, EPA anticipated that most small business compliance costs would fall at the low end of the cost ranges.

Twenty-four of the twenty-eight commenters who believed that the estimated cost of compliance is too high also expressed concern that the proposed permit will bear an unfair burden on small businesses and possibly threaten their ability to remain in operation. However, several of these commenters based their position on the high end of the cost estimates, which are most likely to apply to larger facilities. In response to this concern,

EPA estimated the cost of compliance for a hypothetical small business in the automobile salvage yard industry. This example has been added to the fact sheet of the permit and illustrates an estimate of a small auto salvage yard costs that such a facility many actually incur in complying with this permit. The Agency expects that the actual cost of compliance with the permit for a hypothetical small automobile salvage yard would be \$874 in the first year and \$561 for each following year. The low-end estimate is appropriate for the majority of smaller facilities, with some facilities, like the hypothetical small auto salvage yard, likely to face even lower costs.

Nineteen commenters (including eleven of the twenty-eight who believe that the estimated cost of compliance is too high) stated that EPA's upper cost estimates given for complying with the proposed permit are too low. Many of the commenters questioned how EPA has developed its cost estimates and argued that the actual cost of compliance will greatly exceed the costs cited by EPA. In response, EPA does not believe its cost estimates are too low as mentioned above. EPA based the cost estimates in the proposed permit on those prepared for the baseline general permit. Because the compliance requirements in today's permit reflect those in the baseline permit, EPA believes that the cost of compliance with the multi-sector permit will be similar to the baseline permit. Actual costs for some facilities may be lower in some circumstances under the multi-sector permit because the multi-sector permit fact sheet provides guidance on the types of BMPs that may be applicable for an industry sector.

In addition, several other specific concerns were presented by small businesses. Sixteen small businesses commented that the compliance costs would force small businesses to either lay off employees or go out of business completely. Another seven commenters warned of the consequences that could result if small automobile recyclers were forced out of business by the cost of compliance with the permit. They argued that vehicles would be abandoned along roads, left in back yards, etc., resulting in a worse scenario than that which existed before the permit was put into effect. In response, EPA does not expect the costs of compliance with the multi-sector permit to force a small business out of business as described above. In developing the permit, the Agency considered not only the needs for storm water controls, but also the capabilities of each sector's facilities to maximize available in-house

resources. EPA encourages facilities to use activities and controls already routinely conducted to the maximum extent possible to meet the permit requirements. EPA anticipates that many small businesses will be able to tailor their existing activities to satisfy many of the requirements of the multi-sector permit and that trade associations will help in developing model pollution prevention plans and in providing technical information and assistance to their membership.

Eight small business responses called for a small business exemption to eliminate storm water sampling and documentation requirements. They perceived the costs for sampling and documentation to be most burdensome on small businesses, many of which have limited human resources. In response, EPA is not providing exemptions in the multi-sector permit to businesses because of their size. However, EPA has changed several requirements of the permit which will reduce burden on the permittee. For example, comprehensive site compliance evaluations are now required only annually for all industrial sectors. EPA has also reduced some of the inspection requirements where appropriate. Additional revisions have been made to various industrial sector requirements to help reduce the burden on small business and other permittees.

Endangered Species Act (ESA) and National Historic Preservation Act (NHPA)

To address the provisions of the Endangered Species Act, the proposed permit denied coverage to any discharge which had "a direct or indirect effect upon a listed endangered or threatened species or its designated habitat". The permit allowed coverage to discharges with an impact on endangered or threatened species where the facility had obtained an incidental take permit from either the U.S. Fish and Wildlife Service (FWS) or the National Marine Fisheries Service (NMFS). The proposed permit required that a discharger seeking coverage, certify in its Notice of Intent (NOI) to be covered by the multi-sector permit that its storm water discharge will not have any direct or indirect effect on listed species or critical habitat unless the discharger had first obtained a permit under § 10 of the ESA (for incidental takings).

To comply with the provisions of the National Historic Preservation Act, the proposed permit denied coverage to discharges that "disturb a site that is listed or eligible for listing in the National Historic Register." A discharge that does disturb a historic site may be

eligible for coverage if the facility obtained, and is in compliance with, a written agreement with the State Historic Preservation Officer (SHPO). The permit required that a discharger seeking coverage must certify in its Notice of Intent (NOI) to be covered by the multi-sector permit that its storm water discharge will not disturb a site that is listed or eligible for listing.

A number of commenters opposed these eligibility restrictions and suggested that the requirements be modified. Several commenters suggested that the permit allow coverage for all facilities initially, but include a provision which would allow the Director to exclude from coverage any discharge which was determined to have an impact upon a threatened or endangered species, or which disturbs a historic site. Others stated that the terms "no direct or indirect effect" in the ESA eligibility restrictions, and "will not disturb" in the NHPA eligibility restrictions are overly broad and subject to varying degrees of interpretation. These commenters requested clarification as to what constitutes a direct effect, an indirect effect or a disturbance. Still other commenters suggested that the eligibility requirements merely require the applicant to send a letter to the appropriate Agency requesting a determination of the facility's impact upon threatened species, endangered species or historic sites. These commenters argued that a facility does not have the resources to make a determination on its own. Several commenters suggested that the eligibility restrictions only apply to new facilities. They argued that existing facilities should not be required to make the determination because any effects or disturbances due to their discharges have already occurred.

Commenters also listed a number of reasons for removing the eligibility restrictions altogether. Many commenters stated that the permit inappropriately deferred EPA's responsibility to consult with FWS, NMFS or Historic Preservation Offices to the discharger. They argued that both ESA and NHPA require EPA to perform the consultation prior to issuing the permit. The commenters argued that the consultation would be costly and time consuming for dischargers to perform. Several commenters stated that the Services and Offices which would have to be consulted would be overwhelmed by the number of inquiries generated by the permit and unable to respond to requests for consultations in a timely manner. Other commenters stated that it was unnecessary to include the ESA and

NHPA requirements in the permit because facilities are already subject to these and other existing federal laws and regulations. Requiring compliance with these provisions in the permit places undue emphasis upon these statutes in comparison to all other laws and regulations.

In response to the comments regarding endangered species, the ESA requires, among other things, that EPA ensure, in consultation with the FWS and/or NMFS that actions it authorizes or carries out are not likely to jeopardize the continued existence of threatened and endangered ("listed") species or result in the destruction or adverse modification of the designated critical habitat of listed species. In addition, the ESA generally prohibits EPA, as well as those seeking general permit coverage, from "taking" listed species without the prior authorization of the FWS/NMFS.

To fulfill its responsibilities under the ESA, EPA developed a series of conditions in the proposed permit which were reviewed by the services during the consultation. The consultation culminated in the issuance of a FWS/NMFS Biological Opinion that EPA's approach would not likely jeopardize listed species, adversely modify critical habitat, or result in takes. The consultation also resulted in changes to the conditions of the permit for endangered species protection. The revised conditions represent a simplified process that should be easier for permittees to comply with, yet will still ensure that storm water discharges authorized under this permit will not adversely affect endangered species.

The revised ESA conditions require that an applicant comply with the ESA and be granted coverage under the permit only if the storm water discharges and BMPs to be constructed are not likely to adversely affect the endangered species listed in Addendum H of the permit; or the applicant has received previous authorization under the ESA and established an environmental baseline; or the applicant is implementing other appropriate measures, as required by the Director, to address adverse affects. In addition, the applicant must certify that their storm water discharges and potential BMP construction activities are not likely to adversely affect the species listed in Addendum H of the permit. Addendum H is a county-by-county listing of the endangered species upon which the consultation is based. EPA believes this new process fully implements the requirements of the ESA and the outcome of the consultation with FWS and NMFS, and is protective of endangered species. EPA also considers

this revised approach to be a more practical and straightforward process for an applicant to gain coverage under the multi-sector general permit.

EPA expects that the vast majority of applicants will be able to meet the ESA certification requirement by either determining that no listed species are found in the county of the discharge or by determining that listed species found in the county are not in proximity to the discharge. EPA believes that requiring applicants to provide the certification commented upon is reasonable and necessary so that EPA may act to lawfully authorize an applicant's general permit coverage. See § 308(a)(A)(v).

EPA does not need to enforce every law and regulation through permits—only those which create obligations on EPA for its actions (through statutes such as the ESA and the NHPA) that are in response to permit applications presented to EPA by persons seeking to comply with the CWA, e.g., applicants for NPDES permits.

As to permit coverage for existing facilities, "action" under the pertinent ESA regulations includes "all activities. . . of any kind authorized by federal agencies. . . [including] the granting of. . . permits. . ." 50 C.F.R. § 402.02. Agencies must consult with the FWS or NMFS wherever an action may affect listed species. 50 C.F.R. § 402.14. Given that storm water discharges from existing facilities may have new or continuing effects on listed species (in addition to past effects), there was a clear need for coverage of existing facilities also to be adequately protective.

In response to the comments raised regarding the NHPA, EPA recognizes that the National Historic Preservation Act ("NHPA") imposes obligations on the Agency to take into account the effect of permit issuance on historic properties. Today's general permit establishes a mechanism whereby the Agency can efficiently administer the permit and still take into account the effect of general permit coverage on historic properties consistent with its obligations under the NHPA. EPA will assure NHPA compliance primarily through the eligibility and certification requirements of the general permit. The general permit does not authorize discharges that (1) affect a property that is listed or eligible for listing on the National Register of Historic Places, unless (2) the applicant has obtained and is in compliance with a written agreement between the applicant and the State Historic Preservation Officer ("SHPO") that outlines all measures to be undertaken by the applicant to

mitigate and prevent adverse effects to the historic property. Applicants for general permit coverage must certify that they have read and are in compliance with the eligibility provisions of the permit.

The operation of this mechanism should assure compliance with the NHPA for any authorization to discharge provided under today's permit. EPA anticipates the first component of the eligibility/certification mechanism will provide an adequate opportunity to take into account the effect on historic properties for the vast majority of discharges to be authorized under the permit. EPA anticipates that the preliminary evaluation by the applicant will quickly identify those discharges that may implicate concerns about historic preservation. The second component will allow for general permit coverage after effects have been effectively addressed (minimizing the need for an individual permit).

EPA recognizes that the eligibility/certification mechanism in today's permit will not resolve all historic preservation concerns that may arise due to control of storm water discharges. In some instances, the first component of the eligibility/certification may not assure "no effect" on historic properties, for example, if the applicant's certification of eligibility is subsequently determined to be false. In such instances, the discharge would be "without a permit" based on the eligibility provisions. In some instances, the applicant and the SHPO may have difficulty in reaching agreement on how to resolve historic preservation concerns. Such instances may necessitate EPA intervention or issuance of an individual permit. The eligibility/certification mechanism represents EPA's effort to assure Agency compliance with the National Historic Preservation Act consistent with the efficiencies of general permitting under the Clean Water Act.

#### Comprehensive Site Compliance Evaluations

The proposed permit contained requirements for facilities to perform and document comprehensive site compliance evaluations. The intent of the compliance evaluation is to: confirm the accuracy of the description of potential pollution sources at the site, determine the effectiveness of the storm water pollution prevention plan, and assess compliance with the permit. The evaluation should be conducted by members of the pollution prevention team. Deficiencies in the plan must be corrected within two weeks of the

evaluation and the corrections must be implemented within 12 weeks. Most of the industry sectors required the evaluation to be performed annually, however, a few sectors required more frequent comprehensive site compliance evaluations. For example, the chemical and allied products sector of the proposed permit required quarterly comprehensive site compliance evaluations. A few industry sectors allowed less frequent evaluations, for example the ore mining and dressing sector only required evaluations every three years at inactive mine sites.

Commenters expressed several concerns with the comprehensive site compliance evaluation requirements. The primary concern dealt with the required frequency for the evaluation. A number of commenters stated that the evaluation should not be required more frequently than once per year in any industry sector. Commenters stated that an annual evaluation was sufficient to assure compliance of the plan with permit requirements. Commenters also stated that the frequency should be consistent across all sectors unless more frequent evaluations could be justified. Commenters were also concerned with the time frame allowed to modify the pollution prevention plan following the evaluation. Commenters stated that two weeks is not sufficient time to obtain the resources necessary to modify the plan. A few commenters also felt that the comprehensive site compliance evaluation is redundant and duplicative of the inspections required by the storm water pollution prevention plan. The commenters argued that the evaluation should not be required unless the inspections reveal recurring problems with the plan. Finally, one commenter stated that the evaluation should be performed by an outside consultant or corporate official with expertise in storm water pollution prevention.

In response, EPA has reconsidered the frequencies of the comprehensive site compliance evaluation in the proposed permit and has standardized the frequency to once per year in all sectors, unless sector-specific justification is given for a more frequent inspection. EPA also wants to clarify that the comprehensive site compliance evaluation requirements are different from other inspection and monitoring requirements of the permit. The comprehensive site compliance evaluation is intended to be an overall comprehensive inspection that is conducted at a minimum on an annual basis where the pollution prevention plan is totally reviewed. The inspection should 1) confirm the accuracy of the description of potential pollution

sources contained in the pollution prevention plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit. These goals, in combination, are more comprehensive than the other inspection and monitoring requirements in the permit. The annual comprehensive site compliance evaluation also satisfies the minimum monitoring requirement of all NPDES permits (40 CFR 122.44(i)(4)). Therefore, EPA is retaining the requirement that all industrial sectors conduct an annual comprehensive site compliance evaluation. To the extent that this compliance evaluation overlaps with other inspections (e.g., daily inspections of storage areas), the comprehensive site compliance evaluation can be used in place of the other inspections. Because the comprehensive site compliance evaluations are intended in part to determine the effectiveness of the pollution prevention plan and compliance with the permit, EPA believes it is important that a member of the pollution prevention team be involved in conducting the evaluation.

In response to the concern about the two week timeframe being too short to fully implement changes to the plan if such are necessary as a result of the inspection, EPA disagrees and believes a clarification is necessary. Under the terms of the final permit, if a facility operator determines a deficiency in the storm water pollution prevention plan after conducting the annual comprehensive site compliance evaluation, then the permit provides for up to two weeks to modify the plan and then up to 12 weeks to implement the actual plan modifications. EPA anticipates that many plan changes will be procedural or programmatic in nature and as such should not take an excessive amount of time to perform. EPA expects these to be easily completed within the 12 week deadline. Where major changes are necessary that require construction, such as installation of a new structural BMP, the permit conditions allow for up to three years. EPA believes these timeframes are adequate and therefore no changes to the final permit have been made.

#### Response to Major Sector-Specific Issues

##### *Timber Products Facilities*

The proposed permit for timber product facilities does not cover nonpoint source silvicultural activities, such as timber harvesting operations and certain other silvicultural activities described under SIC code 2411, which

may be exempt from the National Pollutant Discharge Elimination System (NPDES) permit program as described in the silvicultural definition at 40 CFR Part 122.27. Many commenters agreed that certain silvicultural activities are not covered by NPDES permit requirements and are best controlled under the section 319 nonpoint source program. Because these discharges are addressed by the section 319 nonpoint source program, some commenters recommended that the language in the permit and the fact sheet be changed from providing an "exemption" of these discharges to say that "certain silvicultural activities are not prohibited by or otherwise subject to these regulations." Other commenters requested that the language concerning coverage of silvicultural activities that is in the permit fact sheet, also be placed in the permit to avoid confusion.

In response, EPA believes that nonpoint source silvicultural activities not covered under this permit (e.g., harvesting operations, and certain other activities) are exempt from the NPDES permit program. Exempt activities do not need to obtain an NPDES storm water discharge permit. EPA does not believe that further clarification is necessary beyond that already stated in the fact sheet to the timber products sector. If a facility operator questions its regulatory status after reviewing the fact sheet, the operator should contact the permitting authority for the State in which it is located for additional guidance on its regulatory status.

Many commenters suggested that the definition of timber products activities not required to obtain NPDES permits for storm water discharges be expanded in the fact sheet. Some commenters wanted to include remote log sort/concentration yards that do not conduct processing activities. These commenters were concerned that the proposed permit groups all log sort/concentration yards into the same category as facilities processing timber products. They stated that the activities performed at these yards are similar to forest harvesting operations including unloading, stacking, storing and reloading roundwood. In addition, they stated that the pesticides, herbicides, and fertilizers presumed present at these sites are not usually there. Another commenter requested that forest roads be included as nonpoint sources, as well as forest recreational sites and national forest administrative sites that do not include treatment facilities. The commenter stated that these facilities could be effectively covered under nonpoint source programs.

In response, the permit fact sheet discusses coverage of certain silvicultural activities which are classified as storm water discharges associated with industrial activity under the NPDES storm water program and those which are considered to be nonpoint source discharges. This discussion explains the consistency between coverage under this multi-sector permit and existing NPDES storm water regulations defining storm water discharges associated with industrial activity for the Timber Products industry. EPA believes this discussion is clear and consistent with NPDES regulations and that further expansion of the definition of exempt nonpoint source activities at timber products facilities would be inconsistent.

Many commenters were concerned that the proposed sector had grouped together all facilities that perform any wood treating, including facilities that only end-treat boards with a paraffin wax. In response, EPA has grouped together all those facilities that perform any wood treating because they exhibit similar types of industrial activities at their facilities. The groupings were made because the documentation and data submitted in the group applications described them as similar. Therefore, wood preservers who treat their wood with paraffin were not separated from wood preservers, as a whole. In relation to monitoring, while the proposed multi-sector permit required specific monitoring by wood preservers and surface treaters, including those that only end-treat boards, the final multi-sector permit comprehensively changes the monitoring requirements for all timber products facilities due to a reassessment of the benchmark levels used to trigger monitoring and the revised sub-categorization approach to determining the need for industry sub-categories to monitor (See response to comments on monitoring provisions). Facilities that end-treat boards with paraffin are still required to monitor their storm water discharges, but for fewer pollutants. Although the revised monitoring provisions in the permit now require monitoring for all subcategories within the timber products sector, the revised alternative certification provisions should allow individual facilities with no exposure of the pollutants of concern to forego the need to monitor. In relation to pollution prevention plans, all timber products facilities will still be required to control pollutants discharged into storm water through the use of site-specific best management practices implemented through pollution prevention plans

which are tailored to each specific facility on a case-by-case basis. This site-specific approach will allow a facility which end-treats wood with paraffin to design a pollution prevention plan appropriate for their facility.

The proposed permit authorized non-storm water discharges from the spray down of lumber at wood product storage yards where no chemical additives are used in the spray down waters and no chemicals are applied to the wood during storage. Several commenters supported the proposed permit condition as an acceptable non-storm water discharge. The commenters believed that the authorization of these discharges at timber processing facilities is appropriate because these discharges are intermittent and the activity is performed only when necessary. In response, EPA believes that these non-storm water discharges, where identified in a pollution prevention plan and where appropriate pollution prevention measures are implemented, can be effectively controlled under today's multi-sector permit and therefore are allowable non-storm water discharges.

Numerous entities commented on the pollution prevention plan for timber product facilities. Many commenters supported the use of best management practices in that they allow the permittees to determine the most efficient and cost-effective measures for controlling pollutants in storm water discharges. Several commenters provided lists of additional BMPs that are appropriate for use at timber product facilities. However, many commenters stated that the proposed requirement for daily inspections of "material handling activities and unloading and loading areas whenever industrial activities occur in those areas" is confusing because these areas are considered industrial activities. In addition, they believe the proposed frequency of the inspections is overly burdensome and clarification of the required documentation is needed. Some facilities stated that they already conduct inspection of material handling and loading/unloading areas when chemical preservatives are shipped or received. Some commenters suggested that no documentation be required.

In response, EPA would like to clarify that the proposed requirement was intended to require site personnel to inspect the areas where material handling and loading/unloading activities were occurring on a daily basis. These areas would be inspected on those days when material handling or loading/unloading activities were occurring but would not be required to

be inspected when the activities were not occurring. This requirement was placed in the permit because these areas are subject to leaks and spills of materials, tracking of spilled chemicals by equipment, discharge of wood debris and dust generation from heavy equipment. Daily inspection of these areas would only require that someone be responsible for examining each of the areas to determine which BMPs should be implemented to limit the contamination of storm water discharges. For example, the inspector may see that a small amount of a chemical has been spilled near a loading dock which could potentially either be tracked away from the site on truck tires or if it rained could enter the storm water discharge. With daily inspections of these areas, the inspector could immediately initiate clean up of the spill and make suggestions for additional BMPs to be implemented into the plan to avoid future spills. No elaborate documentation of these inspections is required, however, the facility's pollution prevention team should develop a simple method of tracking whether someone has observed the areas when material handling and loading/unloading activities are being performed on a daily basis. If follow-up measures are appropriate in response to the inspection, these should be documented as well. For example, the documentation may simply be checking a log sheet and stating on the sheet that the inspection was performed on a particular day. Follow-up action may require initiating the work and marking a log sheet stating that the work was performed.

EPA disagrees that daily inspections would be burdensome. The inspection of material handling and loading/unloading areas is being required daily (when activities are occurring in those areas) because of the nature of the activities. These activities create a high risk for discharging pollutants to storm water discharges and require that more frequent assessments be made to ascertain the effectiveness of BMPs in those areas. These inspections, which should become a simple daily routine, may be made by personnel who are already in these areas at the time the activity is occurring. If inspections are already being conducted at material handling and loading/unloading areas when chemical preservatives are shipped or received then these can be incorporated as part of the pollution prevention plan and may satisfy part of the requirement. In addition, EPA believes the commenters are confused by the proposed language for daily

inspections of material handling and loading/unloading areas in the permit. Therefore, the language in today's multi-sector permit will clarify this requirement.

Numerous comments were received on the requirement to perform monthly inspections at processing areas, transport areas and treated wood storage areas of facilities performing wood surface protection and preservation activities. The commenters argued that these inspections are unnecessary because employees are currently trained to prevent drippage of treatment chemicals on unprotected soils. They feel these requirements are duplicative of requirements under RCRA Subpart W. EPA disagrees that these inspections are unnecessary. Documentation associated with the listing of wood preserving and wood surface protection wastes at 40 CFR 261 showed that there remains a potential for storm water to become contaminated through incidental activities such as tracking of material, fugitive emissions, rushed operations and miscellaneous other activities. EPA therefore believes it is necessary to require these inspections so that site personnel may identify sources of pollutants and to implement BMPs to minimize contamination of storm water discharges at each facility. Where inspections of this type are being conducted for another program requirement, such as for RCRA, those inspections can suffice for meeting the requirements of this permit.

Some commenters were concerned that the requirement to identify areas where soils are contaminated as a result of past surface protection and preserving activities would be too burdensome. Some commenters stated that it might require extensive and very expensive testing of areas to determine where residual contamination remained and may even require expensive environmental site assessments. Several commenters argued that areas where contamination still remains could be identified through the site inspections, and once identified could then be remediated. In response, EPA disagrees that the requirement is too burdensome. The proposed permit stated that "Where information is available, facilities that have used chlorophenolic, creosote, or chromium-copper-arsenic formulations for wood surface protection or preserving activities on site in the past should identify in the inventory the following: areas of contaminated soils, treatment equipment and stored materials that still remain and practices employed to minimize the contact of these materials with storm water runoff." If information is readily

available, then the pollution prevention team would merely incorporate that information into the plan and identify pollution prevention measures to minimize contact with run-off. If the information is not available, no additional site assessments would be required. The fact sheet language in today's multi-sector permit clarifies this requirement.

In general, commenters supported the proposal that timber product facilities that do not surface protect or preserve should not be required to monitor their storm water discharges. These commenters agreed that storm water pollution prevention plans provide the necessary protection for controlling storm water pollution at timber product facilities. Many comments were received on the sampling and monitoring required by those timber products facilities that use formulations for wood surface protection and preservation. Many of the commenters were opposed to the sampling and monitoring requirements because they would impose significant administrative and economic burdens on wood preserving facilities in particular. They stated that the data obtained through the proposed monitoring program would provide marginal benefits to EPA because the highly variable data could not be used to measure the performance of BMPs. They believe that the efforts and expenses would be better used in developing and implementing pollution control measures. A few commenters also argued that wood preserving facilities should not have to monitor for TSS, COD and BOD because the requirement is based on concentrations from NURP studies which were performed in residential areas and because these pollutants are not toxic to aquatic life. Some commenters were opposed to monitoring requirements at remote storage sites because there is neither meteorological equipment nor staff available and transportation to these sites is very difficult.

Some commenters did not agree with the requirement for facilities that use copper-chromium-arsenic formulations to sample for both copper and arsenic because it is not supported in the data. These commenters suggested that, if additional data was needed, only one of the parameters (copper) be monitored because sampling for both was unnecessary. Other commenters argued that arsenic should not be required to be sampled because, while toxic to humans if ingested, it is not toxic to aquatic organisms. Numerous commenters argued that timber product facilities where chlorophenolic formulations were used in the past for wood

preservation should not be required to monitor storm water discharges for pentachlorophenol where prior testing has shown that there is no chlorophenolic residue at the facility.

A number of commenters in this sector also commented about: the proposed cut-off concentrations that would be used to determine whether facilities must sample during the fourth year of the permit term or under the alternative certification provisions of the permit; the variability of pollutant concentrations in storm water discharges; the eventual imposition of effluent limitations based on the cutoff concentrations; the use of total recoverable metals analyses; the toxicity of pollutants to aquatic organisms given receiving water dilution during wet weather events; the alternative monitoring provisions proposed in the fact sheet; the use of visual monitoring; the quality of the part II sampling database; the identification of priority sectors for monitoring and other monitoring issues that are discussed under the monitoring section of this summary.

As a result of the comments on monitoring throughout the multi-sector permit, EPA has revised the methodology for determining which sectors need to monitor (See discussion under monitoring). The methodology developed for the final permit analyzed the group application data based on three digit (or more) sub-sectorization of the industries represented in the groups. Based on this revised methodology, the timber products sector has been divided into four sub-sectors for data analysis. These four sub-sectors are SIC code groups 2421 (sawmills and planing mills), 2491 (wood preserving), 2411 (log storage), and 2426/2429/243/244/245/2493/2499 (millwork, veneer, wood containers, plywood and structural wood, and wood products not elsewhere classified). Using the data in the group application database, and data submitted subsequent to development of the database, EPA analyzed the monitoring requirements for these four sub-sectors using the revised benchmarks. As a result, EPA is now requiring monitoring of all four sub-sectors in the timber products sector. SIC code 2421 will monitor for COD, TSS and zinc. SIC code group 2491 will monitor for total recoverable arsenic and total recoverable copper, SIC code group 2411 will monitor for TSS and SIC code groups 2426/2429/243/244/245/2493/2499 will monitor for COD and TSS. In addition, the timber products industry must perform quarterly visual examinations of their storm water pollution prevention plan. EPA believes

these revised monitoring requirements are responsive to the major comments received on the proposed monitoring provisions in that the monitoring is more industry-specific due to the sub-sector approach and that this approach more accurately identifies the pollutants of concern within each industry subsector. In response to the issue of whether a remote facility should be required to comply with the monitoring provisions, EPA realizes that if a facility is inactive and unstaffed it may be difficult for the operator to collect storm water discharge samples when a qualifying event occurs. Today's final permit has been revised so that inactive, unstaffed facilities can exercise a waiver of the requirement to conduct quarterly chemical sampling. In addition, if an active facility cannot collect a sample within a given quarter due to weather problems, inaccessibility, etc. then the permit allows the facility operator to take a replacement sample in the next quarter.

With regard to the requirement to conduct monthly visual examinations, EPA has reduced the visual examination schedule for active sites to only quarterly and has allowed a waiver of this requirement for inactive, unstaffed facilities. The operator should consult their permitting authority. Under these circumstances, the multi-sector storm water permit may not be a feasible permit for the facility and an alternative storm water discharge permit may be more appropriate.

#### *Chemical and Allied Products Manufacturing*

EPA received 19 comments specifically concerning the Chemical and Allied Products Manufacturing sector. A common concern of these commenters was a disagreement with EPA's grouping of all chemical and allied product manufacturers into one sector. Various commenters stated that they should not be in the same sector with certain facilities which they believed posed more of a threat to water quality. Several commenters suggested that this sector be subdivided with different requirements for each of the subdivisions.

Although the proposed permit divided the Chemical and Allied Product Manufacturing sector into eight subsectors, it applied the same requirements to each of these subsectors. Commenters expressed dissatisfaction with this aspect of the proposal. One commenter stated that some groups in this sector should get monitoring exemptions granted if they can demonstrate that they are substantially different from other groups

in the sector. Commenters raised several other issues. One stated that there is no such thing as a typical chemical manufacturing facility and that EPA needs to visit each in the "broad array of chemical facilities" in order to understand the diversity of the industry. EPA understands that there may be significant differences between facilities in each sector and even within a subsector. Each facility has its own unique land features, operations and storage activities, material management practices, and chemical product manufacturing, packaging, and transferring techniques. It is not feasible that EPA visit each facility that will be regulated under this permit and in fact this level of scrutiny would best lead to the development of an individual storm water discharge permit for each chemical manufacturing plant. However, this is not the intent of this permit action, which is to issue a storm water general permit for similar types of industrial activities described under this sector and subsectors. In recognition of the differences between facilities, EPA is issuing a flexible storm water general permit, which allows each permittee to develop a pollution prevention plan for their own facility. This permit also contains an "alternative certification" condition, which allows a waiver for any chemical monitoring requirement for a pollutant that the permittee believes is not present at the facility.

One commenter stated that the proposal arbitrarily and capriciously requires thirty (30) mandatory structural and non-structural Best Management Practices (BMPs) and that EPA should defer BMP selection to the discretion of the facility operators. In response to this concern, EPA has reviewed the requirements in this sector, and for all other sectors, for BMP implementation and has revised the final permit to maintain flexibility in the selection of BMPs to be implemented at any particular industrial activity. The facility operator is allowed to choose the best type of management practices for their facility and their particular storm water problems. The permit does not mandate specific structural controls.

#### *Asphalt Paving and Roofing Materials and Lubricant Manufacturing Facilities*

Several commenters indicated that there should be further subdivision of the industries covered by the asphalt paving and roofing materials manufacturers and lubricant manufacturers sector. Commenters indicated that the industries covered by the sector do not have similar raw materials, finished products or processes. EPA realizes there are

differences in the industrial activities covered under this section of the permit. EPA has analyzed the sampling data for the asphalt paving and roofing materials manufacturers separately from the lubricant manufacturers. The determination of the monitoring requirements for the final permit were made based upon the subsector analyses, not upon analyses of the entire sector's data. Although there were differences in the concentrations of pollutants in storm water discharges from these types of facilities, these differences are not substantial. Regardless, the permit requirements allow for variation from facility to facility. The operator must prepare a storm water pollution prevention plan based upon the sources of contamination which they identify.

Commenters also expressed concern with the portion of the proposed permit's fact sheet which discusses the potential pollutants of concern. Commenters stated that they disagreed with EPA's characterization of several pollutants being "of concern". The commenters felt that the part 2 application sampling results clearly indicated that these pollutants were not of concern for the industry.

The pollutants of concern are the parameters listed in the fact sheet as potentially being present in the storm water discharges and they may be different from the pollutants which a sector is required to monitor. These pollutants are listed based upon significant materials and industrial activities and other information submitted in the group applications. The listing of these pollutants provides guidance to facility operators in helping identify potential sources of storm water contamination and in selecting appropriate BMPs. EPA believes that the Part 2 sampling results cannot be the sole factor considered when selecting pollutants of concern for an industry. Permit writers must also consider all significant materials and industrial activities exposed to storm water.

Several commenters reinforced EPA's decision not to include analytical monitoring requirements for the asphalt or lubricant manufacturing facilities. A number of commenters stated their opposition to the alternative monitoring requirements included in the proposed permit's fact sheet. (The alternative monitoring requirements included annual analytical requirements for TSS, COD, pH and oil and grease.) One commenter expressed support for the analytical requirements, indicating that this would be the best way to evaluate the effectiveness of the storm water pollution prevention plan.

Based on the revised methodology for determining pollutants of concern (discussed under monitoring), EPA has determined that limited analytical monitoring requirements are necessary to aid the asphalt or lubricant manufacturing facilities in evaluating the effectiveness of the permit. Today's permit contains analytical monitoring requirements for total suspended solids (TSS) from these facilities. There are also compliance monitoring requirements for asphalt emulsion manufacturing facilities which are subject to the storm water effluent limitations guidelines. Facilities in this sector should not overlook this requirement.

One commenter indicated that the frequency of the visual examination of storm water discharge was burdensome and suggested reducing the frequency to a semi-annual basis. In response EPA believes that facilities must perform visual examinations of storm water discharges in order to assess the effectiveness of the storm water pollution prevention plan over the course of the year. The discharge of pollutants may be impacted by the seasonal weather changes, or operational changes that occur over the course of 6 months. It is necessary for a facility to examine their storm water discharge on a quarterly basis to assess how these changes impact the quality of the discharge. The same commenter also suggested that a facility not be required to perform the visual exam after two consecutive "clean" samples are observed. EPA does not agree with the commenters suggestion. It is not possible to define a "clean" sample for a visual examination, because the visual exam is subjective. The exam is not intended to provide facilities with an absolute means of comparing their discharge to other facilities' discharges, it is intended to provide operators with a relative comparison of the discharge quality from one period to another.

One commenter indicated that the compliance monitoring requirements and numerical effluent limitations should be eliminated for the asphalt roofing emulsion manufacturing facilities. The commenter felt that group application sampling data showed there was no need for monitoring. EPA's response is that the numerical effluent limitations for storm water discharges associated with asphalt roofing or pavement emulsion must be included in any NPDES permit which covers these discharges as required by the effluent limitations guideline at 40 CFR Part 443. The permit must also require at least annual monitoring for any pollutant limited by the effluent limitations

guideline. These are requirements which cannot be modified in the context of this permit issuance.

#### *Stone, Clay, Glass, and Concrete Products*

There were a number of comments received regarding the proposed permit requirements for the glass, clay, cement, concrete, and gypsum product manufacturing sector. These comments focused primarily upon three areas; the types of industrial activities addressed under the sector, the storm water pollution prevention plan storm water pollution prevention plan requirements, and the monitoring requirements.

Several commenters indicated that they believed the sector included too diverse a range of industrial activities, and that sectors should be created for each of the various industrial activities currently covered under the one sector. Commenters were concerned that industries with relatively little discharge of contaminated storm water had been placed into a sector with industries with higher contamination, and that more stringent monitoring requirements were being placed upon their industry than would have been required had their industry or group been considered separately.

In response to these and other concerns, EPA has revised its methodology for determining the monitoring requirements. EPA divided this sector into four subsectors for further data analyses and comparison to benchmarks. The subsectors included: glass products manufacturing, cement manufacturing, clay products manufacturing, and concrete products manufacturing. Monitoring requirements were determined based upon this subsector analyses.

However, in relation to the storm water pollution prevention plan requirements for the sector, these requirements remain the same as proposed. EPA believes there is sufficient flexibility within these requirements to allow the each permittee to select the most appropriate measures for their site. Therefore, subsectored pollution prevention plan requirements were not added to the final permit.

Commenters also expressed concern that the storm water pollution prevention plan requirements for this sector are burdensome, particularly the requirements for storage of fine granular solids, removal of spilled materials, and management of runoff. One commenter stated that storage of bulk dry materials in an enclosed area would be too costly, and that covering the materials with a tarp would be impractical given the

need to access the piles. In response, EPA wishes to clarify that today's permit requires that facilities prevent the exposure of fine, dry granular solids to storm water. The permit does not require these materials to be enclosed, or permanently covered. At a minimum, a facility must cover these storage piles while the piles are not in use and while it is raining. However, the piles need not be constantly covered, provided a tarp or other removable cover is near by. It should also be clarified that the requirement does not apply to coarse granular material such as sand or gravel, only to fine granular materials that are readily suspended or dissolved into storm water such as cement or fly ash.

The same commenter stated that a facility should be permitted to select the BMPs for removal of spilled materials from paved areas. In response, EPA wishes to clarify that the permit allows "regular sweeping, or other equivalent measures" therefore the permit does provide the permittee flexibility in selecting the methods for removing spilled materials.

The majority of the comments received regarding the requirements for glass, clay, cement, concrete, and gypsum product manufacturing facilities addressed the monitoring requirements contained in the proposed permit. Many of these comments addressed the methodology for selection of this sector as a "priority" monitoring sector. These comments expressed concern that the monitoring methodology did not consider the variation in industrial activities within the sector.

The comments also expressed concern that the bench mark or "cut-off" concentrations were too restrictive. As a result of these and other comments, EPA has modified the methodology for selection of industries as "priority monitoring sectors (comments regarding the methodology for selection are addressed separately in this attachment). The selection of industries and parameters for monitoring was made at the subsector level. Sampling requirements for the glass subsector, the cement subsector, the clay subsector, and the concrete subsector were determined separately. The results of the modification in the monitoring methodology are a reduced list of parameters for analytical monitoring in the concrete, clay and cement products manufacturing facilities.

A number of commenters endorsed the alternative monitoring requirements which were included in the fact sheet for the proposed permit because these requirements only consisted of visual examination of discharge without any

analytical monitoring. After further review and consideration of the sampling data submitted, EPA has determined there is a significant potential for the clay and concrete products facilities to discharge pollutants at high concentrations. Sampling at these facilities during the term of the permit is necessary to determine the presence of pollutants and to assess the effectiveness of the storm water pollution prevention plan in controlling them. The alternative monitoring requirements are not included in today's permit for this sector.

Several commenters state that the requirements for monthly visual examination of storm water is unreasonable, and burdensome. In response, EPA has determined that a monthly visual examination is not necessary and that a quarterly (four times per year) visual examination of storm water discharge will provide sufficient information to the permittees in evaluation of the storm water pollution prevention plan, without imposing a substantial burden on the facility.

#### *Primary Metals*

A number of commenters were opposed to the use of benchmark levels for the determination of which sectors should conduct monitoring, or opposed benchmark levels for specific pollutants as being inappropriate. Generally, commenters expressed concern that the benchmark levels were unrealistically low and would result in monitoring requirements even for "clean" facilities. Primary metals facilities were especially concerned about the proposed benchmark level for pyrene, which commenters believed was below detection levels, and is not used by many facilities in the industry.

In response, EPA has reevaluated benchmark levels for all pollutants, and has adjusted the level for several. The new benchmark level for pyrene is 0.01 mg/L based on a laboratory derived minimum level (ML). Because of this new benchmark, facilities in the Primary Metals sector are no longer required to monitor for pyrene under the standard monitoring requirements of this sector. In addition, flexibility has been added to the permit through the adoption of an alternate certification that allows facilities that can certify that they do not have exposure of a particular pollutant to storm water to eliminate monitoring for that specific pollutant.

EPA received many comments opposing the combination of several group applications into the primary

metals sector. Commenters pointed out differences between industry subgroups and requested different requirements for different subgroups. Several commenters stressed that unless monitoring requirements were to be determined based on subgroups within the sector, that additional flexibility was needed to account for the wide variety of facilities within the sector.

Although EPA agrees that industries within the primary metals sector conduct a variety of activities, the flexible conditions of the permit address those differences adequately. In response to comments regarding inappropriate grouping of industry sectors, sampling data has been reevaluated at the 3 digit SIC code level to determine which facilities will be required to conduct monitoring. Facilities in the primary metals sector have been subdivided into seven groups: SIC 331—steel works, blast furnaces, and rolling and finishing mills; SIC 332—iron and steel foundries; SIC 333—primary smelting and refining of nonferrous metals; SIC 334—secondary smelting and refining of nonferrous metals; SIC 335—rolling, drawing, and extruding of nonferrous metals; SIC 336—nonferrous foundries (castings); and SIC 339—miscellaneous primary metals products. The final permit monitoring requirements now apply to only facilities in SIC groups 331, 332, 335, and 336.

Some commenters also opposed the monthly inspections and visual monitoring requirements, as well as the quarterly comprehensive site compliance evaluations for this sector. EPA has dropped the monthly facility inspections and visual monitoring requirements. EPA believes that quarterly facility inspections and visual monitoring should be adequate to evaluate the effectiveness of the pollution prevention plan. The requirements for conducting comprehensive site compliance evaluations have also been modified. Comprehensive evaluations will be required only on an annual basis for this sector rather than quarterly, as proposed.

Many commenters suggested alternate monitoring frequencies than those proposed. Generally, commenters felt that monitoring four times per year in years 2 and 4 was unnecessarily burdensome, impractical, or unrealistic, especially in arid and remote locations. Some commenters suggested that monitoring one or two times per year would provide representative data at less expense to regulated facilities.

EPA disagrees that quarterly sampling is unrealistic and has provided some

flexibility for active facilities that do not experience a representative storm event during the required sampling period. When a discharger is unable to collect a sample during a monitoring period due to adverse climatic conditions, the discharger may collect two samples from two separate qualifying storm events in the next period and submit these data. This waiver is only intended to apply to insurmountable weather conditions such as drought or dangerous conditions such as lightning, flash flooding, or hurricanes. EPA believes that quarterly sampling will allow better characterization of storm water discharges and assessment of the effectiveness of the facilities' pollution prevention plan, without placing an undue burden on permittees. Annual sampling could not accomplish an adequate assessment.

Several commenters expressed opposition to the potential inclusion of whole effluent toxicity (WET) testing under the multi-sector permit and characterized WET testing as expensive, impractical, inappropriate, and useless. Although EPA is not including WET testing under the terms of today's permit for this sector, EPA disagrees that WET testing is inappropriate for testing storm water discharges. EPA believes that WET testing can be a valuable monitoring tool in certain circumstances.

#### *Metal Mining*

Comments on permit requirements in the metal mining (ore mining and dressing) sector, focused on the application of the effluent limitation guidelines, compliance time, grouping of facilities, end-of-pipe treatment, definition of inactive and active mining, scope of coverage offered by the permit, and monitoring requirements.

A special condition of the multi-sector general permit is that those discharges subject to the effluent limitations guidelines (ELG) for the Ore Mining and Dressing Point Source Category (40 CFR 440) cannot be covered under the permit. Table G-4 in Part VIII.G. of the Fact Sheet contains a listing of various sources of discharges at active metal mining facilities and specifies whether or not discharges from those sources are subject to the ELG. Several commenters contend that through this clarification, EPA will expand the scope of discharges subject to the ELG by including storm water runoff from overburden, waste rock piles, haul roads, and other sources as being subject to the ELG. The commenters contend that storm water runoff from these sources previously had not been subject to the ELG and

could, in the past, be permitted as storm water discharges.

EPA believes Table G-4 represents a clarification of the relationship of ELG and storm water at active metal mining sites, and does not expand the current ELG requirements. EPA also believes the development document and the ELG support the interpretation given in Table G-4. In the November 6, 1975 preamble to the effluent limitations guideline, it states "The definition of a mine was intended to be sufficiently broad to cover all point source pollution resulting from all of the activities related to operation of the mine including drainage tunnels, haul roads, storage piles, etc." (40 FR 51727). In the 1978 development document (Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Ore Mining and Dressing Point Source Category, EPA, July 1978, page 146), the following definition of a mine was given for purposes of recommending subcategories and effluent limitations guidelines and standards:

A mine is an area of land upon which or under which minerals or metal ores are extracted from natural deposits in the earth by any means or methods. A mine includes the total area upon which such activities occur or where such activities disturb the natural land surface. A mine shall also include land affected by such ancillary operations which disturb the natural land surface, and any adjacent land the use of which is incidental to any such activities; all lands affected by the construction of new roads or the improvements or use of existing roads to gain access to the site of such activities and for haulage and excavations, workings, impoundments, dams, ventilation shafts, drainage tunnels, entryways, refuse banks, dumps, stockpiles, overburden piles, spoil banks, culm banks, tailings, holes or depressions, repair areas, storage areas and other areas upon which are site structures, facilities, or other property or materials on the surface, *resulting from* or incident to such activities (emphasis added).

It is important to note that the definition of "mine" includes the term "resulting from". Thus, something "resulting from" the mining activity is considered part of the active mine even though there is no activity at that specific part of the mine (e.g. waste rock is no longer being placed on a waste rock pile that is part of the mine). It would continue to be considered as part of the active mine until reclamation is started on that same portion of the mine. Residuals (waste rock piles, tailings piles, etc.) from historical mining at the site are not part of the active mining area unless they are re-disturbed by the current mining activity. The revision of the ELG in 1982 addressed best available

technology economically achievable (BAT), best conventional pollutant control technology (BCT), and best available demonstrated technology (BADT). That revision did not address the issue of what discharges were subject to the ELG. The definition of mine remained unchanged. In 1983, training sessions on how to implement the ELG were held for permit writers from EPA Regions and approved NPDES States. The guidance document used for those training sessions included the following Statement:

"Active mine areas" include the excavations in deep mines and surface mines; leach areas; refuse, middling, and tailing areas; tailing pond, holding and settling basins; and other ancillary areas to a mine or mill. Active mine areas do not include areas unaffected by mining or milling.

Based on the above, it is EPA's position that the following storm water discharges at active metal mining facilities are not subject to the ELG and can be covered by the multi-sector general permit: offsite haul/access roads; onsite haul roads not constructed of waste rock or spent ore; runoff from tailings dams/ dikes when not constructed of waste rock/tailings; concentration building and mill site if storm water only and no contact with material storage piles; chemical storage area; docking facility; explosive storage; fuel storage; vehicle/equipment maintenance area/building; vehicle/equipment parking areas; power plant; truck wash area; reclaimed areas released from reclamation bonds prior to December 17, 1990; and partially/ inadequately reclaimed areas or areas not released from reclamation bond. Storm water discharges from inactive mining facilities can be covered under the multi-sector permit.

In developing Table G-4, consideration was given to such factors as the nature of the source, the materials in the sources (e.g. raw materials, intermediate products, or waste products from the mining and milling operations), and whether or not it was likely that source was considered in the development of the ELG. It was decided that runoff from on-site haul roads not constructed of waste rock or spent ore, and runoff from tailings dams/dikes not constructed of waste rock/tailings should not be considered subject to the ELG because they do not have the same potential for containing toxic pollutants as do mine wastes. Such runoff would be similar to that from non-mine facilities.

Two commenters stated that if the scope of discharges subject to the ELG for the Ore Mining and Dressing Point

Source Category is expanded, then the permit needs to allow additional time (up to 3 years) to come into compliance with the effluent limitations as was proposed for the effluent limitations in the mineral mining sector. As explained in the response to the previous comment, Table G-4 is a clarification, not an expansion, of the discharges subject to the ELG. The multi-sector general permit does not authorize (apply to) discharges subject to the ELG for metal mining (i.e., 40 CFR Part 440). Therefore, a schedule for achieving compliance with those effluent limitations is not appropriate for the multi-sector general permit. Furthermore, the statutory deadline for compliance with the ELG is past.

A commenter felt that the draft multi-sector permit is extremely generic and lumps together all facilities in an extremely broad industry sector (e.g., ore mining and dressing), regardless of differences in product, processes used, or topographic and climatic conditions. The commenter further stated that difficulties caused by generic treatment of disparate facilities in a broad industry "sector" (e.g., the ore mining and dressing sector) are exemplified by the manner in which EPA determined the need for analytical monitoring requirements. The commenter had understood the purpose of the group application process to be the development of tailored, industry-specific permits for groups of facilities located in very similar areas, with permit conditions being tied to the particular circumstances of those facilities as described in the group application (including the sampling data provided in those applications).

This comment is similar to comments on several other sectors of the permit. The requirements to develop a storm water pollution prevention plan for metal mining facilities allows a great deal of flexibility to take into consideration such variables as type of ore being mined, pollutants of concern, type of mine, and local topography and climate. It would be difficult to have a variety of monitoring options to cover the various combinations of ores and climates, given the limited data submitted. Decisions being made on benchmark values may reduce monitoring requirements. Two commenters felt that imposing end-of-pipe treatment requirements for storm water discharges from mining operations, such as those contained in the ore mining and dressing effluent limitation guidelines, is both impractical and unnecessary. In the commenters opinion, the use of BMPs is

more appropriate than the use of numerical effluent limitations.

This comment appears to be related to a previous comment about EPA expanding the scope of discharges from metal mining facilities that are subject to the effluent limitations guidelines (ELG) for the Ore Mining and Dressing Point Source Category (40 CFR Part 440). As previously mentioned, those discharges subject to the ELG are not authorized by the multi-sector permit. The storm water pollution prevention plan requirements in the permit do not include the requirement to use end-of-pipe treatment for those storm water discharges from metal mining operations that can be covered by the permit. In some situations end-of-pipe treatment may be the appropriate means of control and should be used. That would be determined on a case-by-case basis.

With regard to the definition of inactive metal mining and dressing facilities, two commenters stated that the proposed 10-year period for declaring inactive status is arbitrary. They suggest that a more logical date for the distinction between active and inactive facilities would be December 17, 1990, which is now expressly referenced in EPA's storm water regulations at 40 CFR § 122.26(b)(14)(iii).

In response, some metal mining facilities may be temporarily shut down due to poor market conditions (e.g., uranium mines), seasonal conditions (e.g., heavy winter snows), and/or other factors. Some of these facilities are "mothballed" with the intent of bringing them back into operation when conditions improved to an acceptable level. For purposes of the multi-sector permit it was decided to consider such facilities as "temporarily inactive" rather than inactive. The distinction between "temporarily inactive" and "inactive" often is unclear when no reclamation activities have occurred at the site. In the draft permit the distinction between temporarily inactive and inactive was a period of ten (10) years with no mining and/or milling activity at the site. In the final permit the determination will be based on whether or not the facility has an active mining permit issued by the applicable (federal or State) governmental agency that authorizes mining at the site. All States now have agencies that have the authority to authorize mining on non-federal lands. Even though there may be no activity at the facility, it will be considered temporarily inactive as long as it has a permit for mining activity at the site.

The definitions of inactive and temporarily inactive facilities have been revised somewhat to reflect what EPA believes to be the appropriate distinction between the two definitions. In order for a site, or portion thereof, to be considered "inactive," there must not be any current metal mining and/or milling activities, as defined in this permit, at that portion of the site and that portion of the facility does not have an active mining permit issued by the applicable governmental agency that authorizes mining at the site.

A metal mining facility, or portion thereof, is considered to be "temporarily inactive" if metal mining and/or milling activities occurred in the past, but currently are not being actively undertaken, the facility has an active mining permit issued by the applicable governmental agency that authorizes mining at the site. There is no time limitation on how long such a site can be considered to be temporarily inactive. EPA believes such sites should provide the extra storm water pollution prevention requirements that the temporarily inactive status requires compared to what is required for inactive status.

The proposed permit would require metal mining sites to identify, in pollution prevention plans, the outfalls from the site that contain mine drainage or process water and designate for each outfall the boundaries of the area that contribute to such areas. A commenter objected to this permit condition as being beyond the scope of the proposed multi-sector permit. Except for primary metals industrial sector, this is not being required of other industrial sectors.

In response, Part XI.G.3.a(3)(a)(i) of the draft permit stated "A site topographic map shall be included in the plan that indicates, at a minimum: . . . and boundary of area that contributes runoff to outfalls that are subject to effluent limitations guidelines." EPA would like to clarify that the last part should read ". . . boundary of tributary area that is subject to effluent limitations guidelines." Those discharges that are subject to effluent limitations guidelines (ELG) need to be regulated under another permit. It is the permittee's responsibility to identify discharges that are not authorized under this permit, but that mix with those storm water discharges that are authorized by the permit. This requirement is included in the metal mining sector because at most metal mines there are numerous areas where the storm water runoff is subject to the ELG. That is not the situation for most of the other sectors covered under the multi-sector permit.

One commenter stated that EPA should clarify that storm water permits are not required for discharges at mining sites which are not contaminated by contact with significant materials. This comment also applies to the coal mining and mineral mining sectors.

In response, based on the definition of storm water discharges associated with industrial activity (40 CFR 122.26(b)(14)(iii)), a permit is required for discharges from mining and milling facilities where the discharge has come into contact with any overburden, raw material, intermediate products, finished products, byproducts, or waste products located on the site. The exception is for discharges from areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or for discharges from areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990.

Two commenters felt that EPA's proposed analytical monitoring requirements for metal mining facilities should be substantially reduced, and they should be eliminated if EPA does not retract its proposed overly expansive interpretation of the Part 440 regulations.

In response, EPA has reevaluated the monitoring requirements for all the sectors of the multi-sector general permit and the number of pollutants for which monitoring is required for the metal mining sector has been reduced. EPA does not see any reason why the monitoring requirements should be further reduced just because EPA provided clarification as to what sources are subject to the effluent limitations guidelines for Metal Mining and Ore Dressing. The determination of the monitoring requirements for the metal mining sector was based on an evaluation of the monitoring data submitted with the group applications for metal mining facilities. The activity status of many metal mining facilities was taken into consideration in determining the monitoring requirements. Monitoring for the metal mining sector was limited to the active facilities.

#### *Oil and Gas Extraction*

Comment on Sector I, the oil and gas extraction sector, focused on coverage allowed under the general permit for oil and gas sites and pollution prevention plan requirements, particularly for remote, unmanned sites. Representatives of the oil industry made

the comment that the landfarming of oilfield wastes as a practice to allow biological break down should be covered by this sector of the general permit. They state that this is a common practice at exploration and production facilities sites and should be considered a part of the oil and gas facility activity and not an industrial waste land application site subject to the requirements under the land application sector in part XI.L. of the multi-sector permit.

In response, EPA would first like to note that the land application or disposal of oilfield wastes, produced waters, and oilfield drilling muds is an activity that is regulated by most States; and as such must be taken to State approved disposal sites. The discharge of any of these materials and their associated pollutants to a water of the U.S. is not authorized under this sector. Although, in theory, the practice of landfarming oilfield wastes would seem consistent with a no discharge requirement, there is the potential for pollutants from these land application sites to be discharged in storm water runoff and as such should comply with the permitting requirements of 122.26(b)(14). The oil and gas industry is not unique in that it land applies industrial wastes as a disposal practice. EPA must be consistent in its approach to land disposal practices under the storm water program. Also, EPA is concerned that proximity of the disposal site to actual drilling activity may be variable. For these reasons EPA believes these sites are more accurately described as land application/disposal sites and are subject to storm water permitting under section XI.L. of this permit. Where these sites are indeed proximate to the drilling/production site the disposal activity would be considered a co-located activity and would be subject to the additional requirements under Sector XI.L. of this permit.

Commenters requested that the construction activities associated with oil and gas exploration and production (e.g., construction of access roads, drill pads, mud pits etc.) should be covered under the erosion requirements of this permit and that those activities not require a separate general permit coverage for the construction activities. In response, erosion, sediment, and pollution control should be addressed in all pollution prevention plans for industrial activity. Particularly where the industrial activity has the potential to disturb vegetation or natural runoff patterns and exacerbate erosion. This is true of oil and gas exploration and production activities. Therefore EPA has

included additional requirements in the development of pollution prevention plans for these facilities. However, where the construction of a drilling site or any construction of facilities covered by this sector would cause the disturbance or is part of a plan to develop which would disturb five acres or more, then that construction activity itself, becomes an industrial activity which is defined in the regulations (40 CFR 122.26) as having storm water associated with industrial activity which requires separate permitting. EPA has issued a general permit which addresses the runoff from construction activities. This multi-sector general permit, while providing guidance for construction activities under five acres that may occur at a site, does not authorize large scale construction (5 or greater acres) and erosion control. EPA does not believe that it is unnecessarily burdensome for the oil and gas industry to file a construction general permit Notice of Intent and be compliant with the pollution prevention requirements for their sites which will cause the disturbance of five acres or more.

Many commenters expressed concern that it will be very difficult (if not impossible) for oil and gas facilities to do visual monitoring on their remote unmanned sites. They complain that they will not know when its raining and cannot get there in time to get a proper sample. These commenters request that this quarterly visual monitoring be dropped from the multi-sector general permit as a requirement for remote, unmanned oil and gas sites.

In response to the issue of a remote facility being required to comply with the monitoring provisions, EPA realizes that if a facility is inactive and unstaffed it may be difficult for the operator to collect storm water discharge samples when a qualifying event occurs. Today's final permit has been revised so that inactive, unstaffed facilities can exercise a waiver of the requirement to conduct quarterly visual examinations.

Commenters asked for a two-tiered storm water pollution prevention plan. One for those facilities with lots of activity and a less burdensome plan (a de minimis plan) for remote facilities that are unmanned and have no activities (e.g., old oil field with a few capped wells on the property).

EPA agrees that a pollution prevention plan for inactive, unmanned sites should not include all of the same elements of a facility with continuous activity and personnel. However, the proposed pollution prevention plan requirements already allow for a plan that addresses potential pollutant sources in a way that is appropriate for

each facility. EPA believes that this allows adequate flexibility for operators of unstaffed, inactive sites to address activities such as housekeeping and preventive maintenance in a manner that is appropriate for that site.

#### *Coal Mines and Related Facilities*

EPA includes inactive mining areas because significant materials remain on site which can be exposed to storm water and runoff. Two commenters disagreed with the listing of solvents, cleaning agents, contaminated soils and sludges as significant materials found on inactive sites. EPA agrees that these materials are not normally found on inactive sites in significant amounts, especially compared to exposed overburden and refuse piles. However, the Agency wishes to call attention to the possibility of these materials existing at inactive sites where machinery has been intensively used or has been abandoned.

One commenter disagreed with the Agency's conclusion that suspended solids and iron in storm runoff merit attention based on sampling data submitted. The commenter indicated that the sampling could not be presumed representative and that very high suspended solids concentrations are found in runoff from undisturbed areas in many western coal mines. The Agency agrees that the data was provided by only a small percentage of coal mines participating in the group application process and may not be representative. However, the sampling data submitted does give some indication of the relative amounts of pollutants contributed by storm runoff and the Agency wishes to call attention to those pollutants which appear to be more significant.

EPA requested comments on alternative monitoring and reporting requirements which include annual sampling of 20 percent of haul road discharges and analyzing the samples for settleable solids. Four commenters responded to these alternative requirements, all negatively. The primary reason indicated was that the expense and burden of analytical monitoring would not be justified. Most indicated that controls through Best Management Practices (BMPs) and visual examinations would be sufficient. EPA acknowledges these responses and, although it believes there is value in occasionally performing settleable solids evaluations, withdraws the alternative monitoring requirements as an option to the required visual examinations.

Four commenters indicated that the Surface Mining Control and

Reclamation Act (SMCRA) requires sediment and erosion controls in the form of BMPs and this requirement should be sufficient for purposes of the storm water general permit. One of the commenters disagreed with the reference of SMCRA requirements as minimum requirements rather than primary requirements of the pollution prevention plan of the general permit. EPA acknowledges the SMCRA sedimentation and erosion control requirements as the primary requirements for active coal mining-related areas and for inactive areas under SMCRA bond authority. The permit wording is modified to this effect while still indicating that, where determined appropriate for protection of water quality, additional sedimentation and erosion controls may be warranted.

Four commenters felt that the requirement for quarterly sampling and visual examination of representative discharges is burdensome and unnecessary. Reasons cited were that active areas and regulated by SMCRA, haul roads in some areas are remote, and rainfall in some western areas is unpredictable and spotty. Two of these commenters suggested as-needed visual examinations, one suggested annual examinations, and one suggested semi-annual examinations.

Although haul roads are regulated by SMCRA and in some cases may be remote, EPA is concerned that they can be a significant source of stream siltation if sediment and erosion control measures are not adequate to provide necessary protection of stream quality during precipitation events. The Agency believes that a requirement for periodic visual examinations of representative discharges is necessary in order to provide some evaluation of the effectiveness of control measures under actual runoff conditions. EPA also acknowledges that drier western areas would have less frequent incidences of precipitation resulting in runoff. The Agency has reduced the sampling and visual examination requirements from quarterly to semi-annually both for areas having an average annual precipitation of 20 inches or less as well as for inactive areas under SMCRA bond.

One commenter suggested that the requirement to collect samples from discharges resulting from storm events greater than 0.1 inch should be replaced by a requirement to collect samples resulting from any storm event sufficient to produce a visual flow. The Agency is concerned that some very small storm events may not have sufficient potential to significantly disturb and carry off sediment even though the storm events may produce

visual flows. To evaluate effectiveness of sediment and erosion control measures under conditions which have potential for stream siltation, sampling discharges resulting from at least a 0.1 inch storm is felt warranted.

Four commenters disagreed with the requirement to sample within a 30-minute period or, where not practical, within a one-hour maximum period after beginning of a discharge resulting from a 0.1 inch storm event. Their concerns were similar in that some mining areas are extensive, rainfall measurements may differ in different parts of a mining area, and one hour is not enough time to respond with sampling. One of the commenters suggested that the sampling be required within one hour or as soon as practical after discharge begins. Another of the commenters suggested that samples be collected within two hours of discharge within normal business hours at 25 percent of a facility's representative outfalls.

The requirement of a 30-minute period (one hour where impractical) for obtaining samples is based on the fact that the highest potential of sediment runoff and resulting stream siltation occurs during early stages of storm periods where loose dirt and other materials are most likely to be swept away. However, the Agency recognizes possible problems at large mining areas for sampling within the required 30-minute to one-hour maximum period after beginning of discharge. The requirements are changed to allow sampling within the first one hour after beginning of discharge or, as soon as practical, but not to exceed a two-hour maximum time period. The Agency believes that this requirement is not burdensome since samples are required only from representative discharges and at frequencies of once per quarter and less in drier areas of the nation. Sampling flexibility is also provided by the number of 0.1 inch or greater precipitation events occurring during the quarterly or semi-annually sampling periods.

One commenter pointed out that the chemical monitoring requirements do not distinguish between active and inactive areas. This commenter and three others opposed monitoring requirements for inactive areas. Two of these commenters suggested, however, that samples be collected if discharges occurred during an inspection. The Agency agrees that mandatory sampling of inactive areas within a specific time period after initiation of a discharge due to a minimum precipitation event may be burdensome and has changed that

requirement for operators of inactive, unstaffed facilities.

Three commenters suggest that inspections for inactive sites be specified at once every three years rather than yearly with an allowance under certain conditions of less frequent inspections. EPA does not believe that an across-the-board allowance of one inspection every three years would be adequate. Although no mining-related activity may be taking place at inactive sites, exposure of unreclaimed overburden, refuse or other materials on site is susceptible to erosion and runoff and warrants more frequent inspections of sediment and erosion control measures. Yearly inspections are felt to be appropriate to better assure that control measures have not deteriorated.

#### *Mineral Mining and Processing Sector*

The comments on sector J, the mineral mining and processing sector focussed on eligibility under the sector, monitoring requirements, and the pollution prevention plan requirements of the permit. EPA requested comment on whether mine dewatering should be included in the storm water multi-sector permit, and if included, if it should be expanded from just Region VI to all EPA Regions.

EPA has elected to allow currently unpermitted mine dewatering discharges from Construction Sand and Gravel, Industrial Sand, and Crushed Stone mines to be included in this permit, but only for facilities located in EPA Region VI and Arizona. This option does not exist in other EPA regions. Region VI and Arizona have a large number of unpermitted mine dewatering discharges and limited resources necessitating this requirement.

EPA Region VI proposed a limited amount of monitoring. Commenters felt that monitoring should be limited to only those parameters for which there are ELGs. For example, the construction sand and gravel subcategory (SIC Code 1442) only has ELGs for pH.

EPA Region VI has elected to require monitoring for those parameters indicated in the proposed permit. EPA believes that such monitoring is necessary to assess the pollutants levels in the discharge and to assess the effectiveness of the pollution prevention plan.

Commenters felt that industry should not be required to attain discharge levels for solids to a greater degree than that occurring in the natural erosion of the surrounding area or that found in the receiving stream during storm events. To that end, the commenters requested that the industrial facility or the State be

responsible for establishing criteria for TSS limitations. In the proposed storm water discharge permit EPA did not establish any new storm water effluent limitations. Rather, the limits in the proposed permit are existing effluent guidelines under the NPDES program which the discharger should already be meeting. EPA believes that it would be imprudent to allow industry to establish its own TSS limitations. The method which a owner/operator of a facility chooses to reduce storm water discharges is left to the industrial facility.

In addition, EPA wishes to clarify that the "cut off" concentrations are not the same as effluent limitations. If a facility is unable to verify that its storm water discharge is below the cut-off concentration it will be responsible for the continued monitoring of that pollutant in its storm water discharge. Once again, the "cut off" concentrations are not storm water effluent limitations and should not be viewed as limits that must be met.

Commenters felt that while assessment and implementation of needed BMPs may be necessary, written discussion, documentation and scheduling of this procedure should not be a requirement of the storm water pollution prevention plan. According to the commenters, such assessments and decisions should be made prior to the development of the storm water pollution prevention plan. The outcome of those decisions should be made a part of the storm water pollution prevention plan. The commenters felt that the storm water pollution prevention plan represents the avenue for preventing storm water pollution and should not be used as an engineering report for BMP evaluation and selection.

On page 61162 of the November 19, 1993, Federal Register EPA identified the focus of storm water pollution prevention plans. The plan has "two major objectives: (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from the facility and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges associated with industrial activity. . . ." EPA further States the storm water pollution prevention plan requirements are intended to facilitate a process whereby the operator of the industrial facility thoroughly evaluates potential pollutant sources at the site and selects and implements appropriate measures designed to prevent or control the discharge of pollutants in storm water runoff. EPA believes it is necessary to

include the discussion and documentation of BMP selection in the storm water pollution prevention plan to ensure the plan developed for a facility is operating effectively. The storm water pollution prevention plan process involves four steps including the assessment of potential storm water pollution sources, the selection and implementation of appropriate management practices and controls, and the periodic evaluation of the effectiveness of the plan to prevent storm water contamination. Because of the uniqueness of mine sites, the effectiveness of the BMPs can most effectively be evaluated after their implementation.

Commenters requested that EPA provide for reduced inspection and visual examination requirements for active mineral mining and processing sites given the Agency's findings that these sites have "generally low pollutant values." In response, EPA strongly believes that quarterly visual examinations of storm water discharges is appropriate. Since EPA is not proposing the monitoring of storm water discharges from all subsectors, quarterly visual examinations will allow for feedback to be incorporated into a storm water pollution prevention plan.

Commenters requested that EPA provide for flexible inspection requirements and no monitoring requirements for inactive mineral mining and processing facilities, consistent with the Agency's proposed approach for metal mining sites. In response, EPA will require chemical monitoring of storm water discharges only from active sand and gravel and dimensional stone, crushed stone and non-metallic minerals facilities in this sector. The permit still requires quarterly visual examinations of all storm water discharges from active facilities but this requirement can be waived for inactive, unstaffed facilities.

The proposed mineral mining and processing sector permit required annual inspections for temporarily and permanently inactive sites, but did not allow for reduced inspection requirements for remote and inaccessible sites as EPA proposed for inactive ore mining and coal mining sites. Commenters requested that EPA provide the same relief provision for mineral mining sites as it did for coal and ore mining sites. In response, EPA has revised its inspection requirements by reducing the frequency of the comprehensive site compliance evaluation to annual for all active and inactive mineral mining and processing facilities.

Commenters felt that the requirements and conditions for termination of permit coverage would be unworkable because the "background values" for certain parameters, such as total suspended solids, would be highly variable from outfall to outfall and according to the intensity of storm events. In response, EPA has elected to delete the conditions for termination of coverage. These conditions would have been made available only if the alternative monitoring requirements were imposed in the final permit for this sector.

#### *Hazardous Waste Treatment Storage and Disposal Facilities*

One commenter questioned the definition of "treatment, storage, or disposal facility" that will be used relative to the storm water regulations. The storm water regulations published in the November 16, 1990 Federal Register apply to "hazardous waste treatment, storage, or disposal facilities that are operating under interim status or a permit under subtitle C of RCRA." The multi-sector permit requirements in this sector, apply to "facilities that treat, store, or dispose of hazardous wastes, including those that are operating under interim status or a permit under subtitle C." The use of the term "including" is not clear. The same commenter requested clarification regarding the inclusion of hazardous waste generators who operate storage areas (with less than 90-day accumulation) or temporary satellite accumulation areas. In addition, another commenter requested clarification on whether facilities regulated under Subpart X of 40 CFR 264 are subject to the storm water provisions.

EPA's intent regarding storm water permit coverage for facilities under this sector, is to include all treatment, storage, or disposal facilities (TSDFs) operating under interim status (40 CFR 265) and those operating under a permit issued pursuant to 40 CFR Parts 264 and 270. This includes facilities regulated under Subpart X of Part 264. It also includes recycling facilities whose operations are subject to regulation under Part 266, to the extent that these activities also are subject to interim status or permitting requirements under Subtitle C of RCRA. Used oil recycling facilities that are subject to regulations under Part 279 are included in Sector N of this permit, rather than Sector K. Sector K does not include generators who temporarily store hazardous waste pursuant to the requirements in 40 CFR 262. The permit language has been clarified to confirm that the multi-sector permit requirements in this sector apply to facilities that treat, store, or dispose

of hazardous wastes and that are operating under interim status or a permit under subtitle C of RCRA.

Several questions were received regarding the parameters included in the monitoring requirements. More specifically, several commenters questioned the inclusion of Total Kjeldahl Nitrogen (TKN) and Chemical Oxygen Demand (COD) in the industry monitoring requirements in Table K-3, and the exclusion of Total Suspended Solids. The U.S. Army questioned whether the data they submitted was incorporated into Table K-1 on conventional pollutants in storm water. The Army also requested that EPA clarify the form of cyanide that is to be monitored, and suggested that a numerical detection limit should be specified for total recoverable magnesium and cyanide, rather than the words "detection limit."

The monitoring parameters and the cut-off concentrations specified by EPA for this sector primarily were based on the parameters previously established for the baseline general permit. These parameters were based on consideration of significant materials and the industrial activities of facilities in this industry. The amount of storm water data specific to TSDFs that EPA was able to evaluate was very limited; any data submitted from military organizations was evaluated separately and not included in Table K-1. Total recoverable cyanide is to be monitored by TSDFs; the commenter is referred to 40 CFR 136 regarding analytical methods to be used in the storm water program. Regarding the cut-off values for total recoverable magnesium and total cyanide, the concentration for magnesium is .0636 mg/l and the concentration of cyanide is .022 mg/l.

Some commenters questioned Region 6's assertion that storm water from hazardous waste Treatment, Storage, and Disposal Facilities (TSDFs) would not be allowed coverage under the Multi-Sector General Permit in Region 6 States (OK, NM TX, and LA). These commenters asked whether Region 6 intended to exclude only commercial facilities or all TSDFs. A few of these commenters noted that the exclusion of all TSDFs would put a financial and resource burden on both the regulated TSDFs and EPA by requiring all facilities to obtain individual permits. One commenter asked whether this applied to closed TSDFs as well.

Region 6 agrees with the commenters that it would be unduly burdensome to both the industry and the Agency to issue individual permits for all TSDFs. At this time, Region 6 would like to clarify their intent and indicate which

TSD facilities would be allowed to be covered by a general permit; and those the Region specifically believe must obtain individual permits. Region 6 believes that General Permit coverage is appropriate for TSDFs that are self generating and are probably covered by the Multi-Sector General Permit via some other (primary) industrial sector. These facilities would be required to comply with the specific requirements in the Multi-Sector General Permit for their TSDF areas. The Region believes that the Multi-Sector General Permit requirements and monitoring for these facilities are appropriate. This would also apply to facilities that only store hazardous waste and do not treat or dispose of the hazardous materials. Also, the Region believes that disposal facilities that have been properly closed and capped, and have no significant materials exposed to storm water should not require permits in accordance with the description of storm water associated with industrial activity [40 CFR 122.26 (b)(14)].

However, it is Region 6's intent to issue individual permits for all commercial Treatment and Disposal Facilities. Those facilities would only be those which take commercially produced hazardous wastes (not their own) and treat or dispose of those materials. The Region has few of these, and the burden on the Regional permitting staff is small. Only six commercial facilities applied for coverage through the group application process. To date, Region 6 has required individual permit applications from all such facilities; and permits have included specific technology and water quality based limits. To allow existing facilities to obtain permit coverage under the Multi-Sector General Permit would be backsliding, and not allowable under part 402(o) of the CWA. To allow new facilities with permit conditions that are less stringent would not be consistent and would provide an economic advantage to new facilities over existing ones. In addition, Region 6 believes that more careful compliance tracking is warranted for facilities that treat and dispose of hazardous waste as a commercial operation. The Region does not believe that this would be burdensome on the few facilities that fall into this "commercial" category. These are large facilities that treat and dispose of large quantities of hazardous wastes as a service to generators. Because individual permits for these commercial hazardous waste treatment and disposal facilities has always been a priority, the Region believes it is consistent and appropriate to require all

such facilities to apply for individual NPDES permits for their storm water discharges. This distinction does not apply to facilities that take and dispose of household (residentially produced) hazardous wastes. Facilities that accept, for disposal or treatment, wastes generated by private individuals at their residence are not required to submit individual applications unless they are a commercial facility for the treatment or disposal of hazardous wastes. Region 6 does not wish to discourage benevolent industry operators from offering this service and thereby discourage the proper disposal of household hazardous wastes by limiting their eligibility under this general permit.

#### *Landfills and Land Application Sites*

One commenter stated that the permit should provide reduced monitoring and pollution prevention plan requirements for landfills and land application sites that receive a homogenous waste stream. EPA agrees with the commenter that there are a wide range of industrial landfill and land application types depending on the nature of the waste received/managed. Even where the same waste categories are received by two landfills (or land application sites), waste characteristics may be highly source-specific. For example, ash composition varies significantly depending upon the fuel type/source and the combustion process. Because of this diversity and the limited extent of monitoring data submitted with the group applications, the Agency has established broad monitoring requirements for this sector. Further, the Agency believes that quarterly monitoring during the second year of the permit is necessary to fully characterize storm water discharges from individual sites. The Agency also notes that Section 5.a.(3). (a) of the permit waives monitoring requirements during the fourth year on a pollutant-by-pollutant basis where sampling shows concentrations below the threshold levels.

Several commenters expressed concern that a wide variety of pollutants are listed in the monitoring requirements of the proposed permit. Potential source of pollutants and pollutant types vary significantly from landfill to landfill. EPA concurs with the commenter that there are a wide range of industrial landfill types depending on the nature of the waste received/managed. To address the commenter's concern, the Agency has developed the alternative certification described in Section L.5.a.(5) of the permit. This provision will allow

permittees to exercise a waiver of the monitoring if they can certify that storm water will not be exposed to potential sources of pollution.

The Agency believes that permittees should implement BMPs to minimize erosion at sites (i.e., to prevent/minimize pollutant loadings to storm water). This includes stabilizing daily cover piles, wherever practicable, regardless of their locations. These measures will reduce the need to rely on other controls to manage/treat storm water runoff after contamination has occurred.

One commenter questioned the analytical monitoring requirements proposed for landfills closed prior to the effective date of 40 CFR 258.60. The commenter felt that all landfills closed in accordance with State or local regulations should be exempted from analytical monitoring. In response, the Agency believes that prior to the effective date of 40 CFR 258.60 there was significant variability in State MSWLF closure requirements. The closure provisions of State industrial landfill regulations are similarly diverse. Because of this variability, the Agency cannot be certain that landfill areas closed under State programs do not have the potential to contribute pollutants to storm water discharges (unless the requirements are equivalent to or more stringent than 40 CFR 258.60). Therefore, the Agency does not believe it is unreasonable to require monitoring for such sites. For landfills that are closed according to State or local requirements that are equal to, or more stringent than 40 CFR 258.60, the permit includes the "alternative certification" and "low concentration" waivers which should provide a means for such a landfill to forego the need to monitor.

Several commenters expressed concern that the frequency of the inspections required for storm water pollution prevention plan are excessive and impose an excessive burden upon facility operators. The Agency appreciates the commenters feedback on the inspection frequency and recognizes the potential difficulties that may arise from requiring inspections within 24 hours of a storm event. Therefore, the final permit has been revised to only include weekly inspections. The Agency believes that this frequency is appropriate for landfills and land application sites because of the nature of the BMPs typically used at these facilities. Erosion and sediment control measures often require frequent upkeep and maintenance to ensure proper operation.

One commenter requested a reduction in the monitoring requirements for facilities located in cold climates due to difficulty in collecting samples during winter periods. The Agency does not believe that monitoring requirements should be adjusted for landfills solely because they are located in cold climates. The permit provides a temporary exclusion from monitoring requirements during a quarter if sampling is unfeasible due to adverse conditions (including weather) and this provision should account for difficulties in conducting sampling due to climate. Under this exclusion, permittees are, however, required to collect two samples during the next quarter to make up for the missed sampling requirement.

Several commenters stated that the monthly visual examination requirements for this sector were excessive and burdensome. In response to these comments, today's permit requires only quarterly visual examination of storm water discharges. For active and staffed landfills and land application sites, the Agency does not believe that it is unreasonable to require sampling/visual examinations once each quarter within the first hour a storm event.

#### *Auto Salvage Yards*

A few commenters indicated that storm water runoff from automobile salvage yards is often contaminated with spilled residues of engine and transmission fluids, and battery acid saturated with lead. The Agency agrees that automobile salvage yard facilities may have many potential sources of storm water pollutants. Therefore, today's final permit incorporates permit conditions to address these potential sources. Such conditions include development of a pollution prevention plan, which includes the implementation of BMPs, regularly scheduled inspections, and visual and analytical monitoring to help assess the effectiveness of the pollution prevention plan and to identify potential problems with the plan that would lead to making plan revisions and incorporating additional control measures.

A few commenters stated that some of the conditions under the proposed multi-sector permit for automobile salvage yards are more stringent than those under the baseline general permit. In response, EPA wants to clarify that certain information, not available at the time of finalization of the baseline general permit, such as the group application information and sampling data, was used extensively in the development of the conditions in today's final permit. This information

and data has identified pollutants of concern, the concentrations of these pollutants, and the industrial activities that are conducted on-site that generate these pollutants. The Agency has developed appropriate conditions in this final permit to address these storm water discharges.

Several commenters feel that the proposed semi-annual employee training requirement for facilities in the automobile salvage yard sector is too burdensome, especially considering the annual training required for most other sectors. Today's final permit requires facilities themselves to identify periodic dates for employee training in the storm water pollution prevention plan. The focus of the employee training required under the multi-sector permit is on informing personnel of the components and goals of the storm water pollution prevention plan (storm water pollution prevention plan). This includes familiarizing employees with their responsibilities under this plan. The Agency believes that periodic training programs are needed to keep employees up-to-date with the storm water pollution prevention plan but agrees that semi-annual requirements may be too burdensome for some facilities. EPA leaves the decision as to the frequency of employee training up to the facility operator because site-specific circumstances will call for different training frequencies and the facility operator is in the best position to make that decision. The frequency of training for auto salvage facilities can therefore be determined by each facility operator at the time they develop their pollution prevention plans. If additional training is necessary than what is originally identified, then the plan can be modified by the operator and the training frequency increased.

A few commenters requested that the frequency of the visual monitoring required for facilities in the automobile salvage yard sector be reduced from monthly to quarterly. In response to these comments and other comments on this issue, and given further consideration of climatic variations and the other types of inspections required under this sector, today's final permit requires facilities to conduct only quarterly visual monitoring. Visual monitoring will allow facilities to detect potential problems and evaluate the effectiveness of the pollution prevention plan more frequently than just through chemical sampling.

Several commenters indicated that existing BMPs at their facilities are sufficient or that specific BMPs listed in the proposed fact sheet are not appropriate. EPA wants to clarify that

facilities with BMPs already in place are still required to develop a pollution prevention plan. Existing BMPs may, however, be used as part of the pollution prevention plan, if it is determined that the BMPs adequately address the potential pollutant sources at the site. The Agency notes that Table M-3 of the proposed fact sheet, Storm Water BMPs for Automobile Salvage Yards, is a list of BMPs to be considered when developing the pollution prevention plan. These BMPs may not, however, be appropriate under all conditions, nor may this list be all inclusive. Permittees should use this table as guidance when considering which BMPs to implement at their site.

Numerous commenters indicated that the costs for automobile salvage yard facilities to comply with the proposed multi-sector permit will be too burdensome. Several comments stated that the cost would exceed \$15,000 per facility. Costs, including the time and money necessary to meet the proposed documentation and monitoring requirements, may force some facilities out of business. Several comments stated that smaller facilities would have to hire a professional engineering firm to develop the pollution prevention plan and an additional employee to perform the recordkeeping and monitoring requirements. The cost estimates referred to in these comments are based on the requirements in the proposed multi-sector permit. The Agency notes that several of these proposed requirements have been reduced in today's final permit and that these reductions will significantly reduce the cost of compliance. The reductions include requiring analytical monitoring only for certain facilities, a pollutant-by-pollutant alternative certification for those facilities that are subject to analytical monitoring, a decrease in the minimum frequency of visual examinations of storm water discharges from monthly to quarterly, and a reduction in the minimum employee training requirements. EPA believes it is feasible, even for small businesses, to fulfill the requirements of today's permit without hiring outside help. The Agency has provided guidance, such as the manual, "Storm Water Management for Industrial Activities; Developing Pollution Prevention Plans and Best Management Practices" to assist permittees with the development and implementation of pollution prevention plans.

A few commenters stated that the comprehensive site compliance evaluation for automobile salvage yard facilities should only be required once a year, not twice as was proposed in the

multi-sector permit. The Agency agrees with these commenters and notes that today's final permit has been revised to require a comprehensive site compliance evaluation at a minimum of once per year in this and all other sectors.

A few commenters stated that the inspection requirements for automobile salvage yard facilities are too burdensome. In particular, commenters stated that the requirement to implement any changes in measures and controls as a result of these inspections within 12 weeks should be changed. Although 12 weeks is enough time to make management procedural changes, commenters felt it is not sufficient to implement structural changes to the facility. Commenters requested a 1 year time frame to implement such changes.

The Agency believes that the majority of the changes required as a result of the quarterly inspections will be procedural or programmatic in nature. Therefore, a 12 week time-frame should be sufficient for the implementation of the majority of the changes to the plan under this section. In the event that a permittee believes structural changes to the facility are necessary, the permittee should contact their EPA permitting authority and discuss a possible schedule for implementing the changes. Changes requiring construction are allowed additional time for implementation under the terms of the permit.

Several commenters stated that the quarterly inspections for leaks from vehicles and outdoor storage areas are too burdensome. Comprehensive site compliance evaluations and the requirement to remove fluids from vehicles when they arrive on-site, or as soon as feasible thereafter, make quarterly inspections unnecessary. One commenter questioned why quarterly inspections for leaks from vehicles is necessary if fluids must be removed from vehicles when they arrive on-site, or as soon as feasible thereafter. The Agency notes that there are certain circumstances in which fluids cannot be removed from vehicles immediately. Therefore, quarterly inspections should include checking vehicles which still have fluids for leaks. Vehicles that have been completely drained of fluids are not of concern for this inspection. EPA believes that the quarterly inspections required under the proposed permit target areas with a significant potential to contaminate storm water, such as outdoor storage of containers. Therefore, today's final permit includes quarterly inspection requirements.

A few commenters stated that EPA should allow facilities in the

Automobile Salvage Yard sector additional time to construct structures needed to control contamination of storm water runoff. One suggestion was to allow these facilities 5 years to construct storm water pollution control structures, as long as the construction design and schedule is developed by a professional engineer (PE) and is 50% complete within 24 months, 75% complete within 36 months, and 100% complete within 60 months. Compliance deadlines under the multi-sector permit allow facilities up to 3 years from the effective date of the permit to construct structural BMPs that are called for in the pollution prevention plan. The Agency believes that in most cases 3 years is sufficient time to complete construction of structural BMPs. Permittees that feel they cannot complete construction within this specified time period should contact the applicable EPA Regional office.

Several commenters stated that the proposed recordkeeping requirements would be the most expensive segment for facilities subject to the Automobile Salvage Yard sector. Facilities should not be required to document the volume of fluids removed from vehicles as they are received since transporters or recyclers document the total volume of fluids removed from the site when collection is made for recycling. Commenters also indicated that reports should be prepared at the time the materials are sold or recycled, and not necessarily every month. In response, EPA has deleted these requirements from the final permit since many permittee already track such information for other purposes.

#### *Scrap Recycling and Waste Recycling Industries*

A number of commenters requested clarification on the prohibition of the discharge of washwater from tipping floor areas. To clarify, the final permit specifically prohibits the discharge of washwater from tipping floor areas to any part of a storm sewer system. This is considered a process wastewater discharge which is not authorized by this storm water permit. This permit also does not authorize discharges to the sanitary sewer system.

A substantial number of commenters expressed concerns regarding the appropriateness and costs associated with requiring the usage of structural erosion and sediment controls at scrap recycling facilities. Commenters frequently stated that such a requirement was inappropriate at this stage of the permitting process and that scrap recycling facilities should be

provided the flexibility to implement a range of source control measures. Commenters frequently stated that their facilities did not have the room for structural controls such as retention ponds and sediment basins. It was further suggested that the results of monitoring data, particularly for total suspended solids (TSS), warranted a more flexible approach to the use of erosion and sediment control measures.

EPA believes that erosion and sediment controls are necessary at scrap recycling facilities due to the large amount of facility property (used for the industrial activities) which is unstabilized exposed soil and which receives large amounts of vehicular traffic similar to a construction site. For these areas, there are many types of erosion and sediment control measures that are appropriate for a recycling facility. A review of the group application information indicates that both structural and non-structural erosion & sediment control practices have been employed at scrap recycling facilities. In addition, scrap recycling facilities also commonly use spray water as a means of dust control. Regardless, EPA believes that these areas are appropriately classified as engaged in industrial activity and require storm water BMPs for controlling pollutant sources. Analysis of the part II sampling data indicates that approximately 22% of the grab samples for TSS were above 500 mg/l and, similarly for approximately 20% of the composite samples. EPA considers the use of erosion and sediment source control measures to reduce sediment loadings to be appropriate for scrap recycling facilities.

The permit does provide the flexibility for operators to select a mix of erosion and sediment control practices to reduce suspended sediment loadings. However, EPA wishes to clarify an issue with regard to requirements for the construction of permanent erosion and sediment controls such as retention ponds and sediment basins. EPA expects that these types of controls, or their equivalent, would only be constructed after the operator has had the opportunity to employ a full range of non-structural type source control measures and where substantial settleable and/or suspended solids loadings still persist. EPA is aware that site-specific conditions could exist which would preclude the siting of a structural control, i.e., a retention pond. Space restrictions caused by permanent buildings, permanently-fixed processing equipment, other semi-permanent or permanent obstructions, and/or restrictions posed by property

boundaries would be considered examples where the operator could make a determination that construction of a structural control (i.e., a retention pond or its equivalent) is not a viable option. If such a determination is made by the facility operator, the operator would be required to annotate the plan accordingly. The operator would then update the plan to indicate what modified or additional or BMPs will be implemented to reduce suspended solids loadings.

Many commenters interpreted proposed permit conditions as mandating the use of permanent or semi-permanent covers over stockpiled materials. EPA is not mandating the use of covers over stockpiled materials. Because of the substantial quantities of stockpiled materials typically located at scrap recycling facilities, EPA believes that a requirement to mandate the use of covers is not appropriate and most often would be impracticable. Therefore, the decision whether to construct or install covers is left to the discretion of the facility operator. The proposed permit provides that the operator "shall consider" the use of these types of BMPs, however, the decision whether to use permanent or semi-permanent covers is left to the operator's discretion.

EPA is concerned with controlling storm water contamination from certain types of recyclable materials, specifically significant residual fluids, accumulated particulate matter and shredder fluff that could be exposed to runoff in the absence of any physical means of minimizing contact. Consequently, EPA expects that the plan will include measures to minimize exposure of these materials to surface runoff, where appropriate.

A significant number of commenters expressed concerns about proposed permit requirements that would eliminate exposure of turnings to precipitation or runoff. EPA wishes to clarify that it is primarily concerned with turnings that are produced from certain types of machine tool operations (e.g., milling machines, machine tool centers, and lathes) and which have come in contact with cutting fluids. Because of the potential for significant quantities of residual fluids associated with turnings, EPA believes they pose a substantial risk of contaminating surface runoff. EPA notes that this particular sub-section of the permit does not apply to cuttings or turnings that have not been exposed to cutting fluids.

In the draft permit, EPA required that "all turnings and cuttings shall be handled in such a manner as to prevent exposure to either precipitation or storm

water runoff. . . ." Based on information provided by the industry, EPA believes that the requirement to prevent all exposure of all turning and cuttings would pose an undue burden on the scrap recycling industry. Such information demonstrated that, in most cases, turnings piles can be very large in size and are mostly stored outdoors due to size. Therefore, in the revised permit EPA is requiring scrap recycling facilities to select an appropriate BMP from either two suggested options, or employ an equivalent measure, to help minimize exposure. These options were developed based on input of current practices used by the scrap recycling industry.

The final permit identifies the discharge of fluids from containment areas, in the absence of a storm event, as a non-storm water discharge prohibited under this permit. The operator would be required to obtain a separate NPDES permit for this non-storm water discharge. Discharges from turnings containment areas to the sanitary sewer system are not covered by this permit. The operator must seek the necessary approval(s), if any, from the appropriate local pretreatment authority.

A substantial number of scrap recycling facilities requested clarification on the prohibition of non-storm water discharges from oil/water separators. EPA clarifies that in the absence of a storm event, discharges from oil/water separators to a storm sewer system are considered non-storm water discharges, which are not covered under this permit. Discharges from oil/water separators that occur as a consequence of a storm event, either a current event or past event, are permitted provided that the oil/water separator is properly maintained on a regularly scheduled basis as established in the plan.

Commenters also wanted clarification on the liquids draining requirements as they applied to "white goods," i.e., appliances. EPA clarifies that it is not requiring scrap recycling facilities to drain fluids from appliances or "white goods," oil-filled shock absorbers, and other permanently sealed containers with very small amounts of fluids, though the permittee may elect to do so.

A number of commenters requested clarification on the applicability of other sections of the permit where co-located facilities exist, e.g., equipment and vehicle maintenance in section VIII-P. Section VIII.N.1 specifically provides that scrap and waste recycling facilities that have additional facilities which satisfy the definition of an industrial activity covered by another section of

this permit (e.g., equipment and vehicle maintenance facilities), must comply with the pollution prevention plan and monitoring requirements of that other section. The purpose of this requirement is to ensure that the pollution prevention plan and monitoring requirements appropriately address all aspects of regulated industrial activity that occur at a specific facility. For more explanation of this requirement, see the Co-located activities section of this summary.

Another commenter noted that differences exist between the list of BMPs identified in Table N-11 of the factsheet and section VIII.P of the permit. BMPs identified in Table N-11 were not intended to be all inclusive; rather the table identifies optional and alternative BMPs that may be used for vehicle and equipment maintenance. If scrap and waste recycling facilities have co-located facilities that meet the definition of industrial activity covered under section VIII.P, the operator is required to comply with the plan requirements for that section, including any specifically identified BMPs.

A number of commenters argued that EPA should drop the analytical monitoring requirements since many BMPs would be implemented thereby obviating the need for monitoring. In addition, these commenters said it would be more beneficial to target resources towards BMP implementation rather than to put resources towards monitoring. EPA does not agree that the implementation of BMPs at scrap recycling facilities should automatically eliminate the need to conduct monitoring. EPA is requiring monitoring primarily for purposes of demonstrating the effectiveness and adequacy of the pollution prevention plan as implemented over the term of the permit. EPA believes that the transient nature of activities at scrap recycling facilities and the results of the group application sampling effort clearly justify analytical monitoring during the permit term.

Some commenters questioned why EPA proposed to require monitoring for aluminum and iron at scrap recycles. Only 5 scrap recycling facilities sampled for these pollutants during the group application process. The limited sampling information provided by scrap recycling facilities for iron and aluminum, however, suggests that these facilities may be significant sources of iron and aluminum in storm water runoff. Given the volumes of ferrous and non-ferrous materials commonly handled at scrap recycling facilities, EPA believes that it is reasonable to monitor for these pollutants to

determine if they are present and if so to provide information to the facility operator to ensure the pollution prevention plan is effective at controlling these pollutants. Therefore, EPA believes that additional data on these two pollutant parameters is needed for purposes of better characterizing pollutant sources that may be present so that pollution prevention plans may be more appropriately designed.

A number of commenters requested clarification on the use of the term "battery reclaimers" as it applies to scrap recycling and waste recycling industries. EPA agrees that scrap and waste recycling facilities which only collect and temporarily store used lead-acid batteries are not classified as battery reclaimers as described by 40 CFR Part 266. Battery reclaimers engage in the practice of breaking-up used lead-acid batteries for purposes of reclaiming the lead contained within them. During the group application process, EPA did not receive any group applications composed of battery reclaimers. Therefore, facilities which engage in the reclaiming of used, lead-acid batteries are not eligible for coverage under this permit.

EPA has reviewed a cost study provided by industry and concludes that a substantial portion of the costs arose as a consequence of unclear permit language or activities that are already substantively employed at scrap recycling facilities (i.e., not necessarily in response to the NPDES storm water program). EPA believes that the cost estimates provided in the fact sheet to the proposed permit are reasonably accurate and representative of the actual range of costs most facilities will experience to comply with the requirements of this permit (see cost of compliance discussion in this summary).

EPA is not requiring scrap recycling facilities to construct permanent or semi-permanent covers over stockpiled materials, therefore, the estimated capital costs would be substantively reduced over those calculated by industry. In addition, EPA observed during a site visit that a scrap facility with a shredder already had at least one roll-off box for collecting shredder fluff. Given the substantial volume of shredder fluff produced annually, some means of collecting and disposing of shredder fluff already exists at shredder facilities. Therefore, EPA does not agree that scrap recycling facilities are facing the additional capital expenses as reported in the industry cost report.

With regard to retention ponds, the final permit provides additional

clarifying language that states that the operator is expected to employ a full range of non-structural erosion and sediment control measures to reduce sediment loadings. If substantial loadings persist after employing a full array of non-structural measures, the operator could be expected to construct a retention pond or its equivalent. However, the operator would first be expected to identify what additional measures might be taken to reduce sediment loadings before constructing a retention pond. In addition, the final permit allows the operator to make a determination that insufficient area is available to construct a pond or its equivalent. These additional provisions in the final permit are expected to dramatically reduce the likelihood that many scrap recycling facilities will be required to construct retention ponds.

Discussions with the scrap recycling industry indicate that facilities that receive substantial quantities of turnings have established appropriate containment areas with suitable berming and drainage collection (including the use of sumps and/or oil/water separators). In addition, measures to properly dispose or recycle substantial quantities of residual fluids are already in practice in response to other environmental and safety regulations at the Federal, State, and local levels. Consequently, EPA does not agree that the estimated annual operation and maintenance cost of \$13,000 can be exclusively attributed to the NPDES storm water program.

The scrap recycling industry cost study estimates that berms around stockpile as will be replaced quarterly at an annual cost of \$55,000. EPA has a number of concerns with regard to this estimate. The use of berms around certain stockpile areas was proposed as a BMP alternative by industry and many of its members. In addition, group applications cited the use of berms as a frequently employed best management practice. If such a cost estimate were accurate, it is unrealistic to expect that a scrap recycling facility would incur such a cost given the industry's expressed concerns about extreme competitive pressures. It is more likely that such a BMP would be considered impractical or economically infeasible by the facility operator and other BMPs would be chosen in preference.

EPA also wishes to respond to a number of other costs elements reported in the industry study. The study also identifies additional costs in response to the draft permit:

- Encourage suppliers to drain fluids.
- Inbound scrap lead acid battery control program.

- Inbound material inspection program.
- Segregate, handle and store used batteries.
- Periodic inspections of processing equipment.

• Employee and supplier training.

In discussions with industry representatives and scrap recycling facility operators during site visits, it was observed or noted that many of these practices are already commonly employed by the scrap recycling industry. In particular, manufacturer specifications on what is acceptable for scrap often dictates what materials are or are not accepted. In addition, frequent training of employees and buyers of scrap is necessary in order to ensure that only acceptable materials are received. Concerns over potential liability of accepting undetected hazardous waste within scrap necessitated the need for the industry to provide adequate training of both employees and its major suppliers. Therefore, EPA does not believe that the costs associated with these activities are overly burdensome or that they can be exclusively attributed to the NPDES storm water program.

A number of commenters expressed concerns about the appropriateness of requiring WET testing as an alternative monitoring requirement. EPA has removed any requirements to conduct whole effluent toxicity testing from this section of the permit. A substantial number of comments were received by the industry with regard to other monitoring requirements during the permit term. To a large extent, commenters disagreed that monitoring during the permit term would provide the necessary information to support EPA's goal of assessing the effectiveness of pollution prevention plans. Many commenters specifically stated that EPA's use of benchmarks was not appropriate and that, in effect, the Agency was establishing numeric effluent limits for the scrap recycling industry. Commenters added that the site-to-site and storm-to-storm variability of the data will prevent EPA from determining the effectiveness of BMPs. In sum, the excessive cost of monitoring, the lack of technical and regulatory expertise, excessive administrative burden, and the need to hire consulting engineers were cited as justified reasons for eliminating monitoring requirements.

EPA's analysis of all sampling data provided by group applicants within this sector revealed that the scrap recycling industry consistently exhibited high concentrations of metals, particularly copper, lead, and zinc.

Moreover, sampling data also revealed that, in general, scrap recycling facilities were a consistent source of a wide diversity of conventional and toxic pollutants. EPA believes that the range of concentration values reported for many pollutants adequately supports the inclusion of monitoring for these pollutants in the permit.

The group application sampling was intended to demonstrate to operators of facilities and to EPA the types of pollutants typically found in industrial storm water discharges and to give, to some extent, a measure of the magnitude of those pollutants. It was not expected that sampling results would be used as a basis of establishing numeric effluent limits. The purpose of monitoring in today's final permit is to substantiate, over the long term, that scrap recycling facilities are employing the full range of BMPs and to judge the overall effectiveness of pollution prevention plan measures in controlling the pollutants of concern.

A number of commenters requested that EPA subdivide this sector to distinguish between scrap recycling facilities (MRF) that recycle paper, newspaper, glass, plastic containers, cardboard, and aluminum cans received primarily from residential and commercial sources. Commenters argued that MRFs are not the same as scrap recycling facilities, particularly with regard to the degree of exposure of significant materials. Commenters requested that EPA clarify its position with regard to BMP and monitoring requirements with regard to MRFs. Commenters also requested that EPA clarify any distinctions between MRFs that receive source-separated recyclable materials only (so called clean MRFs) versus those that do not receive source separated materials (so called dirty MRFs).

Based on information and data submitted in two group applications, EPA has created a separate sub-sector for recycling facilities that receive only recyclable materials (source-separated facilities) primarily from commercial and residential sources. This sub-sector excludes scrap recycling facilities and dirty MRFs. EPA concludes that source-separated recycling facilities are different in many respects from scrap and waste recycling facilities and from dirty MRFs. Source separated recycling facilities do not produce the volume of non-recyclable wastes that scrap recycling and waste recycling and dirty MRF facilities do. In addition, recycling facilities do not have heavy industrial processing equipment such as shearers or shredders.

EPA observed during one site visit to a MRF that the majority of storage occurred indoors and there were few outdoor processing operations. Outdoor storage consisted only of processed materials, e.g., compacted bundles of aluminum cans and bins containing glass cullet. Outdoor storage of processed materials tended to be for only short periods of time as compared to scrap recycling facilities where stockpiled materials may be exposed for long periods of time.

EPA also believes that recycling facilities that reject non-recyclable waste materials at the source, e.g., curbside, also distinguishes them from scrap recycling and waste recycling facilities. This practice is an effective means of substantially reducing the potential that household hazardous wastes will be accepted. Frequent training of pickup drivers is also common to ensure that nonrecyclable materials such as paints, fluorescent tubes, used oil, and pesticides and are not accepted. EPA believes that separate pollution prevention plan and monitoring requirements are appropriate for this sub-group and has revised the final permit to reflect this.

EPA believes that municipal recycling facilities (MRFs) that receive only source-separated recyclable materials (e.g., glass, plastic, aluminum cans, paper, newspaper, tin cans, magazines, and alike) should not have the same monitoring requirements as those for scrap recycling facilities. MRFs are characterized as facilities that receive recyclable materials primarily from commercial and residential sources. In addition, MRF processing operations frequently occur indoors. EPA conducted a subsector review of sampling data submitted by four groups. These groups consist of facilities which receive source-separated recyclable wastes. EPA's analysis of median concentration data for pollutants sampled indicated that all pollutants were below the benchmarks.

EPA believes that given the nature of operations at these facilities and the implementation of BMPs, that these facilities should not be required to conduct storm water monitoring. EPA is also establishing separate pollution prevention plan requirements for recycling facilities that receive only source-separated, recyclable materials.

#### *Steam Electric Generating Facilities*

Several comments were received concerning the EPA's proposed monitoring regimen on which sector monitoring frequencies were based upon "benchmark" concentrations of pollutants, a representation of

monitoring data from NURP and the Gold Book.

After reviewing the comments and data, EPA revised the "benchmark" values and the methodology used to determine which industries will monitor for their storm water. Based upon the revised methodology, steam electric facilities are required to conduct chemical monitoring of their storm water discharges for total recoverable iron. Monitoring discharges from coal piles is still required if coal is utilized or stored at the facility in conformance with 40 CFR 423.

Several commenters complained that there would be exorbitant additional costs involved with the "benchmark" monitoring requirements and/or BMP's required by and peculiar to the Multi-Sector permit. Several commenters requested justification for those requirements which they felt were unjustified and more stringent than the requirements of the general baseline permit.

Since the Multi-Sector permit was created as a result of the group application process using data supplied by and specific to each industry sector, the permit requirements have been tailored to the unique needs of each industry sector. For this reason, EPA believes that industries that obtain coverage under the Multi-Sector permit and comply with the terms of that permit will reduce pollutant discharges to waters of the United States to a greater degree than would occur under coverage of the baseline general permit. However, coverage is available to those industries under either permit upon the submission of the appropriate notice of intent (NOI). All the BMPs mentioned in the Multi-Sector permit are suggestions utilized to illustrate the intent of the permit and illustrate a method by which compliance can be achieved. Other equivalent BMPs may be implemented, at the discretion of the permittee, to attain those illustrated results. EPA realizes that the permittee is most familiar with the particular industrial site and is best qualified to determine which BMPs are equal to, or perhaps more effective in satisfying the intent of the permit. EPA encourages the use of these other BMPs or practices which attain or improve upon the Multi-Sector permit goals, especially those which are easier or less costly to implement.

Sector O of the Multi-Sector permit focuses attention on both coal pile runoff and any other storm water discharge associated with industrial activity at steam electric power generating facilities. Coal pile runoff has, however, been identified as a particularly serious threat to water

quality and therefore the EPA has developed effluent guidelines (40 CFR 423) to regulate its discharge. The requirements for coal pile runoff from the guidelines have been incorporated into the multi-sector general permit.

Storm water discharges from wood-burning power plants are not covered under the Multi-Sector permit since no applications were received from wood-burning power plants under the group permit application process. EPA developed the Multi-Sector permit in response to only those facilities who applied for group permit coverage. Wood-burning plants may obtain coverage under the baseline general permit or an individual storm water permit.

For the sake of consistency with the other sectors in the multi-sector permit and to eliminate the duplication of regulation, EPA has removed reference to the requirements for permit coverage for industrial activities associated with construction. It must be noted, however, that a permit is required for storm water discharges from construction activities which additively disturb five or more acres, and such coverage is available through EPA's general permit for storm water discharges associated with construction activity.

Several comments dealt with the topic of monthly visual examination and documentation of storm water discharges as being burdensome, unjustified, and potentially impossible to comply with when dealing with the random occurrences of storm events and the numbers of outfalls to be sampled. EPA has relaxed the required frequency of visual examinations from a monthly to a quarterly basis. EPA has included the requirement for only limited analytical monitoring of storm water discharges from Sector O facilities based upon "benchmark" values. Annual compliance monitoring/reporting of runoff from coal storage areas/piles is also required as specified in 40 CFR 423. To aid in the reduction of resources necessary to comply with the visual sampling requirements for facilities with several outfalls, the permittee, if practicable, can combine and/or eliminate outfalls, apply the representative discharge provisions of VI.C.4. of the permit or utilize automatic samplers.

*Motor Freight, Rail, and Passenger Transportation, Petroleum Bulk Oil Stations, and the U.S. Postal Service*

There were a number of comments received regarding the requirements for the sector P, the ground transportation sector. The comments focused on grouping of facility types in the sector,

eligibility under the sector, and the storm water pollution prevention plan requirements.

Several commenters, including members of the passenger bus, tank truck carrier, motor carrier, and warehouse industries, were concerned with the grouping of a range of transportation facilities in the ground transportation sector. Concern was particularly expressed regarding the "long-term implications" of this "umbrella" permitting practice. In response, EPA has retained the original grouping of transportation facilities as presented in the proposed permit. Although the gross operations of these different types of facilities may differ, EPA found that the vehicle maintenance and repair activities are remarkably similar and pose equally similar threats to storm water pollution. Further, EPA found that comparable best management practices were used at these varying facilities. In terms of the long term effect of this grouping, EPA assures the commenters any additional permitting efforts will revisit the appropriateness of sector groupings based upon information as it becomes available.

One commenter expressed particular concern about the inclusion of warehouses in the land transportation sector. EPA grouped regulated warehouse facilities in the land transportation sector because, when such facilities have exposure to storm water, it is often due to exposure of vehicle maintenance shops and equipment cleaning operations. EPA reminds the commenter that facilities are required to meet the permit conditions for all industrial activities (and hence sectors) which they may have onsite.

Several commenters, including members of the passenger bus, tank truck carrier, and warehouse industries, requested that EPA clarify its position regarding vehicle wash waters and its definition of "commingling" of storm water and vehicle wash waters. Vehicle wash waters, water discharged from a vehicle washing activity, are required to be permitted separately from the storm water discharges from such areas. Although most facilities design such wash areas to drain most, if not all, wash waters during the washing activity, some facilities may have stagnant pools of washwater that do not drain or discharge. If a storm event results in the discharge of both the remaining wash waters and storm water, the storm water permit would only cover the storm water discharges and not commingled wastes. Similarly, if vehicle washing activities are performed during a storm event or immediately

preceding an event, the storm water permit only covers the portion of the discharge originating from the storm event. If, however, the washing activity is performed prior to a storm event and the washwater that is not immediately discharged is allowed to evaporate prior to being discharged with storm water, the storm water discharge that is now contaminated with the dry residue from the washwater is entirely covered by the storm water permit. Such residues would be expected to be specifically addressed in the facility's storm water pollution prevention plan.

Another commenter requested that vehicle wash waters from land-based transportation facilities be allowed to be discharged under this permit provided appropriate pollution prevention measures have been implemented to ensure that such discharges do not contain a visible sheen, detergents, or solids as was proposed for water-based transportation facilities. EPA disagrees that such discharges should be allowed. In the final permit, vehicle washwaters are not allowed from water-based transportation facilities. Such discharges must be permitted separately.

Many commenters, including members of the passenger bus, tank truck carrier, petroleum marketers, motor carrier, and warehouse industries, requested that employee training only be required to be conducted on an annual basis. In response, EPA has reduced the *required* frequency of employeetraining to once per calendar year. However, EPA would like to emphasize that more frequent training, perhaps on an informal basis, is encouraged and will most likely result in better implementation of the storm water pollution prevention plan.

Two commenters also expressed concern that the training requirements apply to all employees regardless of their effect on storm water pollution prevention and control. In response, EPA would like to clarify that only those employees that play a role in the industrial activities at the site must be trained. Because job descriptions differ tremendously from site to site, EPA has left it to the discretion of the pollution prevention team to determine who are the appropriate employees to be trained. The team is cautioned to err on the side of training too many employees rather than too few. Even if an employee is remotely involved in an industrial operation that may affect the quality of the storm water discharge that employee should be included in the employee training. To demonstrate EPA's intention of who should be trained it is easier to list positions that *may* not require the

employee storm water training: secretaries, administrative personnel, and salespersons. One commenter also listed executive staff as potentially not requiring training. EPA would like to emphasize that it is necessary and helpful for executive staff to fully understand what activities are taking place on site to protect water quality. As such, executive staff should be fully considered as potential trainees along with other employees.

Two commenters argued that the proposed requirement to store vehicles awaiting maintenance in designated areas only would be more effective if the requirement only applied to vehicles with actual or potential fluid leaks since it could be interpreted that all vehicles are awaiting maintenance. EPA agrees with the commenters and has altered the permit language accordingly.

Several commenters felt that the monthly inspections required in the proposed permit were too burdensome, particularly due to the required documentation of such inspections. In response, EPA has reduced the frequency of inspections to quarterly. It is EPA's intention that the quarterly inspection and the visual storm water examination requirements be coordinated into one comprehensive program. By performing the two within similar time frames, it is hoped that the facility will gain useful insight by comparing the results of the overall facility inspection and the storm water visual examination. More frequent inspections, preferable with documentation, are encouraged, but are not required.

One commenter suggested providing an alternative certification option for facilities that eliminate exposure to storm water runoff such that the facility may be exempt from the quarterly visual examinations requirements. In response, EPA disagrees that the alternative certification provided to other sectors for purposes of chemical monitoring is appropriate for quarterly visual examinations. The quarterly visual examinations are still useful in areas where exposure has been "eliminated" to ensure that exposure has not re-occurred causing a storm water contamination problem.

Many commenters, including members of the passenger bus, tank truck carrier, petroleum marketers, motor carrier, and warehouse industries concurred with EPA in not requiring chemical analysis of storm water discharges from ground transportation facilities. As such, the commenters strongly opposed the alternative monitoring requirements presented in the proposed permit. EPA has retained

the proposed monitoring of quarterly visual examinations only.

Most commenters supported the quarterly visual examination requirements. A few commenters expressed concern about fulfilling the requirement on large sites where employees may be on the road a significant amount of time and where rainfall is sporadic. The commenters were also concerned about sites without a dedicated environmental staff. The commenter suggested requiring the visual examination on an annual basis or only recommending the practice on a quarterly basis. In response, EPA has retained the quarterly visual examination requirements as proposed and has added a waiver of this requirement at inactive and unstaffed sites (see discussion of monitoring requirements above). EPA reminds the commenter that visual examination may be performed by a non-technical person who has been trained as to how to collect the sample and what to observe.

Many commenters were concerned with the requirement to attain the same water quality in the storm water discharges as an oil/water separator when such technology operates with such great variability. Concern was also expressed regarding the qualifications of facility personnel to make such an engineering judgment. In response, EPA has removed this reference in the final permit due to the difficulty in determining what water quality would be achieved with an oil/water separator. EPA does however encourage permittees to strive for the pollutant removal levels referenced in the literature for oil/water separators.

#### *Water Transportation*

The comments received on Sector Q, the water transportation sector, focused on eligibility, who is responsible for permit compliance, and monitoring conditions. One commenter raised concerns that the permitting for barge discharges (including barge storm water, washwater, and wastewater) is too uncertain. In response, today's permit regulates the storm water and washwater from the maintenance and equipment cleaning areas for canal barge operations (SIC code 4449) and for barge building and repair facilities (SIC code 3731). Today's permit, however, does not regulate wastewaters, such as bilge and ballast water, washwater, sanitary wastes, and cooling water originating from vessels. The permit specifies that the operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the United States or through

a municipal separate storm sewer system.

One commenter indicated that many Navy activities would fall under both VIII.Q. Vehicle Maintenance Shops/ Equipment Cleaning Operations and VIII.R. Ship Building and Repair and would like to see EPA establish some guidelines for sector applicability. In response, the permit does specify that when an industrial facility has industrial activities being conducted onsite that meet the description(s) of industrial activities in another sector(s), that the industrial facility must comply with any and all applicable monitoring and pollution prevention plan requirements of each of those sector(s).

One commenter explained that marine terminal and ports have a multitude of activities undertaken by many industrial facilities and contractors in the common areas of the port. This commenter wanted to know who is responsible for obtaining permit coverage for these common areas which are usually served by a common storm sewer system. The commenter suggested that EPA require the property owner (port authority) to be the primary permit holder and have each lessee or contractor become a co-permittee. In response, the property owner (port authority) is responsible for permitting the common areas of the facility, and each lessee operating an industrial activity is responsible for obtaining permit coverage for the specific operations occurring on their leased property. In today's permit, EPA does require that the co-permittee arrangement be utilized at airport facilities; however, EPA will not require this approach at marine terminals or ports. The industrial facilities and contractors located at airports generally are similar in nature, and one pollution prevention plan can more easily address the issues of concern. A marine terminal or port often has many dissimilar activities occurring within the facility lending itself to an approach which can focus on each specific industrial operation. A co-permittee approach would be acceptable to the Agency, but it is not required.

One commenter felt that facilities in this sector are being forced to monitor for parameter(s) that no one believed were of concern, were not monitored for in Part II, and are not even handled by the facility, specifically, the metals. In response, EPA has revised the monitoring requirements in the final permit for the water transportation sector based on the methodology described previously. To address the concern that some facilities would have to monitor for pollutants not found or

suspected in their discharge, pollutant-by-pollutant certification will eliminate the requirement to monitor for those pollutants not present.

#### *Ship and Boat Building or Repairing Yards*

Comments received on the permit requirements included in sector R, ship and boat building or repairing yards, focused on grouping of industrial facilities, the benchmark values, and the application of multiple sectors to one facility (co-located industrial activities). Several commenters were concerned with the grouping of fiberglass and aluminum boat manufacturers into one sector. In response, EPA has evaluated the grouping of these types of boat manufacturers and has determined retain these industrial activities in one sector. EPA does not believe this will cause an undue burden on either industry given the revised monitoring requirements, which are now sub-sector specific and the flexibility of the pollution prevention plan requirements.

Two commenters took issue with the basis of the benchmark values. The benchmarks have been revised. For a full discussion of the revision see the part of the fact sheet that address the benchmark values directly.

One commenter was concerned with the burden of complying with all applicable sectors of the permit under the co-located industrial activities requirement. EPA has retained this provision in the final permit to ensure comprehensive environmental protection and does not believe this requirement is overly burdensome. This provision does not require that a separate and distinct pollution prevention plan be developed based on each applicable sector, but requires consideration of other BMPs from other sectors, and incorporation of those applicable BMPs into the pollution prevention plan for the facility. Where monitoring requirements from two or more sectors overlap, only one sample and analysis needs to be conducted (see discussion of co-located industrial activities above).

#### *Air Transportation*

Comments on Sector S, Air Transportation, primarily focused on obligations and responsibilities of the airport authority and its tenants. The storm water permit application regulations at 40 CFR 122.26(b)(14) define the storm water discharges associated with industrial activity in terms of eleven categories of industrial activities. Category (viii) includes transportation facilities classified as Standard Industrial Classification (SIC)

code 45 that have vehicle and equipment maintenance (including vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or airport deicing operations (including aircraft and runway deicing). Review of the *Standard Industrial Classification Manual*, published in 1987 by the Office of Management and Budget, clarifies that SIC code 45, which addresses air transportation facilities, is not limited to the operators of airports, air terminals and flying fields. In fact, SIC code 45 also includes establishments primarily engaged in providing foreign and domestic air transportation, air courier services, and other fixed base operators who are primarily engaged in servicing, repairing, or maintaining airports and/or aircraft and these activities will also need to be permitted if they have point source discharges of storm water from regulated activities defined under 40 CFR 122.26(b)(14)(viii).

Tenants at the airport, other than the airport authority itself, who conduct industrial operations at the airport facility described at 40 CFR 122.26(b)(14)(viii), and establishments who conduct regulated industrial activities described elsewhere under 40 CFR 122.26(b)(14), and whose operations result in storm water point source discharges are also required to apply for coverage under an NPDES storm water permit for their areas of operation. EPA recognizes that airports and their tenants enter into contractual relationships, therefore, these types of tenant facilities could be co-permittees with the airport operator if both parties chose, or could be permitted separately, and thereby be responsible individually for compliance with the permit and implementation of a pollution prevention plan. EPA encourages co-permittee status because this approach to permit coverage promotes better coordination of the pollution prevention plan measures and possibly better control of the storm water discharges. However, as the owner/operator of an airport facility and the storm sewer system, airport authorities are ultimately responsible for storm water discharges from their storm sewer system to waters of the U.S. or to a municipal separate storm sewer system.

Other tenants at the airport, such as car rental and food preparation establishments, which are not defined separately as storm water discharges associated with industrial activity under 40 CFR 122.26(b)(14) must also be addressed. These tenants may chose to be co-permittees with the airport operator, or private agreements may be

worked out with the airport authority through contractual, or other means, to ensure that the storm water pollution prevention plan of the airport adequately addresses storm water contamination from these types of tenants. Regardless, airport authorities are required to identify the location and activities of all airport tenants as apart of the development of the storm water pollution prevention plan for the airport. EPA would like to clarify, however, that airport authorities are not responsible for ensuring compliance with the conditions of today's permit for storm water discharges associated with industrial activities regulated under 40 CFR 122.26(b)(14) conducted by tenants of the airport that apply separately for a storm water permit and which are not co-permittees with the airport authority.

Because the applicability of Part XI.S. of today's permit extends to storm water discharges from airport facilities, and in light of the fact that industrial activities conducted by the airport authorities and tenants of the airport are similar in nature, the eligibility section of Part XI.S. has been broadened to allow coverage for both airport authorities and tenants of an airport facility who conduct industrial activities as described in Part XI.S.1.

#### *Treatments Works*

Comments on Sector T, Domestic Wastewater Treatment Plants focused on required elements of the storm water pollution prevention plan and monitoring requirements. One commenter raised an issue regarding the requirement of providing a certification that the discharge contains nothing but storm water is unrealistic and can interfere with plant operations. It makes no allowances for temporary discharges into a storm water system.

In response, the Agency wants to clarify that some non-storm water discharges may be authorized by the permit. These non-storm water discharges include: discharges from fire fighting activities, fire hydrant flushing; potable water sources including waterline flushings; irrigation drainage; lawn watering; routine external building washdown which does not use detergents or other compounds; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate, springs, uncontaminated ground water; foundation or footing drains where flows are not contaminated with process materials such as solvents. The Agency notes that certification that the discharge contains

nothing but storm water, except as mentioned above, is consistent with similar requirements for NPDES general permit requirements for storm water discharges associated with industrial activity published September 9, 1992.

Many commenters have concerns about the excessive training required in the permit for treatment works employees. Semiannual training for employees will result in an excessive amount of employee "downtime," thereby decreasing the effectiveness of current employees to control the POTW process and may result in the need for increase staff. It is therefore very important that the training program be reasonable. An alternative would be to have employee training conducted once per year instead of every 6 months. In response, EPA agrees and the permit has been modified to require employee training only annually (at least once per calendar year).

EPA received many comments on the requirements of monthly inspections plus annual comprehensive site compliance evaluation. Commenters state that it is likely that the same person who conducts the monthly inspections will also conduct the annual comprehensive site compliance evaluation. If the facility successfully passes the monthly inspections, then there is no reason to believe that it would not pass a yearly inspection. In response, EPA wants to clarify that the monthly inspections cover specific designated equipment and areas of the facility where there is a high potential for storm water contamination. The areas to be included in all inspections include: access roads/rail lines, equipment storage and maintenance areas (both indoor and outdoor areas); fueling; material handling areas; residuals treatment, storage, and disposal areas; and waste water treatment areas. A monthly inspection can be done easily and routinely, possibly with the guidance of an inspection checklist. Whereas the comprehensive site evaluation is a full site evaluation being conducted to assess the pollution prevention plan and to determine the overall level of compliance by the permittee, and if necessary incorporation of changes or modifications to the pollution prevention plan needed as a result of the inspection.

Several commenters indicated that requiring an inventory of materials, an investigation of past practices, and a list of significant spills for the previous 3 years is an inventory accumulation of history and only generates paperwork. Commenters suggested that a pollution prevention plan should evaluate current

situation and determine potential problems that may result. In response, the Agency believes that past activities may have resulted in pollutant sources for present storm water discharges, and that it is appropriate to address materials that have been exposed to storm water within the past 3 years. EPA believes that the 3-year period is reasonable and does not impose excessive burdens for collecting information on permittees. The Agency notes that the 3-year period is consistent with similar requirements for individual applications for storm water discharges associated with industrial activity at 40 CFR 122.26(c)(1)(i) (B) and (D) and general NPDES records retention requirements under 40 CFR 122.21(p) and 40 CFR 112.7(d)(8).

A number of commenters strongly supported the use of the annual monitoring of the alternative monitoring constituents requirements. Other commenters questioned the accuracy of the statistical analysis performed for the proposed permit. In response, EPA has revised the methodology for determining which facilities will be required to perform monitoring as described elsewhere in the fact sheet. Under this new methodology, domestic wastewater treatment plants are not required to perform monitoring under this permit.

#### *Food and Kindred Products*

The greatest number of commenters on Sector U, Food and Kindred Products, are concerned with the monitoring requirements described in the proposed permit. The major objections to monitoring result from the consolidation of the entire food and tobacco industry into one sector which commenters believe compromises the group process since identical monitoring requirements are inappropriate for an industry with such a wide range in process operations. Commenters argue that several subsectors conduct most activities indoors, allowing little opportunity for storm water contamination, while other subsectors perform significant operations outdoors. Commenters also point out that EPA described in the proposed rule several factors that influence the impact of storm water on water quality (e.g., geographic location, hydrogeology, etc.) yet these factors were not considered when proposing monitoring requirements for the industry.

Commenters also argued that basing the monitoring requirements on such a diminutive set of sampling data is not valid given that data for only four pollutants was collected in sufficient

quantities to be analyzed. Commenters felt that insufficient samples were collected for four other pollutants. Commenters indicated that the inclusion of metals in the monitoring requirements for all sector members, when so little data was submitted for these pollutants, is not statistically valid. Commenters also took exception to EPA's decision to aggregate data for the food processing industry because lack of subsector-specific data does not substantiate monitoring requirements for these pollutants. Commenters believe that monitoring data that does exist for the sector shows no difference between industrial and residential/commercial areas. Also, commenters suggested that storm water data has shown to be very inconsistent and unrepresentative of the actual impact of discharges on receiving waters. Another common issue raised by the commenters was that the benchmark concentrations are unobtainable even with good BMPs. Commenters believe these levels are comparable to tertiary treatment standards for a full treatment system. Also, these cutoff levels appear to presage future permit limits for the industry which EPA has not demonstrated are necessary.

Several commenters believed that, if monitoring had to be conducted, the alternative monitoring is more appropriate since it more accurately reflects wastes from food and kindred products facilities. However, they suggested there should be an escape clause as with the proposed monitoring allowing facilities to only monitor for those pollutants expected to be present. Commenters felt that monitoring requirements will divert limited funds away from pollution prevention techniques needed to reduce pollutants in storm water as monitoring data show a correlation between enhanced housekeeping and preventative maintenance and reduced pollutant concentrations. Commenters concluded that combining visual examinations and a comprehensive site inspection is a much more appropriate way to evaluate storm water than monitoring.

Commenters also stated that EPA should give weight to the facilities who met Federal requirements in the application process and enforce against the thousands of facilities that ignored their obligations under the law rather than spending money on additional paperwork burdens. They suggested that sample results from the group applications should be credited towards the alternative monitoring requirements. Conversely, others commented that EPA should not provide "credit" to these groups, rather, EPA should recognize

the difficulty facilities experience in collecting adequate storm water samples from acceptable rainfall events, especially small business facilities and facilities in arid climates.

Realistically, commenters stated, very few facilities will be able to obtain all four quarterly samples and almost none will be able to collect all monthly samples for visual observation without constructing automatic sampling facilities. They pointed out that EPA has previously indicated manual sampling was acceptable and automatic sampling would not be required.

Additional concerns were raised with regard to specific pollutants recommended for analysis in the proposed monitoring. For example commenters pointed out that ammonia data are not presented in the proposed permit fact sheet but the proposed permit states that ammonia exceeds benchmark values. Commenters stated that absent data to substantiate, EPA should not require food and kindred products facilities to monitor for ammonia. Also, EPA should clarify its intent in requiring ammonia monitoring. Specifically, the proposed permit does not state whether EPA is concerned with the nitrogen load (i.e., TKN) on receiving waters, making ammonia monitoring irrelevant, or with the toxic effects of ammonia, making TKN monitoring unnecessary.

Commenters also argued that EPA does not discuss iron and zinc as pollutants of concern for the industry, raising question as to why food facilities have to sample for these parameters. EPA should work with the few facilities or subsectors of the industry that are found to have metals in their discharge rather than requiring all food and kindred products facilities to monitor these pollutants. Also, the proposed cutoff for iron (0.3 mg/l) is overly protective. The gold book acute aquatic life freshwater criteria is 1.0 mg/l. Commenters also pointed out that fecal coliform data would be superfluous to BOD and TSS data for the industry and testing is much more difficult.

Based on the comments on the proposed permit, EPA has eliminated the alternative monitoring requirements and re-evaluated the proposed monitoring requirements for the sector through conducting a subsector analysis for the industry. The sub-sector analysis identified only two of the nine subsectors as having pollutants in storm water at concentrations above the revised benchmark values. As a result, most facilities in the food and kindred products sector no longer are required to collect and chemically analyze storm water samples. Only two sub-sectors

will monitor: Grain Mill Products manufacturing (SIC code group 204) which will monitor for TSS and Fats and Oils manufacturing (SIC code group 207) which will monitor for TSS, BOD, COD and nitrate plus nitrite nitrogen.

Commenters in this sector also felt that additional requirements for pesticide storage were unnecessary. They contend that pesticide storage and use are currently regulated under FIFRA, State pesticide laws and the FDA. Further, anyone applying pesticides must be a certified applicator, trained in the safe and prudent use, as well as proper storage, of these products.

In response, EPA disagrees with the commenters statement that current pesticide storage and use regulations are adequate to prevent storm water contamination. Criteria for evaluating pesticide use and storage and criteria for evaluating storm water contamination from pesticide use and storage are not the same. With the increased use of pesticides at food and kindred products facilities compared to facilities in other sectors, EPA believes that the application and storage of these pesticides with storm water in mind is crucial to an effective storm water pollution prevention plan in this sector.

#### *Textile Mill Products*

Comments on Sector V, Textile Mill Products, focused primarily on the pollution prevention plan requirements and monitoring requirements. One commenter supported the permit requirement for visual examinations by indicating that visual examinations accompanied by facility-specific BMPs should most adequately address the minimal potential for controlling the contamination of storm water discharges at textile mill facilities. However, another commenter questions the usefulness of visual examinations, stating that EPA provides no justifications for such examinations.

In response, periodic inspections of controls are a requirement of the pollution prevention plan, and visual storm water runoff examinations and inspections should be treated as two distinct requirements. Visual examinations represent a minimum requirement in the assessment of the storm water discharge. The relative economic impact of the visual examination of the storm water should be minimal and, in conjunction with site specific BMPs can be used to evaluate the performance and effectiveness of best management practices employed at a particular facility. Visual examinations have been reduced to a quarterly frequency in the

final permit. For more information on visual examinations see the monitoring section of this summary.

In response to the Agency's request for comments regarding proposed alternative monitoring requirements, one commenter contends that it does not believe that the annual or semiannual monitoring and reporting requirements put forth by the Agency are necessary or appropriate. In assessing this comment, it should again be noted that the Agency had only requested comments on the possibility of imposing the proposed alternative monitoring requirements on textile facilities.

Today's permit does not include the proposed alternative monitoring requirements. Based on the revised methodology for determining monitoring requirements at the industry sub-sector level, the textile industry is no longer required to conduct chemical monitoring for any specific pollutant. Due to the nature of the industry, and the fact that most operations at such facilities are conducted indoors, the contact of storm water with most pollutants typical of this industry are minimized or eliminated. The statistical analysis performed by the Agency using the Part 2 sampling data when conducted at the sub-sector level supports this conclusion.

#### *Wood and Metal Furniture and Fixtures*

Only six comments were submitted addressing the wood and metal furniture and fixtures manufacturing industry. Each of the comments supported the proposed monitoring conditions, which only requires quarterly visual examinations of storm water discharges. In today's final permit, this requirement remains unchanged. Analytical monitoring of storm water discharges will not be necessary from wood and metal furniture and fixtures manufacturing facilities, unless there are co-located activities, such as coal piles, refuse piles, landfills etc., which may be required to monitor under provisions elsewhere in the permit.

#### *Rubber, Plastic, and Miscellaneous Products*

The majority of the comments received on Sector Y, Rubber, Plastic Products, and miscellaneous manufacturing industries, pertained to the proposed monitoring requirements and the inspection and recordkeeping requirements of the permit. In addition, comments were received regarding EPA's description of the pollutant sources and the assessment of the monitoring results submitted with the

group applications. The Rubber Manufacturers Association (RMA) supported the specific BMP requirements which were proposed to control zinc in storm water discharges from rubber manufacturing facilities. Concern was also expressed regarding the consolidation of group applications into the 29 industrial sectors. The proposed permit only required visual examinations of storm water samples for facilities in this sector, rather than chemical testing which was proposed for 17 of the 29 sectors. While commenters supported the absence of analytical testing requirements, they also argued that the frequency (quarterly) for the visual examinations was excessive. Commenters also opposed the proposed alternate monitoring requirements which would have required analytical testing for certain parameters.

In the final permit, EPA modified the methodology for determining the types of facilities which are required to conduct analytical testing of storm water. The revised methodology is discussed in section VI.E of the final fact sheet and also in the monitoring portion of this summary. EPA believes that the sub-sector methodology better targets the monitoring requirements toward the specific types of facilities within the 29 sectors which pose the greatest risk to the storm water quality.

Based on the sub-sector methodology, the final permit requires that manufacturers of rubber products conduct analytical testing of storm water samples for zinc. This pollutant was shown to be a pollutant of concern from the monitoring data which were submitted by rubber products manufacturers (i.e., the median concentration was above the EPA benchmark concentration of 0.065 mg/l for zinc). Testing of grab samples is required quarterly during the second and fourth years of the permit. However, permittees may omit the testing during the fourth year if the second year results are below the benchmark concentration. In addition, the final permit provides for "alternate certification" in lieu of monitoring (see section VI.E.3 of the fact sheet) on a pollutant-by-pollutant basis as well as on an outfall-by-outfall basis. As such, analytical testing for zinc would not be required for facilities which do not use zinc, or for facilities where industrial activities are not exposed to storm water.

The final permit only requires analytical testing of storm water samples for rubber products manufacturers. However, the final permit does retain the requirement for a quarterly visual examination for all

facilities (including rubber manufacturers) in this sector. This requirement is also standard for all sectors of the permit. EPA believes that the quarterly frequency appropriately balances the costs associated with the visual examinations with the need to periodically assess any pollutant loadings in the discharges and the effectiveness of the storm water pollution prevention plan.

A commenter in this sector also expressed concern that analytical testing for a number of parameters in storm water had been a requirement of EPA's baseline general permit of September 9, 1992 for facilities in major SIC group 30. EPA recognizes that there are differences in the requirements between today's multi-sector general permit and the previous baseline general permit. These differences are the result of the additional information concerning these facilities obtained during the group application process. However, concerns regarding the requirements of the baseline general permit are outside the scope of the present permitting action.

The proposed permit would have required a comprehensive site compliance evaluation at "appropriate" intervals, but not less than once per year. A commenter argued that this was too vague and should be clarified. In response, the final permit now simply requires a comprehensive site compliance evaluation at a minimum of once per year for all facilities covered by the permit.

The commenter was also unclear regarding the "qualified" personnel who are required to conduct the comprehensive site compliance evaluations. In discussing the requirements for a comprehensive site compliance evaluation, section VI.C.4 of the fact sheet notes that inspectors should be members of the pollution prevention team. Such individuals should be familiar with the potential pollutant sources at the facility, and the control measures developed for the storm water pollution prevention plan to control pollutant discharges. EPA believes that facilities should be able to identify appropriate individuals for the necessary site evaluations. The commenter also requested that the permit provide that the facility inspections (required by Part XI.Y.3.d of the permit) would be conducted at appropriate intervals as stated in the storm water pollution prevention plan. Such a requirement was included in the proposed permit and has been retained in the final permit. The commenter objected to the requirement that facilities maintain records of inspections and visual examinations.

EPA disagrees with the commenter on this issue and believes that such records are necessary for EPA to verify compliance with the requirements of the permit. Therefore, the records retention requirements were retained in final permit basically as proposed. One relatively minor change was made which standardizes the records retention period for all sectors to 3 years, which is the minimum required by NPDES regulations at 40 CFR 122.42(j). Additional information concerning issues associated with inspections and recordkeeping can be found in the reporting and record keeping portion of this summary.

#### *Leather Tanning*

In response to comments that the leather tanning industry was required to monitor in error and that manganese and aluminum should not be included in the list of monitoring parameters, the final multi-sector permit does not require leather tanning facilities to conduct chemical monitoring. However, the industry must still perform visual examinations. More discussion of the revised monitoring requirements under today's final permit can be found in the monitoring section of this summary.

In response to a comment that EPA should simply adopt the model permit and pollution prevention plan submitted by one industry organization, EPA has determined that the proposed leather tanning permit and pollution prevention plan with BMPs which was published in the Federal Register on November 19, 1993, is best suited to control storm water discharges from this industry.

In response to the comment that facilities submitted chromium data because they were required to (as a categorical pollutant), EPA clarifies that chromium is limited in an effluent guideline for leather tanning process wastewater. The industry was therefore required to submit monitoring data for chromium. The leather industry was also required to submit monitoring data for "those pollutants that they knew or had reason to believe were present." These pollutants were shown in tables which listed conventional and nonconventional pollutants, toxic pollutants and hazardous pollutants. These tables were included in the permit application Form 2-F.

#### *Fabricated Metal Products Industry*

Many commenters stated that the fabricated metal industry should be further divided into dry and wet fabricating industries. Most explained that the processes and practices vary widely between these two types of

fabricating industries. In particular, many pollutants vary between these groups due to the fact that each of these industries require very different chemicals in their processes. The main concern expressed by commenters was that monitoring for the entire group was based on a wide range of chemicals for both industrial processes that may not be present at a facility if only one process is conducted at the facility.

EPA agrees that the industries covered under this section of the permit should be re-evaluated to examine more carefully inherent differences between subgroups in the industry. As a result, today's rule has identified industry subgroups using the three and four-digit SIC classification for the purposes of determining which industries will conduct monitoring in this sector. Industry subgroups will monitor for specific pollutants where the median value exceeds the revised benchmark levels. EPA has also expanded the flexibility of the monitoring requirement by allowing facilities to certify on a pollutant-by-pollutant basis to no exposure to storm water in lieu of monitoring for that chemical. This can result in some facilities not monitoring and others limiting the number of pollutants required to be monitored.

Several commenters requested that the fabricated metal industry be required to conduct visual examinations and annual site compliance evaluations only. EPA does not agree. Chemical monitoring is still necessary, given the results of the data evaluation conducted on the subsectors. Visual examinations in combination with chemical monitoring and site compliance evaluations will help assess the presence of pollutants of concern in the discharges and the effectiveness of the pollution prevention plan at controlling these.

A commenter requested that EPA clarify whether all of SIC code group 34 is covered in Sector 29, such as the forgings industry. They pointed out a discrepancy between the preamble language and the permit language relating to coverage. In response, EPA inadvertently left out certain SIC code group 34 industries in the proposed permit. The fact sheet contained the entire list of industries covered under this section. EPA has clarified the permit language to correct this omission.

Several commenters suggested that EPA differentiate between dry fabricators and others by adding a definition that placed a qualifier "Metal Treatment Only" to the terms and conditions that apply only to metal treatment operations. Commenters also

suggested the permit should require dry fabricators to certify to no metal treatment operations or other operations likely to result in discharges of the pollutants of concern.

EPA has not placed a qualifier on the terms and conditions of the permit. However, using the revised analysis to determine monitoring, addresses some of the concerns about the grouping of sectors. Also, determining site-specific BMPs and certifying, on a pollutant-by-pollutant basis to no exposure to storm water will add more flexibility in determining monitoring requirements.

A commenter requested that EPA expand the definition of fabricated metal industries in the permit language. EPA has not expanded the definition of fabricated metal industries other than including the other industries identified in the proposed fact sheet that were inadvertently left out of the permit language. Other industries that could be related to this sector are covered under the Primary Metals Industry section of the permit. EPA believes that it has listed as eligible for coverage, all industries that participated in the group application process.

Commenters stated that the list of options for controlling pollutants can be expensive and uneconomical. Many thought that the BMPs may later become mandatory and do not allow for alternative measures to control pollutants at a given site.

To clarify, EPA has only provided a list of potential BMPs to be considered by each facility operator when preparing a pollution prevention plan. This list is neither totally inclusive nor mandatory. Permittees are free to determine the most economical and effective BMPs specific for a given facility and activity.

Commenters felt that most fabricators do not have process wastewater discharges. Because of this, they requested a waiver on requiring proof of no commingling of process waste water with storm water. Today's permit does not change this requirement. Some fabricators employ acid baths, wash waters and other process wastewater related activities. Certification of no commingling remains an important part of the permit requirements to be included with the storm water pollution prevention plan certification to ensure that storm water discharges are not contaminated by these discharges.

A commenter pointed out that the description of the materials used at facilities in this sector should have noted that many of these materials are not necessarily used at all types of facilities within the sector. The commenter was apparently concerned that this description could erroneously

suggest that the runoff from certain types of facilities in the sector could be contaminated with pollutants which are not used at all facilities. In response, EPA has modified the final fact sheet to clarify that the list of materials is a cumulative list gathered from all the types of facilities in the sector, and that individual facilities may not use all materials which are listed.

A commenter also disagreed with EPA's assessment in the draft fact sheet for this sector that the monitoring results which were submitted with the group applications may not be inclusive of all the pollutants which could be present in the runoff. In response, EPA has deleted the discussion in question from the final fact sheet.

*Transportation Equipment, and Industrial or Commercial Machinery*

One commenter was concerned with the grouping of facilities in Sector AB. The commenter felt that it is inappropriate to regulate commercial machine manufacturing facilities with other miscellaneous machinery manufacturing facilities. In response, EPA has retained the proposed grouping of the transportation equipment, industrial, or commercial machinery manufacturing sector. Although the specific processes that occur indoors and the final products produced will vary at the different facilities, the group application data indicated that the industrial activities and significant materials that may be exposed to storm water are similar. In addition, today's final permit includes flexible requirements for this sector which allow operators to implement controls based upon site-specific activities and materials.

The same commenter also expressed concern over the use of such sector groupings in the future. In response, EPA is making use of these industrial groupings only for the development of this storm water general permit. Future uses of these industrial groupings will be reevaluated by EPA based upon all available information at the time and based upon the intended usage.

*Electronic and Electrical Equipment, Photographic and Optical Goods*

EPA received a total of 6 comments on the multi-sector permit from facilities in sector AC, facilities which manufacture electronic and electrical equipment and components, photographic and optical goods. Comments addressed the proposed monitoring requirements and the proposed requirements for the storm water pollution prevention plan. The proposed permit only required visual

examinations of storm water samples for facilities in sector AC, rather than analytical testing which was proposed for certain other sectors. Commenters supported these proposed monitoring requirements and opposed the proposed alternate monitoring requirements which would have required analytical testing for certain parameters. Like the proposed permit, the final permit does not require analytical testing of storm water samples for facilities in sector AC. A more detailed discussion of EPA's responses to the monitoring issues overall is found in the portion of the response to comments which addresses monitoring. The proposed permit required that facilities in sector AC develop and implement a storm water pollution prevention plan and did not include any industry-specific numeric effluent limits. Commenters supported these provisions and the final permit has not been changed in this regard.

**Authorization to Discharge Under the National Pollution Discharge Elimination System**

In compliance with the provisions of the Clean Water Act, as amended, (33 U.S.C. 1251 et seq., the "Act") except as provided in Part I.B.3. of this storm water multi-sector general permit, operators of point source discharges of storm water associated with industrial activity that discharge into waters of the United States, represented by the industry sectors identified in Part XI. of this permit, are authorized to discharge in the areas of coverage listed below in accordance with the conditions and requirements set forth herein.

Operators of storm water discharges from the industrial activities covered under this permit who intend to be authorized by this permit must submit a Notice of Intent (NOI) in accordance with Part II.B. of this permit. Operators of storm water discharges associated with industrial activity who fail to submit an NOI in accordance with Part II.B. of this permit are not authorized under this general multi-sector permit.

This permit shall become effective on October 1, 1995, and shall expire at midnight on October 1, 2000.

**NPDES General Permit for Storm Water Discharges From Industrial Activities Table of Contents**

**I. Coverage Under This Permit**

- A. Permit Area
- B. Eligibility
  - 1. Discharges Covered
  - 2. Construction
  - 3. Limitations on Coverage
  - 4. Storm Water Not Associated With Industrial Activity
  - 5. Endangered Species Protection
  - 6. National Historic Preservation Act
  - 7. Discharges Subject to New Source Performance Standards
- C. Authorization

**D. Overview of the Multisector General Permit**

- II. Notification Requirements
  - A. Deadlines for Notification
    - 1. Existing Facility
    - 2. New Facility
    - 3. Oil and Gas Operations
    - 4. New Operator
    - 5. Late Notification
    - 6. Part II.A.6 Facilities Previously Subject to the Baseline General Permit
  - B. Contents of Notice of Intent
    - 1. Permit
    - 2. Name
    - 3. Location
    - 4. Federal Indian Reservations
    - 5. Receiving Water
    - 6. Co-permittee
    - 7. Monitoring
    - 8. SIC Code
    - 9. Other Permits
    - 10. Presence of Endangered Species
    - 11. National Historic Preservation Act Compliance
    - 12. Eligibility Certification
    - 13. Pollution Prevention Plan Certification
  - C. Where to Submit
  - D. Additional Notification

**III. Special Conditions**

- A. Prohibition of Non-storm Water Discharges
  - 1. Storm Water Discharges
  - 2. Non-storm Water Discharges
- B. Releases in Excess of Reportable Quantities
  - 1. Hazardous Substances or Oil
  - 2. Multiple Anticipated Discharges
  - 3. Spills
- C. Co-located Industrial Activity

**IV. Storm Water Pollution Prevention Plans**

- A. Deadlines for Plan Preparation and Compliance
  - 1. Existing Facilities
  - 2. New Facilities
  - 3. Oil and Gas Facilities
  - 4. Facilities Switching From the Baseline General Permit to This Permit
  - 5. Facilities Electing Multi-Sector General Permit upon Expiration of the Baseline General Permit
  - 6. Measures That Require Construction
  - 7. Extensions
- B. Signature and Plan Review
  - 1. Signature/Location
  - 2. Availability
  - 3. Required Modifications
  - 4. Keeping Plans Current
- D. Contents of the Plan
- E. Special Pollution Prevention Plan Requirements
  - 1. Additional Requirements for Storm Water Discharges Associated With Industrial Activity that Discharge Into or Through Municipal Separate Storm Sewer Systems Serving a Population of 100,000 or More
  - 2. Additional Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Requirements
  - 3. Additional Requirements for Salt Storage
  - 4. Consistency With Other Plans
- V. Numeric Effluent Limitations
  - A. Discharges Associated With Specific Industrial Activity

- B. Coal Pile Runoff
- VI. Monitoring and Reporting Requirements
  - A. Monitoring Requirements
    - 1. Limitations on Monitoring Requirements
    - B. Reporting: Where to Submit
      - 1. Location
      - 2. Additional Notification
    - C. Special Monitoring Requirements for Coal Pile Runoff
      - 1. Sample Type.
      - 2. Sampling Waiver
      - 3. Representative Discharge
      - 4. Alternative Certification
      - 5. When to Submit
  - VII. Standard Permit Conditions
    - A. Duty to Comply
      - 1. Permittee's Duty to Comply
      - 2. Penalties for Violations of Permit Conditions
    - B. Continuation of the Expired General Permit
    - C. Need to Halt or Reduce Activity Not a Defense
    - D. Duty to Mitigate
    - E. Duty to Provide Information
    - F. Other Information
    - G. Signatory Requirements
      - 1. Signature
      - 2. Authorized Representative
    - H. Penalties for Falsification of Reports
    - I. Penalties for Falsification of Monitoring Systems
    - J. Oil and Hazardous Substance Liability
    - K. Property Rights
    - L. Severability
    - M. Requiring an Individual Permit or an Alternative General Permit
      - 1. Director Designation
      - 2. Individual Permit Application
      - 3. Individual/Alternative General Permit Issuance
    - N. State/Environmental Laws
    - O. Proper Operation and Maintenance
    - P. Monitoring and Records
      - 1. Representative Samples/Measurements
      - 2. Retention of Records
      - 3. Records Contents
      - 4. Approved Monitoring Methods
    - Q. Inspection and Entry
    - R. Permit Actions
    - S. Bypass of Treatment Facility
      - 1. Notice
      - 2. Prohibition of Bypass
    - T. Upset Conditions
      - 1. Affirmative Defense
      - 2. Required Defense
      - 3. Burden of Proof
  - VIII. Reopener Clause
    - A. Potential or Realized Impacts on Water Quality
    - B. Applicable Regulations
  - IX. Termination of Coverage
    - A. Notice of Termination
      - 1. Facility Information
      - 2. Operator Information
      - 3. Permit Number
      - 4. Reason for Termination
      - 5. Certification
    - B. Addresses

  - Addendum D—Partial List of Large, Medium, and Designated Municipalities
  - Addendum E—Basic Format for Environmental Assessment
  - Addendum F—Section 313 Water Priority Chemicals
  - Addendum G—List of Applicable References
  - Addendum H—Endangered Species Guidance
- I. Coverage Under This Permit
  - A. *Permit Area*

The permit is being issued in the following areas:

    - Region I—the States of Maine, Massachusetts, and New Hampshire; Federal Indian Reservations located in Connecticut, Massachusetts, New Hampshire, Maine, Rhode Island, and Vermont; and Federal facilities located in Vermont.
    - Region II—the Commonwealth of Puerto Rico; and Federal facilities located in Puerto Rico.
    - Region III—the District of Columbia and Federal facilities located in Delaware and the District of Columbia.
    - Region IV—the State of Florida.
    - Region V—no areas.

- Region VI—the States of Louisiana, New Mexico, Oklahoma, and Texas and Federal Indian Reservations located in Louisiana, New Mexico (except Navajo Reservation lands, which are handled by Region IX, and Ute Mountain Reservation lands, which are handled by Region VIII and are not being covered by this permit), Oklahoma, and Texas.
  - Region VII—no areas.
  - Region VIII—no areas.
  - Region IX—the State of Arizona; the Territories of Johnston Atoll, and Midway and Wake Island; all Federal Indian Reservations located in Arizona, California, and Nevada; those portions of the Duck Valley, Fort McDermitt, and Goshute Reservations located outside Nevada, those portions of the Navajo Reservation located outside Arizona; and Federal facilities located in Arizona, Johnston Atoll, and Midway and Wake Islands.
  - Region X—the State of Idaho; Federal Indian Reservations located in Alaska, Oregon (except for Fort McDermitt Reservation lands which are handled by Region IX), Idaho (except Duck Valley Reservation lands which are handled by Region IX), and Washington; and for Federal facilities located in Alaska, Idaho and Washington.
- B. Eligibility*
  - 1. *Discharges Covered.* Except for storm water discharges identified under paragraph I.B.3., this permit may cover all new and existing point source discharges of storm water to waters of the United States that are associated with industrial activity identified under the coverage sections contained in Part XI. (see Table 1). Military installations must comply with the permit and monitoring requirements for all sectors that describe industrial activities that such installations perform.

TABLE 1

Storm water discharges from	Are covered if listed in part
Timber Products Facilities .....	XI.A.1.
Paper and Allied Products Manufacturing Facilities .....	XI.B.1.
Chemical and Allied Products Manufacturing Facilities .....	XI.C.1.
Asphalt Paving, Roofing Materials, and Lubricant Manufacturing Facilities .....	XI.D.1.
Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing Facilities .....	XI.E.1.
Primary Metals Facilities .....	XI.F.1.
Metal Mines (Ore Mining and Dressing) .....	XI.G.1.
Coal Mines and Coal Mine-Related Facilities .....	XI.H.1.
Oil or Gas Extraction Facilities .....	XI.I.1.
Mineral Mining and Processing Facilities .....	XI.J.1.
Hazardous Waste Treatment Storage or Disposal Facilities .....	XI.K.1.
Landfills and Land Application Sites .....	XI.L.1.
Automobile Salvage Yards .....	XI.M.1.
Scrap Recycling and Waste and Recycling Facilities .....	XI.N.1.
Steam Electric Power Generating Facilities .....	XI.O.1.

TABLE 1—Continued

Storm water discharges from	Are covered if listed in part
Vehicle Maintenance or Equipment Cleaning areas at Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, the United States Postal Service, or Railroad Transportation Facilities.	XI.P.1.
Vehicle Maintenance Areas and Equipment Cleaning Areas of Water Transportation Facilities .....	XI.Q.1.
Ship or Boat Building and Repair Yards .....	XI.R.1.
Vehicle Maintenance Areas, Equipment Cleaning Areas or From Airport Deicing Operations located at Air Transportation Facilities.	XI.S.1.
Wastewater Treatment Works .....	XI.T.1.
Food and Kindred Products Facilities .....	XI.U.1.
Textile Mills, Apparel and other Fabric Product Manufacturing Facilities .....	XI.V.1.
Furniture and Fixture Manufacturing Facilities .....	XI.W.1.
Printing and Publishing Facilities .....	XI.X.1.
Rubber and Miscellaneous Plastic Product Manufacturing Facilities .....	XI.Y.1.
Leather Tanning and Finishing Facilities .....	XI.Z.1.
Facilities That Manufacture Metal Products including Jewelry, Silverware and Plated Ware .....	XI.AA.1.
Facilities That Manufacture Transportation Equipment, Industrial or Commercial Machinery .....	XI.AB.1.
Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods .....	XI.AC.1.

2. *Construction.* This permit may authorize storm water discharges associated with industrial activity that are mixed with storm water discharges associated with industrial activity from construction activities provided that the storm water discharge from the construction activity is authorized by and in compliance with the terms of a different NPDES general permit or individual permit authorizing such discharges.

3. *Limitations on Coverage.* The following storm water discharges associated with industrial activity are not authorized by this permit:

a. Storm water discharges associated with industrial activities that are not listed under the coverage sections contained in Part XI. (see Table 1).

b. Storm water discharges subject to New Source Performance Standards except as provided in Part I.B.7. below.

c. Storm water discharges associated with industrial activity that are mixed with sources of non-storm water other than non-storm water discharges that are:

(1) In compliance with a different NPDES permit; or

(2) Identified by and in compliance with Part III.A. (Prohibition of Non-storm Water Discharges) of this permit.

d. Storm water discharges associated with industrial activity that are subject to an existing NPDES individual or general permit (except storm water discharges subject to the NPDES General Permit for Storm Water Discharges Associated With Industrial Activity published September 9, 1992 [57 FR 41297], or September 25, 1992 [57 FR 44438]).

e. Are located at a facility where an NPDES permit has been terminated (other than at the request of the permittee) or denied, or that are issued

a permit in accordance with Part VII.M (Requirements for Individual or Alternative General Permits) of this permit;

f. Storm water discharges associated with industrial activity that the Director [U.S. Environmental Protection Agency (EPA)] has determined to be or may reasonably be expected to be contributing to a violation of a water quality standard.

g. Discharges subject to storm water effluent guidelines, not described under Part XI.

h. Storm water discharges associated with industrial activity from inactive mining, inactive landfills, or inactive oil and gas operations occurring on Federal lands where an operator cannot be identified.

4. *Storm Water Not Associated With Industrial Activity.* Storm water discharges associated with industrial activity that are authorized by this permit may be combined with other sources of storm water that are not classified as associated with industrial activity pursuant to 40 CFR 122.26(b)(14).

5. *Endangered Species Protection.*

a. Permit Coverage Restrictions: In order to be eligible for coverage under this permit, the applicant must comply with the Endangered Species Act. A discharge of storm water associated with industrial activity may be covered under this permit only if either:

(1) The storm water discharge(s), and the construction of BMPs to control storm water runoff, are not likely to adversely affect species identified in Addendum H of this permit; or

(2) The applicant's activity has received previous authorization under the Endangered Species Act and established an environmental baseline that is unchanged; or,

(3) The applicant is implementing appropriate measures as required by the Director to address adverse affects.

b. All dischargers applying for coverage under this multi-sector storm water general permit must certify that their storm water discharge(s), and the construction of BMPs to control storm water runoff, are not likely to adversely affect species identified in Addendum H of this permit.

6. *National Historic Preservation Act.* In order to be eligible for coverage under this permit, the applicant must be in compliance with the National Historic Preservation Act. A discharge of storm water associated with industrial activity may be covered under this permit only if:

(i) The discharge does not affect a property that is listed or is eligible for listing in the National Historic Register maintained by the Secretary of Interior; or,

(ii) The applicant has obtained and is in compliance with a written agreement between the applicant and the State Historic Preservation Officer (SHPO) that outlines all measures to be undertaken by the applicant to mitigate or prevent adverse effects to the historic property.

7. *Discharges Subject to New Source Performance Standards.* Operators of facilities with storm water discharges subject to New Source Performance Standards<sup>1</sup> shall have documentation of

<sup>1</sup> Storm water discharges subject to New Source Performance Standards (NSPS) and that may be covered under this permit include: runoff from material storage piles at cement manufacturing facilities [40 CFR Part 411 Subpart C (established February 23, 1977)]; contaminated runoff from phosphate fertilizer manufacturing facilities [40 CFR Part 418 Subpart A (established April 8, 1974)]; coal pile runoff at steam electric generating facilities [40 CFR Part 423 (established November 19, 1982)]; and runoff from asphalt emulsion

a final EPA decision indicating that the Agency has determined that the storm water discharge has no direct or indirect impact. This documentation shall be obtained and retained on site prior to the submittal of the Notice of Intent. Operators of these facilities shall not be authorized under the terms and conditions of this permit until the submittal of a Notice of Intent to gain coverage under this permit. Where documentation of the Agency's decision has not been obtained for a facility subject to New Source Performance Standards, the operator must obtain such documentation prior to submitting a NOI. The permittee may use the format in Addendum E to submit information to EPA to initiate the process of the environmental review. The information shall be sent to the appropriate address listed in Part VI.B. of this permit. In order to maintain eligibility, the permittee must implement any mitigation required of the facility as a result of the National Environmental Policy Act (NEPA) review process. Failure to implement mitigation measures upon which the Agency's NEPA finding is based is grounds for termination of permit coverage.

### C. Authorization

Dischargers of storm water associated with industrial activity must submit a complete NOI in accordance with the requirements of Part II of this permit, using an NOI form as found in Addendum B (or photocopy thereof), to be authorized to discharge under this general permit. Unless notified by the Director to the contrary, owners or operators who submit such notification are authorized to discharge storm water associated with industrial activity under the terms and conditions of this permit 2 days after the date that the NOI is postmarked. The Director may deny coverage under this permit and require submittal of an application for an individual NPDES permit based on a review of the NOI or other information.

### D. Overview of the Multisector General Permit

Parts I.–X. apply to all facilities. Parts I. and II. describe eligibility requirements and the process for obtaining permit coverage. Parts III.–X. contain "basic" permit requirements.

facilities [40 CFR Part 443 Subpart A (established July 24, 1975)]. NSPS apply only to discharges from those facilities or installations that were constructed after the promulgation of NSPS. For example, storm water discharges from areas where the production of asphalt paving and roofing emulsions occurs are subject to NSPS only if the asphalt emulsion facility was constructed after July 24, 1975.

Part XI. provides additional requirements for particular sectors of industrial activity. For example, primary metal facilities add Part XI.F., to the "universal" Parts I.–X. requirements.

Some facilities may have "co-located" activities that are described in more than one sector and need to comply with applicable conditions of each sector. For example, a chemical manufacturing facility could have a land application site and be subject to Part XI.C.—Chemical and Allied products Manufacturing sector (primary activity), with runoff from the land application site (co-located activity) also subject to conditions in the Part XI.L.—Landfills and Land Application Sites sector.

Part XII of the permit contains conditions (e.g., effluent limitations or special reporting requirements) that only apply to facilities located in a particular State, EPA Region, or other area. Those special conditions are in addition to, or in lieu of, the "generic" Parts I.–XI. permit requirements.

Part XII of the permit also contains differences in permit eligibility and availability. For example, only the permits for Louisiana, New Mexico, Oklahoma, and Texas allow coverage of certain mine dewatering discharges from construction sand and gravel, industrial sand, and crushed stone mines (subject to additional permit conditions) under Sector J.—Mineral Mining and Processing.

Addendum D. lists large and medium municipal separate storm sewer systems (MS4s). Facilities located in these jurisdictions have special responsibilities (described in the permit) with regard to compliance with local requirements and providing information to the operator of the MS4).

## II. Notification Requirements

### A. Deadlines for Notification

1. *Existing Facility.* Except as provided in paragraphs II.A.4. (New Operator), and II.A.5. (Late Notification), individuals who intend to obtain coverage for an existing storm water discharge associated with industrial activity under this general permit shall submit an NOI in accordance with the requirements of this part on or before [insert date 90 days after permit finalization];

2. *New Facility.* Except as provided in paragraphs II.A.3. (Oil and Gas Operations), II.A.4. (New Operator), and II.A.5. (Late Notification), operators of facilities that begin industrial activity after [insert date 90 days after permit finalization] shall submit an NOI in accordance with the requirements of

this part at least 2 days prior to the commencement of the industrial activity at the facility;

3. *Oil and Gas Operations.* Operators of oil and gas exploration, production, processing, or treatment operations or transmission facilities, that are not required to submit a permit application as of [insert date 90 days after permit finalization] in accordance with 40 CFR 122.26(c)(1)(iii), but that after [insert date 90 days after permit finalization] have a discharge of a reportable quantity of oil or a hazardous substance for which notification is required pursuant to either 40 CFR 110.6, 40 CFR 117.21, or 40 CFR 302.6, must submit an NOI in accordance with the requirements of Part II.C. of this permit within 14 calendar days of the first knowledge of such release.

4. *New Operator.* Where the operator of a facility with a storm water discharge associated with industrial activity that is covered by this permit changes, the new operator of the facility must submit an NOI in accordance with the requirements of this part at least 2 days prior to the change.

5. *Late Notification.* An operator of a storm water discharge associated with industrial activity is not precluded from submitting an NOI in accordance with the requirements of this part after the dates provided in Parts II.A.1., 2., 3., or 4. (above) of this permit.

6. *Part II.A.6 Facilities Previously Subject to the Baseline General Permit.* Eligible facilities previously covered by EPA's 1992 Baseline General Permits for Storm Water Discharges Associated with Industrial Activity (57 FR 41297 or 57 FR 44438) may elect to be covered by this permit by submitting an NOI in accordance with the requirements of this Part within [insert date 90 days after permit finalization]. To avoid a lapse in permit coverage should reissuance or termination of the 1992 Baseline General Permits eliminate coverage for certain industries under those permits, NOIs from eligible facilities may also be submitted during the period 90 days prior to the expiration date of the applicable Baseline General Permit.

### B. Contents of Notice of Intent

The NOI shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit and shall include the following information:

1. *Permit.* An indication of which NPDES storm water general permit is being applied for (either baseline general, baseline construction, or multi-sector);

2. *Name.* The operator's name, address, telephone number, and status

as Federal, State, private, public, or other entity;

3. *Location.* The street address of the facility for which the notification is submitted. Also describe the location of the approximate center of the facility in terms of the latitude and longitude to the nearest 15 seconds, or the quarter section, township and range (to the nearest quarter section);

4. *Federal Indian Reservations.* An indication of whether the facility is located on Federal Indian Reservations;

*Receiving Water.* The name of the receiving water(s), or if the discharge is through a municipal separate storm sewer, the name of the municipal operator of the storm sewer and the ultimate receiving water(s) for the discharge through the municipal separate storm sewer;

6. *Co-permittee.* The storm water general permit number if such a number has been issued to a co-permittee;

7. *Monitoring.* The monitoring status of the facility;

8. *SIC Code.* Up to four 4-digit Standard Industrial Classification (SIC) codes that best represent the principal products produced or services rendered, or for hazardous waste treatment, storage or disposal facilities, land/disposal facilities that receive or have received any industrial waste, steam electric power generating facilities, or treatment works treating domestic sewage, a narrative identification of those activities;

9. *Other Permits.* The permit number(s) of additional NPDES permit(s) for any discharge(s) (including non-storm water discharges) from the site that are currently authorized by an NPDES permit;

10. *Presence of Endangered Species.* Based on the instructions in Addendum H, no species identified in Addendum H are in proximity to the storm water discharges to be covered under this permit, or the areas of BMP construction to control those storm water discharges.

11. *National Historic Preservation Act Compliance.* A yes or no response to the following statement: Applicant has obtained and is in compliance with Historic Preservation Agreement.

12. *Eligibility Certification.* The following certifications shall be signed in accordance with Part VII.G.

I certify under penalty of law that I have read and understand the Part I.B. eligibility requirements for coverage under the multi-sector storm water general permit including those requirements relating to the protection of species identified in Addendum H.

To the best of my knowledge the discharges covered under this permit, and the construction of BMPs to control storm water runoff, are not likely and will not

likely, adversely affect any species identified in Addendum H of this permit, or are otherwise eligible for coverage due to previous authorization under the Endangered Species Act.

To the best of my knowledge, I further certify that such discharges, and construction of BMPs to control storm water runoff, do not have an effect on properties listed or eligible for listing on the National Register of Historic Places under the National Historic Preservation Act, or are otherwise eligible for coverage due to a previous agreement under the National Historic Preservation Act.

I understand that continued coverage under the multi-sector storm water general permit is contingent upon maintaining eligibility as provided for in Part I.B.

13. *Pollution Prevention Plan Certification.* For any facility that begins to discharge storm water associated with industrial activity after [insert date 270 days after permit finalization], a certification that a storm water pollution prevention plan has been prepared for the facility in accordance with Part IV. of this permit must be included on the NOI. (Do not include a copy of the plan with the NOI submission.)

#### C. Where To Submit

Facilities that discharge storm water associated with industrial activity must use an NOI form provided by the Director (or photocopy thereof). NOIs must be signed in accordance with Part VII.G. (Signatory Requirements) of this permit. NOIs are to be submitted to the Director of the NPDES program at the following address: Storm Water Notice of Intent (4203), 401 M Street, S.W., Washington, D.C. 20460.

#### D. Additional Notification

Facilities that discharge storm water associated with industrial activity through large or medium municipal separate storm sewer systems (systems located in an incorporated city with a population of 100,000 or more, or in a county identified as having a large or medium system (see definition in Part X. of this permit and Addendum D of this notice)), or into a municipal separate storm sewer that has been designated by the permitting authority shall, in addition to filing copies of the NOI in accordance with paragraph II.C., submit signed copies of the NOI to the operator of the municipal separate storm sewer through which they discharge in accordance with the deadlines in Part II.A. (Deadlines for Notification) of this permit.

### III. Special Conditions

#### A. Prohibition of Non-storm Water Discharges

1. *Storm Water Discharges.* Except as provided in paragraph III.A.2 (below),

all discharges covered by this permit shall be composed entirely of storm water.

2. *Non-storm Water Discharges. a.* Except as provided in paragraph III.A.2.b (below), discharges of material other than storm water must be in compliance with an NPDES permit (other than this permit) issued for the discharge.

b. The following non-storm water discharges may be authorized by this permit provided the non-storm water component of the discharge is in compliance with Part IV and Part XI: discharges from fire fighting activities; fire hydrant flushings; potable water sources including waterline flushings; drinking fountain water, uncontaminated compressor condensate, irrigation drainage; lawn watering; routine external building washdown that does not use detergents or other compounds; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; compressor condensate; uncontaminated springs; uncontaminated ground water; and foundation or footing drains where flows are not contaminated with process materials such as solvents.

#### B. Releases in Excess of Reportable Quantities

1. *Hazardous Substances or Oil.* The discharge of hazardous substances or oil in the storm water discharge(s) from a facility shall be prevented or minimized in accordance with the applicable storm water pollution prevention plan for the facility. This permit does not relieve the permittee of the reporting requirements of 40 CFR Part 117 and 40 CFR Part 302. Except as provided in paragraph III.B.2 (Multiple Anticipated Discharges) of this permit, where a release containing a hazardous substance in an amount equal to or in excess of a reporting quantity established under either 40 CFR Part 117 or 40 CFR Part 302, occurs during a 24-hour period:

a. The discharger is required to notify the National Response Center (NRC) (800-424-8802; in the Washington, DC metropolitan area 202-426-2675) in accordance with the requirements of 40 CFR Part 117 and 40 CFR Part 302 as soon as he or she has knowledge of the discharge;

b. The storm water pollution prevention plan required under Part IV. (Storm Water Pollution Prevention Plans) of this permit must be modified within 14 calendar days of knowledge of the release to: provide a description of

the release, the circumstances leading to the release, and the date of the release. In addition, the plan must be reviewed by the permittee to identify measures to prevent the reoccurrence of such releases and to respond to such releases, and the plan must be modified where appropriate; and

c. The permittee shall submit within 14 calendar days of knowledge of the release a written description of: the release (including the type and estimate of the amount of material released), the date that such release occurred, the circumstances leading to the release, and steps to be taken in accordance with paragraph III.B.1.b. (above) of this permit to the appropriate EPA Regional Office at the address provided in Part VI.B. (Reporting: Where to Submit) of this permit.

**2. Multiple Anticipated Discharges.** Facilities that have more than one anticipated discharge per year containing the same hazardous substance in an amount equal to or in excess of a reportable quantity established under either 40 CFR Part 117 or 40 CFR Part 302, that occurs during a 24-hour period, where the discharge is caused by events occurring within the scope of the relevant operating system shall:

a. Submit notifications in accordance with Part III.B.1.b. (above) of this permit for the first such release that occurs during a calendar year (or for the first year of this permit, after submittal of an NOI); and

b. Shall provide in the storm water pollution prevention plan required under Part IV. (Storm Water Pollution Prevention Plans) a written description of the dates on which all such releases occurred, the type and estimate of the amount of material released, and the circumstances leading to the releases. In addition, the plan must be reviewed to identify measures to prevent or minimize such releases and the plan must be modified where appropriate.

**3. Spills.** This permit does not authorize the discharge of hazardous substances or oil resulting from an onsite spill.

### C. Co-located Industrial Activity

In the case where a facility has industrial activities occurring onsite which are described by any of the activities in other sections of Part XI, those industrial activities are considered to be co-located industrial activities. Storm water discharges from co-located industrial activities are authorized by this permit, provided that the permittee complies with any and all additional pollution prevention plan and monitoring requirements from other

sections of Part XI applicable to the co-located industrial activity. The operator of the facility shall determine which additional pollution prevention plan and monitoring requirements are applicable to the co-located industrial activity by examining the narrative descriptions of each coverage section (Discharges Covered Under This Section) in Part XI of this permit.

### IV. Storm Water Pollution Prevention Plans

A storm water pollution prevention plan shall be developed for each facility covered by this permit. Storm water pollution prevention plans shall be prepared in accordance with good engineering practices and in accordance with the factors outlined in 40 CFR 125.3(d)(2) or (3) as appropriate. The plan shall identify potential sources of pollution that may reasonably be expected to affect the quality of storm water discharges associated with industrial activity from the facility. In addition, the plan shall describe and ensure the implementation of practices that are to be used to reduce the pollutants in storm water discharges associated with industrial activity at the facility and to assure compliance with the terms and conditions of this permit. Facilities must implement the provisions of the storm water pollution prevention plan required under this part as a condition of this permit.

#### A. Deadlines for Plan Preparation and Compliance

**1. Existing Facilities.** Except as provided in paragraphs 3., 4., and 5. (below), all existing facilities and new facilities that begin operation on or before [insert date 270 days after permit finalization] shall prepare and implement the plan by [insert date 270 days after permit finalization].

**2. New Facilities.** Facilities that begin operation after [insert date 270 days after permit finalization] shall prepare and implement the plan prior to submitting the Notice of Intent.

**3. Oil and Gas Facilities.** Oil and gas exploration, production, processing or treatment facilities that are not required to submit a permit application on or before [insert date 90 days after permit finalization] in accordance with 40 CFR 122.26(c)(1)(iii), but after [insert date 270 days after permit finalization] have a discharge of a reportable quantity of oil or a hazardous substance for which notification is required pursuant to either 40 CFR 110.6 or 40 CFR 302.6, shall prepare and implement the plan on or before the date 60 calendar days after first knowledge of such release.

**4. Facilities Switching From the Baseline General Permit to This Permit.** Facilities previously subject to the NPDES General Permit for Storm Water Discharges Associated With Industrial Activity (57 FR 41297 or 57 FR 44438) that switch to coverage under this permit shall continue to implement the storm water pollution prevention plan required by that permit. The plan shall be revised as necessary to address requirements under Part XI. of this permit no later than [insert date 270 days after permit finalization]. The revisions made to the plan shall be implemented on or before [insert date 270 days after permit finalization].

**5. Facilities Electing Multi-Sector General Permit Upon Expiration of the Baseline General Permit.** Facilities electing to obtain coverage under this permit during the period 90 days prior to expiration of the Baseline General Permit shall revise the pollution prevention plan required by that permit as necessary to address requirements under Part X.I. of this permit and implement the revised plan prior to submittal of the NOI.

**6. Measures That Require Construction.** In cases where construction is necessary to implement measures required by the plan, the plan shall contain a schedule that provides compliance with the plan as expeditiously as practicable, but no later than [insert date 3 years after permit finalization]. Where a construction compliance schedule is included in the plan, the schedule shall include appropriate non-structural and/or temporary controls to be implemented in the affected portion(s) of the facility prior to completion of the permanent control measure.

**7. Extensions.** Upon a showing of good cause, the Director may establish a later date in writing for preparing and compliance with a plan for a storm water discharge associated with industrial activity.

#### B. Signature and Plan Review

**1. Signature/Location.** The plan shall be signed in accordance with Part VII.G. (Signatory Requirements), and be retained onsite at the facility that generates the storm water discharge in accordance with Part VII.P.2. (Retention of Records) of this permit. For inactive facilities, the plan may be kept at the nearest office of the permittee.

**2. Availability.** The permittee shall make the storm water pollution prevention plan, annual site compliance inspection report, or other information available upon request to the Assistant Administrator for Fisheries for the National Oceanic and Atmospheric

Administration; the U.S. Fisheries and Wildlife Service Regional Director; or authorized representatives of these officials.

3. *Required Modifications.* The Director, or authorized representative, may notify the permittee at any time that the plan does not meet one or more of the minimum requirements of this part. Such notification shall identify those provisions of the permit that are not being met by the plan, and identify which provisions of the plan requires modifications in order to meet the minimum requirements of this part. Within 30 days of such notification from the Director, (or as otherwise provided by the Director), or authorized representative, the permittee shall make the required changes to the plan and shall submit to the Director a written certification that the requested changes have been made.

*C. Keeping Plans Current*

The permittee shall amend the plan whenever there is a change in design, construction, operation, or maintenance, that has a significant effect on the potential for the discharge of pollutants to the waters of the United States or if the storm water pollution prevention plan proves to be ineffective in eliminating or significantly minimizing pollutants from sources identified under Part IV.D. (Contents of the Plan) of this permit, or in otherwise achieving the general objectives of controlling pollutants in storm water discharges associated with industrial activity. New owners shall review the existing plan and make appropriate changes: Amendments to the plan may be reviewed by EPA in the same manner as Part IV.B. (above).

*D. Contents of the Plan*

The contents of the pollution prevention plan shall comply with the requirements listed in the appropriate section of Part XI. (Specific Requirements for Industrial Activities). Table 2 lists the location of the plan requirements for the respective industrial activities. These requirements are cumulative. If a facility has co-located activities that are covered in more than one section of Part XI., that facility's pollution prevention plan must comply with the requirements listed in all applicable sections of this permit.

TABLE 2.—POLLUTION PREVENTION PLAN REQUIREMENTS

	Are subject to pollution prevention plan requirements listed in part
Storm water discharges from	
Timber Products Facilities .....	XI.A.3
Paper and Allied Products Manufacturing Facilities.	XI.B.3
Chemical and Allied Products Manufacturing Facilities.	XI.C.4
Asphalt Paving, Roofing Materials, and Lubricant Manufacturing Facilities.	XI.D.3
Glass, Clay, Cement Concrete and Gypsum Product Manufacturing Facilities.	XI.E.3
Primary Metals Facilities .....	XI.F.3.
Metal Mines (Ore Mining and Dressing).	XI.G.3
Coal Mines and Coal Mine-Related Facilities.	XI.H.3
Oil or Gas Extraction Facilities	XI.I.3
Mineral Mining and Processing Facilities.	XI.J.3
Hazardous Waste Treatment Storage or Disposal Facilities.	XI.K.3
Landfills and Land Application Sites.	XI.L.3
Automobile Salvage Yards .....	XI.M.2
Scrap and Waste Recycling Facilities.	XI.N.3
Steam Electric Power Generating Facilities.	XI.O.3
Vehicle Maintenance or Equipment Cleaning areas at Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, the United States Postal Service, or Railroad Transportation Facilities.	XI.P.3
Vehicle Maintenance Areas and Equipment Cleaning Areas of Water Transportation Facilities.	XI.Q.3
Ship or Boat Building and Repair Yards.	XI.R.3
Vehicle Maintenance Areas, Equipment Cleaning Areas or From Airport Deicing Operations located at Air Transportation Facilities.	XI.S.3
Wastewater Treatment Works	XI.T.3
Food and Kindred Products Facilities.	XI.U.3
Textile Mills, Apparel and other Fabric Product Manufacturing Facilities.	XI.V.3
Furniture and Fixture Manufacturing Facilities.	XI.W.3
Printing and Publishing Facilities.	XI.X.3
Rubber and Miscellaneous Plastic Product Manufacturing Facilities.	XI.Y.3
Leather Tanning and Finishing Facilities.	XI.Z.3

	Are subject to pollution prevention plan requirements listed in part
Storm water discharges from	
Facilities That Manufacture Metal Products including Jewelry, Silverware and Plated Ware.	XI.AA.3
Facilities That Manufacture Transportation Equipment, Industrial or Commercial Machinery.	XI.AB.3
Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods.	XI.AC.3.

*E. Special Pollution Prevention Plan Requirements*

In addition to the minimum standards listed in Part XI. of this permit (Specific Requirements for Industrial Activities), the storm water pollution prevention plan shall include a complete discussion of measures taken to conform with the following applicable guidelines, other effective storm water pollution prevention procedures, and applicable State rules, regulations and guidelines:

1. *Additional Requirements for Storm Water Discharges Associated With Industrial Activity that Discharge Into or Through Municipal Separate Storm Sewer Systems Serving a Population of 100,000 or More.* a. In addition to the applicable requirements of this permit, facilities covered by this permit must comply with applicable requirements in municipal storm water management programs developed under NPDES permits issued for the discharge of the municipal separate storm sewer system that receives the facility's discharge, provided the discharger has been notified of such conditions.

b. Permittees that discharge storm water associated with industrial activity through a municipal separate storm sewer system serving a population of 100,000 or more, or a municipal system designated by the Director shall make plans available to the municipal operator of the system upon request.

2. *Additional Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Requirements.* In addition to the requirements of Part XI. of this permit and other applicable conditions of this permit, storm water pollution prevention plans for facilities subject to

reporting requirements under EPCRA Section 313 for chemicals that are classified as 'Section 313 water priority chemicals' in accordance with the definition in Part X. of this permit, except as provided in paragraph IV.E.2.c.(below), shall describe and ensure the implementation of practices that are necessary to provide for conformance with the following guidelines:

a. In areas where Section 313 water priority chemicals are stored, processed or otherwise handled, appropriate containment, drainage control and/or diversionary structures shall be provided unless otherwise exempted under Part IV.E.2.c. At a minimum, one of the following preventive systems or its equivalent shall be used:

(1) Curbing, culverting, gutters, sewers, or other forms of drainage control to prevent or minimize the potential for storm water runoff to come into contact with significant sources of pollutants; or

(2) Roofs, covers or other forms of appropriate protection to prevent storage piles from exposure to storm water and wind.

b. In addition to the minimum standards listed under Part IV.E.2.a. (above) of this permit, except as otherwise exempted under Part IV.E.2.c (below) of this permit, the storm water pollution prevention plan shall include a complete discussion of measures taken to conform with other effective storm water pollution prevention procedures, and applicable State rules, regulations, and guidelines:

(1) *Liquid Storage Areas Where Storm Water Comes Into Contact With Any Equipment, Tank, Container, or Other Vessel Used for Section 313 Water Priority Chemicals.* (a) No tank or container shall be used for the storage of a Section 313 water priority chemical unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature, etc.

(b) Liquid storage areas for Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 chemicals. Appropriate measures to minimize discharges of Section 313 chemicals may include secondary containment provided for at least the entire contents of the largest single tank plus sufficient freeboard to allow for precipitation, a strong spill contingency and integrity testing plan, and/or other equivalent measures.

(2) *Material Storage Areas for Section 313 Water Priority Chemicals Other Than Liquids.* Material storage areas for Section 313 water priority chemicals other than liquids that are subject to

runoff, leaching, or wind shall incorporate drainage or other control features that will minimize the discharge of Section 313 water priority chemicals by reducing storm water contact with Section 313 water priority chemicals.

(3) *Truck and Rail Car Loading and Unloading Areas for Liquid Section 313 Water Priority Chemicals.* Truck and rail car loading and unloading areas for liquid Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 water priority chemicals. Protection such as overhangs or door skirts to enclose trailer ends at truck loading/unloading docks shall be provided as appropriate. Appropriate measures to minimize discharges of Section 313 chemicals may include: the placement and maintenance of drip pans (including the proper disposal of materials collected in the drip pans) where spillage may occur (such as hose connections, hose reels and filler nozzles) for use when making and breaking hose connections; a strong spill contingency and integrity testing plan; and/or other equivalent measures.

(4) *Areas Where Section 313 Water Priority Chemicals Are Transferred, Processed, or Otherwise Handled.* Processing equipment and materials handling equipment shall be operated so as to minimize discharges of Section 313 water priority chemicals. Materials used in piping and equipment shall be compatible with the substances handled. Drainage from process and materials handling areas shall minimize storm water contact with Section 313 water priority chemicals. Additional protection such as covers or guards to prevent exposure to wind, spraying or releases from pressure relief vents from causing a discharge of Section 313 water priority chemicals to the drainage system shall be provided as appropriate. Visual inspections or leak tests shall be provided for overhead piping conveying Section 313 water priority chemicals without secondary containment.

(5) *Discharges From Areas Covered by Paragraphs (1), (2), (3), or (4).* (a)

Drainage from areas covered by paragraphs (1), (2), (3), or (4) of this part should be restrained by valves or other positive means to prevent the discharge of a spill or other excessive leakage of Section 313 water priority chemicals. Where containment units are employed, such units may be emptied by pumps or ejectors; however, these shall be manually activated.

(b) Flapper-type drain valves shall not be used to drain containment areas. Valves used for the drainage of containment areas should, as far as is

practical, be of manual, open-and-closed design.

(c) If facility drainage is not engineered as above, the final discharge of all in-facility storm sewers shall be equipped to be equivalent with a diversion system that could, in the event of an uncontrolled spill of Section 313 water priority chemicals, return the spilled material to the facility.

(d) Records shall be kept of the frequency and estimated volume (in gallons) of discharges from containment areas.

(6) *Facility Site Runoff Other Than From Areas Covered By (1), (2), (3), or (4).* Other areas of the facility (those not addressed in paragraphs (1), (2), (3), or (4)), from which runoff that may contain Section 313 water priority chemicals or spills of Section 313 water priority chemicals could cause a discharge shall incorporate the necessary drainage or other control features to prevent discharge of spilled or improperly disposed material and ensure the mitigation of pollutants in runoff or leachate.

(7) *Preventive Maintenance and Housekeeping.* All areas of the facility shall be inspected at specific intervals identified in the plan for leaks or conditions that could lead to discharges of Section 313 water priority chemicals or direct contact of storm water with raw materials, intermediate materials, waste materials or products. In particular, facility piping, pumps, storage tanks and bins, pressure vessels, process and material handling equipment, and material bulk storage areas shall be examined for any conditions or failures that could cause a discharge. Inspection shall include examination for leaks, wind blowing, corrosion, support or foundation failure, or other forms of deterioration or noncontainment. Inspection intervals shall be specified in the plan and shall be based on design and operational experience. Different areas may require different inspection intervals. Where a leak or other condition is discovered that may result in significant releases of Section 313 water priority chemicals to waters of the United States, action to stop the leak or otherwise prevent the significant release of Section 313 water priority chemicals to waters of the United States shall be immediately taken or the unit or process shut down until such action can be taken. When a leak or noncontainment of a Section 313 water priority chemical has occurred, contaminated soil, debris, or other material must be promptly removed and disposed in accordance with Federal, State, and local requirements and as described in the plan.

(8) *Facility Security.* Facilities shall have the necessary security systems to prevent accidental or intentional entry that could cause a discharge. Security systems described in the plan shall address fencing, lighting, vehicular traffic control, and securing of equipment and buildings.

(9) *Training.* Facility employees and contractor personnel that work in areas where Section 313 water priority chemicals are used or stored shall be trained in and informed of preventive measures at the facility. Employee training shall be conducted at intervals specified in the plan, but not less than once per year. Training shall address: pollution control laws and regulations, the storm water pollution prevention plan and the particular features of the facility and its operation that are designed to minimize discharges of Section 313 water priority chemicals. The plan shall designate a person who is accountable for spill prevention at the facility and who will set up the necessary spill emergency procedures and reporting requirements so that spills and emergency releases of Section 313 water priority chemicals can be isolated and contained before a discharge of a Section 313 water priority chemical can occur. Contractor or temporary personnel shall be informed of facility operation and design features in order to prevent discharges or spills from occurring.

c. Facilities subject to reporting requirements under EPCRA Section 313 for chemicals that are classified as "Section 313 water priority chemicals" in accordance with the definition in Part X. of this permit that are handled and stored onsite only in gaseous or non-soluble liquid or solid (at atmospheric pressure and temperature) forms may provide a certification as such in the pollution prevention plan in lieu of the additional requirements in Part IV.E.2. Such certification shall include a narrative description of all water priority chemicals and the form in which they are handled and stored, and shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

d. The storm water pollution prevention plan shall be certified in accordance with Section VII.G (Signatory Requirements) of this permit.

3. *Additional Requirements for Salt Storage.* Storage piles of salt used for deicing or other commercial or industrial purposes and that generate a storm water discharge associated with industrial activity that is discharged to waters of the United States shall be enclosed or covered to prevent exposure to precipitation, except for exposure

resulting from adding or removing materials from the pile. Dischargers shall demonstrate compliance with this provision as expeditiously as practicable, but in no event later than [insert date 3 years after permit finalization]. Dischargers with previous coverage under the Baseline general permit for storm water shall be compliant with this provision upon submittal of the NOI. Piles do not need to be enclosed or covered where storm water from the pile is not discharged to waters of the United States.

4. *Consistency With Other Plans.* Storm water pollution prevention plans may reference the existence of other plans for Spill Prevention Control and Countermeasure (SPCC) plans developed for the facility under Section 311 of the CWA or Best Management Practices (BMP) Programs otherwise required by an NPDES permit for the facility as long as such requirement is incorporated into the storm water pollution prevention plan.

#### V. Numeric Effluent Limitations

##### A. *Discharges Associated With Specific Industrial Activity*

Numeric effluent limitations for storm water discharges associated with a specific industrial activity are described in Part XI. of this permit.

##### B. *Coal Pile Runoff*

Any discharge composed of coal pile runoff shall not exceed a maximum concentration for any time of 50 mg/L total suspended solids. Coal pile runoff shall not be diluted with storm water or other flows in order to meet this limitation. The pH of such discharges shall be within the range of 6.0 to 9.0. Runoff from coal piles located at steam electric generating facilities shall be in compliance with these limits upon submittal of the Notice of Intent (NOI). Runoff from coal piles at all other types of facilities shall comply with these limitations as expeditiously as practicable, but in no case later than [insert date 3 years after permit finalization]. Dischargers with previous coverage under the Baseline general permit for storm water shall be compliant with this provision upon submittal of the NOI. Any untreated overflow from facilities designed, constructed and operated to treat the volume of coal pile runoff that is associated with a 10-year, 24-hour rainfall event shall not be subject to the 50 mg/L limitation for total suspended solids.

#### VI. Monitoring and Reporting Requirements

##### A. *Monitoring Requirements*

1. *Limitations on Monitoring Requirements.* a. Except as required by paragraph b., only those facilities with discharges or activities identified in Part VI.C. and Part XI. are required to conduct sampling of their storm water discharges associated with industrial activity. Monitoring requirements under parts VI.C. and XI. are additive. Facilities with discharges or activities described in more than one monitoring section are subject to all applicable monitoring requirements from each section.

b. The Director can provide written notice to any facility otherwise exempt from the sampling requirements of Parts VI.C. and XI. that it shall conduct discharge sampling for a specific monitoring frequency for specific parameters.

##### B. *Reporting: Where To Submit*

1. *Location.* Signed copies of discharge monitoring reports required under Parts XI. and VI.C., individual permit applications, and all other reports required herein, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office:

a. *CT, MA, ME, NH, RI, VT*  
EPA, Region I, Water Management Division, (WCP), Storm Water Staff, JFK Federal Building, Boston, MA 02203

b. *PR*  
EPA, Region II, Water Management Division, (2WM-WPC), Storm Water Staff, 290 Broadway, New York, NY 10007-1866

c. *DE, DC*  
EPA, Region III, Water Management Division, (3WM55), Storm Water Staff, 841 Chestnut Building, Philadelphia, PA 19107

d. *FL*  
EPA, Region IV, Water Management Division, Permits Section (WPEB-7), 345 Courtland Street, NE., Atlanta, GA 30365

e. *LA, NM (except see Region IX for Navajo lands), OK, TX*  
EPA, Region VI, Enforcement and Compliance Assurance Division (GEN-WC), EPA SW MSGP, First Interstate Bank Tower at Fountain Place, P.O. Box 50625, Dallas, TX 75205

f. *AZ, CA, NV, Johnson Atoll, Midway Island, Wake Island, the Goshute Reservation in UT and NV, the Navajo Reservation in UT, NM, and AZ, the Fort McDermitt Reservation*

in OR, the Duck Valley Reservation in NV and ID

EPA, Region IX, Water Management Division, (W-5-3), Storm Water Staff, 75 Hawthorne Street, San Francisco, CA 94105

g. AK Indian Reservations, ID (except see Region IX for Duck Valley Reservation lands), OR (except see Region IX for Fort McDermitt Reservation lands), WA

EPA, Region X, Water Division, (WD-134), Storm Water Staff, 1200 Sixth Avenue, Seattle, WA 98101

For each outfall, one Discharge Monitoring Report form must be submitted per storm event sampled.

2. *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with Part VI.B. (Reporting: Where to Submit), facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) or a municipal system designated by the Director must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in Part XI. Facilities not required to report monitoring data under Part XI. and facilities that are not otherwise required to monitor their discharges, need not comply with this provision.

### C. Special Monitoring Requirements for Coal Pile Runoff

During the period beginning on the effective date and lasting through the expiration date of this permit, permittees with storm water discharges containing coal pile runoff shall monitor such storm water for: pH and TSS (mg/l) at least annually (1 time per year). Permittees with discharges containing coal pile runoff must report in accordance with Part V.B (Numeric Effluent Limitations) and Part VI.B. (Reporting: Where to Submit). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) samples; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event samples and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge samples.

1. *Sample Type.* For discharges containing coal pile runoff from holding ponds or other impoundments with a retention period greater than 24 hours (estimated by dividing the volume of the

detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected), a minimum of one grab sample may be taken. For all other discharges containing coal pile runoff, data shall be reported for a grab sample. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

2. *Sampling Waiver.* When a discharger is unable to collect samples of coal pile runoff due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit this data along with the data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

3. *Representative Discharge.* When a facility has two or more outfalls containing coal pile runoff that, based on a consideration of the other industrial activity, and significant materials, and upon management practices and activities within the area drained by the outfall, and the permittee reasonably believes substantially identical effluents are discharged, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge

substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. Permittees required to submit monitoring information under Part VIII. of this permit shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report. This representative discharge provision is not applicable to storm water discharges from coal piles regulated under the national effluent limitations guidelines.

4. *Alternative Certification.* Facilities with storm water discharges containing coal pile runoff may not submit alternative certification in lieu of the required monitoring data.

5. *When to Submit.* Permittees with discharges containing coal pile runoff shall submit monitoring results annually no later than the 28th day of [insert month following permit finalization].

## VII. Standard Permit Conditions

### A. Duty to Comply

1. *Permittee's Duty to Comply.* The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

2. *Penalties for Violations of Permit Conditions.*

#### a. Criminal.

(1) *Negligent Violations.* The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than \$2,500 nor more than \$25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

(2) *Knowing Violations.* The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than \$5,000 nor more than \$50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

(3) *Knowing Endangerment.* The CWA provides that any person who

knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than \$250,000, or by imprisonment for not more than 15 years, or both.

(4) *False Statement.* The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than \$10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Clean Water Act).

*b. Civil Penalties.* The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed \$25,000 per day for each violation.

*c. Administrative Penalties.* The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

(1) *Class I Penalty.* Not to exceed \$10,000 per violation nor shall the maximum amount exceed \$25,000.

(1) *Class II Penalty.* Not to exceed \$10,000 per day for each day during which the violation continues nor shall the maximum amount exceed \$125,000.

#### *B. Continuation of the Expired General Permit*

This permit expires on [insert date 5 years after permit finalization]. However, an expired general permit continues in force and effect until a new general permit is issued. Permittees that choose, or are required, to obtain an individual permit must submit an application (Forms 1 and 2F and any other applicable forms) 180 days prior to expiration of this permit. Permittees that are eligible and choose to be covered by a new general permit must submit an NOI by the date specified in that permit.

#### *C. Need to Halt or Reduce Activity Not a Defense*

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

#### *D. Duty to Mitigate*

The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

#### *E. Duty to Provide Information*

The permittee shall furnish to the Director, within a time specified by the Director, any information that the Director may request to determine compliance with this permit. The permittee shall also furnish to the Director upon request, copies of records required to be kept by this permit.

#### *F. Other Information*

When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in the NOI or in any other report to the Director, he or she shall promptly submit such facts or information.

#### *G. Signatory Requirements*

All Notices of Intent, Notices of Termination, storm water pollution prevention plans, reports, certifications or information either submitted to the Director (and/or the operator of a large or medium municipal separate storm sewer system), or that this permit requires be maintained by the permittee, shall be signed.

*1. Signature.* All reports required by the permit and other information requested by the Director shall be signed as follows:

*a.* For a corporation: by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (1) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or (2) the manager of one or more manufacturing, production or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding \$25,000,000 (in second-quarter 1980 dollars) if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

*b.* For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

*c.* For a municipality, State, Federal, or other public facility: by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (1) the chief executive officer of the agency, or (2) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

*2. Authorized Representative.* All reports required by the permit and other information requested by the Director shall be signed by a person described in Section VII.G.1. above or be signed by a duly authorized representative of that person. A person is a duly authorized representative only if:

*a.* The authorization is made in writing by a person described above and submitted to the Director.

*b.* The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

*c. Changes to Authorization.* If an authorization under paragraph VII.G.2. is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new NOI satisfying the requirements of paragraph II.B. (Contents of NOI) must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

*d. Certification.* Any person signing documents under this section shall make the following certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

#### H. Penalties for Falsification of Reports

Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than 2 years, or by both.

#### I. Penalties for Falsification of Monitoring Systems

The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

#### J. Oil and Hazardous Substance Liability

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under Section 311 of the CWA or Section 106 of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA).

#### K. Property Rights

The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State, or local laws or regulations.

#### L. Severability

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

#### M. Requiring an Individual Permit or an Alternative General Permit

**1. Director Designation.** The Director may require any person authorized by this permit to apply for and/or obtain either an individual NPDES permit or an alternative NPDES general permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the

owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form, a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of issuance or denial of the individual NPDES permit or the alternative general permit as it applies to the individual permittee, coverage under this general permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part VI.B. (Reporting: Where to Submit) of this permit. The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Director, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

**2. Individual Permit Application.** Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application (Form 1 and Form 2F) with reasons supporting the request to the Director. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part VI.B. of this permit. The request may be granted by the issuance of any individual permit or an alternative general permit if the reasons cited by the owner or operator are adequate to support the request.

**3. Individual/Alternative General Permit Issuance.** When an individual NPDES permit is issued to an owner or operator otherwise subject to this permit, or the owner or operator is authorized for coverage under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the effective date of the individual permit or the date of authorization of coverage under the alternative general permit, whichever the case may be. When an individual NPDES permit is denied to an owner or operator otherwise subject to this permit, or the owner or operator is denied for coverage under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the date of

such denial, unless otherwise specified by the Director.

#### N. State/Environmental Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Act.

No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

#### O. Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) that are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water pollution prevention plans. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

#### P. Monitoring and Records

**1. Representative Samples/Measurements.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

##### **2. Retention of Records.**

**a.** The permittee shall retain records of all monitoring information, copies of all reports required by this permit, and records of all data used to complete the application of this permit for a period of at least three (3) years from the date of sample, measurement, evaluation or inspection, report, or application. This period may be extended by request of the Director at any time. Permittees must submit any such records to the Director upon request.

**b.** The permittee shall retain the pollution prevention plan developed in accordance with Parts IV. and XI. of this permit until a date 3 years after the last modification or amendment is made to the plan, and at least 1 year after coverage under this permit terminates.

**3. Records Contents.** Records of monitoring information shall include:

**a.** The date, exact place, and time of sampling or measurements;

b. The initials or name(s) of the individual(s) who performed the sampling or measurements;

c. The date(s) analyses were performed;

d. The time(s) analyses were initiated;

e. The initials or name(s) of the individual(s) who performed the analyses;

f. References and written procedures, when available, for the analytical techniques or methods used; and

g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

#### 4. *Approved Monitoring Methods.*

Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

#### Q. *Inspection and Entry*

The permittee shall allow the Director or an authorized representative of EPA, the State environmental agency, or, in the case of a facility that discharges through a municipal separate storm sewer, an authorized representative of the municipal operator or the separate storm sewer receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to: enter upon the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit; have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

#### R. *Permit Actions*

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

#### S. *Bypass of Treatment Facility*

##### 1. *Notice.*

a. *Anticipated Bypass.* If a permittee subject to the numeric effluent limitations of Parts V. and XI. of this permit knows in advance of the need for a bypass, he or she shall submit prior notice, if possible, at least 10 days before the date of the bypass; including an evaluation of the anticipated quality and effect of the bypass.

b. *Unanticipated Bypass.* The permittee subject to the numeric

effluent limitations of Parts V. and XI. of this permit shall submit notice of an unanticipated bypass. Any information regarding the unanticipated bypass shall be provided orally within 24 hours from the time the permittee became aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee became aware of the circumstances. The written submission shall contain a description of the bypass and its cause; the period of the bypass; including exact dates and times, and if the bypass has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the bypass.

##### 2. *Prohibition of Bypass.*

a. Bypass is prohibited and the Director may take enforcement action against a permittee for a bypass. Unless:

(1) The bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

(2) There were no feasible alternatives to the bypass, such as the use of auxiliary facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if the permittee should, in the exercise of reasonable engineering judgement, have installed adequate backup equipment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance; and

(3) The permittee submitted notices of the bypass.

b. The Director may approve an anticipated bypass after considering its adverse effects, if the Director determines that it will meet the three conditions listed in Part VII.S.2.a.

#### T. *Upset Conditions*

1. *Affirmative Defense.* An upset constitutes an affirmative defense to an action brought for noncompliance with technology-based numeric effluent limitations in Parts V. and XI. of this permit if the requirements of paragraph 2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.

2. *Required Defense.* A permittee who wishes to establish the affirmative defense of an upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence, that:

a. An upset occurred and that the permittee can identify the specific cause(s) of the upset;

b. The permitted facility was at the time being properly operated; and

c. The permittee provided oral notice of the upset to EPA within 24 hours from the time the permittee became aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee became aware of the circumstances. The written submission shall contain a description of the upset and its cause; the period of the upset; including exact dates and times, and if the upset has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the upset.

3. *Burden of Proof.* In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

#### VIII. *Reopener Clause*

##### A. *Potential or Realized Impacts on Water Quality*

If there is evidence indicating potential or realized impacts on water quality or on a listed endangered species due to any storm water discharge associated with industrial activity covered by this permit, the owner or operator of such discharge may be required to obtain an individual permit or an alternative general permit in accordance with Part VII.M. (Requiring an Individual Permit or an Alternative General Permit) of this permit or the permit may be modified to include different limitations and/or requirements.

##### B. *Applicable Regulations*

Permit modification or revocation will be conducted according to 40 CFR 122.62, 122.63, 122.64, and 124.5.

#### IX. *Termination of Coverage*

##### A. *Notice of Termination*

Where all storm water discharges associated with industrial activity that are authorized by this permit are eliminated, or where the operator of storm water discharges associated with industrial activity at a facility changes, the operator of the facility may submit a Notice of Termination that is signed in accordance with Part VII.G. (Signatory Requirements) of this permit. The Notice of Termination shall include the following information:

1. *Facility Information.* Name, mailing address, and location of the facility for which the notification is submitted. Describe the location of the approximate center of the site in terms of the latitude and longitude to the nearest 15 seconds, or the section,

township and range to the nearest quarter section;

2. *Operator Information.* The name, address, and telephone number of the operator addressed by the Notice of Termination;

3. *Permit Number.* The NPDES permit number for the storm water discharge associated with industrial activity identified by the Notice of Termination;

4. *Reason for Termination.* An indication of whether the storm water discharges associated with industrial activity have been eliminated or the operator of the discharges has changed; and

5. *Certification.* The following certification signed in accordance with Part VII.G. (Signatory Requirements) of this permit:

I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that are authorized by an NPDES general permit have been eliminated or that I am no longer the operator of the industrial activity. I understand that by submitting this notice of termination, that I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by an NPDES permit. I also understand that the submittal of this notice of termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

#### B. Addresses

All Notices of Termination are to be sent, using the form provided by the Director (or a photocopy thereof),<sup>2</sup> to the Director of the NPDES program at the following address: Storm Water Notice of Termination (4203), 401 M Street, S.W., Washington, D.C. 20460.

#### X. Definitions

*Best Management Practices* ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

*Bypass* means the intentional diversion of waste streams from any portion of a treatment facility.

*Coal pile runoff* means the rainfall runoff from or through any coal storage pile

*Co-located industrial activity* means when a facility has industrial activities being conducted onsite that are described under more than one of the coverage sections of Part XI in this permit (Discharges Covered Under This Section). Facilities with co-located industrial activities shall comply with all applicable monitoring and pollution prevention plan requirements of each section in which a co-located industrial activity is described.

*CWA* means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972).

*Commercial Treatment and Disposal Facilities* means facilities that receive, on a commercial basis, any produced hazardous waste (not their own) and treat or dispose of those wastes as a service to the generators. Such facilities treating and/or disposing exclusively residential hazardous wastes are not included in this definition.

*Director* means the Regional Administrator or an authorized representative.

*Flow-weighted composite sample* means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

*Landfill* means an area of land or an excavation in which wastes are placed for permanent disposal, and that is not a land application unit, surface impoundment, injection well, or waste pile.

*Land application unit* means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

*Large and medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the

large or medium municipal separate storm sewer system.

*NOT* means notice of termination (see Part IX.A. of this permit.)

*Point source* means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

*Section 313 water priority chemical* means a chemical or chemical categories that: (1) Are listed at 40 CFR 372.65 pursuant to Section 313 of the Emergency Planning and Community Right-to-Know Act (EPCRA) (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986); (2) are present at or above threshold levels at a facility subject to EPCRA Section 313 reporting requirements; and (3) meet at least one of the following criteria: (i) are listed in Appendix D of 40 CFR Part 122 on either Table II (organic priority pollutants), Table III (certain metals, cyanides, and phenols) or Table V (certain toxic pollutants and hazardous substances); (ii) are listed as a hazardous substance pursuant to Section 311(b)(2)(A) of the CWA at 40 CFR 116.4; or (iii) are pollutants for which EPA has published acute or chronic water quality criteria. See Addendum A of this permit. This addendum was revised based on final rulemaking EPA published in the Federal Register November 30, 1994.

*Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of CERCLA; any chemical the facility is required to report pursuant to EPCRA Section 313; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

*Significant spills* includes, but is not limited to: releases of oil or hazardous substances in excess of reportable quantities under Section 311 of the Clean Water Act (see 40 CFR 110.10 and CFR 117.21) or Section 102 of CERCLA (see 40 CFR 302.4).

*Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

<sup>2</sup> A copy of the approved NOT form is provided in Addendum C of this notice.

*Storm water associated with industrial activity* means the discharge from any conveyance that is used for collecting and conveying storm water and that is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program. For the categories of industries identified in paragraphs (i) through (x) of this definition, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR Part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (xi) of this definition, the term includes only storm water discharges from all areas (except access roads and rail lines) listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in paragraphs (i) to (xi) of this definition) include those facilities designated under 122.26(a)(1)(v). The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR Subchapter N (except facilities with toxic pollutant effluent standards that are exempted under category (xi) of this definition);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283 and 285), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of noncoal mining operations that have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; inactive mining operations are mining sites that are not being actively mined, but that have an identifiable owner/operator;

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45 and 5171 that have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in

vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or that are otherwise identified under paragraphs (i) to (vii) or (ix) to (xi) of this subsection are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and that are not physically located in the confines of the facility, or areas that are in compliance with 40 CFR Part 503;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than 5 acres of total land area that are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and that are not otherwise included within categories (i) to (x)).<sup>3</sup>

*Time-weighted composite* means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

*Upset* means an exceptional incident in which there is unintentional and temporary noncompliance with the numeric effluent limitations of Parts V. and XI. of this permit because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

*Waste pile* means any noncontainerized accumulation of solid, nonflowing waste that is used for treatment or storage.

*Waters of the United States* means:

<sup>3</sup>On June 4, 1992, the United States Court of Appeals for the Ninth Circuit remanded the exclusion for manufacturing facilities in category (xi) that do not have materials or activities exposed to storm water to the EPA for further rulemaking. (Nos. 90-70671 and 91-70200.)

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;

b. All interstate waters, including interstate wetlands;

c. All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

1. That are or could be used by interstate or foreign travelers for recreational or other purposes;

2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

3. That are used or could be used for industrial purposes by industries in interstate commerce;

d. All impoundments of waters otherwise defined as waters of the United States under this definition;

e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;

f. The territorial sea; and

g. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.

(Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA are not waters of the United States.)

#### Specific Requirements for Industrial Activities

##### *A. Storm Water Discharges Associated With Industrial Activity From Timber Products Facilities*

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges from the following activities: establishments [generally classified under Standard Industrial Classification (SIC) Major Group 24] that are engaged in cutting timber and pulpwood, merchant sawmills, lath mills, shingle mills, cooperage stock mills, planing mills, and plywood and veneer mills engaged in producing lumber and wood basic materials; and establishments engaged in wood preserving or in manufacturing finished articles made entirely of wood or related materials, except for wood kitchen cabinet manufacturers (SIC Code 2434), which are addressed under Part XI.W. of this permit.

When an industrial facility, described by the above coverage provisions of this

section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

#### 2. *Special Conditions.*

##### *a. Prohibition of Non-storm Water Discharges.*

(1) Discharges of boiler blowdown and water treatment wastewaters, noncontact and contact cooling waters, wash down waters from treatment equipment, and storm water that has come in contact with areas where spraying of chemical formulations designed to provide surface protection, to waters of the United States, or through municipal separate storm sewer systems are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES discharge permit.

(2) In addition to the discharges described in part III.A.2., the following non-storm water discharges may be authorized by this permit provided the non-storm water component of the discharge is in compliance with paragraph XI.A.3.a.(3)(g)(i) (Measures and Controls for Non-storm Water Discharges): discharges from the spray down of lumber and wood product storage yards where no chemical additives are used in the spray down waters and no chemicals are applied to the wood during storage.

#### 3. *Storm Water Pollution Prevention Plan Requirements.*

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall

address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

#### *(a) Drainage.*

(i) A site map indicating the location of outfalls covered by the permit, the types of discharges contained in the drainage areas of the outfalls, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.A.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading/unloading areas; material handling areas; locations used for the treatment, storage, or disposal of wastes; liquid storage tanks; processing areas; treatment chemical storage areas; treated wood and residue storage areas; wet decking areas; dry decking areas; untreated wood and residue storage areas; and treatment equipment storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemicals; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative

description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water and material management practices employed that were listed for the facility in the approved group application. Where information is available, facilities that have used chlorophenolic, creosote, or chromium-copper-arsenic formulations for wood surface protection or wood preserving activities onsite in the past should identify in the inventory the following: areas where contaminated soils, treatment equipment, and stored materials still remain and management practices employed to minimize the contact of these materials with storm water runoff.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any specific

pollutant or pollutant parameter (e.g., total suspended solids, biochemical oxygen demand, chemical oxygen demand, oil and grease, arsenic, copper, chromium, pentachlorophenol, other specific metals, toxicity, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water best management practices (BMPs) and controls appropriate for the facility and implement such controls. The appropriateness of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following areas of the site: log, lumber and other wood product storage areas; residue storage areas, loading and unloading areas; material handling areas; chemical storage areas; and equipment/vehicle maintenance, storage and repair areas. Facilities that surface protect and/or preserve wood products should address specific BMPs for wood surface protection and preserving activities. The pollution prevention plan should address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. Good housekeeping measures in storage areas, loading and unloading areas, and material handling areas should be designed to: 1) limit the discharge of wood debris; 2) minimize the leachate generated from decaying wood materials; and 3) minimize the generation of dust.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Periodic removal of debris from ditches, swales, diversions, containment basins, sediment ponds and infiltration measures should be performed to limit discharges of solids and to maintain the effectiveness of the controls.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm

water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a cleanup should be available to personnel. Response schedules should be developed to limit tracking of spilled materials to other areas of the site. Leaks or spills of wood surface protection or preservation chemicals shall be cleaned up immediately in accordance with applicable RCRA regulations at 40 CFR Part 264 and 40 CFR Part 265.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.A.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Operators of facilities are required to conduct quarterly visual inspections of BMPs. The inspections shall include: 1) an assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; 2) visual inspection of sediment and erosion BMPs to determine if soil erosion has occurred; and 3) visual inspections of storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

Material handling, and unloading and loading areas should be inspected daily whenever industrial activities occur in those areas. If no activities are occurring, no inspection is required.

Inspections at processing areas, transport areas, and treated wood storage areas of facilities performing wood surface protection and preservation activities should be performed monthly to assess the usefulness of practices in minimizing drippage of treatment chemicals on unprotected soils and in areas that will come in contact with storm water discharges.

A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management

at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

*(f) Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

*(g) Non-storm Water Discharges.*

*(i)* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.A.3.a.(3)(g)(iii) (below).

*(ii)* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

*(iii) Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-

storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

*(h) Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. When developing the plan, the following areas of the site should be considered: loading and unloading areas, access roads, material handling areas, storage areas, and any other areas where heavy equipment and vehicle use is prevalent. The following erosion and sediment controls shall be considered to minimize the discharge of sediments from the site: stabilization measures such as seeding, mulching, contouring, porous pavement, paving and sodding or its equivalent and structural measures such as sediment traps and silt fences or other equivalent measures.

*(i) Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.A.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of

collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices or other equivalent measures.

*(4) Comprehensive Site Compliance Evaluation.* Personnel knowledgeable about storm water management as it relates to the facility shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall include the following:

*(a)* Areas contributing to a storm water discharge associated with industrial activity such as loading/unloading areas, material handling areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas, treatment chemical storage areas, treated wood and residue storage areas, wet decking areas, dry decking areas, untreated wood and residue storage areas, and treatment equipment storage areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

*(b)* Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.A.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.A.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

*(c)* A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.A.3.a.(4)(b) (above) of the permit shall be made and retained as part of the

storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations.* There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

5. *Monitoring and Reporting Requirements.*

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with timber product facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Timber product facilities are required to monitor their storm water discharges for the pollutants of concern listed in the appropriate table (Tables A-1, A-2, A-3 or A-4). Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Tables A-1, A-2, A-3 and A-4 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE A-1.—MONITORING REQUIREMENTS FOR GENERAL SAWMILLS AND PLANNING MILLS FACILITIES

Pollutants of concern	Monitoring cut-off concentration
Chemical Oxygen Demand ....	120.0 mg/L
Total Suspended Solids .....	100 mg/L
Total Recoverable Zinc, .....	0.065 mg/L

TABLE A-2.—MONITORING REQUIREMENTS FOR WOOD PRESERVING FACILITIES

Pollutant of concern	Monitoring cut-off concentration
Total Recoverable Arsenic .....	0.16854 mg/L
Total Recoverable Copper .....	0.0636 mg/L

TABLE A-3.—MONITORING FOR LOG STORAGE AND HANDLING FACILITIES

Pollutant of concern	Monitoring cut-off concentration
Total Suspended Solids .....	100 mg/L

TABLE A-4.—MONITORING REQUIREMENTS FOR HARDWOOD DIMENSION AND FLOORING MILLS; SPECIAL PRODUCTS SAWMILLS, NOT ELSEWHERE CLASSIFIED; MILLWORK, VENEER, PLYWOOD AND STRUCTURAL WOOD; WOOD CONTAINERS; WOOD BUILDINGS AND MOBILE HOMES; RECONSTITUTED WOOD PRODUCTS; AND WOOD PRODUCTS FACILITIES NOT ELSEWHERE CLASSIFIED

Pollutants of concern	Monitoring cut-off concentration
Chemical Oxygen Demand ....	120 mg/L
Total Suspended Solids .....	100 mg/L

(1) *Monitoring Periods.* Facilities required to perform monitoring shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event

interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next monitoring period and submit the data along with the data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous or inaccessible conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table A-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in

the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

(b) *Reporting.* Permittees shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), facilities engaged in wood preservation and/or surface protection with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* All timber products facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall,

except discharges exempted below. The examination(s) must be made at least once in each of the following three-month periods: January through March, April through June, July through September, and October through December. The examination shall be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examination shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an

estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *B. Storm Water Discharges Associated With Industrial Activity From Paper And Allied Products Manufacturing Facilities*

*1. Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges from the following activities: facilities engaged in the manufacture of pulps from wood and other cellulose fibers and from rags; the manufacture of paper and paperboard into converted products, such as paper coated off the paper machine, paper bags, paper boxes and envelopes; and establishments primarily engaged in manufacturing bags of plastic film and sheet. These facilities are commonly identified by Standard Industrial Classification (SIC) Major Group 26.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution

prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

#### *2. Special Conditions.*

*a. Prohibition of Non-storm Water Discharges.* There are no additional requirements beyond those in Part III.A. of this permit.

#### *3. Storm Water Pollution Prevention Plan Requirements.*

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

*(1) Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

*(2) Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

#### *(a) Drainage.*

*(i)* A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.B.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes and wastewaters, locations used for the treatment, filtration, or storage of

water supplies, liquid storage tanks, processing areas, and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

*(ii)* For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water and material management practices employed that were listed for the facility in the approved group application.

*(c) Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water

discharges from the facility, including a summary of sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices, and wastewater treatment activities to include sludge drying, storage, application or disposal activities. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

*(3) Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

*(a) Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. The plan shall describe procedures performed to minimize contact of materials with storm water runoff. Examples include cleaning of lots and roofs that collect debris; routine cleaning of wastewater treatment, and other waste disposal (such as sludge handling) locations.

*(b) Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

*(c) Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material

handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

*(d) Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

*(e) Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

*(f) Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

*(g) Non-storm Water Discharges.*

*(i)* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan

shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

*(ii)* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

*(iii) Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 270 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

*(h) Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

*(i) Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.B.3.a.(2)

of this permit (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices; reuse of collected storm water (such as for a process or as an irrigation source); inlet controls (such as oil/water separators); snow management activities; infiltration devices, and wet detention/retention devices; screens or fences used to protect dust and particulate collection activities from wind or to minimize the effects of wind on material loading and storage, and processing activities to eliminate or reduce windblown or airborne pollutants; secondary containment of storage areas such as berms and dikes; diversionary structures to direct storm water away from areas of potential contamination; and tarpaulins, roofs, or other coverings of outdoor storage or industrial activities or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity such as material storage, handling, and disposal activities shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.B.3.a.(2) of this permit (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with Part XI.B.3.a.(3) of this permit (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.*

During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with paperboard mills must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Paperboard mills are required to monitor their storm water discharges for the pollutant of concern listed in Table B-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table B-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE B-1.—MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Chemical Oxygen Demand .....	120 mg/L

(1) *Monitoring Periods.* Paperboard mills shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table B-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area

and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting*. Permittees with paperboard mills shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report Form must be submitted per storm event completed. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the

appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), paperboard mills with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual will carry out the collection and examination of discharges for the life of the permit.

(3) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse

weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(4) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

(5) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(6) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

### *C. Storm Water Discharges Associated With Industrial Activity From Chemical and Allied Products Manufacturing Facilities*

#### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges associated with industrial activity from a facility engaged in manufacturing the following products and generally described by the SIC code shown:

- a. Basic industrial inorganic chemicals (including SIC 281).
- b. Plastic materials and synthetic resins, synthetic rubbers, and cellulosic and other humanmade fibers, except glass (including SIC 282).
- c. Soap and other detergents and in producing glycerin from vegetable and animal fats and oils; specialty cleaning, polishing, and sanitation preparations; surface active preparations used as emulsifiers, wetting agents, and finishing agents, including sulfonated oils; and perfumes, cosmetics, and other toilet preparations (including SIC 284).
- d. Paints (in paste and ready-mixed form); varnishes; lacquers; enamels and shellac; putties, wood fillers, and sealers; paint and varnish removers; paint brush cleaners; and allied paint products (including SIC 285).
- e. Industrial organic chemicals (including SIC 286).
- f. Nitrogenous and phosphatic basic fertilizers, mixed fertilizer, pesticides, and other agricultural chemicals (including SIC 287).
- g. Industrial and household adhesives, glues, caulking compounds, sealants, and linoleum, tile, and rubber cements from vegetable, animal, or synthetic plastics materials; explosives; printing ink, including gravure ink, screen process ink, and lithographic; miscellaneous chemical preparations, such as fatty acids, essential oils, gelatin (except vegetable), sizes, bluing, laundry sours, writing and stamp pad ink, industrial compounds, such as boiler and heat insulating compounds, metal, oil, and water treatment compounds, waterproofing compounds, and chemical supplies for foundries (including facilities with SIC 289).
- h. Ink and paints, including china painting enamels, india ink, drawing ink, platinum paints for burnt wood or leather work, paints for china painting, artists' paints and artists' water colors (SIC 3952, limited to those listed).
- i. *Co-located Industrial Activities.*

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the

description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

#### 2. Discharges Not Covered By This Section

a. Storm water discharges from drug manufacturing facilities and other establishments classified as SIC Code 283.

#### 3. Special Conditions

a. *Prohibition of Non-storm Water Discharges.* In addition to those non-storm water discharges prohibited under section III.A.2, this section does not authorize the discharge of:

- (1) Inks, paints, or substances (hazardous, nonhazardous, etc.) resulting from an onsite spill, including materials collected in drip pans.
- (2) Washwaters from material handling and processing areas. This includes areas where containers, equipment, industrial machinery, and any significant materials are exposed to storm water.
- (3) Washwaters from drum, tank, or container rinsing and cleaning.

#### 4. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

- (1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team. The team will be responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's plan.
- (2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources of pollutants to storm water discharges and sources of discharges of pollutants during dry weather. Each plan shall

identify all activities and materials that may be pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage and Site Plan*—A site map shall be developed for the facility. This map shall include, at a minimum: the location of all structures (manufacturing buildings, garages, etc.), impervious areas, the location of each storm water outfall and/or connection to municipal storm sewer; types of discharges included in each discharge; an outline of the portions of the drainage area of each outfall within the facility boundaries and a prediction of the direction of flow in each area; each existing structural control measure to reduce pollutants in storm water runoff; surface water bodies; locations where materials are exposed to precipitation; and locations where major spills or leaks identified under Part XI.C.4.a.(2)(c) (below) of this permit have occurred. The map shall also indicate the locations of the following outdoor activities: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading/unloading areas; locations used for the treatment, storage or disposal of wastes; storage tanks and other containers; processing and storage areas; access roads, rail cars and tracks; the location of transfer of substances in bulk; and machinery.

(b) *Inventory of Exposed Materials and Management Practices*—An inventory of the types of materials handled at the site that may be exposed to precipitation shall be collected. Such inventory shall include: a narrative description of materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and leaks of material that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance after the date of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit. The list

shall be updated as appropriate to include any significant spills and leaks during the term of the permit.

(d) *Sampling Data*—A summary of existing storm water sampling data describing pollutants discharged from the facility, including a summary of sampling data collected during the term of this permit. In addition, the report of monitoring data that is submitted to EPA pursuant to Part VI. of this permit shall be maintained with the pollution prevention plan.

(e) *Risk Identification and Summary of Potential Pollutant Sources.*

(i) A narrative description of the potential pollutant sources from the following: loading, unloading, and transfer of chemicals; outdoor storage of salt, pallets, coal, drums, containers, fuels, or other materials; outdoor manufacturing or processing activities; significant dust or particulate generating processes; fueling stations; vehicle and equipment maintenance and/or cleaning areas; locations used for the treatment, storage or disposal (on or off site) of wastes and wastewaters; storage tanks and other containers; processing and storage areas; access roads, rail cars and tracks; the location of transfer of substances in bulk; and machinery.

(ii) The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., chemical oxygen demand, etc.) of concern shall be identified.

(iii) Factors to consider include: quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills. In addition, flows with a significant potential for causing erosion shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a reasonable schedule for implementing such controls:

(a) *Nonstructural Controls.*

(i) *Good Housekeeping*—Good housekeeping requires that areas that may contribute pollutants to storm water discharges are maintained in a clean, orderly manner. At a minimum, the permittee shall:

(a) Schedule regular pickup and disposal of garbage and waste materials,

or use other appropriate measures to reduce the potential for the discharge of storm water that has come into contact with garbage or waste materials. This schedule shall be included in the plan. Individuals responsible for waste management and disposal shall be informed of the procedures established under the plan.

(b) Routinely inspect for leaks and the condition of drums, tanks and containers. Ensure that spill cleanup procedures are understood by employees.

(c) Keep an up-to-date inventory of all materials present at the facility. While preparing the inventory, all containers should be clearly labeled. Hazardous containers that requires special handling, storage, use and disposal shall be clearly marked.

(d) Maintain clean ground surfaces.

(ii) *Preventive Maintenance*—A preventive maintenance program shall be developed and shall involve timely inspection and maintenance of storm water management devices (e.g., oil/water separators, catch basins, dikes, storm sewer, basins, pipes). Also, preventive maintenance includes inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures, and ensuring appropriate maintenance of such equipment and systems.

(iii) *Spill Prevention and Response Procedures*—Spill prevention and response procedures shall be developed. Areas where potential spills (that can contribute pollutants to storm water discharges) can occur and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up (e.g., absorbent materials) should be available to personnel.

(iv) *Inspections*—Qualified personnel shall conduct quarterly inspections. A wet weather inspection (during a rainfall event) shall be conducted in the second (April to June) and third quarters (July to September) of each year. A dry weather inspection (no precipitation) shall be conducted in the first (January to March) and fourth quarters (October to December). Such inspections shall be documented and this documentation shall be retained as part of the pollution prevention plan. Changes based on the

results of the quarterly inspections shall be made in a timely manner.

(a) When a seasonal dry period is sustained for more than 3 months, a dry weather inspection will satisfy the wet weather inspection requirement.

(b) All areas exposed to precipitation at the facilities shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented or whether additional control measures are needed. Structural storm water management measures (diking, berming, curbing, sediment and erosion control measures, stabilization controls, etc.) required under this section shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(v) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices and procedures for equipment and container cleaning and washing. The pollution prevention plan shall identify periodic dates for such training of at least once per year.

(vi) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(vii) *Facility Security*—Facilities shall have the necessary security systems to prevent accidental or intentional entry that could cause a discharge. Security systems described in the plan shall address fencing, lighting, vehicular traffic control, and securing of equipment and buildings.

(b) *Structural Practices*—The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.C.4.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining

reasonable and appropriate structural measures. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained.

(i) *Practices for Material Handling and Storage Areas*—Permittees shall ensure the implementation of practices that conform with the following:

(a) In areas where liquid or powdered materials are stored, facilities shall provide either diking, curbing, berms, or other appropriate measures to reduce the potential of discharge of liquid or powdered materials in storm water.

(b) In all other outside storage areas including storage of used containers, machinery, scrap and construction materials, and pallets, facilities shall prevent or minimize storm water runoff to the storage area by using curbing, culverting, gutters, sewers or other forms of drainage control.

(c) In all storage areas, roofs, covers or other forms of appropriate protection shall be used to prevent storage areas from exposure to storm water and wind. For the purpose of this paragraph, tanks would be considered to be appropriate protection.

(d) In areas where liquid or powdered materials are transferred in bulk from truck or rail cars, permittees shall provide appropriate measures to minimize contact of material with precipitation. Permittees shall consider providing for hose connection points at storage containers to be inside containment areas, and drip pans to be used in areas that are not in a containment area, where spillage may occur (e.g., hose reels, connection points with rail cars or trucks) or equivalent measures.

(e) In areas of transfer of contained or packaged materials and loading/unloading areas, permittee shall consider providing appropriate protection such as overhangs or door skirts to enclose trailer ends at truck loading/unloading docks or an equivalent.

(f) Drainage from areas covered by paragraph XI.C.4.a.(3)(b)(i) of this section should be restrained by valves or other positive means to prevent the discharge of a spill or leak. Containment units may be emptied by pumps or ejectors; however, these shall be manually activated.

(g) Flapper-type drain valves shall not be used to drain containment areas. Valves used for the drainage of containment areas should, as far as is practical, be of manual, open-or-closed design.

(h) If facility drainage is not engineered as above, the final discharge point of all in-facility sewers should be

equipped to prevent or divert the discharge, in the event of an uncontrolled spill of materials, return the spilled material to the facility.

(c) *Management of Runoff*—The plan shall contain a description of storm water management practices used and/or to be used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. Appropriate measures may include: vegetative swales, ripraps, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, use of porous pavements, and wet detention/retention devices.

(d) *Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a potential for significant soil erosion. Plans shall describe permanent stabilization practices and shall ensure that disturbed portions of the site are stabilized. Stabilization practices may include: permanent seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, protection of trees, preservation of mature vegetation, and other appropriate measures.

(e) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water

listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance] 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(4) *Comprehensive Site Compliance Evaluation*. A member(s) of the pollution prevention team or a qualified professional designated by the team shall conduct, at a minimum, annual site compliance evaluations.

(a) Areas contributing to a storm water discharge associated with industrial activity such as material storage and handling, loading and unloading, process activities, and plant yards shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, other structural pollution prevention measures identified in the plan, as well as process related pollution control equipment shall be observed or tested to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources (see Part XI.C.4.a.(2)) and pollution prevention measures and controls (see Part XI.C.4.a.(3)) identified in the plan shall be revised as appropriate within 2 weeks of such evaluation. In addition, it shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, observations relating to the

implementation of the plan, and actions taken in accordance with paragraph XI.C.4.a.(4)(b) (above) shall be made and retained as part of the plan for at least 3 years after the date of the evaluation. The report shall also identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

5. Numeric Effluent Limitations

In addition to the numeric effluent limitations described by Part V.B. of this permit, the following effluent limitations shall be met by existing and new discharges with:

a. *Phosphate Fertilizer Manufacturing Runoff*. The provisions of this paragraph are applicable to storm water discharges from the Phosphate Subcategory of the Fertilizer Manufacturing Point Source Category (40 CFR 418.10). The term contaminated storm water runoff shall mean precipitation runoff, that during manufacturing or processing, comes into contact with any raw materials, intermediate product, finished product, by-products or waste product (40 CFR 418.11(c)). The concentration of pollutants in storm water discharges shall not exceed the effluent limitations in Table C-1.

TABLE C-1.—NUMERIC EFFLUENT LIMITATIONS

Effluent characteristics	Effluent limitations (mg/L)	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Total Phosphorus (as P) .....	105.0	35.0
Fluoride .....	75.0	25.0

6. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*.

During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with agricultural chemical manufacturing facilities; industrial

inorganic chemical facilities; soaps, detergents, cosmetics, and perfume manufacturing facilities; and plastics, synthetics, and resin manufacturing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 6.a.(3) (Sampling Waiver), 6.a.(4) (Representative Discharge), and 6.a.(5) (Alternative Certification). Agricultural chemical manufacturing facilities;

industrial inorganic chemical facilities; soaps, detergents, cosmetics, and perfume manufacturing facilities; and plastics, synthetics, and resin manufacturing facilities are required to monitor their storm water discharges for the pollutants of concern listed in Tables C-2, C-3, C-4, and C-5 below. Facilities must report in accordance with 6.b. (Reporting). In addition to the parameters listed in Tables C-2, C-3, C-4, and C-5 below, the permittee shall

provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE C-2.—AGRICULTURAL CHEMICALS MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Nitrate plus Nitrite Nitrogen ....	0.68 mg/L
Total Recoverable Lead .....	0.0816 mg/L
Total Recoverable Iron .....	1.0 mg/L
Total Recoverable Zinc .....	0.065 mg/L
Phosphorus .....	2.0 mg/L

TABLE C-3.—INDUSTRIAL INORGANIC CHEMICALS MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Total Recoverable Aluminum .	0.75 mg/L
Total Recoverable Iron .....	1.0 mg/L
Nitrate plus Nitrite Nitrogen ....	0.68 mg/L

TABLE C-4.—SOAPS, DETERGENTS, COSMETICS, AND PERFUMES MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Nitrate plus Nitrite Nitrogen ....	0.68 mg/L
Total Recoverable Zinc .....	0.065 mg/L

TABLE C-5.—PLASTICS, SYNTHETICS, AND RESINS MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Total Recoverable Zinc .....	0.065 mg/L

(1) *Monitoring Periods.* Agricultural chemical manufacturing facilities; industrial inorganic chemical facilities; soaps, detergents, cosmetics, and perfume manufacturing facilities; and plastics, synthetics, and resin manufacturing facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the

discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table C-2 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that

there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility

within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph *b.* below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

*b Reporting.* Permittees with agricultural chemical manufacturing facilities; industrial inorganic chemical facilities; soaps, detergents, cosmetics, and perfume manufacturing facilities; and plastics, synthetics, and resin manufacturing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one Discharge Monitoring Report Form must be submitted per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

*(1) Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph *b* (above), agricultural chemical manufacturing facilities; industrial inorganic chemical facilities; soaps, detergents, cosmetics, and perfume manufacturing facilities; and plastics, synthetics, and resin manufacturing facilities with at least one storm water discharge associated with industrial activity through a large

or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph *b* (above).

*c. Compliance Monitoring Requirements.* In addition to the monitoring required in paragraph 6a (above), permittees with contaminated storm water runoff from phosphate fertilizer manufacturing facilities must monitor their contaminated storm water discharges for the presence of phosphorus and fluoride at least annually (one time per year). Facilities must report in accordance with Part XI.C.6.c.(2) (Reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

*(1) Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

*(2) Reporting.* Permittees with phosphate fertilizer manufacturing facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert month after permit issuance date]. For

each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit.

*(3) Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (2) (above), permittees that discharge through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (3) (above).

*d. Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each of the following periods: January through March; April through June; July through September; and October through December during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

*(1) Examinations* shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

*(2) Visual examination reports* must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids,

settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *D. Storm Water Discharges Associated With Industrial Activity From Asphalt Paving and Roofing Materials and Lubricant Manufacturers*

*1. Discharges Covered Under This Section. a.* This section of the permit

describes requirements for all existing point source discharges of storm water associated with industrial activity to waters of the United States from facilities engaged in manufacturing asphalt paving and roofing materials, including those facilities commonly identified by Standard Industrial Classification (SIC) codes 2951 and 2952.

*b.* This section of the permit describes requirements for all existing point source discharges of storm water associated with industrial activity to waters of the United States from portable asphalt plant facilities (also commonly identified by SIC code 2951).

*c.* This section of the permit describes requirements for all existing point source discharges of storm water associated with industrial activity to waters of the United States from facilities engaged in manufacturing lubricating oils and greases, including those facilities classified as SIC code 2992.

*d.* When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*e. Limitations on Coverage.* The following storm water discharges associated with industrial activity are not authorized by this section of the permit:

(1) Storm water discharges from petroleum refining facilities, including those that manufacture asphalt or asphalt products and that are classified as SIC code 2911,

(2) Storm water discharges from oil recycling facilities, and

(3) Storm water discharges associated with fats and oils rendering.

#### *2. Special Conditions. a. Prohibition of Non-storm Water Discharges.*

(1) There are no additional prohibitions beyond those listed in Section III.A.2. of this permit.

#### *3. Storm Water Pollution Prevention Plan Requirements. a. Contents of Plan.*

The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

#### *(a) Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under XI.D.3.a.(2)(c) (spills and leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas including areas where raw materials, finished products and drums are stored. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used,

produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(d) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for

the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. Particular attention should be paid to areas where raw materials are stockpiled, material handling areas, storage areas, liquid storage tanks, material handling areas, and loading/unloading areas.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under XI.D.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Material storage and handling areas, liquid storage tanks, hoppers or silos, vehicle and equipment maintenance, cleaning, and fueling areas, material handling vehicles, equipment and processing areas shall be inspected at least once per month as part of the maintenance program. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the

inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.D.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan.

The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.D.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetated swales, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), infiltration devices, and detention/retention basins or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall

conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Evaluations shall be conducted at least once at portable plant locations that are not in operation for a complete year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including: material storage and handling areas, liquid storage tanks, hoppers or silos, vehicle and equipment maintenance, cleaning, and fueling areas, material handling vehicles, equipment and processing areas, and areas where aggregate is stockpiled outdoors shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, (e.g., oil/water separators, detention ponds, sedimentation basins or equivalent measures) sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as dust collection equipment and spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with XI.D.3.a.(2) of this section (description of potential pollutant sources) and pollution prevention measures and controls identified in the plan in accordance with XI.D.3.a.(3) of this section (measures and controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case later than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in

compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.D.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations*. In addition to the numeric effluent limitations listed in Part V.B. of this permit, discharges from areas where production of asphalt paving and roofing emulsions occurs may not exceed a TSS concentration of 23.0 mg/L of runoff for any 1 day, nor shall the average of daily values for 30 executive days exceed a TSS concentration of 15.0 mg/L of runoff. Oil and grease concentrations in storm water discharges from these areas may not exceed 15.0 mg/L of runoff for any 1 day, nor should the average daily values for 30 consecutive days exceed an oil and grease concentration of 10.0 mg/L of runoff. The pH of these discharges must be within the range of 6.0 to 9.0.

5. *Monitoring and Reporting Requirements*. a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with asphalt paving and roofing materials manufacturing facilities (including portable plants) must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Asphalt paving and roofing materials manufacturing facilities are required to monitor their storm water discharges for the pollutant of concern listed in Table D-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table D-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE D-1.—MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Total Suspended Solids .....	100 mg/L

(1) *Monitoring Periods.* Asphalt paving and roofing materials manufacturing facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a

sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table B-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and

estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements in part XI.D.5.c of this permit associated with effluent limitations.

b. *Reporting.* Permittees with asphalt paving and roofing materials manufacturing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report Form must be submitted per storm event completed. Signed copies of Discharge Monitoring

Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), asphalt paving and roofing materials manufacturing facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of evaluating storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the life of the permit.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time,

examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation on site with the results of the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

d. *Compliance Monitoring Requirements.* Permittees with facilities

that produce asphalt paving or roofing emulsions must monitor their storm water discharges associated with these activities for the presence of TSS, oil and grease, and for pH at least annually (one time per year). Facilities must report in accordance with 5.d.(2) (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Reporting.* Permittees with asphalt paving or roofing emulsion production facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the last day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit. For each outfall one Discharge monitoring form shall be submitted per storm event sampled.

(3) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (2) (above), permittees that discharge through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (3) (above).

*E. Storm Water Discharges Associated With Industrial Activity From Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing Facilities*

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges from the following activities: manufacturing flat, pressed, or blown glass or glass containers; manufacturing hydraulic cement; manufacturing clay products including tile and brick; manufacturing of pottery and porcelain electrical supplies; manufacturing concrete products; manufacturing gypsum products; nonclay refractories; and grinding or otherwise treating minerals and earths. This section generally includes the following types of manufacturing operations: flat glass, (SIC code 3211); glass containers, (SIC code 3221); pressed and blown glass, not elsewhere classified, (SIC code 3229); hydraulic cement, (SIC code 3241); brick and structural clay tile, (SIC code 3251); ceramic wall and floor tile, (SIC code 3253); clay refractories, (SIC code 3255); structural clay products not elsewhere classified (SIC code 3259); vitreous china table and kitchen articles (SIC code 3262); fine earthenware table and kitchen articles (SIC code 3263); porcelain electrical supplies, (SIC code 3264); pottery products, (SIC code 3269); concrete block and brick, (SIC code 3271); concrete products, except block and brick (SIC code 3272); ready-mix concrete, (SIC code 3273); gypsum products, (SIC code 3275); minerals and earths, ground or otherwise treated, (SIC code 3295); and nonclay refractories, (SIC code 3297).

Facilities engaged in the following activities are not eligible for coverage under this section: lime manufacturing (SIC 3274); cut stone and stone products (SIC 3281); abrasive products (SIC 3291); asbestos products (SIC 3292); mineral wool and mineral wool insulation products (SIC 3296).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other

monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. *Special Conditions. a. Prohibition of Non-storm Water Discharges.* The discharge of pavement washwaters are only authorized where the permittee has minimized the presence of spilled materials in accordance with part XI.E.3.a.(3).(a).(i) of this permit.

3. *Storm Water Pollution Prevention Plan Requirements. a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.E.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. Facilities shall also identify, on the site map, the location of any: bag house or other dust control device; recycle/sedimentation pond, clarifier or other device used for the treatment of process wastewater and

the areas that drain to the treatment device. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials.*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks.*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data.*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources.*—A narrative description of the potential

pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter [e.g., Total Suspended Solids (TSS), etc.] of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner.

(i) Facilities shall prevent or minimize the discharge of spilled cement, aggregate (including sand or gravel), kiln dust, fly ash, settled dust other significant materials in storm water from paved portions of the site that are exposed to storm water. Measures used to minimize the presence of these materials may include regular sweeping, or other equivalent measures. The plan shall indicate the frequency of sweeping or other measures. The frequency shall be determined based upon consideration of the amount of industrial activity occurring in the area and frequency of precipitation, but shall not be less than once per week when cement, aggregate, kiln dust or fly ash are being handled or otherwise processed in the area.

(ii) Facilities shall prevent the exposure of fine granular solids such as cement, fly ash, and kiln dust to storm water. Where practicable, these materials shall be stored in enclosed silos, hoppers or buildings, in covered areas, or under covering.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve routine inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of

pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility specified in the plan. The inspection frequency shall be specified in the plan based upon a consideration of the level of industrial activity at the facility, but shall be a minimum of once per month while the facility is in operation. The inspection shall take place while the facility is in operation and shall at a minimum include all of the following areas that are exposed to storm water at the site: material handling areas, above ground storage tanks, hoppers or silos, dust collection/containment systems, truck wash down and equipment cleaning areas. Tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, truck wash out procedures, equipment wash down procedures and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and

records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.E.3.a.(3)(g)(iii) (below).

Facilities engaged in production of ready-mix concrete, concrete block, brick or other products shall include in the certification a description of measures that insure that process waste water that results from washing of trucks, mixers, transport buckets, forms or other equipment are discharged in accordance with NPDES requirements or are recycled. Facilities with wash water recycle ponds shall include an estimate of the amount of rainfall (in inches) required to cause the recycle pond to overflow in a 24-hour period.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water

associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(i) *Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.E.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including but not limited to: material handling areas, above ground storage tanks, hoppers or silos, dust collection/containment systems, truck wash down and

equipment cleaning areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures such as recycle ponds, identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.E.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.E.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.E.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

In addition to the numeric effluent limitations described by Part V.B, the following limitations shall be met by existing and new dischargers.

a. *Cement Manufacturing Facility, Material Storage Runoff*. Any discharge composed of runoff that derives from the storage of materials including raw materials, intermediate products, finished products, and waste materials that are used in or derived from the manufacture of cement shall not exceed a maximum concentration for any time of 50 mg/L Total Suspended Solids (TSS) nor the 6.0 to 9.0 range limitation for pH. Runoff from the storage piles shall not be diluted with other storm water runoff or flows to meet this limitation. Any untreated overflow from facilities designed, constructed and operated to treat the volume of material storage pile runoff that is associated with a 10-year, 24-hour rainfall event shall not be subject to the TSS or pH limitations. Dischargers subject to these numeric effluent limitations must be in compliance with these limits upon commencement of coverage and for the entire term of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees that manufacture clay products and concrete products and gypsum products must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year during years 2 and 4) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification).

Clay product manufacturers include; brick and structural clay tile manufacturers (SIC 3251), ceramic wall and floor tile manufacturers (SIC 3253), clay refractories (SIC 3255), manufacturers of structural clay products, not elsewhere classified (SIC 3259), manufacturers of vitreous china table and kitchen articles (SIC 3232), manufacturers of fine earthenware table and kitchen articles (SIC 3263), manufacturers of porcelain electrical supplies (SIC 3264), pottery products (SIC 3269) and non-clay refractories (3297). Facilities with these industrial activities must monitor for the pollutant listed in Table E-1.

Concrete and gypsum product manufacturers include concrete block and brick manufacturers (SIC 3271), concrete products manufacturers (SIC 3272), ready mix concrete manufacturers (SIC 3273), gypsum

product manufacturers (SIC 3275) and manufacturers of mineral and earth products (SIC 3295). Facilities with these industrial activities must monitor for the pollutant listed in Table E-2.

Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Tables E-1 and E-2 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE E-1.—MONITORING REQUIREMENTS FOR CLAY PRODUCT MANUFACTURERS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Aluminum .....	0.75 mg/L

TABLE E-2.—MONITORING REQUIREMENTS FOR CONCRETE AND GYPSUM PRODUCT MANUFACTURERS

Pollutants of concern	Monitoring cut-off concentration
Total Suspended Solids (TSS) ...	100 mg/L
Total Recoverable Iron .....	1.0 mg/L

(1) *Monitoring Periods.* Facilities subject to analytical monitoring requirements described in part XI.E.5.a, shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the

collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table E-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that

collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on pollutant by pollutant basis in lieu of monitoring reports required by paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required

up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations. EPA does not expect facilities to be able to exercise this certification for indicator parameters, such as TSS and BOD.

(b) *Reporting.* Permittees with monitoring requirements under Part XI.E.5.a. shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report Form must be submitted for each event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), facilities with monitoring requirements under Part XI.E.5.a. with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* Glass, clay, cement, concrete, and gypsum manufacturing facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination(s) must be made at least once in each of the following three-month periods: January through March, April through June, July through September, and October through

December. The examination shall be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of grab samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the evaluation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

d. *Compliance Monitoring Requirements.* Permittees with cement manufacturing facilities must monitor runoff from material storage for the presence of TSS and pH at least annually (one time per year). Facilities must report in accordance with 5.d.(2) below (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Reporting.* Permittees with material storage runoff from cement manufacturing facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit. For each outfall, one signed Discharge Monitoring Report form shall be submitted for each storm event sampled.

(3) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (2) (above), permittees with discharges of material storage runoff from cement manufacturing facilities through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph 5.d.(3) (above).

*F. Storm Water Discharges Associated With Industrial Activity From Primary Metals Facilities*

1. Discharges Covered Under This Section

The requirements listed under this section of today's permit shall apply to storm water discharges from the primary metal industry, which includes the following types of facilities:

a. Steel works, blast furnaces, and rolling and finishing mills including: steel wiredrawing and steel nails and spikes; cold-rolled steel sheet, strip, and bars; and steel pipes and tubes (SIC code 331).

b. Iron and steel foundries, including: gray and ductile iron, malleable iron, steel investment, and steel foundries not elsewhere classified (SIC code 332).

c. Primary smelting and refining of nonferrous metals, including: primary smelting and refining of copper, and primary production of aluminum (SIC code 333).

d. Secondary smelting and refining of nonferrous metals (SIC code 334).

e. Rolling, drawing, and extruding of nonferrous metals, including: rolling, drawing, and extruding of copper; rolling, drawing, and extruding of nonferrous metals, except copper and aluminum; and drawing and insulating of nonferrous wire (SIC code 335).

f. Nonferrous foundries (castings), including: aluminum die-castings,

nonferrous die-castings, except aluminum, aluminum foundries, copper foundries, and nonferrous foundries, except copper and aluminum (SIC code 336).

g. Miscellaneous primary metal products, not elsewhere classified, including: metal heat treating, and primary metal products, not elsewhere classified (SIC code 339).

Activities covered include, but are not limited to, storm water discharges associated with coking operations, sintering plants, blast furnaces, smelting operations, rolling mills, casting operations, heat treating, extruding, drawing, or forging of all types of ferrous and nonferrous metals, scrap, and ore.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Special Conditions

a. *Prohibition of Non-storm Water Discharges.* There are no additional requirements beyond those described in Part III.A.2. of this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a

description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.F.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes such as spent solvents or baths, sand, slag or dross, liquid storage tanks or drums, processing areas including pollution control equipment such as baghouses, and storage areas of raw materials such as coal, coke, scrap, sand, fluxes, refractories, or metal in any form. The map shall also indicate areas of the facility where accumulation of significant amounts of particulate matter from operations such as furnace or oven emissions or losses from coal/coke handling operations, etc., is likely, and could result in a discharge of pollutants to waters of the United States. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. This description should also include areas with the potential for deposition of particulate matter from process air emissions or losses during material handling activities. The description shall be updated whenever there is a significant change in the type or quantity of exposed materials, or material management practices, that may affect the exposure of materials to storm water.

*(c) Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes occurring indoors or out, with or without pollution control equipment in place to trap particulates; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source,

any pollutant or pollutant parameter (e.g., chemical oxygen demand, oil and grease, copper, lead, zinc, etc.) of concern, shall be identified.

*(3) Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

*(a) Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. The pollution prevention plan should consider implementation of the following measures, or equivalent measures, where applicable.

*(i)* Establish a cleaning or maintenance program for all impervious areas of the facility where particulate matter, dust, or debris may accumulate, particularly areas of material loading/unloading, material storage and handling, and processing.

*(ii)* Pave areas of vehicle traffic or material storage where vegetative or other stabilization methods are not practical. Institute sweeping programs in these areas as well.

*(iii)* For unstabilized areas of the facility where sweeping is not practical, storm water management devices such as sediment traps, vegetative buffer strips, filter fabric fence, sediment filtering boom, gravel outlet protection, or other equivalent measures, that effectively trap or remove sediment should be considered.

*(b) Source Controls*—The permittee shall consider preventive measures to minimize the potential exposure of all significant materials (as described in Part XI.F.3.a.(3) of this section) to precipitation and storm water runoff. The permittee should consider the implementation of the following measures, or equivalent measures, to reduce the exposure of all materials to storm water:

*(i)* Relocating all materials, including raw materials, intermediate products, material handling equipment, obsolete equipment, and wastes currently stored outside to inside locations.

*(ii)* Establishment of a schedule for removal of wastes and obsolete equipment to minimize the volume of these materials stored onsite that may be exposed to storm water.

*(iii)* Substitution of less hazardous materials, or materials less likely to contaminate storm water, or substitution of recyclable materials for nonrecyclables wherever possible.

*(iv)* Constructing permanent or semipermanent covers, or other similar forms of protection over stockpiled materials, material handling and processing equipment. Options include roofs, tarps, and covers. This may also include the use of containment bins or covered dumpsters for raw materials, waste materials and nonrecyclable waste materials.

*(v)* Dikes, berms, curbs, trenches, or other equivalent measures to divert runoff from material storage, processing, or waste disposal areas.

*(c) Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

*(i)* A schedule for inspection and maintenance of all particulate emissions control equipment should be established to ensure proper operation. Inspections should be conducted as described in Section XI.F.3.a.(3)(e) below. Detection of any leaks or defects that could lead to excessive emissions shall be repaired as soon as practicable. Where significant settling or deposition from process emissions are observed during proper operation of existing equipment, the permittee shall consider ways to reduce these emissions including but not limited to: upgrading or replacing existing equipment; collecting runoff from areas of deposition for treatment or recycling; or changes in materials or processes to reduce the generation of particulate matter.

*(ii)* Structural Best Management Practices (BMPs) will be visually inspected for signs of washout, excessive sedimentation, deterioration, damage, or overflowing, and shall be repaired or maintained as soon as practicable.

*(d) Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges may occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage

requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(e) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals, but no less frequently than once during each of the following periods: January through March; April through June; July through September; and October through December. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. Inspections shall be conducted on a quarterly basis and address, at a minimum, the following areas where applicable:

(i) Air pollution control equipment such as baghouses, electrostatic precipitators, scrubbers, and cyclones, should be inspected on a routine basis for any signs of disrepair such as leaks, corrosion, or improper operation that could limit their efficiency and lead to excessive emissions. The permittee should consider monitoring air flow at inlets and outlets, or equivalent measures, to check for leaks or blockage in ducts. Visual inspections shall be made for corrosion, leaks, or signs of particulate deposition or visible emissions that could indicate leaks.

(ii) All process or material handling equipment such as conveyors, cranes, and vehicles should be inspected for leaks, drips, etc. or for the potential loss of materials.

(iii) Material storage areas such as piles, bins or hoppers for storing coke, coal, scrap, or slag, as well as chemicals stored in tanks or drums, should be examined for signs of material losses due to wind or storm water runoff.

(f) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(g) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other

information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(h) *Non-storm Water Discharges.*

(i) *Certification.* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.F.3.a.(3)(h)(iii) (below).

(ii) *Exceptions.* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the

presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(i) *Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. The plan shall also contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.F.3.a.(2) of this section (Description of Potential Pollutant Sources) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices or other equivalent measures.

(i) *Management of Runoff*—Facilities shall consider implementation of the following storm water management practices or other equivalent measures to address pollutants of concern:

(i) Vegetative buffer strips, filter fabric fence, sediment filtering boom, or other equivalent measures, that effectively trap or remove sediment prior to discharge through an inlet or catch basin.

(ii) Media filtration such as catch basin filters and sand filters.

(iii) Oil/water separators or the equivalent.

(iv) Structural BMPs such as settling basins, sediment traps, retention or detention ponds, recycling ponds or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at

appropriate intervals specified in the plan but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity such as material storage and handling, loading and unloading, process activities, and plant yards shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, other structural pollution prevention measures identified in the plan, as well as process related pollution control equipment shall be observed or tested to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.F.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.F.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.F.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(e), the compliance evaluation may be

conducted in place of one such inspection.

4. Numeric Effluent Limitations

There are no additional effluent limitations beyond those described in Part V.B. of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with primary metals facilities identified by SIC codes 331, 332, 335, and 336 must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year during the second and fourth year of coverage) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Primary metals facilities are required to monitor their storm water discharges for the pollutants of concern listed in Tables F-1, F-2, F-3, and F-4 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Tables F-1 through F-4 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE F-1.—STEEL WORKS, BLAST FURNACES, AND ROLLING AND FINISHING MILLS (SIC 331) MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Aluminum .	0.75 mg/L
Total Recoverable Zinc .....	0.065 mg/L

TABLE F-2.—IRON AND STEEL FOUNDRIES (SIC 332) MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Aluminum .	0.75 mg/L

TABLE F-2.—IRON AND STEEL FOUNDRIES (SIC 332) MONITORING REQUIREMENTS—Continued

Pollutants of concern	Monitoring cut-off concentration
Total Suspended Solids .....	100 mg/L
Total Recoverable Copper .....	0.0636 mg/L
Total Recoverable Iron .....	1 mg/L
Total Recoverable Zinc .....	0.065 mg/L

TABLE F-3.—ROLLING, DRAWING, AND EXTRUDING OF NON-FERROUS METALS (SIC 335) MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Copper .....	0.0636 mg/L
Total Recoverable Zinc .....	0.065 mg/L

TABLE F-4.—NON-FERROUS FOUNDRIES (SIC 336) MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Copper .....	0.0636 mg/L
Total Recoverable Zinc .....	0.065 mg/L

(1) *Monitoring Periods.* Primary metals facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why

a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table F-1 under the column Monitoring Cutoff Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities

within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. The certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting.* Permittees with primary metals facilities shall submit monitoring results for each outfall associated with

industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one Discharge Monitoring Report Form must be submitted per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), primary metals facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snow melt begins discharging. The examinations shall

document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan, a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions that may prohibit the collection of samples include

weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *G. Storm Water Discharges Associated With Industrial Activity From Metal Mining (Ore Mining and Dressing) Facilities*

##### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges from active and inactive metal mining and ore dressing facilities (Standard Industrial Classification (SIC) Major Group 10) if the storm water has come into contact with, or is contaminated by, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of the operation. SIC Major Group 10 includes establishments primarily engaged in mining, developing mines, or exploring for metallic minerals (ores) and also includes all ore dressing and beneficiating operations, whether performed at mills operated in conjunction with the mines served or at mills, such as custom mills, operated separately. For the purposes of this part of the permit, the term "metal mining" includes all ore mining and/or dressing and beneficiating operations, whether performed at mills operated in conjunction with the mines served or at mills, such as custom mills, operated separately. All storm water discharges from inactive metal mining facilities and the storm water discharges from the following areas of active, and temporarily inactive, metal mining facilities are the only discharges covered by this section of the permit: topsoil piles; offsite haul/access roads if off active area; onsite haul roads if not constructed of waste rock or if spent ore and mine water is not used for dust control; runoff from tailings dams/dikes when not constructed of waste rock/tailings and no process fluids are

present; concentration building, if no contact with material piles; mill site, if no contact with material piles; chemical storage area; docking facility, if no excessive contact with waste product; explosive storage; reclaimed areas released from reclamation bonds prior to December 17, 1990; and partially/inadequately reclaimed areas or areas not released from reclamation bonds.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*a. Limitations on Coverage.* The following storm water discharges associated with industrial activity are not authorized by this permit:

(1) Discharges from active metal mining facilities that are subject to the effluent limitation guidelines for the Ore Mining and Dressing Point Source Point Source Category (40 CFR Part 440). Coverage under this permit does not include adit drainage or contaminated springs or seeps at active facilities, temporarily inactive facilities, or inactive facilities. Also see Limitations on Coverage, Part I.B.3.

(2) Storm water discharges associated with an industrial activity that the Director (EPA) has determined to be, or may reasonably be expected to be, contributing to a violation of a water quality standard.

(3) Storm water discharges associated with industrial activity from inactive mining operations occurring on Federal lands where an operator cannot be identified.

##### 2. Special Definitions

The following definitions are only for this section of today's permit and are not intended to supersede the definitions of active and inactive mining facilities established by 40 CFR 122.26(b)(14)(iii):

"Active Metal Mining Facility" is a place where work or other related activity to the extraction, removal, or recovery of metal ore is being

conducted. With respect to surface mines, an "active metal mining facility" does not include any area of land on or in which grading has been completed to return the earth to a desired contour and reclamation work has begun.

"Inactive Metal Mining Facility" means a site or portion of a site where metal mining and/or milling activities occurred in the past but is not an active metal mining facility, as defined in this permit and that portion of the facility does not have an active mining permit issued by the applicable (federal or state) governmental agency.

"Temporarily Inactive Metal Mining Facility" means a site or portion of a site where metal mining and/or milling activities occurred in the past, but currently are not being actively undertaken, and the facility has an active mining permit issued by the applicable (federal or state) government agency that authorizes mining at the site.

### 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan for Active and Temporarily Inactive Metal Mining Facilities.* The plan shall include, at a minimum, the following items:

*(1) Pollution Prevention Team.*

Identification of a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

*(2) Description of Mining Activities.* A description of the mining and associated activities taking place at the site that affect or may affect storm water runoff intended to be covered by this permit. The description shall report the total acreage within the mine site, an estimate of the number of acres of disturbed land and an estimate of the total amount of land proposed to be disturbed throughout the life of the mine. A general description of the location of the mining site relative to major transportation routes and communities shall also be provided.

*(3) Description of Potential Pollutant Sources.* A description of potential sources that may reasonably be expected to add significant amounts of pollutants (including sediment) to storm water discharges or that may result in the discharge of pollutants during dry

weather. Each description shall identify all activities and significant materials that may potentially be significant storm water pollutant sources from the active mining activity (see Part XI.G.1.), including, at a minimum:

*(a) Drainage.*

*(i)* A site topographic map that indicates, at a minimum: mining/milling site boundaries and access and haul roads; the location of each storm water outfall and an outline of the portions of the drainage area that are within the facility boundaries; equipment storage, fueling and maintenance areas; materials handling areas; storage areas for chemicals and explosives; areas used for storage of overburden, materials, soils or wastes; location of mine drainage (where water leaves mine) or any other process water; tailings piles/ponds, both proposed and existing; heap leach pads; points of discharge from the property for mine drainage or any other process water; springs, streams, wetlands and other surface waters; and boundary of tributary areas that are subject to effluent limitations guidelines. In addition, the map must indicate the types of discharges contained in the drainage areas of the outfalls.

*(ii)* Prediction of the direction of flow, and identification of the types of pollutants (e.g., heavy metals, sediment) that are likely to be present in storm water discharges associated with industrial activity, for each area of the mine/mill site that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants. Factors to consider include the mineralogy of the ore and waste rock (e.g., acid forming), toxicity and quantity of chemical(s) used, produced or discharged; the likelihood of contact with storm water; vegetation on site if any, and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation for each storm water outfall that may be covered under this permit (see Part XI.G.1.). Such inventory shall include a narrative description of: significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management

practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water, and material management practices employed that were listed for the facility in the approved group application.

A summary of any existing ore or waste rock/overburden characterization data, including results of testing for acid rock generation potential. If the ore or waste rock/overburden characterization data is updated due to a change in the ore type being mined, the storm water pollution prevention plan shall be updated with the new data.

*(c) Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities associated with metal mining: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., heavy metals, etc.) of concern shall be identified.

*(4) Measures and Controls.* A description of storm water management controls appropriate for the facility, and procedures for implementing such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management

controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping such as maintenance in a clean, orderly manner of areas that may contribute pollutants to storm water discharges. (For suggested measures for vehicle maintenance operations, see good housekeeping measures specified in Part XI.P. for transportation facilities.)

(b) *Preventive Maintenance*—A narrative describing the program for timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspection and testing of facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Particular attention shall be given to erosion control and sediment control systems and devices.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges, and their accompanying drainage points. The description area shall include, where appropriate, specific material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered; procedures for cleaning up spills and the method for making these plans and the necessary equipment to implement a clean up available to the appropriate personnel.

(d) *Inspections*—Provisions for qualified personnel to inspect designated equipment and mine areas at least on a monthly basis for active sites. The monthly inspections can be done at any time during the month and do not have to be done immediately following a precipitation event. For temporarily inactive sites, the inspections should be quarterly; however, inspections are not required when adverse weather conditions (e.g., snow) make the site inaccessible. All material handling areas shall be inspected for evidence of, or the potential for, pollutants entering the drainage system. Erosion control systems and sediment control devices shall also be inspected to determine if they are working properly. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the facility is encouraged.

(e) *Employee Training*—Outlines of employee training programs that inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, and material management practices. The pollution prevention plan shall specify how often training shall take place, but in all cases training must be held at least annually (once per calendar year).

(f) *Recordkeeping and Internal Reporting Procedures*—Descriptions of incidents (such as spills, major storm events, or other discharges), as well as information describing the quality and quantity of storm water discharges. Inspections, maintenance activities, and training sessions shall also be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) A certification that any discharge has been tested or evaluated for the presence of non-storm water discharges, such as seeps or adit discharges or discharges subject to effluent limitation guidelines (e.g., 40 CFR Part 440), such as mine drainage or process water of any kind. The certification shall include the identification of potential significant sources of non-storm water or water subject to effluent limitation guidelines at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.G.3.a.(4)(g)(iii) (below).

Alternatively, the plan may include a certification that any non-storm water discharge that mixes with storm water is

subject to a separate NPDES permit that applies applicable effluent limitations prior to the mixing of non-storm water and storm water. In such cases, the certification shall identify the non-storm water discharge(s), the applicable NPDES permit(s), the effluent limitations placed on the non-storm water discharge by the NPDES permit(s), and the point(s) at which the limitations are applied.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—Identification of areas that, due to topography, activities, or other factors, have a high potential for significant erosion of soil and/or other materials, and measures to be used to limit erosion and/or remove sediment from storm water runoff. The measures to consider include diversion of flow away from areas susceptible to erosion (such as interceptor dikes and swales; diversion dikes curbs and berms; pipe slope drains; subsurface drains; and drainage/storm water conveyance systems [channels or gutters; open top box culverts, and waterbars; rolling dips and road sloping; roadway surface water deflector; and culverts]), stabilization methods to prevent or minimize erosion (such as temporary or permanent seeding; vegetative buffer strips; protection of trees; topsoiling; soil

conditioning; contouring; mulching; geotextiles [matting; netting; or blankets]; riprap; gabions; and retaining walls), and structural methods for controlling sediment (such as check dams; rock outlet protection; level spreaders; gradient terraces; straw bale barriers; silt fences; gravel or stone filter berms; brush barriers; sediment traps; grass swales; pipe slope drains; earth dikes; other controls such as entrance stabilization, waterway crossings or wind breaks; or other equivalent measures).

(i) *Management of Runoff*—A narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site and provisions for implementation and maintenance of measures that the permittee determines to be reasonable and appropriate. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.G.3.a.(3) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices, or impoundments.

(i) *Capping*—Where capping of a contaminant source is necessary, the source being capped and materials and procedures used to cap the contaminant source must be identified. In some cases, the elimination of a pollution source through capping contaminant sources may be the most effective control measure for discharges from inactive ore mining and dressing facilities.

(k) *Treatment*—A description of how storm water will be treated prior to discharging to waters of the United States if treatment of a storm water discharge is necessary. Storm water treatments include the following: chemical/physical treatment; oil/water separators; and artificial wetlands.

(5) *Comprehensive Site Compliance Evaluation*. Procedures for qualified personnel to conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less

than once a year. Such evaluations shall include:

(a) Visual inspections of areas contributing to a storm water discharge associated with industrial activity for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.G.3.a.(3) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.G.3.a.(4) of this section (Measures and Controls) shall be revised as appropriate within 30 days of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation unless additional time is authorized by the permit issuing authority.

(c) Preparation of a report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.G.3.a.(5)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.G.3.a.(4)(d), the compliance evaluation may be conducted in place of one such inspection.

b. *Contents of Plan for Inactive Metal Mining Facilities*. The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team*. Identification of a specific individual or individuals that are responsible for the development, implementation, maintenance, and revision of the storm water pollution prevention plan. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the storm water pollution prevention plan at the inactive facility.

(2) *Description of Mining Activities*. A description of the mining and associated activities that took place at the site. The description shall report the approximate dates of operation, the total acreage within the mine and/or processing site, an estimate of the number of acres of disturbed area, and the current activities (e.g., reclamation) that are taking place at the facility. A general description of the location of the mining site relative to major transportation routes and communities shall also be provided.

(3) *Description of Potential Pollutant Sources*. A description of potential sources that may reasonably be expected to add significant amounts of pollutants (including sediment) to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant storm water pollutant sources from the inactive mining site. Each description shall include, at a minimum:

(a) *Site Map*—A generalized site map or maps that depict any of the following that may be applicable: mining/milling site boundaries and access and haul roads; the location of each storm water outfall and an outline of the portions of the drainage area that are within the facility boundaries; areas used for storage of overburden, materials, soils, tailings, or wastes; areas used for outdoor manufacturing, storage, or disposal of materials; any remaining equipment storage, fueling, and maintenance areas; tailings piles/ponds; mine drainage or any other process water discharge points; an estimate of the direction(s) of flow; existing structural controls to reduce pollutants in storm water runoff; and springs, streams, wetlands, and other surface waters. The map must also indicate the types of discharges contained in the drainage areas of the outfalls.

(b) *Inventory of Exposed Materials*—An inventory and narrative description

for each outfall of any significant materials that may still be at the site. This description of sources should agree with sources identified on the map.

(c) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(d) *Risk Identification and Summary of Potential Pollutant Sources*—For each potential pollutant source at the site the pollutants of concern (e.g., heavy metals) shall be identified and an assessment made of the potential of these pollutant sources to contribute pollutants to storm water discharges.

(4) *Measures and Controls*. A description of storm water management controls appropriate for the facility, and procedures for implementing such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Storm Water Diversion*—Description of how and where storm water will be diverted away from potential pollutant sources to prevent storm water contamination. Storm water diversions may include the following: interceptor dikes and swales; diversion dikes curbs and berms; pipe slope drains; subsurface drains; drainage/storm water conveyance systems (channels or gutters; open top box culverts, and waterbars; rolling dips and road sloping; roadway surface water deflector; and culverts) or equivalent measures.

(b) *Sediment and Erosion Control*—Identification of areas that, due to topography, activities, or other factors, have a high potential for significant erosion of soil and/or other materials, and measures to be used to limit erosion and/or remove sediment from storm water runoff. The measures to consider include diversion of flow away from areas susceptible to erosion, stabilization methods to prevent or minimize erosion (such as temporary or permanent seeding; vegetative buffer strips; protection of trees; topsoiling; soil conditioning; contouring; mulching; geotextiles (matting; netting; or blankets); riprap; gabions; and retaining walls), structural methods for controlling sediment (such as check dams; rock outlet protection; level spreaders; gradient terraces; straw bale barriers; silt fences; gravel or stone filter berms; brush barriers; sediment traps;

grass swales; pipe slope drains; earth dikes; and other controls such as entrance stabilization, waterway crossings or wind breaks; or other equivalent measures).

(c) *Management of Runoff*—A narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site and provisions for implementation and maintenance of measures that the permittee determines to be reasonable and appropriate. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.G.3.b.(3) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls, snow management activities, infiltration devices, and wet detention/retention devices, or impoundments.

(d) *Capping*—Where capping of a contaminant source is necessary, the source being capped and materials and procedures used to cap the contaminant source must be identified. In some cases, the elimination of a pollution source through capping contaminant sources may be the most effective control measure for discharges from inactive ore mining and dressing facilities.

(e) *Treatment*—A description of how storm water will be treated prior to discharging to waters of the United States if treatment of a storm water discharge is necessary. Storm water treatments include the following: chemical/physical treatment; oil/water separators; artificial wetlands or other equivalent measures.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), as well as information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(5) *Comprehensive Site Compliance Evaluation*. Procedures for qualified personnel to conduct site compliance evaluations at appropriate intervals

specified in the plan, but, except as provided in paragraph XI.G.3.b.(5)(d) (below), in no case less than once a year. Such evaluations shall include:

(a) Visual inspection of areas contributing to a storm water discharge associated with industrial activity for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.G.3.a.(3) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.G.3.a.(4) of this section (Measures and Controls) shall be revised as appropriate within 30 days of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation unless additional time is authorized by the permit issuing authority.

(c) Preparation of a report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.G.3.b.(5)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where annual site compliance evaluations are shown in the plan to be impractical for inactive mining sites due to the remote location and inaccessibility of the site, site

evaluations required under this part shall be conducted at appropriate intervals specified in the plan, but, in no case less than once in 3 years.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

##### a. Analytical Monitoring

**Requirements.** During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], copper ore mining and dressing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Active copper ore mining and dressing facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table G-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table G-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE G-1.—MONITORING REQUIREMENTS FOR ACTIVE FACILITIES

Pollutants of concern	Monitoring cut-off concentration
Chemical Oxygen Demand (COD).	120 mg/L
Total Suspended Solids (TSS)	100 mg/L
Nitrate plus Nitrite Nitrogen ....	0.68 mg/L

(1) **Monitoring Periods.** Active copper ore mining and dressing facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) **Sample Type.** A minimum of one grab sample shall be taken. All such

samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

##### (3) Sampling Waiver.

(a) **Adverse Conditions**—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) **Low Concentration Waiver**—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table G-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of

the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(4) **Representative Discharge.** When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) **Alternative Certification.** A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of the monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under

paragraph *b.* below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

*b. Reporting.* Permittees with active copper ore mining and dressing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph *b.* (above), active ore mining and dressing facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph *b.* (above).

*c. Visual Examination of Storm Water Quality.* Mining facilities covered under this sector shall perform and document a visual examination of storm water discharges associated with industrial activity from each outfall, except discharges exempted below. The examination must be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event. Mining facilities must examine storm water quality at least once in each of the following

periods: January through March; April through June; July through September; and October through December.

(1) Examinations shall be made of grab samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to conduct one of the required visual

examinations during the required period as a result of adverse climatic conditions or inaccessibility, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *H. Storm Water Discharges Associated With Industrial Activity From Coal Mines and Coal Mining-Related Facilities*

##### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges from coal mining-related areas (SIC Major Group 12) if they are not subject to effluent limitations guidelines under 40 CFR Part 434.

*a. Coverage.* Storm water discharges from the following portions of coal mines may be eligible for this permit: haul roads (nonpublic roads on which coal or coal refuse is conveyed), access roads (nonpublic roads providing light vehicular traffic within the facility property and to public roadways), railroad spurs, sidings, and internal haulage lines (rail lines used for hauling coal within the facility property and to offsite commercial railroad lines or loading areas), conveyor belts, chutes, and aerial tramway haulage areas (areas under and around coal or refuse conveyor areas, including transfer stations), equipment storage and maintenance yards, coal handling buildings and structures, and inactive coal mines and related areas (abandoned and other inactive mines, refuse disposal sites and other mining-related areas on private lands).

When an industrial facility, described by the above coverage provisions of this

section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*b. Limitations.* Storm water discharges from inactive mining activities occurring on Federal lands where an operator cannot be identified are not eligible for coverage under this permit.

## 2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* In addition to the broad prohibition of non-storm water discharges of Part III.A.2. of the permit, point source discharges of pollutant seeps or underground drainage from inactive coal mines and refuse disposal areas that do not occur as storm water discharges in response to precipitation events are also excluded from coverage under this permit. In addition, floordrains from maintenance buildings and other similar drains in mining and preparation plant areas are prohibited.

## 3. Storm Water Pollution Prevention Plan Requirements

Most of the active coal mining-related areas, described in paragraph XI.H.1. above, are subject to sediment and erosion control regulations of the U.S. Office of Surface Mining (OSM) that enforces the Surface Mining Control and Reclamation Act (SMCRA). OSM has granted authority to most coal-producing states to implement SMCRA through State SMCRA regulations. All SMCRA requirements regarding control of erosion, siltation and other pollutants resulting from storm water runoff, including road dust resulting from erosion, shall be primary requirements of the pollution prevention plan and shall be included in the contents of the plan directly, or by reference. Where determined to be appropriate for protection of water quality, additional sedimentation and erosion controls may be warranted.

*a. Contents of Plan.* The plan shall include at a minimum, the following items:

*(1) Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

*(2) Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

### *Drainage.*

*(i)* A site map, such as a drainage map required for SMCRA permit applications, that indicate drainage areas and storm water outfalls. These shall include but not be limited to the following:

*(a)* Drainage direction and discharge points from all applicable mining-related areas described in Section XI.H.1.a. (discharges covered under this section) above, including culvert and sump discharges from roads and rail beds and also from equipment and maintenance areas subject to storm runoff of fuel, lubricants and other potentially harmful liquids.

*(b)* Location of each existing erosion and sedimentation control structure or other control measures for reducing pollutants in storm water runoff.

*(c)* Receiving streams or other surface water bodies.

*(d)* Locations exposed to precipitation that contain acidic spoil, refuse or unreclaimed disturbed areas.

*(e)* Locations where major spills or leaks of toxic or hazardous pollutants have occurred.

*(f)* Locations where liquid storage tanks containing potential pollutants, such as caustics, hydraulic fluids and lubricants, are exposed to precipitation.

*(g)* Locations where fueling stations, vehicle and equipment maintenance areas are exposed to precipitation.

*(h)* Locations at outfalls and the types of discharges contained in the drainage areas of the outfalls.

*(ii)* For each area of the facility that generates storm water discharges associated with the mining-related activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with the activity. Factors to consider include the toxicity of the pollutant; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

*(c) Spills and Leaks—*A list of significant spills and leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of any existing discharge sampling data describing pollutants in storm water discharges from the portions of the facility covered by this permit, including a summary of any sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: truck traffic on haul roads and resulting generation of sediment subject to runoff and dust generation; fuel or

other liquid storage; pressure lines containing slurry, hydraulic fluid or other potential harmful liquids; and loading or temporary storage of acidic refuse or spoil. Specific potential pollutants shall be identified, where known.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls.

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. These would be practices that would minimize the generation of pollutants at the source or before it would be necessary to employ sediment ponds or other control measures at the discharge outlets. Where applicable, such measures or other equivalent measures would include the following: sweepers and covered storage to minimize dust generation and storm runoff; conservation of vegetation where possible to minimize erosion; watering of haul roads to minimize dust generation; collection, removal, and proper disposal of waste oils and other fluids resulting from vehicle and equipment maintenance; or other equivalent measures.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Where applicable, such measures would include the following: removal and proper disposal of settled solids in catch basins to allow sufficient retention capacity; periodic replacement of siltation control measures subject to deterioration such as straw bales; inspections of storage tanks and pressure lines for fuels, lubricants, hydraulic fluid or slurry to prevent leaks due to deterioration or faulty connections; or other equivalent measures.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.H.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated areas of the facility at appropriate intervals specified in the plan. The following shall be included in the plan:

(i) *Active Mining-Related Areas and Those Inactive Areas Under SMCRA Bond Authority*—The plan shall require quarterly inspections by the facility personnel for areas of the facility covered by pollution prevention plan requirements. This inspection interval corresponds with the quarterly inspections for the entire facility required to be provided by SMCRA authority inspectors for all mining-related areas under SMCRA authority, including sediment and erosion control measures. Inspections by the facility representative may be done at the same time as the mandatory inspections performed by SMCRA inspectors. Records of inspections of the SMCRA authority facility representative shall be maintained.

(ii) *Inactive Mining-Related Areas Not Under SMCRA Bond.*—The plan shall require annual inspections by the facility representative except in situations referred to in paragraph XI.H.3.a.(4)(d) below.

(iii) *Inspection Records*—The plan shall require that inspection records of the facility representative and those of the SMCRA authority inspector shall be maintained. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan.

Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges) along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges such as drainage from underground portions of inactive mines or floor drains from maintenance or coal handling buildings. The certification shall include the identification of potential significant sources of non-storm water discharges at the site, a description of the results of any test and/or evaluation, a description of the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit.

(ii) Except for flows from fire fighting activities, authorized sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Any facility that is unable to provide the certification required (testing or other evaluation for non-storm water discharges) must notify the Director by [270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water to the storm discharge lines; and why adequate tests for such storm

discharge lines were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion and reduce sediment concentrations in storm water discharges. As indicated in paragraph XI.H.3.a.(3) above, SMCRA requirements regarding sediment and erosion control measures are primary requirements of the pollution prevention plan for mining-related areas subject to SMCRA authority. The following sediment and erosion control measures or other equivalent measures, should be included in the plan where reasonable and appropriate for all areas subject to storm water runoff:

(i) *Stabilization Measures*—Interim and permanent stabilization measures to minimize erosion and lessen amount of structural sediment control measures needed, including: mature vegetation preservation; temporary seeding; permanent seeding and planting; temporary mulching, matting, and netting; sod stabilization; vegetative buffer strips; temporary chemical mulch, soil binders, and soil palliatives; nonacidic roadsurfacing material; and protective trees.

(ii) *Structural Measures*—Structural measures to lessen erosion and reduce sediment discharges, including: silt fences; earth dikes; straw dikes; gradient terraces; drainage swales; sediment traps; pipe slope drains; porous rock check dams; sedimentation ponds; riprap channel protection; capping of contaminated sources; and physical/chemical treatment of storm water.

(i) *Management of Flow*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (other than those as sediment and erosion control measures listed above) used to manage storm water runoff in a manner that reduces pollutants in storm water runoff from the site. The plan shall provide that the measures, which the permittee determines to be reasonable and appropriate, shall be implemented and maintained. Appropriate measures may include: discharge diversions; drainage/storm water conveyances; runoff dispersion; sediment control and collection; vegetation/soil stabilization; capping of contaminated sources; treatment; or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with coal mining-related areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. These areas include haul and access roads; railroad spurs, sidings, and internal haulage lines; conveyor belts, chutes and aerial tramways; equipment storage and maintenance yards; coal handling buildings and structures; and inactive mines and related areas. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures, as indicated in paragraphs XI.H.3.a.(3)(h) and XI.H.3.a.(3)(i) above and where identified in the plan, shall be observed to ensure that they are operating correctly. A visual evaluation of any equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan, in accordance with paragraph XI.H.3.a.(2) of this section, and pollution prevention measures and controls identified in the plan, in accordance with paragraph XI.H.3.a.(3) of this section, shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner. For inactive mines, such revisions may be extended to a maximum of 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.H.3.a.(4)(b) above shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water

pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection. Where annual site compliance evaluations are shown in the plan to be impractical for inactive mining sites due to the remote location and inaccessibility of the site, site inspections required under this part shall be conducted at appropriate intervals specified in the plan, but, in no case less than once in 3 years.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with coal mining activities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Coal mining facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table H-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table H-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE H-1.—MONITORING REQUIREMENTS FOR COAL MINING FACILITIES

Pollutants of concern	Cut-off concentration (mg/L)
Total Recoverable Aluminum .....	0.75
Total Recoverable Iron .....	1.0
Total Suspended Solids .....	100

(1) *Monitoring Periods.* Coal mining facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next monitoring period and submit the data along with the data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel

(such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table H-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the

location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph b. below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph b. below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting.* Permittees shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of

Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.B.1. of the permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph *b.* (above), coal-mining related facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph *b.* (above).

*c. Visual Examination of Storm Water Quality.* Coal mining-related facilities shall perform and document a visual examination of a representative storm water discharge at the following frequencies: quarterly for active areas under SMCRA bond located in areas with average annual precipitation over 20 inches; semi-annually for inactive areas under SMCRA bond, and active areas under SMCRA bond located in areas with average annual precipitation of 20 inches or less; visual examinations are not required at inactive areas not under SMCRA bond.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water runoff or snow melt: Quarterly—January through March; April through June; July through September; and October through December. Semi-annually—January through June and July through December.

(2) Examinations shall be made of samples collected within the first 60 minutes (or as soon thereafter as practical, but not to exceed two hours) of when the runoff or snow melt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual will carry out the collection and examination of discharges for the life of the permit.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual

examinations during a qualifying event is not feasible.

### *I. Storm Water Discharges Associated With Industrial Activity From Oil and Gas Extraction Facilities*

#### 1. Discharges Covered Under This Section

*a. Coverage.* This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from oil and gas facilities listed under Standard Industrial Classification (SIC) Major Group 13 which are required to be permitted under 40 CFR 122.26. These include “\* \* \* oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with any overburden raw material, intermediate products, finished products, by-products or waste products located on the site of such operations.” Contaminated storm water discharges from petroleum refining or drilling operations that are subject to nationally established BAT or BPT guidelines found at 40 CFR 419 and 435 respectively are not included. Industries in SIC Major Group 13 include the extraction and production of crude oil, natural gas, oil sands and shale; the production of hydrocarbon liquids and natural gas from coal; and associated oil field service, supply and repair industries.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*b. Limitations.* Storm water discharges associated with industrial activity from inactive oil and gas operations occurring on Federal lands where an operator cannot be identified are not covered by this permit.

## 2. Special Conditions

There are no additional requirements beyond those listed in Part III. of this permit.

## 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

### (a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part IX.I.3.a.(1)(c) (Spills and Leaks) of this permit have occurred, location of any areas where RQ releases have occurred; and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas, chemical mixing areas, construction and drilling areas. The site map will indicate all areas subject to the effluent guidelines requirement of "No Discharge" in accordance with 40 CFR 435.32 and the

existing structural controls to achieve compliance with the "No Discharge" requirement. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. The permittee should consider the cause of RQ releases, the materials used to contain and remediate releases, and any other aspect of releases or clean-up which could potentially contribute pollutants to a storm water discharge. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data

describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; chemical, cement, mud or gel mixing activities; outdoor manufacturing or processing activities; drilling or mining activities; significant dust or particulate generating processes; and onsite waste disposal practices, equipment cleaning and rehabilitation activities. List any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

In its description of potential pollutant sources, a facility must include information about the RQ release which triggered the permit application requirements. Such information must include: the nature of the release (e.g., spill of oil from a drum storage area); the amount of oil or hazardous substance released; amount of substance recovered; date of the release; cause of the release (e.g., poor handling techniques as well as lack of containment in area); area affected by release, including land and waters; procedure to cleanup release; actions or procedures implemented to prevent or better respond to a release; and remaining potential contamination of storm water from release. The analysis shall take into account human health risks, the control of drinking water intakes, and the designated uses of the receiving stream.

(3) *Measures and Controls.* Each facility covered by this permit shall develop and implement storm water management controls appropriate for the facility. The controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such measures:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility

equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. The preventative maintenance program shall also include the inspection of all on site and off site mixing tanks and equipment, and all vehicles which carry supplies and chemicals to oil field activities.

*(c) Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Materials shall be stored indoors where possible, and drainage systems designed to discharge downstream from drinking water intakes. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

*(d) Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.I.3.a.(4) of this section, qualified facility or plant personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. All equipment and areas addressed in the pollution prevention plan shall be inspected at a minimum of 6-month intervals. Equipment and vehicles which store, mix or transport hazardous materials will be inspected routinely, but not less than quarterly. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

*(e) Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

*(f) Recordkeeping and Internal Reporting Procedures*—A description of

incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. All records shall be kept for a period of not less than 3 years.

*(g) Non-storm Water Discharges*

*(i)* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.I.a.(3)(g)(iii) (below).

*(ii)* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

*(iii) Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an

NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

*(h) Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. Unless covered by the General Permit for Construction Activity (57 FR 41209), the additional erosion control requirement for well drillings oil, sand, and shale mining areas are as follows:

*(i) Site Description*—Each plan shall provide a description of the following: (1) A description of the nature of the exploration activity; (2) estimates of the total area of the site and the area of the site that is expected to be disturbed due to the exploration activity; (3) an estimate of the runoff coefficient of the site; (4) a site map indicating drainage patterns and approximate slopes, the location of major control structures identified in the plan, and surface waters; and (5) the name of the receiving water(s) and the ultimate receiving water(s) of the runoff.

*(ii) Controls*—The pollution prevention plan shall include a description of controls appropriate for the activity and implement such controls. The description of controls shall address the following minimum components:

*(a)* A description of vegetative practices designed to preserve existing vegetation where attainable and revegetate open areas as soon as practicable after grade drilling. Such practices may include: temporary seeding, permanent seeding, mulching, sod stabilization, vegetative buffer strips, protection of trees, or other equivalent measures. The operator shall initiate appropriate vegetative practices on all disturbed areas within 14 calendar days of the last activity at that area.

*(b)* A description of structural practices that, to the degree attainable, divert flows from exposed soils, store flows or otherwise limit runoff from exposed areas of the site. Such practices

may include straw bale dikes, silt fences, earth dikes, brush barriers, drainage swales, check dams, subsurface drain, pipe slope drain, level spreaders storm drain inlet protection, rock outlet protection, sediment traps, temporary sediment basins, or other equivalent measures.

(iii) Offsite vehicle tracking of sediments shall be minimized.

(iv) Procedures in a plan shall provide that all erosion controls on the site are inspected at least once every 7 calendar days. Weekly inspections are necessary to ensure erosion controls continue to effectively reduce the amount of sediment carried offsite. A silt fence or silt trap is no longer effective when filled with silt.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide the measures that the permittee determines to be reasonable and appropriate which shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, wet detention/retention devices, or other equivalent measures.

(j) *Reportable Quantity (RQ) Release*—The permittee must describe the measures taken to clean up RQ releases or related spills of materials, as well as measures proposed to avoid future releases of RQs. Such measures may include, among others: Improved handling or storage techniques; containment around handling areas of liquid materials; and use of improved spill cleanup materials and techniques.

(k) *Vehicle and Equipment Storage Areas*—The storage of vehicles and equipment awaiting or having completed maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility may consider the use of drip pans under vehicles and equipment,

indoor storage of the vehicles and equipment, installation of berming and diking of this area, or other equivalent measures.

(l) *Vehicle and Equipment Cleaning and Maintenance Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment cleaning. The facility may consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to a sanitary sewer, and/or collecting the storm water runoff from the cleaning area and providing treatment or recycling. The discharge of vehicle and equipment wash waters, including tank cleaning operations, are not authorized by this permit and must be authorized under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment maintenance and rehabilitation. The facility may consider performing all maintenance activities indoors, using drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, collecting the storm water runoff from the maintenance area and providing treatment or recycling, or other equivalent measures.

(m) *Materials and Chemical Storage Areas*—Storage units of all chemicals and materials (e.g., fuels, oils, used filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids, detergents drilling mud components, acids, organic additives) must be maintained in good condition so as to prevent contamination of storm water. Hazardous materials must be plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility may consider indoor storage of the materials and/or installation of berming and diking at the area.

(n) *Chemical Mixing Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from chemical mixing areas. The facility may consider covering the mixing area, using spill and overflow protection, minimizing runoff of storm water to the mixing area, using dry cleanup methods, and/or

collecting the storm water runoff and providing treatment or recycling. The facility may consider installation of berming and diking of the area.

*Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (e.g., materials and chemical storage areas, vehicle and equipment cleaning and maintenance areas, vehicle and equipment storage areas, chemical mixing areas, and areas of materials handling at the drill site areas) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.I.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.I.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, and major observations relating to the implementation of the storm water pollution prevention plan the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in

accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional requirements beyond those listed in Part V.B. of this permit.

#### 5. Monitoring and Reporting Requirements

##### a. Monitoring Requirements

(1) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination(s) must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water

discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(f) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### J. Storm Water Discharges Associated With Industrial Activity From Mineral Mining and Processing Facilities

##### 1. Discharges Covered Under This Section

This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from active and inactive mineral mining and processing facilities (generally identified by Standard Industrial Classification (SIC) Major Group 14), except for storm water discharges identified under paragraph XI.J.1.a.

This permit may authorize storm water discharges associated with industrial activity that are mixed with storm water discharges associated with industrial activity from construction activities, provided that the storm water discharge from the construction activity is in compliance with the terms, including applicable Notice of Intent (NOI) or application requirements, of a different NPDES general permit or individual permit authorizing such discharges.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

a. *Limitations on Coverage.* The following storm water discharges associated with industrial activity are not authorized by this permit:

(1) Storm water discharges associated with industrial activity which are subject to an existing effluent limitation guideline (40 CFR Part 436), except mine dewatering discharges composed entirely of storm water or ground water seepage from construction sand and gravel, industrial sand, and crushed stone mining facilities located in Region VI (the States of Louisiana, New Mexico, Oklahoma, and Texas) and Arizona.

(2) Storm water discharges associated with industrial activity from inactive mineral mining activities occurring on Federal lands where an operator cannot

be identified are not eligible for coverage under this permit.

## 2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* This section of today's permit does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater. Part III.A.2 of today's permit does allow certain non-storm water discharges to be covered by this permit.

## 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include at a minimum, the following items:

*(1) Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

*(2) Description of Potential Pollutant Sources.* Each storm water pollution prevention plan must describe industrial activities, significant materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows and mine pumpout. Plans must describe the following elements:

*(a) Drainage*—The plan must contain a map of the site that shows the pattern of storm water drainage, structural or nonstructural features that control pollutants in storm water runoff and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. The map also must show areas where the following activities take place: fueling, vehicle and equipment maintenance and/or cleaning, loading and unloading, material storage (including tanks or other vessels used for liquid or waste storage), material processing, and waste disposal, haul roads, access roads, and rail spurs. In addition, the map must indicate the outfall locations and the types of

discharges contained in the drainage areas of the outfalls.

*(b) Inventory of Exposed Materials*—Facility operators are required to carefully conduct an inspection of the site and related records to identify significant materials that are or may be exposed to storm water. The inventory must address materials that within 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls that limit process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

*(c) Significant Spills and Leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

*(d) Sampling Data*—Any existing data on the quality or quantity of storm water discharges from the facility must be described in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

*(e) Risk Identification and Summary of Potential Pollutant Sources*—The description of potential pollution sources culminates in a narrative

assessment of the risk potential that sources of pollution pose to storm water quality. This assessment should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such industrial activities, significant materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: loading and unloading operations; outdoor storage activities; outdoor processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The assessment must list any significant pollution sources at the site and identify the pollutant parameter or parameters (i.e., total suspended solids, total dissolved solids, etc.) associated with each source.

*(3) Measures and Controls.* Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, best management practices (BMPs), and other controls that will be implemented at the facility. The permittee must assess the applicability of the following BMPs for their site: discharge diversions, drainage/storm water conveyance systems, runoff dispersions, sediment control and collection mechanisms, vegetation/soil stabilization, and capping of contaminated sources. In addition, BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

The pollution prevention plan must discuss the reasons each selected control or practice is appropriate for the facility and how each will address the potential sources of storm water pollution. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems.

*(a) Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner.

*(b) Preventive Maintenance*—The maintenance program requires periodic

removal of debris from discharge diversions and conveyance systems. These activities should be conducted in the spring, after snowmelt, and during the fall season. Permittees using ponds to control their effluents frequently use impoundments or sedimentation ponds as their BAT/BCT. Maintenance schedules for these ponds must be provided in the pollution prevention plan.

*(c) Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

*(d) Inspections*—Operators of active facilities are required to conduct quarterly visual inspections of all BMPs. Temporarily and permanently inactive operations are required to perform annual inspections. The inspections shall include: (1) An assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; (2) visual inspections of vegetative BMPs, serrated slopes, and benched slopes to determine if soil erosion has occurred; and (3) visual inspections of material handling and storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

The inspection must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to produce a runoff event. Inspections shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: January through March (storm water runoff or snow melt); April through June (storm water runoff); July through September (storm water runoff); October through December (storm water runoff or snow melt).

*(e) Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the

components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

*(f) Recordkeeping and Internal Reporting Procedures*—A description of incidents such as spills or other discharges along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. The permittee must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be recorded and the date of their corrective action noted.

*(g) Non-storm Water Discharges*

*(i)* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.J.3.a.(g)(iii) (Failure to Certify) of this permit.

*(ii)* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

*(iii) Failure to Certify*.—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe the procedure of any test conducted for the presence of non-storm water discharges to the storm sewer and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful and must be terminated.

*(h) Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

Permittees must indicate the location and design for proposed BMPs to be implemented prior to land disturbance activities. For sites already disturbed but without BMPs, the permittee must indicate the location and design of BMPs that will be implemented. The permittee is required to indicate plans for grading, contouring, stabilization, and establishment of vegetative cover for all disturbed areas, including road banks. Reclamation activities must continue until final closure notice has been issued.

*(i) Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.J.3.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of

collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, wet detention/retention devices, or equivalent measures. In addition, the permittee must describe the storm water pollutant source area or activity (i.e., loading and unloading operations, raw material storage piles, etc.) to be controlled by each storm water management practice.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. When annual compliance evaluations are shown in the plan to be impractical for inactive mining sites, due to remote location and inaccessibility, site evaluations must be conducted at least once every 3 years. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.J.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.J.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.J.3.a.(4)(b) (above) of the permit shall be made and retained as part of the

storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site evaluation that qualified personnel will conduct to 1) confirm the accuracy of the description of potential pollution sources contained in the plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit. Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

Except as discussed in a below, there are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

a. *Region VI—Construction Sand and Gravel; Industrial Sand, and Crushed Stone Mining, Mine Dewatering.* Any discharge composed entirely of storm water or ground water seepage that derives from mine dewatering activities at construction sand and gravel, industrial sand, or crushed stone mining facilities located in Region VI (the States of Louisiana, New Mexico, Oklahoma, and Texas) and in Arizona shall not exceed a maximum concentration for any day of 45 mg/L or an average of daily values for 30 consecutive days of 25 mg/L Total Suspended Solids (TSS) nor the 6.0 to 9.0 range limitation for pH. The discharge from the dewatering activity shall not be diluted with other storm water runoff or flows to meet this limitation. Dischargers subject to these numeric effluent limitations must be in compliance with these limits upon commencement of coverage and for the entire term of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with dimension

and crushed stone, and nonmetallic minerals (except fuels), and sand and gravel mining activities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Such facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table J-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table J-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE J-1.—MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Sand and Gravel Mining Nitrate plus Nitrite Nitrogen .. Total Suspended Solids (TSS).	0.68 mg/L. 100 mg/L.
Dimension and Crushed Stone and Nonmetallic Minerals (except fuels): Total Suspended Solids (TSS).	100 mg/L.

(1) *Monitoring Periods.* Facilities subject to analytical monitoring requirements shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when

sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with the data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table J-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification

statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph *b* below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph *b* below. If the permittee cannot certify for an entire period, they

must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent guidelines.

*b. Reporting*. Permittees with dimension and crushed stone, sand and gravel or nonmetallic mineral (except fuels) mining facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report Form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph *b* (above), sand and gravel mining facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph *b* (above).

*c. Quarterly Visual Examination of Storm Water Quality*. Mineral mining and processing facilities covered under this sector shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examinations must be made at least once in each designated period [described in (1), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; June through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall,

the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*d. Compliance Monitoring Requirements.* Permittees with construction sand and gravel, industrial sand, and crushed stone mining facilities in Region VI that have mine dewatering discharges composed entirely of storm water or ground water seepage which are covered by this permit must monitor the discharge from the dewatering activity for the presence of TSS and pH at least quarterly (four times per year). Facilities must report in accordance with 5.d.(2) below (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken

during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Reporting.* Permittees with mine dewatering discharges from construction sand and gravel, industrial sand, or crushed stone mining facilities located in Region VI and Arizona shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit. For each outfall, one signed Discharge Monitoring Report form shall be submitted for each storm event sampled.

(3) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (2) (above), permittees with discharges of material storage runoff from cement manufacturing facilities through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph 5.d.(3) (above).

#### *K. Storm Water Discharges Associated With Industrial Activity From Hazardous Waste Treatment, Storage, or Disposal Facilities*

##### *1. Discharges Covered Under This Section*

The requirements listed under this section shall apply to storm water discharges associated with industrial activity from facilities that treat, store, or dispose of hazardous wastes, including those that are operating under interim status or a permit under subtitle C of RCRA.

Coverage under this sector for facilities located in Region VI is limited to Hazardous Waste Treatment Storage or Disposal Facilities (TSDFs) that are self-generating or totally residential wastes and to those facilities that only store hazardous waste and do not treat or dispose. These permits are issued by EPA Region VI for Louisiana (LAR05\*###), New Mexico

(NMR05\*###), Oklahoma (OKR05\*###), Texas (TXR05\*###), and Federal Indian Reservations in these States (LAR05\*##F, NMR05\*##F, OKR05\*##F, or TXR05\*##F). Disposal facilities that have been properly closed and capped, and have no significant materials exposed to storm water, are considered inactive and do not require permits [(40 CFR 122.26(b)(14)]. Prohibited from coverage under this sector are those commercial hazardous wastes disposal and treatment facilities located in Region VI that dispose and treat on a commercial basis any produced hazardous waste (not their own) as a service to generators.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

## 2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* There are no additional requirements under this section other than those stated in Part III.A.2 of this permit.

## 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which

may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part IV.D.3.c. (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemicals; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff

between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., chemical oxygen demand, etc.) of concern shall be identified.

(e) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance—*A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., berms, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause

breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

*Spill Prevention and Response*

*Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.K.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test

and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.K.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, wet detention/retention devices, or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.K.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.K.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2

weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those in Part V.B of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with hazardous waste treatment, storage, or disposal facilities (TSDFs) must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). TSDFs are required to monitor their storm water discharges for the pollutants of concern listed in Table K-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table K-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the

duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE K-1.—INDUSTRY MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Ammonia .....	19.0 mg/L.
Total Recoverable Magnesium*.	0.0636 mg/L.
Chemical Oxygen Demand (COD).	120.0 mg/L.
Total Recoverable Arsenic.	0.16854 mg/L.
Total Recoverable Cadmium.	0.0159 mg/L.
Total Cyanide** .....	0.0636 mg/L.
Total Recoverable Lead ..	0.0816 mg/L.
Total Recoverable Mercury.	0.0024 mg/L.
Total Recoverable Selenium.	0.2385 mg/L.
Total Recoverable Silver .	0.0318 mg/L.

\* The MDL for magnesium is 0.02 mg/L method 200.6.

\*\* The MDL for cyanide is 0.02 mg/L method 335.1, 335.2, or 335.3.

(1) *Monitoring Periods.* TSDFs shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with

process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table K-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the

effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.B. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting.* Permittees with TSDFs shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after

permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), TSDFs with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each of the following periods: January through March, April through June, July through September, and October through December during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event

that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and

unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*L. Storm Water Discharges Associated With Industrial Activity From Landfills and Land Application Sites*

1. Discharges Covered Under This Section

*a. Coverage.* The requirements listed under this section shall apply to storm water discharges associated with industrial activity from waste disposal at landfills and land application sites that receive or have received industrial wastes. Landfill and land application operators that have storm water discharges from other types of industrial activities such as vehicle maintenance, truck washing, and/or recycling may be subject to additional requirements specified elsewhere in this permit.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*b. Limitations.* Storm water discharges associated with industrial activities from inactive landfills and land application sites occurring on Federal lands where an operator cannot be identified are ineligible for coverage under this permit.

2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* In addition to the broad non-storm water prohibition in Part III.A of today's permit, the discharge of leachate and vehicle and equipment washwaters to waters of the United States or a municipal separate storm sewer system is not authorized by this permit. Operators with such discharges

must obtain coverage under a separate NPDES permit (other than this permit). Discharges from open dumps as defined under RCRA are also not authorized under this permit (e.g., leachate, runoff).

3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

*(1) Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

*(2) Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutant to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

*(a) Drainage.*

*(i)* A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations of active and closed landfill cells or trenches, locations of active and closed land application areas, locations of any known leachate springs or other areas where uncontrolled leachate may commingle with runoff, locations of any leachate collection and handling systems, locations where major spills or leaks identified under Part XI.L.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and locations of the following activities where such activities are exposed to precipitation: fueling station, vehicle and equipment maintenance and/or cleaning areas, and waste and other significant material loading/unloading and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

*(ii)* For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemicals; quantities of chemicals used, produced or discharged; the likelihood of contact with storm water; and the history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, or disposed of in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant material management practices employed.

*(c) Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water of sampling data collected during the term of this permit. Permittees shall also provide all available sampling data for leachate generated at the site.

*(e) Risk Identification and Summary of Potential Pollutant Sources—*Include a narrative description of potential

pollutant sources associated with any of the following, providing they occur at the facility: fertilizer, herbicide and pesticide application; earth/soil moving; waste hauling and loading/unloading; outdoor storage of significant materials including daily, interim and final cover material stockpiles as well as temporary waste storage areas; exposure of active and inactive landfill and land application areas; uncontrolled leachate flows; failure or leaks from leachate collection and treatment systems; haul roads; and vehicle tracking of sediments. The description shall specifically list any significant potential sources of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Permittees shall consider providing protected materials storage areas for pesticides, herbicides, fertilizers, and other significant materials.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

Where applicable, permittees addressed by this section shall also: (1) maintain containers used for outdoor chemical and significant materials storage to prevent leaking or rupture; (2) maintain all elements of leachate collection and treatment systems to prevent commingling of leachate with storm water; and (3) maintain the integrity and effectiveness of any intermediate or final cover, including making repairs to the cover as necessary

to minimize the effects of settlement, sinking, and erosion.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan.

(i) For operating landfills and land application sites, inspections shall be conducted at least once every 7 days. Qualified personnel shall inspect areas of landfills that have not yet been finally stabilized, active land application areas, areas used for storage of materials/wastes that are exposed to precipitation, stabilization and structural control measures, leachate collection and treatment systems, and locations where equipment and waste trucks enter and exit the site. Where landfill areas have been finally stabilized and where land application has been completed, or during seasonal arid periods in arid areas (areas with an average annual rainfall of 0 to 10 inches) and semiarid areas (areas with an average annual rainfall of 10 to 20 inches), inspections will be conducted at least once every month. Erosion and sediment control measures shall be observed to ensure they are operating correctly.

(ii) For inactive landfills and land application sites, inspections shall be conducted at least quarterly, and qualified personnel shall inspect: landfill stabilization and structural erosion control measures and leachate collection and treatment systems, and all closed land application areas.

A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. The pollution prevention plan shall be revised to address any problems found during inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise

responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as conducting inspections, spill response, good housekeeping, conducting inspections and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Landfill operators shall provide for a tracking system for the types of wastes disposed of in each cell or trench of a landfill. Land application site operators shall track the types and quantities of wastes applied in specific areas.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges including leachate and vehicle wash waters. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.L.3.a.(3)(g)(ii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water

discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 180 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

Landfill operators shall provide for temporary stabilization of materials stockpiled for daily, intermediate and final cover. Stabilization practices to consider include, but are not limited to, temporary seeding, mulching, and placing geotextiles on the inactive portions of the stockpiles.

Landfill operators shall provide for temporary stabilization of inactive areas of the landfill which have an intermediate cover but no final cover.

Landfill operators shall provide for temporary stabilization of any landfill areas which have received a final cover until vegetation has established itself. Land application site operators shall also stabilize areas where waste application has been completed until vegetation has been established.

(i) *Management of Runoff*—The plan shall also contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall

provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.L.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: silt fences, earth dikes, gradient terraces, drainage swales, sediment traps, check dams, pipe slope drains, level spreaders, storm drain inlet protection, rock outlet protection, reinforced soil retaining systems, gabions and temporary or permanent sediment basins, or other equivalent measures. Structural practices should be placed on upland soils as practicable.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity at landfill and land application sites shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.L.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.L.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation,

major observations relating to the implementation of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

(a) *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with landfill/land application sites must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Landfill/land application sites are required to monitor their storm water discharges for the pollutants of concern listed in Table L-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table L-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE L-1.—INDUSTRY MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Total Suspended Solids (TSS) <sup>i</sup> .	100 mg/L
Total Recoverable Iron <sup>ii</sup> .	1.0 mg/L

<sup>i</sup> Applicable to all landfill and land application sites.

<sup>ii</sup> Applicable to all facilities except MSWLF areas closed in accordance with 40 CFR 258.60 requirements.

(1) *Monitoring Periods.* Landfill/land application sites shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable, permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous

conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table L-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee

shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph (b) below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of the fact sheet to this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

(b) *Reporting.* Permittees with landfill/land application sites shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one Discharge Monitoring

Report form must be submitted per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above) landfill/land application sites, with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

(c) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(3) Visual examination reports must be maintained onsite in the pollution

prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to conduct a visual examination as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

## 6. Definition

*"Inactive Landfill"*— For the purposes of this permit, a landfill is considered inactive when, on a permanent basis, it will no longer receive waste and has completed closure in accordance with any applicable Federal, State, and/or local requirements.

### *M. Storm Water Discharges Associated With Industrial Activity From Automobile Salvage Yards*

#### 1. Discharges Covered Under This Section

The requirements of this section apply to point source discharges of storm water associated with industrial activity from facilities engaged in dismantling or wrecking used motor vehicles for parts recycling or resale and for scrap (Standard Industrial Classification (SIC) Code 5015).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

#### 2. Storm Water Pollution Prevention Plan Requirements

(a.) *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each storm water pollution prevention plan must describe industrial activities, significant

materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows. Plans must include the following elements:

(a) *Site Map*—The plan must contain a map of the site that shows structural features that control pollutants in storm water runoff<sup>4</sup> and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. The map must also indicate the flow direction of storm water runoff. The location of each storm water outfall associated with an industrial activity, as well as an outline of the drainage area for each storm water outfall and an indication of the types of discharges in each drainage area must be indicated. The map must indicate the location of each monitoring point. The map must include an estimation (in acres) of the total area used for industrial activity including, but not limited to, dismantling, storage, and maintenance of used motor vehicles and motor vehicle parts. The map must also indicate the location of the following activities where such activities are exposed to precipitation: vehicle storage areas; dismantling areas; parts storage areas, including engine blocks, tires, hub caps, batteries, hoods, and mufflers; fueling stations; vehicle and equipment maintenance areas; cleaning areas (parts, vehicles, and/or equipment); loading and unloading areas; locations used for the treatment, storage, and disposal of wastes; and liquid storage tanks and drums for fuel and other fluids.

(b) *Inventory of Potential Pollutant Sources*—Facility operators are required to carefully conduct an inspection of the site to identify significant materials exposed to precipitation that may contribute pollutants to storm water discharges. The inventory must address materials that within 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal;

practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls that prohibit/control process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or through a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) *Significant Spills and Leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 40 CFR 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance. This list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—Any existing data or data collected during the term of this permit describing the quality or quantity of storm water discharges from the facility must be summarized in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

(e) *Summary of Potential Pollutant Sources*—The description of potential pollution sources should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water discharges. Any such industrial activities, significant materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the potential for the following activities to contribute pollutants: vehicle storage areas; dismantling areas; parts storage areas, including engine blocks, tires, hub caps, batteries, and hoods; fueling stations;

vehicle and equipment maintenance areas; cleaning areas (parts and vehicles and/or equipment); loading/unloading areas; locations used for the treatment, storage, and disposal of wastes; and liquid storage tanks and drums for fuel and other fluids.

The assessment must identify the pollutant parameter or parameters (i.e., copper, iron, lead, oil and grease, total suspended solids, etc.) associated with each pollutant source.

(3) *Measures and Controls*. Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, best management practices (BMPs), and other controls that will be implemented at the facility. BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

The pollution prevention plan must discuss the reasons each selected control or practice is appropriate for the facility and how each will address the potential sources of storm water pollution. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems.

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—The preventive maintenance program shall schedule periodic inspections and ensure appropriate maintenance of storm water management devices and facility equipment and systems. This program will address conditions that could cause breakdowns or failures resulting in the discharge of pollutants to surface waters. The maintenance program shall include periodic removal of debris from discharge diversions, conveyance systems, and impoundments/ponds. These activities should be conducted in the spring, after snow melt, and during the fall season. Maintenance schedules for sedimentation/impoundments must be provided in the pollution prevention plan.

(c) *Spill and Leak Prevention and Response Procedures*—Areas where potential spills which can contribute

<sup>4</sup> Features such as grass swales and vegetative buffer strips also should be shown.

pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel. After clean up from a spill, absorbents must be promptly placed in containers for proper disposal. All vehicles that are intended to be dismantled must be properly drained of all fluids upon arrival at the site, or as soon as feasible thereafter, or other equivalent means must be taken to prevent leaks or spills of such fluids.

(d) *Inspections*—Upon arrival at the site, or as soon as feasible thereafter, vehicles must be inspected for leaks. Any equipment containing oily parts, hydraulic fluids, or any other types of fluids shall be inspected at least quarterly (four times per year) for signs of leaks. Any outdoor storage of fluids including, but not limited to, brake fluid, transmission fluid, radiator water, and antifreeze, must be inspected at least quarterly for leaks. All outdoor liquid storage containers (e.g., tanks, drums) must be inspected at least quarterly for leaks.

Qualified facility personnel are required to conduct quarterly visual inspections of BMPs. The inspections shall include: (1) An assessment of the integrity of storm water flow diversion and source minimization systems; (2) visual inspections of dismantling areas, vehicle and equipment maintenance areas, vehicle, equipment, and parts cleaning and storage areas, and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

Inspections shall be conducted in each of the following periods: January through March; April through June; July through September; and October through December.

Reports of the quarterly inspections (or more frequent if appropriate) shall be retained as part of the plan. Based on the results of each inspection the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing

activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall include a schedule for training. Employee training must, at a minimum, address the following areas when applicable to a facility: proper handling (collection, storage, and disposal) of oil, used mineral spirits, anti-freeze, and solvents; spill prevention and response; fueling procedures; good housekeeping practices; and used battery management.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents such as spills, or other discharges, along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. The permittee must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be reported and the date of their corrective action noted.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.M.2.b.(3)(g)(iii) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water

listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. Permittees must consider measures to maximize stabilization of industrial areas using vegetative cover, gravel, impervious surfaces or other appropriate measures.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide measures that the permittee determines to be reasonable and appropriate and shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see Part XI.M.2.a.(2) (Description of Potential Pollutant Sources) of this permit) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include:

vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, wet detention/retention devices, or other equivalent measures. In addition, the permittee must describe the storm water pollutant source area or activity (e.g., dismantling area, storage area, cleaning operations) to be controlled by each storm water management practice.

The plan must consider management practices, such as berms or drainage ditches on the property line, that may be used to prevent runoff from neighboring properties. Berms must be considered for uncovered outdoor storage of oily parts, engine blocks, and above ground liquid storage. The installation of detention ponds must also be considered. The permittee shall consider the installation of a filtering device to receive runoff from industrial areas. The installation of oil/water separators must also be considered.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct comprehensive site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. The storm water pollution prevention plan must describe the scope and content of comprehensive site evaluations that qualified personnel will conduct to (1) confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. The individual or individuals who will conduct the evaluations must be identified in the plan and should be members of the pollution prevention team. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.M.2.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.M.2.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.M.2.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

### 3. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

### 4. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees operating automobile salvage yards must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 4.a.(3) (Sampling Waiver), 4.a.(4) (Representative Discharge), and 4.a.(5) (Alternative Certification). Automobile salvage yards are required to monitor their storm water discharges for the

pollutants of concern listed in Table M-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table M-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE M-1.—Monitoring Requirements

Pollutants of concern	Monitoring cut-off concentration (mg/L)
Total Suspended Solids .....	100
Total Recoverable Aluminum .....	0.75
Total Recoverable Iron .....	1.0
Total Recoverable Lead .....	0.0816

(1) *Monitoring Periods.* Automobile salvage yards shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water

discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table M-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in the area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also

applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and conduct any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting*. Permittees with automobile salvage yards shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge

Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report Form must be submitted per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.C. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), automobile salvage yards with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality*. All automobile salvage yard facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination(s) must be made at least once in each of the following 3-month periods: January through March, April through June, July through September, and October through December. The examination shall be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event

that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and

unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### 5. Retention of Records

The permittee shall retain records of all inspections and monitoring information, including certification reports, noncompliance reports, calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports, and supporting data, requested by the permitting authority for at least 3 years after the date of the inspection or monitoring event.

#### *N. Storm Water Discharges Associated With Industrial Activity From Scrap Recycling and Waste Recycling Facilities*

##### 1. Discharges Covered Under This Section

The requirements listed under this section are applicable to storm water discharges from the following activities: facilities that are engaged in the processing, reclaiming and wholesale distribution of scrap and waste materials such as ferrous and nonferrous metals, paper, plastic, cardboard, glass, animal hides (these types of activities are typically identified as SIC code 5093). Facilities that are engaged in reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits, and industrial solvents (also identified as SIC code 5093) are also covered under this section. Separate permit requirements have been established for recycling facilities that only receive source-separated recyclable materials primarily from non-industrial and residential sources (also identified as SIC 5093) (e.g., common consumer products including paper, newspaper, glass, cardboard, plastic containers, aluminum and tin cans). This includes recycling facilities commonly referred to as material recovery facilities (MRF).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all

applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

#### 2. Special Conditions

##### *a. Prohibition of Non-storm Water Discharges*

(1) Except as provided in paragraph XI.N.2.b., all discharges covered by this permit shall be composed entirely of storm water. Non storm water discharges from turnings containment areas are not covered under this permit.

(a) Except as provided in paragraph XI.N.2.b. (below), discharges of material other than storm water to waters of the United States, or through municipal separate storm sewer systems, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit (other than this permit) issued for the discharge.

(b) The following non-storm water discharges are authorized by this permit provided the non-storm water component of the discharge is in compliance with paragraph XI.N.3.a.(3) (Measures and Controls for Storm Water Discharges): discharges from fire fighting activities; fire hydrant flushing; potable water sources including waterline flushings; irrigation drainage; lawn watering; routine external building washdown which does not use detergents or other compounds; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled materials have been removed) and where detergents are not used; air conditioning condensate; springs; and uncontaminated ground water.

#### 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The following general requirements for the storm water pollution prevention plan are applicable to activities which reclaim and recycle either recyclable nonliquid and liquid waste materials. In addition to the general requirements, Paragraph XI.N.3.a.(3)(a) (below) identifies special requirements for scrap recycling and waste recycling facilities (nonsource-separated facilities) that handle nonliquid wastes. Paragraph XI.N.3.a.(3)(b) (below) identifies special

requirements for waste recycling facilities that handle only liquid wastes. Paragraph XI.N.3.a.(3)(c) identifies special requirements for recycling facilities, including MRFs, that receive only source-separated recyclable materials primarily from non-industrial and residential sources. The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources or, during periods of dry weather, result in dry weather flows. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating the outfall locations and the types of discharges contained in the drainage areas of the outfalls, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies (including wetlands), locations where significant materials are exposed to precipitation including scrap and waste material storage and outdoor scrap and waste processing equipment, locations where major spills or leaks identified in paragraph XI.N.3.a.(2)(c) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, material storage (including tanks or other vessels used for liquid or waste storage). Scrap recycling facilities that handle turnings that have been

previously exposed to cutting fluids will delineate these containment areas as required in paragraph XI.N.3.a.(iii). The site map must also identify monitoring locations.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of the Clean Water Act (CWA) (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Such a list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A

narrative description of potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities, outdoor processing activities; significant dust or particulate generating processes and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., Chemical Oxygen Demand (COD), oil and grease, Total Suspended Solids (TSS), zinc, lead, copper, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls for scrap recycling and waste recycling facilities (nonsource-separated, nonliquid recyclable materials), waste recycling facilities (recyclable liquid wastes), and recycling facilities (source-separated materials) are identified in Parts XI.N.3.a.(3)(a), XI.N.3.a.(3)(b), and XI.N.3.a.(3)(c), respectively. At a minimum, the description shall also include a schedule for implementing such controls:

(a) *Scrap and Waste Recycling Facilities (nonsource-separated, nonliquid recyclable wastes)*—The following special conditions have been established for the pollution prevention plan for those scrap and waste recycling facilities that receive, process and provide wholesale distribution of nonliquid recyclable wastes, (e.g., ferrous and nonferrous metals, plastics, glass, cardboard, and paper). This section of the permit is intended to distinguish waste recycling facilities that receive both nonrecyclable and recyclable materials from those recycling facilities that only accept recyclable materials primarily from non-industrial and residential sources. Under the description of measures and controls in the storm water pollution prevention plan, the plan will address all areas that have a reasonable potential to contribute pollutants to storm water discharges and will be maintained in a clean and orderly manner. At a minimum, the plan will address the following activities and areas within the plan:

(i) *Inbound Recyclable and Waste Material Control Program*—The plan shall include a recyclable and waste material inspection program to

minimize the likelihood of receiving materials that may be significant pollutant sources to storm water discharges. At a minimum, the plan shall address the following:

(a) Provision of information/education (flyers, brochures and pamphlets) to encourage suppliers of scrap and recyclable waste materials to drain residual fluids, whenever applicable, prior to its arrival at the facility. This includes vehicles and equipment engines, radiators, and transmissions, oil-filled transformers, and individual containers or drums;

(b) Activities which accept scrap and materials that may contain residual fluids, e.g., automotive engines containing used oil, transmission fluids, etc., shall describe procedures to minimize the potential for these fluids from coming in contact with either precipitation or runoff. The description shall also identify measures or procedures to properly store, handle and dispose of these residual fluids;

(c) Procedures pertaining to the acceptance of scrap lead-acid batteries. Additional requirements for the handling, storage and disposal or recycling of batteries shall be in conformance with conditions for a scrap lead-acid battery program, see paragraph XI.N.3.a.(3)(a)(vi) (below);

(d) A description of training requirements for those personnel engaged in the inspection and acceptance of inbound recyclable materials.

(e) Liquid wastes, including used oil, shall be stored in materially compatible and nonleaking containers and disposed or recycled in accordance with all requirements under the Resource Recovery and Conservation Act (RCRA), and other State or local requirements.

(ii) *Scrap and Waste Material Stockpiles/Storage (outdoors)*—The plan shall address areas where significant materials are exposed to either storm water runoff or precipitation. The plan must describe those measures and controls used to minimize contact of storm water runoff with stockpiled materials, processed materials and nonrecyclable wastes. The plan should include measures to minimize the extent of storm water contamination from these areas. The operator may consider the use of permanent or semipermanent covers, or other similar forms of protection over stockpiled materials where the operator determines that such measures are reasonable and appropriate. The operator may consider the use of sediment traps, vegetated swales and strips, to facilitate settling or filtering out of pollutants. The operator shall

consider within the plan the use of the following BMPs (either individually or in combination) or their equivalent to minimize contact with storm water runoff:

(a) Promoting the diversion of runoff away from these areas through such practices as dikes, berms, containment trenches, culverts and/or surface grading;

(b) Media filtration such as catch basin filters and sand filters; and,

(c) Silt fencing; and,

(d) Oil/water separators, sumps and dry adsorbents in stockpile areas that are potential sources of residual fluids, e.g., automotive engine storage areas.

(iii) *Stockpiling of Turnings Previously Exposed to Cutting Fluids (outdoors)*—The plan shall address all areas where stockpiling of industrial turnings previously exposed to cutting fluids occurs. The plan shall implement those measures necessary to minimize contact of surface runoff with residual cutting fluids. The operator shall consider implementation of either of the following two alternatives or a combination of both or equivalent measures:

(a) Alternative 1: Storage of all turnings previously exposed to cutting fluids under some form of permanent or semi-permanent cover. Discharges of residual fluids from these areas to the storm sewer system in the absence of a storm event is prohibited. Discharges to the storm sewer system as a consequence of a storm event is permitted provided the discharge is first directed through an oil/water separator or its equivalent. Procedures to collect, handle, and dispose or recycle residual fluids that may be present shall be identified in the plan, or,

(b) Alternative 2: Establish dedicated containment areas for all turnings that have been exposed to cutting fluids where runoff from these areas is directed to a storm sewer system, providing the following:

(i) containment areas constructed of either concrete, asphalt or other equivalent type of impermeable material;

(ii) a perimeter around containment areas to prevent runoff from moving across these areas. This would include the use of shallow berms, curbing, or constructing an elevated pad or other equivalent measure;

(iii) a suitable drainage collection system to collect all runoff generated from within containment areas. At a minimum, the drainage system shall include a plate-type oil/water separator or its equivalent. The oil/water separator or its equivalent shall be installed according to the

manufacturer's recommended specifications, whenever available, specifications will be kept with the plan.

(iv) a schedule to maintain the oil/water separator (or its equivalent) to prevent the accumulation of appreciable amounts of fluids. In the absence of a storm event, no discharge from containment areas to the storm sewer system are prohibited unless covered by a separate NPDES permit;

(v) identify procedures for the proper disposal or recycling of collected residual fluids.

(iv) *Scrap and Waste Material Stockpiles/Storage (covered or indoor storage)*—The plan shall address measures and controls to minimize residual liquids and accumulated particulate matter, originating from scrap and recyclable waste materials stored indoors or under cover, from coming in contact with surface runoff. The operator shall consider including in the plan the following or equivalent measures:

(a) Good housekeeping measures, including the use of dry absorbent or wet vacuum clean up methods, to collect, handle, store and dispose or recycle residual liquids originating from recyclable containers, e.g., beverage containers, paint cans, household cleaning products containers, etc.;

(b) Prohibiting the practice of allowing washwater from tipping floors or other processing areas from discharging to any portion of a storm sewer system;

(c) Disconnecting or sealing off all existing floor drains connected to any portion of the storm sewer system.

(v) *Scrap and Recyclable Waste Processing Areas*—The plan shall address areas where scrap and waste processing equipment are sited. This includes measures and controls to minimize surface runoff from coming in contact with scrap processing equipment. In the case of processing equipment that generate visible amounts of particulate residue, e.g., shredding facilities, the plan shall describe good housekeeping and preventive maintenance measures to minimize contact of runoff with residual fluids and accumulated particulate matter. At a minimum, the operator shall consider including in the plan the following or other equivalent measures:

(a) A schedule of periodic inspections of equipment for leaks, spills, malfunctioning, worn or corroded parts or equipment;

(b) Preventive maintenance program to repair and/or maintain processing equipment;

(c) Measures to minimize shredder fluff from coming in contact with surface runoff;

(d) Use of dry-absorbents or other cleanup practices to collect and to dispose or recycle spilled or leaking fluids;

(e) Installation of low-level alarms or other equivalent protection devices on unattended hydraulic reservoirs over 150 gallons in capacity. Alternatively, provide secondary containment with sufficient volume to contain the entire volume of the reservoir.

The operator shall consider employing the following additional BMPs or equivalent measures: diversion structures such as dikes, berms, culverts, containment trenches, elevated concrete pads, grading to minimize contact of storm water runoff with outdoor processing equipment; oil/water separators, sumps or equivalent, in processing areas that are potential sources of residual fluids and grease; permanent or semipermanent covers, or other similar measures; retention and detention basins or ponds, sediment traps or vegetated swales and strips, to facilitate settling or filtering out of pollutants in runoff from processing areas; or media filtration such as catch basin filters and sand filters.

(vi) *Scrap Lead-Acid Battery Program*—The plan shall address measures and controls for the proper handling, storage and disposition of scrap lead-acid batteries (note: this permit does apply to the reclaiming of scrap lead-acid batteries, i.e., breaking up battery casings to recover lead). The operator shall consider including in the plan the following or equivalent measures:

(a) Segregating all scrap lead-acid batteries from other scrap materials;

(b) A description of procedures and/or measures for the handling, storage and proper disposal of cracked or broken batteries;

(c) A description of measures to collect and dispose of leaking battery fluid (lead-acid);

(d) A description of measures to minimize and, whenever possible, eliminate exposure of scrap lead-acid batteries to precipitation or runoff; and

(e) A description of employee training for the management of scrap batteries.

(vii) *Erosion and Sediment Control*—The plan shall identify all areas associated with industrial activity that have a high potential for soil erosion and suspended solids loadings, i.e., areas that tend to accumulate significant particulate matter. Appropriate source control, stabilization measures, nonstructural, structural controls or an equivalent shall be provided in these

areas. The plan shall also contain a narrative discussion of the reason(s) for selected erosion and sediment controls. At a minimum, the operator shall consider in the plan, either individually or in combination, the following erosion and sediment control measures:

(a) Filtering or diversion practices, such as filter fabric fence, sediment filter boom, earthen or gravel berms, curbing or other equivalent measure,

(b) Catch basin filters, filter fabric fence, or equivalent measure, place in or around inlets or catch basins that receive runoff from scrap and waste storage areas, and processing equipment; or

(c) Sediment traps, vegetative buffer strips, or equivalent, to remove sediment prior to discharge through an inlet or catch basin.

(viii) *Structural Controls for Sediment and Erosion Control*—In instances where significant erosion and suspended solids loadings continue after installation of one or more of the BMPs identified in paragraph XI.N.3.a.(3)(a)(vii) (above), the operator shall consider providing in the plan for a detention or retention basin or other equivalent structural control. All structural controls shall be designed using good engineering practice. All structural controls and outlets that are likely to receive discharges containing oil and grease must include appropriate measures to minimize the discharge of oil and grease through the outlet. This may include the use of an absorbent boom or other equivalent measures.

Where space limitations (e.g., obstructions caused by permanent structures such as buildings and permanently-sited processing equipment and limitations caused by a restrictive property boundary) prevent the siting of a structural control, i.e., retention basin, such a determination will be noted in the plan. The operator will identify in the plan what existing practices shall be modified or additional measures shall be undertaken to minimize erosion and suspended sediment loadings in lieu of a structural BMP.

(ix) *Spill Prevention and Response Procedures*—To prevent or minimize storm water contamination at loading and unloading areas, and from equipment or container failures, the operator shall consider including in the plan the following practices:

(a) Description of spill prevention and response measures to address areas that are potential sources of leaks or spills of fluids;

(b) Leaks and spills should be contained and cleaned up as soon as possible. If malfunctioning equipment is

responsible for the spill or leak, repairs should also be conducted as soon as possible;

(c) Cleanup procedures should be identified in the plan, including the use of dry absorbent materials or other cleanup methods. Where dry absorbent cleanup methods are used, an adequate supply of dry absorbent material should be maintained onsite. Used absorbent material should be disposed of properly;

(d) Drums containing liquids, including oil and lubricants, should be stored indoors; or in a bermed area; or in overpack containers or spill pallets; or in similar containment devices;

(e) Overfill prevention devices should be installed on all fuel pumps or tanks;

(f) Drip pans or equivalent measures should be placed under any leaking piece of stationary equipment until the leak is repaired. The drip pans should be inspected for leaks and checked for potential overflow and emptied regularly to prevent overflow and all liquids will be disposed of in accordance with all requirements under RCRA.

(g) An alarm and/or pump shut off system should be installed and maintained on all outside equipment with hydraulic reservoirs exceeding 150 gallons (only those reservoirs not directly visible by the operator of the equipment) in order to prevent draining the tank contents in the event of a line break. Alternatively, the equipment may have a secondary containment system capable of containing the contents of the hydraulic reservoir plus adequate freeboard for precipitation. Leaking hydraulic fluids should be disposed of in accordance with all requirements under RCRA.

(x) *Quarterly Inspection Program*—A quarterly inspection shall include all designated areas of the facility and equipment identified in the plan. The inspection shall include a means of tracking and conducting follow up actions based on the results of the inspection. The inspections shall be conducted by members of the Storm Water Pollution Prevention team. At a minimum, quarterly inspections shall include the following areas: all outdoor scrap processing areas; all material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff; areas where structural BMPs have been installed; all erosion and sediment BMPs; outdoor vehicle and equipment maintenance areas; vehicle and equipment fueling areas; and all areas where waste is generated, received, stored, treated, or disposed of and which are exposed to either precipitation or storm water runoff.

The objective of the inspection shall be identify any corroded or leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and deterioration in diversionary or containment structures that are exposed to precipitation or storm water runoff.

Spills or leaks identified during the visual inspection shall be immediately addressed using the procedures identified in Part XI.N.3.a.(3)(a)(ix) (Spill Prevention and Response Procedures). Structural BMPs shall be visually inspected for signs of washout, breakage, deterioration, damage, or overflowing and breaks shall be repaired or replaced as expeditiously as possible.

(xi) *Employee Training*—At a minimum, storm water control training appropriate to their job function shall be provided for truck drivers, scale operators, supervisors, buyers and other operating personnel. The plan shall include a proposed schedule for the training. The employee training program shall address at a minimum: BMPs and other requirements of the plan; proper scrap inspection, handling and storage procedures; procedures to follow in the event of a spill, leak, or break in any structural BMP. A training and education program shall be developed for employees and for suppliers for implementing appropriate activities identified in the storm water pollution prevention plan.

(xii) *Supplier Notification*—The plan shall include a supplier notification program that will be applicable to major suppliers and shall include: description of scrap materials that will not be accepted at the facility or that are accepted only under certain conditions.

(b) *Waste Recycling Facilities (liquid recyclable wastes)*—The following special conditions have been established for the pollution prevention plan for those facilities that reclaim and recycle liquid wastes (e.g., used oil, antifreeze, mineral spirits, and industrial solvents). For these facilities, the storm water pollution prevention plan shall address all areas that have a reasonable potential to contribute pollutants to storm water discharges and will be maintained in a clean and orderly manner. At a minimum, the plan shall address the following activities and areas within the plan:

(i) *Waste Material Storage (indoors)*—The plan shall address measures and controls to minimize/eliminate residual liquids from waste materials stored indoors from coming in contact with surface runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required

under 40 CFR Part 112. At a minimum, the operator shall consider including in the plan the following:

(a) Procedures for material handling (including labeling and marking);

(b) A sufficient supply of dry-absorbent materials or a wet vacuum system to collect spilled or leaked materials;

(c) An appropriate containment structure, such as trenches, curbing, gutters or other equivalent measures; and

(d) A drainage system to handle discharges from diked or bermed areas. The drainage system should include appurtenances, (e.g., pumps or ejectors, manually operated valves). Drainage should be discharged to an appropriate treatment facility, sanitary sewer system, or otherwise disposed of properly. Discharges from these areas should be covered by a separate NPDES permit or industrial user permit under the pretreatment program.

(ii) *Waste Material Storage (outdoors)*—The plan shall address areas where waste materials are exposed to either storm water runoff or precipitation. The plan shall include measures to provide appropriate containment, drainage control and other appropriate diversionary structures. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. At a minimum, the plan shall describe those measures and controls used to minimize contact of storm water runoff with stored materials. The operator shall consider including in the plan the following preventative measures, or an equivalent:

(a) An appropriate containment structure such as dikes, berms, curbing or pits, or other equivalent measures. The containment should be sufficient to store the volume of the largest single tank and should include sufficient freeboard for precipitation;

(b) A sufficient supply of dry-absorbent materials or a wet vacuum system, or other equivalent measure, to collect liquids from minor spills and leaks in contained areas; and

(c) Discharges of precipitation from containment areas containing used oil shall be in accordance with applicable sections of 40 CFR Part 112.

(iii) *Truck and Rail Car Waste Transfer Areas*—The plan shall describe measures and controls for truck and rail car loading and unloading areas. This includes appropriate containment and diversionary structures to minimize contact with precipitation or storm water runoff. The plan shall also address measures to clean up minor spills and/or leaks originating from the

transfer of liquid wastes. This may include the use of dry-clean up methods, roof coverings, runoff controls, or other equivalent measures.

(iv) *Erosion and Sediment Control*—The plan shall identify all areas associated with industrial activity that have a high potential for soil erosion. Appropriate stabilization measures, nonstructural and structural controls shall be provided in these areas. The plan shall contain a narrative consideration of the appropriateness for selected erosion and sediment controls. Where applicable, the facility shall consider the use of the following types of preventive measures: sediment traps; vegetative buffer strips; filter fabric fence; sediment filtering boom; gravel outlet protection; or other equivalent measures that effectively trap or remove sediment prior to discharge through an inlet or catch basin.

(v) *Spill Prevention and Response Procedures*—The plan shall address measures and procedures to address potential spill scenarios that could occur at the facility. This includes all applicable handling and storage procedures, containment and/or diversion equipment, and clean-up procedures. The plan shall specifically address all outdoor and indoor storage areas, waste transfer areas, material receiving areas (loading and unloading), and waste disposal areas.

(vi) *Quarterly Inspections*—Quarterly visual inspections shall be conducted by a member, or members, of the storm water pollution prevention team. The quarterly inspection shall include all designated areas of the facility and equipment identified in the plan. The inspection shall include a means of tracking and conducting follow up actions based on the results of the inspection. At a minimum, the inspections shall include the following areas: material storage areas; material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff; areas where structural BMPs have been installed; all erosion and sediment BMPs; outdoor vehicle and equipment maintenance areas (if applicable); vehicle and equipment fueling areas (if applicable); and all areas where waste is generated, received, stored, treated, or disposed and which are exposed to either precipitation or storm water runoff.

The inspection shall identify the presence of any corroded or leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and deterioration in diversionary or containment structures

that are exposed to precipitation or storm water runoff. Spills or leaks shall be immediately addressed according to the facility's spill prevention and response procedures.

(c) *Recycling Facilities (source separated materials)*—The following special conditions have been established for the pollution prevention plan for recycling facilities, including MRFs, that receive only source-separated recyclable materials primarily from non-industrial and residential sources.

(i) *Inbound Recyclable Material Control Program.* The plan shall include a recyclable material inspection program to minimize the likelihood of receiving non-recyclable materials (e.g., hazardous materials) that may be a significant source of pollutants in surface runoff. At a minimum, the operator shall consider addressing in the plan the following:

(a) A description of information and education measures to educate the appropriate suppliers of recyclable materials on the types of recyclable materials that are acceptable and those that are not acceptable, e.g., household hazardous wastes;

(b) A description of training requirements for drivers responsible for pickup of recyclable materials;

(c) Clearly mark public drop-off containers as to what materials can be accepted;

(d) Rejecting non-recyclable wastes or household hazardous wastes at the source; and

(e) A description of procedures for the handling and disposal of non-recyclable materials.

(ii) *Outdoor Storage.* The plan shall include BMPs to minimize or reduce the exposure of recyclable materials to surface runoff and precipitation. The plan, at a minimum, shall include good housekeeping measures to prevent the accumulation of visible quantities of residual particulate matter and fluids, particularly in high traffic areas. The plan shall consider tarpaulins or their equivalent to be used to cover exposed bales of recyclable waste paper. The operator shall consider within the plan the use of the following types of BMPs (individually or in combination) or their equivalent, where practicable:

(a) Provide totally enclosed drop-off containers for public.

(b) Provide a sump and sump pump with each containment pit. Discharge collected fluids to sanitary sewer system. Prevent discharging to the storm sewer system;

(c) Provide dikes and curbs for secondary containment, i.e., around bales of recyclable waste paper;

(d) Divert surface runoff away from outside material storage areas; and/or

(e) Provide covers over containment bins, dumpsters, roll-off boxes; and,

(f) Store the equivalent one day's volume of recyclable materials indoors.

(iii) *Indoor Storage and Material Processing.* The plan shall address BMPs to minimize the release of pollutants from indoor storage and processing areas to the storm sewer system. The plan shall establish specific measures to ensure that all floor drains do not discharge to the storm sewer system. The following BMPs shall be considered for inclusion in the plan:

(a) Schedule routine good housekeeping measures for all storage and processing areas;

(b) Prohibit a practice of allowing tipping floor washwaters from draining to any portion of the storm sewer system;

(c) Provide employee training on pollution prevention practices.

(iv) *Vehicle and Equipment Maintenance.* The plan shall also provide for BMPs in those areas where vehicle and equipment maintenance is occurring outdoors. At a minimum, the following BMPs or equivalent measures shall be considered for inclusion in the plan:

(a) Prohibit vehicle and equipment washwater from discharging to the storm sewer system;

(b) Minimize or eliminate outdoor maintenance areas, wherever possible;

(c) Establish spill prevention and clean-up procedures in fueling areas;

(d) Provide employee training on avoiding topping off fuel tanks;

(e) Divert runoff from fueling areas;

(f) Store lubricants and hydraulic fluids indoors;

(g) Provide employee training on proper, handling, storage of hydraulic fluids and lubricants.

(d) *Recordkeeping and Internal Reporting Procedures*—The following record and internal reporting procedures are applicable to all discharges seeking coverage under this permit. The plan shall include a description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. The plan must address spills, monitoring, and BMP inspection and maintenance activities. BMPs which are ineffective must be reported and the date of their corrective action noted. Employees must report incidents of leaking fluids to facility management

and these reports must be incorporated into the plan.

(e) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.N.3.a.(3)(d)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate

tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.N.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.N.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.N.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site evaluations that qualified personnel shall conduct to (1) confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. The individual or individuals who shall conduct the evaluation must be identified in the plan and should be members of the pollution prevention team.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with scrap recycling and waste recycling facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Scrap recycling and waste recycling facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table N-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table N-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE N-1.—INDUSTRY MONITORING REQUIREMENTS

Pollutants of concern <sup>i</sup>	Cut-off concentration (mg/L)
Chemical Oxygen Demand (COD)	120
Total Suspended Solids (TSS) .....	100

TABLE N-1.—INDUSTRY MONITORING REQUIREMENTS—Continued

Pollutants of concern <sup>i</sup>	Cut-off concentration (mg/L)
Total Recoverable Aluminum .....	0.75
Total Recoverable Copper .....	0.0636
Total Recoverable Iron .....	1.0
Total Recoverable Lead .....	0.0816
Total Recoverable Zinc .....	0.065

<sup>i</sup>Several congeners of PCBs (PCB-1016, -1221, -1242, -1248, -1260) were above established benchmarks, however, EPA believes that these constituents will readily bound up with sediment and particulate matter. Therefore, EPA believes that BMPs will effectively address sources of PCBs and that monitoring for TSS will serve as an adequate indicator of the control of PCBs.

(1) *Monitoring Periods.* Scrap and waste material processing and recycling facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable, permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due

to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table N-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in the area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical

effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of the monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph b. below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting*. Permittees with scrap and waste material processing and recycling facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance

with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), scrap and waste material processing and recycling facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once each quarter during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event. Examinations must be conducted at least once in each of the following periods: January through March; April through June; July through September; and October through December.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm

event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain the documentation on-site with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The

facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*O. Storm Water Discharges Associated With Industrial Activity From Steam Electric Power Generating Facilities, Including Coal Handling Areas*

1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges from steam electric power generating facilities, including coal handling areas. Non-storm water discharges subject to effluent limitations guidelines are not covered by this permit. Storm water discharges from coal pile runoff subject to numeric limitations are eligible for coverage under this permit, but are subject to the limitations established by 40 CFR 423.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

*a. Limitations on Coverage.* Storm water discharges from ancillary facilities such as fleet centers, gas turbine stations, and substations that are not contiguous to a steam electric power generating facility are not covered by this permit. Heat capture co-generation facilities are not covered by this permit; however, dual fuel co-generation facilities are included.

2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* Except as provided under Part III.A.2 of this permit, non-storm water discharges are not authorized by this permit. The operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the United States or through a municipal separate

storm sewer system. Storm water discharges associated with industrial activities that are mixed with sources of non-storm water are not authorized by this permit, except if mixed with non-storm water discharges that are in compliance with a different NPDES permit or identified by and in compliance with Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit.

Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*  
(i) A site map which clearly outlines the locations of the following, as they apply to the facility: The outfall locations and the types of discharges contained in the drainage areas of the outfalls, and an outline of the drainage area of each storm water outfall that is within the facility boundaries (and indicating the direction of storm water flow); processing areas and buildings; treatment ponds; locations where significant materials are exposed to precipitation; storage tanks; scrap yards, and general refuse areas; fuel storage and distribution areas; vehicle and equipment maintenance and storage areas; loading/unloading areas; locations used for treatment, storage or disposal of wastes; location of short and long term storage of general materials (including but not limited to: supplies, construction materials, plant

equipment, oils, fuels, used and unused solvents, cleaning materials, paint, water treatment chemicals, fertilizers, and pesticides); landfills; location of construction sites; locations of stock pile areas (such as coal piles and limestone piles); locations where major spills or leaks identified under Part XI.O.3.a.(2)(c) (Spills and Leaks) of this permit have occurred; surface water bodies; and existing structural control measures to reduce pollutants in storm water runoff (such as bermed areas, grassy swales, etc.).

(ii) For each storm water outfall identify the types of pollutants which are likely to be present in the storm water discharges. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., total suspended solids, copper, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed:

(i) *Fugitive Dust Emissions*—The plan must describe measures that prevent or minimize fugitive dust emissions from coal handling areas. The permittee shall consider establishing procedures to minimize offsite tracking of coal dust. To prevent offsite tracking the facility may consider specially designed tires, or washing vehicles in a designated area before they leave the site, and controlling the wash water.

(ii) *Delivery Vehicles*—The plan must describe measures that prevent or minimize contamination of storm water runoff from delivery vehicles arriving on the plant site. At a minimum the permittee should consider the following:

(a) Develop procedures for the inspection of delivery vehicles arriving on the plant site, and ensure overall integrity of the body or container; and

(b) Develop procedures to deal with leakage or spillage from vehicles or containers, and ensure that proper protective measures are available for personnel and environment.

(iii) *Fuel Oil Unloading Areas*—The plan must describe measures that prevent or minimize contamination of storm water runoff from fuel oil unloading areas. At a minimum the

facility operator must consider using the following measures, or an equivalent:

(a) Use containment curbs in unloading areas;

(b) During deliveries station personnel familiar with spill prevention and response procedures must be present to ensure that any leaks or spills are immediately contained and cleaned up; and

(c) Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath fuel oil connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors).

(iv) *Chemical Loading/Unloading Areas*—The plan must describe measures that prevent or minimize the contamination of storm water runoff from chemical loading/unloading areas. Where practicable, chemical loading/unloading areas should be covered, and chemicals should be stored indoors.

At a minimum the permittee must consider using the following measures or an equivalent:

(a) Use containment curbs at chemical loading/unloading areas to contain spills; and

(b) During deliveries station personnel familiar with spill prevention and response procedures must be present to ensure that any leaks or spills are immediately contained and cleaned up.

(v) *Miscellaneous Loading/Unloading Areas*—The plan must describe measures that prevent or minimize the contamination of storm water runoff from loading and unloading areas. The facility may consider covering the loading area, minimizing storm water runoff to the loading area by grading, berming, or curbing the area around the loading area to direct storm water away from the area, or locate the loading/unloading equipment and vehicles so that leaks can be contained in existing containment and flow diversion systems.

(vi) *Liquid Storage Tanks*—The plan must describe measures that prevent or minimize contamination of storm water runoff from above ground liquid storage tanks. At a minimum the facility operator must consider employing the following measures or an equivalent:

(a) Use protective guards around tanks;

(b) Use containment curbs;

(c) Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath chemical connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors); and

(d) Use dry cleanup methods.

(vii) *Large Bulk Fuel Storage Tanks*—The plan must describe measures that prevent or minimize contamination of storm water runoff from liquid storage tanks. At a minimum the facility operator must consider employing the following measures, or an equivalent:

(a) Comply with applicable State and Federal laws, including Spill Prevention Control and Countermeasures (SPCC); and

(b) Containment berms.

(viii) The plan must describe measures to reduce the potential for an oil spill, or a chemical spill, or reference the appropriate section of their SPCC plan. At a minimum the structural integrity of all above ground tanks, pipelines, pumps and other related equipment shall be visually inspected on a weekly basis. All repairs deemed necessary based on the findings of the inspections shall be completed immediately to reduce the incidence of spills and leaks occurring from such faulty equipment.

(ix) *Oil Bearing Equipment in Switchyards*—The plan must describe measures to reduce the potential for storm water contamination from oil bearing equipment in switchyard areas. The facility operator may consider level grades and gravel surfaces to retard flows and limit the spread of spills; collection of storm water runoff in perimeter ditches.

(x) *Residue Hauling Vehicles*—All residue hauling vehicles shall be inspected for proper covering over the load, adequate gate sealing and overall integrity of the body or container. Vehicles without load coverings or adequate gate sealing, or with leaking containers or beds must be repaired as soon as practicable.

(xi) *Ash Loading Areas*—Plant procedures shall be established to reduce and/or control the tracking of ash or residue from ash loading areas including, where practicable, requirements to clear the ash building floor and immediately adjacent roadways of spillage, debris and excess water before each loaded vehicle departs.

(xii) *Areas Adjacent to Disposal Ponds or Landfills*—The plan must describe measures that prevent or minimize contamination of storm water runoff from areas adjacent to disposal ponds or landfills. The facility must develop procedures to:

(a) Reduce ash residue which may be tracked on to access roads traveled by residue trucks or residue handling vehicles; and

(b) Reduce ash residue on exit roads leading into and out of residue handling areas.

(xiii) *Landfills, Scrapyards, Surface Impoundments, Open Dumps, General Refuse Sites*—The plan must address landfills, scrapyards, surface impoundments, open dumps and general refuse sites. The permittee is referred to Parts XI.L. and XI.N of the permit for applicable Best Management Practices (BMPs).

(xiv) *Maintenance Activities*—For vehicle maintenance activities performed on the plant site, the permittee shall use the applicable BMPs outlined in Part XI.P. of the permit (Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Passenger Transportation Facilities, Rail Transportation Facilities, and United States Postal Service Transportation Facilities).

(xv) *Material Storage Areas*—The plan must describe measures that prevent or minimize contamination of storm water from material storage areas (including areas used for temporary storage of miscellaneous products, and construction materials stored in lay down areas). The facility operator may consider flat yard grades, runoff collection in graded swales or ditches, erosion protection measures at steep outfall sites (e.g., concrete chutes, riprap, stilling basins), covering lay down areas, storing the materials indoors, covering the material with a temporary covering made of polyethylene, polyurethane, polypropylene, or hypalon. Storm water runoff may be minimized by constructing an enclosure or building a berm around the area.

(b) *Preventive Maintenance*—A preventive maintenance program shall be implemented and shall include timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in

the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under Part XI.O.3.a.(4) of this section, qualified facility personnel shall be identified to inspect the following areas on a monthly basis: coal handling areas, loading/unloading areas, switchyards, fueling areas, bulk storage areas, ash handling areas, areas adjacent to disposal ponds and landfills, maintenance areas, liquid storage tanks, and long term and short term material storage areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained onsite. Such records are subject to review by the U.S. Environmental Protection Agency, and State, and local agencies with jurisdiction, and must be retained onsite a minimum of 3 years after the date of the inspection.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as goals of the pollution prevention plan, spill prevention and control, proper handling procedures for hazardous wastes, good housekeeping and material management practices, and storm water sampling techniques. The pollution prevention plan shall identify periodic dates for such training, but in all cases training must be held at least annually.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the

evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.O.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and, why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see Part XI.O.3.a.(2)) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, wet detention/retention devices, or other equivalent measures.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual evaluation of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.O.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with Part XI.O.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the

plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.O.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

Coal pile runoff is subject to the effluent guidelines described in Part V.B. of this permit. However, steam electric generating facilities must comply with the requirement of Part V.B. immediately upon permit issuance. Steam electric generating facilities are not permitted to take 3 years to meet this requirement.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with steam electric power generating facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3). (sampling waiver), 5.a.(4). (representative discharge), and 5.a.(5). (alternative certification), steam electric power generating facilities are required to monitor their storm water discharges for the pollutant of concern listed in Table O-1 below. Facilities must report in accordance with 5.b.(reporting). In addition to the parameter listed in Table O-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s)

sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

TABLE O-1.—MONITORING REQUIREMENTS FOR STEAM ELECTRIC POWER GENERATING FACILITIES

Pollutant of concern	Cut-Off concentration (mg/L <sup>2</sup> )
Total Recoverable Iron .....	1.0

(1) *Monitoring Periods.* Steam electric power generating facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute

sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table O-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has 2 or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an

estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (signatory requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting.* Permittees with steam electric power generating facilities shall submit monitoring results, or a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived, obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results, or a certification that there has not been a significant change in

industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived, obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above) steam electric power generating facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Compliance Monitoring Requirements.* Permittees with point sources of coal pile runoff associated with steam electric power generation must monitor these storm water discharges for the presence of TSS and for pH at least annually (one time per year). Facilities must report in accordance with 5.c.(2) (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be

taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Reporting.* Permittees with asphalt paving or roofing emulsion production facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the last day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit. For each outfall one Discharge monitoring form shall be submitted per storm event sampled.

(3) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (2) (above), permittees that discharge through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (3) (above).

d. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in paragraph (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable

(greater than 0.1 inch rainfall) storm event. Where practicable the same individual should carry out the collection and examination of discharges for entire permit term.

(3) Visual examination reports must be maintained on-site in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution, and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility

remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*P. Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, Rail Transportation Facilities, and United States Postal Service Transportation Facilities*

1. Discharges Covered Under This Section

Storm water discharges from ground transportation facilities and rail transportation facilities (generally identified by Standard Industrial Classification (SIC) codes 40, 41, 42, 43, and 5171), that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and/or equipment cleaning operations are eligible for coverage under this section.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Storm Water Pollution Prevention Plan Requirements

*a. Deadlines for Plan Preparation and Compliance.* There are no additional deadlines for plan preparation and compliance, other than those stated in Part IV.A.

*b. Contents of the Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm

water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*—A site map indicating the location of each point of discharge of storm water associated with industrial activity, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries (with a prediction of the direction of flow), each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.P.3.b.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities: fueling stations, vehicle and equipment maintenance and/or cleaning areas, storage areas for vehicles and equipment with actual or potential fluid leaks loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas, storage areas, and all monitoring locations. The site map must also indicate the types of discharges contained in the drainage areas of the outfalls (e.g., storm water and air conditioner condensate). In order to increase the readability of the map, the inventory of the types of discharges contained in each outfall may be kept as an attachment to the site map.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present;

method and location of onsite storage or disposal; dirt or gravel parking areas for storage of vehicles to be maintained; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities associated with vehicle and equipment maintenance and equipment cleaning: fueling stations; maintenance shops; equipment or vehicle cleaning areas; paved dirt or gravel parking areas for vehicles to be maintained; loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—All areas that may contribute pollutants to storm

water discharges shall be maintained in a clean, orderly manner. The following areas must be specifically addressed:

(i) *Vehicle and Equipment Storage Areas*—The storage of vehicles and equipment awaiting maintenance with actual or potential fluid leaks must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility shall consider the use of drip pans under vehicles and equipment, indoor storage of the vehicles and equipment, installation of berming and diking of this area, use of absorbents, roofing or covering storage areas, cleaning pavement surface to remove oil and grease, or other equivalent methods.

(ii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility shall consider covering the fueling area, using spill and overflow protection and cleanup equipment, minimizing runoff/runoff of storm water to the fueling area, using dry cleanup methods, collecting the storm water runoff and providing treatment or recycling, or other equivalent measures.

(iii) *Material Storage Areas*—Storage units of all materials (e.g., used oil, used oil filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids) must be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil," "spent solvents," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility shall consider indoor storage of the materials, installation of berming and diking of the area, minimizing runoff/runoff of storm water to the areas, using dry cleanup methods, collecting the storm water runoff and providing treatment, or other equivalent methods.

(iv) *Vehicle and Equipment Cleaning Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment cleaning. The facility shall consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to the intended collection system (i.e., not the storm water drainage system unless NPDES permitted), collecting the storm water runoff from the cleaning area and providing treatment or recycling, or other equivalent measures. The discharge of vehicle and equipment wash waters, including tank cleaning

operations, are not authorized by this permit and must be covered under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

(v) *Vehicle and Equipment Maintenance Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment maintenance. The facility shall consider performing all maintenance activities indoors, using drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting wet clean up practices where the practices would result in the discharge of pollutants to storm water drainage systems, using dry cleanup methods, collecting the storm water runoff from the maintenance area and providing treatment or recycling, minimizing runoff/runoff of storm water areas or other equivalent measures.

(vi) *Locomotive Sanding (loading sand for traction) Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from areas used for locomotive sanding. The facility shall consider covering sanding areas, minimizing storm water runoff, appropriate sediment removal practices to minimize the offsite transport of sanding material by storm water, or other equivalent measures.

(b) *Preventive Maintenance*—A preventive maintenance program shall include timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins, drip pans, vehicle-mounted drip containment devices) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills could contribute pollutants to storm water discharges, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures and equipment for cleaning up spills shall be identified in the plan and made available to the appropriate personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a quarterly basis. The following areas shall be included in all inspections: storage area for vehicles and equipment awaiting maintenance, fueling areas, vehicle and equipment maintenance areas (both indoors and outdoors), material storage areas, vehicle and equipment cleaning areas, and loading and unloading areas. Follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist should be considered by the facility.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place; at a minimum, training must be held annually (once per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: summary of the facility's pollution prevention plan requirements; used oil management; spent solvent management; spill prevention, response and control; fueling procedures; general good housekeeping practices; proper painting procedures; and used battery management.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage

points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit. Such certification may not be practical if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not practical, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.P.3.b.(3)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) A copy of the NPDES permit issued for vehicle and equipment washwaters or, if an NPDES permit has not yet been issued, a copy of the pending application must be attached to or referenced in the plan. For facilities that discharge vehicle and equipment washwaters to the sanitary sewer system, the operator of the sanitary system and associated treatment plant must be notified. In such cases, a copy of the notification letter must be attached to the plan. If an industrial user permit is issued under a pretreatment program, a copy of that permit must be attached in the plan. In all cases, any permit conditions or pretreatment requirements must be considered in the plan. If the washwaters are handled in another manner (e.g., hauled offsite), the disposal method must be described and all pertinent documentation (e.g., frequency, volume, destination, etc.) must be attached to the plan.

(iv) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an

NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide for the implementation and maintenance of measures that the permittee determines to be reasonable and appropriate. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see XI.P.3.b.(2) (description of potential pollutant sources) of this permit) shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct comprehensive site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in

accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.P.3.b.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.P.3.b.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.P.3.b.(3)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

### 3. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

### 4. Monitoring and Reporting Requirements

#### a. Monitoring Requirements.

(1) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges

exempted under paragraph (d) below. The examination(s) must be made at least once in each designated period [described in (a), below] during facility operation in the daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable

sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*Q. Storm Water Discharges Associated With Industrial Activity From Water Transportation Facilities That Have Vehicle Maintenance Shops and/or Equipment Cleaning Operations*

**1. Discharges Covered Under This Section**

The requirements listed under this section shall apply to storm water discharges from water transportation facilities that have vehicle (vessel) maintenance shops and/or equipment cleaning operations. The water transportation industry includes facilities engaged in foreign or domestic transport of freight or passengers in deep sea or inland waters; marine cargo handling operations; ferry operations; towing and tugboat services; and marinas (facilities commonly identified by Standard Industrial Classification (SIC) code Major Group 44).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the

description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

**2. Special Conditions**

*a. Prohibition of Non-storm Water Discharges.* In addition to the general discharge prohibitions in part III.A, this section specifically prohibits non-storm water discharges of wastewaters, such as bilge and ballast water, sanitary wastes, pressure wash water, and cooling water originating from vessels. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the United States or through a municipal separate storm sewer system.

**3. Storm Water Pollution Prevention Plan Requirements**

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.Q.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling, engine maintenance and repair, vessel maintenance and repair, pressure washing, painting, sanding, blasting, welding, metal fabrication, loading/unloading areas, locations used for the treatment, storage or disposal of wastes; liquid storage tanks, liquid storage areas (i.e., paint, solvents, resins), and material storage areas (i.e., blasting media, aluminum, steel, scrap iron). In addition, the map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff;

and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities if applicable: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities (i.e., welding, metal fabricating); significant dust or particulate generating processes (i.e., abrasive blasting, sanding, painting); loading/unloading areas; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at a facility:

(i) *Pressure Washing Area*—When pressure washing is used to remove marine growth from vessels, the discharge water must be permitted by an NPDES permit. The pollution prevention plan must describe the measures to collect or contain the discharge from the pressure washing area, detail the method for the removal

of the visible solids, describe the method of disposal of the collected solids, and identify where the discharge will be released (i.e., the receiving waterbody, storm sewer system, sanitary sewer system).

(ii) *Blasting and Painting Areas*—The facility must consider containing all blasting and painting activities to prevent abrasives, paint chips, and overspray from reaching the receiving water or the storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. Where required, a schedule for cleaning storm water conveyances to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Such included items may be the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

(iii) *Material Storage Areas*—All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

(iv) *Engine Maintenance and Repair Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility may consider performing all maintenance activities indoors,

maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(v) *Material Handling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from material handling operations and areas (i.e., fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). The facility may consider covering fueling areas; using spill and overflow protection; mixing paints and solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas or other equivalent measures. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(vi) *Drydock Activities*—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in the storm water runoff. The plan must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility should consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills or other equivalent measures.

(vii) *General Yard Area*—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility may consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm

drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: pressure washing area; blasting, sanding, and painting areas; material storage areas; engine maintenance and repair areas; material handling areas; drydock area; and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place, but in all cases training must be held at least annually (once per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers

must be informed about BMPs and be required to perform in accordance with these practices. The facility must consider posting instructions, easy to read descriptions or graphic depictions of BMPs, spill control/clean-up equipment and emergency phone numbers in the work areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Q.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the

Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.Q.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (pressure washing

area, blasting and sanding areas, painting areas, material storage areas, engine maintenance and repair areas, material handling areas, and drydock area) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.Q.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Q.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.Q.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the inspection. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with water transportation facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Water transportation facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table Q-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table Q-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE Q-1.—MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Aluminum	0.75 mg/L
Total Recoverable Iron .....	1.0 mg/L
Total Recoverable Lead .....	0.0816 mg/L
Total Recoverable Zinc .....	0.065 mg/L

(1) *Monitoring Periods*. Water transportation facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm

event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table Q-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in

the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

b. *Reporting.* Permittees with water transportation facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), water transportation facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges

exempted below. The examination must be made at least once in each designated period [described in paragraph (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snowmelt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially

identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *R. Storm Water Discharges Associated With Industrial Activity From Ship and Boat Building or Repairing Yards*

##### 1. Discharges Covered Under This Section

The requirements listed under this section apply to storm water discharges from facilities engaged in ship building and repairing and boat building and repairing<sup>5</sup> (Standard Industrial Classification (SIC) code 373).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of

this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

##### 2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* In addition to the prohibitions listed in Part III.A of the permit, this section specifically prohibits non-storm water discharges of wastewaters, such as bilge and ballast water, pressure wash water, sanitary wastes, and cooling water originating from vessels, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the United States or through a municipal separate storm sewer system.

##### 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating the location of the outfalls and the types of discharges contained in the drainage areas of the outfalls, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface

<sup>5</sup> According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship, and a vessel smaller than 65 feet is a boat.

water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.R.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling, engine maintenance and repair, vessel maintenance and repair, pressure washing, painting, sanding, blasting, welding, metal fabrication, loading/unloading areas, locations used for the treatment, storage or disposal of wastes; liquid storage tanks, liquid storage areas (i.e., paint, solvents, resins), and material storage areas (i.e., blasting media, aluminum, steel, scrap iron).

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent

(NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities if applicable: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities (i.e., welding, metal fabricating); significant dust or particulate generating processes (i.e., abrasive blasting, sanding, painting); loading/unloading areas; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at a facility:

(i) *Pressure Washing Area*—When pressure washing is used to remove marine growth from vessels, the discharge water must be permitted as a process wastewater by an NPDES permit.

(ii) *Blasting and Painting Areas*—The facility must consider containing all blasting and painting activities to prevent abrasives, paint chips, and overspray from reaching the receiving water or the storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting

operations to contain debris. Where required, a schedule for cleaning storm systems to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Practices may include the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

(iii) *Material Storage Areas*—All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

(iv) *Engine Maintenance and Repair Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility must consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting wet clean up practice where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(v) *Material Handling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from material handling operations and areas (i.e., fueling, paint & solvent mixing, disposal of process wastewater streams from vessels). The facility must consider covering fueling areas; using spill and overflow protection; mixing paints and

solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(vi) *Drydock Activities*—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in the storm water runoff. The plan must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility must consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills.

(vii) *General Yard Area*—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility must consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan

should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: pressure washing area; blasting, sanding, and painting areas; material storage areas; engine maintenance and repair areas; material handling areas; drydock area; and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases training must be held at least annually (once per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. The facility should consider posting easy to read descriptions or graphic depictions of BMPs and emergency phone numbers in the work areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of

non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.R.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due

to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.R.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including, but not limited to, pressure washing area, blasting and sanding areas, painting areas, material storage areas, engine maintenance and repair areas, material handling areas, and drydock area, shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.R.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.R.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.R.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

#### 5. Monitoring and Reporting Requirements

(a) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity from each outfall except discharges exempted below. The examination must be made at least once in each designated period [described in (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July

through September; October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snow melt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse

climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*S. Storm Water Discharges Associated With Industrial Activity From Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing Areas Located at Air Transportation Facilities*

1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges from establishments and/or facilities including airports, air terminals, air carriers, flying fields, and establishments engaged in servicing or maintaining airports and/or aircraft (generally classified under Standard Industrial Classification (SIC) code 45) which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport and/or aircraft deicing/anti-icing operations. For the purpose of this permit, the term "deicing" is defined as the process to remove frost, snow, or ice and "anti-icing" is the process which prevents the accumulation of frost, snow, or ice.

(a) *Coverage.* Only those portions of the facility or establishment that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or deicing/anti-icing operations are addressed under this section.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution

prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Special Conditions

(a) *Prohibition of Non-storm Water Discharges.* In addition to those discharges prohibited under Part III.A.2, non-storm water discharges including aircraft, ground vehicle, runway and equipment washwaters, and dry weather discharges of deicing/anti-icing chemicals are not authorized by this permit. Dry weather discharges are those discharges generated by processes other than those included in the definition of storm water. The definition of storm water includes storm water runoff, snow melt runoff, and surface runoff and drainage. All other discharges constitute non-storm water discharges. Operators of non-storm water discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the United States or through a municipal separate storm sewer system.

(b) *Releases of Reportable Quantities of Hazardous Substances and Oil.* Each individual permittee is required to report spills equal to or exceeding the reportable quantity levels specified at 40 CFR 110, 117, and 302 as described at Part VI.B.2. If an airport authority is the sole permittee, then the sum total of all spills at the airport must be assessed against the RQ. If the airport authority is a co-permittee with other deicing/anti-icing operators at the airport, such as numerous different airlines, the assessed amount must be the summation of spills by each co-permittee. If separate, distinct individual permittees exist at the airport, then the amount spilled by each separate permittee must be the assessed amount for the RQ determination.

3. Storm Water Pollution Prevention Plan Requirements

Storm water pollution prevention plans developed for areas of the facility occupied by tenants of the airport shall be integrated with the plan for the entire airport. For the purposes of today's permit, tenants of the airport facility include airline companies, fixed based operators and other parties which have

contracts with the airport authority to conduct business operations on airport property which result in storm water discharges associated with industrial activity as described in paragraph 1 of this section. Plans should be developed in accordance with Part IV. Storm Water Pollution Prevention Plans).

(a) *Contents of Plan.* Each plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals as member(s) of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility management in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map indicating an outline of the drainage area of each storm water outfall within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under paragraph XI.S.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: aircraft and runway deicing/anti-icing operations; fueling stations; aircraft, ground vehicle and equipment maintenance and/or cleaning areas; storage areas for aircraft, ground vehicles and equipment awaiting maintenance; loading/unloading areas; locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges

associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(iii) The site map developed for the entire airport shall indicate the location of each tenant of the facility that conducts industrial activities as described in Part XI.S.1.a., and incorporate information from the tenants site map (including a description of industrial activities, significant materials exposed, and existing management practices).

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment of storm water runoff.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: aircraft, runway, ground vehicle and equipment maintenance and cleaning; aircraft and runway deicing/anti-icing operations (including apron and centralized aircraft deicing/anti-icing stations, runways, taxiways and ramps); outdoor storage activities; loading and unloading operations; and onsite waste disposal. The description shall specifically list any significant potential source of pollutants at the facility and for each potential source, any pollutant or pollutant parameter [e.g., biochemical oxygen demand (BOD<sub>5</sub>), oil and grease, etc.] of concern shall be identified.

Facilities which conduct deicing/anti-icing operations shall maintain a record of the types [including the Material Safety Data Sheets (MSDS)] and monthly quantities of deicing/anti-icing chemicals used. Tenants and fixed-base operators who conduct deicing/anti-icing operations shall provide the above information to the airport authority for inclusion in the storm water pollution prevention plan for the entire facility.

(3) *Measures and Controls*. Operators covered by this permit shall develop a description of storm water management controls appropriate for their areas of operation, and implement such controls. The priority in selecting controls shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(i) *Aircraft, Ground Vehicle and Equipment Maintenance Areas*—Permittees should ensure the maintenance of equipment is conducted in designated areas only and clearly identify these areas on the ground and delineate them on the site map. The plan must describe measures that prevent or minimize the contamination of the storm water runoff from all areas used for aircraft, ground vehicle and equipment maintenance (including the maintenance conducted on the terminal apron and in dedicated hangars). Management practices or equivalent measures such as performing maintenance activities indoors, maintaining an organized inventory of materials used in the maintenance areas, draining all parts of fluids prior to

disposal, preventing the practice of hosing down the apron or hangar floor, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling should be considered.

(ii) *Aircraft, Ground Vehicle and Equipment Cleaning Areas*—Permittees should ensure that cleaning of equipment is conducted in designated areas only and clearly identify these areas on the ground and delineate them on the site map. The plan must describe measures that prevent or minimize the contamination of the storm water runoff from all areas used for aircraft, ground vehicle and equipment cleaning. Management practices such as performing cleaning operations indoors, and/or collecting the storm water runoff from the cleaning area and providing treatment or recycling should be considered.

(iii) *Aircraft, Ground Vehicle and Equipment Storage Areas*—The storage of aircraft, ground vehicles and equipment awaiting maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize the contamination of the storm water runoff from these areas. Management practices such as indoor storage of aircraft and ground vehicles, the use of drip pans for the collection of fluid leaks, and perimeter drains, dikes or berms surrounding storage areas should be considered.

(iv) *Material Storage Areas*—Storage units of all materials (e.g., used oils, hydraulic fluids, spent solvents, and waste aircraft fuel) must be maintained in good condition, so as to prevent or minimize contamination of storm water, and plainly labeled (e.g., "used oil," "Contaminated Jet A," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from storage areas. Management practices or equivalent measures such as indoor storage of materials, centralized storage areas for waste materials, and/or installation of berming and diking around storage areas should be considered for implementation.

(v) *Airport Fuel System and Fueling Areas*—The plan must describe measures that prevent or minimize the discharge of fuels to the storm sewer resulting from fuel servicing activities or other operations conducted in support of the airport fuel system. Where the discharge of fuels into the storm sewer cannot be prevented, the plan shall indicate measures that will be employed to prevent or minimize the discharge of the contaminated runoff into receiving

surface waters. Management practices or equivalent measures such as implementing spill and overflow practices (e.g., placing sorptive materials beneath aircraft during fueling operations), using dry cleanup methods, and/or collecting the storm water runoff should be considered.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, removing debris from catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. The plan shall describe material handling procedures, storage requirements, and consider the use of equipment such as diversion valves. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Source Reduction*—Operators who conduct aircraft and/or runway (including taxiways and ramps) deicing/anti-icing operations shall evaluate present operating procedures to consider alternative practices to reduce the overall amount of deicing/anti-icing chemicals used and/or lessen the environmental impact of the pollutant source.

(i) With regard to runway deicing operations, operators, at a minimum, shall evaluate: present application rates to ensure against excessive over application; metered application of deicing chemical; pre-wetting dry chemical constituents prior to application; installation of runway ice detection systems; implementing anti-icing operations as a preventive measure against ice buildup; the use of substitute deicing compounds such as potassium acetate in lieu of ethylene glycol, propylene glycol and/or urea.

(ii) In considering source reduction management practices for aircraft deicing operations, operators, at a minimum, should evaluate current application rates and practices to ensure against excessive over application, and consider pretreating aircraft with hot

water prior to the application of a deicing chemical, thus reducing the overall amount of chemical used per operation.

Source reduction measures that the operator determines to be reasonable and appropriate shall be implemented and maintained. The plan shall provide a narrative explanation of the options considered and the reasoning for whether or not to implement them.

(e) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which prevent or reduce source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.S.3.a.(2) (Description of Potential Pollutant Sources)] shall be considered. Appropriate measures or equivalent measures may include: vegetative swales, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. Measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained.

(i) Operators that conduct aircraft and/or runway deicing/anti-icing operations shall also provide a narrative consideration of management practices to control or manage contaminated runoff from areas where deicing/anti-icing operations occur to reduce the amount of pollutants being discharged from the site. Structural controls such as establishing a centralized aircraft deicing facility, and/or collection of contaminated runoff for treatment or recycling should be considered. Collection and treatment alternatives include, but are not limited to, retention basins, detention basins with metered controlled release, Underground Storage Tanks (USTs) and/or disposal to Publicly Owned Treatment Works (POTW) by way of sanitary sewer or hauling tankers. Runoff management controls that the operator determines to be reasonable and appropriate shall be implemented and maintained. The plan should consider the recovery of deicing/anti-icing materials when these materials are applied during non-precipitation events to prevent these materials from later becoming a source of storm water contamination. The plan

shall provide a narrative explanation of the controls selected and the reasons for their selection.

(f) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.S.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility specified in the plan. The inspection frequency shall be specified in the plan, but at a minimum be conducted once per week during deicing/anti-icing application periods for areas where deicing/anti-icing operations are being conducted. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the pollution prevention team is encouraged.

(g) *Pollution Prevention Training*—Pollution prevention training programs shall be developed to inform management and personnel responsible for implementing activities identified in the storm water pollution prevention plan of the components and goals of the plan. Training should address topics such as spill response, good housekeeping, aircraft and runway deicing/anti-icing procedures, and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(h) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan. Inspections and maintenance activities shall be documented and records shall be incorporated into the plan.

(i) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge points have been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of

access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.S.3.a.(3)(iii) (below).

(ii) Except for flows from fire fighting activities, other sources of non-storm water listed in Part III.A.2 (Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting a notice of intent to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(j) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations during periods of deicing/anti-icing operations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the

potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.S.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.S.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.S.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(f), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

a. During the period beginning on the effective date and lasting through the

expiration date of this permit, (airports that use more than 100,000 gallons of glycol-based deicing/anti-icing) chemicals and/or 100 tons or more of urea on an average annual basis):

(1) Shall prepare estimates for annual pollutant loadings resulting from discharges of spent deicing/anti-icing chemicals from the entire airport. The loading estimates shall reflect the amounts of deicing/anti-icing chemicals discharged to separate storm sewer systems or surface waters, prior to and after implementation of the facility's storm water pollution prevention plan. Such estimates shall be reviewed by an environmental professional, and certified by such professional. By means of the certification, the environmental professional, having examined the facility's deicing/anti-icing procedures, and proposed control measures described in the storm water pollution prevention plan, shall attest that the loading estimates have been accurately prepared. Certified loading estimates are to be retained at the airport facility and attached to the storm water pollution prevention plan.

b. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], airports that use more than 100,000 gallons of glycol-based deicing/anti-icing chemicals and/or 100 tons or more of urea on an average annual basis shall monitor outfalls from the airport facility that collect runoff from areas where deicing/anti-icing activities occur, except as provided in paragraph 5.a.(3) (Sampling Waiver). Airports which are subject to these monitoring requirements must sample their storm water discharges for the parameters listed in Table S-1 below. Such facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table S-1 below, the permittee shall provide the date and duration (in hours) of the precipitation event(s) sampled; measurements or estimates (in inches) of the precipitation event that generated the sampled runoff; the duration between the event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE S-1.—MONITORING REQUIREMENTS

Pollutants of concern	Monitoring cut-off concentration
Biochemical Oxygen Demand (BOD <sub>5</sub> ).	30 mg/L
Chemical Oxygen Demand (COD).	120 mg/L
Ammonia .....	19 mg/L
pH .....	6.0 to 9 s.u.

For the purposes of today's final permit, the "average annual" usage rate of deicing/anti-icing chemicals is determined by averaging the cumulative amount of deicing/anti-icing chemicals used by all operators at the airport facility in the 3 previous calendar years.

(1) *Monitoring Periods.* Airports where more than 100,000 gallons of glycol-based deicing/anti-icing chemicals and/or 100 tons or more of urea are used on an average annual basis shall monitor outfalls from the facility that collect runoff from areas where deicing/anti-icing activities occur four times per year during the months of December, January, and February when deicing/anti-icing activities are occurring, in the years specified in paragraph b. (above).

(2) *Sample Type.* A minimum of one grab sample and one flow-weighted composite sample shall be taken from each outfall that collects runoff from areas where deicing/anti-icing activities occur. All such samples shall be collected from a discharge resulting from a precipitation event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) precipitation event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample should be taken when pollutant concentrations in the storm water/melt water discharges from deicing/anti-icing operations are expected to be at a maximum. The recommended methodology for performing grab and flow-weighted composite sampling is described at 40 CFR 122.21(g)(7). The permittee has the option to submit site-specific deicing/anti-icing discharge monitoring protocol and methodology, better suited to the particular facility, to the Director for approval.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as high winds, blizzard conditions, ice storms, etc.) or otherwise make the collection of a sample impracticable (extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a parameter calculated from all grab samples collected during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that parameter listed in Table S-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the

drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* The Alternative Certification provision discussed in other sections of Part XI is not applicable to discharges included under Part XI.S. (Storm Water Discharges Associated with Industrial Activity from Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing/Anti-icing Areas Located at Air Transportation Facilities).

(c) *Reporting.* Airports identified in Part XI.S.5.6 shall submit monitoring results obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of March [insert the date 2 years after permit issuance]. Monitoring results obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of March [insert date 4 years after permit issuance]. A separate Discharge Monitoring Report Form is required for each sampling period. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or waiver, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph cb (above), facilities identified in Part XI.S.5.6 that discharge storm water to a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph bc (above).

*T. Storm Water Discharges Associated With Industrial Activity From Treatment Works*

1. Discharges Covered Under This Section

a. This permit covers all existing point source discharges of storm water from treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of sewage sludge that are located within the confines of the facility with a design flow of 1.0 MGD or more, or required to have an approved pretreatment program under 40 CFR Part 403. When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Special Conditions

a. *Prohibition of Non-storm Water Discharges.* Prohibited non-storm water discharges including sanitary and industrial wastewater, and equipment and vehicle washwaters are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the United States or through a municipal separate storm sewer system.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of the Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and

revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*—A site map indicating the location of each point of discharge of storm water associated with industrial activity, types of discharges contained in the drainage areas of the outfalls, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries (with a prediction of the direction of flow), each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part III.B. (Spills and Leaks) of this permit have occurred. In addition, the locations of the following activities shall be indicated: fueling areas; vehicle and equipment maintenance and/or cleaning areas; locations used for treatment, storage and disposal areas for wastes, liquid storage tanks, processing areas and storage areas for process chemicals, petroleum products, solvents, fertilizers, herbicides and pesticides; and loading/unloading areas.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to

reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities associated with treatment works: access roads/rail lines; loading and unloading operations; outdoor storage activities; material handling sites; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., acid, bases, and solvents, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—All areas that may contribute pollutants to storm waters discharges shall be maintained in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures and equipment for cleaning up spills shall be identified in the plan and made available to the appropriate personnel.

(d) *Inspections*—In addition to the comprehensive site evaluation required under Part XI.T.3.a.(4) of this permit, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a periodic basis. The following areas shall be included in all inspections: access roads/rail lines, equipment storage and maintenance areas (both indoor and outdoor areas); fueling; material handling areas, residual treatment, storage, and disposal areas; and wastewater treatment areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the facility is encouraged.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place, but training should be held at least annually (once per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: petroleum product management; process chemical management; spill prevention and control; fueling procedures; general good housekeeping practices; proper procedures for using fertilizers, herbicides and pesticides.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance

activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be practical if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not practical, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.T.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) A copy of all the current NPDES permit issued for wastewater, industrial, vehicle and equipment washwater discharges or, if an NPDES permit has not yet been issued, a copy of the pending application must be attached to the plan. For facilities that discharge vehicle and equipment washwaters to the sanitary sewer system, the operator of the sanitary system and associated treatment plant must be notified. In such cases, a copy of the notification letter must be attached to the plan. If an industrial user permit is issued under a pretreatment program, a copy of that permit must be attached in the plan. In all cases, any permit conditions must be considered in the plan. If the washwaters are handled in another

manner (e.g., hauled offsite), the disposal method must be described and all pertinent documentation (e.g., frequency, volume, destination, etc.) must be attached to the plan.

(iv) *Failure to Certify.* Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notifications shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.T.3.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.T.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.T.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.T.3.a.(4)(b) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no numeric effluent limitations beyond those in Part V.B.

#### 5. Monitoring and Reporting Requirements

a. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each of the following designated periods during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event: January through March; April through June; July through September; and October through December.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such

outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the results of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### U. Storm Water Discharges Associated With Industrial Activity From Food and Kindred Products Facilities

##### 1. Discharges Covered Under This Section

This section covers all storm water discharges from food and kindred products processing facilities (commonly identified by Standard Industrial Classification (SIC) code 20), including: meat products; dairy products; canned, frozen and preserved fruits, vegetables, and food specialties; grain mill products; bakery products; sugar and confectionery products; fats and oils; beverages; and miscellaneous food preparations and kindred products and tobacco products manufacturing (SIC Code 21), except for storm water

discharges identified under paragraph I.B.3. where industrial plant yards; material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residential treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; and storage areas for raw material and intermediate and finished products are exposed to storm water and areas where industrial activity has taken place in the past and significant materials remain. For the purposes of this paragraph, material handling activities include the storage, loading, and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product, or waste product.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

## 2. Special Conditions

### a. Prohibition of Non-storm Water Discharges.

(1) Discharges of non-storm water, including boiler blowdown, cooling tower overflow and blowdown, ammonia refrigeration purging, and vehicle washing/clean-out operations, to waters of the United States, or through municipal separate storm sewer systems, are not authorized by this permit (except those discharges identified in part III.A.2 in the permit). The operators of such discharges must obtain coverage under a separate NPDES wastewater discharge permit.

## 3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm

water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*—A site map indicating the pattern of storm water drainage, existing structural control measures to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, and locations where major spills or leaks identified under Part XI.U.3.a.(2)(c) (Spills and Leaks) of this permit have occurred since 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. The map must also indicate the locations of all industrial activities that are exposed to precipitation, including, but not limited to: loading/unloading areas; vehicle fueling; vehicle and equipment maintenance and/or cleaning areas; waste treatment, storage and disposal locations; liquid storage tanks; vents and stacks from cooking, drying, and similar operations, dry product vacuum transfer lines; animal holding pens; spoiled product and broken product container storage areas; significant dust or particulate generating areas; and any other processing and storage areas exposed to storm water. Flows with a significant potential for causing erosion shall also be identified. In addition, the site map must identify monitoring locations. In addition, the map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3

years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Summary of Potential Pollutant Sources*—The description of potential pollutant sources culminates in a narrative assessment of the risk potential that the industrial activities, materials, and physical features of the site, as identified in XI.U.3.a.(2)(a) (drainage), pose to storm water quality. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, oil and grease, etc.) of concern shall be identified.

In addition to food and kindred products processing-related industrial activities, the plan must also describe application/storage of pest control chemicals (e.g., rodenticides, insecticides, fungicides, and others) used on plant grounds, including a description of pest control application and chemical storage practices.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following

minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Areas that must be identified should include loading/unloading stations, outdoor storage areas, and waste management areas exposed to storm water. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to the comprehensive site evaluation required under Part XI.U.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility. At a minimum, the following areas, where the potential for exposure to storm water exists, must be inspected on a regularly scheduled basis: loading and unloading areas for all significant materials; storage areas, including associated containment areas; waste management units; vents and stacks emanating from industrial activities; spoiled product and broken product container holding areas; animal holding pens; staging areas; and air pollution control equipment. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. Based on the results of the inspection, the description of potential pollutant sources and pollution prevention measures and controls

identified in the plan shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices, unloading/loading practices, outdoor storage areas, waste management practices, pest control, and improper connections to the storm sewer. At a minimum, this training must be provided annually. The pollution prevention plan shall identify frequencies and approximate dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs must be recorded and the date of their corrective actions noted in the plan.

(g) *Non-storm Water Discharges*  
 (i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible,

along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.U.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) If the facility discharges wastewater, other than storm water via an existing NPDES permit, a copy of the NPDES permit authorizing the discharge must be attached to the plan. Similarly, if the facility submitted an application for an NPDES permit for non-storm water discharges, but has not yet received that permit, a copy of the permit application must be attached. Upon issuance or reissuance of an NPDES permit, the facility must modify its plan to include a copy of that permit.

(iv) *Failure To Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which

control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.U.3.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures or equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Where compliance evaluation schedules overlap with inspections required under XI.U.3.a.(3)(d) of this section, the compliance evaluation may be conducted in place of one such inspection. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.U.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.U.3.a.(3) (Measures and Controls) of this permit shall be

revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.U.3.a.(4)(d) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of the comprehensive site evaluations that qualified personnel will conduct to (1) confirm the accuracy of the description of potential sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. The individual or individuals who will conduct the evaluations must be identified in the plan and should be members of the pollution prevention team, as identified in Part XI.U.3.a.(1) (Pollution Prevention Team).

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with grain mill and fats and oils products facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Grain mill and fats and oils products facilities are required to monitor their storm

water discharges for the pollutants of concern listed in Table U-1 or U-2 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table U-1 or U-2 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE U-1.—GRAIN MILL PRODUCTS

Pollutant of concern	Cut-off concentration (mg/L)
Total Suspended Solids .....	100

TABLE U-2.—FATS AND OILS PRODUCTS MONITORING REQUIREMENTS

Pollutant of concern	Cut-off concentration (mg/L)
Biochemical Oxygen Demand (BOD <sub>5</sub> ) .....	30
Chemical Oxygen Demand (COD) .....	120
Nitrate Plus Nitrite Nitrogen .....	0.68
Total Suspended Solids .....	100

(1) *Monitoring Periods.* Grain mill and fats and oils products facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first

hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table U-1 under the column Monitoring Cutoff Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that,

based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph *b* below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph *(b)* below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance

monitoring requirements associated with effluent limitations.

*b. Reporting.* Permittees with grain mill and fats and oils products facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph *b* (above) food and kindred products, facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph *b* (above).

*a. Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination(s) must be made at least once in each of the following 3-month periods: January through March, April through June, July through September, and October through December. The examination shall be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of a grab sample collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of

when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse

weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *V. Storm Water Discharges Associated With Industrial Activity From Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities*

##### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges from the following activities: Textile Mill Products, of and regarding facilities and establishments engaged in the preparation of fiber and subsequent manufacturing of yarn, thread, braids, twine, and cordage, the manufacturing of broadwoven fabrics, narrow woven fabrics, knit fabrics, and carpets and rugs from yarn; processes involved in the dyeing and finishing of fibers, yarn fabrics, and knit apparel; the integrated manufacturing of knit apparel and other finished articles of yarn; the manufacturing of felt goods (wool), lace goods, nonwoven fabrics, miscellaneous textiles, and other apparel products (generally described by SIC codes 22 and 23).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention

plan section(s) of this permit (if any) are applicable to the facility.

##### 2. Special Conditions

###### *a. Prohibition of Non-storm Water Discharges.*

(1) In addition to the general prohibition of non-storm water discharges at Part III A.2 of this permit to discharges of wastewater, such as wastewater as a result of wet processing, wastewaters resulting from any processes relating to the production process, reused or recycled water, and waters used in cooling towers are prohibited under this permit. Operators of such discharges to waters of the United States, must obtain coverage under a separate NPDES permit.

##### 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

###### *(a) Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.V.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation:

loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks or silos, bulk storage areas that may exist, processing areas and storage areas, fueling stations, vehicle and equipment maintenance and/or cleaning areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a

summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; onsite waste disposal practices; industry-specific significant materials and industrial activities (e.g., backwinding, beaming, bleaching, backing, bonding carbonizing, carding, cut and sew operations, desizing, drawing, dyeing flocking, fulling, knitting, mercerizing, opening, packing, plying, scouring, slashing, spinning, synthetic-felt processing, textile waste processing, tufting, turning, weaving, web forming, winging, yarn spinning, and yarn texturing). The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at the facility:

(i) *Material Storage Areas*—All stored and containerized materials (fuels, petroleum products, solvents, dyes, etc.) must be stored in a protected area, away from drains and clearly labeled. The plan must describe measures that prevent or minimize contamination of storm water runoff from such storage areas. The facility should specify which materials are stored indoors and must provide a description of the containment area or enclosure for those materials which are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the appropriated containment measures in place to

prevent leaks and spills. The facility may consider an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous substances. In the case of storage of empty chemical drums and containers, facilities should employ practices which ensure that barrels are clean and residuals are not subject to contact with storm water, such practices may include triple-rinsing containers. The discharge waters from such washings must be collected and disposed of properly.

(ii) *Material Handling Area*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from materials handling operations and areas. The facility may consider the use of spill and overflow protection; covering fueling areas; covering and enclosing areas where the transfer of materials may occur. Where applicable, the plan must address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, dyes, or wastewater.

(iii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility may consider covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling.

(iv) *Above Ground Storage Tank Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from above ground storage tank areas. The facility must consider storage tanks and their associated piping and valves. The facility may consider regular cleanup of these areas, preparation of a spill prevention control and countermeasure program, provide spill and overflow protection, minimizing runoff of storm water from adjacent areas, restrict access to the area, insertion of filters in adjacent catch basins, provide absorbent booms in unbermed fueling areas, use of dry cleanup methods, and permanently sealing drains within critical areas that may discharge to a storm drain.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps, catch basins, infiltration devices, ponds) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns

or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Inspection intervals are to occur on a monthly basis. Inspections of this nature shall include, but not be limited to, the following areas: all containment and storage areas, transfer and transmission lines, spill prevention, good housekeeping practices, management of process waste products, all structural and nonstructural management practices. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify dates for such training to take place at least annually (once per calendar year). Employee training must, at a minimum address the following areas when applicable to a facility: use of reused/recycled waters; solvents management; proper disposal of dyes; proper disposal of petroleum products and spent lubricants; spill prevention and control; fueling procedures; and general good housekeeping practices. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. Copies of BMPs and any specific management plans, including

emergency phone numbers, shall be posted in the work areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.  
(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.V.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the

failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.V.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (storage tank areas, waste disposal and storage areas, dumpsters and open containers stored outside, materials storage areas, engine maintenance and repair areas, material handling areas, and loading dock areas) shall be visually inspected for evidence of, or the potential for, pollutants

entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.V.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.V.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.V.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Quarterly Visual Examination of Storm Water Quality.* Facilities shall

perform and document a visual examination of a representative storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(3) Visual examination reports must be maintained in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids,

settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and an explanation in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *W. Storm Water Discharges Associated With Industrial Activity From Wood and Metal Furniture and Fixture Manufacturing Facilities*

##### 1. Discharges Covered Under This Section.

The requirements listed under this section shall apply to storm water discharges associated with industrial activities from facilities involved in the manufacturing of: wood kitchen cabinets (generally described by SIC code 2434); household furniture (generally described by SIC code 251); office furniture (generally described by SIC code 252); public buildings and related furniture (generally described by SIC code 253); partitions, shelving, lockers, and office and store fixtures (generally described by SIC code 254); and miscellaneous furniture and fixtures (generally described by SIC code 259).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

## 2. Special Conditions

*a. Prohibition of Non-storm Water Discharges.* This section does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater.

## 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

*(a) Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing

structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.W.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading and unloading areas; material storage (including tanks or other vessels used for liquid or waste storage) areas; outdoor material processing areas; areas where wastes are treated, stored, or disposed; access roads; and rail spurs. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of the chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to

precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste treatment, storage, or disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance—*A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures—*Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm

water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to the comprehensive site compliance evaluation required under Part XI.W.3.a.(4), of this permit, qualified facility personnel shall be identified to inspect the following on a quarterly basis: the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; vegetative BMPs to determine if soil erosion has occurred; and material handling and storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water. Information must be maintained onsite and include the inspection date and time and the name of personnel conducting the visual inspection. The pollution prevention plan must be updated based on the results of each inspection. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the facility is encouraged.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), BMP inspection and maintenance activities, along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs must be reported and the date of their corrective action noted.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.W.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to

waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.W.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including, but not limited to, coal piles, ash disposal areas, loading/unloading operations, and waste treatment, storage, or disposal locations shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual

inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.W.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.W.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.W.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.W.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

##### *a. Monitoring Requirements.*

(1) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period (described in (a), below) during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the

purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(d) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

(e) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of

color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(f) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan.

(g) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

#### *X. Storm Water Discharges Associated With Industrial Activity From Printing and Publishing Facilities*

##### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to storm water discharges associated with industrial activity from the following types of facilities: book printing (SIC Code 2732); commercial printing, lithographic (SIC Code 2752); commercial printing, gravure (SIC Code 2754); commercial printing, not elsewhere classified (SIC Code 2759); and platemaking and related services (SIC Code 2796).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being

conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

## 2. Special Conditions

There are no additional special conditions beyond those found in Part III. of today's permit.

## 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

### (a) Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part

XI.X.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of the chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as

appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities associated with printing, publishing and allied facilities: loading and unloading operations; outdoor storage activities; significant dust or particulate generating processes; and onsite waste disposal practices (i.e., blanket wash). The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, scrap metal, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Areas where good housekeeping should be implemented include:

(i) *Material Storage Areas*—All stored and containerized materials (skids, pallets, solvents, bulk inks, and hazardous waste, empty drums, portable/mobile containers of plant debris, wood crates, steel racks, fuel oil, etc.) should be stored in a protected area, away from drains and properly labeled. The plan should describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility should specify which materials are stored indoors and must provide a description of the containment area or enclosure for those materials which are stored outdoors. The facility may consider an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous substances. The facility may consider indoor storage of the materials and/or

installation of berming and diking of the area.

(ii) *Material Handling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from materials handling operations and areas (i.e., blanket wash, mixing solvents, loading/unloading materials). The facility may consider the use of spill and overflow protection; covering fuel areas; covering and enclosing areas where the transfer of materials may occur. Where applicable, the plan must address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, or wastewater.

(iii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility may consider covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling.

(iv) *Above Ground Storage Tank Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from above ground storage tanks and their associated piping and valves. The facility may consider regular cleanup of these areas, preparation of a spill prevention control and countermeasure program, provide spill and overflow protection, minimizing runoff of storm water from adjacent facilities and properties, restrict access to the area, insertion of filters in adjacent catch basins, provide absorbent booms in unbermed fueling areas, use of dry cleanup methods, and permanently sealing drains within critical areas that may discharge to a storm drain.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, vegetative swales, secondary containment, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where

appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on an annual basis. The following areas shall be included in, but not limited to, all inspections: all containment and material storage areas, fueling areas, loading and unloading areas, equipment cleaning areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but training should be provided annually. Employee training must, at a minimum, address the following areas when applicable to a facility: spent solvent management; spill prevention and control; used oil management; fueling procedures; and general good housekeeping practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or

evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.X.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional

storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.X.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (including, but not limited to, material handling areas, material storage areas, waste disposal and storage areas, loading/unloading areas) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.X.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.X.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2

weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.X.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

#### 5. Monitoring and Reporting Requirements

##### a. *Monitoring Requirements.*

(1) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity for each outfall except discharges exempted below. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of a grab sample collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and

other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual examination reports must be maintained in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the

drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### *Y. Storm Water Discharges Associated With Industrial Activity From Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries*

##### 1. Discharges Covered Under This Section

The requirements listed under this section shall apply to all storm water discharges associated with industrial activity from rubber and miscellaneous plastic products manufacturing facilities (SIC major group 30) and miscellaneous manufacturing industries, except jewelry, silverware, and plated ware (SIC major group 39, except 391).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

##### 2. Special Conditions

*Prohibition of Non-storm Water Discharges.* Other than as provided in Part III.A. of this permit, non-storm water discharges are not authorized by this section.

##### 3. Storm Water Pollution Prevention Plan Requirements

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual

or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. All rubber manufacturers shall in particular review the use of zinc at their facilities and the possible pathways through which zinc may be discharged in storm water runoff. Each plan shall include, at a minimum:

###### *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.Y.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history

of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

*Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of

controls in a plan shall reflect identified potential sources of pollutants at the facility. Facilities subject to EPCRA Section 313 should note that the special requirements of Part IV.E. of this permit also apply to their facilities. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a cleanup should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.Y.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as

spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

*Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Y.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after

[Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.Y.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(j) *Special Requirements for All Rubber Products Manufacturers*—All rubber products manufacturing facilities shall include specific measures and controls to minimize the discharge of zinc in their storm water discharges. The following possible sources of zinc shall be reviewed and the accompanying BMPs shall be included as appropriate in the storm water pollution prevention plan:

(i) *Inadequate Housekeeping*—All permittees shall review the handling

and storage of zinc bags at their facilities and consider the following BMPs for the pollution prevention plan: employee training regarding the handling and storage of zinc bags, indoor storage of zinc bags, thorough cleanup of zinc spills without washing the zinc into the storm drain, and the use of 2,500-pound sacks of zinc rather than 50- to 100-pound sacks.

(ii) *Zinc in Dumpsters*—The following BMPs or equivalent measures shall be considered to reduce discharges of zinc from dumpsters: providing a cover for the dumpster; move the dumpster to an indoors location; or provide a lining for the dumpster.

(iii) *Malfunctioning Dust Collectors or Baghouses*—Permittees shall review dust collectors and baghouses as possible sources in zinc in storm water runoff. Improperly operating dust collectors or baghouses shall be replaced or repaired as appropriate. The pollution prevention plan shall also provide for regular maintenance of these facilities.

(iv) *Grinding Operations*—Permittees shall review dust generation from rubber grinding operations at their facility and, as appropriate, install a dust collection system.

(v) *Zinc Stearate Coating Operations*—Permittees shall include in the pollution prevention plan appropriate measures to prevent and/or clean up drips or spills of zinc stearate slurry which may be released to the storm drain. Alternate compounds to zinc stearate shall also be considered.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan

in accordance with paragraph XI.Y.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Y.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.Y.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

#### 5. Monitoring and Reporting Requirements

##### a. Analytical Monitoring Requirements

During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with rubber product manufacturing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 6.a.(3) (Sampling Waiver), 6.a.(4) (Representative Discharge), and 6.a.(5) (Alternative Certification). Rubber product manufacturing facilities are required to monitor their storm water discharges for the pollutants of concern

listed in Table Y-1 below. Facilities must report in accordance with 6.b. (Reporting). In addition to the parameters listed in Table Y-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE Y-1—MONITORING REQUIREMENTS

Pollutants of concern	Cut-off concentration
Total Recoverable Zinc ...	0.065 mg/L

(1) *Monitoring Periods*. Rubber product manufacturing facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Water*.

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table Y-1 under the column Monitoring Cut-Off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the

location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent, or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis, in lieu of monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph b below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance monitoring requirements associated with effluent limitations.

(b) *Reporting*. Permittees with rubber product manufacturing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s)

postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph (b) (above), rubber product manufacturing facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (b) (above).

(c) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No

analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of

a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

#### Z. Storm Water Discharges Associated With Industrial Activity From Leather Tanning and Finishing Facilities

##### 1. Discharges Covered Under This Section.

The requirements listed under this section shall apply to storm water discharges from the following activities: leather tanning, currying and finishing (commonly identified by Standard Industrial Classification (SIC) code 3111). Discharges from facilities that make fertilizer solely from leather scraps and leather dust are also covered under this section. When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

##### 2. Special Conditions

There are no special conditions for this section beyond those in Part III. of this permit.

##### 3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm

water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources or, during periods of dry weather, result in dry weather flows. Each plan shall include, at a minimum:

##### (a) *Drainage.*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies (including wetlands), locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.Z.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, material storage (including tanks or other vessels used for liquid or waste storage), processing and storage areas for activities associated with beamhouse, tanyard, retan-wet finishing and dry finishing operations, and haul roads, access roads and rail spurs. The site map must also identify the location of all outfalls covered by this permit and include an inventory of the types of discharges contained in each outfall.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history

of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of the Clean Water Act (CWA) (see 40 CFR 110.10 and 40 CFR 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A

narrative description of potential pollutant sources including but not limited to the following activities: loading and unloading operations; outdoor storage activities, including but not limited to: temporary or permanent storage of fresh and brine cured hides, chemical drums, bags, containers and above ground tanks, leather dust, scraps, trimmings and shavings, spent solvents, extraneous hide substances and hair, and empty chemical containers and bags; floor sweepings and washings; refuse and waste piles and sludge; outdoor manufacturing or processing activities; significant dust or particulate generating processes including buffing; vehicle maintenance, washing and fueling and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, total suspended solids, chromium, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed:

(i) *Storage Areas for Raw, Semiprocessed, or Finished Tannery By-products*—Pallets and/or bales of raw, semiprocessed or finished tannery by-products (e.g., splits, trimmings, shavings, etc.) should be stored indoors or protected by polyethylene wrapping, tarpaulins, roofed storage area or other suitable means. Materials should be placed on an impermeable surface, the area should be enclosed or bermed or other equivalent measures should be employed to prevent runoff and runoff of storm water.

(ii) *Material Storage Areas*—Label storage units of all materials (e.g., specific chemicals, hazardous materials, spent solvents, waste materials). Maintain such containers and units in good condition. Describe measures that prevent or minimize contact with storm water. The facility must consider indoor

storage, installation of berming and diking around the area, and/or other equivalent measures to prevent runoff and runoff of storm water.

(iii) *Buffing/Shaving Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff with leather dust from buffing/shaving areas. The facility may consider dust collection enclosures, preventive inspection/maintenance programs or other appropriate preventive measures.

(iv) *Receiving, Unloading, and Storage Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from receiving, unloading, and storage areas. Exposed receiving, unloading and storage areas for hides and chemical supplies should be protected by a suitable cover, diversion of drainage to the process sewer, grade berming or curbing area to prevent runoff of storm water or other appropriate preventive measures. Materials must be plainly labelled and maintained in good condition.

(v) *Outdoor Storage of Contaminated Equipment*—The plan must describe measures that minimize contact of storm water with contaminated equipment. Equipment should be protected by suitable cover, diversion of drainage to the process sewer, thorough cleaning prior to storage or other appropriate preventive measures.

(vi) *Waste Management*—The plan must describe measures that prevent contamination of the storm water runoff from waste storage areas. The facility may consider inspection/maintenance programs or other equivalent measures for leaking containers or spills, covering dumpsters, moving waste management activities indoors, covering waste piles with temporary covering material such as tarpaulins or polyethylene, and minimizing storm water runoff by enclosing the area or building berms around the area.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points

shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

*(d) Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at least on a quarterly basis. The following areas shall be included in all inspections: leather processing areas, storage areas for chemicals, including but not limited to above ground tanks, fueling areas, vehicle and equipment maintenance areas, material storage areas, loading and unloading areas, waste management areas and other potential sources of pollution for evidence of actual or potential discharges of contaminated storm water. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections and that the pollution prevention plan is appropriately modified. Records of inspections shall be maintained as part of the pollution prevention plan.

Qualified personnel are required to conduct quarterly inspections of all Best Management Practices (BMPs). The inspections shall include an assessment of the effectiveness and need for maintenance of storm water roofing and covers, dikes and curbs, discharge diversions, sediment control and collection systems and all other BMPs.

Quarterly inspections must be made at least once in each of the following designated periods during daylight hours: January through March (storm water runoff or snow melt), April through June (storm water runoff), July through September (storm water runoff), and October through December (snow melt runoff). Records shall be maintained as part of the pollution prevention plan.

*(e) Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases, training must be held at least annually. Employee training must, at a minimum, address the following

areas when applicable to a facility: general good housekeeping practices, spill prevention and control, waste management, inspections, preventive maintenance, detection of non-storm water discharges and other areas.

*(f) Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as leaks, spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. The plan must address spills, monitoring, and BMP inspection and maintenance activities. BMPs which were ineffective must be reported and the date of their corrective action recorded. Employees must report incidents of leaking fluids to facility management and these reports must be incorporated into the plan.

*(g) Non-storm Water Discharges.*  
*(i)* The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Z.3.a.(3)(g)(iii) (below).

*(ii)* Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution

prevention measures for the non-storm water component(s) of the discharge.

*(iii) Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

*(h) Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

*(i) Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.Z.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (e.g., storage areas, loading and unloading areas,

above ground storage of chemicals) to be controlled by each storm water management practice.

The plan must consider management practices, such as berms for uncovered storage areas, uncovered loading and unloading areas, above ground liquid storage and waste management areas. The installation of detention ponds must also be considered.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.Z.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Z.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.Z.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in

compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to (1) Confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. Comprehensive site compliance evaluations must be conducted at least once a year. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Evaluation reports must be retained for at least 3 years from the date of the evaluation.

(e) Where compliance evaluation schedules overlap with inspections required under XI.Z.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

5. Monitoring and Reporting Requirements.

(a) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(2) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be

performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(3) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(5) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(6) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*AA. Storm Water Discharges Associated With Industrial Activity From Fabricated Metal Products Industry*

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges associated with industrial activity from the fabricated metals industry listed below, except for electrical related industries: fabricated metal products, except machinery & transportation equipment, SIC 34 (3429, 3441, 3442, 3443, 3444, 3451, 3452, 3462, 3471, 3479, 3494, 3496, 3499); and jewelry, silverware, and plated ware (SIC Code 391).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Special Conditions.

*a. Prohibition of Non-storm Water Discharges.*

(1) This permit does not authorize the discharge of process wastewater. Certain non-storm discharges identified in Part III.A.2. are authorized under this permit.

3. Storm Water Pollution Prevention Plan Requirements.

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm

water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all industrial activities and significant materials which may potentially be significant pollutant sources. Each plan shall specifically identify the physical features of the facility that may contribute to storm water runoff. Each plan shall include, at a minimum:

*(a) Drainage*

(i) A site map indicating the outfall locations and types of discharges contained in the drainage areas of the outfalls, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part IX.AA.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: raw metal storage areas, finished metal storage areas, scrap disposal collection sites, equipment storage areas, retention and detention basins, temporary diversion dikes or berms, permanent diversion dikes or berms, right-of-way or perimeter diversion devices, any sediment traps or barriers, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas including outside painting areas, wood preparation, recycling and raw material storage.

(ii) For each area of the facilities that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to

consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. In addition, flows with a significant potential for causing erosion shall be identified such as heavy equipment use areas, drainage from roofs, parking lots, etc.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills that should be considered for the fabricated metals industry include, but are not limited to, chromium, toluene, pickle liquor, sulfuric acid, zinc and other water priority chemicals and hazardous chemicals and wastes. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations for paints, chemicals and raw materials; outdoor storage activities for raw materials, paints, empty containers, corn cob, chemicals, scrap metals; outdoor manufacturing or processing

activities such as grinding, cutting, degreasing, buffing, brazing, etc.; significant dust or particulate generating processes; and onsite waste disposal practices for spent solvents, sludge, pickling baths, shavings, ingots pieces, refuse and waste piles. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical or chemical oxygen demand, chromium, total suspended solids, oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Permittees should address the following areas in the manner described.

(i) *Raw Steel Handling Storage*—Include measures controlling or recovering scrap metals, fines, and iron dust, including measures for containing materials within storage handling areas.

(ii) *Paints and Painting Equipment*—Consider control measures to prevent or minimize exposure of paint and painting equipment from exposure to storm water.

(b) *Preventive Maintenance*—Preventive maintenance measures shall include timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which could contribute pollutants to storm water discharges may occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment

such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel. The following areas should be addressed:

(i) *Metal Fabricating Areas*—Include measures for maintaining clean, dry, orderly conditions in these areas. Use of dry clean-up techniques should be considered in the plan.

(ii) *Storage Areas for Raw Metal*—Include measures to keep these areas free of conditions that could cause spills or leakage of materials. Storage areas should be maintained for easy access in case spill clean up is necessary. Stored materials should be able to be identified correctly and quickly.

(iii) *Receiving, Unloading, and Storage Areas*—Include measures to prevent spills and leaks; plan for quick remedial clean up and instruct employees on clean-up techniques and procedures.

(iv) *Storage of Equipment*—Include measures for preparing equipment for storage and the proper method to store equipment including protecting with covers, storing indoors. The plan should include clean-up measures for equipment that will be stored outdoors to remove potential pollutants.

(v) *Metal Working Fluid Storage Areas*—The plan should include measures that identify controls particularly for storage of metal working fluids.

(vi) *Cleaners and Rinse Water*—The plan should include measures to control and cleanup spills of solvents and other liquid cleaners; control sand buildup and disbursement from sand-blasting operations, prevent exposure of recyclable wastes; and employ substitute cleaners when possible.

(vii) *Lubricating Oil and Hydraulic Fluid Operations*—Consider using devices or monitoring equipment to detect and control leaks and overflows, including the installation of perimeter controls such as dikes, curbs, grass filter strips, or other equivalent measures.

(viii) *Chemical Storage Areas*—Identify proper storage that prevents storm water contamination and prevents accidental spillage. The plan should include a program to inspect containers, and identify proper disposal and spill controls.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Metal fabricators shall at a minimum include the following areas for inspection: raw metal storage areas,

finished product storage areas, material and chemical storage areas, recycling areas, loading and unloading areas, equipment storage areas, paint areas, fueling and maintenance areas, and waste management areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in

accordance with paragraph XI.AA.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting a notice of intent to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion. The plan shall identify structural, vegetative, and/or stabilization measures to be used to limit erosion. These shall include but not be limited to grass swales, filter strips, treatment works, or other equivalent measures. Metal fabricators must include in their plan measures to minimize erosion related to the high volume of traffic from heavy equipment for delivery to and from the facility and for equipment operating at the facility on a daily basis such as forklifts, cranes, etc.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutant(s) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee

determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activities under the SIC codes identified under paragraph XI.AA.1. of this section shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at least once a year. Such evaluations shall include:

(a) Visual inspection of areas contributing to a storm water discharge for evidence of, or the potential for, pollutants entering the drainage system. Inspection shall address areas associated with the storage of raw metals, storage of spent solvents and chemicals, outdoor paint areas, drainage from roof, unloading and loading areas, equipment storage areas, recycling areas, and retention ponds (sludge). Potential pollutants include chromium, zinc, lubricating oil, solvents, aluminum, oil and grease, methyl ethyl ketone, steel, and other related materials. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, such as detention basins and channels, gutters or drains to direct discharge flow, oil/water separators in storm drains, containment structures, concrete pads, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment and containment drums, shall be made to determine if the equipment is functioning properly and that drums are not in a corrosive or deteriorating state.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.AA.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in

accordance with paragraph XI.AA.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AA.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the inspection. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

#### 4. Numeric Effluent Limitations.

There are no additional numeric effluent limitations beyond those described in Part V.B. of this permit.

#### 5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with metal fabricating facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) during years 2 and 4 except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Metal fabricating facilities are required to monitor their storm water discharges for the pollutants of concern listed in Tables AA-1 and AA-2 below. The monitoring requirements are subdivided into two classifications to determine pollutants of concern: (1) fabricated metal products except coating and (2) fabricated metal coating and engraving. Facilities must report in accordance with 5.b. (Reporting). In addition to the

parameters listed in Tables AA-1 and AA-2 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE AA-1.—MONITORING REQUIREMENTS FOR FABRICATED METAL PRODUCTS EXCEPT COATING

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Aluminum	0.75 mg/L
Total Recoverable Iron .....	1.0 mg/L
Total Recoverable Zinc .....	0.065 mg/L
Nitrate plus Nitrite Nitrogen	0.68 mg/L

TABLE AA-2.—MONITORING REQUIREMENTS FOR FABRICATED METAL COATING AND ENGRAVING

Pollutants of concern	Monitoring cut-off concentration
Total Recoverable Zinc .....	0.065 mg/L
Nitrate plus Nitrite Nitrogen	0.068 mg/L

(1) *Monitoring Periods.* Metal fabricating facilities shall monitor samples collected during the sampling periods of: January through March, April through June, July through September, and October through December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The required 72-hour storm event interval is waived where the preceding measurable storm event did not result in a measurable discharge from the facility. The required 72-hour storm event interval may also be waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the

discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples within a specified sampling period due to adverse climatic conditions, the discharger shall collect a substitute sample from a separate qualifying event in the next period and submit the data along with data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutants listed in Tables AA-1 and AA-2 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in areas of the facility which drain to the outfall for which sampling was waived.

(c) When a discharger is unable to conduct quarterly chemical storm water sampling at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirements as long as the facility remains inactive and unstaffed. The facility must submit to the Director, in lieu of monitoring data, a certification statement on the DMR stating that the site is inactive and unstaffed so that collecting a sample during a qualifying event is not possible.

(4) *Representative Discharge.* When a facility has two or more outfalls that,

based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall or on a pollutant-by-pollutant basis in lieu of monitoring reports required under paragraph b below, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit. In the case of certifying that a pollutant is not present, the permittee must submit the certification along with the monitoring reports required under paragraph (b) below. If the permittee cannot certify for an entire period, they must submit the date exposure was eliminated and any monitoring required up until that date. This certification option is not applicable to compliance

monitoring requirements associated with effluent limitations.

*b. Reporting.* Permittees with metal fabricating and engraving facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. For each outfall, one signed Discharge Monitoring Report form must be submitted to the Director per storm event sampled. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

*(1) Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), metal fabricating facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

*c. Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in paragraph (1) below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

*(1)* Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snowmelt: January through March; April through June; July

through September; and October through December.

*(2)* Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

*(3)* Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

*(4)* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

*(5)* When a discharger is unable to collect samples over the course of the visual examination period as a result of

adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

*(6)* When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

*AB. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Transportation Equipment, Industrial, or Commercial Machinery*

**1. Discharges Covered Under This Section**

*a.* The requirements listed under this section shall apply to storm water discharges associated with transportation equipment, industrial or commercial machinery manufacturing facilities (commonly described by SIC Major Group 35 except SIC 357, and SIC Major Group 37, except SIC 373). Common activities include: industrial plant yards; material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas for raw material and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water.

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all

applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Prohibition of Non-storm Water Discharges. There are no additional requirements other than those in Part III. of the permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify the specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating the pattern of storm water drainage, existing structural control measures to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, and locations where major spills or leaks identified under Part XI.AB.3.a.(2)(c) (Spills and Leaks) of this permit have occurred since 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. The map must also indicate the locations of all industrial activities that are exposed to precipitation, including, but not limited to: loading/unloading areas; waste treatment; storage and disposal locations; liquid storage tanks; vents

and stacks from metal processing and similar operations; significant dust or particulate generating areas; and any other processing and storage areas exposed to storm water. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for contacting significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to present in storm water discharges associated with industrial activity must be identified. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced, or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also

include releases of oil or hazardous substances that are not excess of reporting requirements and releases of materials that are not classified as oil or hazardous substance. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; significant dust or particulate generating processing activities; and onsite waste disposal. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner. Areas where good housekeeping practices should be implemented are storage areas for raw materials, waste materials and finished products; loading/unloading areas; and waste disposal areas for hazardous and nonhazardous wastes. Examples of good housekeeping measures include sweeping; labelling drums containing hazardous materials; and preventive monitoring practices (e.g., routine observation of manufacturing processes) or equivalent measures.

(b) *Preventive Maintenance—*A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and

ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Areas to be identified should include loading/unloading areas, outdoor storage areas, and waste management areas exposed to storm water. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a periodic basis. At a minimum, the following areas, where the potential for exposure to storm water exists, must be inspected on a regularly scheduled basis: loading and unloading areas for all significant materials; storage areas, including associated containment areas; waste management units; and vents and stacks from industrial activities. For any problems identified during inspections, the plan shall be revised to include measures to address these problems. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices, unloading/loading practices, outdoor storage areas, waste management practices, proper handling procedures of hazardous waste, and improper connections to the storm sewer. At a minimum, this training should be provided annually. The pollution prevention plan shall identify frequencies and approximate dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other

discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs should be reported and the date of their corrective actions noted.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges as identified in Part III.A.2. of this permit. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.AB.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) If the facility discharges wastewater, other than storm water via an existing NPDES permit, a copy of the NPDES permit authorizing the discharge must be attached to the plan. Similarly, if the facility submitted an application for an NPDES permit for non-storm water discharges, but has not yet received that permit, a copy of the permit application must be attached. Upon issuance or reissuance of an NPDES permit, the facility must modify

its plan to include a copy of that permit. For facilities that discharge wastewater, other than solely domestic wastewater, to a Publicly Owned Treatment Works (POTW), the facility must notify the POTW of its discharge. Proof of this notification should be attached to the plan in the form of either (1) a copy of the permit issued by the treatment plant to the facility or (2) a copy of a notification letter to the POTW. Notification should identify, in general, the types of wastewater discharged to the POTW, including any storm water discharges. In any of these cases, specific permit conditions must be considered in the plan.

(iv) *Failure to Certify*—Any facility that is unable to provide the certification required for non-storm water discharges, must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.AB.3.a.(2) (Description of

Potential Pollutant Sources) of this permit) shall be considered when determining reasonable and appropriate measures. Appropriate measures or other equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (storage areas, loading/unloading) to be controlled by each storm water management practice.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with Part XI.AB.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.AB.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the evaluation, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AB.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after the date of the

evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric limitations beyond those described in Part V.B of this permit.

5. Monitoring and Reporting Requirements.

a. *Monitoring Requirements.*

(1) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) When a discharger is unable to collect samples over the course of the

visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(d) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

(e) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(f) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

*AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods*

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to all storm water discharges associated with industrial activity from facilities that manufacture: electronic and other electrical equipment and components, except computer equipment (SIC major group 36); measuring, analyzing, and controlling instruments; photographic, medical and optical goods; watches and clocks (SIC major group 38) and computer and office equipment (SIC code 357).

When an industrial facility, described by the above coverage provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

2. Special Conditions.

*a. Prohibition of Non-storm Water Discharges.* Other than as provided in use this Section III.A. of this permit, non-storm water discharges are not authorized by this permit.

3. Storm Water Pollution Prevention Plan Requirements.

*a. Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a

description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.AC.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. The map must indicate the outfall locations and the types of discharges contained in the drainage areas of the outfalls.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—*

An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; method and location of onsite storage or disposal; materials management

practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the date of the submission of a Notice of Intent (NOI) to be covered under this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance—*A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/

water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.AC.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the

identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution prevention plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.AC.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2 (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for

significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.AC.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures or equivalent measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the evaluation, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.AC.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in

accordance with paragraph XI.AC.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such evaluation and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation.

(c) A report summarizing the scope of the inspection, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AC.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years from the date of the evaluation. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V.B of this permit.

5. Monitoring and Reporting Requirements

*a. Monitoring Requirements*

(1) *Quarterly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a storm water discharge associated with industrial activity from each outfall, except discharges exempted below. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: January through March; April through June; July through September; and October through December.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor,

clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel

(such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(f) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

## XII. Coverage Under This Permit

### *Region III*

#### *A. Federal Facilities in the District of Columbia (DCR05\*##F)*

District of Columbia 401 certification special permit conditions revise the permit as follows:

1. Part IV section B is amended by the addition of the following:

Part IV. Storm Water Pollution Prevention Plans

\* \* \* \* \*

#### *B. Signature and Plan Review*

\* \* \* \* \*

4. Review and Approval by Department of Consumer and Regulatory Affairs

A copy of all storm water pollution prevention plans required under the permit shall be submitted to the District of Columbia's Department of Consumer and Regulatory Affairs, Environmental Regulation Administration, for review and approval.

2. Part IV section E is amended by the addition of the following:

Part IV. Storm Water Pollution Prevention Plans

\* \* \* \* \*

#### *E. Special Pollution Prevention Plan Requirements*

\* \* \* \* \*

5. Nitrogen, Phosphorus, Fertilizer, Pesticides and Urea Loadings and Usages

Permittees shall include in the storm water pollution prevention plan current nitrogen and phosphorus loads, current fertilizer usage, current exterior pesticide usage, and current urea for deicing usage.

6. Storm Water and Ground Water Diversions to Sanitary Sewers

Permittees shall include in the storm water pollution prevention plan the volume of any storm water diverted to the sanitary sewer from roof leaders or other connections and the volume any ground water diverted to the sanitary sewer.

7. Proposed Reductions in Nutrient and Pesticide Loads

Permittees shall include in the storm water pollution prevention plan the proposed reductions in nutrient and pesticides loads in accordance with the Chesapeake Bay Restoration goals.

8. Animal Waste Management Plans

Any permittee that manages significant quantities of animals or animal wastes, shall provide in the storm water pollution prevention plan an accounting of these animal wastes, and nutrient control measures for avoiding, reducing, or eliminating runoff of these animal wastes.

B. District of Columbia (DCR05\*###)

District of Columbia 401 certification special permit conditions revise the permit as follows:

1. Part IV section B is amended by the addition of the following:

Part IV. Storm Water Pollution Prevention Plans

\* \* \* \* \*

B. Signature and Plan Review

\* \* \* \* \*

4. Review and Approval by Department of Consumer and Regulatory Affairs

A copy of all storm water management plans required under the permit shall be submitted to the District of Columbia's Department of Consumer and Regulatory Affairs, Environmental Regulation Administration, for review and approval.

Region VI

C. Louisiana (LAR05\*###)

Louisiana 401 certification and Coastal Zone special permit conditions revise the permit as follows:

1. Part I section B. is amended by the addition of the following:

Part I. Coverage Under This Permit

B. Eligibility

\* \* \* \* \*

8. Discharges Subject to Louisiana Coastal Zone Management Program

Facilities whose activities occur in, or have an effect on, the designated coastal zone of Louisiana, shall have obtained an individual coastal zone consistency concurrence, permit, or waiver from the Coastal Management Division of the Louisiana Department of Natural Resources (in accordance with the Louisiana Coastal Zone Management Program LRS 49:214). Facilities wishing to obtain a description of the areas designated by the State of Louisiana as the "coastal zone" should request that information by writing to: State of Louisiana, Department of Natural Resources, Coastal Zone Management Division, P.O. Box 44487, Baton Rouge, Louisiana 70804-4487.

2. The following section is added to Part V of the Permit:

Part V. Numeric Effluent Limitations

\* \* \* \* \*

c. Limitations for all discharges of storm water associated with industrial activity.

(1) General Limitations: Effective [insert effective date of permit].

Parameter	Daily maximum
Total Organic Carbon (TOC) .....	50 mg/l
Oil & Grease .....	15 mg/l

(2) Oil & Gas Exploration and Production Facilities: Effective on effective date of permit.

Parameter	Daily maximum
Chemical Oxygen Demand (COD)	100 mg/l
Total Organic Carbon (TOC) .....	50 mg/l
Oil & Grease .....	15 mg/l

Chlorides:

(a) Maximum chloride concentration of the discharge shall not exceed two times the ambient concentration of the receiving water in brackish marsh areas.

(b) Maximum chloride concentration of the discharge shall not exceed 500 mg/l in freshwater or intermediate marsh areas and upland areas.

Facilities without monitoring requirements must insure the pollution prevention plan developed in accordance with Part IV will insure compliance with these effluent limitations.

\* \* \* \* \*

3. The following definitions are added to Part X of the permit:

Part X. Definitions

"Brackish Marshes"—those areas that are inundated or saturated by surface water or groundwater of moderate salinity at a frequency and duration sufficient to support, and that under normal circumstances do support, emergent vegetation characterized by a prevalence of species typically adapted for life in these soil and contiguous surface water conditions. Typical vegetation includes wiregrass (Spartina patens), three-cornered grass (Scirpus olneyi), coco (Scirpus robustus), and widgeongrass (Ruppia maritima). Interstitial water salinity normally ranges between 7 and 15 parts per thousand. (LAC 33:IX.708)

"Freshwater Swamps and Marshes"—those areas that are inundated or saturated by surface water or groundwater of negligible to very low salinity at a frequency and duration sufficient to support, and that under normal circumstances do support, emergent vegetation characterized by a prevalence of species typically adapted for life in these soil and contiguous surface water conditions. Typical vegetation includes maiden cane (Panicum hemitomon), Hydrocotyl sp., water hyacinth (Eichhornia crassipes), pickerelweed (Pontederia cordata), alligatorweed (Alternanthera philoxeroides), and bulltongue (Sagittaria sp.). Interstitial water salinity is normally less than 2 parts per thousand. (LAC 33:IX.708)

"Intermediate Marshes"—those areas that are inundated or saturated by surface water

or groundwater of salinity at a frequency and duration sufficient to support, and that under normal circumstances do support, emergent vegetation characterized by a prevalence of species typically adapted for life in these soil and contiguous surface water conditions. Typical vegetation includes wiregrass (Spartina patens), deer pea (Vigna repens), bulltongue (Sagittaria sp.), wild millet (Echinochloa walteri), bullwhip (Scirpus californicus), and sawgrass (Cladium jamaicense). Interstitial water salinity normally ranges between 3 and 6 parts per thousand. (LAC 33:IX.708)

"Saline Marshes"—those wetland areas that are inundated or saturated by surface water or groundwater of salinity characteristic of near Gulf of Mexico ambient water at a frequency and duration sufficient to support, and that under normal circumstances do support, emergent vegetation characterized by a prevalence of species typically adapted for life in these soil and contiguous surface water conditions. Typical vegetation includes oystergrass (Spartina alterniflora), glasswort (Salicornia sp.), black rush (Juncus roemerianus), Batis maritima, black mangrove (Avicennia nitida), and saltgrass (Distichlis spicata). Interstitial water salinity normally exceeds 16 parts per thousand. (LAC 33:IX.708)

"Upland"—any land area that is not normally inundated with water and that would not, under normal circumstances, be characterized as swamp or fresh, intermediate, brackish, or saline marsh. The term shall have both a regional and site-specific connotation; for example, naturally occurring and man-made topographic highs that are partially or totally surrounded by swamp, marsh, or open water will be considered upland on a local basis, but will not necessitate characterization of the surrounding area as upland. The land and water bottoms of all parishes north of the nine parishes contiguous with the Gulf of Mexico shall be determined on a case-by-case basis with reference to the presences of a regional expanse of emergent aquatic vegetation or open water. (LAC 33:IX.708)

D. New Mexico (NMR05\*###)

New Mexico 401 certification special permit conditions revise the permit as follows:

1. Part VI.B of the permit is revised to read:

Part VI. Monitoring and Reporting Requirements

\* \* \* \* \*

B. Reporting: Where to Submit.

\* \* \* \* \*

3. Location. Signed copies of discharge monitoring reports required under Parts XI. and VI.C., individual permit applications, and all other reports required herein, shall be submitted to the appropriate state office address:

New Mexico

Program Manager, Point Source Regulation Section, Surface Water Quality Bureau, New Mexico Environment Department, 1190 St. Francis Drive, Santa Fe, New Mexico 87504-0968

2. Part XI of the permit is revised to include the following additional monitoring for the industrial sectors indicated:

Part XI.

*A. Storm Water Discharges Associated With Industrial Activity From Timber Products Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Tables A-1,2,3,4 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Sawmill & planing facilities: shall monitor Biochemical Oxygen Demand (BOD), Nitrate + Nitrite (NO<sub>3</sub>+NO<sub>2</sub>), Ammonia (NH<sub>3</sub>) and Total Kjeldahl Nitrogen (TKN);
- (2) Wood preserving facilities: shall monitor Total Suspended Solids (TSS), NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub> and TKN;
- (3) Log storage & handling facilities: shall monitor Chemical Oxygen Demand (COD), NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub> and TKN;
- (4) Other wood products: shall monitor BOD, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub> and oil & grease.

\* \* \* \* \*

*B. Storm Water Discharges Associated With Industrial Activity From Paper And Allied Products Manufacturing Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table B-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Paperboard mills: shall monitor TSS, BOD, NO<sub>3</sub>+NO<sub>2</sub>, and TKN;
- (2) Paperboard containers & boxes: shall monitor COD, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN;
- (3) Converted paper & paperboard products: shall monitor COD, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN.

\* \* \* \* \*

*C. Storm Water Discharges Associated With Industrial Activity From Chemical and Allied Products Manufacturing Facilities*

\* \* \* \* \*

6. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Tables C-2,3,4,5 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Agricultural chemical: shall monitor total mercury (Hg), TSS, NH<sub>3</sub>, and TKN;
- (2) Inorganic chemical: shall monitor total Hg, NH<sub>3</sub>, and TKN;
- (3) Detergents, cosmetics & perfumes: shall monitor COD, TKN, NH<sub>3</sub>, and TSS;
- (4) Paints, varnishes, enamels & allied products: shall monitor TSS, NH<sub>3</sub>, NO<sub>3</sub>+NO<sub>2</sub>, and TKN.
- (5) Plastics, synthetics, and resins: shall monitor total Hg, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN.

\* \* \* \* \*

*D. Storm Water Discharges Associated With Industrial Activity From Asphalt Paving and Roofing Materials and Lubricant Manufacturers*

\* \* \* \* \*

5. Monitoring and Reporting Requirements.

(a) \* \* \* In addition to the parameters listed in Table D-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

Asphalt paving & roofing materials: shall monitor COD, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN.

*E. Storm Water Discharges Associated With Industrial Activity From Glass, Clay, Cement, Concrete, Gypsum Product Manufacturing Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Tables E-1,2 the following facilities shall conduct monitoring of the additional

parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Clay product manufactures: shall monitor TSS;
- (2) Concrete & gypsum product manufactures: shall monitor TKN, NH<sub>3</sub>, and NO<sub>3</sub>+NO<sub>2</sub>;
- (3) Flat glass, glass & glassware, pressed or blown glass products: shall monitor TKN, NH<sub>3</sub>, and NO<sub>3</sub>+NO<sub>2</sub>.

\* \* \* \* \*

*F. Storm Water Discharges Associated With Industrial Activity From Primary Metals Facilities.*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Tables F-1, 2, 3, 4 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Steel works: shall monitor total Hg, TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TSS;
- (2) Iron & steel foundries: shall monitor total Hg, COD, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN;
- (3) Rolling, drawing & extruding—non-ferrous: shall monitor total Hg, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN;
- (4) Non-ferrous foundries: shall monitor total Hg, TSS, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN.

\* \* \* \* \*

*G. Storm Water Discharges Associated With Industrial Activity From Metal Mining (Ore Mining and Dressing) Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table G-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per

year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

All metal mining facilities shall monitor for COD, TSS, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, total Hg; in addition, all permittees in the SIC code for metals mining shall monitor for any heavy metal which the permittee has reason to believe may be present in storm water runoff from the mining facility.

\* \* \* \* \*

*I. Storm Water Discharges Associated With Industrial Activity From Oil and Gas Extraction Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) All facilities in this sector shall conduct analytical monitoring for oil and grease; total phosphorus; and total suspended solids (TSS). The data shall be reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*J. Storm Water Discharges Associated With Industrial Activity From Mineral Mining and Processing Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table J-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March. Sand & gravel mining facilities: shall monitor TKN and NH<sub>3</sub>.

\* \* \* \* \*

*K. Storm Water Discharges Associated With Industrial Activity From Hazardous Waste Treatment, Storage, or Disposal Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table K-1 all facilities shall monitor TKN, NO<sub>3</sub>+NO<sub>2</sub>, and TSS and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*L. Storm Water Discharges Associated With Industrial Activity From Landfills and Land Application Sites*

5. Monitoring and Reporting Requirements.

(a) \* \* \* In addition to the parameters listed in Table L-1 all facilities shall monitor TKN, NH<sub>3</sub>, and NO<sub>3</sub>+NO<sub>2</sub> and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*M. Storm Water Discharges Associated With Industrial Activity From Automobile Salvage Yards*

\* \* \* \* \*

4. Monitoring and Reporting Requirements.

(a) \* \* \* In addition to the parameters listed in Table M-1 all facilities shall monitor oil & grease, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*N. Storm Water Discharges Associated With Industrial Activity From Scrap Recycling and Waste Recycling Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table N-1 all facilities shall monitor oil & grease, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*O. Storm Water Discharges Associated With Industrial Activity From Steam Electric Power Generating Facilities, Including Coal Handling Areas*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table O-1 all facilities shall monitor TSS, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, and total Zinc (Zn) and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*P. Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, Rail Transportation Facilities, and United States Postal Service Transportation Facilities*

\* \* \* \* \*

4. Monitoring and Reporting Requirements

(a) The following facilities shall conduct analytical monitoring of the parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Railroad transportation: shall monitor COD, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, TSS, total Zn, and oil & grease;

- (2) Local & highway passenger transportation: shall monitor NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, oil & grease, TSS, and TKN;
- (3) Motor freight transportation & warehousing: shall monitor NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, TSS, total Zn, TKN, and oil & grease;
- (4) U.S. Postal Service: shall monitor total Zn;
- (5) Petroleum bulk stations: shall monitor TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TSS.

\* \* \* \* \*

*Q. Storm Water Discharges Associated With Industrial Activity From Water Transportation Facilities That Have Vehicle Maintenance Shops and/or Equipment Cleaning Operations*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table Q-1 all facilities shall monitor TSS, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TKN and the data reported to the New Mexico State Program Manager at the address above (Part VI.B.). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*S. Storm Water Discharges Associated With Industrial Activity From Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing Areas Located at Air Transportation Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table S-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B.). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

(1) Vehicle maintenance and/or cleaning areas: shall monitor oil & grease, COD, TSS;

\* \* \* \* \*

(b) *Quarterly Visual Examination of Storm Water Quality.* Storm water discharge from vehicle maintenance, cleaning or deicing areas shall be visually examined once each quarter as specified below. These facilities shall perform and document a visual examination of a storm water discharge

associated with industrial activity from each outfall, except discharges exempted below. The examination(s) must be made at least once in each of the following 3-month periods: January through March, April through June, July through September, and October through December. The examination shall be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snow melt begins discharging. The examination shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual examination reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the examination data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the visual examination period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions that may prohibit the collection of samples include weather conditions that

create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(5) When a discharger is unable to conduct visual storm water examinations at an inactive and unstaffed site, the operator of the facility may exercise a waiver of the monitoring requirement as long as the facility remains inactive and unstaffed. The facility must maintain a certification with the pollution prevention plan stating that the site is inactive and unstaffed so that performing visual examinations during a qualifying event is not feasible.

\* \* \* \* \*

*T. Storm Water Discharges Associated With Industrial Activity From Treatment Works.*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the visual monitoring, all facilities shall conduct analytical monitoring of BOD, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, TSS, and fecal coliform, and the data reported to the New Mexico State Program Manager at the address above (Part VI.B.). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*U. Storm Water Discharges Associated With Industrial Activity From Food and Kindred Products Facilities*

\* \* \* \* \*

5. Monitoring and Reporting Requirements

(a) \* \* \* In addition to the parameters listed in Table U-1.2 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B.). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Grain mill products: shall monitor COD, total Zn, TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and total phosphorus;
- (2) Fats and oils products: shall monitor TKN and NH<sub>3</sub>;
- (3) Dairy products: shall monitor BOD, COD, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, and TSS;
- (4) Meat products: shall monitor NO<sub>3</sub>+NO<sub>2</sub>, TKN, and TSS;

- (5) Canned, frozen & preserved fruits: shall monitor NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, COD, and TKN;
- (6) Bakery products: shall monitor TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TSS;
- (7) Beverage facilities: shall monitor total Zn;
- (8) Miscellaneous: shall monitor TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and TSS.

\* \* \* \* \*

*W. Storm Water Discharges Associated With Industrial Activity From Wood and Metal Furniture and Fixture Manufacturing Facilities*

\* \* \* \* \*

**5. Monitoring and Reporting Requirements**

(a) All facilities shall conduct analytical monitoring of NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, TSS and total Zn, and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*Y. Storm Water Discharges Associated With Industrial Activity From Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries*

\* \* \* \* \*

**5. Monitoring and Reporting Requirements**

(a) \* \* \* In addition to the parameters listed in Table Y-1 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Rubber products manufacturing: shall monitor TSS, TKN, NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, and total Hg;
- (2) Miscellaneous plastics products: shall monitor NO<sub>3</sub>+NO<sub>2</sub>, NH<sub>3</sub>, TKN, TSS, and total Hg.

\* \* \* \* \*

*Z. Storm Water Discharges Associated With Industrial Activity From Leather Tanning and Finishing Facilities*

\* \* \* \* \*

**5. Monitoring and Reporting Requirements**

(a) \* \* \* In addition to the visual monitoring, all facilities shall conduct analytical monitoring of COD, NO<sub>3</sub>+NO<sub>2</sub>, TKN, NH<sub>3</sub>, and TSS, and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

\* \* \* \* \*

*AA. Storm Water Discharges Associated With Industrial Activity From Fabricated Metal Products Industry*

\* \* \* \* \*

**5. Monitoring and Reporting Requirements**

(a) \* \* \* In addition to the parameters listed in Table AA-1,2 the following facilities shall conduct monitoring of the additional parameters indicated and the data reported to the New Mexico State Program Manager at the address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

- (1) Metal products except coating: shall monitor TKN, NH<sub>3</sub>, and TSS;
- (2) Metal coating & engraving: shall monitor TKN, and NH<sub>3</sub>.

\* \* \* \* \*

*AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods*

\* \* \* \* \*

**5. Monitoring and Reporting Requirements**

(a) All facilities shall conduct analytical monitoring of total Aluminum (Al), total Zn and total Hg, and the data reported to the New Mexico State Program Manager at the

address above (Part VI.B). A copy of the data shall be kept with the Pollution Prevention Plan. Monitoring for the additional parameters indicated shall be conducted at least quarterly (4 times per year) in the second and fourth year of the permit. The first period of monitoring to begin on the date one year following the date of issuance of this permit. Each year of monitoring (four quarters) shall be reported no later than the following March. The report to NMED shall be postmarked no later than the 31st day of the following March.

In addition to the above-referenced conditions, per 40 CFR 122.44(d)(6) to ensure consistency with work element 6 of the State-adopted Water Quality Management Plan (WQMP) approved by EPA under Section 208(b) of the CWA, NMED is requiring that all permittees covered under this general permit, who are required to do sampling, be additionally required to monitor and report pH.

\* \* \* \* \*

*E. Oklahoma (OKR05\*###)*

Oklahoma 401 certification special permit conditions revise the permit as follows:

*Part I.B.3. Limitations on Coverage.* Insert the following paragraph:

*f. Discharges to Oklahoma Outstanding Resource Waters and Scenic Rivers.* "New" point source discharges of storm water associated with industrial activity (those commencing after the June 25, 1992, effective date of the Oklahoma Water Quality Standards—Oklahoma Annotated Code Title 785, Chapter 45) to the following waters:

- (1) waterbodies designated as "Outstanding Resource Waters" and/or "Scenic Rivers" in Appendix A of the Oklahoma Water Quality Standards;
- (2) Oklahoma waterbodies located within the watersheds of waterbodies designated as "Scenic Rivers" in Appendix A of the Oklahoma Water Quality Standards; and
- (3) waterbodies located within the boundaries of Oklahoma Water Quality Standards Appendix B areas which are specifically designated as "Outstanding Resource Waters" in Appendix A of the Oklahoma Water Quality Standards.

*D. Texas (TXR05\*###)*

Texas 401 certification special permit conditions revise the permit as follows:

The following sections are added to Part V of the permit:

Part V. Numeric Effluent Limitations

\* \* \* \* \*

*C. All Discharges to Inland Waters*

The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to inland waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.05	0.1	0.2
Chromium .....	0.5	1.0	5.0

Total metal	Monthly average	Daily composite	Single grab
Copper .....	0.5	1.0	2.0
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.05	0.1	0.2
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

C. All Discharges to Tidal Waters of milligrams per liter (mg/l), for discharges of tidal waters are as follows:  
 The maximum allowable concentrations of each of the hazardous metals, stated in terms

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.1	0.2	0.3
Chromium .....	0.5	1.0	5.0
Copper .....	0.5	1.0	2.0
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.10	0.2	0.3
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

2. The following section is added to Part VI. of the permit:

\* \* \* \* \*

D. *Toxicity Testing.* All facilities that have demonstrated significant lethality, which has not been controlled, shall continue to perform WET testing in accordance with the requirements below. Permittees that are required to monitor for acute whole effluent toxicity shall initiate the series of tests described below within 180 days after the issuance of this permit or within 90 days after the commencement of a new discharge.

The permittee shall test the effluent for lethality in accordance with the provisions of this section. Such testing will determine if an effluent sample meets the Texas Surface Water Quality Standard listed at 31 TAC § 307.6(e)(2)(B) of greater than 50% survival of the appropriate test organisms in 100% effluent for a 24-hour period.

1. Test Procedures

a. The permittee shall conduct acute 24 hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev. 9/91, Section 6.1.). Freshwater species must be used for discharges to freshwater water bodies. Due to the non-saline nature of rainwater, freshwater test species should also be used for discharges to

estuarine, marine or other naturally saline waterbodies.

The following tests shall be used:

1. Acute static 24-hour definitive toxicity test using *Daphnia pulex*. A minimum of four (4) replicates with a minimum of five (5) organisms per replicate shall be used for this test.

2. Acute static 24-hour definitive toxicity test using fathead minnow (*Pimephales promelas*). A minimum of four (4) replicates with a minimum of ten (10) organisms per replicate shall be used for this test.

b. Five dilutions in addition to an appropriate control (0% effluent), shall be used in the toxicity tests. These effluent concentrations shall be 6%, 13%, 25%, 50% and 100%. The control and/or dilution water shall consist of a standard, synthetic, moderately hard, reconstituted water. If more than 10% of the test organisms in any control die, that test, including the control and all effluent dilution(s), shall be repeated, with all results from *both* tests reported.

c. All test organisms, procedures and quality assurance criteria used shall be in accordance with *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, EPA/600/4-90-027 (Rev. September 1991). EPA has proposed to establish regulations

regarding these test methods (December 4, 1989, 53 FR 50216).

d. Tests shall be conducted semiannually (twice per year) on a grab sample of the discharge at 100% strength (no dilution), the dilutions specified in paragraph b. above, and a control consisting of either receiving water or synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-027 (Rev. September 1991), Section 12, Report Preparation, and the report retained onsite. The test results shall be summarized in the format used on Table VI-A and submitted to EPA with the Discharge Monitoring Reports (DMR's). On the DMR, the permittee shall report test results in accordance with the instructions on Table VI-A.

\* \* \* \* \*

2. The following sections are added to Part V of the permit:

Part V. Numeric Effluent Limitations

\* \* \* \* \*

B. All Discharges to Inland Waters

The maximum allowable concentrations of each of the hazardous metals, stated in terms of milligrams per liter (mg/l), for discharges to inland waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.05	0.1	0.2
Chromium .....	0.5	1.0	5.0
Copper .....	0.5	1.0	2.0

Total metal	Monthly average	Daily composite	Single grab
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.05	0.1	0.2
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

**C. All Discharges to Tidal Waters**

The maximum allowable concentrations of each of the hazardous metals, stated in terms

of milligrams per liter (mg/l), for discharges to tidal waters are as follows:

Total metal	Monthly average	Daily composite	Single grab
Arsenic .....	0.1	0.2	0.3
Barium .....	1.0	2.0	4.0
Cadmium .....	0.1	0.2	0.3
Chromium .....	0.5	1.0	5.0
Copper .....	0.5	1.0	2.0
Lead .....	0.5	1.0	1.5
Manganese .....	1.0	2.0	3.0
Mercury .....	0.005	0.005	0.01
Nickel .....	1.0	2.0	3.0
Selenium .....	0.10	0.2	0.3
Silver .....	0.05	0.1	0.2
Zinc .....	1.0	2.0	6.0

3. The following definitions are added to Part X of the permit:

**Part X. Definitions**

*"Inland Waters"*—all surface waters in the State other than "tidal waters" as defined below.

*"Tidal Waters"*—those waters of the Gulf of Mexico within the jurisdiction of the State of Texas, bays and estuaries thereto, and those portions of the river systems which are subject to the ebb and flow of the tides, and to the intrusion of marine waters.

**Region IX**

*Arizona (AZR05\*###) and Federal Facilities in Arizona (AZR05\*##F)*

Arizona 401 certification special permit conditions revise the permit as follows:

1. Part I section B is amended by the addition of the following:

**Part I. Coverage Under This Permit**

\* \* \* \* \*

**B. Eligibility**

\* \* \* \* \*

**8. Compliance with Water Quality Standards of the State of Arizona**

Discharges authorized by this permit shall not cause or contribute to a violation of any applicable water quality standard of the State of Arizona (Arizona Administrative Code, Title 18, Chapter 11).

2. The following language is added to Part II section D:

**Part II. Notification Requirements**

\* \* \* \* \*

**D. Where to Submit**

Notices of Intent shall also be submitted to the State of Arizona Department of Environmental Quality at the following address: Storm Water Coordinator, Arizona Department of Environmental Quality, 3033 N. Central Avenue, Phoenix, Arizona 85012.

NOIs submitted to the State of Arizona shall include the well registration number if storm water associated with industrial activity is discharged to a dry well or an injection well.

3. The following language is added to Part IV section E.2:

**Part IV. Storm Water Pollution Prevention Plans**

\* \* \* \* \*

**E. Special Pollution Prevention Plan Requirements**

\* \* \* \* \*

**2. Additional Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Requirements**

\* \* \* \* \*

e. SARA Section 313 (Community Right to Know) Facilities shall have the following requirement:

Liquid storage areas for Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 chemicals. Appropriate measures to

minimize discharges of Section 313 chemicals shall include secondary containment provided for at least the entire contents of the largest tank plus sufficient freeboard to allow for the 25-year, 24-hour precipitation event, a strong spill contingency and integrity testing plan, and/or other equivalent measures.

4. Part IV. Section E is amended by the addition of the following:

**Part IV. Storm Water Pollution Prevention Plans**

\* \* \* \* \*

**E. Special Pollution Prevention Plan Requirements**

\* \* \* \* \*

**5. Delineation of Facility Areas Below Base Elevation**

All facilities with any portion of the facility that is located at or below the Base Elevation shall delineate on the site map those portions of the facility that are located at or below the Base Elevation.

5. The following language is added to Part VI section B.2:

**Part VI. Monitoring and Reporting Requirements**

\* \* \* \* \*

**B. Reporting: Where to Submit**

\* \* \* \* \*

2. **Additional Notification.** Facilities subject to monitoring and reporting requirements shall also submit Discharge Monitoring Report Form(s) and other required monitoring information to the State of Arizona Department of Environmental Quality at the following address: Storm

Water Coordinator/DMR, Arizona  
Department of Environmental Quality, 3033  
N. Central Avenue, Phoenix, Arizona 85012.

6. The following is added to Part IX  
section B:

Part IX. Termination of Coverage

\* \* \* \* \*

#### B. Addresses

Notices of Termination shall also be  
submitted to the State of Arizona Department  
of Environmental Quality at the following  
address: Storm Water Coordinator, Arizona  
Department of Environmental Quality, 3033  
N. Central Avenue, Phoenix, Arizona 85012.

7. The following definitions are added  
to Part X of the permit:

Part X. Definitions

"*Significant Sources of Non-Storm  
Water*"—includes, but is not limited to  
discharges which could cause or contribute  
to violations of water quality standards of the  
State of Arizona, and discharges which could  
include releases of oil or hazardous  
substances in excess of reportable quantities  
under Section 311 of the Clean Water Act  
(see 40 CFR 110.10 and CFR 117.21) or  
Section 102 of CERCLA (see CFR 302.4).

"*Base Elevation*"—elevation of a surface  
waterbody having a one percent chance of  
being equaled or exceeded during any given  
year.

#### Region X

##### F. Washington (WAR05\*###)

Washington 401 certification special  
permit conditions revise the permit as  
follows:

1. Part I section B is amended by the  
addition of the following:

Part I. Coverage Under This Permit

\* \* \* \* \*

#### B. Eligibility

\* \* \* \* \*

8. Compliance with Washington Water  
Quality and Sediment Standards

Discharges authorized by this permit shall  
not cause or contribute to a violation of any  
applicable water quality standard of the State  
of Washington, specifically Chapter 173–  
201A WAC Surface Water Quality Standards,  
Chapter 173–204 WAC Sediment Standards,  
and the National Toxics Rule for human  
health related to water quality standards.

Addendum A—Pollutants Identified in

THIS FORM REPLACES PREVIOUS FORM 3510-6 (8-92) See Reverse for Instructions		Form Approved. OMB No. 2040-0086 Approval expires: 8-31-98
<b>NPDES FORM</b>		United States Environmental Protection Agency Washington, DC 20460 <b>Notice of Intent (NOI) for Storm Water Discharges Associated with Industrial Activity Under a NPDES General Permit</b>
Submission of this Notice of Intent constitutes notice that the party identified in Section II of this form intends to be authorized by a NPDES permit issued for storm water discharges associated with industrial activity in the State identified in Section III of this form. Becoming a permittee obligates such discharger to comply with the terms and conditions of the permit. <b>ALL NECESSARY INFORMATION MUST BE PROVIDED ON THIS FORM.</b>		
<b>I. Permit Selection: You must indicate the NPDES Storm Water general permit under which you are applying for coverage. Check one of these.</b>		
Baseline Industrial <input type="checkbox"/>	Baseline Construction <input type="checkbox"/>	Multi-Sector (Group Permit) <input type="checkbox"/>
<b>II. Facility Operator Information</b>		
Name: _____		Phone: _____
Address: _____		Status of Owner/Operator: <input type="checkbox"/>
City: _____	State: _____	ZIP Code: _____
<b>III. Facility/Site Location</b>		
Name: _____		Is the facility located on Indian Lands? (Y or N) <input type="checkbox"/>
Address: _____		
City: _____	State: _____	ZIP Code: _____

<b>VI. Certification:</b> The certification statement in Box 1 applies to <u>all</u> applicants. The certification statement in Box 2 applies <u>only</u> to facilities applying for the Multi-Sector storm water general permit.		
<b>BOX 1</b> <b>ALL APPLICANTS:</b> I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.	<b>BOX 2</b> <b>MULTI-SECTOR STORM WATER GENERAL PERMIT APPLICANTS ONLY:</b> I certify under penalty of law that I have read and understand the Part I.B. eligibility requirements for coverage under the Multi-Sector storm water general permit, including those requirements relating to the protection of species identified in Addendum H.  To the best of my knowledge, the discharges covered under this permit, and construction of BMPs to control storm water run-off, are not likely to and will not likely adversely affect any species identified in Addendum H of the Multi-Sector storm water general permit or are otherwise eligible for coverage due to previous authorization under the Endangered Species Act.  To the best of my knowledge, I further certify that such discharges, and construction of BMPs to control storm water run-off, do not have an effect on properties listed or eligible for listing on the National Register of Historic Places under the National Historic Preservation Act, or are otherwise eligible for coverage due to a previous agreement under the National Historic Preservation Act.  I understand that continued coverage under the Multi-Sector general permit is contingent upon maintaining eligibility as provided for in Part I.B.

**Instructions - EPA Form 3510-6**  
**Notice Of Intent (NOI) For Storm Water Discharges Associated With Industrial Activity**  
**To Be Covered Under a NPDES General Permit**

**Who Must File A Notice Of Intent (NOI) Form**

Federal law at 40 CFR Part 122 prohibits point source discharges of storm water associated with industrial activity to a water body(ies) of the U.S. without a National Pollutant Discharge Elimination System (NPDES) permit. The operator of an industrial activity that has such a storm water discharge must submit a NOI to obtain coverage under a NPDES Storm Water General Permit. If you have questions about whether you need a permit under the NPDES Storm Water program, or if you need information as to whether a particular program is administered by EPA or a state agency, telephone or write to the Notice of Intent Processing Center at (703) 931-3230.

**Where To File NOI Form**

NOIs must be sent to the following address: Storm Water Notice of Intent (4203)  
 401 M Street, S.W.  
 Washington, DC 20460

**Completing The Form**

You must type or print, using upper-case letters, in the appropriate areas only. Please place each character between the marks. Abbreviate if necessary to stay within the number of characters allowed for each item. Use one space for breaks between words, but not for punctuation marks unless they are needed to clarify your response. If you have any questions on this form, call the Notice of Intent Processing Center at (703) 931-3230.

**Section I Permit Selection**

You must indicate the NPDES storm water general permit under which you are applying for coverage. Check one box only. The Baseline Industrial and Baseline Construction permits were issued in September 1992. The Multi-Sector Permit became effective October 1, 1995.

**Section II Facility Operator Information**

Provide the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this application. The name of the operator may or may not be the same as the name of the facility. The responsible party is the legal entity that controls the facility's operation, rather than the plant or site manager. Do not use a colloquial name. Enter the complete address and telephone number of the operator.

Enter the appropriate letter to indicate the legal status of the operator of the facility: F = Federal; S = State; M = Public (other than federal or state); P = Private.

**Section III Facility/Site Location Information**

Enter the facility's or site's official or legal name and complete street address, including city, state, and ZIP code. If the facility or site lacks a street address, indicate the state and either the latitude and longitude of the facility to the nearest 15 seconds or the quarter, section, township, and range (to the nearest quarter section) of the approximate center of the site. Do not provide a P.O. Box number as the street address.

Indicate whether the facility is located on Indian lands.

**Section IV Site Activity Information**

If the storm water discharges to a municipal separate storm sewer system (MS4), enter the name of the operator of the MS4 (e.g., municipality name, county name) and the receiving water of the discharge from the MS4. (A MS4 is defined as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains) that is owned or operated by a state, city, town, borough, county, parish, district, association, or other public body which is designed or used for collecting or conveying storm water.)

If the facility discharges storm water directly to receiving water(s), enter the name of the receiving water(s).

If you are filing as a co-permittee and a storm water general permit number has been issued, enter that number in the space provided.

Indicate the monitoring status of the facility. Refer to the permit for information on monitoring requirements. Indicate the monitoring status by entering one of the following:

- 1 = Not subject to monitoring requirements under the conditions of the permit.
- 2 = Subject to monitoring requirements and required to submit data.
- 3 = Subject to monitoring requirements but not required to submit data.
- 4 = Subject to monitoring requirements but submitting certification for monitoring exclusion.

List, in descending order of significance, up to two 4-digit standard industrial classification (SIC) codes that best describe the principal products or services provided at the facility or site identified in Section III of this application. If you are applying for coverage under the construction general permit, enter "CO" (which represents SIC codes 1500 - 1799).

For industrial activities defined in 40 CFR 122.26(b)(14)(i)-(xi) that do not have SIC codes that accurately describe the principal products produced or services provided, use the following 2-character codes.

- HZ = Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA [40 CFR 122.26 (b)(14)(v)];
- LF = Landfills, land application sites, and open dumps that receive or have received any industrial wastes, including those that are subject to regulation under subtitle D of RCRA [40 CFR 122.26 (b)(14)(v)];
- SE = Steam electric power generating facilities, including coal handling sites [40 CFR 122.26 (b)(14)(vi)];
- TW = Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage [40 CFR 122.26 (b)(14)(b)]; or,
- CO = Construction activities [40 CFR 122.26 (b)(14)(x)].

If there is another NPDES permit presently issued for the facility or site listed in Section III, enter the permit number. If an application for the facility has been submitted but no permit number has been assigned, enter the application number.

Facilities applying for coverage under the Multi-Sector storm water general permit must answer the last three questions in Section IV. Refer to Addendum H of the Multi-Sector general permit for a list of species that are either proposed or listed as threatened or endangered. "BMP" means "Best Management Practices" that are used to control storm water discharges.

Indicate whether any construction will be conducted to install or develop storm water runoff controls.

**Section V Additional Information Required for Construction Activities Only**

Construction activities must complete Section V in addition to Sections I through IV. Only construction activities need to complete Section V.

Enter the project start date and the estimated completion date for the entire development plan.

Provide an estimate of the total number of acres of the site on which soil will be disturbed (round to the nearest acre).

Indicate whether the storm water pollution prevention plan for the site is in compliance with approved state and/or local sediment and erosion plans, permits, or storm water management plans.

**Section VI Certification**

Federal statutes provide for severe penalties for submitting false information on this application form. Federal regulations require this application to be signed as follows:

*For a corporation:* by a responsible corporate officer, which means: (i) president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding \$25 million (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

*For a partnership or sole proprietorship:* by a general partner or the proprietor; or

*For a municipality, state, Federal, or other public facility:* by either a principal executive officer or ranking elected official.

**Paperwork Reduction Act Notice**

Public reporting burden for this application is estimated to average 0.5 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of the collection of information, or suggestions for improving this form, including any suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, 2136, U.S. Environmental Protection Agency, 401 M Street, SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

**THIS FORM REPLACES PREVIOUS FORM 3510-7 (8-92)** Form Approved. OMB No. 2040-0066  
 Please See Instructions Before Completing This Form Approval expires: 8-31-98

<b>NPDES FORM</b>		United States Environmental Protection Agency Washington, DC 20460 <b>Notice of Termination (NOT) of Coverage Under a NPDES General Permit for                  Storm Water Discharges Associated with Industrial Activity</b>
-----------------------	---	--

Submission of this Notice of Termination constitutes notice that the party identified in Section II of this form is no longer authorized to discharge storm water associated with industrial activity under the NPDES program. ALL NECESSARY INFORMATION MUST BE PROVIDED ON THIS FORM.

**IV. Certification:** I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that are authorized by a NPDES general permit have been eliminated or that I am no longer the operator of the facility or construction site. I understand that by submitting this Notice of Termination, I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by a NPDES permit. I also understand that the submittal of this Notice of Termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

Print Name:  Date:

Signature: \_\_\_\_\_

**Instructions for Completing Notice of Termination (NOT) Form**

<p><b>Who May File a Notice of Termination (NOT) Form</b></p> <p>Permittees who are presently covered under an EPA-issued National Pollutant Discharge Elimination System (NPDES) General Permit (including the 1995 Multi-Sector Permit) for Storm Water Discharges Associated with Industrial Activity may submit a Notice of Termination (NOT) form when their facilities no longer have any storm water discharges associated with industrial activity as defined in the storm water regulations at 40 CFR 122.26(b)(14), or when they are no longer the operator of the facilities.</p> <p>For construction activities, elimination of all storm water discharges associated with industrial activity occurs when disturbed soils at the construction site have been finally stabilized and temporary erosion and sediment control measures have been removed or will be removed at an appropriate time, or that all storm water discharges associated with industrial activity from the construction site that are authorized by a NPDES general permit have otherwise been eliminated. Final stabilization means that all soil-disturbing activities at the site have been completed, and that a uniform perennial vegetative cover with a density of 70% of the cover for unpaved areas and areas not covered by permanent structures has been established, or equivalent permanent stabilization measures (such as the use of riprap, gabions, or geotextiles) have been employed.</p>	<p><b>Where to File NOT Form</b></p> <p>Send this form to the the following address:</p> <p style="padding-left: 20px;">Storm Water Notice of Termination (4203)                  401 M Street, S.W.                  Washington, DC 20460</p> <p><b>Completing the Form</b></p> <p>Type or print, using upper-case letters, in the appropriate areas only. Please place each character between the marks. Abbreviate if necessary to stay within the number of characters allowed for each item. Use only one space for breaks between words, but not for punctuation marks unless they are needed to clarify your response. If you have any questions about this form, telephone or write the Notice of Intent Processing Center at (703) 931-3230.</p>
---	---

**Instructions - EPA Form 3510-7**  
**Notice of Termination (NOT) of Coverage Under The NPDES General Permit**  
**for Storm Water Discharges Associated With Industrial Activity**

**Section I Permit Information**

Enter the existing NPDES Storm Water General Permit number assigned to the facility or site identified in Section III. If you do not know the permit number, telephone or write your EPA Regional storm water contact person.

Indicate your reason for submitting this Notice of Termination by checking the appropriate box:

If there has been a change of operator and you are no longer the operator of the facility or site identified in Section III, check the corresponding box.

If all storm water discharges at the facility or site identified in Section III have been terminated, check the corresponding box.

**Section II Facility Operator Information**

Give the legal name of the person, firm, public organization, or any other entity that operates the facility or site described in this application. The name of the operator may or may not be the same name as the facility. The operator of the facility is the legal entity which controls the facility's operation, rather than the plant or site manager. Do not use a colloquial name. Enter the complete address and telephone number of the operator.

**Section III Facility/Site Location Information**

Enter the facility's or site's official or legal name and complete address, including city, state and ZIP code. If the facility lacks a street address, indicate the state, the latitude and longitude of the facility to the nearest 15 seconds, or the quarter, section, township, and range (to the nearest quarter section) of the approximate center of the site.

**Section IV Certification**

Federal statutes provide for severe penalties for submitting false information on this application form. Federal regulations require this application to be signed as follows:

*For a corporation:* by a responsible corporate officer, which means: (i) president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding \$25 million (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

*For a partnership or sole proprietorship:* by a general partner or the proprietor; or

*For a municipality, State, Federal, or other public facility:* by either a principal executive officer or ranking elected official.

**Paperwork Reduction Act Notice**

Public reporting burden for this application is estimated to average 0.5 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of the collection of information, or suggestions for improving this form, including any suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, 2138, U.S. Environmental Protection Agency, 401 M Street, SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

Addendum E—Basic Format for Environmental Assessment

This is the basic format for the Environmental Assessment prepared by EPA from the review of the applicant's Environmental Information Document (EID) required for new source NPDES permits. Comprehensive information should be provided for those items or issues that are affected; the greater the impact, the more detailed information needed. The EID should contain a brief statement addressing each item listed below, even if the item is not applicable. The statement should at least explain why the item is not applicable.

A. General Information

1. Name of applicant
2. Type of facility
3. Location of facility
4. Product manufactured

B. Description Summaries

1. Describe the proposed facility and construction activity
2. Describe all ancillary construction not directly involved with the production processes
3. Describe briefly the manufacturing processes and procedures
4. Describe the plant site, its history,

and the general area  
C. Environmental Concerns

1. Historical and Archeological (include a statement from the State Historical Preservation Officer)
2. Wetlands Protection and 100-year Floodplain Management (the Army Corps of Engineers must be contacted if any wetland area of floodplain is affected)
3. Agricultural Lands (a prime farmland statement from the Soil Conservation Service must be included)
4. Coastal Zone Management and Wild and Scenic Rivers
5. Endangered Species Protection and Fish and Wildlife Protection (a statement from the U.S. Fish and Wildlife Service must be included)
6. Air, Water, and Land Issues: quality, effects, usage levels, municipal services used, discharges and emissions, runoff and wastewater control, geology and soils involved, land-use compatibility, solid and hazardous waste disposal, natural and man-made hazards involved.
7. Biota concerns: floral, faunal, aquatic resources, inventories, and

effects

8. Community Infrastructures available and resulting effects: social, economic, health, safety, educational, recreational, housing, transportation, and road resources

Basic Environmental Information Document Guidelines for New Source Category Industries

I. General Information

- A. Name of Applicant and Proposed Facility:

- B. Description of Site and Location:

- C. Description of Project, Product, and Process:

## ADDENDUM F—SECTION 313 WATER PRIORITY CHEMICALS

CAS No.	Common name
75-07-0	Acetaldehyde.
107-02-8	Acrolein.
107-13-1	Acrylonitrile.
309-00-2	Aldrin[1,4:5,8-Dimethanonaphthalene, 1, 2, 3, 4, 10, 10-hexachloro-1, 4, 4a, 5, 8, 8a hexahydro-(1.alpha., 4.alpha., 4a.beta., 5.alpha., 8.alpha., 8a.beta.)-].
107-05-1	Allyl Chloride.
7429-90-5	Aluminum (fume or dust).
7664-41-7	Ammonia.
62-53-3	Aniline.
120-12-7	Anthracene.
7440-36-0	Antimony.
7647189	Antimony pentachloride.
28300745	Antimony potassium tartrate.
7789619	Antimony tribromide.
10025919	Antimony trichloride.
7783564	Antimony trifluoride.

## Addendum G—List of Applicable References

The following guidance manuals contain valuable information in assisting permittees in complying with the permit conditions of the multi-sector general permit and are available from The Office of Water Resources Center, USEPA—RC-4100, 401 M Street, SW.,

Washington, DC 20460, Telephone: (202) 260-7786.

Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices (EPA-832-R-92-006, September 1992).

Summary: Storm Water Management for Industrial Activities, Developing

Pollution Prevention Plans and Best Management Practices (October 1992).

NPDES Storm Water Sampling Guidance Document (EPA 833-B-92-001, July 1992).

## Addendum H—Endangered Species Guidance

### I. Instructions

Below is a list of species that EPA has determined may be affected by the activities covered by the multi-sector general permit (MSGP). These species are listed by county. In order to get MSGP coverage, applicants must:

- Indicate in box provided on the NOI whether any species listed in this Addendum are in proximity to the facility, and
- Certify pursuant to Section II.B.12 of the MSGP that their storm water discharges, and BMPs constructed to control storm water runoff, are not likely, and will not be likely to adversely affect species identified in Addendum H of this permit.

To do this, please follow steps 1 through 4 below.

#### Step 1: Review the County Species List to Determine if any Species are Located in the Discharging Facility County

If no species are listed in a facility's county or if a facility's county is not found on the list, an applicant is eligible for MSGP coverage and may indicate in the NOI that no species are found in proximity and provide the necessary certification. If species are located in the county, follow step 2 below. Where a facility is located in more than one county, the lists for all counties should be reviewed.

#### Step 2: Determine if any Species may be Found "In Proximity" to the Facility

A species is in proximity to a facility's storm water discharge when the species is:

- Located in the path or immediate area through which or over which contaminated point source storm water flows from industrial activities to the point of discharge into the receiving water.
- Located in the immediate vicinity of, or nearby, the point of discharge into receiving waters.
- Located in the area of a site where storm water BMPs are planned or are to be constructed.

The area in proximity to be searched/surveyed for listed species will vary with the size of the facility, the nature and quantity of the storm water discharges, and the type of receiving waters. Given the number of facilities potentially covered by the MSGP, no specific method to determine whether species are in proximity is required for permit coverage under the MSGP. Instead, applicants should use the method or methods which best allow them to determine to the best of their

knowledge whether species are in proximity to their particular facility. These methods may include:

- *Conducting visual inspections:* This method may be particularly suitable for facilities that are smaller in size, facilities located in non-natural settings such as highly urbanized areas or industrial parks where there is little or no nature habitat; and facilities that discharge directly into municipal storm water collection systems. For other facilities, a visual survey of the facility site and storm water drainage areas may be insufficient to determine whether species are likely to be located in proximity to the discharge.

- *Contacting the nearest State Wildlife Agency or U.S. Fish and Wildlife Service (FWS) or National Marine Fisheries Service (NMFS) offices.* Many endangered and threatened species are found in well-defined areas or habitats. That information is frequently known to state or federal wildlife agencies. FWS has offices in every state. NMFS has regional offices in: Gloucester, Massachusetts; St. Petersburg, Florida; Long Beach, California; Portland, Oregon; and Juneau, Alaska.

- *Contacting local/regional conservation groups.* These groups inventory species and their locations and maintain lists of sightings and habitats.

- *Conducting a formal biological survey.* Larger facilities with extensive storm water discharges may choose to conduct biological surveys as the most effective way to assess whether species are located in proximity and whether there are likely adverse effects.

If no species are in proximity, an applicant is eligible for MSGP coverage and may indicate that in the NOI and provide the necessary certification. If listed species are found in proximity to a facility, applicants must follow step 3 below.

#### Step 3: Determine if Species Could be Adversely Affected by the Facility's Storm Water Discharges or by BMPS to Control Those Discharges

Scope of Adverse Effects: Potential adverse effects from storm water include:

- *Hydrological.* Storm water may cause siltation, sedimentation or induce other changes in the receiving waters such as temperature, salinity or pH. These effects will vary with the amount of storm water discharged and the volume and condition of the receiving water. Where a storm water discharge constitutes a minute portion of the total volume of the receiving water, adverse hydrological effects are less likely.

- *Habitat.* Storm water may drain or inundate listed species habitat.

- *Toxicity.* In some cases, pollutants in storm water may have toxic effects on listed species.

The scope of effects to consider will vary with each site. Applicants must also consider the likelihood of adverse effects on species from any BMPs to control storm water. Most adverse impact from BMPs are likely to occur from the construction activities.

*Using earlier ESA authorizations for MSGP eligibility:* In some cases, a facility may be eligible for MSGP coverage because actual or potential adverse effects were addressed or discounted through an earlier ESA authorization. Examples of such authorization include:

- An earlier ESA section 7 consultation for that facility.
- A section 10(a) permit issued for the facility.
- An area-wide Habitat Conservation Plan applicable to that facility.
- A clearance letter from the Services (which discounts the possibility of an adverse impact from the facility).

In order for applicants to use an earlier ESA authorization to meet eligibility requirements: (1) The authorization must adequately address impacts for storm water discharges and BMPs from the facility on endangered and threatened species, (2) it must be current because there have been no subsequent changes in facility operations or circumstances which might impact species in ways not considered in the earlier authorization, and (3) the applicant must comply with any requirements from those authorizations to avoid or mitigate adverse effects to species. Applicants who wish to pursue this approach should carefully review documentation for those authorizations ensure that the above conditions are met.

If adverse effects are not likely, an applicant is eligible for MSGP coverage and may indicate in the NOI that species are found in proximity and provide the necessary certification. If adverse effects are likely, follow step 4 below.

#### Step 4: Determine if Measures can be Implemented to Avoid any Adverse Effects

If an applicant determines that adverse effects are likely, it can receive coverage if appropriate measures are undertaken to avoid or eliminate any actual or potential adverse effects prior to applying for permit coverage. These measures may involve relatively simple changes to facility operations such as re-routing a storm water discharge to

bypass an area where species are located.

At this stage, applicants may wish to contact the FWS and/or NMFS to see what appropriate measures might be suitable to avoid or eliminate adverse impacts to species.

If applicants adopt these measures, they must continue to abide by them during the course of permit coverage.

If appropriate measures are not available, the applicant is not eligible at that time for coverage under the MSGP. Applicants should contact the

appropriate EPA regional office about either:

- Entering into Section 7 consultation in order to obtain MSGP coverage, or
- Obtaining an individual NPDES storm water permit.

## II. COUNTY/SPECIES LIST

[The following list identifies federally listed or proposed U.S. species by State and County. It has been updated through March 31, 1995.]

		MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF

II. COUNTY/SPECIES LIST—Continued

[The following list identifies federally listed or proposed U.S. species by State and County. It has been updated through March 31, 1995.]

State/County	Group name	Inventory name	Scientific name	IR/FF*	
LINCOLN	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
MASON	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	PLANTS	HOWELLIA, WATER	HOWELLIA AQUATILIS	IR,FF	
OKANOGAN	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
PACIFIC	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
		GOOSE, ALEUTIAN CANADA	Branta canadensis leucopareia	IR,FF	
		MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
		PELICAN, BROWN	Pelicanus occidentalis	IR,FF	
		PLOVER, WESTERN SNOWY	CHARADRIUS ALEXANDRINUS NIVOSUS.	IR,FF	
		FISHES	SALMON, SNAKE RIVER SOCKEYE	ONCORHYNCHUS NERKA	IR,FF
		BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF
PEND OREILLE	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
PIERCE	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
		MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
SAN JUAN	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
SKAGIT	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
		MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
SKAMANIA	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
SNOHOMISH	FISHES	SALMON, SNAKE RIVER SOCKEYE	ONCORHYNCHUS NERKA	IR,FF	
	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
SPOKANE	MAMMALS	MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
		BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
STEVENSON	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	PLANTS	HOWELLIA, WATER	HOWELLIA AQUATILIS	IR,FF	
THURSTON	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	MAMMALS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
WAHIAKUM	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
		MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
WALLA WALLA	BIRDS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
	FISHES	SALMON, CHINOOK (SNAKE RIVER SPRING/SUMMER).	ONCORHYNCHUS TSHAWYTSCHA	IR,FF	
WHATCOM	BIRDS	SALMON, SNAKE RIVER SOCKEYE	ONCORHYNCHUS NERKA	IR,FF	
		EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	
WHITMAN	FISHES	MURRELET, MARBLED	BRACHYRAMPHUS MARMORATUS	IR,FF	
	MAMMALS	SALMON, SNAKE RIVER SOCKEYE	ONCORHYNCHUS NERKA	IR,FF	
YAKIMA	BIRDS	BEAR, GRIZZLY	Ursus arctos (=U.a. horribilis)	IR,FF	
	MAMMALS	EAGLE, BALD	Haliaeetus leucocephalus	IR,FF	

\* Permit is being issued for these areas only: IR=Federal Indian Reservations, FF=Federal Facilities.

<sup>6</sup>County was listed in regulation; however, population dropped below 100,000 in 1990 census.

<sup>7</sup>Unincorporated areas defined as: beginning at the mouth of the South Fork Deer River and extending west to SW corner Section 18, Township 6 South, Range 2 West, thence north to NW corner, Section 6, Township 2 South, Range 2 West, thence east to the Mobile County line, thence south along the county line to U.S. Highway 90 bridge.

<sup>8</sup>All unincorporated areas of Shelby County within the drainage basin of the Cahaba River upstream of the confluence of Shoal Creek and the Cahaba River.

<sup>9</sup>Unincorporated areas of St. Clair County within the drainage basin of the Cahaba River.

\* Identified in November 1990 rule.

† 1990 Census unincorporated, urbanized population increased to more than 100,000.
