

The proposed Lake Shelbyville Project would consist of: (1) A powerhouse located downstream on the western embankment of the spillway; (2) a penstock, which would be connected to the west outlet structure, and extend along the western bank to the powerhouse; (3) a trash rack with 4-inch spacing that would be integrated into the existing intake structure; (4) a new transformer pad located adjacent to the powerhouse; (5) a modified access road that would pass to the west of the powerhouse; (6) a parking lot on the west side of the powerhouse; (7) a 49-foot-long by 105-foot-wide tailrace; (8) 407 feet of 12.47-kilovolt (kV) buried transmission line to connect the project to the existing Shelby Electric Cooperative substation located 900 feet downstream of the dam; (9) three turbine-generator units for a combined installed capacity of 6.8 megawatts; and (10) appurtenant facilities. The

projected annual energy generation would be 20.3 gigawatt hours.

The project would operate in a run-of-release mode utilizing releases from Lake Shelbyville as they are dictated by the Corps, with no proposed change to the Corps' facility operation. Power generation would be seasonally variable as flow regimens and pool levels are set forth by the Corps. The project would generate power using flows between 130 cfs (cubic feet per second) to 1,500 cfs. When flows are below 130 cfs, all flows would be passed through the existing outlet structure and the project would then be offline. When flows are greater than 1,500 cfs, excess flow would be passed through the existing outlet structure.
