We proposed a payment rate for 340B drugs of ASP minus 28.7 percent based on survey data, and also proposed in the alternative that the agency could continue its current policy of paying ASP minus 22.5 percent for CY 2021. We explained that we adopted the OPPS 340B payment policy based on the average minimum discount for 340B-acquired drugs being approximately ASP minus 22.5 percent. The estimated discount was based on a MedPAC analysis identifying 22.5 percent as a conservative minimum discount that 340B entities receive when they purchase drugs under the 340B program, which we discussed in the CY 2018 OPPS/ASC final rule with comment period (82 FR 52496). We emphasized that we continue to believe that ASP minus 22.5 percent is an appropriate payment rate for 340B-acquired drugs under the authority of section 1833(t)(14)(A)(iii)(II) for the reasons we stated when we adopted this policy in CY 2018 (82 FR 59216). We pointed out that on July 31, 2020, the D.C. Circuit reversed the decision of the district court, holding that this interpretation of the statute was reasonable. Therefore, we also proposed in the alternative that the agency could continue the current Medicare payment policy for CY 2021. If adopted, we stated that this proposed policy would continue the current Medicare payment policy for CY 2021.

Based on feedback from stakeholders, we stated that we believed maintaining the current payment policy of paying ASP minus 22.5 percent for 340B drugs was appropriate in order to maintain consistent and reliable payment for these drugs both for the remainder of the PHE, and after its conclusion, to give hospitals increased certainty as to payments for these drugs. We explained that continuing our current policy also gives us more time to conduct further analysis of hospital survey data for potential future use for 340B drug payment. We also noted that any changes to the current 340B payment policy would be adopted through public notice and comment rulemaking.

Finally, we stated that while we believe our methods to conduct the 340B Drug Acquisition Cost Survey, as well as the methodology we used to calculate the proposed average or typical discount received by 340B entities on 340B drugs, are valid, we nonetheless recognize the comments that we received from stakeholders. Utilization of the survey data is complex, and we emphasized that we wish to continue to evaluate how to balance and weigh the use of the survey data, the necessary adjustments to the data, and the weighting and incorporation of ceiling prices—all to determine how best to take the relevant factors into account for potentially using the survey to set Medicare OPPS drug payment policy. We stated that we would continue to assess commenters' feedback as we explore whether survey data should be considered hospital acquisition cost data for purposes of paying for drugs acquired under section 1833(t)(14)(A)(iii)(I) of the Act.

c. CY 2022 Proposed 340B Drug Payment Policy

For CY 2022, we proposed to continue our current policy of paying ASP minus 22.5 percent for 340B-acquired drugs and biologicals, including when furnished in nonexcepted off-campus PBDs paid under the PFS. We proposed, in accordance with section 1833(t)(14)(A)(iii)(II) of the Act, to pay for separately payable Medicare Part B drugs and biologicals (assigned status indicator ''K''), other than vaccines and drugs on pass-through status, that are acquired through the 340B Program at ASP minus 22.5 percent when billed by a hospital paid under the OPPS that is not excepted from the payment adjustment. We proposed to continue our current policy for calculating payment for 340B-acquired biosimilars, which is discussed in section V.B.2.c. of the CY 2019 OPPS/ASC final rule with comment period, and would continue the policy we finalized in CY 2019 to pay ASP minus 22.5 percent for 340B-acquired drugs and biologicals furnished in nonexcepted off-campus PBDs paid under the PFS.

We also proposed to continue the 340B payment adjustment for WAC-priced drugs, which is WAC minus 22.5 percent. 340B-acquired drugs that are priced using AWP would continue to be paid an adjusted amount of 69.46 percent of AWP. Additionally, we proposed to continue to exempt rural sole community hospitals (as described under the regulations at § 412.92 and designated as rural for Medicare purposes), children's hospitals, and PPS-exempt cancer hospitals from the 340B payment adjustment. We stated that these hospitals would continue to report informational modifier ''TB'' for 340B-acquired drugs, and would continue to be paid ASP+6 percent. We also explained that we may revisit our policy to exempt rural SCHs, as well as other hospital types, from the 340B drug payment reduction in future rulemaking.

We stated that we are also continuing to require hospitals to use modifiers to identify 340B-acquired drugs. We refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59353 through 59370) for a full discussion and rationale for the CY 2018 policies and the requirements for use of modifiers ''JG'' and ''TB''. We explained that we believe maintaining the current policy of paying ASP minus 22.5 percent for 340B drugs is appropriate given the July 31, 2020 D.C. Circuit decision, which reversed the district court's decision and held that the interpretation of the statute was reasonable when the 340B drug payment policy was implemented in CY 2018. We noted that any changes to the current 340B payment policy would be adopted through public notice and comment rulemaking.

While we believe the Secretary has discretion to propose a payment rate for 340B drugs based on the 2020 survey results, we explained that we also continue to believe that the current payment rate of ASP minus 22.5 percent represents the minimum discount that 340B covered entities receive, which more closely aligns the payment rate with the resources expended by 340B hospitals to acquire such drugs compared to a payment rate of ASP+6 percent, while also recognizing the intent of the 340B program to allow covered entities, including eligible hospitals, to stretch scarce resources in ways that enable hospitals to continue providing access to care for Medicare beneficiaries and other patients. Additionally, we stated that we continue to believe it is important to provide consistency and reliable payment for these drugs both for the remainder of the PHE, and after its conclusion, to give hospitals increased certainty as to payments for these drugs.

d. Comments on the Proposed CY 2022 340B Payment Policy

Comment: Several commenters, including a hospital association, pharmaceutical research and manufacturing companies, and a community oncology association,

supported the current OPPS payment policy for 340B-acquired drugs. They believed that approximating payment based on acquisition costs is appropriate; however, they also recommended reform to the 340B program itself. Some of these commenters believed the policy would continue to address the inappropriate growth of the 340B Program, stem physician practice consolidation with hospitals, and preserve patient access to community-based care.

Response: We thank the commenters for their support of our 340B payment policies. We note that comments related to the reform of the 340B program are outside of the scope of this final rule and we also note that the 340B program is administered by the Health Resources and Services Administration, not CMS; however, we thank commenters for their input.

Comment: A commenter inquired if the 340B drug payment policy applies to therapeutic radiopharmaceuticals that are paid based on the mean unit cost data, stating that it would be inappropriate and inaccurate to apply the 22.5 percent reduction to these payment amounts. Another commenter opposed the 340B drug payment policy specifically for therapeutic radiopharmaceuticals, citing the unique cost structure of radiopharmaceuticals. Another commenter requested a similar-product specific exemption for Chimeric Antigen Receptor T-cell (CAR T-cell) therapy when purchased through the 340B program.

Response: The 340B drug payment policy applies to OPPS separately payable drugs (status indicator ''K'') purchased through the 340B drug program, which include therapeutic radiopharmaceuticals when these products are acquired through the 340B drug program. The classes of drugs exempted from the policy are vaccines (status indicator ''L'' or ''M''), and drugs with transitional pass-through payment status (status indicator ''G''). We note that the drug cost methodology has no impact on the application of the 340B discount. As we noted above, our policy applies to all drugs purchased through the 340B drug program except for vaccines and drugs with transitional pass-through payment status. While we acknowledge that radiopharmaceuticals necessitate special handling, we note that there are other drug classes that also necessitate special handling under the 340B program. Therefore, we disagree with the commenter that therapeutic radiopharmaceuticals purchased through the 340B drug program should qualify for an exemption from application of the payment adjustment. We note that, under the OPPS, the 340B payment adjustment is ASP minus 22.5 percent, WAC minus 22.5 percent, or 69.46 percent of AWP. We reiterate, these payment rates are based on the minimum average discount for products purchased through the 340B program, with the actual acquisition costs likely being much lower.

Comment: Some commenters had concerns that new biosimilars on pass-through status would have a competitive advantage over their reference product as a result of the disparity in OPPS payment for these products when a biosimilar has pass-through status. Commenters believed the disparity resulting from the combined 340B drug payment and pass-through policies would advantage biosimilars receiving pass-through payment if the applicable reference product is acquired under the 340B program and not receiving pass-through payment. The commenters believe the disparity would lead to inappropriate prescribing inconsistent with clinical guidelines and/or standards of care.

Response: We disagree with commenters that the current payment policy would unfairly place reference products at a competitive disadvantage relative to their applicable biosimilars. We believe the continuation of our current biosimilar policy will allow for appropriate payment and access to these important treatments. As noted in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86043), we do not believe that the biosimilars' temporary payments provided by pass-through status will create the substantial competitive advantage that commenters described. We note that the advantage of pass-through payment exists under the current 340B policy that includes both new drugs and biosimilars. We also note we are continuing the policy from previous years regarding biosimilars and 340B payment. Please see section V.B.2.C. of this final rule with comment period for additional discussion regarding biosimilars and section V.A.1. for additional discussion on drug pass-through payments. We note that the advantage of pass-through payment exists under the current 340B policy that includes both new drugs and biosimilars. We are continuing the policy from previous years regarding payment for biosimilars acquired under the 340B program.

Comment: Several commenters disagreed that ASP minus 22.5 was a conservative adjustment that represented the minimum discount that hospitals receive when they acquire drugs through the 340B program. They contended that they are losing money when dispensing certain drugs as the price paid by CMS is significantly lower than the price paid by the entity.

Response: We thank the commenters for their feedback. The 22.5 percent discount off of ASP is a conservative minimum discount for products acquired under the 340B program based on a 2015 MedPAC analysis, which we discussed in the CY 2018 OPPS/ASC final rule with comment period (82 FR 52496). Our 2020 Hospital Acquisition Cost Survey for 340B-Acquired SCODs has shown the average discount to be about 34.7 percent. As noted in the 2021 OPPS/ASC final rule with comment period (85 FR 86045), the 2020 Hospital Acquisition Cost Survey for 340B-Acquired SCODS incorporated the 340B ceiling prices for hospitals that did not affirmatively respond to the survey and may have skewed the average discount determined based on survey results (34.7 percent off of ASP) towards the *minimum* average discount (that is, the ceiling price) that a 340B hospital would receive on a drug. Since the ceiling price is the maximum amount covered entities may permissibly be required to pay for a drug under section 340B(a)(1) of the Public Health Service Act, we would not expect any 340B hospital to have acquisition costs for any acquired drug that are greater than ASP minus 22.5 percent. Therefore, we disagree that covered entities are, on average, losing money under the current 340B drug payment policy of ASP minus 22.5 percent for drugs purchased through the 340B drug program.

Comment: Several commenters requested that we make our 340B exemptions policy permanent. Additionally, commenters asked CMS to extend the exemption to urban SCHs, Medicare Dependent Hospitals, Rural Referral Centers.

Response: We thank commenters for their recommendations. At this time, we do not believe it is appropriate to revise our 340B exemptions policy and believe we should maintain our current policy for CY 2022. Nonetheless, we will take these comments into consideration for future rulemaking.

Comment: Several commenters stated that CMS has not provided sufficient analysis for the continuation of the 340B payment policy, expressing their belief that CMS has not considered changes in utilization or volume for hospitals that are actively participating in the 340B program since the implementation of the policy. They further noted that CMS has not analyzed the impact of the prior year's reimbursement changes for drugs acquired under the 340B program for the affected hospitals. They contended

that CMS has not provided evidence that the payment policy remains budget neutral by recalculating the policy's impact to make sure the conversion factor is properly adjusted over time to reflect changes in inflation or 340B drug utilization.

Response: In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59369 through 59370), we implemented the 340B drug payment policy and adjusted the payment rate for separately payable drugs and biologicals (other than drugs with pass-through payment status and vaccines) acquired under the 340B Program. This adjustment changed the payment rate from ASP+6 percent to ASP minus 22.5 percent for drugs subject to this policy. In that rule, we stated that our goal was to make Medicare payment for separately payable drugs more aligned with the resources expended by hospitals to acquire such drugs. We believe the current 340B drug payment policy reflects the average minimum discount that 340B participating hospitals receive for drugs acquired under the 340B Program, and we believe it is inappropriate for Medicare to subsidize other programs through Medicare payments for separately payable drugs. We note the data collected in our 2020 Hospital Acquisition Cost Survey for 340B-acquired SCODs found the average 340B program drug discount to be 34.7 percent.

With respect to OPPS budget neutrality and the conversion factor, OPPS budget neutrality is generally developed on a prospective basis by isolating the effect of any changes in payment policy or data under the prospective OPPS with all other factors held constant. We note that since the CY 2018 implementation of the 340B drug payment policy in which we developed a budget neutrality adjustment for the policy, the adjusted percentage payment has remained at ASP minus 22.5 percent. As a result, while some of the claims may change based on drug payment and billing, as indicated by the ''JG'' modifier, these drugs, including their utilization and expected payments, would be included as part of the broader budget neutrality adjustments, but collectively they would not have a separate budget neutrality adjustment specifically for the 340B drug payment policy. We note that in the rules in which we proposed to establish or modify the adjustment, we have included in the impact analysis the estimated effects on different categories of providers based on the policy. Finally, we note that we monitor the payment and utilization patterns associated with this adjustment and for drug spending more broadly, and will continue to do so.

Comment: Several commenters called on CMS to suspend the current 340B drug payment policy and restore the 340B drug and biological payment rate to the statutory ASP+6 percent until the litigation is resolved in the U.S. Supreme Court. Other commenters recommended CMS postpone any changes to the 340B drug payment policy until the court case has concluded. Others recommended CMS suspend the policy amid the COVID–19 Public Health Emergency (PHE).

Response: We acknowledge that the issue of the Secretary's authority to adjust the 340B drug payment rate is subject to litigation before the U.S. Supreme Court. As explained at prior stages of the litigation, we believe that the suit now before the Court is precluded by 1833(t)(12), and, in the alternative, that our 340B drug payment policy is within the statutory authority under 1833(t)(14)(A), which was confirmed by the D.C. Circuit. While the litigation involving this policy is pending, we believe maintaining the current payment policy for CY 2022 would be appropriate in order to maintain consistent and reliable payment. Regarding payment during the COVID–19 PHE, we believe maintaining consistent payment is important; therefore, we are maintaining our proposed policy. We note that any changes to this payment policy would be adopted through notice and comment rulemaking.

Comment: Many commenters opposed the CY 2022 proposal to pay for drugs acquired under the 340B program at the payment rate of ASP minus 22.5 percent. These commenters urged CMS to withdraw its proposed policy and contended that the policy was an unlawful application of the CMS's authority.

Many commenters opposed the current 340B policy and argued that it redistributes resources designated for safety net hospitals to subsidize non-340B or private hospitals because the payment reduction is budget neutral. The commenters requested that CMS end its policy of paying for drugs obtained through the 340B program at ASP minus 22.5 percent and restore the statutory default payment rate of ASP+6 percent.

Many commenters also alleged that private pharmacy benefit managers and third-party payers are citing Medicare's payment reduction to justify implementing similar policies that provide lower reimbursement for 340B drugs compared to non-340B drugs.

Response: We respectfully disagree with the commenters' assertions that our 340B drug payment policy is illegal or an unlawful application of the law. We disagree with commenters that the OPPS 340B payment policy has taken away resources designated for safety net hospitals and our internal analyses have not demonstrated any issues related to access of separately payable drugs as a result of the implementation of this policy. As discussed in this section of the CY 2022 final rule with comment period, the D.C. Circuit has confirmed that our 340B drug payment policy is within our authority in section 1833(t)(14) of the Act.

We note that CMS does not control policies created by private pharmacy benefit managers and third-party payers regarding payment for 340B drugs compared to non-340B drugs.

After reviewing the public comments for CY 2022, we are finalizing our proposal, without modification, to pay ASP minus 22.5 percent for 340B-acquired drugs, including when furnished in nonexcepted off-campus PBDs paid under the PFS. Our finalized proposal continues the 340B Program policies that were implemented in CY 2018 with the exception of the way we are calculating payment for 340B-acquired biosimilars, which is discussed in section V.B.2.c. of the CY 2019 OPPS/ASC final rule with comment period, and would continue the policy we finalized in CY 2019 to pay ASP minus 22.5 percent for 340B-acquired drugs and biologicals furnished in nonexcepted off-campus PBDs paid under the PFS.

We believe that the current payment rate of ASP minus 22.5 percent represents the minimum discount that 340B covered entities receive, which more closely aligns the payment rate with the resources expended by 340B hospitals to acquire such drugs compared to a payment rate of ASP+6 percent, while also recognizing the intent of the 340B program to allow covered entities, including eligible hospitals, to stretch scarce resources in ways that enable hospitals to continue providing access to care for Medicare beneficiaries and other patients. Additionally, we continue to believe it is important to provide consistent and reliable payment for these drugs both for the remainder of the PHE, and after its conclusion, to give hospitals increased certainty as to payments for these drugs. We note that any changes to this payment policy would be adopted through notice and comment rulemaking.

7. High Cost/Low Cost Threshold for Packaged Skin Substitutes

a. Background

In the CY 2014 OPPS/ASC final rule with comment period (78 FR 74938), we unconditionally packaged skin substitute products into their associated surgical procedures as part of a broader policy to package all drugs and biologicals that function as supplies when used in a surgical procedure. As part of the policy to package skin substitutes, we also finalized a methodology that divides the skin substitutes into a high cost group and a low cost group, in order to ensure adequate resource homogeneity among APC assignments for the skin substitute application procedures (78 FR 74933).

Skin substitutes assigned to the high cost group are described by HCPCS codes 15271 through 15278. Skin substitutes assigned to the low cost group are described by HCPCS codes C5271 through C5278. Geometric mean costs for the various procedures are calculated using only claims for the skin substitutes that are assigned to each group. Specifically, claims billed with HCPCS code 15271, 15273, 15275, or 15277 are used to calculate the geometric mean costs for procedures assigned to the high cost group, and claims billed with HCPCS code C5271, C5273, C5275, or C5277 are used to calculate the geometric mean costs for procedures assigned to the low cost group (78 FR 74935).

Each of the HCPCS codes described earlier are assigned to one of the following three skin procedure APCs according to the geometric mean cost for the code: APC 5053 (Level 3 Skin Procedures): HCPCS codes C5271, C5275, and C5277; APC 5054 (Level 4 Skin Procedures): HCPCS codes C5273, 15271, 15275, and 15277; or APC 5055 (Level 5 Skin Procedures): HCPCS code 15273. In CY 2021, the payment rate for APC 5053 (Level 3 Skin Procedures) was $524.17, the payment rate for APC 5054 (Level 4 Skin Procedures) was $1,715.36, and the payment rate for APC 5055 (Level 5 Skin Procedures) was $3,522.15. This information also is available in Addenda A and B of the CY 2021 OPPS/ASC final rule with comment period, as issued with the final rule correction notice (86 FR 11428) (the correction notice and corrected Addenda A and B are available via the internet on the CMS website).

We have continued the high cost/low cost categories policy since CY 2014, and we proposed to continue it for CY 2022. Under the current policy, skin substitutes in the high cost category are reported with the skin substitute application CPT codes, and skin substitutes in the low cost category are reported with the analogous skin substitute HCPCS C-codes. For a discussion of the CY 2014 and CY 2015 methodologies for assigning skin substitutes to either the high cost group or the low cost group, we refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 74932 through 74935) and the CY 2015 OPPS/ASC final rule with comment period (79 FR 66882 through 66885).

For a discussion of the high cost/low cost methodology that was adopted in CY 2016 and has been in effect since then, we refer readers to the CY 2016 OPPS/ASC final rule with comment period (80 FR 70434 through 70435). Beginning in CY 2016 and in subsequent years, we adopted a policy where we determined the high cost/low cost status for each skin substitute product based on either a product's geometric mean unit cost (MUC) exceeding the geometric MUC threshold or the product's per day cost (PDC) (the total units of a skin substitute multiplied by the mean unit cost and divided by the total number of days) exceeding the PDC threshold. We assigned each skin substitute that exceeded either the MUC threshold or the PDC threshold to the high cost group. In addition, we assigned any skin substitute with a MUC or a PDC that does not exceed either the MUC threshold or the PDC threshold to the low cost group (85 FR 86059).

However, some skin substitute manufacturers have raised concerns about significant fluctuation in both the MUC threshold and the PDC threshold from year to year using the methodology developed in CY 2016. The fluctuation in the thresholds may result in the reassignment of several skin substitutes from the high cost group to the low cost group which, under current payment rates, can be a difference of over $1,000 in the payment amount for the same procedure. In addition, these stakeholders were concerned that the inclusion of cost data from skin substitutes with pass-through payment status in the MUC and PDC calculations would artificially inflate the thresholds. Skin substitute stakeholders requested that CMS consider alternatives to the current methodology used to calculate the MUC and PDC thresholds and also requested that CMS consider whether it might be appropriate to establish a new cost group in between the low cost group and the high cost group to allow for assignment of moderately priced skin substitutes to a newly created middle group.

We share the goal of promoting payment stability for skin substitute products and their related procedures as price stability allows hospitals using such products to more easily anticipate future payments associated with these products. We have attempted to limit year-to-year shifts for skin substitute products between the high cost and low cost groups through multiple initiatives implemented since CY 2014, including: Establishing separate skin substitute application procedure codes for low-cost skin substitutes (78 FR 74935); using a skin substitute's MUC calculated from outpatient hospital claims data instead of an average of ASP+6 percent as the primary methodology to assign products to the high cost or low cost group (79 FR 66883); and establishing the PDC threshold as an alternate methodology to assign a skin substitute to the high cost group (80 FR 70434 through 70435).

To allow additional time to evaluate concerns and suggestions from stakeholders about the volatility of the MUC and PDC thresholds, in the CY 2018 OPPS/ASC proposed rule (82 FR 33627), we proposed that a skin substitute that was assigned to the high cost group for CY 2017 would be assigned to the high cost group for CY 2018, even if it did not exceed the CY 2018 MUC or PDC thresholds. We finalized this policy in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59347). We stated in the CY 2018 OPPS/ASC proposed rule that the goal of our proposal to retain the same skin substitute cost group assignments in CY 2018 as in CY 2017 was to maintain similar levels of payment for skin substitute products for CY 2018 while we study our skin substitute payment methodology to determine whether refinements to the existing policies are consistent with our policy goal of providing payment stability for skin substitutes.

We stated in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59347) that we would continue to study issues related to the payment of skin substitutes and take these comments into consideration for future rulemaking. We received many responses to our request for comments in the CY 2018 OPPS/ASC proposed rule about possible refinements to the existing payment methodology for skin substitutes that would be consistent with our policy goal of providing payment stability for these products. In addition, several stakeholders have made us aware of additional concerns and recommendations since the release of the CY 2018 OPPS/ASC final rule with comment period. As discussed in

the CY 2019 OPPS/ASC final rule with comment period (83 FR 58967 through 58968), we identified four potential methodologies that have been raised to us that we encouraged the public to review and provide comments on. We stated in the CY 2019 OPPS/ASC final rule with comment period that we were especially interested in any specific feedback on policy concerns with any of the options presented as they relate to skin substitutes with differing per day or per episode costs and sizes and other factors that may differ among the dozens of skin substitutes currently on the market.

For CY 2020, we sought more extensive comments on the two policy ideas that generated the most comment from the CY 2019 comment solicitation. One of the ideas was to establish a payment episode between 4 to 12 weeks where a lump-sum payment would be made to cover all of the care services needed to treat the wound. There would be options for either a complexity adjustment or outlier payments for wounds that require a large amount of resources to treat. The other policy idea would be to eliminate the high cost and low cost categories for skin substitutes and have only one payment category and set of procedure codes for the application of all graft skin substitute products. Please refer to the CY 2019 OPPS final rule (83 FR 58967 to 58968) and the CY 2020 OPPS final rule (84 FR 61328 to 61331) for a detailed summary and discussion of the comments we received in response to these comment solicitations. We are continuing to consider the comments we received in response to these comment solicitations from CY 2019 and CY 2020.

Comment: Multiple commenters provided suggestions on changes to the payment methodology for graft skin substitute payment policy for future rulemaking.

Response: We appreciate the additional advice regarding possible changes to the payment methodology for graft skin substitute products, and we will consider this information as a part of future rulemaking.

b. Packaged Skin Substitutes for CY 2022

For CY 2022, consistent with our policy since CY 2016, we proposed to continue to determine the high cost/low cost status for each skin substitute product based on either a product's geometric MUC exceeding the geometric MUC threshold or the product's PDC (the total units of a skin substitute multiplied by the MUC and divided by the total number of days) exceeding the PDC threshold. Consistent with the methodology as established in the CY 2014 OPPS/ASC through CY 2018 OPPS/ASC final rules with comment period, we analyzed CY 2019 claims data to calculate the MUC threshold (a weighted average of all skin substitutes' MUCs) and the PDC threshold (a weighted average of all skin substitutes' PDCs). The proposed CY 2022 MUC threshold is $48 per cm^2 (rounded to the nearest $1) and the proposed CY 2022 PDC threshold is $949 (rounded to the nearest $1). We also proposed that our definition of skin substitutes includes synthetic skin substitute products in addition to biological skin substitute products as described in section V.B.7. (86 FR 42137 through 42143) of the CY 2022 OPPS/ASC proposed rule. We also want to clarify that the availability of an HCPCS code for a particular human cell, tissue, or cellular or tissue-based product (HCT/P) does not mean that that product is appropriately regulated solely under section 361 of the PHS Act and the FDA regulations in 21 CFR part 1271. Manufacturers of HCT/Ps should consult with the FDA Tissue Reference Group (TRG) or obtain a determination through a Request for Designation (RFD) on whether their HCT/Ps are appropriately regulated solely under section 361 of the PHS Act and the regulations in 21 CFR part 1271.

For CY 2022, as we did for CY 2021, we proposed to assign each skin substitute that exceeds either the MUC threshold or the PDC threshold to the high cost group. In addition, we proposed to assign any skin substitute with a MUC or a PDC that does not exceed either the MUC threshold or the PDC threshold to the low cost group. For CY 2022, we proposed that any skin substitute product that was assigned to the high cost group in CY 2021 would be assigned to the high cost group for CY 2022, regardless of whether it exceeds or falls below the CY 2022 MUC or PDC threshold. This policy was established in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59346 through 59348).

For CY 2022, we proposed to continue to assign skin substitutes with pass-through payment status to the high cost category. We proposed to assign skin substitutes with pricing information but without claims data to calculate a geometric MUC or PDC to either the high cost or low cost category based on the product's ASP+6 percent payment rate as compared to the MUC threshold. If ASP is not available, we proposed to use WAC+3 percent to assign a product to either the high cost or low cost category. Finally, if neither ASP nor WAC is available, we proposed to use 95 percent of AWP to assign a skin substitute to either the high cost or low cost category. We proposed to continue to use WAC+3 percent instead of WAC+6 percent to conform to our proposed policy described in section V.B.2.b of the CY 2022 OPPS/ASC proposed rule (86 FR 42132) to establish a payment rate of WAC+3 percent for separately payable drugs and biologicals that do not have ASP data available. New skin substitutes without pricing information would be assigned to the low cost category until pricing information is available to compare to the CY 2022 MUC and PDC thresholds. We also proposed to continue to include synthetic products in addition to biological products in our description of skin substitutes. For a discussion of our existing policy under which we assign skin substitutes without pricing information to the low cost category until pricing information is available, we refer readers to the CY 2016 OPPS/ASC final rule with comment period (80 FR 70436). For a discussion of how we determined that synthetic skin graft sheet products can be reported with graft skin substitute procedure codes, we refer readers to the CY 2021 OPPS/ASC final rule (85 FR 86064 to 86067).

Comment: The HOP Panel recommended and several commenters supported ending the packaging of the graft skin substitute add-on codes (CPT codes 15272, 15274, 15276, and 15278; HCPCS codes C5272, C5274, C5276, and C5278). The HOP Panel and the commenters request that these codes be assigned to APCs that reflect the estimated costs of these service codes. Commenters claim that packaging the graft skin substitute add-on codes eliminates the variation of payment for wound care treatment based on the size of the wound. They assert that providers are discouraged from treating wounds between 26 and 99 cm^2 and over 100 cm^2 in the outpatient hospital setting because of the financial losses they experience to provide such care. Commenters believe that packaging graft skin substitute add-on codes disrupts the methodology of how the American Medical Association (AMA), the organization that manages CPT service codes, intended graft skin substitute procedures to be paid.

Response: We do not believe the recommendation of the HOP Panel and the commenters is appropriate for paying for graft skin substitutes under the OPPS. The OPPS is a prospective payment system and not a fee-for-service payment system. That means that we generally attempt to make one payment for all of the services billed with the primary medical procedure, including add-on procedures such as

the ones described by CPT codes 15272, 15274, 15276, and 15278, and HCPCS codes C5272, C5274, C5276, and C5278.

More specifically, we calculate the OPPS payment rate by first calculating the geometric mean cost of the procedure. This calculation includes claims for individual services that used a lower level of resources and claims for individual services that used a higher level of resources. The resulting geometric mean cost will reflect the median service cost for a given medical procedure. Next, we group the medical procedure with other medical procedures with clinical and resource similarity in an APC and calculate the geometric mean of these related procedures to generate a base payment rate for all procedures assigned to the APC.

A prospective payment system like the OPPS is designed to pay providers the geometric mean cost of the primary service they provide, and such a system encourages efficiencies and cost-savings in the administration of health care. However, a prospective payment system is not intended to discourage providers from rendering medically-necessary to patients. For example, it's possible that a provider could experience a financial loss when they perform a service where a patient receives 85 cm^2 of a graft skin substitute product, but that same provider could see a financial gain when the next patient receives a skin graft where only 10 cm^2 of product is used. Paying separately for add-on codes in a prospective payment system defeats the goals of such a payment system. If providers are paid at cost or nearly at cost for each individual service they render, there is no incentive for them to control costs. Add-on codes should be packaged with the primary medical service to be able to establish a median payment rate that gives providers incentives to keep their costs in line with typical providers throughout the Medicare program. The need for cost efficiencies in the application of graft skin substitutes to treat wounds is no different than need for cost efficiencies in other procedures administered in the outpatient hospital setting. Therefore, add-on codes, including the add-on codes for the administration of graft skin substitutes must remain packaged to maintain the integrity of the OPPS.

Comment: The HOP Panel recommended and several commenters support ensuring that the payment rate of graft skin substitute procedures be the same no matter where on the body the graft skin substitute product is applied to the patient. There are four graft skin substitute application procedures for high cost skin substitute products (CPT codes 15271, 15273, 15275, and 15277) and a similar four graft skin substitute applications for low cost skin substitute products (HCPCS codes C5272, C5274, C5276, and C5278). The reason there are four application service codes is that there are different service codes for applying graft skin substitutes to children and infants as compared to adults and there are different service codes for applying graft skin substitutes to the trunk, arms, and legs as compared to the face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, fingers, and toes. Commenters claim that the cost to apply graft skin substitute products does not depend on the location of the wound because the same amount of product is used on the wound and the same clinical resources are used to treat the wound independent of the location of the wound.

Response: We appreciate commenters concerns and note that that current codes describing the application of high and low cost graft skin substitutes for adults (CPT codes 15271 and 15275, and HCPCS codes C5272 and C5276) have been assigned the same APC (5054). Because they are currently included in the same APC, OPPS payment for them is the same, and this payment policy is consistent with the recommendation from the HOP Panel and other commenters. We note that the codes describing the application of high and low cost products for *children and infants* in the trunk, arms, and legs (CPT code 15273 or HCPCS code C5274) have been assigned to a lower-paying APC (APC 5054) than the APC assignment for the application of high and low cost graft skin substitute products for children in the face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hand, feet, fingers, and toes—CPT code 15277 or HCPCS code C5277, which are assigned to APC 5055. These APCs have different payment rates. We note that these services—the application of skin substitutes for children—are fairly low volume services in the OPPS because Medicare beneficiaries tend to be older. In addition, the differences in costs that have determined APC assignments for these services for children have been supported by historical cost data. We also note that none of these service codes are in violation of the 2-times rule. While we do not believe we should change the APC assignments for these services at this time, we are interested in additional feedback on this issue, including whether we should revaluate APC assignments for the application of skin substitutes for children in the future.

Comment: One commenter did not support our proposal to assign graft skin substitute products to a high cost or a low cost group based on if the MUC or PDC of a product exceeds a weighted average of either the MUC or PDC of all graft skin substitute products. The commenter believes the current two-tier system provides incentives for providers to use higher-cost graft skin substitute products instead of lower-cost products that have similar efficacy to the higher-cost products. The commenter supports a payment system where the high cost and low cost groups have been eliminated. The commenter believes geometric mean payment rate for each graft skin substitute application service code would be calculated using all of the separately paid claims for a given code without consideration to the mean unit cost of the graft skin substitute product used in the service. The commenter believes this approach would reduce spending on graft skin substitute procedures by encouraging the use of lower-cost graft skin substitute products and will reduce administration burden for providers as they only need to use one set of product application codes.

Response: As we explained in the CY 2014 OPPS/ASC final rule (78 FR 74933), the graft skin substitute procedures described by CPT codes 15271 through 15278 are clinically homogeneous, but there is resource heterogeneity between different skin substitute products with the cost per cm^2 ranging from under $10 per cm^2 to over $200 per cm^2. As we discussed in prior rules, establishing high cost and low cost groups for skin substitutes makes the payment for these products more homogeneous and reduces the risk of excessive overpayment or underpayment to a provider when a skin substitute product is used. However, we appreciate the commenter's proposal and note that establishing a payment policy in which with only one set of product application service codes may have other benefits, such as simplifying coding and payments for these procedures and products, and we may explore these concepts in future rulemaking.

Comment: Two commenters supported our proposal to continue to assign skin substitutes to the low cost or high cost group. Commenters also supported our proposal that any skin substitute product that was assigned to the high cost group in CY 2020 would be assigned to the high cost group for CY 2021, regardless of whether it exceeds or falls below the CY 2021 MUC or PDC threshold.

Response: We appreciate the support of the commenters for our proposals.

Comment: Two commenters supported our inclusion of synthetic products in our definition of skin substitute products.

Response: We appreciate the support of the commenters.

Comment: One commenter requested that CMS no longer use the term ''skin substitutes'' to describe products that do not function like human skin that is grafted onto a wound and are not substitutes for skin grafts, but do aid in wound healing by stimulating the patient to regenerate lost tissue. Instead, the commenters request that we use the term ''cellular and/or tissue based products for skin wounds'' that is abbreviated ''CTPs''.

Response: We appreciate the suggestion by the commenter, but we do not believe it is appropriate at this time to end our use of the term ''skin substitute.'' Notably, the CPT and HCPCS codes used to report graft procedures using cellular and tissue based products to heal skin wounds, CPT codes 15271 through 15278 and HCPCS codes C5271 through C5278, use the term ''skin substitute'' in the descriptor. We feel that we should use terminology that reflects the service descriptors that are reported in the OPPS. Also, we believe the term ''skin substitute'' is well-understood by providers and industry stakeholders.

Comment: Two commenters wanted us to confirm that our proposed rule language that encourages manufacturers of HCT/Ps to consult with the FDA Tissue Reference Group (TRG) or obtain a determination through a Request for Designation (RFD) on whether their HCT/Ps are appropriately regulated solely under section 361 of the PHS Act and the regulations in 21 CFR part 1271 applied only to those HCT/Ps that do not have either an FDA 510(k) clearance, premarket approval (PMA), or biologic license application (BLA) approval. These commenters are supportive of the policy as long as no consultation or determination is required for HCT/Ps with either a 510(k) clearance, a PMA, or a BLA approval.

Response: We can confirm that our suggestion for manufacturers of HCT/Ps to consult with the FDA Tissue Reference Group (TRG) or obtain a determination through a Request for Designation (RFD) on whether their HCT/Ps are appropriately regulated solely under section 361 of the PHS Act and the regulations in 21 CFR part 1271 does apply only to those HCT/Ps that do not have either a 510(k) clearance, a PMA, or a BLA approval from FDA.

Comment: Multiple commenters stated that HCPCS code C1849, which is used to report synthetic graft skin substitute products, should be assigned to the low cost skin substitute group by default, similar to how we pay for HCPCS code Q4100 (Skin substitute, not otherwise specified), which is used to report multiple biological skin substitute products that do not have product-specific HCPCS codes. Commenters also expressed concerns that synthetic graft skin substitute products that should receive payment through the low cost skin substitute group would instead receive payment in the high cost skin substitute group and increase overall graft skin substitute costs for Medicare.

Response: We were aware of one synthetic graft skin substitute product that was described by HCPCS code C1849 when the code was established in July 2020. The manufacturer provided pricing data that showed the cost of the product is above the MUC threshold for graft skin substitute products and therefore HCPCS code C1849 should be assigned to the high cost skin substitute group. We note that we used pricing data to assign HCPCS code C1849 to the high cost group, and the assignment of HCPCS code C1849 to the high cost skin substitute group was not automatic. As more synthetic graft skin substitute products are identified, we will use their pricing data to calculate an average price for the products described by HCPCS code C1849 and compare that average price to the overall MUC threshold to determine whether HCPCS code C1849 should be assigned to the high cost or low cost skin substitute group.

Comment: One commenter noted that CMS previously assigned HCPCS code Q4117 (Hyalomatrix, per square centimeter) to a product considered a synthetic skin substitute which demonstrates that synthetic skin substitutes can function within the current coding under both the PFS and OPPS frameworks. The commenter stated that it would be better for CMS to judiciously assign HCPCS codes to synthetic products that meet these application requirements.

Response: We will take this suggestion into consideration for future rulemaking as we continue our work to address payment for all skin substitutes across settings, taking into account the intersection between biological, bioengineered, and synthetic components of these products. We also plan to further evaluate the characteristics of products with an existing Q-code for future rulemaking.

Comment: One commenter, the manufacturer, has requested that HCPCS codes Q4122 (Dermacell, per square centimeter) and Q4150 (Allowrap ds or dry, per square centimeter) continue to be assigned to the high-cost skin substitute group.

Response: HCPCS codes Q4122 and Q4150 were both assigned to the high cost group in CY 2021 and also were proposed to be assigned to the high-cost group for CY 2022. Any skin substitute assigned to the high cost group in CY 2021 will continue to be assigned to the high cost group in CY 2022 even if the MUC and PDC for the skin substitute product is below the overall MUC and PDC thresholds for all skin substitute products. Accordingly, we are finalizing our proposal to assign HCPCS codes Q4122 and Q4150 to the high-cost group in CY 2022.

After consideration of the public comments we received, we are finalizing our proposal to assign a skin substitute with a MUC or a PDC that does not exceed either the MUC threshold or the PDC threshold to the low cost group, unless the product was assigned to the high cost group in CY 2021, in which case we would assign the product to the high cost group for CY 2022, regardless of whether it exceeds the CY 2022 MUC or PDC threshold. We are also finalizing our proposal to assign to the high cost group any skin substitute product that exceeds the CY 2022 MUC or PDC thresholds and assign to the low cost group any skin substitute product that does not exceed the CY 2021 MUC or PDC thresholds and was not assigned to the high cost group in CY 2021. We are finalizing our proposal to continue to use payment methodologies, including ASP+6 percent and 95 percent of AWP, for skin substitute products that have pricing information but do not have claims data to determine if their costs exceed the CY 2022 MUC. In addition, we are finalizing our proposal to continue to use WAC+3 percent instead of WAC+6 percent for skin substitute products that do not have ASP pricing information or claims data to determine if those products' costs exceed the CY 2022 MUC. We also are finalizing our proposal to retain our established policy to assign new skin substitute products with pricing information to the low cost group. Table 42 includes the final CY 2022 cost category assignment for each skin substitute product.

BILLING CODE 4120–01–P

TABLE 42: SKIN SUBSTITUTE ASSIGNMENTS TO HIGH COST AND LOW COST GROUPS FOR CY 2022

CY 2022 HCPCS Code	CY 2022 Short Descriptor	CY 2021 High/Low Cost Assignment	Final CY 2022 High/Low Cost Assignment

* These products do not exceed either the proposed MUC or PDC threshold for CY 2022, but are assigned to the high cost group because they were assigned to the high cost group in CY 2021.

BILLING CODE 4120–01–C

VI. Estimate of OPPS Transitional Pass-Through Spending for Drugs, Biologicals, Radiopharmaceuticals, and Devices

A. Amount of Additional Payment and Limit on Aggregate Annual Adjustment

Section 1833(t)(6)(E) of the Act limits the total projected amount of transitional pass-through payment for drugs, biologicals, and categories of devices for a given year to an ''applicable percentage,'' currently not to exceed 2.0 percent of total program payments estimated to be made for all covered services under the OPPS furnished for that year. If we estimate before the beginning of the calendar year that the total amount of pass-through payments in that year would exceed the applicable percentage, section 1833(t)(6)(E)(iii) of the Act requires a uniform prospective reduction in the amount of each of the transitional pass-through payments made in that year to ensure that the limit is not exceeded. We estimate the pass-through spending to determine whether payments exceed the applicable percentage and the appropriate pro rata reduction to the conversion factor for the projected level of pass-through spending in the following year to ensure that total estimated pass-through spending for the prospective payment year is budget neutral, as required by section 1833(t)(6)(E) of the Act.

For devices, developing a proposed estimate of pass-through spending in CY 2022 entails estimating spending for two groups of items. The first group of items consists of device categories that are currently eligible for pass-through payment and that will continue to be eligible for pass-through payment in CY 2022. The CY 2008 OPPS/ASC final rule with comment period (72 FR 66778) describes the methodology we have used in previous years to develop the pass-through spending estimate for known device categories continuing into the applicable update year. The second group of items consists of devices that we know are newly eligible, or project may be newly eligible, for device pass-through payment in the remaining quarters of CY 2021 or beginning in CY 2022. The sum of the proposed CY 2022 pass-through spending estimates for these two groups of device categories equaled the proposed total CY 2022 pass-through spending estimate for device categories with pass-through payment status. We determined the device pass-through estimated payments for each device category based on the amount of payment as required by section 1833(t)(6)(D)(ii) of the Act, and as outlined in previous rules, including the CY 2014 OPPS/ASC final rule with

comment period (78 FR 75034 through 75036). We note that, beginning in CY 2010, the pass-through evaluation process and pass-through payment methodology for implantable biologicals newly approved for pass-through payment beginning on or after January 1, 2010, that are surgically inserted or implanted (through a surgical incision or a natural orifice) use the device pass-through process and payment methodology (74 FR 60476). As has been our past practice (76 FR 74335), in the proposed rule, we proposed to include an estimate of any implantable biologicals eligible for pass-through payment in our estimate of pass-through spending for devices. Similarly, we finalized a policy in CY 2015 that applications for pass-through payment for skin substitutes and similar products be evaluated using the medical device pass-through process and payment methodology (76 FR 66885 through 66888). Therefore, as we did beginning in CY 2015, for CY 2022, we also proposed to include an estimate of any skin substitutes and similar products in our estimate of pass-through spending for devices.

For drugs and biologicals eligible for pass-through payment, section 1833(t)(6)(D)(i) of the Act establishes the pass-through payment amount as the amount by which the amount authorized under section 1842(o) of the Act (or, if the drug or biological is covered under a competitive acquisition contract under section 1847B of the Act, an amount determined by the Secretary equal to the average price for the drug or biological for all competitive acquisition areas and year established under such section as calculated and adjusted by the Secretary) exceeds the portion of the otherwise applicable fee schedule amount that the Secretary determines is associated with the drug or biological. Our proposed estimate of drug and biological pass-through payment for CY 2022 for this group of items was $462.4 million, as discussed below, because we proposed that most non pass-through separately payable drugs and biologicals would be paid under the CY 2022 OPPS at ASP+6 percent with the exception of 340B-acquired separately payable drugs, which we proposed would be paid at ASP minus 22.5 percent, and because we proposed to pay for CY 2022 pass-through payment drugs and biologicals at ASP+6 percent, as we discuss in section V.A. of the CY 2022 OPPS/ASC proposed rule (86 FR 42116).

Furthermore, payment for certain drugs, specifically diagnostic radiopharmaceuticals and contrast agents without pass-through payment status, is packaged into payment for the associated procedures, and these products are not be separately paid. In addition, we policy-package all non pass-through drugs, biologicals, and radiopharmaceuticals that function as supplies when used in a diagnostic test or procedure, drugs and biologicals that function as supplies when used in a surgical procedure, drugs and biologicals used for anesthesia, and other categories of drugs and biologicals, as discussed in section V.B.1.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42129 through 42131). We proposed that all of these policy-packaged drugs and biologicals with pass-through payment status will be paid at ASP+6 percent, like other pass-through drugs and biologicals, for CY 2022, less the policy-packaged drug APC offset amount described below. Our estimate of pass-through payment for policy-packaged drugs and biologicals with pass-through payment status approved prior to CY 2022 is not $0. This is because the pass-through payment amount and the fee schedule amount associated with the drug or biological will not be the same, unlike for separately payable drugs and biologicals. In section V.A.6. of the CY 2022 OPPS/ASC proposed rule (86 FR 42126 through 42127), we discuss our policy to determine if the costs of certain policy-packaged drugs or biologicals are already packaged into the existing APC structure. If we determine that a policy-packaged drug or biological approved for pass-through payment resembles predecessor drugs or biologicals already included in the costs of the APCs that are associated with the drug receiving pass-through payment, we proposed to offset the amount of pass-through payment for the policy-packaged drug or biological. For these drugs or biologicals, the APC offset amount is the portion of the APC payment for the specific procedure performed with the pass-through drug or biological, which we refer to as the policy-packaged drug APC offset amount. If we determine that an offset is appropriate for a specific policy-packaged drug or biological receiving pass-through payment, we proposed to reduce our estimate of pass-through payments for these drugs or biologicals by the APC offset amount.

Similar to pass-through spending estimates for devices, the first group of drugs and biologicals requiring a pass-through payment estimate consists of those products that were recently made eligible for pass-through payment and that will continue to be eligible for pass-through payment in CY 2022. The second group contains drugs and biologicals that we know are newly eligible, or project will be newly eligible, in the remaining quarters of CY 2021 or beginning in CY 2022. The sum of the CY 2022 pass-through spending estimates for these two groups of drugs and biologicals equals the total CY 2022 pass-through spending estimate for drugs and biologicals with pass-through payment status.

B. Estimate of Pass-Through Spending for CY 2022

For 2022, we proposed to set the applicable pass-through payment percentage limit at 2.0 percent of the total projected OPPS payments for CY 2022, consistent with section 1833(t)(6)(E)(ii)(II) of the Act and our OPPS policy from CY 2004 through CY 2021 (85 FR 86068). The pass-through payment percentage limit is calculated using pass-through spending estimates for devices and for drugs and biologicals.

For the first group of devices, consisting of device categories that are currently eligible for pass-through payment and will continue to be eligible for pass-through payment in CY 2022, there are 9 active categories for CY 2022. The active categories are described by HCPCS codes C2596, C1734, C1982, C1824, C1839, C1748, C1825, C1052, and C1062. Based on the information from the device manufacturers, we estimate that HCPCS code C2596 will cost $11.3 million in pass-through expenditures in CY 2022, HCPCS C1734 will cost $36.9 million in pass-through expenditures in CY 2022, HCPCS code C1982 will cost $116.3 million in pass-through expenditures in CY 2022, HCPCS code C1824 will cost $46 million in pass-through expenditures in CY 2022, HCPCS code C1839 will cost $500,000 in pass-through expenditures in CY 2022, HCPCS code C1748 will cost $39.1 million in pass-through expenditures in CY 2022, HCPCS code C1825 will cost $3.5 million pass-through expenditures in CY 2022, HCPCS code C1052 will cost $40 million in pass-through expenditures in CY 2022, and HCPCS code C1062 will cost $14.3 million in pass-through expenditures in CY 2022. Therefore, we proposed an estimate for the first group of devices of $307.9 million.

In estimating our proposed CY 2022 pass-through spending for device categories in the second group, we included: device categories that we assumed at the time of the development of the CY 2022 OPPS/ASC proposed rule will be newly eligible for pass-through payment in CY 2022; additional device categories that we estimated

could be approved for pass-through status after the development of the proposed rule and before January 1, 2022; and contingent projections for new device categories established in the second through fourth quarters of CY 2022. For CY 2022, we proposed to use the general methodology described in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66778), while also taking into account recent OPPS experience in approving new pass-through device categories. The proposed estimate of CY 2022 pass-through spending for this second group of device categories is $244.4 million.

We did not receive any public comments on this proposal. As stated earlier in this final rule with comment period, we are approving three devices for pass-through payment status in the CY 2022 rulemaking cycle: RECELL® Autologous Cell Harvesting Device, Shockwave C2 Coronary Intravascular Lithotripsy (IVL) catheter, and AngelMed Guardian® System. The manufacturers of these systems provided utilization and cost data that indicate the amount of spending for the devices would be approximately $18.4 million for RECELL® Autologous Cell Harvesting Device, $118.4 million for Shockwave C2 Coronary Intravascular Lithotripsy (IVL) catheter, and $5.1 million for AngelMed Guardian® System. Therefore, we are finalizing an estimate of $141.9 million for this second group of devices for CY 2022.

To estimate proposed CY 2022 pass-through spending for drugs and biologicals in the first group, specifically those drugs and biologicals recently made eligible for pass-through payment and continuing on pass-through payment status for at least one quarter in CY 2022, we proposed to use the CY 2019 Medicare hospital outpatient claims data regarding their utilization, information provided in the respective pass-through applications, other historical hospital claims data, pharmaceutical industry information, and clinical information regarding these drugs and biologicals to project the CY 2022 OPPS utilization of the products.

For the known drugs and biologicals (excluding policy-packaged diagnostic radiopharmaceuticals, contrast agents, drugs, biologicals, and radiopharmaceuticals that function as supplies when used in a diagnostic test or procedure, and drugs and biologicals that function as supplies when used in a surgical procedure) that will be continuing on pass-through payment status in CY 2022, we estimate the pass-through payment amount as the difference between ASP+6 percent and the payment rate for non pass-through drugs and biologicals that will be separately paid. Separately payable drugs are paid at a rate of ASP+6 percent with the exception of 340B-acquired drugs, for which we proposed to pay ASP minus 22.5 percent. Therefore, the proposed payment rate difference between the pass-through payment amount and the non pass-through payment amount is $462.4 million for this group of drugs.

Because payment for policy-packaged drugs and biologicals is packaged if the product is not paid separately due to its pass-through payment status, we proposed to include in the CY 2022 pass-through estimate of the difference between payment for the policy-packaged drug or biological at ASP+6 percent (or WAC+6 percent, or 95 percent of AWP, if ASP or WAC information is not available) and the policy-packaged drug APC offset amount, if we determine that the policy-packaged drug or biological approved for pass-through payment resembles a predecessor drug or biological already included in the costs of the APCs that are associated with the drug receiving pass-through payment, which we estimate for CY 2022 for the first group of policy-packaged drugs to be $0 since there are currently no policy-packaged drugs for which we have cost data that will be on pass-through in CY 2022.

We did not receive any public comments on our proposal. Using our methodology for this final rule with comment period, we calculated a CY 2022 spending estimate for this first group of drugs and biologicals of approximately $466.7 million based on our decision to maintain our current policy of paying ASP minus 22.5 percent for 340B-acquired drugs.

To estimate proposed CY 2022 pass-through spending for drugs and biologicals in the second group (that is, drugs and biologicals that we knew at the time of development of the proposed rule were newly eligible or recently became eligible for pass-through payment in CY 2022, additional drugs and biologicals that we estimated could be approved for pass-through status subsequent to the development of the proposed rule and before January 1, 2022, and projections for new drugs and biologicals that could be initially eligible for pass-through payment in the second through fourth quarters of CY 2022), we proposed to use utilization estimates from pass-through applicants, pharmaceutical industry data, clinical information, recent trends in the per unit ASPs of hospital outpatient drugs, and projected annual changes in service volume and intensity as our basis for making the CY 2022 pass-through payment estimate. We also proposed to consider the most recent OPPS experience in approving new pass-through drugs and biologicals. Using our proposed methodology for estimating CY 2022 pass-through payments for this second group of drugs, we calculated a proposed spending estimate for this second group of drugs and biologicals of approximately $10 million.

We did not receive any public comments on our proposal. Since the release of the CY 2022 OPPS/ASC proposed rule, we have identified seven additional policy-packaged drugs in addition to the three policy-packaged drugs that had pass-through status when the proposed rule was released. Our original proposed estimate of $10 million of additional pass-through payments for the second group of drugs and biologicals did anticipate the approval of some of the additional policy-packaged drugs and biologicals with pass-through status, but not all of them. Therefore, for this final rule, we are revising our estimate of pass-through spending for the second group of drugs and biologicals to be $20 million.

We estimate for this final rule with comment period that the amount of pass-through spending for the device categories and the drugs and biologicals that are continuing to receive pass-through payment in CY 2022 and those device categories, drugs, and biologicals that first become eligible for pass-through payment during CY 2022 would be approximately $936.5 million (approximately $449.8 million for device categories and approximately $486.7 million for drugs and biologicals) which represents 1.14 percent of total projected OPPS payments for CY 2022 (approximately $82 billion). Therefore, we estimate that pass-through spending in CY 2022 will not amount to 2.0 percent of total projected OPPS CY 2022 program spending. As discussed in section X.E. of the CY 2022 OPPS/ASC proposed rule (86 FR 42188 through 42190), due to the effects of the COVID–19 PHE, we proposed to generally use CY 2019 claims data instead of CY 2020 claims data to establish the CY 2022 OPPS rates and to use cost report data from the same set of cost reports originally used in CY 2021 final rule OPPS ratesetting. We stated that if our proposal to use CY 2019 data, rather than CY 2020 data, to inform CY 2022 ratesetting is finalized, we would effectively remove approximately one year of pass-through data collection time for ratesetting purposes. Therefore, for CY 2022, in section X.F. of the CY 2022 OPPS/ASC proposed rule (86 FR 42190 through 42193), we proposed to

use our equitable adjustment authority under 1833(t)(2)(E) to provide up to four quarters of separate payment for 21 drugs and biologicals whose pass-through payment status will expire on March 31, 2022, June 30, 2022, or September 30, 2022 and six drugs and biologicals and one device category whose pass-through payment status will expire on December 31, 2021. This would ensure that we have a full year of claims data from CY 2021 to use for CY 2023 ratesetting and would allow us to avoid using CY 2020 data to set rates for these pass-through drugs, biologicals, and the device category for CY 2022.

We estimated the spending for the drugs, biologicals, and device category for which we proposed to provide separate payment for the remainder of CY 2022 using our equitable adjustment authority. To estimate proposed CY 2022 spending for the one device pass-through category with pass-through status expiring on December 31, 2021, we also used the general methodology described in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66778). For this device category, we calculate a proposed spending estimate of $34.5 million. To estimate proposed CY 2022 spending for the six drugs with pass-through status expiring on December 21, 2021 and the 18 drugs and three biologicals with pass-through status expiring on March 30, 2022, June 30, 2022, and September 30, 2022, we performed an analysis similar to the analysis for the first group of drugs and biologicals described earlier in this section where we estimated the pass-through payment amount as the difference between ASP+6 percent and the payment rate for non pass-through drugs and biologicals that will be separately paid. For this group, we calculate a proposed spending estimate for CY 2022 of $44.4 million. We estimate that total spending for these 27 drugs and biologicals and one device category would be approximately $78.9 million for CY 2022. The drugs, biologicals, and device category for which we proposed to provide separate payment for one to four quarters in CY 2022 are listed in Table 43 below. Please refer to section X.F. of this final rule with comment period regarding our decision to implement our proposal to utilize our equitable adjustment authority to pay separately for the remainder of CY 2022 for the device category, drugs, and biologicals with pass-through status that expires between December 31, 2021, and September 30, 2022.

BILLING CODE 4120–01–C

VII. OPPS Payment for Hospital Outpatient Visits and Critical Care Services

For CY 2022, we proposed to continue with our current clinic and emergency department (ED) hospital outpatient visits payment policies. For a description of the current clinic and ED hospital outpatient visits policies, we refer readers to the CY 2016 OPPS/ASC final rule with comment period (80 FR 70448). We also proposed to continue our payment policy for critical care services for CY 2022. For a description of the current payment policy for critical care services, we refer readers to the CY 2016 OPPS/ASC final rule with comment period (80 FR 70449), and for the history of the payment policy for critical care services, we refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75043). In the CY 2022 OPPS/ASC proposed rule, we sought public comments on any changes to these codes that we should consider for future rulemaking cycles. We continue to encourage commenters to provide the data and analysis necessary to justify any suggested changes.

In the CY 2022 OPPS/ASC proposed rule, we stated that we would continue the clinic visit payment policy for CY 2022 and beyond. More specifically, we stated that we would continue to utilize a PFS-equivalent payment rate for the hospital outpatient clinic visit service described by HCPCS code G0463 when

it is furnished by excepted off-campus provider-based departments. The PFS-equivalent rate for CY 2022 is 40 percent of the proposed OPPS payment (that is, 60 percent less than the proposed OPPS rate). Under this policy, these departments will be paid approximately 40 percent of the OPPS rate (100 percent of the OPPS rate minus the 60-percent payment reduction that is applied in CY 2022) for the clinic visit service in CY 2022. We stated that we would continue to monitor the effect of this change in Medicare payment policy, including the volume of these types of OPD services.

Comment: We received several comments on our payment policy for hospital outpatient visits. Many commenters expressed concerns that CMS's policy to pay the PFS-equivalent rate for outpatient clinic visits furnished in excepted off-campus provider-based departments would cause financial harm to hospitals. Other commenters suggested that CMS develop a set of national guidelines for coding ED visits, and a few of commenters provided specific edits to the descriptor of the HCPCS code for hospital outpatient clinic visits (G0463).

Response: We appreciate commenters' concerns and will continue to examine these concerns and determine if any modifications to these policies are warranted in future rulemaking.

After consideration of the public comments, we are finalizing our proposal to continue to utilize a PFS-equivalent payment rate for the hospital outpatient clinic visit service described by HCPCS code G0463 when it is furnished by excepted off-campus provider-based departments as proposed. We are also finalizing our proposal to continue our current ED outpatient visits and critical care payment policies.

VIII. Payment for Partial Hospitalization Services

A. Background

A partial hospitalization program (PHP) is an intensive outpatient program of psychiatric services provided as an alternative to inpatient psychiatric care for individuals who have an acute mental illness, which includes, but is not limited to, conditions such as depression, schizophrenia, and substance use disorders. Section 1861(ff)(1) of the Act defines partial hospitalization services as the items and services described in paragraph (2) prescribed by a physician and provided under a program described in paragraph (3) under the supervision of a physician pursuant to an individualized, written plan of treatment established and periodically reviewed by a physician (in consultation with appropriate staff participating in such program), which sets forth the physician's diagnosis, the type, amount, frequency, and duration of the items and services provided under the plan, and the goals for treatment under the plan. Section 1861(ff)(2) of the Act describes the items and services included in partial hospitalization services. Section 1861(ff)(3)(A) of the Act specifies that a PHP is a program furnished by a hospital to its outpatients or by a community mental health center (CMHC), as a distinct and organized intensive ambulatory treatment service, offering less than 24-hour-daily care, in a location other than an individual's home or inpatient or residential setting. Section 1861(ff)(3)(B) of the Act defines a CMHC for purposes of this benefit. We refer readers to sections 1833(t)(1)(B)(i), 1833(t)(2)(B), 1833(t)(2)(C), and 1833(t)(9)(A) of the Act and 42 CFR 419.21, for additional guidance regarding PHP.

In CY 2008, we began efforts to strengthen the PHP benefit through extensive data analysis, along with policy and payment changes by implementing two refinements to the methodology for computing the PHP median. For a detailed discussion on these policies, we refer readers to the CY 2008 OPPS/ASC final rule with comment period (72 FR 66670 through 66676). In CY 2009, we implemented several regulatory, policy, and payment changes. For a detailed discussion on these policies, we refer readers to the CY 2009 OPPS/ASC final rule (73 FR 68688 through 68697). In CY 2010, we retained the two-tier payment approach for partial hospitalization services and used only hospital-based PHP data in computing the PHP APC per diem costs, upon which PHP APC per diem payment rates are based (74 FR 60556 through 60559). In CY 2011 (75 FR 71994), we established four separate PHP APC per diem payment rates: Two for CMHCs (APC 0172 and APC 0173) and two for hospital-based PHPs (APC 0175 and APC 0176) and instituted a 2-year transition period for CMHCs to the CMHC APC per diem payment rates. For a detailed discussion, we refer readers to section X.B. of the CY 2011 OPPS/ASC final rule with comment period (75 FR 71991 through 71994). In CY 2012, we determined the relative payment weights for partial hospitalization services provided by CMHCs based on data derived solely from CMHCs and the relative payment weights for partial hospitalization services provided by hospital-based PHPs based exclusively on hospital data (76 FR 74348 through 74352). In the CY 2013 OPPS/ASC final rule with comment period, we finalized our proposal to base the relative payment weights that underpin the OPPS APCs, including the four PHP APCs (APCs 0172, 0173, 0175, and 0176), on geometric mean costs rather than on the median costs. For a detailed discussion on this policy, we refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68406 through 68412).

In the CY 2014 OPPS/ASC proposed rule (78 FR 43621 through 43622) and CY 2015 OPPS/ASC final rule with comment period (79 FR 66902 through 66908), we continued to apply our established policies to calculate the four PHP APC per diem payment rates based on geometric mean per diem costs using the most recent claims data for each provider type. For a detailed discussion on this policy, we refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75047 through 75050). In the CY 2016, we described our extensive analysis of the claims and cost data and ratesetting methodology, corrected a cost inversion that occurred in the final rule data with respect to hospital-based PHP providers and renumbered the PHP APCs. In CY 2017 OPPS/ASC final rule with comment period (81 FR 79687 through 79691), we continued to apply our established policies to calculate the PHP APC per diem payment rates based on geometric mean per diem costs and finalized a policy to combine the Level 1 and Level 2 PHP APCs for CMHCs and for hospital-based PHPs. We also implemented an eight-percent outlier cap for CMHCs to mitigate potential outlier billing vulnerabilities. For a comprehensive description of PHP payment policy, including a detailed methodology for determining PHP per diem amounts, we refer readers to the CY 2016 and CY 2017 OPPS/ASC final rules with comment period (80 FR 70453 through 70455 and 81 FR 79678 through 79680).

In the CYs 2018 and 2019 OPPS/ASC final rules with comment period (82 FR 59373 through 59381, and 83 FR 58983 through 58998, respectively), we continued to apply our established policies to calculate the PHP APC per diem payment rates based on geometric mean per diem costs, designated a portion of the estimated 1.0 percent hospital outpatient outlier threshold specifically for CMHCs, and proposed updates to the PHP allowable HCPCS codes. We finalized these proposals in the CY 2020 OPPS/ASC final rule with

comment period (84 FR 61352). We refer readers to section VIII.D. of the CY 2022 OPPS/ASC proposed rule for a discussion of the proposed updates and the applicability for CY 2021.

In the CY 2020 OPPS/ASC final rule with comment period (84 FR 61339 through 61350), we finalized our proposal to use the calculated CY 2020 CMHC geometric mean per diem cost and the calculated CY 2020 hospital-based PHP geometric mean per diem cost, but with a cost floor equal to the CY 2019 final geometric mean per diem costs as the basis for developing the CY 2020 PHP APC per diem rates. Also, we continued to designate a portion of the estimated 1.0 percent hospital outpatient outlier threshold specifically for CMHCs, consistent with the percentage of projected payments to CMHCs under the OPPS, excluding outlier payments.

In the April 30, 2020 interim final rule with comment (85 FR 27562 through 27566), effective as of March 1, 2020 and for the duration of the COVID–19 Public Health Emergency (PHE), hospital and CMHC staff are permitted to furnish certain outpatient therapy, counseling, and educational services (including certain PHP services), incident to a physician's services, to beneficiaries in temporary expansion locations, including the beneficiary's home, so long as the location meets all conditions of participation to the extent not waived. A hospital or CMHC can furnish such services using telecommunications technology to a beneficiary in a temporary expansion location if that beneficiary is registered as an outpatient. These provisions apply only for the duration of the COVID–19 PHE.

In the CY 2021 final rule (85 FR 86073 through 86080), we finalized a CMHC geometric mean per diem cost of $136.14 and a final hospital-based PHP geometric mean per diem cost of $253.76 using the most recent updated claims and cost data. In the CY 2021 proposed rule (85 FR 48901 through 48905), we had proposed, for CY 2021 and subsequent years, to use the CY 2021 CMHC geometric mean per diem cost calculated in accordance with our existing methodology, but with a cost floor equal to the per diem cost for CMHCs of $121.62 that was calculated for CY 2020 ratesetting (84 FR 61339 through 61344), as the basis for developing the CY 2021 CMHC APC per diem rate. We had also proposed, for CY 2021 and subsequent years, to use the CY 2021 hospital-based geometric mean per diem cost calculated in accordance with our existing methodology, but with a cost floor equal to the per diem cost for hospital-based providers of $222.76 that was calculated for CY 2020 ratesetting (84 FR 61344 through 61345). We explained in the CY 2021 final rule that the final calculated geometric mean per diem costs for both CMHCs and hospital-based PHPs were significantly higher than each proposed cost floor, therefore a floor was not necessary at the time, and we did not finalize the proposed cost floors in the CY 2021 OPPS/ASC final rule with comment period.

B. PHP APC Update for CY 2022

1. PHP APC Geometric Mean Per Diem Costs

In summary, for CY 2022 only, we proposed to use the CY 2022 CMHC geometric mean per diem cost calculated in accordance with our existing methodology, but with a cost floor equal to the per diem cost for CMHCs of $136.14, which is the final CMHC geometric mean per diem cost calculated last year for CY 2021 ratesetting (85 FR 86080), as the basis for developing the CY 2022 CMHC APC per diem rate. We also proposed, for CY 2022 only, to use the CY 2022 hospital-based geometric mean per diem cost calculated in accordance with our existing methodology, but with a cost floor equal to the per diem cost for hospital-based providers of $253.76 calculated last year for CY 2021 ratesetting (85 FR 86080). Following this methodology, we proposed to use the cost floor value of $136.14 for CMHCs as the basis for developing the CY 2022 CMHC APC per diem rate, and to use the cost floor value of $253.76 as the basis for developing the CY 2021 hospital-based APC per diem rate. We also proposed to use the latest available CY 2019 claims and cost data from the CY 2021 rulemaking to determine CY 2022 geometric mean per diem costs in the CY 2022 OPPS/ASC proposed rule, and we proposed that if the final CY 2022 cost for CMHCs or hospital-based PHPs was calculated to be above the proposed floor for that provider type, we would use the final calculated cost instead of the floor. Lastly, in accordance with our longstanding policy, we proposed to continue to use CMHC APC 5853 (Partial Hospitalization (three or More Services Per Day)) and hospital-based PHP APC 5863 (Partial Hospitalization (three or More Services Per Day)).

We are finalizing these proposals in this CY 2022 OPPS/ASC final rule as proposed, and we discuss our rationale and the public comments received on these proposals in the following sections.

2. Development of the PHP APC Geometric Mean Per Diem Costs

In preparation for CY 2022, we followed the PHP ratesetting methodology described in section VIII.B.2. of the CY 2016 OPPS/ASC final rule with comment period (80 FR 70462 through 70466) to calculate the PHP APCs' geometric mean per diem costs and payment rates for APCs 5853 and 5863, incorporating the modifications made in the CY 2017 OPPS/ASC final rule with comment period. As discussed in section VIII.B.1. of the CY 2017 OPPS/ASC final rule with comment period (81 FR 79680 through 79687), the geometric mean per diem cost for hospital-based PHP APC 5863 is based upon actual hospital-based PHP claims and costs for PHP service days providing three or more services. Similarly, the geometric mean per diem cost for CMHC APC 5853 is based upon actual CMHC claims and costs for CMHC service days providing three or more services. In addition, for CY 2022, we proposed to use cost and charge data from the Hospital Cost Report Information System (HCRIS) as the source for the CMHC cost-to-charge ratios (CCRs), instead of using the Outpatient Provider Specific File (OPSF). As discussed in section VIII.B.2.a of this OPPS/ASC final rule, we are finalizing our proposal to use HCRIS as the source for CMHC CCRs.

As discussed in section X.E of the OPPS/ASC proposed rule (86 FR 42188 through 42190), we analyzed OPPS cost and claims information from CY 2019 and CY 2020 to better understand the effects of the COVID–19 PHE on outpatient services, including PHP, and to identify which data would be the best available for ratesetting. As discussed in that section of the proposed rule, we observed a number of changes, likely as a result of the COVID–19 PHE, in the CY 2020 OPPS claims that we would ordinarily use for ratesetting, and this includes changes in the claims for partial hospitalization, and we continue to observe those changes in the data for this OPPS/ASC final rule. For PHP services in particular, we observe that for hospital-based PHPs, the number of PHP days in our trimmed CY 2020 claims dataset is approximately 49 percent less than the number of PHP days in our trimmed CY 2019 claims dataset; and for CMHCs, the number of PHP days in our trimmed CY 2020 claims dataset is approximately 51 percent less than the number of PHP days in our trimmed CY 2019 claims dataset.

For this CY 2022 ratesetting, we proposed to use CY 2019 claims and the

cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking. We explained that we believe this is appropriate and necessary for PHP services, because of the substantial decrease in the number of PHP days in the CY 2020 claims dataset, which we would normally use for ratesetting. Furthermore, there was a substantial decrease in the number of PHP providers in the CY 2020 data that we continue to observe for this CY 2022 OPPS/ASC final rule. Our trimmed CY 2020 claims dataset for this final rule contains cost and claim information from 31 fewer hospital-based PHP providers than are in the CY 2019 data. These significant decreases in utilization and in the number of hospital-based PHP providers who submitted CY 2020 claims led us to believe that CY 2020 data are not the best overall approximation of expected PHP services in CY 2022. We stated that we believe the CY 2019 data, as the most recent complete calendar year of data prior to the COVID–19 PHE, are a better approximation of expected CY 2022 PHP services. Therefore, as discussed in section X.E of the OPPS/ASC proposed rule (86 FR 42188 through 42190), and consistent with what CMS proposed to do for other APCs under the OPPS, we proposed to use CY 2019 claims and the cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking, for calculating the CY 2022 CMHC and hospital-based PHP APC per diem costs.

Comment: We received 6 comments, which were all in support of our proposal to use the CY 2019 claims and the cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking, for calculating the CY 2022 CMHC and hospital-based PHP APC per diem costs. Several commenters stated their agreement with CMS' assessment that the ongoing COVID–19 PHE has disrupted the provision PHP services, and acknowledged that the proposed PHP payment rate methodology outlined in the proposed rule should help lessen the impact of COVID–19 on providers. One national organization expressed its belief that ensuring financial stability and sustainability for these programs is critical to ensuring access to this level of care for some of Medicare's most vulnerable patients.

Response: We thank commenters for their support. We agree with commenters that ensuring access to PHP services is critical, especially within the context of the COVID–19 PHE. As discussed above, we have analyzed more recent data for this CY 2022 OPPS/ASC final rule, and continue to observe significant changes from the CY 2019 PHP claims, which lead us to continue to believe that the CY 2019 data, as the most recent complete calendar year of data prior to the COVID–19 PHE, are a better approximation of expected CY 2022 PHP services.

After careful consideration of the comments we received and after analyzing more recent data, we are finalizing our proposal to use the CY 2019 claims and the cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking, for calculating the CY 2022 CMHC and hospital-based PHP APC per diem costs.

The CMHC and hospital-based PHP APC per diem costs are the provider-type specific costs derived from the latest updated CY 2019 claims and cost data from the CY 2021 rulemaking. The CMHC and hospital-based PHP APC per diem payment rates are the national unadjusted payment rates calculated from the CMHC and hospital-based PHP APC geometric mean per diem costs, respectively, after applying the OPPS budget neutrality adjustments described in section II.A.4 of this CY 2022 OPPS/ASC final rule.

a. CMHC Data Preparation: Data Trims, Exclusions, and CCR Adjustments

For this CY 2022 OPPS/ASC final rule, we prepared data consistent with our policies as described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70463 through 70465). However, as discussed above, we finalized our proposal to use CY 2019 claims data and the cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking, for calculating the CY 2022 CMHC PHP APC per diem cost.

For CY 2022 and future years, we also proposed to use cost and charge information from HCRIS as the basis for determining the CMHC CCRs used to calculate the geometric mean per diem cost for CMHC APC 5853. Following the methodology described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70462), we calculated the CCR based on Medicare costs and charges. However, we noted that CMHCs are now reporting their costs using the newer cost reporting form, Form CMS 2088–17, which has different lines and columns than the ones described in the CY 2016 OPPS/ASC final rule for Form CMS 2088–92. Therefore, to calculate each CMHC's CCR for the CY 2022 OPPS/ASC proposed rulemaking, we divided costs from Worksheet C, Line 50, Column 5 by charges from Worksheet C, Line 50, Column 4.

As noted above, prior to this year's proposed rulemaking, our longstanding methodology for calculating CCRs for CMHCs had been to use the CCRs from the OPSF. As discussed in the CY 2004 OPPS/ASC final rule (68 FR 63468), a Program Memorandum was issued on January 17, 2003, which directed the fiscal intermediaries to recalculate hospital and CMHC cost-to-charge ratios and to update the cost-to-charge ratios on an ongoing basis in the OPSF, which was used as the basis for the CCRs used in calculating the geometric mean per diem costs for CMHCs. Subsequently, in the CY 2009 OPPS/ASC final rule (73 FR 68690), commenters addressed the fact that cost report information for CMHCs was not at that time included in HCRIS, and recommended that CMS base its calculations only in the cost report information that the agency can verify directly and not on data provided by the fiscal intermediary. CMS responded in the same OPPS/ASC final rule that it was working to include CMHC cost reports in the system, but that the CCRs from the OPSF continued to be the best available data for ratesetting. In the CY 2011 OPPS/ASC final rule (75 FR 71993 through 71994), commenters requested that CMHC cost report information be included in HCRIS, and CMS explained that CMHC cost reports would begin to be available in HCRIS starting in early 2011. Since that time, CMHC cost reports have become available in HCRIS. Because the data is now available and consistently populated based on the cost reports that CMHCs submit, we stated that we believe using cost information from HCRIS would be more consistent with the methodology for calculating most other OPPS services, including hospital-based PHP services. Therefore, we proposed for CY 2022 and future years to use HCRIS as the source for CMHC cost information used for calculating the geometric mean per diem cost for CMHC APC 5853.

We did not receive any comments on this proposal, and we are finalizing it as proposed. For CY 2022 and future years, we will use HCRIS as the source for CMHC cost information used for calculating the geometric mean per diem cost for CMHC APC 5853. Accordingly, we used HCRIS as the source for the CMHC cost information for this CY 2022 OPPS/ASC final rule.

Prior to calculating the final geometric mean per diem cost for CMHC APC 5853, we prepared the data by first applying trims and data exclusions, and assessing CCRs as described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70463 through 70465), so that ratesetting is not skewed by providers with extreme data. Before any trims or exclusions were applied, there were 40 CMHCs in the PHP claims data file. Under the ±2 standard deviation trim policy, we excluded any data from a CMHC for ratesetting purposes when the CMHC's geometric mean cost per day was more than ±2 standard deviations from the geometric mean cost per day for all CMHCs. In applying this trim for CY 2022 ratesetting, one CMHC had geometric mean costs per day below the trim's lower limit of $32.94, and one had geometric mean costs per day above the trim's upper limit of $486.92. Therefore, we are excluding data for ratesetting from these 2 CMHCs.

In accordance with our PHP ratesetting methodology (80 FR 70465), we also remove service days with no wage index values, because we use the wage index data to remove the effects of geographic variation in costs prior to APC geometric mean per diem cost calculation (80 FR 70465). For this CY 2022 final rule ratesetting, no CMHC was missing wage index data for all of its service days and, therefore, no CMHC was excluded. We also exclude providers without any days containing 3 or more units of PHP-allowable services. One provider is excluded from ratesetting because it had no days containing 3 or more units of PHP-allowable services. In addition to our trims and data exclusions, before calculating the PHP APC geometric mean per diem costs, we also assess CCRs (80 FR 70463). Our longstanding PHP OPPS ratesetting methodology defaults any CMHC CCR that is not available or any CMHC CCR greater than one to the statewide hospital CCR associated with the provider's urban/rural designation and their state location (80 FR 70463). For the CY 2022 OPPS/ASC proposed rule ratesetting and this OPPS/ACS final rule, there are 3 CMHCs with CCRs greater than one, and 12 CMHCs with missing CCR information. Therefore, we are defaulting the CCRs for these 15 CMHCs for ratesetting to the applicable statewide hospital CCR for each CMHC based on its urban/rural designation and its state location.

In summary, the application of these data preparation steps resulted in an adjusted CCR during our ratesetting process for 15 CMHCs having either a CCR greater than one or having no CCR. We are also excluding one CMHC because it had no days containing 3 or more services and 2 CMHCs for failing the ±2 standard deviation trim, resulting in the inclusion of 37 CMHCs. There were 564 CMHC claims removed during data preparation steps due to the ±2 standard deviation trim or because they either had no PHP allowable-codes or had zero payment days, leaving 10,370 CMHC claims in our CY 2022 final rule ratesetting modeling. After applying all of the previously listed trims, exclusions, and adjustments, we followed the methodology described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70464 through 70465) and modified in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79687 through 79688, and 79691), using the CMHC CCRs calculated based on the cost information from HCRIS as discussed in this OPPS/ASC final rule, to calculate the CMHC APC geometric mean per diem cost.[185] The calculated CY 2022 geometric mean per diem cost for all CMHCs for providing three or more services per day (CMHC APC 5853) is $129.93, a decrease from $136.14 calculated last year for CY 2021 ratesetting (85 FR 86080).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42151 through 42152), we proposed a cost floor of $136.14, which is equal to the final CY 2021 geometric mean per diem cost for CMHC APC 5853, in order to stabilize the geometric mean per diem costs for CY 2022 only. We recognized the disruption that the ongoing COVID–19 PHE appears to be having on CMHCs' operations, and stated that we believe it is important for CMS to continue to support Medicare beneficiaries' access to critical PHP services during the COVID–19 PHE by helping to maintain the stability of payments to PHP providers. We stated that we were concerned that the calculated geometric mean per diem cost of $130.41 for the proposed rule would result in a disruption to CMHC payments at a time when the need for mental health services has increased.[186]

Because the calculated geometric mean per diem cost for CMHC APC 5853 was below the cost floor, we proposed to calculate the CY 2022 CMHC APC 5853 payment rate based on the cost floor of $136.14. We also proposed that if the final CY 2022 geometric mean per diem cost is calculated to be higher than $136.14, then we would use the calculated geometric mean per diem cost.

Comment: We received 3 comments on our proposed calculation of the geometric mean per diem cost for CMHC APC 5853. All commenters were supportive of the proposed cost floor to stabilize the geometric mean per diem costs finalized in the prior year, CY 2021. Commenters also encouraged CMS to consider long-term approaches to addressing cost fluctuations in PHP services and provide more stable payment rates to ensure access to these important services. Additionally, one commenter urged CMS to consider making CMHCs financially whole, which should include payment that will expand their capacity to meet growing need, particularly in underserved communities.

Response: We appreciate commenters' support for the proposed policies. We agree with commenters about the importance of maintaining stable payment rates to ensure access to PHP services. We continue to recognize that because the CMHC ratesetting dataset is small (n=37), changes in costs from a small number of providers can influence the overall geometric mean per diem cost calculation. We are considering approaches to address cost fluctuations in future years; however, since we did not propose a methodology for future years, we are not finalizing any methodology in this CY 2022 OPPS/ASC final rule to address cost fluctuations in future years.

We also appreciate the commenter's suggestion about the need for ensuring that CMS supports the capacity of CMHCs to meet the growing needs of underserved communities. We recognize the critical role that CMHCs play in the communities they serve. The commenter did not offer specific information about which growing community needs CMHCs are facing or

[185] Each revenue code on the CMHC claim must have a HCPCS code and charge associated with it. We multiply each claim service line's charges by the CMHC's overall CCR (or statewide CCR, where the overall CCR was greater than 1 or was missing) to estimate CMHC costs. Only the claims service lines containing PHP allowable HCPCS codes and PHP allowable revenue codes from the CMHC claims remaining after trimming are retained for CMHC cost determination. The costs, payments, and service units for all service lines occurring on the same service date, by the same provider, and for the same beneficiary are summed. CMHC service days must have three or more services provided to be assigned to CMHC APC 5853. The final geometric mean per diem cost for CMHC APC 5853 is calculated by taking the *n*th root of the product of *n* numbers, for days where three or more services were provided. CMHC service days with costs ±3 standard deviations from the geometric mean costs within APC 5853 are deleted and removed from modeling. The remaining PHP service days are used to calculate the final geometric mean per diem cost for each PHP APC by taking the *n*th root of the product of *n* numbers for days where three or more services were provided.

[186] *https://www.cdc.gov/mmwr/volumes/70/wr/mm7013e2.htm.*

what mechanism CMS should consider for enabling CMHCs to expand capacity in order to meet these needs, but we note that section 1866(e)(2) of the Act only authorizes Medicare to make payments to CMHCs for PHP services.

We agree with the commenter that PHP payment rates should accurately reflect the financial costs to providers of providing PHP services to their communities. Sections 1833(t)(2) and 1833(t)(9) of the Act set forth the requirements for establishing and adjusting OPPS payment rates, which are based on costs, and which include PHP payment rates. Because our PHP ratesetting methodology depends heavily on provider-reported costs, we strongly encourage CMHCs to review cost reporting instructions to be sure they are reporting their costs correctly. These instructions are available in chapter 45 of the Provider Reimbursement Manual (PRM), Part 2, available on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Paper-Based-Manuals*. We want to reiterate that it is a requirement for CMHCs, unless they are approved as a low-utilization or no-utilization provider in accordance with PRM–1, chapter 1, section 110 (42 CFR 413.24(g) and (h)), to file full cost reports, which helps us capture accurate CMHC costs in rate setting. We furthermore encourage those CMHCs that do not file full cost reports to consider doing so.

After careful consideration of the comments received, we are finalizing our proposal to establish a cost floor for CY 2022 equal to the final CY 2021 geometric mean per diem cost for CMHC APC 5853, which is $136.14. The calculated CY 2022 geometric mean per diem cost for all CMHCs for providing three or more services per day (CMHC APC 5853) is $129.93. Because this amount is below the cost floor, we are finalizing our proposal to calculate the CY 2022 CMHC APC 5853 payment rate based on the cost floor of $136.14.

b. Hospital-Based PHP Data Preparation: Data Trims and Exclusions

For this CY 2022 final rule, we prepared data consistent with our policies as described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70463 through 70465) for hospital-based PHP providers, which is similar to that used for CMHCs. However, as discussed above, we finalized our proposal to use CY 2019 claims data and the cost information from prior to the COVID–19 PHE, that is, the cost information that was available for the CY 2021 OPPS/ASC rulemaking, for calculating the CY 2022 hospital-based PHP APC per diem cost. The CY 2019 PHP claims included data for 449 hospital-based PHP providers for our calculations in the CY 2022 OPPS/ASC final rule.

Consistent with our policies, as stated in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70463 through 70465), we prepared the data by applying trims and data exclusions. We applied a trim on hospital service days for hospital-based PHP providers with a CCR greater than 5 at the cost center level. To be clear, the CCR greater than 5 trim is a service day-level trim in contrast to the CMHC ±2 standard deviation trim, which is a provider-level trim. Applying the CCR greater than 5 trim removed affected service days from one hospital-based PHP provider from our proposed ratesetting. However, 100 percent of the service days for this hospital-based PHP provider had at least one service associated with a CCR greater than 5, so the trim removed this provider entirely from our proposed ratesetting. In addition, 68 hospital-based PHPs were removed for having no days with PHP payment. Two hospital-based PHPs were removed because none of their days included PHP-allowable HCPCS codes. No hospital-based PHPs were removed for missing wage index data, and a single hospital-based PHP was removed by the OPPS ±3 standard deviation trim on costs per day. (We refer readers to the OPPS Claims Accounting Document, available online at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/index.html*).[187]

Overall, we removed 72 hospital-based PHP providers (1 with all service days having a CCR greater than 5) + (68 with no PHP payment) + (2 with no PHP-allowable HCPCS codes) + (1 provider with geometric mean costs per day outside the ± 3 SD limits)], resulting in 377 (449 total − 72 excluded) hospital-based PHP providers in the data used for calculating ratesetting.

After completing these data preparation steps, we calculated the CY 2022 geometric mean per diem cost for hospital-based PHP APC 5863 by following the methodology described in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70464 through 70465) and modified in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79687 and 79691).[188] The calculated CY 2022 hospital-based PHP APC geometric mean per diem cost for hospital-based PHP providers that provide three or more services per service day (hospital-based PHP APC 5863) is $253.02, which is a very slight decrease from $253.76 calculated last year for CY 2021 ratesetting (85 FR 86080).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42151 through 42152), we proposed a cost floor of $253.76, which is equal to the final CY 2021 geometric mean per diem cost for CMHC APC 5863, in order to stabilize the geometric mean per diem costs for CY 2022 only. We noted that, in general, a decrease of the magnitude calculated for the proposed rule would not be unexpected due to normal variation in cost and claims data. However, we recognized the disruption that the ongoing COVID–19 PHE appears to be having on the operations of hospital-based PHPs, and stated that we believe it is important for CMS to continue to support Medicare beneficiaries' access to critical PHP services during the COVID–19 PHE by helping to maintain the stability of payments to PHP providers. We stated that while the decrease in the geometric mean per diem cost for hospital-based PHP APC 5863 would be very slight based on the CY 2019 claims and cost data used for the CY 2022 OPPS/ASC proposed rule, we continue to believe, as we have stated before in recent years, that access is better supported when geometric mean per diem costs do not fluctuate greatly. We also noted that the proposed cost floor would protect access to PHP services at hospital-based PHPs if the final CY 2022 calculated hospital-based PHP APC geometric mean per diem cost is significantly less,

[187] Click on the link labeled ''CY 2022 OPPS/ASC Notice of Proposed Rulemaking'', which can be found under the heading ''Hospital Outpatient Prospective Payment System Rulemaking'' and open the claims accounting document link at the bottom of the page, which is labeled ''2022 NPRM OPPS Claims Accounting (PDF)''.

[188] Each revenue code on the hospital-based PHP claim must have a HCPCS code and charge associated with it. We multiply each claim service line's charges by the hospital's department-level CCR; in CY 2020 and subsequent years, that CCR is determined by using the PHP-only revenue-code-to-cost-center crosswalk. Only the claims service lines containing PHP-allowable HCPCS codes and PHP-allowable revenue codes from the hospital-based PHP claims remaining after trimming are retained for hospital-based PHP cost determination. The costs, payments, and service units for all service lines occurring on the same service date, by the same provider, and for the same beneficiary are summed. Hospital-based PHP service days must have three or more services provided to be assigned to hospital-based PHP APC 5863. The final geometric mean per diem cost for hospital-based PHP APC 5863 is calculated by taking the *n*th root of the product of *n* numbers, for days where three or more services were provided. Hospital-based PHP service days with costs ±3 standard deviations from the geometric mean costs within APC 5863 are deleted and removed from modeling. The remaining hospital-based PHP service days are used to calculate the final geometric mean per diem cost for hospital-based PHP APC 5863.

which we were concerned would result in a disruption to hospital-based PHP payments at a time when the need for mental health services has increased.

Because the calculated geometric mean per diem cost for hospital-based PHP APC 5863 was below the cost floor, we proposed to calculate the CY 2022 hospital-based PHP APC 5863 payment rate based on the cost floor of $253.76. We also proposed that if the final CY 2022 geometric mean per diem cost is calculated to be higher than $253.76, then we would use the calculated geometric mean per diem cost.

Comment: We received 5 comments on our proposed calculation of the geometric mean per diem cost for CMHC APC 5863. All commenters were supportive of the proposed cost floor to stabilize the geometric mean per diem costs finalized in the prior year, CY 2021. Commenters also encouraged CMS to consider long-term approaches to addressing cost fluctuations in PHP services and provide more stable payment rates to ensure access to these important services. Three national provider associations commented that while the PHE has magnified the need for improved access to behavioral healthcare, there are severe shortages of behavioral healthcare providers in many parts of the United States, stating their belief that the proposed ratesetting methodology should help lessen the impact of COVID–19 on PHP providers.

Response: We appreciate commenters' support for the proposed policies. We share commenters' concerns about ensuring that Medicare beneficiaries continue to have access to PHP services, particularly in light of the impact of the COVID–19 PHE. We also continue to recognize, as we have noted in past years, that changes in costs from a small number of providers can influence the overall geometric mean per diem cost calculation. We are considering approaches to address cost fluctuations in future years; however, since we did not propose a methodology for future years, we are not finalizing any methodology in this CY 2022 OPPS/ASC final rule to address cost fluctuations in future years.

After careful consideration of the comments received, we are finalizing our proposal to establish a cost floor for CY 2022 equal to the final CY 2021 geometric mean per diem cost for CMHC APC 5863, which is $253.76. The calculated CY 2022 geometric mean per diem cost for all hospital-based PHPs for providing three or more services per day (CMHC APC 5863) is $253.02. Because this amount is below the cost floor, we are finalizing our proposal to calculate the CY 2022 hospital-based PHP APC 5863 payment rate based on the cost floor of $253.76.The final CY 2022 PHP geometric mean per diem costs are shown in Table 44 and are used to derive the proposed CY 2022 PHP APC per diem rates for CMHCs and hospital-based PHPs. The final CY 2022 PHP APC per diem rates are included in Addendum A to the CY 2022 OPPS/ASC proposed rule (which is available on our website at:*https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/Hospital-Outpatient-Regulations-and-Notices.html*).[189]

TABLE 44: CY 2022 PHP APC Geometric Mean Per Diem Costs

CY 2022 APC	Group Title	Final PHP APC Geometric Mean Per Diem Costs
5853	Partial Hospitalization (three or more services per day) for CMHCs	$136.14
5863	Partial Hospitalization (three or more services per day) for hospital-based PHPs	$253.76

C. Outlier Policy for CMHCs

For 2022, we proposed to continue to calculate the CMHC outlier percentage, cutoff point and percentage payment amount, outlier reconciliation, outlier payment cap, and fixed dollar-threshold according to previously established policies. These topics are discussed in more detail. We refer readers to section II.G.1 of this CY 2022 OPPS/ASC final rule for our general policies for hospital outpatient outlier payments.

We did not receive any public comments on our proposal, and are finalizing it as proposed.

1. Background

As discussed in the CY 2004 OPPS final rule with comment period (68 FR 63469 through 63470), we noted a significant difference in the amount of outlier payments made to hospitals and CMHCs for PHP services. Given the difference in PHP charges between hospitals and CMHCs, we did not believe it was appropriate to make outlier payments to CMHCs using the outlier percentage target amount and threshold established for hospitals. Therefore, beginning in CY 2004, we created a separate outlier policy specific to the estimated costs and OPPS payments provided to CMHCs. We designated a portion of the estimated OPPS outlier threshold specifically for CMHCs, consistent with the percentage of projected payments to CMHCs under the OPPS each year, excluding outlier payments, and established a separate outlier threshold for CMHCs. This

[189] As discussed in section XX. of the CY 2022 OPPS/ASC proposed rule, OPPS APC geometric mean per diem costs (including PHP APC geometric mean per diem costs) are divided by the geometric mean per diem costs for APC 5012 (Clinic Visits and Related Services) to calculate each PHP APC's unscaled relative payment weight. An unscaled relative payment weight is one that is not yet adjusted for budget neutrality. Budget neutrality is required under section 1833(t)(9)(B) of the Act, and ensures that the estimated aggregate weight under the OPPS for a calendar year is neither greater than nor less than the estimated aggregate weight that would have been made without the changes. To adjust for budget neutrality (that is, to scale the weights), we compare the estimated aggregated weight using the scaled relative payment weights from the previous calendar year at issue. We refer readers to the ratesetting procedures described in Part 2 of the OPPS Claims Accounting narrative and in section II. of the CY 2022 OPPS/ASC proposed rule for more information on scaling the weights, and for details on the final steps of the process that leads to final PHP APC per diem payment rates. The OPPS Claims Accounting narrative is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/Hospital-Outpatient-Regulations-and-Notices.html*.

separate outlier threshold for CMHCs resulted in $1.8 million in outlier payments to CMHCs in CY 2004 and $0.5 million in outlier payments to CMHCs in CY 2005 (82 FR 59381). In contrast, in CY 2003, more than $30 million was paid to CMHCs in outlier payments (82 FR 59381).

2. CMHC Outlier Percentage

In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59267 through 59268), we described the current outlier policy for hospital outpatient payments and CMHCs. We note that we also discussed our outlier policy for CMHCs in more detail in section VIII.C. of that same final rule (82 FR 59381). We set our projected target for all OPPS aggregate outlier payments at 1.0 percent of the estimated aggregate total payments under the OPPS (82 FR 59267). This same policy was also reiterated in the CY 2019 OPPS/ASC final rule with comment period (83 FR 58996), the CY 2020 OPPS/ASC final rule with comment period (84 FR 61350), and the CY 2021 OPPS/ASC final rule with comment period (85 FR 86082).

We estimate CMHC per diem payments and outlier payments by using the most recent available utilization and charges from CMHC claims, updated CCRs, and the updated payment rate for APC 5853. For increased transparency, we are providing a more detailed explanation of the existing calculation process for determining the CMHC outlier percentages. To calculate the CMHC outlier percentage, we follow three steps:

- Step 1: We multiply the OPPS outlier threshold, which is 1.0 percent, by the total estimated OPPS Medicare payments (before outliers) for the prospective year to calculate the estimated total OPPS outlier payments: (0.01 × Estimated Total OPPS Payments) = Estimated Total OPPS Outlier Payments.
- Step 2: We estimate CMHC outlier payments by taking each provider's estimated costs (based on their allowable charges multiplied by the provider's CCR) minus each provider's estimated CMHC outlier multiplier threshold (we refer readers to section VIII.C.3. of the CY 2022 OPPS/ASC proposed rule). That threshold is determined by multiplying the provider's estimated paid days by 3.4 times the CMHC PHP APC payment rate. If the provider's costs exceed the threshold, we multiply that excess by 50 percent, as described in section VIII.C.3. of the CY 2022 OPPS/ASC proposed rule, to determine the estimated outlier payments for that provider. CMHC outlier payments are capped at 8 percent of the provider's estimated total per diem payments (including the beneficiary's copayment), as described in section VIII.C.5. of the CY 2022 OPPS/ASC proposed rule, so any provider's costs that exceed the CMHC outlier cap will have its payments adjusted downward. After accounting for the CMHC outlier cap, we sum all of the estimated outlier payments to determine the estimated total CMHC outlier payments. (Each Provider's Estimated Costs − Each Provider's Estimated Multiplier Threshold) = A. If A is greater than 0, then (A × 0.50) = Estimated CMHC Outlier Payment (before cap) = B. If B is greater than (0.08 × Provider's Total Estimated Per Diem Payments), then cap adjusted B = (0.08 × Provider's Total Estimated Per Diem Payments); otherwise, B = B. Sum (B or cap-adjusted B) for Each Provider = Total CMHC Outlier Payments.
- Step 3: We determine the percentage of all OPPS outlier payments that CMHCs represent by dividing the estimated CMHC outlier payments from Step 2 by the total OPPS outlier payments from Step 1: (Estimated CMHC Outlier Payments/Total OPPS Outlier Payments).

We proposed to continue to calculate the CMHC outlier percentage according to previously established policies, and we did not propose any changes to our current methodology for calculating the CMHC outlier percentage for CY 2022. Therefore, based on our CY 2022 payment estimates, CMHCs are projected to receive 0.02 percent of total hospital outpatient payments in CY 2022, excluding outlier payments. We proposed to designate approximately less than 0.01 percent of the estimated 1.0 percent hospital outpatient outlier threshold for CMHCs. This percentage is based upon the formula given in Step 3.

We did not receive any public comments on our proposal, and are finalizing it as proposed.

3. Cutoff Point and Percentage Payment Amount

As described in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59381), our policy has been to pay CMHCs for outliers if the estimated cost of the day exceeds a cutoff point. In CY 2006, we set the cutoff point for outlier payments at 3.4 times the highest CMHC PHP APC payment rate implemented for that calendar year (70 FR 68551). For CY 2018, the highest CMHC PHP APC payment rate is the payment rate for CMHC PHP APC 5853. In addition, in CY 2002, the final OPPS outlier payment percentage for costs above the multiplier threshold was set at 50 percent (66 FR 59889). In CY 2018, we continued to apply the same 50 percent outlier payment percentage that applies to hospitals to CMHCs and continued to use the existing cutoff point (82 FR 59381). Therefore, for CY 2018, we continued to pay for partial hospitalization services that exceeded 3.4 times the CMHC PHP APC payment rate at 50 percent of the amount of CMHC PHP APC geometric mean per diem costs over the cutoff point. For example, for CY 2018, if a CMHC's cost for partial hospitalization services paid under CMHC PHP APC 5853 exceeds 3.4 times the CY 2018 payment rate for CMHC PHP APC 5853, the outlier payment would be calculated as 50 percent of the amount by which the cost exceeds 3.4 times the CY 2018 payment rate for CMHC PHP APC 5853 [0.50 × (CMHC Cost − (3.4 × APC 5853 rate))]. This same policy was also reiterated in the CY 2019 OPPS/ASC final rule with comment period (83 FR 58996 through 58997), CY 2020 OPPS/ASC final rule with comment period (84 FR 61351) and the CY 2021 OPPS/ASC final rule with comment period (85 FR 86082 through 86083). For CY 2022, we proposed to continue to pay for partial hospitalization services that exceed 3.4 times the proposed CMHC PHP APC payment rate at 50 percent of the CMHC PHP APC geometric mean per diem costs over the cutoff point. That is, for CY 2022, if a CMHC's cost for partial hospitalization services paid under CMHC PHP APC 5853 exceeds 3.4 times the payment rate for CMHC APC 5853, the outlier payment will be calculated as [0.50 × (CMHC Cost − (3.4 × APC 5853 rate))].

We did not receive any public comments on our proposal, and are finalizing it as proposed.

4. Outlier Reconciliation

In the CY 2009 OPPS/ASC final rule with comment period (73 FR 68594 through 68599), we established an outlier reconciliation policy to address charging aberrations related to OPPS outlier payments. We addressed vulnerabilities in the OPPS outlier payment system that lead to differences between billed charges and charges included in the overall CCR, which are used to estimate cost and would apply to all hospitals and CMHCs paid under the OPPS. We initiated steps to ensure that outlier payments appropriately account for the financial risk when providing an extraordinarily costly and

complex service, but are only being made for services that legitimately qualify for the additional payment.

For a comprehensive description of outlier reconciliation, we refer readers to the CY 2019 OPPS/ASC final rules with comment period (83 FR 58874 through 58875 and 81 FR 79678 through 79680).

We proposed to continue these policies for partial hospitalization services provided through PHPs for CY 2022. The current outlier reconciliation policy requires that providers whose outlier payments meet a specified threshold (currently $500,000 for hospitals and any outlier payments for CMHCs) and whose overall ancillary CCRs change by plus or minus 10 percentage points or more, are subject to outlier reconciliation, pending approval of the CMS Central Office and Regional Office (73 FR 68596 through 68599). The policy also includes provisions related to CCRs and to calculating the time value of money for reconciled outlier payments due to or due from Medicare, as detailed in the CY 2009 OPPS/ASC final rule with comment period and in the Medicare Claims Processing Manual (73 FR 68595 through 68599 and Medicare Claims Processing Internet Only Manual, Chapter 4, Section 10.7.2 and its subsections, available online at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c04.pdf*).

We did not receive any public comments on our proposal, and are finalizing it as proposed.

5. Outlier Payment Cap

In the CY 2017 OPPS/ASC final rule with comment period, we implemented a CMHC outlier payment cap to be applied at the provider level, such that in any given year, an individual CMHC will receive no more than a set percentage of its CMHC total per diem payments in outlier payments (81 FR 79692 through 79695). We finalized the CMHC outlier payment cap to be set at 8 percent of the CMHC's total per diem payments (81 FR 79694 through 79695). This outlier payment cap only affects CMHCs, it does not affect other provider types (that is, hospital-based PHPs), and is in addition to and separate from the current outlier policy and reconciliation policy in effect. In the CY 2020 OPPS/ASC final rule with comment period (84 FR 61351), we finalized a proposal to continue this policy in CY 2020 and subsequent years. In the CY 2022 OPPS/ASC proposed rule, we did not propose any changes to this policy.

6. Fixed-Dollar Threshold

In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59267 through 59268), for the hospital outpatient outlier payment policy, we set a fixed-dollar threshold in addition to an APC multiplier threshold. Fixed-dollar thresholds are typically used to drive outlier payments for very costly items or services, such as cardiac pacemaker insertions. CMHC PHP APC 5853 is the only APC for which CMHCs may receive payment under the OPPS, and is for providing a defined set of services that are relatively low cost when compared to other OPPS services. Because of the relatively low cost of CMHC services that are used to comprise the structure of CMHC PHP APC 5853, it is not necessary to also impose a fixed-dollar threshold on CMHCs. Therefore, in the CY 2018 OPPS/ASC final rule with comment period, we did not set a fixed-dollar threshold for CMHC outlier payments (82 FR 59381). This same policy was also reiterated in the CY 2020 OPPS/ASC final rule with comment period (84 FR 61351) and the CY 2021 OPPS/ASC final rule with comment period (85 FR 86083). We proposed to continue this policy for CY 2022.

We did not receive any public comments on our proposal, and are finalizing it as proposed.

IX. Services That Will Be Paid Only as Inpatient Services

A. Background

Established in rulemaking as part of the initial implementation of the OPPS, the inpatient only (IPO) list identifies services for which Medicare will only make payment when the services are furnished in the inpatient hospital setting because of the nature of the procedure, the underlying physical condition of the patient, or the need for at least 24 hours of postoperative recovery time or monitoring before the patient can be safely discharged (70 FR 68695). The IPO list was created based on the premise (rooted in the practice of medicine at that time), that Medicare should not pay for procedures furnished as outpatient services that are performed on an inpatient basis virtually all of the time for the Medicare population, either because of the invasive nature of the procedures, the need for postoperative care, or the underlying physical condition of the patient who would require such surgery, because performing these procedures on an outpatient basis would not be safe or appropriate, and therefore not reasonable and necessary under Medicare rules (63 FR 47571). Services included on the IPO list were those determined to require inpatient care, such as those that are highly invasive, result in major blood loss or temporary deficits of organ systems (such as neurological impairment or respiratory insufficiency), or otherwise require intensive or extensive postoperative care (65 FR 67826). There are some services designated as inpatient only that, given their clinical intensity, would not be expected to be performed in the hospital outpatient setting. For example, we have traditionally considered certain surgically invasive procedures on the brain, heart, and abdomen, such as craniotomies, coronary-artery bypass grafting, and laparotomies, to require inpatient care (65 FR 18456). Designation of a service as inpatient-only does not preclude the service from being furnished in a hospital outpatient setting, but means that Medicare will not make payment for the service if it is furnished to a Medicare beneficiary in the hospital outpatient setting (65 FR 18443). Conversely, the absence of a procedure from the list should not be interpreted as identifying those procedures as appropriately performed only in the hospital outpatient setting (70 FR 68696).

As part of the annual update process, we have historically worked with interested stakeholders, including professional societies, hospitals, surgeons, hospital associations, and beneficiary advocacy groups, to evaluate the IPO list and to determine whether services should be added to or removed from the list. Stakeholders were encouraged to request reviews for a particular code or group of codes; and we have asked that their requests include evidence that demonstrates that the procedure was performed on an outpatient basis in a safe and appropriate manner in a variety of different types of hospitals—including but not limited to—operative reports of actual cases, peer-reviewed medical literature, community medical standards and practice, physician comments, outcome data, and post-procedure care data (67 FR 66740).

Prior to CY 2021, we traditionally used five criteria to determine whether a procedure should be removed from the IPO list (65 FR 18455). As noted in the CY 2012 OPPS/ASC final rule with comment period (76 FR 74353), we assessed whether a procedure or service met these criteria to determine whether or not it should be removed from the IPO list and assigned to an APC group for payment under the OPPS when provided in the hospital outpatient setting. We have explained that a

procedure is not required to meet all of the established criteria to be removed from the IPO list. The criteria for assessing procedures for removal from the IPO list prior to CY 2021 are the following:

- Most outpatient departments are equipped to provide the services to the Medicare population.
- The simplest procedure described by the code may be furnished in most outpatient departments.
- The procedure is related to codes that we have already removed from the IPO list.
- A determination is made that the procedure is being furnished in numerous hospitals on an outpatient basis.
- A determination is made that the procedure can be appropriately and safely furnished in an ASC and is on the list of approved ASC services or has been proposed by us for addition to the ASC list.

In the past, we have requested that stakeholders submit corresponding evidence in support of their claims that a code or group of codes met the longstanding criteria for removal from the IPO list and was safe to perform on the Medicare population in the hospital outpatient setting—including, but not limited to case reports, operative reports of actual cases, peer-reviewed medical literature, medical professional analysis, clinical criteria sets, and patient selection protocols. Our clinicians thoroughly reviewed all information submitted within the context of the established criteria and if, following this review, we determined that there was sufficient evidence to confirm that the code could be safely and appropriately performed on an outpatient basis, we assigned the service to an APC and included it as a payable procedure under OPPS (67 FR 66740).

We stated in prior rulemaking that, over time, given advances in technology and surgical technique, we would continue to evaluate services to determine whether they should be removed from the IPO list. Our goal is to ensure that inpatient only designations are consistent with current standards of practice. We have asserted in prior rulemaking that, insofar as advances in medical practice mitigate concerns about these procedures being performed on an outpatient basis, we would be prepared to remove procedures from the IPO list and provide for payment for them under the OPPS (65 FR 18443). Prior to CY 2021, changes to the IPO list have been gradual. Further, CMS has at times had to reclassify codes as inpatient only services with the emergence of new information.

We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74352 through 74353) for a full discussion of our historic policies for identifying services that are typically provided only in an inpatient setting and, therefore, that will not be paid by Medicare under the OPPS, as well as the criteria we have used to review the IPO list to determine whether or not any services should be removed.

In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86084 through 86088), we significantly adjusted our approach to the IPO list. As we stated in that final rule, we no longer saw the need for CMS to restrict payment for certain procedures by maintaining the IPO list to identify services that require inpatient care. In that final rule, we acknowledged the seriousness of the concerns regarding patient safety and quality of care that various stakeholders expressed regarding removing procedures from the IPO list or eliminating the IPO list altogether. But we stated that we believed that the developments in surgical technique and technological advances in the practice of medicine, as well as various safeguards, including, but not limited to, physician clinical judgment, state and local regulations, accreditation requirements, medical malpractice laws, hospital conditions of participation, CMS quality and monitoring initiatives and programs and other CMS initiatives would continue to ensure that procedures removed from the IPO list and provided in the hospital outpatient setting could be performed safely on appropriately selected beneficiaries. We also stated that given our increasing ability to measure the safety of procedures performed in the hospital outpatient setting and to monitor the quality of care, in addition to the other safeguards detailed above, we believed that quality of care was unlikely to be affected by the elimination of the IPO list. We noted that we do not require services that are not included on the IPO list to be performed solely in the hospital outpatient setting and that services that were previously identified as inpatient only can continue to be performed in the inpatient setting. We emphasized that physicians should use their clinical knowledge and judgment, together with consideration of the beneficiary's specific needs, to determine whether a procedure can be performed appropriately in a hospital outpatient setting or whether inpatient care is required for the beneficiary, subject to the general coverage rules requiring that any procedure be reasonable and necessary. We also stated that the elimination of the IPO list would ensure maximum availability of services to beneficiaries in the hospital outpatient setting. Finally, we stressed that as medical practice continues to develop, we believed that the difference between the need for inpatient care and the appropriateness of outpatient care has become less distinct for many services.

Accordingly, in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86084 through 86088), we finalized, with modification, our proposal to eliminate the IPO list over the course of three years (85 FR 86093). We revised our regulation at § 419.22(n) to state that, effective on January 1, 2021, the Secretary shall eliminate the list of services and procedures designated as requiring inpatient care through a 3-year transition. As part of the first phase of this elimination of the IPO list, we removed 298 codes, including 266 musculoskeletal-related services, from the list beginning in CY 2021 and, because we proposed to eliminate the IPO list entirely, the removed procedures were not assessed against our longstanding criteria for removal (85 FR 86094).

B. Changes to the Inpatient Only (IPO) List

In the CY 2022 OPPS/ASC proposed rule, for CY 2022, we proposed to halt the elimination of the IPO list and, after clinical review of the services removed from the IPO list in CY 2021 as part of the first phase of eliminating the IPO list, we proposed to add the 298 services removed from the IPO list in CY 2021 back to the IPO list beginning in CY 2022. In accordance with this proposal, we proposed to amend the regulation at § 419.22(n) to remove the reference to the elimination of the list of services and procedures designated as requiring inpatient care through a three-year transition. We also proposed to codify the five longstanding criteria for determining whether a service or procedure should be removed from the IPO list in the regulation in a new § 419.23.

1. Proposal To Halt the Elimination of the IPO List

Following the CY 2021 OPPS/ASC final rule with comment period, stakeholders continued to express concerns regarding the pace at which the IPO list would be eliminated, the perceived lack of transparency in determining the order of removal of procedures over the course of the elimination process, and what stakeholders believed were insufficient

details concerning rate setting for procedures for which payment would be made when furnished in the hospital outpatient department (HOPD) setting, as well as the accuracy of those rates for the HOPD setting. We have received stakeholder requests to reconsider the elimination of the IPO list, to reevaluate procedures removed from the IPO list due to safety and quality concerns, and to, at a minimum, extend the timeframe for eliminating the list.

In the CY 2022 OPPS/ASC proposed rule, we stated that after further consideration of the policy we adopted in the CY 2021 OPPS/ASC final rule with comment period and the concerns stakeholders have raised since the final rule was issued, we believe that we should halt the elimination of the IPO list to ensure that any service removed from the IPO list is evaluated against the previous longstanding criteria for removal from the IPO list before it is removed. We stated that we believe assessing whether a procedure or service meets the criteria for removal would allow for a more gradual removal of services from the IPO list—which would also allow stakeholders more time to evaluate the safety of the service in the HOPD and to prepare to safely furnish the services migrating off of the IPO list, if they so choose. We stated that after further consideration, we continue to believe that the IPO list is a valuable tool for ensuring that the OPPS only pays for services that can safely be performed in the hospital outpatient setting, and we had therefore reconsidered eliminating the IPO list at that time. We stated that we believe that there are many surgical procedures that cannot be safely performed on a typical Medicare beneficiary in the hospital outpatient setting, and therefore, it would be inappropriate for us to assign them separately payable status indicators and establish payment rates in the OPPS (78 FR 75055). We recognized that while physicians are able to make safety determinations for a specific beneficiary, CMS is in the position to make safety determinations for the broader population of Medicare beneficiaries, that is, the typical Medicare beneficiary. Furthermore, we explained that while we want to afford physicians and hospitals the maximum flexibility in choosing the most clinically appropriate site of service for the procedure, as long as the characteristics of the procedure are consistent with the criteria listed above, we believe that the IPO list was a necessary safeguard that considers the broader Medicare population.

In the CY 2021 OPPS/ASC final rule with comment period, we recognized that stakeholders may need time to adjust to the removal of procedures from the list, especially given the significant number of services removed beginning in CY 2021 (85 FR 86085 and 86092). We also recognized that providers may need time to prepare, update their billing systems, and gain experience with newly removed procedures eligible to be paid under either the IPPS or the OPPS (85 FR 86086). We also acknowledged that it will take time for clinical staff and providers to gain experience furnishing these services to the appropriate Medicare beneficiaries in the HOPD, and to develop comprehensive patient selection criteria and other protocols to identify whether a beneficiary can safely have these procedures performed in the hospital outpatient setting (85 FR 86088). In the CY 2021 OPPS/ASC proposed rule, we also reiterated that the removal of a particular procedure from the IPO list does not require that all beneficiaries be treated in the hospital outpatient setting, but explained that we are cognizant that it does require the physician and clinical care team to exercise complex medical judgment to determine the appropriate setting of care, in accordance with the 2-midnight rule.

Separately, we also acknowledged the numerous challenges that providers are facing due to the COVID–19 PHE (85 FR 86089). After further experience with the PHE and its impact on provider and beneficiary behavior, we recognized that the COVID–19 PHE has likely reduced providers' ability to prepare to furnish these services in the hospital outpatient setting in the manner they would absent the PHE. We acknowledged that the COVID–19 PHE may have negatively impacted the time and resources that providers have to adapt to the removal of these procedures from the IPO list—making it more difficult for providers to prepare, update their billing systems, and gain experience with newly removed procedures eligible to be paid under either the IPPS or the OPPS. We also recognized that the COVID–19 PHE has negatively impacted clinical staff and providers' opportunity to develop the comprehensive patient selection criteria and other protocols necessary to identify whether a Medicare beneficiary could safely have these procedures performed in the hospital outpatient setting while guaranteeing them appropriate quality of care.

We explained in the CY 2022 OPPS/ASC proposed rule that after further consideration and review of the additional feedback from stakeholders, we recognized that the timeframe we finalized in the CY 2021 OPPS/ASC final rule with comment period for eliminating the IPO list did not, and would not, give us a sufficient opportunity to carefully assess whether a procedure should be payable in the HOPD setting, with considerations to beneficiary safety and medical advancements. We also explained that the unprecedented removal of the 298 codes from the IPO list transpired quickly. Given the significant policy shift and work required to operationalize the elimination of the IPO list, we acknowledged that more time is required to separately evaluate and consider the inpatient only classification of each service and its potential APC assignment. In addition, we stated that we believe that we should continue to use the longstanding criteria for removing services from the IPO list to evaluate each service before proposing to remove it from the list, and, as noted above, we proposed to codify these criteria in the regulation in a new § 419.23.

We emphasized in the CY 2022 OPPS/ASC proposed rule that we still believe that as medical practice continues to develop, the difference between the need for inpatient care and the appropriateness of outpatient care has become less distinct for many services. We stated that while we recognize that there are services currently classified as inpatient only that may be appropriate in the hospital outpatient setting for some Medicare beneficiaries, we continue to strive to balance the goals of increasing physician and patient choice of setting of care with considerations to patient safety for all Medicare beneficiaries. We explained that we must also consider the timing with which we remove services from the IPO list and the availability of evidence that may support the removal of those services. We stated that we believe that with additional time stakeholders can provide supportive evidence to aid in the evaluation of each individual procedure's assignment to the IPO list, as well as the appropriate APC assignment and corresponding payment for any codes, including but not limited to case reports, operative reports of actual cases, peer-reviewed medical literature, medical professional analysis, clinical criteria sets, and patient selection protocols.

Furthermore, we explained that an initial review of 2021 billing data through May 21, 2021 supported our proposal to halt the elimination of the list, revealing that 131 of the 298 codes removed from the IPO list in the CY 2021 OPPS/ASC final rule with comment period appeared on either zero or one OPPS claim and 269 of the 298

codes appeared on fewer than 100 claims. These data indicated that fewer than 3 percent of the services removed from the IPO list in 2021 had seen notable volume in the hospital outpatient setting following their removal from the IPO list. For perspective, we also note that even before we removed these codes from the IPO list, it was not uncommon to see at least some volume for these codes in the claims data. In CY 2020, when these codes were still not payable under the OPPS, 188 of the codes had at least one outpatient claim and 18 codes had greater than 100 claims, for reasons undetermined. We stated that, as a result, it was likely that not all of the reported claims represent services provided in the hospital outpatient setting due to these services being removed from the IPO list in CY 2021.

Therefore, we proposed to halt the elimination of the IPO list in order to allow for greater consideration of the impact removing services from the list has on beneficiary safety and to allow providers impacted by the COVID–19 PHE additional time to prepare to furnish appropriate services safely and efficiently before continuing to remove large numbers of services from the list.

Comment: Many commenters, including hospital associations, health systems, medical specialty societies, professional organizations, and advocacy groups supported our proposal to halt the elimination of the IPO list. Several commenters thanked CMS for listening to stakeholders' concerns about beneficiary safety and reconsidering the elimination of the IPO list. Commenters stated that the IPO list is a necessary tool and an important programmatic safeguard, and that maintaining the IPO list is necessary to set a national standard for services that should be restricted to the inpatient setting.

Specifically, commenters who supported halting the elimination of the IPO list wanted to maintain the IPO list due to patient safety concerns. These commenters stated that the high-risk, invasive procedures that require post-operative monitoring and care coordination that are included on the IPO list would not be safe to perform on Medicare beneficiaries in the hospital outpatient setting. Commenters noted that complications can occur with any surgical procedure, particularly during the post-operative period and that for many services on the IPO list, such post-operative complications are best identified early and treated promptly in the inpatient hospital setting. Several commenters responded that even with future advancements in medical practice and technology, they could not anticipate that such complicated procedures could ever be provided safely in the hospital outpatient setting, given their clinical nature. Commenters noted that physicians are in the best position to make safety determinations for their patients, but CMS must make policies for the broader, average beneficiary population. The commenters suggested that a careful review is needed before removing extensive surgical procedures performed on patients with complications and/or comorbidities, which are common in the Medicare population.

Supporters of maintaining the IPO list acknowledged operational and administrative concerns with maintaining the IPO list, largely focused on the 2-midnight rule and burden of proof required to allow services removed from the IPO list to be furnished inpatient, but contended that eliminating the IPO list would create new clinical and operational challenges for both practitioners and facilities that would require additional time and resources to adjust to. Several commenters also expressed concerns that the elimination of the IPO list could potentially inappropriately shift costs onto patients and subsequently discourage beneficiaries from seeking necessary care. Most supporters of maintaining the IPO list also supported CMS retaining its current process for evaluating and removing procedures from the IPO list through rulemaking.

Response: We thank the commenters for their support and we refer readers to sections 1X.B.2. and B.4. of this final rule with comment period for additional discussion of commenters' feedback on policy modifications, including whether CMS should maintain the longer-term objective of eliminating the IPO list or maintain the IPO list but continue to systematically scale the list back so that inpatient only designations are consistent with current standards of practice.

Comment: We also received comments from physicians and medical specialty societies who stated that, while they agreed that physicians should be the primary arbiters regarding the clinically appropriate site of service for a procedure for a particular beneficiary, they support maintaining the IPO list because a physician's medical judgment is not always the primary factor in determining whether a procedure is furnished in the inpatient or outpatient hospital setting. These commenters stated that many of the adverse impacts from removing procedures from the IPO list arise from hospitals that drive provider admission decisions. These commenters noted that when procedures are removed from the IPO list, many hospitals and other payers, including Medicare Advantage plans, make rules establishing outpatient status as the assumed baseline site of service for these procedures, regardless of patient characteristics or the physician's clinical assessment. Commenters divulged various reasons for this action on the part of hospitals and payers, including a desire to have the procedure performed in a lower cost setting, misinterpretation of CMS' rulemaking guidance, a desire for administrative simplicity, concerns regarding the application of the 2-midnight benchmark to services that are removed from the IPO list, the potential for claim denials if this benchmark is not met and/or excessive administrative burden to support the case-by-case exception to the 2-midnight rule. According to commenters, physicians must, at times, convince a hospital or payer that a particular patient should receive a given procedure in an inpatient setting due to patient safety concerns.

Commenters requested that CMS provide robust stakeholder education and issue various forms of guidance as a means of reducing administrative and operational burden, to support site of service decisions and to encourage consideration of and deference to the judgment of the physician, professional societies, and hospital associations regarding the procedures that are appropriate to be performed in the HOPD setting. Commenters referenced prior CMS guidance as a useful tool for providers and hospitals. One commenter noted that guidance increases the likelihood of hospital awareness of CMS preamble statements on patient selection. One commenter acknowledged CMS' historical reticence to define clinical criteria in light of our deference to physician judgment but reasoned that a CMS-established baseline protocol would not limit clinical decision-making, as clinicians would still be able to provide supporting clinical documentation to justify inpatient stays for patients that may otherwise be candidates for outpatient surgery. Commenters also requested that CMS institute a safeguard against inappropriate payer behavior that requires services to be furnished in the HOPD setting, despite the clinical judgment of the physician or needs of the patient.

Response: We thank the commenters for their support and we acknowledge the commenters' concerns regarding the administrative burden associated with the IPO list and the removal of

procedures from the list. As we have stated in previous rulemaking (85 FR 86087; 84 FR 61354; 82 FR 59384; 81 FR 79697) when commenters raised similar concerns, the removal of a service from the IPO list does not require the service to be performed only on an outpatient basis. Rather, it allows for payment under the OPPS when the service is performed on a registered hospital outpatient. We reiterate that services that are removed from the IPO list can be and are performed on individuals who are admitted as inpatients (as well as individuals who are registered hospital outpatients) when the patient's condition warrants inpatient admission (65 FR 18456). It is a misinterpretation of CMS payment policy for providers to create policies or guidelines that establish the hospital outpatient setting as the baseline or default site of service for a procedure based on its removal from the IPO list. As stated in previous rulemaking, services that are no longer included on the IPO list are payable in either the inpatient or hospital outpatient setting subject to the general coverage rules requiring that any procedure be reasonable and necessary, and payment should be made pursuant to the otherwise applicable payment policies (84 FR 61354; 82 FR 59384; 81 FR 79697).

We also recognize commenters' concerns regarding the need for additional stakeholder education on considerations that would support physician decision-making in selecting an appropriate site of service for procedures furnished to Medicare beneficiaries. We note the balance between several factors on this important issue, namely, the prohibition on CMS interfering with the practice of medicine in Section 1801 of the Social Security Act, the need to provide clear information about CMS billing and payment rules that ensures hospitals, physicians and other stakeholders can understand and operate within them, and that the specific decision about the most appropriate care setting for a given surgical procedure is a complex medical judgment made by the physician based on the beneficiary's individual clinical needs and preferences and on the general coverage rules requiring that any procedure be reasonable and necessary (84 FR 61354). We note that, in the past when services have come off the IPO list, we have attempted to provide general educational information regarding our billing and payment rules. For example, we published Medicare Learning Network (MLN) Booklet 909065 regarding major hip and knee replacement procedures, which is available here: *https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNProducts/Downloads/jointreplacement-ICN909065.pdf*.

We also note the Beneficiary and Family-Centered Care Quality Improvement Organizations (BFCC–QIOs) are contracted by CMS to review a sample of Medicare fee-for-service (FFS) short-stay inpatient claims (claims with hospital stays lasting less than 2 midnights after formal inpatient admission) for compliance with the 2-Midnight Rule. In the CY 2020 OPPS/ASC final rule with comment period (84 FR 61364 through 61365) the BFCC–QIO program adopted a period of exemption from certain medical review activities for procedures newly removed from the IPO list where the length of stay after inpatient admission is less than 2 midnights. During the exemption period, BFCC–QIOs may conduct medical reviews for education purposes but will not deny claims or make referrals to RACs for noncompliance with the 2-midnight rule for procedures that are removed from the IPO list within the first 2 years of their removal. This exemption period was intended to allow providers time to become more familiar with the application of the 2-midnight rule to procedures newly removed from the IPO list, and allows the BFCC–QIOs the opportunity to provide education regarding application of that payment policy to such procedures. In section X.A of this CY 2022 OPPS/ASC final rule with comment period we are reinstating this 2-year exemption policy, and believe that this will give providers needed time to adapt when procedures are newly removed from the IPO list starting January 1, 2022.

In addition to the 2-year exemption period for certain medical review activities, in the coming months we plan to use our experience gained through BFCC–QIO reviews to engage stakeholders to determine if developing additional materials for services that are newly removed from the IPO list would be helpful, including materials that are similar to MLN Booklet 909065 noted above. We reiterate that any such materials will not supersede physicians' medical judgment about whether a procedure should be performed in the inpatient or outpatient hospital setting. With regard to the behavior of commercial payers and site selection for outpatient services, we believe that these comments are out of the scope of the proposed rule.

We refer readers to section X. of this final rule with comment period for additional discussion regarding the 2-midnight rule. We also refer readers to sections 1X.B.2. and B.4. of this final rule with comment period for additional discussion of commenters' feedback on policy modifications, including whether CMS should maintain the longer-term objective of eliminating the IPO list or maintain the IPO list but continue to systematically scale the list back so that inpatient only designations are consistent with current standards of practice.

Comment: Numerous commenters, including some health systems, individual physicians and certain payers, opposed halting the elimination of the IPO list. Most of these commenters opposed halting the elimination of the IPO list due to administrative and operational issues that they believe stem from the existence of the IPO list, including site of service claims denials and compliance documentation. Other commenters contended that eliminating the IPO list would reduce administrative and operational burden and allow for necessary flexibility that could help providers serve the diversity of clinical needs and health statuses among Medicare beneficiaries and would increase patient choice and access to advances in surgical care that have made outpatient procedures safe, effective and efficient. Commenters who supported eliminating the IPO list maintained that the existence of the IPO list did not impact the quality of care beneficiaries receive as there is no distinction between inpatient and outpatient care. Specifically, a few commenters insisted that, for most hospitals the IPO list has no impact on the quality of care provided: Procedures are done in the same operating rooms, with the same infrastructure and the same staff. One commenter asserted that it is an inaccurate conclusion that the provision of services is less safe when conducted in an hospital outpatient setting. The commenter argued that no data has been provided to demonstrate that the removal of services from the IPO list in 2021 resulted in higher incidences of adverse events or increased risk to patient safety when performed in the hospital outpatient setting. Another commenter requested clarification on why CMS believes the IPO list is in the best interest of patient safety. The commenter stated that while there may be enhanced safety for surgeries performed in a hospital versus an ASC or physician office, it is unclear how patient safety differs between the hospital inpatient and hospital outpatient settings. They claimed that utilization of outpatient services

increased across all plan types with the 2021 elimination of the IPO list, highlighting the impact across the healthcare system. The commenter noted high levels of patient satisfaction and no compromise in quality as measured by unplanned returns to the emergency department or operating room and no readmissions following services performed in the hospital outpatient setting. Several commenters acknowledged that there will be patients for whom an inpatient procedure remains the safest and most clinically appropriate option but believed that there should be additional flexibility for Medicare beneficiaries who meet relevant clinical criteria. In addition, one commenter suggested that the elimination of the IPO list should occur over 5 to 7 instead of 3.

Response: We appreciate the commenter's feedback. We again acknowledge commenters' concerns regarding the administrative and operational challenges associated with the IPO list, including the application of the 2-midnight benchmark to services that are removed from the IPO list. In addition to the mechanisms that are already in place, including the case-by-case exceptions to the 2-midnight benchmark and the exemption from certain medical review activities related to the 2-midnight rule for procedures that have been recently removed from the IPO list, CMS will continue to work with stakeholders to address these operational concerns in future rulemaking. We again refer readers to section X. of this final rule with comment period for additional discussion regarding the 2-midnight rule.

We also acknowledge stakeholders' concerns regarding the lack of definitive data that shows a difference between services performed in the inpatient and outpatient settings. In the absence of data demonstrating that these procedures can be safely furnished to the typical Medicare beneficiary in the hospital outpatient setting we continue to believe that it is necessary to prioritize the potential impact that removing services from the IPO list has on beneficiary safety and quality of care and develop additional ways to monitor safety prior to removing such a large number of services from the IPO list. We note that certain commenters in this rulemaking cycle (and past OPPS rules) have indicated that hospitals and other payers may use the circumstance of CMS removing a service from the IPO list to encourage that service to be performed outpatient, even when not clinically appropriate for the patient, and we remain concerned about these potential spillover effects due to changes in our policy. As described above, we also believe that the policy to eliminate the IPO list transpired quickly, and we believe it is necessary to halt the elimination of the IPO list and reinstate a more measured process of separately evaluating the inpatient only classification of each service against the five longstanding criteria.

We also note and appreciate commenters concerns about the varying clinical appropriateness of furnishing a given service in the hospital outpatient setting based on a beneficiary's clinical status; that is, we acknowledge that it may be appropriate to furnish certain services in the hospital outpatient setting for a certain number of beneficiaries due to their clinical circumstances, while at the same time it may not be appropriate to furnish those same services in the hospital outpatient setting for many other beneficiaries. As stated in the CY 2022 OPPS/ASC proposed rule, we continue to believe that physicians should use their complex clinical judgment, together with consideration of the beneficiary's needs, to determine the appropriate site of service. We continue to strive to balance the goals of increasing physician and patient choice of setting of care with consideration of patient safety for all Medicare beneficiaries.

After consideration of the comments, we are finalizing our proposal without modification to halt the elimination of the IPO list. In accordance with this proposal, we are finalizing our proposal to amend the regulation at § 419.22(n) to remove the reference to the elimination of the list of services and procedures designated as requiring inpatient care through a 3-year transition.

We refer readers to section IX.B.3 of this final rule with comment period for a discussion on the services removed in CY 2021 that we proposed to return to the IPO list in CY 2022.

2. Proposal To Codify Longstanding Criteria

As we stated in the CY 2022 OPPS/ASC proposed rule, we continue to believe that physicians must use their complex clinical judgment, together with consideration of the beneficiary's needs, to determine the appropriate site of service, but we explained that the broad removal of services from the IPO list in CY 2021 did not allow us to assess whether procedures proposed for removal met the longstanding removal criteria that we have historically used in consideration of the typical Medicare beneficiary. As discussed above and in the proposed rule, to ensure beneficiary safety, we have historically used longstanding criteria to determine if a procedure should be removed from the IPO list, but we noted that the procedures removed from the IPO list beginning in CY 2021 were not assessed against these criteria because we adopted a policy to eliminate the IPO list entirely. After further consideration, we explained that we believe it is important to continue to assess whether services individually meet any of the criteria for removal from the IPO list before being removed. In the CY 2022 OPPS/ASC proposed rule, we proposed to codify in the regulation text in a new § 419.23 our five longstanding criteria, listed above, for determining whether a service or procedure should be removed from the IPO list.

Comment: A majority of commenters, including hospital systems, medical specialty societies, and professional organizations, supported our proposal to codify the five longstanding criteria to determine if a procedure should be removed from the IPO list and supported using the criteria to evaluate the 298 procedures removed from the IPO list in the CY 2021 OPPS/ASC final rule with comment period. Many commenters supported the criteria as proposed, stating that the longstanding criteria appropriately reflect progress and allow us to efficiently assess if outpatient departments are equipped to provide the services under consideration for removal.

Response: We thank commenters for their support.

Comment: Some commenters suggested modifications to the five proposed criteria. One commenter requested that CMS modify the first two criteria to change ''most outpatient departments'' to ''outpatient departments conducting surgical procedures,'' due to concerns that the proposed language is undefined and vague. The commenter also expressed that our third criterion—that the procedure is related to codes that we have already removed from the IPO list—was limiting and should be modified to address codes that do not have related codes being considered for removal from the IPO list. We also received comments requesting that we modify the fourth criterion (a determination is made that the procedure is being furnished in numerous hospitals on an outpatient basis) to further define ''outpatient basis'' and ''numerous''. We also received a comment citing concerns that many hospitals do submit claims to Medicare for procedures on the IPO list when they are performed in the hospital outpatient setting due to lack of payment. We also received two

comments requesting that we remove the fifth criterion due to concerns that CMS is comparing the capabilities and safety of performing a service in the ASC setting to that of the hospital setting, noting that hospitals have greater resources and are able to admit patients if complications arise.

Further, a few commenters believed our longstanding pre-2021 policy of requiring a service to meet only one criterion to be removed from the IPO list was too lenient and prevented stakeholders from anticipating when a procedure would be eligible for removal from the IPO list. The commenters recommended that we require services to meet all five criteria in order to be removed from the IPO list.

Response: We appreciate the commenters' recommendations and will consider them for future rulemaking. Due in part to the overwhelming support we received from commenters to codify in regulation the current five criteria as well as our position that the criteria remain appropriate, we do not believe it is necessary to change them at this time. However, we plan to continue to engage stakeholders and consider feedback on modifications to the criteria.

As we stated in previous rulemaking, we created the first three criteria because we identified services that were often safely performed in the hospital outpatient setting based on comments we received. We also identified additional services where the simplest procedure described by the code may be performed safely in the hospital outpatient setting or that they were related to codes we removed from the IPO list (65 FR 18456). We established the fourth and fifth criteria in later rulemaking after identifying procedures that were on the IPO list but were also being performed on an outpatient basis or being safely and appropriately performed in the ASC setting (67 FR 66741). These criteria were created to ensure consistency between the IPO list and the ASC CPL and to identify services that are included on the ASC CPL, and therefore should be removed from the IPO list. These criteria were created to help independently identify procedures that could be appropriately performed in the hospital outpatient setting and we reiterate that a service does not need to meet all of the criteria to be removed from the IPO list, meaning that a service does not need to have related codes already removed from the IPO list or does not need to be safely furnished in the ASC setting to be removed from the IPO list.

Additionally, we do not believe that our policy to only require a service to meet one criterion to be removed from the IPO list is too lenient. We believe that not requiring a service to meet multiple criteria allows for greater flexibility to determine if a service is appropriate to remove from the IPO list, as some criteria are irrelevant to certain services. As stated above, while we only require a service to meet one criterion to be considered for removal, satisfying only one criterion does not guarantee that the service will be removed, instead, the case for removal is strengthened with the more criteria the service meets.

Comment: Commenters also recommended additional criteria as well as methods of evaluating the five existing criteria. We also received multiple comments recommending that criteria used to determine if a service is appropriate to remove from the IPO list should consider clinical factors and social factors, including patient's age and comorbidities, support systems, access to care, health literacy, prior hospitalizations, and functional status. Numerous commenters stressed that without consideration of clinical and social factors, patients, surgeons, and hospitals in underserved communities could bear a disproportionate burden and experience unintended consequences of more services being payable in the hospital outpatient setting. Commenters recommended that we also evaluate the out-of-pocket financial impact that moving a service to the hospital outpatient setting would have on Medicare beneficiaries.

Commenters suggested that changes to the IPO list should be based upon scientific evidence on safety, quality, and advancements in medical technology. They acknowledged that a majority of inpatient procedures have limited or no evidence on the safety of performing them in the hospital outpatient setting and that at least some of the evidence available is based on limited, incomplete, or conflicting data from other claims.

We also received some comments with recommendations regarding the data that CMS uses for evaluating services on the IPO list. We received several comments suggesting that CMS analyze claims data for services that had a stay less than 2-midnights and use this data to determine if a service should be eligible to be paid when furnished in the hospital outpatient setting. One commenter also requested that CMS clarify how different data, including commercial data, would be considered when evaluating services for removal using the five criteria as the general patient population used in the collection of the data may vary from the Medicare population.

One commenter urged CMS not to use billed and denied outpatient claims as a source of data to determine if hospitals are equipped to provide a service in the hospital outpatient setting. The commenter advised that there would be few outpatient claims for services on the IPO list because hospitals would avoid billing claims that would be denied. The commenter suggested that CMS should instead analyze the geometric mean or median length of stay for IPPS claims reported with procedures on the IPO list, and crosswalk the ICD–10–PCS codes on the IPPS claims to the CPT codes on the IPO list, so that CMS could analyze data where the patient would remain in the hospital post-procedure, but require less time, less intensive care, or pose less risk than the typical hospital inpatient. The commenter also suggested that CMS analyze data on short-stay inpatient hospitalizations from the Beneficiary Family Centered Care-Quality Improvement Organizations (BFCC–QIOs), with the QIOs nominating procedures that they commonly see in their reviews. Finally, we also received comments recommending that CMS work closely with stakeholders and providers and consider their feedback when evaluating services on the IPO list against our criteria, and to allow for the consideration of factors in addition to the five criteria.

Response: We appreciate the commenters' recommendations. We note that we take clinical evidence into consideration when evaluating a service for removal from the IPO list. We also consider all other available data, including outpatient, inpatient, and professional claims data. This includes data on length-of-stay, and we have continuously encouraged stakeholders to bring decreasing length-of-stays and successful same day discharges to our attention to aid our review (65 FR 18456). We agree that there are limitations in the studies and data available to aid our assessment of the appropriateness of removing procedures from the IPO list, particularly studies that compare outcomes for services furnished in the inpatient hospital setting versus the outpatient hospital setting as well as studies that analyze outcomes for the typical Medicare beneficiary. More specifically, while studies may demonstrate safety for a given procedure in the outpatient hospital setting, those studies may not focus on a Medicare-aged population, or involve patients with certain comorbid conditions that are common for patients 65 and older. We continue to explore

ways to engage stakeholders to effectively address limitations in these studies, and we look forward to future work on these important issues. We reiterate that we do not believe it is appropriate at this time to modify the criteria, which were overwhelmingly supported by commenters, as we reinstate and codify them in regulation text. However, as previously stated, we will continue to engage stakeholders and consider feedback on modifications to the criteria for removal from the IPO list.

Comment: One commenter opposed codifying the five longstanding criteria and expressed concern that codifying the criteria would delay timely updates to the IPO. The commenter was concerned that the process of submitting a request to add or remove a service and providing evidence, including peer-reviewed medical literature, physician comments, and outcome data, is time consuming and may cause unnecessary delays in hospitals' ability to provide care and be paid under the OPPS when services are furnished in the hospital outpatient setting for beneficiaries for whom the services are clinically appropriate.

Response: We appreciate the commenter's response. We believe that using our five criteria to evaluate services for removal from the IPO list is necessary to ensure OPPS payment is available for services that are safe for the typical Medicare beneficiary to receive in the hospital outpatient setting. We also believe that the comments and evidence we receive are an important aspect of determining whether it is appropriate to remove a service from the IPO list. Because we review requests to add or remove services from the IPO list annually and address those removals or additions in notice-and-comment rulemaking, we do not believe that use of criteria to assess whether procedures should be removed causes unnecessary delays in making payment available for appropriate procedures under the OPPS.

After reviewing the public comments we received we are finalizing our proposal without modification to codify our five longstanding criteria for determining whether a service or procedure should be removed from the IPO list in the regulation text in a new § 419.23.

3. Returning Procedures Removed in CY 2021 to the IPO List for CY 2022

As discussed earlier in section IX.A. of this final rule with comment period, we typically evaluate whether a service should be removed from the IPO list using five criteria and, while a service does not need to meet all of the criteria to be removed from the IPO list, it should meet at least one criterion, with the case for removing the service from the IPO list strengthened with the more criteria the service meets. For CY 2021, in light of our proposal to eliminate the IPO list over a three-year transition, we proposed that musculoskeletal services would be the first group of services removed from the IPO list. We stated that we proposed to remove this group of services first for several reasons. In recent years, due to new technologies and advances in surgical care protocols, expedited rehabilitation protocols, and significant enhancements in postoperative processes, we have removed TKA and THA, which are both musculoskeletal services, from the IPO list. During the process of proposing and finalizing removing TKA and THA from the IPO list, stakeholders have continuously requested that CMS remove other musculoskeletal services from the IPO list as well, citing shortened length of stay times, advancements in technologies and surgical techniques, and improved postoperative processes. Additionally, we noted that, more often than not, stakeholders historically requested that we remove musculoskeletal services from the IPO list more than other types of services. We also recognized that there is already a set of comprehensive APCs for musculoskeletal services for payment under the OPPS, which facilitates payment for these services and further supported their removal for CY 2021. Specifically, because we had previously removed codes from the IPO list that are similar clinically and in terms of resource cost and assigned them to these comprehensive APCs, we explained that these APCs generally describe appropriate ranges for the musculoskeletal codes removed in CY 2021, which we believed allowed for appropriate payment. We also proposed to remove additional related services that were recommended for removal by stakeholders during the annual HOP panel meeting. As stated above, because these services were being removed from the IPO list as the first phase of the elimination of the list, we did not evaluate each of these services against the longstanding criteria for removing a service from the IPO list.

During the 2021 rulemaking process, a number of commenters supported the removal of the 298 services, but the vast majority of commenters were opposed to removing the services and shared concerns regarding their inability to properly review the clinical nature of this large number of procedures and to provide comprehensive feedback on their removal from the list. Some commenters were able to review the individual services and requested that specific CPT codes remain payable in the inpatient setting only, including CPT codes 27280 (Arthrodesis, open, sacroiliac joint, including obtaining bone graft, including instrumentation, when performed) and 22857 (Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar) due to concerns about the safety of these procedures if they are performed in the hospital outpatient setting.

As previously stated in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86087), an overwhelming number of stakeholders supported the previously established methodology for identifying appropriate changes to the IPO list. CMS received numerous requests to continue to use the established criteria to review and analyze services proposed for removal as opposed to removing large numbers of services in groups or categories. Commenters noted that they preferred the historical process for assessing services for removal from the IPO list using the five criteria, as they believed this process was more manageable for patients, providers, and other stakeholders, allowing them to provide meaningful input on a procedure-by-procedure basis.

We stated in the CY 2022 OPPS/ASC proposed rule that because we proposed to halt elimination of the IPO list, we also believe it is appropriate to continue to evaluate services that we proposed for removal against the longstanding criteria, and include with our proposals an in-depth analysis of whether most outpatient departments are equipped to provide the services to the Medicare population; whether the simplest procedure described by the code may be performed in most outpatient departments; whether the procedure is related to codes that we have already removed from the IPO list; whether the procedure is being performed in numerous hospitals on an outpatient basis; and whether the procedure can be appropriately and safely performed in an ASC, is on the list of approved ASC procedures, or has been proposed by us for addition to the ASC list. Historically, we have included discussions of the individual codes proposed for removal in the proposed rule and stakeholders have had the opportunity to comment with evidence in support of or opposition to the service's assignment to the IPO list, and we believe it is appropriate to continue to do so.

Furthermore, we explained in the CY 2022 OPPS/ASC proposed rule that in light of ongoing stakeholder feedback, we reviewed each of the procedures removed from the IPO list in CY 2021 to determine whether they individually meet the longstanding criteria for removal from the list for CY 2022. Our review considered the clinical intensity and characteristics of the service, the underlying condition of the beneficiary who would require the service, peer-reviewed medical literature, case reports, clinical criteria sets, and utilization data. This initial review determined that none of the services removed in CY 2021 have sufficient supporting evidence that the service can be safely performed on the Medicare population in the hospital outpatient setting, that most outpatient departments are equipped to provide the services to the Medicare population, or that the services are being performed safely on an outpatient basis. For a large number of the removed services, we did not find vignettes, claims or utilization data, or literature to support their removal under our longstanding criteria. For the few services that did have some data supporting their removal from the list, we found the data to be either incomplete or to be countered by conflicting data. For example, a few services, including CPT code 21627 (sternal debridement), showed increasing migration to the hospital outpatient setting, but we could not locate supportive medical literature case studies or outcomes data to support that the services are safe for the Medicare population in the hospital outpatient setting. Some services, such as CPT code 22558 (Lumbar spine fusion) and CPT code 23472 (reconstruct shoulder joint), show increasing outpatient claims data, but have high length of stay times and extensive post-operative care needs that indicate these services may not be appropriate for the Medicare population in the hospital outpatient setting. Other services, such as CPT code 22846 (Anterior instrumentation; 4 to 7 vertebral segments), lack medical literature or case studies, lack supportive claims data, and have conflicting stakeholder feedback for the safety of the service in the hospital outpatient setting. We were unable to find literature and data for services that included outcomes specific to the Medicare population, particularly in the hospital outpatient setting.

We stated in the CY 2022 OPPS/ASC proposed rule that given that our initial review of each of the services removed from the list in CY 2021 using the five criteria mentioned in section IX.A. of this final rule with comment period did not find sufficient evidence that any of these services would be safe to perform on the Medicare population in the hospital outpatient setting, we did not believe it would be appropriate for Medicare to pay for these services when performed in a hospital outpatient setting. In particular, we found that the simplest procedures described by the codes for these services cannot be furnished safely in most outpatient departments, most outpatient departments are not equipped to provide these services to the Medicare population, and the procedures were not being performed in numerous hospitals on an outpatient basis. We also did not believe the services could be appropriately and safely furnished in an ASC. As a result of this review, we proposed to return all of the procedures removed in the CY 2021 OPPS/ASC final rule with comment period to the IPO list for CY 2022 because we did not believe they met the previously established criteria for removal from the IPO list. Therefore, after further clinical review and additional consideration of safety and quality of care concerns for the group of services removed from the IPO list in the CY 2021 final rule, for CY 2022 we proposed to return these 298 services to the IPO list, as shown in Table 45 below.

We solicited public comment on whether there are services that were removed from the IPO list in CY 2021 that stakeholders believe do meet the longstanding criteria for removing services from the IPO list and should continue to be payable in the hospital outpatient setting in CY 2022. If so, we requested that commenters submit corresponding evidence—including, but not limited to, case reports, operative reports of actual cases, peer-reviewed medical literature, medical professional analysis, clinical criteria sets, and patient selection protocols—that the service meets the longstanding criteria for removal from the IPO list and is safe to perform on the typical Medicare population in the hospital outpatient setting.

As mentioned above, the services that we proposed to add back to the IPO list reflect those services that we believe may pose increased safety risk to the typical Medicare beneficiary. However, we recognized that there may be a subset of Medicare beneficiaries who, on a case-by case-basis, may nonetheless be appropriate to treat in the hospital outpatient setting and we sought comment below on whether any services that were removed in CY 2021, but were proposed to be added back to the IPO for CY 2022, should in fact, remain off the IPO list. Table 45 below contains the proposed additions to the IPO list for CY 2022.

BILLING CODE 4120–01–P

TABLE 45: PROPOSED ADDITIONS TO THE INPATIENT ONLY (IPO) LIST FOR CY 2022

CY 2022 CPT Code	CY 2022 Long Descriptor	CY 2022 OPPS Proposed Status Indicator
00192	Anesthesia for procedures on facial bones or skull; radical surgery (including prognathism)	C
00474	Anesthesia for partial rib resection; radical procedures (e.g., pectus excavatum)	C
00604	Anesthesia for procedures on cervical spine and cord; procedures with patient in the sitting position	C
00904	Anesthesia for; radical perineal procedure	C
0095T	Removal of total disc arthroplasty (artificial disc), anterior approach, each additional interspace, cervical (list separately in addition to code for primary procedure)	C
0098T	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, each additional interspace, cervical (list separately in addition to code for primary procedure)	C
01140	Anesthesia for interpelviabdominal (hindquarter) amputation	C
01150	Anesthesia for radical procedures for tumor of pelvis, except hindquarter amputation	C
01212	Anesthesia for open procedures involving hip joint; hip disarticulation	C
01232	Anesthesia for open procedures involving upper two-thirds of femur; amputation	C
01234	Anesthesia for open procedures involving upper two-thirds of femur; radical resection	C
01274	Anesthesia for procedures involving arteries of upper leg, including bypass graft; femoral artery embolectomy	C
01404	Anesthesia for open or surgical arthroscopic procedures on knee joint; disarticulation at knee	C

CY 2022 CPT Code	CY 2022 Long Descriptor	CY 2022 OPPS Proposed Status Indicator
01486	Anesthesia for open procedures on bones of lower leg, ankle, and foot; total ankle replacement	C
0163T	Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), each additional interspace, lumbar (list separately in addition to code for primary procedure)	C
01634	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; shoulder disarticulation	C
01636	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; interthoracoscapular (forequarter) amputation	C
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	C
0164T	Removal of total disc arthroplasty, (artificial disc), anterior approach, each additional interspace, lumbar (list separately in addition to code for primary procedure)	C
0165T	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, each additional interspace, lumbar (list separately in addition to code for primary procedure)	C
01756	Anesthesia for open or surgical arthroscopic procedures of the elbow; radical procedures	C
0202T	Posterior vertebral joint(s) arthroplasty (for example, facet joint[s] replacement), including facetectomy, laminectomy, foraminotomy, and vertebral column fixation, injection of bone cement, when performed, including fluoroscopy, single level, lumbar spine	C
0219T	Placement of a posterior intrafacet implant(s), unilateral or bilateral, including imaging and placement of bone graft(s) or synthetic device(s), single level; cervical	C

CY 2022 CPT Code	CY 2022 Long Descriptor	CY 2022 OPPS Proposed Status Indicator
0220T	Placement of a posterior intrafacet implant(s), unilateral or bilateral, including imaging and placement of bone graft(s) or synthetic device(s), single level; thoracic	C
20661	Application of halo, including removal; cranial	C
20664	Application of halo, including removal, cranial, 6 or more pins placed, for thin skull osteology (e.g., pediatric patients, hydrocephalus, osteogenesis imperfecta)	C
20802	Replantation, arm (includes surgical neck of humerus through elbow joint), complete amputation	C
20805	Replantation, forearm (includes radius and ulna to radial carpal joint), complete amputation	C
20808	Replantation, hand (includes hand through metacarpophalangeal joints), complete amputation	C
20816	Replantation, digit, excluding thumb (includes metacarpophalangeal joint to insertion of flexor sublimis tendon), complete amputation	C
20824	Replantation, thumb (includes carpometacarpal joint to MP joint), complete amputation	C
20827	Replantation, thumb (includes distal tip to MP joint), complete amputation	C
20838	Replantation, foot, complete amputation	C
20955	Bone graft with microvascular anastomosis; fibula	C
20956	Bone graft with microvascular anastomosis; iliac crest	C

27712	Osteotomy; multiple, with realignment on intramedullary rod (for example, sofield type procedure)	C
27715	Osteoplasty, tibia and fibula, lengthening or shortening	C
27724	Repair of nonunion or malunion, tibia; with iliac or other autograft (includes obtaining graft)	C
27725	Repair of nonunion or malunion, tibia; by synostosis, with fibula, any method	C
27727	Repair of congenital pseudarthrosis, tibia	C
27880	Amputation, leg, through tibia and fibula;	C
27881	Amputation, leg, through tibia and fibula; with immediate fitting technique including application of first cast	C
27882	Amputation, leg, through tibia and fibula; open, circular (guillotine)	C
27886	Amputation, leg, through tibia and fibula; re-amputation	C
27888	Amputation, ankle, through malleoli of tibia and fibula (for example, syme, pirogoff type procedures), with plastic closure and resection of nerves	C
28800	Amputation, foot; midtarsal (for example, chopart type procedure)	C
35372	Thromboendarterectomy, including patch graft, if performed; deep (profunda) femoral	C
35800	Exploration for postoperative hemorrhage, thrombosis or infection; neck	C
37182	Insertion of transvenous intrahepatic portosystemic shunt(s) (tips) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation)	C
37617	Ligation, major artery (eg, post-traumatic, rupture); abdomen	C
38562	Limited lymphadenectomy for staging (separate procedure); pelvic and para-aortic	C

CY 2022 CPT Code	CY 2022 Long Descriptor	CY 2022 OPPS Proposed Status Indicator
43840	Gastrorrhaphy, suture of perforated duodenal or gastric ulcer, wound, or injury	C
44300	Placement, enterostomy or cecostomy, tube open (eg, for feeding or decompression) (separate procedure)	C
44314	Revision of ileostomy; complicated (reconstruction in-depth) (separate procedure)	C
44345	Revision of colostomy; complicated (reconstruction in-depth) (separate procedure)	C
44346	Revision of colostomy; with repair of paracolostomy hernia (separate procedure)	C
44602	Suture of small intestine (enterorrhaphy) for perforated ulcer, diverticulum, wound, injury or rupture; single perforation	C
49010	Exploration, retroperitoneal area with or without biopsy(s) (separate procedure)	C
49255	Omentectomy, epiploectomy, resection of omentum (separate procedure)	C
51840	Anterior vesicourethropexy, or urethropexy (eg, marshall-marchetti-krantz, burch); simple	C
56630	Vulvectomy, radical, partial;	C
61624	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord)	C
G0412	Open treatment of iliac spine(s), tuberosity avulsion, or iliac wing fracture(s), unilateral or bilateral for pelvic bone fracture patterns which do not disrupt the pelvic ring includes internal fixation, when performed	C
G0414	Open treatment of anterior pelvic bone fracture and/or dislocation for fracture patterns which disrupt the pelvic ring, unilateral or bilateral, includes internal fixation when performed (includes pubic symphysis and/or superior/inferior rami)	C

CY 2022 CPT Code	CY 2022 Long Descriptor	CY 2022 OPPS Proposed Status Indicator
G0415	Open treatment of posterior pelvic bone fracture and/or dislocation, for fracture patterns which disrupt the pelvic ring, unilateral or bilateral, includes internal fixation, when performed (includes ilium, sacroiliac joint and/or sacrum)	C

BILLING CODE 4120–01–C

Comment: Most comments supported returning all 298 services back to the IPO list for 2022. Of those commenters that supplied a rationale for their support for returning all 298 services to the IPO list, the most frequently cited reasons were the commenters' concerns with the pace that this shift would take place; the lack of data and evidence available to support furnishing these services in the hospital outpatient setting for the typical Medicare beneficiary; CMS' inability to monitor the impact of such a large migration of services from the inpatient setting to the hospital outpatient setting; CMS' inability to monitor patient safety outcomes for the services if furnished in the hospital outpatient setting; and that the PHE has impacted the commenters' ability to prepare for this shift. Commenters also expressed concerns regarding how quickly a large number of services were removed from the IPO list. Emphasizing the financial and clinical resources needed to prepare clear criteria for surgical site selection; develop criteria for patient selection; update their billing systems; and gain experience with furnishing newly removed services, commenters requested that CMS provide additional time in between removing services from the IPO list.

Response: We thank commenters for their support for our proposal to return 298 services to the IPO list, and their detailed feedback regarding their concerns about patient safety and the timeline for transitioning services off of the IPO list.

Comment: Some commenters opposed returning all 298 services to the IPO list and believed that if all 298 services are moved back on the IPO list in CY 2022, beneficiaries would receive care in an unnecessarily high-cost inpatient setting and experience higher out-of-pocket costs for services. In addition, they argued that higher costs coupled with potential delays in returning home will cause beneficiary dissatisfaction and increase overall cost to the healthcare system. One commenter stated that policy changes over the past 2 years have burdened facilities and clinicians. The commenter noted that many inpatient procedures are canceled due to the PHE, adding additional delays and negatively affecting patient experience and health. For these reasons the commenter suggested CMS reassess returning all 298 procedures to the IPO list.

Some commenters expressed concerns regarding outpatient surgeries for procedures we are returning to the IPO list that were scheduled prior to the publication of the final rule and the subsequent impact on beneficiaries when these surgeries are cancelled or payment is not available for them under the OPPS. Commenters requested that in the event the policy is finalized as proposed, CMS allow services scheduled as outpatient prior to the final rule's implementation date to be payable as they believe this would decrease provider burden and minimize impact on patients expecting outpatient care. The commenters stated that it is difficult for facilities and clinicians to invest in new equipment and develop protocols to move new procedures to the outpatient department if they are unsure how long services will remain payable in the hospital outpatient setting.

Response: We thank commenters for their support and for detailing their experiences. We recognize that there may be operational changes (including scheduling and other administrative changes) that may be necessary to adjust to our final policy to return services to the IPO list. We also recognize that the PHE has broadly impacted access to hospital services and note that we have taken several steps to broaden access to care during the PHE through rulemaking and through waivers issued using our authority in section 1135 of the Act. For additional information about the actions taken to expand access to care and otherwise address the PHE for COVID–19, please visit: *https://www.cms.gov/about-cms/emergency-preparedness-response-operations/current-emergencies/coronavirus-waivers*. However, we continue to share concerns expressed by other commenters regarding the speed at which we implemented this policy change. We believe that we need to reinstate a more measured process of evaluating individual services for removal from the IPO list against the five longstanding criteria, and to prioritize the potential impacts on the quality and safety of care for services when they are removed from the IPO list.

Comment: Certain commenters (mainly specialists and medical associations) requested specific services (roughly 120 services in total, ranging in complexity) not be placed back on the IPO list. Those services are listed in Table 46 below. These commenters indicated that they were currently performing some of these procedures on an outpatient basis in both the HOPD and ASC setting on non-Medicare patients.

Of those approximately 120 services requested to remain off of the IPO list, two stakeholders included supportive information for CPT 22630 (Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar); CPT 23472 (Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (for example, total shoulder))); and CPT 27702 (Arthroplasty, ankle; with implant (total ankle). Several commenters, including medical associations, specialty groups, and surgeons suggested that shoulder and ankle replacement surgeries performed in HOPDs and ASCs demonstrated optimal clinical outcomes. Commenters submitted several peer-reviewed studies

comparing outcomes for CPT 23472 and CPT 27702 performed in the inpatient versus the hospital outpatient setting. As a result, they believed performing CPT 23472 and CPT 27702 in a hospital outpatient setting is appropriate as determined by the treating health care provider. Some commenters cited all payer claims data and stated that, following the removal of services from the IPO list, nearly half of shoulder replacement surgeries were performed in the hospital outpatient setting in the first few months of 2021. Commenters that supported leaving CPT 23472 and CPT 27702 off the IPO list and payable under the OPPS highlighted that other procedures that were removed from the IPO list in CY 2021 did not demonstrate similar utilization in the hospital outpatient setting. The commenters stated that low utilization of the majority of services removed from the IPO in CY 2021 confirms physicians are using clinical judgment to determine when the hospital outpatient setting is clinically appropriate.

In regards to CPT 22630, a commenter noted that CPT codes 22633 (Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar) and 22612 (Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed), which are not on the IPO list, are performed with CPT code 22630 when a posterior approach 360-degree spinal fusion is performed. The commenter noted that while CPT code 22633 was removed from the IPO list in 2020 (84 FR 61355 through 61357), the service described by CPT code 22630, if added to the IPO list, will in effect make the combined procedure, described by CPT codes 22630 and 22633, unable to be performed in the outpatient hospital setting because both procedures need to be payable under the OPPS to be performed there. The commenter recommended keeping CPT code 22630 off the IPO list for CY 2022 so that the individual procedures, along with the combined procedure, are eligible for Medicare payment when furnished in the hospital outpatient setting for appropriate Medicare beneficiaries. A different commenter provided an unpublished study that they believe demonstrates that safety, efficacy, and patient satisfaction for lumbar interbody fusion surgery furnished in the ASC setting are comparable to or better than in the hospital setting for Medicare beneficiaries.

The services that commenters believed should remain off the IPO list in CY 2022 and continue to be paid under the OPPS when furnished in the hospital outpatient setting are included in Table 46.

BILLING CODE 4120–01–P

TABLE 46: SERVICES REQUESTED TO REMAIN OFF OF THE IPO LIST FOR CY 2022

CY 2022 CPT Code	CY 2022 Long Descriptor
01486	Anesthesia for open procedures on bones of lower leg, ankle, and foot; total ankle replacement
01634	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; shoulder disarticulation
21141	Reconstruction midface, lefort i; single piece, segment movement in any direction (for example, for long face syndrome), without bone graft
21188	Reconstruction midface, osteotomies (other than lefort type) and bone grafts (includes obtaining autografts)
21194	Reconstruction of mandibular rami, horizontal, vertical, c, or l osteotomy; with bone graft (includes obtaining graft)
21196	Reconstruction of mandibular rami and/or body, sagittal split; with internal rigid fixation
21255	Reconstruction of zygomatic arch and glenoid fossa with bone and cartilage (includes obtaining autografts)
21343	Open treatment of depressed frontal sinus fracture
21344	Open treatment of complicated (for example, comminuted or involving posterior wall) frontal sinus fracture, via coronal or multiple approaches
21347	Open treatment of nasomaxillary complex fracture (lefort ii type); requiring multiple open approaches
21348	Open treatment of nasomaxillary complex fracture (lefort ii type); with bone grafting (includes obtaining graft)
21366	Open treatment of complicated (for example, comminuted or involving cranial nerve foramina) fracture(s) of malar area, including zygomatic arch and malar tripod; with bone grafting (includes obtaining graft)
21422	Open treatment of palatal or maxillary fracture (lefort i type);
21423	Open treatment of palatal or maxillary fracture (lefort i type); complicated (comminuted or involving cranial nerve foramina), multiple approaches
21436	Open treatment of craniofacial separation (lefort iii type); complicated, multiple surgical approaches, internal fixation, with bone grafting (includes obtaining graft)
21510	Incision, deep, with opening of bone cortex (for example, for osteomyelitis or bone abscess), thorax
21620	Excision of chest wall tumor involving rib(s), with plastic reconstruction; without mediastinal lymphadenectomy
22010	Incision and drainage, open, of deep abscess (subfascial), posterior spine; cervical, thoracic, or cervicothoracic
22015	Incision and drainage, open, of deep abscess (subfascial), posterior spine; lumbar, sacral, or lumbosacral

22110	Partial excision of vertebral body, for intrinsic bony lesion, without decompression of spinal cord or nerve root(s), single vertebral segment; cervical
22112	Partial excision of vertebral body, for intrinsic bony lesion, without decompression of spinal cord or nerve root(s), single vertebral segment; thoracic
22114	Partial excision of vertebral body, for intrinsic bony lesion, without decompression of spinal cord or nerve root(s), single vertebral segment; lumbar
22116	Partial excision of vertebral body, for intrinsic bony lesion, without decompression of spinal cord or nerve root(s), single vertebral segment; each additional vertebral segment (list separately in addition to code for primary procedure)
22210	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; cervical
22212	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; thoracic
22214	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; lumbar
22216	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; each additional vertebral segment (list separately in addition to primary procedure)
22220	Osteotomy of spine, including discectomy, anterior approach, single vertebral segment; cervical
22222	Osteotomy of spine, including discectomy, anterior approach, single vertebral segment; thoracic
22224	Osteotomy of spine, including discectomy, anterior approach, single vertebral segment; lumbar
22226	Osteotomy of spine, including discectomy, anterior approach, single vertebral segment; each additional vertebral segment (list separately in addition to code for primary procedure)
22318	Open treatment and/or reduction of odontoid fracture(s) and or dislocation(s) (including os odontoideum), anterior approach, including placement of internal fixation; without grafting
22319	Open treatment and/or reduction of odontoid fracture(s) and or dislocation(s) (including os odontoideum), anterior approach, including placement of internal fixation; with grafting
22325	Open treatment and/or reduction of vertebral fracture(s) and/or dislocation(s), posterior approach, 1 fractured vertebra or dislocated segment; lumbar
22326	Open treatment and/or reduction of vertebral fracture(s) and/or dislocation(s), posterior approach, 1 fractured vertebra or dislocated segment; cervical
22532	Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); thoracic
22533	Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar
22534	Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); thoracic or lumbar, each additional vertebral segment (list separately in addition to code for primary procedure)

22558	Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar
22595	Arthrodesis, posterior technique, atlas-axis (c1-c2)
22600	Arthrodesis, posterior or posterolateral technique, single level; cervical below c2 segment
22610	Arthrodesis, posterior or posterolateral technique, single level; thoracic (with lateral transverse technique, when performed)
22630	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar
22632	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (list separately in addition to code for primary procedure)
22800	Arthrodesis, posterior, for spinal deformity, with or without cast; up to 6 vertebral segments
22802	Arthrodesis, posterior, for spinal deformity, with or without cast; 7 to 12 vertebral segments
22804	Arthrodesis, posterior, for spinal deformity, with or without cast; 13 or more vertebral segments
22808	Arthrodesis, anterior, for spinal deformity, with or without cast; 2 to 3 vertebral segments
22810	Arthrodesis, anterior, for spinal deformity, with or without cast; 4 to 7 vertebral segments
22812	Arthrodesis, anterior, for spinal deformity, with or without cast; 8 or more vertebral segments
22818	Kyphectomy, circumferential exposure of spine and resection of vertebral segment(s) (including body and posterior elements); single or 2 segments
22819	Kyphectomy, circumferential exposure of spine and resection of vertebral segment(s) (including body and posterior elements); 3 or more segments
22830	Exploration of spinal fusion
22841	Internal spinal fixation by wiring of spinous processes (list separately in addition to code for primary procedure)
22843	Posterior segmental instrumentation (for example, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 7 to 12 vertebral segments (list separately in addition to code for primary procedure)
22844	Posterior segmental instrumentation (for example, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 13 or more vertebral segments (list separately in addition to code for primary procedure)
22846	Anterior instrumentation; 4 to 7 vertebral segments (list separately in addition to code for primary procedure)
22847	Anterior instrumentation; 8 or more vertebral segments (list separately in addition to code for primary procedure)

22848	Pelvic fixation (attachment of caudal end of instrumentation to pelvic bony structures) other than sacrum (list separately in addition to code for primary procedure)
22849	Reinsertion of spinal fixation device
22850	Removal of posterior nonsegmental instrumentation (for example, harrington rod)
22852	Removal of posterior segmental instrumentation
22855	Removal of anterior instrumentation
22857	Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar
22864	Removal of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical
22865	Removal of total disc arthroplasty (artificial disc), anterior approach, single interspace; lumbar
23200	Radical resection of tumor; clavicle
23210	Radical resection of tumor; scapula
23220	Radical resection of tumor, proximal humerus
23335	Removal of prosthesis, includes debridement and synovectomy when performed; humeral and glenoid components (for example, total shoulder)
23472	Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (for example, total shoulder))
23474	Revision of total shoulder arthroplasty, including allograft when performed; humeral and glenoid component
24940	Cineplasty, upper extremity, complete procedure
25900	Amputation, forearm, through radius and ulna;
25905	Amputation, forearm, through radius and ulna; open, circular (guillotine)
25915	Krukenberg procedure
25920	Disarticulation through wrist;
25924	Disarticulation through wrist; re-amputation
25927	Transmetacarpal amputation;
26556	Transfer, free toe joint, with microvascular anastomosis
26992	Incision, bone cortex, pelvis and/or hip joint (for example, osteomyelitis or bone abscess)
27005	Tenotomy, hip flexor(s), open (separate procedure)
27025	Fasciotomy, hip or thigh, any type
27030	Arthrotomy, hip, with drainage (for example, infection)
27036	Capsulectomy or capsulotomy, hip, with or without excision of heterotopic bone, with release of hip flexor muscles (i.e., gluteus medius, gluteus minimus, tensor fascia latae, rectus femoris, sartorius, iliopsoas)
27054	Arthrotomy with synovectomy, hip joint
27122	Acetabuloplasty; resection, femoral head (e.g., girdlestone procedure)
27125	Hemiarthroplasty, hip, partial (for example, femoral stem prosthesis, bipolar arthroplasty)

27132	Conversion of previous hip surgery to total hip arthroplasty, with or without autograft or allograft
27134	Revision of total hip arthroplasty; both components, with or without autograft or allograft
27137	Revision of total hip arthroplasty; acetabular component only, with or without autograft or allograft
27138	Revision of total hip arthroplasty; femoral component only, with or without allograft
27187	Prophylactic treatment (nailing, pinning, plating or wiring) with or without methylmethacrylate, femoral neck and proximal femur
27248	Open treatment of greater trochanteric fracture, includes internal fixation, when performed
27457	Osteotomy, proximal tibia, including fibular excision or osteotomy (includes correction of genu varus [bowleg] or genu valgus [knock-knee]); after epiphyseal closure
27487	Revision of total knee arthroplasty, with or without allograft; femoral and entire tibial component
27495	Prophylactic treatment (nailing, pinning, plating, or wiring) with or without methylmethacrylate, femur
27702	Arthroplasty, ankle; with implant (total ankle)
27703	Arthroplasty, ankle; revision, total ankle
27712	Osteotomy; multiple, with realignment on intramedullary rod (for example, sofield type procedure)
27715	Osteoplasty, tibia and fibula, lengthening or shortening
27724	Repair of nonunion or malunion, tibia; with iliac or other autograft (includes obtaining graft)
27725	Repair of nonunion or malunion, tibia; by synostosis, with fibula, any method
27727	Repair of congenital pseudarthrosis, tibia
35372	Thromboendarterectomy, including patch graft, if performed; deep (profunda) femoral
35800	Exploration for postoperative hemorrhage, thrombosis or infection; neck
37182	Insertion of transvenous intrahepatic portosystemic shunt(s) (tips) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation)
37617	Ligation, major artery (e.g., post-traumatic, rupture); abdomen
38562	Limited lymphadenectomy for staging (separate procedure); pelvic and para-aortic
43840	Gastrorrhaphy, suture of perforated duodenal or gastric ulcer, wound, or injury
44300	Placement, enterostomy or cecostomy, tube open (e.g., for feeding or decompression) (separate procedure)
44314	Revision of ileostomy; complicated (reconstruction in-depth) (separate procedure)
44345	Revision of colostomy; complicated (reconstruction in-depth) (separate procedure)

44346	Revision of colostomy; with repair of paracolostomy hernia (separate procedure)
44602	Suture of small intestine (enterorrhaphy) for perforated ulcer, diverticulum, wound, injury or rupture; single perforation
49010	Exploration, retroperitoneal area with or without biopsy(s) (separate procedure)
49255	Omentectomy, epiploectomy, resection of omentum (separate procedure)
51840	Anterior vesicourethropexy, or urethropexy (e.g., marshall-marchetti-krantz, burch); simple
56630	Vulvectomy, radical, partial;
61624	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord)

BILLING CODE 4120–01–C

Response: We conducted an additional clinical review and reevaluation using the five longstanding criteria for removing services from the IPO list discussed earlier in section IX.A of this final rule with comment period for the services we proposed to return to the IPO list to determine whether any of the procedures should remain off of the list and be paid for under the OPPS when furnished in the HOPD setting. We considered all the evidence that commenters submitted to demonstrate that a procedure was performed on an outpatient basis in a safe and appropriate manner—including but not limited to—operative reports of actual cases, peer-reviewed medical literature, community medical standards and practice, physician comments, outcome data, and post-procedure care data, and our medical advisors thoroughly reviewed all information submitted to determine whether the procedures meet the evaluation criteria we are reinstating.

We also conducted an additional review of 2021 OPPS claims data through September 2021. Our review indicated that hospitals have significantly increased the numbers of services described by CPT codes 22630 (Lumbar spine fusion), 23472 (Reconstruct shoulder joint), and 27702 (Reconstruct ankle joint) furnished in the hospital outpatient setting in the roughly nine months since the services were removed from the IPO list. While at this time we cannot determine from the claims data whether this increase in volume is a result of fundamental changes to clinical practice; the impact of the PHE on inpatient operating room availability; or other reasons, the data do indicate that these services are being furnished frequently in the hospital outpatient setting, and furnished at a substantial number of different outpatient departments. Given the studies submitted and the updated analyses of OPPS claims data, we believe that CPT codes 22630 (Lumbar spine fusion), 23472 (Reconstruct shoulder joint), and 27702 (Reconstruct ankle joint) meet several of the longstanding criteria for removing services from the IPO list: Most outpatient departments are equipped to provide the services to the Medicare population; the simplest procedure described by the codes may be furnished in most outpatient departments; the procedures are being furnished in numerous hospitals on an outpatient basis; and the procedures are related to codes that we have already removed from the IPO list. Therefore, at this time we agree that it is appropriate for CPT codes 22630 (Lumbar spine fusion), 23472 (Reconstruct shoulder joint), and 27702 (Reconstruct ankle joint) and their corresponding anesthesia codes, CPT code 01638 (Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement), and CPT 01486 (Anesthesia for open procedures on bones of lower leg, ankle, and foot; total ankle replacement) to remain off the IPO list and payable under the OPPS when furnished in the HOPD setting. We will continue to monitor and evaluate the impact our decision to pay for these services when furnished in the HOPD setting has on beneficiary outcomes, access to care, and hospital payments.

As noted above, we also received comments requesting that approximately 115 other services remain off the IPO list in CY 2022. Based on our evaluation, we do not believe that there is sufficient evidence or data to support that these services can be safely furnished to the typical Medicare beneficiary in the hospital outpatient setting, and to support stakeholder assertions that these procedures meet one of the five longstanding criteria. We note that for many services stakeholders continued to provide conflicting feedback regarding the ability of providers to safely furnish them in the hospital outpatient setting. At this time, we do not believe it would be appropriate to keep these services off of the IPO list and therefore we are reclassifying these codes as inpatient only procedures for CY 2022. We acknowledge the unique circumstances for this CY2022 rulemaking cycle: These approximately 115 services were on the IPO list prior to CY 2021, they were removed from the IPO list for CY 2021 as part of the first phase of the elimination of the IPO list, and are now being added back to the list in CY 2022. It is not our intention to cause any disruptions or barriers to access care for these services, and we will prioritize the review of these services for potential removal from the IPO list in future rulemaking. We emphasize that the assignment of a service to the IPO list does not prohibit the service from being offered in the hospital outpatient setting and the assignment in this final rule should not be considered as a permanent or irrevocable designation (65 FR 18456). Furthermore, we continue to encourage stakeholders to provide supportive evidence to aid in the evaluations of procedures' assignment to the IPO list, and where appropriate the APC assignment and corresponding payment for any codes as well, including but not limited to case reports, operative reports of actual cases, peer-reviewed medical literature, medical professional analysis, clinical criteria sets, and patient selection protocols for future rulemaking considerations.

4. Topics and Questions Posed for Public Comments

In addition to our proposal to halt the elimination of the IPO list and return services summarily removed from the IPO list in CY 2021 that our clinicians have determined do not meet the criteria for removal from the IPO list, we also sought feedback from stakeholders on whether CMS should maintain the longer-term objective of eliminating the IPO list or if CMS should maintain the IPO list but continue to systematically scale the list back to so that inpatient only designations are consistent with current standards of practice. Specifically, we requested comments on the following:

- Should CMS maintain the longer-term objective of eliminating the IPO list? If so, what is a reasonable timeline for eliminating the list? What method do stakeholders suggest CMS use to approach removing codes from the list?
- Should CMS maintain the IPO list but continue to streamline the list of services included on the list and, if so, suggestions for ways to systematically scale the list back to allow for the removal of codes, or groups of codes, that can safely and effectively be performed on a typical Medicare beneficiary in the hospital outpatient setting so that inpatient only designations are consistent with current standards of practice?
- What effect do commenters believe the elimination or scaling back of the IPO list would have on safety and quality of care for Medicare beneficiaries?
- What effect do commenters believe elimination or the scaling back of the IPO list would have on provider behavior, incentives, or innovation?
- What information or support would be helpful for providers and physicians in their considerations of site of service selections?
- Should CMS' clinical evaluation of the safety of a service in the hospital outpatient setting consider the safety and quality of care for the typical Medicare beneficiary or a smaller subset of Medicare beneficiaries for whom the outpatient provision of a service may have fewer risk factors?
- Are there services that were removed from the IPO list in CY 2021 that stakeholders believe meet the longstanding criteria for removal from the IPO list and should continue to be payable in the hospital outpatient setting in CY 2022? If so, what evidence supports the conclusion that the service meets the longstanding criteria for removal from the IPO list and is safe to perform on the Medicare population in the hospital outpatient setting?

Comment: Numerous commenters responded to CMS' comment solicitation on whether CMS should continue the longer-term objective of eliminating the IPO list or if CMS should maintain the IPO list but continue to systematically scale the list back to ensure that inpatient only designations are consistent with current standards of practice. The overwhelming majority of the commenters, including professional associations, hospital associations, hospitals, and many providers, supported maintaining the IPO list.

We received many of the same types of comments we received in response to our CY 2018 OPPS/ASC proposed rule comment solicitation for removing THA and in subsequent rulemaking. Supporters of maintaining the IPO list also acknowledged the possibility that in the future many—but not all—of the services on the IPO could potentially be safely performed on an outpatient basis. Commenters provided feedback on improvements to the IPO list maintenance process, as well as the criteria, evidence and data that should be required to support removing a procedure from the IPO list. Commenters also suggested alternatives to the IPO list, including different coding mechanisms and alternative approaches to APC assignment for services transitioning off of the IPO list, including changes to the ''CA'' modifier, which identifies a procedure payable only in the inpatient setting when performed emergently on an outpatient who expires prior to admission. Commenters also recommended ways for CMS to monitor patient outcomes and the impact of services migrating from the IPO list to ensure that there are not unintended consequences of removing procedures from the IPO list. Several commenters shared concerns regarding the unintended impact that large-scale changes to the IPO list may have on hospital finances, particularly rural hospitals, safety net hospitals, and SNFs.

Response: We thank the commenters for their detailed feedback on this topic. We will consider all of these comments for future rulemaking.

Comment: Several commenters recommended that CPT codes 19306 (Mastectomy, radical, including pectoral muscles, axillary and internal mammary lymph nodes); 32853 (Lung transplant, double (bilateral sequential or en bloc); without cardiopulmonary bypass); 33523 ((Coronary artery bypass, using venous graft(s) and arterial graft(s), six or more); and 33935 (Heart-lung transplant with recipient cardiectomy-pneumonectomy), never come off of the IPO list due to their clinical intensity and nature of the services.

Response: We thank commenters for their recommendations.

Comment: Additionally, CMS received comments recommending the removal of two services not originally proposed for removal from the IPO list for CY 2022. The commenters contended that CPT codes 43775 (Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (*i.e.,* sleeve gastrectomy)) and 47550 (Biliary endoscopy, intraoperative (choledochoscopy) (list separately in addition to code for primary procedure)) should be removed from the IPO list because the commenters believed they meet the removal criteria that we are reinstating beginning CY 2022.

Response: We thank commenters for their feedback regarding these services. We note CPT codes 43775 and 47550 were not included in the 298 codes that were removed from the IPO list for CY 2021 and then proposed to be added back to the IPO list in the CY 2022 OPPS/ASC proposed rule. Rather, these codes were added to the IPO list prior to 2021. As discussed above, we received many comments from stakeholders regarding the speed at which the 298 services were removed from the IPO list for CY 2021, and the need for CMS to reinstate a more measured process that includes additional opportunities for public input and transparency when evaluating codes for removal. In light of these comments, we believe it is appropriate to consider the removal of these services from the IPO list in future rulemaking in order to allow further discussion and evaluation. We also continue to encourage stakeholders to provide supportive evidence to aid in the evaluations of these procedures' assignment to the IPO list, including but not limited to case reports, operative reports of actual cases, peer-reviewed medical literature, medical professional analysis, clinical criteria sets, and patient selection protocols for future rulemaking considerations.

Comment: One commenter, a medical device company, requested a reassignment of the OPPS status indicator for CPT code 0643T (Transcatheter left ventricular restoration device implantation including right and left heart catheterization and left ventriculography when performed, arterial approach) from ''E1'' (not covered by Medicare) to ''C'' (inpatient only) status due to the complex patient population, the need for intra- and post-

operative monitoring and their experience with clinical trials.

Response: We thank the commenter for bringing this CPT code to our attention. CPT code 0643T became effective on July 1, 2021 and for CY 2022, we proposed to assign the code to OPPS status indicator ''E1'' (Items, codes, and services not covered by any Medicare outpatient benefit category; statutorily excluded; not reasonable and necessary) to indicate that the service was not covered by Medicare. We note that the clinical study associated with CPT code 0643T was approved as a Medicare-approved IDE study [190] with a Category B designation [191] for the device effective November 12, 2020. We agree with commenters that given the invasive nature of the procedures, the clinical intensity of the services provided, and the underlying physical condition of the patient who would require surgery, CPT code 0643T should be classified as an inpatient only procedure.

We refer readers to sections III.D. ''OPPS APC-Specific Policies'' of this final rule with comment period for additional discussion regarding CY 2022 status indicators and APC assignments.

Comment: Other commenters requested we keep services off the IPO list that were not included in the proposed CY 2022 IPO list.

Response: We thank commenters for their recommendations. We do agree that it is appropriate for these services to remain payable in the OPPS for CY2022. We reiterate that assignment in this final rule should not be considered as a permanent or irrevocable designation (65 FR 18456). Table 47 lists the CPT codes that were not included in the proposed CY 2022 IPO list and were affirmed by commenters.

BILLING CODE 4120–01–P

TABLE 47: OTHER SERVICES RECOMMENDED BY COMMENTERS FOR OPPS PAYMENT

CY 2022 CPT Code	CY 2022 Long Descriptor
19307	Mastectomy, modified radical, including axillary lymph nodes, with or without pectoralis minor muscle, but excluding pectoralis major muscle
21346	Open treatment of nasomaxillary complex fracture (lefort ii type); with wiring and/or local fixation
21385	Open treatment of orbital floor blowout fracture; transantral approach (caldwell-luc type operation)
21386	Open treatment of orbital floor blowout fracture; periorbital approach
21387	Open treatment of orbital floor blowout fracture; combined approach
21395	Open treatment of orbital floor blowout fracture; periorbital approach with bone graft (includes obtaining graft)
21408	Open treatment of fracture of orbit, except blowout; with bone grafting (includes obtaining graft)
22612	Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)
27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft
27447	Arthroplasty, knee, condyle and plateau; medial and lateral compartments with or without patella resurfacing (total knee arthroplasty)
31292	Nasal/sinus endoscopy, surgical, with orbital decompression; medial or inferior wall
31293	Nasal/sinus endoscopy, surgical, with orbital decompression; medial and inferior wall
31294	Nasal/sinus endoscopy, surgical, with optic nerve decompression

CY 2022 CPT Code	CY 2022 Long Descriptor
43770	Laparoscopy, surgical, gastric restrictive procedure; placement of adjustable gastric restrictive device (eg, gastric band and subcutaneous port components)
43772	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device component only
43773	Laparoscopy, surgical, gastric restrictive procedure; removal and replacement of adjustable gastric restrictive device component only
43774	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device and subcutaneous port components
63035	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (list separately in addition to code for primary procedure)
63048	Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (list separately in addition to code for primary procedure)
63075	Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, single interspace
63076	Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, each additional interspace (list separately in addition to code for primary procedure)

C. Summary of Final Policy and Changes to the IPO List for CY 2022

As explained above, for CY 2022, we are finalizing our proposal to halt the elimination of the IPO list; to codify in regulation text in a new § 419.22 our five longstanding criteria for determining whether a service or procedure should be removed from the IPO list; and to pause the elimination of the IPO list and add back to the IPO list the services removed in CY 2021, except CPT code 22630 (Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar); CPT code 23472 (Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (for example, total shoulder))); CPT code 27702 (Arthroplasty, ankle; with implant (total ankle) and their corresponding anesthesia codes: CPT code 01638 (Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement), and CPT 01486 (Anesthesia for open procedures on bones of lower leg, ankle, and foot; total ankle replacement). We are also classifying CPT code 0643T (Transcatheter left ventricular restoration device implantation including right and left heart catheterization and left ventriculography when performed, arterial approach) as an inpatient only procedure. Finally, we are also finalizing our proposal to amend the regulation at § 419.22(n) to remove the reference to the elimination of the list of services and procedures designated as requiring inpatient care through a 3-year transition and to codify our five longstanding criteria for determining whether a service or procedure should be removed from the IPO list in the regulation in a new § 419.23.

The complete list of codes describing services that are designated as inpatient only services beginning in CY 2022 is also included as Addendum E to this final rule with comment period, which is available via the internet on the CMS website.

TABLE 48: CHANGES TO THE INPATIENT ONLY (IPO) LIST FOR CY 2022

CY 2022 CPT Code	CY 2022 Long Descriptor	Final Action	CY 2022 OPPS APC	CY 2022 OPPS Status Indicator
00192	Anesthesia for procedures on facial bones or skull; radical surgery (including prognathism)	Add to the IPO list	N/A	C
00474	Anesthesia for partial rib resection; radical procedures (eg, pectus excavatum)	Add to the IPO list	N/A	C
00604	Anesthesia for procedures on cervical spine and cord; procedures with patient in the sitting position	Add to the IPO list	N/A	C
00904	Anesthesia for; radical perineal procedure	Add to the IPO list	N/A	C
0095T	Removal of total disc arthroplasty (artificial disc), anterior approach, each additional interspace, cervical (list separately in addition to code for primary procedure)	Add to the IPO list	N/A	C
0098T	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, each additional interspace, cervical (list separately in addition to code for primary procedure)	Add to the IPO list	N/A	C

CY 2022 CPT Code	CY 2022 Long Descriptor	Final Action	CY 2022 OPPS APC	CY 2022 OPPS Status Indicator
01140	Anesthesia for interpelviabdominal (hindquarter) amputation	Add to the IPO list	N/A	C

X. Nonrecurring Policy Changes

A. Medical Review of Certain Inpatient Hospital Admissions Under Medicare Part A for CY 2022 and Subsequent Years

1. Background on the 2-Midnight Rule

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50913 through 50954), we clarified our policy regarding when an inpatient admission is considered reasonable and necessary for purposes of Medicare Part A payment. Under this policy, we established a benchmark providing that surgical procedures, diagnostic tests, and other treatments would be generally considered appropriate for inpatient hospital admission and payment under Medicare Part A when the physician expects the patient to require a stay that crosses at least 2 midnights and admits the patient to the hospital based upon that expectation. Conversely, when a beneficiary enters a hospital for a surgical procedure not designated as an inpatient-only (IPO) procedure as described in 42 CFR 419.22(n), a diagnostic test, or any other treatment, and the physician expects to keep the beneficiary in the hospital for only a limited period of time that does not cross 2 midnights, the services would be generally inappropriate for payment under Medicare Part A, regardless of the hour that the beneficiary came to the hospital or whether the beneficiary used a bed. With respect to services designated under the OPPS as IPO list procedures, we explained that because of the intrinsic risks, recovery impacts, or complexities associated with such services, these procedures would continue to be appropriate for inpatient hospital admission and payment under Medicare Part A regardless of the expected length of stay. We also indicated that there might be further ''rare and unusual'' exceptions to the application of the benchmark, which would be detailed in subregulatory guidance.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50913 through 50954), we also finalized the 2-Midnight presumption, which is related to the 2-Midnight benchmark but is a separate medical review policy. The 2-Midnight benchmark represents guidance to reviewers to identify when an inpatient admission is generally reasonable and necessary for purposes of Medicare Part A payment, while the 2-Midnight presumption relates to instructions to medical reviewers regarding the selection of claims for medical review. Specifically, under the 2-Midnight presumption, inpatient hospital claims with lengths of stay greater than 2 midnights after the formal admission following the order are presumed to be appropriate for Medicare Part A payment and are not the focus of medical review efforts, absent evidence of systematic gaming, abuse, or delays in the provision of care in an attempt to qualify for the 2-Midnight presumption.

In the CY 2016 OPPS/ASC final rule with comment period (80 FR 70538 through 70549), we revisited the previous rare and unusual exceptions policy and finalized a proposal to allow for case-by-case exceptions to the 2-Midnight benchmark, whereby Medicare Part A payment may be made for inpatient admissions where the admitting physician does not expect the patient to require hospital care spanning 2 midnights, if the documentation in the medical record supports the physician's determination that the patient nonetheless requires inpatient hospital care.

In the CY 2016 OPPS/ASC final rule with comment period, we reiterated our position that the 2-Midnight benchmark provides clear guidance on when a hospital inpatient admission is appropriate for Medicare Part A payment, while respecting the role of physician judgment. We stated that the following criteria will be relevant to determining whether an inpatient admission with an expected length of stay of less than 2 midnights is nonetheless appropriate for Medicare Part A payment:

- Complex medical factors such as history and comorbidities;

- The severity of signs and symptoms;
- Current medical needs; and
- The risk of an adverse event.

The exceptions for procedures on the IPO list and for ''rare and unusual'' circumstances designated by CMS as national exceptions were unchanged by the CY 2016 OPPS/ASC final rule with comment period.

As we stated in the CY 2016 OPPS/ASC final rule with comment period, the decision to formally admit a patient to the hospital is subject to medical review. Specifically, for inpatient admissions not related to a surgical procedure specified by Medicare as an IPO procedure under 42 CFR 419.22(n) and for which there is not a national exception, payment of the claim under Medicare Part A is subject to the clinical judgment of the medical reviewer to determine whether the medical record supports a reasonable expectation of the need for hospital care crossing at least 2 midnights or otherwise supports a need for inpatient care. The medical reviewer's clinical judgment involves the synthesis of all submitted medical record information (for example, progress notes, diagnostic findings, medications, nursing notes, and other supporting documentation) to make a medical review determination on whether the clinical requirements in the relevant policy have been met. In addition, Medicare review contractors must abide by CMS' policies in conducting payment determinations, but are permitted to take into account evidence-based guidelines or commercial utilization tools that may aid such a decision. While Medicare review contractors may continue to use commercial screening tools to help evaluate the inpatient admission decision for purposes of payment under Medicare Part A, such tools are not binding on the hospital, CMS, or its review contractors. This type of information also may be appropriately considered by the physician as part of the complex medical judgment that guides their decision to keep a beneficiary in the hospital and formulation of the expected length of stay.

2. Current Policy for Medical Review of Inpatient Hospital Admissions for Procedures Removed From the Inpatient Only List

In the CY 2020 OPPS/ASC final rule with comment period we finalized a policy to exempt procedures that have been removed from the IPO list from certain medical review activities to assess compliance with the 2-Midnight rule within the 2 calendar years following their removal from the IPO list. We stated that these procedures will not be considered by the Beneficiary and Family-Centered Care Quality Improvement Organizations (BFCC–QIOs) in determining whether a provider exhibits persistent noncompliance with the 2-Midnight rule for purposes of referral to the RAC nor will these procedures be reviewed by RACs for ''patient status.'' We explained that during this 2-year period, BFCC–QIOs will have the opportunity to review such claims in order to provide education for practitioners and providers regarding compliance with the 2-Midnight rule, but claims identified as noncompliant will not be denied with respect to the site-of-service under Medicare Part A.

For CY 2021 we proposed to continue the 2-year exemption from site-of-service claim denials, BFCC–QIO referrals to RACs, and RAC reviews for ''patient status'' (that is, site-of-service) for procedures that are removed from the IPO list under the OPPS beginning on January 1, 2021. However, we finalized our proposal with modifications in the CY 2021 OPPS/ASC final rule with comment period. Instead of the 2-year exemption, procedures removed from the IPO list after January 1, 2021 were indefinitely exempted from site-of-service claim denials under Medicare Part A, eligibility for BFCC–QIO referrals to RACs for noncompliance with the 2-Midnight rule, and RAC reviews for ''patient status'' (that is, site-of-service). We stated that this exemption would last until we have Medicare claims data indicating that the procedure is more commonly performed in the outpatient setting than the inpatient setting. Thus, for the exemption to end for a specific procedure, in a single calendar year we would need to have Medicare claims data indicating that the procedure was performed more than 50 percent of the time in the outpatient setting. We stated that we would revisit in rulemaking whether an exemption for a procedure should be ended or whether we may consider additional metrics in the future that could assist us in determining when the exemption period should end for a procedure. Even during this exemption period, the BFCC–QIOs retain the authority to review such claims in order to provide education for practitioners and providers regarding compliance with the 2-Midnight rule, but claims identified as noncompliant will not be denied with respect to the site-of-service under Medicare Part A. Additionally, we stated that we may still conduct medical review in cases in which we believe there is potential fraud or abuse occurring. We explained that the elimination of the IPO list was a large scale change that created brand new considerations for providers regarding site-of-service determinations. At the time, we believed a change of this significance required us to reevaluate our stance on the exemption period for procedures removed from the IPO list, resulting in our decision to finalize an indefinite exemption period rather than continuing the previous 2 year exemption period.

Finally, in the CY 2021 OPPS/ASC final rule with comment period we amended 42 CFR 412.3 to clarify when a procedure removed from the IPO is exempt from certain medical review activities. We stated that for those services and procedures removed between January 1 and December 31, 2020, this exemption will last for 2 years from the date of such removal. For those services and procedures removed on or after January 1, 2021, this exemption will last until the Secretary determines that the service or procedure is more commonly performed in the outpatient setting.

3. Medical Review of Inpatient Hospital Admissions for Procedures Removed From the Inpatient Only List for CY 2022 and Subsequent Years

As stated earlier in this section, services on the IPO list are not subject to the 2-Midnight rule for purposes of determining whether payment is appropriate under Medicare Part A. However, the 2-Midnight rule is applicable once services have been removed from the IPO list. Outside of the exemption periods discussed above, services that have been removed from the IPO list are subject to initial medical reviews of claims for short-stay inpatient admissions conducted by BFCC–QIOs, and are subject to denial for non-compliance with the 2-midnight rule.

BFCC–QIOs may also refer providers to the RACs for further medical review due to exhibiting persistent noncompliance with Medicare payment policies, including, but not limited to:

- Having high denial rates;
- Consistently failing to adhere to the 2-Midnight rule; or
- Failing to improve their performance after QIO educational intervention.

As stated in section IX. of the CY 2022 OPPS/ASC proposed rule (86 FR 42155 through 42176), CMS proposed to halt the elimination of the IPO list. In accordance with this proposal, we proposed to amend 42 CFR 419.22(n) to remove the reference to the elimination

of the list of services and procedures designated as requiring inpatient care through a 3-year transition. We also proposed to return 298 procedures removed from the IPO list in CY 2021 to the IPO list for CY 2022.

Regardless of the status of the IPO list, we believe that the 2-Midnight benchmark remains an important metric to help guide when Part A payment for inpatient hospital admissions is appropriate. As technology advances and more services may be safely performed in the hospital outpatient setting and paid under the OPPS, it is increasingly important for physicians to exercise their clinical judgment in determining the generally appropriate clinical setting for their patient to receive a procedure, whether that be as an inpatient or on an outpatient basis. Importantly, removal of a service from the IPO list has never meant that a beneficiary cannot receive the service as a hospital inpatient—as always, the physician should use his or her complex medical judgment to determine the appropriate setting on a case by case basis.

As stated previously, our current policy regarding IPO list procedures is that they are appropriate for inpatient hospital admission and payment under Medicare Part A regardless of the expected length of stay. Halting the elimination of the IPO list would mean that this will remain true for all services that are still on the list. As in previous years, any services that are removed from the list in the future will be subject to the 2-Midnight benchmark and 2-Midnight presumption. This means that for services removed from the IPO list, under the 2-Midnight presumption, inpatient hospital claims with lengths of stay greater than 2 midnights after admission will be presumed to be appropriate for Medicare Part A payment and will not be the focus of medical review efforts, absent evidence of systematic gaming, abuse, or delays in the provision of care in an attempt to qualify for the 2-Midnight presumption. Additionally, under the 2-Midnight benchmark, services formerly on the IPO list will be generally considered appropriate for inpatient hospital admission and payment under Medicare Part A when the medical record supports either the admitting physician's reasonable expectation that the patient will require a stay that crosses at least 2 midnights, or the physician's determination that the patient required inpatient hospital care despite an expectation of a shorter length of stay.

Because we proposed to halt the elimination of the IPO list and add 298 services that were removed back to the IPO list, we believed this proposed change required us to reexamine the applicable exemption period. We noted in the CY 2021 OPPS/ASC final rule with comment period that we may shorten the exemption period for a procedure if necessary. We heard from many commenters last year that the 2-year exemption was appropriate when CMS was removing a smaller volume of procedures from the IPO list. However, commenters believed that the unprecedented volume of procedures becoming subject to the 2-Midnight rule with the phased elimination of the IPO list would necessitate a longer exemption period. While these commenters expressed their support for continuing the 2-year exemption, they further stated that a longer exemption period may be more appropriate. Some commenters suggested that anywhere between 3 to 6 years or indefinitely would be appropriate. Commenters expressed their belief that increasing the length of the exemption would be necessary to allow hospitals and practitioners sufficient time to adjust their billing and clinical systems, as well as processes used to determine the appropriate setting of care. For a full description of the comments received please refer to the CY 2021 OPPS/ASC final rule with comment period (85 FR 86115).

We noted in the CY 2022 OPPS/ASC proposed rule that we believed that the indefinite exemption was appropriate when the agency was eliminating the IPO list and removing an unprecedented volume of procedures from the list in a short period of time. That would have resulted in a large number of procedures becoming subject to the 2-Midnight rule in a 3-year span. However, we explained in the CY 2022 OPPS/ASC proposed rule that should we finalize our CY 2022 proposal to halt the elimination of the IPO list, there would no longer be an unprecedented volume of procedures removed from the IPO list at once, and thus the indefinite exemption may no longer be appropriate. As we explained in the CY 2021 OPPS/ASC final rule with comment period, the indefinite exemption was necessary given the magnitude of the change for providers. We explained in the CY 2022 OPPS/ASC proposed rule that because we were now proposing to move toward a much smaller volume of procedures becoming subject to the 2-Midnight rule at one time, we believed that in the event we finalized the proposed halt in the elimination of the IPO list, an indefinite exemption from medical review activities related to the 2-Midnight rule would no longer be warranted.

We also explained in the CY 2022 OPPS/ASC proposed rule that we continued to believe that, in order to facilitate compliance with our payment policy for inpatient admissions, some exemption from certain medical review activities for services removed from the IPO list under the OPPS is appropriate. Accordingly, we proposed to rescind the indefinite exemption and instead apply a 2-year exemption from two midnight medical review activities for services removed from the IPO list on or after January 1, 2021. As finalized in the CY 2020 OPPS/ASC final rule with comment period, and unchanged by the CY 2021 rulemaking, services removed from the IPO list between January 1 and December 30, 2020, are currently subject to a 2-year exemption. Accordingly, we stated that under our proposal, the same 2-year exemption would apply to all service removed from the IPO list on or after January 1, 2020. As we explained in the CY 2020 OPPS/ASC final rule with comment period, we believe that a 2-year exemption from certain medical review activities for procedures removed from the IPO list would allow sufficient time for providers to become more familiar with how to comply with the 2-Midnight rule and for hospitals and clinicians to become used to the availability of payment under both the hospital inpatient and outpatient setting for procedures removed from the IPO list. As we indicated in the CY 2022 OPPS/ASC proposed rule, if we finalized our proposal to halt the elimination of the IPO list, we believed that this rationale would apply equally to the smaller number of services that may be removed from the list at any one time in the future, and thus that the same 2-year exemption period is appropriate.

We also noted in the CY 2022 OPPS/ASC proposed rule that, as with the previous 2-year exemption period for services removed from the IPO list between January 1 and December 30, 2020, applying a 2-year exemption period to services removed from the IPO list on or after January 1, 2021, would allow providers time to gather information on procedures newly removed from the IPO list to help inform education and guidance for the broader provider community, develop patient selection criteria to identify which patients are, and are not, appropriate candidates for outpatient procedures, and to develop related policy protocols. We also said that we believed that this exemption period would aid in compliance with our

payment policy for inpatient admissions.

It is important to note that whether there is a limited timeframe or an indefinite exemption from the specified medical review activities, providers are still expected to comply with the 2-Midnight rule. It is also important to note that the 2-Midnight rule does not prohibit procedures from being performed or billed on an inpatient basis. Whether a procedure has an exemption or not does not change what site of service is medically necessary or appropriate for an individual beneficiary. Providers are still expected to use their complex medical judgment to determine the appropriate site of service for each patient and to bill in compliance with the 2-Midnight rule. The exemption is not from the 2-Midnight rule but from certain medical review procedures and site-of-service claim denials.

Absent the removal of an unprecedented number of services at once from the IPO list, we explained in the proposed rule that we continue to believe that a 2-year exemption from BFCC–QIO referral to RACs and RAC ''patient status'' review of the setting for procedures removed from the IPO list under the OPPS and performed in the inpatient setting would be an adequate amount of time to allow providers to gain experience with application of the 2-Midnight rule to these procedures and the documentation necessary for Part A payment for those patients for which the admitting physician determines that the procedures should be furnished in an inpatient setting. Furthermore, we explained that it was our belief that the 2-year exemption from referrals to RACs, RAC patient status review, and claims denials would be sufficient to allow providers time to update their billing systems and gain experience with respect to newly removed procedures eligible to be paid under either the IPPS or the OPPS, while avoiding potential adverse site-of-service determinations. We solicited public comments regarding the appropriate period of time for this exemption. Commenters indicated whether and why they believed the 2-year period is appropriate, or whether they believed a longer or shorter exemption period would be more appropriate.

In summary, for CY 2021 and subsequent years, we proposed to return to the 2-year exemption from site-of-service claim denials, BFCC–QIO referrals to RACs, and RAC reviews for ''patient status'' (that is, site-of-service) for procedures that are removed from the IPO list under the OPPS on January 1, 2021 or later. Under this proposal, services removed beginning on January 1, 2021 would receive the same 2-year exemption from 2-Midnight medical review activities as currently applies to services removed between January 1 and December 30, 2020, and not the indefinite exemption finalized in the CY 2021 OPPS/ASC final rule with comment period. We encouraged BFCC–QIOs to review these cases for medical necessity in order to educate themselves and the provider community on appropriate documentation for Part A payment when the admitting physician determines that it is medically reasonable and necessary to conduct these procedures on an inpatient basis. We noted that we will monitor changes in site-of-service to determine whether changes may be necessary to certain CMS Innovation Center models. While we proposed to halt the elimination of the IPO list, we sought comment on whether a 2-year time period is appropriate, or if a longer or shorter period may be more warranted. We also explained in the CY 2022 OPPS/ASC proposed rule, that if we did not finalize our proposal to halt the elimination of the IPO list we might continue with the indefinite exemptions. Finally, we proposed to amend 42 CFR 412.3 to clarify when a procedure removed from the IPO list is exempt from certain medical review activities. We proposed that for all services and procedures removed after January 1, 2020, this exemption would last for 2 years from the date of such removal. This would include those services and procedures removed on or after January 1, 2021, for which this exemption would also be for 2 years from the date of such removal.

Comment: Many commenters, including organizations representing health insurance plans, physician associations, and specialty medical associations supported an indefinite exemption from site-of-service claim denials under Medicare Part A, eligibility for BFCC–QIO referrals to RACs for noncompliance with the 2-Midnight rule, and RAC reviews for site-of-service for procedures that are removed from the IPO list under the OPPS beginning on January 1, 2021. Some of these commenters recommended exemption from site of service reviews until the procedure is performed in the outpatient setting more than 50 percent of the time, or until clinical evidence supports the safety of procedures performed in an outpatient setting. Additional commenters believed CMS should defer to the physician's judgment on the appropriate site of care and exempt providers from site-of-service claims denials beyond the proposed 2-year exemption period. Commenters stated 2 years does not provide enough time for adequate evidence and research to be conducted to demonstrate that procedures removed from the IPO list can be performed safely for Medicare beneficiaries in hospital outpatient settings. According to the commenters, a longer or indefinite exemption period would extend additional protection to beneficiaries and hospitals providing care in outpatient settings.

Other commenters recommended extending site of service review to 3 or 4 years to allow for quality and safety analysis.

Response: We thank the commenters for their recommendations. As we explained in the CY 2021 OPPS/ASC final rule with comment period, we believed that the prior 2-year exemption might not be sufficient given the magnitude of the change for providers due to the elimination of the IPO list. We agreed at the time that due to the unprecedented number of services removed from the IPO list as part of the phased elimination of that list, additional time (beyond 2 years) would be more appropriate for hospitals and practitioners to adjust their billing and clinical systems, as well as develop their own internal processes to determine the appropriate setting of care for their patients, and review for quality and safety. We acknowledged that providers may not be experienced with assessing procedures on the IPO list against the 2-Midnight benchmark and that a longer exemption would allow them ample time to update their processes to make appropriate decisions about whether to admit patients for the large numbers of procedures being removed from the IPO list at the time (85 FR 86116). We also heard from commenters that the 2-year exemption was appropriate when CMS was removing a smaller volume of procedures from the IPO list. We agreed then and still believe now that the 2-year exemption was appropriate when CMS was removing a smaller, more targeted population of procedures from the IPO list. Accordingly, because we are finalizing our proposal to halt the elimination of the IPO list and return most of the removed services back to the list, we are finalizing our proposal without modification to resume the 2-year exemption period for procedures removed from the IPO list for services removed from the IPO list on January 1, 2020 or later.

Comment: Some commenters supported a two-year exemption from 2-midnight medical reviews. They

believed a 2-year exemption will provide sufficient time for physicians to become more familiar with appropriate coding, billing, and documentation requirements for procedures removed from the IPO list. Commenters also noted that the 2-year exemption time period would help facilitate the transition of services off the IPO list and allow for the development of patient selection criteria to identify which patients are appropriate candidates for outpatient procedures. One commenter in support of the 2-year exemption time period also stressed the importance of CMS and BFCC–QIOs providing education to providers when services are removed from the IPO list.

Response: We thank the commenters for their support. The BFCC–QIOs will continue to review claims even while procedures are exempt from denial based on site-of-service in order to provide education for practitioners and providers regarding compliance with the 2-Midnight rule (85 FR 86119). Additionally, in the future, we may provide additional educational material regarding considerations for the selection of site-of-service for a procedure to support physicians' decision-making. We note that this additional information will be for informational or educational purposes only and will not be intended to prohibit payment of procedures that were previously included on the IPO list in the outpatient setting.

We appreciate the stakeholders' feedback regarding the appropriate period of time for exemptions from site-of-service claim denials under Medicare Part A, eligibility for BFCC–QIO referrals to RACs for noncompliance with the 2-Midnight rule, and RAC reviews for site-of-service for services removed from the IPO list on January 1, 2021, and later. Given our decision to halt the elimination of the IPO list, and the fact that we are accordingly no longer removing an unprecedented number of procedures from the list at one time, we believe that a 2-year exemption time period is adequate to let providers gain experience with the application of the 2-Midnight rule to those procedures that have been newly removed from the IPO list. We also believe that a 2-year exemption from the medical review activities discussed above for procedures removed from the IPO list will be sufficient time for providers and BFCC–QIOs to understand the documentation necessary to support Part A payment for those patients for which the admitting physician determines that the procedures should be furnished in an inpatient setting. Therefore, we are finalizing our proposed policy without modifications. We are also finalizing our proposal to amend § 412.3 of our regulations to clarify when a procedure removed from the IPO list is exempt from certain medical review activities.

B. Changes to Beneficiary Coinsurance for Additional Procedures Furnished During the Same Clinical Encounter as Certain Colorectal Cancer Screening Tests

Section 122 of Division CC of the Consolidated Appropriations Act (CAA) of 2021 (Pub. L. 116–260), Waiving Medicare Coinsurance for Certain Colorectal Cancer Screening Tests, amends section 1833(a) of the Act to offer a special coinsurance rule for screening flexible sigmoidoscopies and screening colonoscopies, regardless of the code that is billed for the establishment of a diagnosis as a result of the test, or for the removal of tissue or other matter or other procedure, that is furnished in connection with, as a result of, and in the same clinical encounter as the colorectal cancer screening test. The reduced coinsurance will be phased in beginning January 1, 2022. Currently, the addition of any procedure beyond a planned colorectal cancer screening test (for which there is no coinsurance), results in the beneficiary having to pay coinsurance.

Section 1861(pp) of the Act defines ''colorectal cancer screening tests'' and, under sections 1861(pp)(1)(B) and (C) of the Act, identifies ''screening flexible sigmoidoscopy'' and ''screening colonoscopy'' as two of the recognized procedures. During the course of either one of these two procedures, removal of tissue or other matter may become necessary for diagnostic purposes. Among other things, section 1861(pp)(1)(D) of the Act authorizes the Secretary to include in the definition, other tests or procedures and modifications to the tests and procedures described under this subsection, with such frequency and payment limits as the Secretary determines appropriate, in consultation with appropriate organizations. Section 1861(s)(2)(R) of the Act includes colorectal cancer screening tests in the definition of the medical and other health services that fall within the scope of Medicare Part B benefits described in section 1832(a)(1) of the Act. Section 1861(ddd)(3) of the Act includes colorectal cancer screening tests within the definition of ''preventive services.'' In addition, section 1833(a)(1)(Y) of the Act provides for payment for a preventive service under the PFS at 100 percent of the lesser of the actual charge or the fee schedule amount for these colorectal cancer screening tests, and under the OPPS at 100 percent of the OPPS payment amount, when the preventive service is recommended by the United States Preventive Services Task Force (USPSTF) with a grade of A or B. As such, there is no beneficiary coinsurance for recommended colorectal cancer screening tests as defined in section 1861(pp)(1) of the Act.

Under these statutory provisions, we have issued regulations governing payment for colorectal cancer screening tests at § 410.152(l)(5). We pay 100 percent of the Medicare payment amount established under the applicable payment methodology for the setting for providers and suppliers, and beneficiaries are not required to pay Part B coinsurance for colorectal cancer screening tests (except for barium enemas, which are not recommended by the USPSTF with a grade of A or B).

In addition to colorectal cancer screening tests, which typically are furnished to patients in the absence of signs or symptoms of illness or injury, Medicare also covers various diagnostic tests (see § 410.32). In general, diagnostic tests must be ordered by the physician or practitioner who is treating the beneficiary and who uses the results of the diagnostic test in the management of the patient's specific medical condition. Under Part B, Medicare may cover flexible sigmoidoscopies and colonoscopies as diagnostic tests when those tests are reasonable and necessary as specified in section 1862(a)(1)(A) of the Act. When these services are furnished as diagnostic tests rather than as screening tests, patients are responsible for the Part B coinsurance (20 or 25 percent depending upon the setting) associated with these services.

We define colorectal cancer screening tests in our regulation at § 410.37(a)(1) to include ''flexible screening sigmoidoscopies'' and ''screening colonoscopies, including anesthesia furnished in conjunction with the service.'' Under our current regulations, we exclude from the definition of colorectal screening services, colonoscopies and sigmoidoscopies that begin as screening services, but where a polyp or other growth is found and removed as part of the procedure. The exclusion of these services from the definition of colorectal cancer screening services is based upon longstanding provisions of the statute under section 1834(d)(2)(D) of the Act dealing with the detection of lesions or growths during procedures (See CY 1998 PFS final rule at 62 FR 59048, 59082).

Prior to the enactment of section 122 of the CAA, section 1834(d)(2)(D) of the

Act provided that if, during the course of a screening flexible sigmoidoscopy, a lesion or growth is detected which results in a biopsy or removal of the lesion or growth, payment under Medicare Part B shall not be made for the screening flexible sigmoidoscopy, but shall be made for the procedure classified as a flexible sigmoidoscopy with such biopsy or removal. Similarly, prior to the recent legislative change, section 1834(d)(3)(D) of the Act provided that if, during the course of a screening colonoscopy, a lesion or growth is detected that results in a biopsy or removal of the lesion or growth, payment under Medicare Part B shall not be made for the screening colonoscopy but shall be made for the procedure classified as a colonoscopy with such biopsy or removal. In these situations, Medicare pays for the flexible sigmoidoscopy and colonoscopy tests as diagnostic tests rather than as screening tests and the 100 percent payment rate for recommended preventive services under section 1833(a)(1)(Y) of the Act, as codified in our regulation at § 410.152(l)(5), has not applied. As such, beneficiaries currently are responsible for the usual coinsurance that applies to the services (20 or 25 percent of the cost of the services depending upon the setting).

Under section 1833(b) of the Act, before making payment under Medicare Part B for expenses incurred by a beneficiary for covered Part B services, beneficiaries must first meet the applicable deductible for the year. Section 4104 of the Affordable Care Act (that is, the Patient Protection and Affordable Care Act (Pub L. 111–148, March 23, 2010), and the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152, March 30, 2010), collectively referred to as the ''Affordable Care Act'') amended section 1833(b)(1) of the Act to make the deductible inapplicable to expenses incurred for certain preventive services that are recommended with a grade of A or B by the USPSTF, including colorectal cancer screening tests as defined in section 1861(pp) of the Act. Section 4104 of the Affordable Care Act also added a sentence at the end of section 1833(b)(1) of the Act specifying that the exception to the deductible shall apply with respect to a colorectal cancer screening test regardless of the code that is billed for the establishment of a diagnosis as a result of the test, or for the removal of tissue or other matter or other procedure that is furnished in connection with, as a result of, and in the same clinical encounter as the screening test. Although amendments made by the Affordable Care Act addressed the applicability of the deductible in the case of a colorectal cancer screening test that involves biopsy or tissue removal, they did not alter the coinsurance provision in section 1833(a) of the Act for such procedures. Although public commenters encouraged the agency to eliminate the coinsurance in these circumstances, the agency found that statute did not provide for elimination of the coinsurance (75 FR 73170 at 73431).

Beneficiaries have continued to contact us noting their concern that a coinsurance percentage applies (20 or 25 percent depending upon the setting) under circumstances where they expected to receive only a colorectal screening test to which coinsurance does not apply. Instead, these beneficiaries received what Medicare considers to be a diagnostic procedure because, for example, polyps were discovered and removed during the procedure. Similarly, physicians have expressed concern about the reactions of beneficiaries when they are informed that they will be responsible for coinsurance if polyps are discovered and removed during a procedure that they had expected to be a screening procedure to which coinsurance does not apply.

Section 122 of the CAA addresses this coinsurance issue by successively reducing, over a period of years, the percentage amount of coinsurance for which the beneficiary is responsible. Ultimately, for services furnished on or after January 1, 2030, the coinsurance will be zero.

To implement the amendments made by section 122 of the CAA, we proposed in the CY 2022 PFS proposed rule to modify our regulations to reflect the changes to Medicare statute. As amended, the statute effectively provides that, for services furnished on or after January 1, 2022, a flexible sigmoidoscopy or a colonoscopy can be considered a screening flexible sigmoidoscopy or a screening colonoscopy test even if an additional procedure is furnished to remove tissue or other matter during the screening test. Specifically, section 122(a)(3) of the CAA added a sentence to the end of section 1833(a) of the Act to include as colorectal screening tests described in section 1833(a)(1)(Y) of the Act, a colorectal cancer screening test, regardless of the code that is billed for the establishment of a diagnosis as a result of the test, or for the removal of tissue or other matter or other procedure that is furnished in connection with, as a result of, and in the same clinical encounter as the screening test. We note that only flexible screening sigmoidoscopies and screening colonoscopies are recognized currently as colorectal cancer screening tests that might involve removal of tissue or other matter. This new sentence added under section 1833(a) uses the same language that was used to amend the statute at section 1833(b)(1) of the Act to broaden the scope of colorectal cancer screening tests to which a deductible does not apply. Section 122(b)(1) of the CAA then limits application of the 100 percent Medicare payment rate (that is, no beneficiary coinsurance) under section 1833(a)(1)(Y) of the Act for the additional colorectal cancer screening tests (those that are not screening tests ''but for'' the new sentence at the end of section 1833(a) of the Act) by making payment for them subject to a new section 1833(dd) of the Act. Section 1833(dd) of the Act provides for a series of increases in the Medicare payment rate percentage for those services over successive periods of years through CY 2029. Thereafter, section 1833(dd) of the Act has no effect, so payment for all colorectal cancer screening tests would be made at 100 percent under section 1833(a)(1)(Y) of the Act.

To codify the amendments made by section 122 of the CAA in our regulations, we proposed in the CY 2022 PFS proposed rule to make two modifications to current regulations.

At § 410.37, we proposed in the CY 2022 PFS proposed rule to modify our regulation where we define conditions for and limitations on coverage for colorectal cancer screening tests by adding a new paragraph (j). That paragraph would provide that, effective January 1, 2022, when a planned colorectal cancer screening test, that is, screening flexible sigmoidoscopy or colonoscopy screening test, requires a related procedure, including removal of tissue or other matter, furnished in connection with, as a result of, and in the same clinical encounter as the screening test, it is considered to be a colorectal cancer screening test.

At § 410.152(l)(5), we also proposed in the CY 2022 PFS proposed rule to modify our regulation. There we describe payment for colorectal cancer screening tests. Effective January 1, 2022, we proposed in the CY 2022 PFS proposed rule to provide for an increase in the Medicare payment percentage that is phased in over time. As the Medicare payment percentage increases, the beneficiary coinsurance percentage decreases. We proposed to revise § 410.152(l)(5) to provide that Medicare payment in a specified year is equal to a specified percent of the lesser of the

actual charge for the service or the amount determined under the fee schedule that applies to the test. The phased in Medicare payment percentages for colorectal cancer screening services described in the amendments we proposed in the CY 2022 PFS proposed rule to our regulation at § 410.37(j) (and the corresponding reduction in coinsurance) are as follows:

- 80 percent payment for services furnished during CY 2022 (with coinsurance equal to 20 percent);
- 85 percent payment for services furnished during CY 2023 through CY 2026 (with coinsurance equal to 15 percent);
- 90 percent payment for services furnished during CY 2027 through CY 2029 (with coinsurance equal to 10 percent); and
- 100 percent payment for services furnished from CY 2030 onward (with coinsurance equal to zero percent).

Thus, between CYs 2022 and 2030, the coinsurance required of Medicare beneficiaries for planned colorectal cancer screening tests that result in additional procedures furnished in the same clinical encounter will be reduced over time from the current 20 or 25 percent to zero percent beginning CY 2030 and will remain at zero percent thereafter. We refer readers to the CY 2022 PFS proposed rule for the discussion of these changes to the regulations at §§ 410.37 and 410.152(l)(5) to implement section 122 of the CAA.

In the CY 2011 OPPS/ASC final rule with comment period (75 FR 72019 through 72020), we adopted a policy that all surgical services furnished on the same date as a planned screening colonoscopy, planned flexible sigmoidoscopy, or barium enema be viewed as being furnished in connection with, as a result of, and in the same clinical encounter as the screening test for purposes of implementing section 4104(c)(2) of the Affordable Care Act. We created the HCPCS modifier ''PT'' for providers to append to the diagnostic procedure code that is reported instead of the screening colonoscopy, screening flexible sigmoidoscopy HCPCS code, or as a result of the barium enema when the screening test becomes a diagnostic service. Where the modifier appears on a claim, the claims processing system does not apply the Part B deductible for all surgical services on the same date as the diagnostic test. We stated that we believed this interpretation was appropriate because we believe that it would be very rare for an unrelated surgery to occur on the same date as one of these scheduled screening tests (75 FR 72019). We also stated that we would reassess the appropriateness of the proposed definition of services that are furnished in connection with, as a result of, and in the same clinical encounter as the colorectal cancer screening test that becomes diagnostic in the event of a legislative change to this policy (for example, a statutory change that would remove the coinsurance for these related services in addition to the deductible).

As we did for purposes of implementing section 4104(c)(2) of the Affordable Care Act, to implement the amendments made by section 122 of the CAA, in the CY 2022 OPPS/ASC proposed rule we proposed that all surgical services furnished on the same date as a planned screening colonoscopy or planned flexible sigmoidoscopy would be viewed as being furnished in connection with, as a result of, and in the same clinical encounter as the screening test for purposes of determining the coinsurance required of Medicare beneficiaries for planned colorectal cancer screening tests that result in additional procedures furnished in the same clinical encounter. We explained that we believe this interpretation is appropriate because we continue to believe that it is very rare for an unrelated surgery to occur on the same date as a scheduled colorectal cancer screening. We stated that providers must continue to report HCPCS modifier ''PT'' to indicate that a planned colorectal cancer screening service converted to a diagnostic service. We also noted that, if our proposal was finalized, we would examine the claims data, monitor for any increases in surgical services unrelated to the colorectal cancer screening test performed on the same date as the screening test, and consider revising our policy through rulemaking if there is a notable increase.

Comment: Overall, commenters expressed support for our proposal that all surgical services furnished on the same date as a planned screening colonoscopy or planned flexible sigmoidoscopy would be viewed as being furnished in connection with, as a result of, and in the same clinical encounter as the screening test for purposes of determining the coinsurance required of Medicare beneficiaries for planned colorectal cancer screening tests that result in additional procedures furnished in the same clinical encounter.

Response: We thank commenters for their support.

Comment: Several commenters requested that CMS allow providers to waive coinsurance even earlier than 2030 or accelerate the reduction in the coinsurance amounts if they elect to do so without fear of violating any CMS rules. A commenter stated the gradual reduction in coinsurance amounts will lead to patient confusion and administration challenges. Other commenters stated that if providers are not permitted to accelerate the reductions in the coinsurance amounts, hospitals should be able to voluntarily waive the co-insurance prior to January 1, 2030. The commenters believed this process could be similar to CMS allowing hospitals to reduce the beneficiary copayment for APC payable services below 20 percent. In addition, one commenter requested that CMS allow hospitals the option to waive the co-payment amounts as long as the hospitals electing this option consider it a contractual allowance not counted as bad debt.

Response: Through this rulemaking, we are adopting Medicare regulations regarding beneficiary coinsurance that reflect the decreasing beneficiary financial obligations over time as established by statute. Prior to the complete phaseout of Medicare coinsurance amounts for colorectal cancer screening tests in CY 2030, suppliers may waive coinsurance amounts only if they comply with applicable law, including the Federal Anti-Kickback Statute and the civil monetary penalty provision prohibiting inducements to beneficiaries. We also note that the election to offer reduced copayment amounts provided for in section 1833(t)(8)(B) of the Act provides copayments can be reduced to amounts not less than 20 percent of the OPD fee schedule amount. The coinsurance amount for colorectal cancer screening services in CY 2022 is 20 percent and therefore could not be further reduced under this provision.

We received several comments that were outside the scope of the proposals made in the CY 2022 OPPS/ASC proposed rule. These comments included questions about coverage of bowel preparation products, coverage of non-invasive screening tests that require a follow-up colonoscopy, and cost-sharing for new colorectal screening technologies. Although we are not summarizing and responding to these comments in this final rule, we will take them into consideration for possible future healthcare provider education or rulemaking.

After considering public comments, we are finalizing as proposed the proposals made in the CY 2022 OPPS/

ASC proposed rule to implement section 122 of the CAA. Specifically, we are finalizing that all surgical services furnished on the same date as a planned screening colonoscopy or planned flexible sigmoidoscopy would be viewed as being furnished in connection with, as a result of, and in the same clinical encounter as the screening test for purposes of determining the coinsurance required of Medicare beneficiaries for planned colorectal cancer screening tests that result in additional procedures furnished in the same clinical encounter. Providers must continue to report HCPCS modifier ''PT'' to indicate that a planned colorectal cancer screening service converted to a diagnostic service. We will examine the claims data, monitor for any increases in surgical services unrelated to the colorectal cancer screening test performed on the same date as the screening test, and consider revising our policy through rulemaking if there is a notable increase or abuse of this policy.

C. Low Volume Policy for Clinical and Brachytherapy APCs

Historically, we have used our equitable adjustment authority at section 1833(t)(2)(E) of the Act on a case-by-case basis to adjust how we determine the costs for certain low volume services. In the CY 2016 OPPS/ASC final rule with comment period, we acknowledged that for low volume procedures with significant device costs, the median cost would be a more appropriate measure of the central tendency for purposes of calculating the cost and the payment rate for low volume procedures (80 FR 70388 through 70389). We explained that the median cost is impacted to a lesser degree than the geometric mean cost by more extreme observations. Therefore, in the CY 2016 OPPS/ASC final rule with comment period, we used our equitable adjustment authority under section 1833(t)(2)(E) of the Act to use the median cost, rather than the geometric mean, to calculate the payment rate for the procedure described by CPT code 0308T (Insertion of ocular telescope prosthesis including removal of crystalline lens or intraocular lens prosthesis) for CY 2016.

In the CY 2017 OPPS/ASC final rule with comment period, we adopted a payment policy for low-volume device-intensive procedures similar to the policy we applied to the procedure described by CPT code 0308T. Under this policy, we calculate the payment rate for any device-intensive procedure that is assigned to an APC with fewer than 100 single claims for all procedures in the APC using the median cost instead of the geometric mean cost (81 FR 79660 through 79661). We explained that we believed this policy would help mitigate to some extent the significant year-to-year payment rate fluctuations while preserving accurate claims data-based payment rates for these procedures.

In the CY 2019 OPPS/ASC final rule with comment period, we developed a policy for establishing payment rates for low-volume procedures assigned to New Technology APCs (83 FR 58892 through 58893). In that rule, we explained that procedures assigned to New Technology APCs are typically new procedures that do not have sufficient claims history to establish an accurate payment for them (83 FR 58892). One of the objectives of establishing New Technology APCs is to generate sufficient claims data for a new procedure so that it can be assigned to an appropriate clinical APC. We stated that some procedures that are assigned to New Technology APCs have very low annual volume, which we consider to be fewer than 100 claims. There is a higher probability that payment data for a procedure with fewer than 100 claims per year may not have a normal statistical distribution, which we were concerned could affect the quality of our standard cost methodology for assigning services to clinical APCs. We also noted that services with fewer than 100 claims per year are not generally considered to be significant contributors to the APC ratesetting calculations, and therefore, are not included in the assessment of the 2 times rule. For these low-volume procedures, we were concerned that the methodology we use to estimate the cost of a procedure under the OPPS—calculating the geometric mean for all separately paid claims for a HCPCS procedure code from the most recent available year of claims data—may not generate an accurate estimate of the actual cost of these procedures.

We noted that low utilization of services can lead to wide variation in payment rates from year to year. This volatility in payment rates from year to year can result in even lower utilization and potential barriers to access for these new technologies, which in turn limits our ability to assign the service to an appropriate clinical APC. To mitigate these issues, we believed that it was appropriate to utilize our equitable adjustment authority at section 1833(t)(2)(E) of the Act to adjust how we determine the costs for low-volume services assigned to New Technology APCs. We finalized a policy to calculate payment rates for low-volume procedures with fewer than 100 claims per year that are assigned to a New Technology APC by using up to four years of claims data to calculate the geometric mean, the median, and the arithmetic mean, to include the result of each statistical methodology in annual rulemaking, and to solicit comment on which methodology should be used to establish the payment rate. We explained that once we identify a payment rate for a low-volume service, we would assign the service to the New Technology APC with the cost band that includes its payment rate (83 FR 58893).

While we believe that the policies we have adopted to calculate payment rates for low-volume procedures have mitigated concerns regarding payment rates for new technologies and device-intensive procedures, we also believe that additional items and services may benefit from a policy that applies to clinical APCs with significantly low claims volume available for ratesetting purposes. In particular, we believe that where there are fewer than 100 single claims from the most recent year available for ratesetting for an APC, there is often significant volatility in the payment rate for those APCs that could be addressed with a low-volume adjustment policy similar to our low-volume policies for device-intensive procedures and New Technology APCs. For example, for CY 2022 ratesetting purposes, there are only 42 single claims from CY 2019 available for determining the geometric mean cost for APC 5244 (Level 4 Blood Product Exchange and Related Services) and the payment rate for this APC has fluctuated significantly from year to year. The geometric mean cost of APC 5244 was $30,424.15 in CY 2018 (based on CY 2016 claims), increased by 25.6 percent to $38,220.27 in CY 2019 (based on CY 2017 claims), and decreased by 18.9 percent to $31,015.17 in CY 2021 (based on CY 2019 claims).

Additionally, for CY 2022 ratesetting purposes, there are only 22 single claims from CY 2019 available for determining the geometric mean cost of APC 2632 (Iodine i-125 sodium iodide). The payment rates for this APC have also fluctuated significantly, with a geometric mean cost of $26.63 in CY 2018 (based on CY 2016 claims), which increased by 43.4 percent to $38.20 in CY 2019 (based on CY 2017 claims), and decreased by 31.8 percent to $26.04 in CY 2021 (based on CY 2019 claims).

As we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42181 through 42185), we believe that APCs with low claims volume available for ratesetting could also benefit from a low-volume adjustment policy similar to the one we currently utilize to set payment rates for device-intensive

procedures and procedures assigned to New Technology APCs. Specifically, we proposed to expand the existing low volume adjustment policy applied to procedures assigned to New Technology APCs and designate clinical APCs and brachytherapy APCs with fewer than 100 single claims that can be used for ratesetting purposes in the claims year used for ratesetting for the prospective year (for example, the CY 2019 claims year for this CY 2022 OPPS/ASC proposed rule) as low volume APCs. For clinical and brachytherapy APCs designated as Low Volume, the number of claims available for ratesetting would include claims for all procedures assigned to such APC. Whereas, the existing low volume adjustment policy is applied to procedures assigned to New Technology APCs with fewer than 100 single claims. For APCs designated as low volume and for procedures assigned to New Technology APCs, we proposed to determine a low volume APC's cost and a low volume procedure assigned to a New Technology APC's cost, choosing the ''greatest of'' the median, arithmetic mean, or geometric mean.

We proposed that the threshold for the low volume APC designation would be fewer than 100 single claims per year for the APC that can be used for ratesetting purposes, as this is how we have traditionally defined low volume under our existing policies. We have defined low volume as fewer than 100 single claims under our existing policies as there is a higher probability that payment data for a procedure with fewer than 100 claims per year may not have a normal statistical distribution, which we were concerned could affect how we set payment rates for low volume APCs and procedures assigned to New Technology APCs. For items and services assigned to clinical and brachytherapy APCs we proposed to designate as low volume APCs, we proposed to use up to 4 years of claims data to establish an APC payment rate as we currently do for low volume services assigned to New Technology APCs. The availability of multiple years of claims data will allow for more claims to be used for ratesetting purposes and create a more statistically reliable payment rate for these APCs than setting rates for APCs with low claims volume based on one year of data alone. Further, using multiple years of claims data, we proposed to use the greatest of the median, arithmetic mean, or geometric mean cost to approximate the cost of items and services assigned to a low volume APC. In previous years, we have received few to no public comments on which statistical methodology to use and have usually chosen the methodology that yields the highest rate to set the payment rate for procedures assigned to New Technology APCs. Going forward, we proposed to formalize this approach for low volume procedures assigned to New Technology APCs as well as clinical and brachytherapy APCs. We believe using the greatest of these three methodologies provides a simple and consistent approach to determining the cost metric to be used for ratesetting for these APCs and avoids uncertainty where multiple cost metrics could be used to set the APC's cost. Additionally, due to the payment volatility and low volume nature of these procedures, we believe that choosing the methodology that yields the highest rate will ensure that these procedures receive sufficient payment and that payment is not a barrier to access for these procedures.

Given the different nature of policies that affect the partial hospitalization program (PHP), we did not propose to apply this low volume APC policy to APC 5853 Partial Hospitalization for CMHCs or APC 5863 Partial Hospitalization for Hospital-based PHPs. We are also not proposing to apply this low volume APC policy to APC 2698 (Brachytx, stranded, nos) or APC 2699 (Brachytx, non-stranded, nos), as we believe our current methodology for determining payment rates for non-specified brachytherapy sources, as discussed in section II.A.2.a.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42028 through 42029), is appropriate. Further, as discussed in section IV.B.5. of the CY 2022 OPPS/ASC proposed rule (86 FR 42116), we proposed to eliminate our low volume Device-Intensive Procedure policy, as HCPCS code 0308T has been the only procedure subject to this policy, and subsume the ratesetting for HCPCS code 0308T within our broader low volume APC proposal.

For information on our proposed low volume APC designations, see Table 36 of the CY 2022 OPPS/ASC proposed rule (86 FR 42184).

Comment: Many commenters supported our proposal. Commenters stated that the policy would provide a more accurate calculation of cost, help mitigate year-to-year payment fluctuations, and create better predictability in Medicare revenue for hospitals providing these low-volume procedures. One commenter recommended that New Technology C-codes with fewer than 100 claims be eligible for such adjustment. Another commenter recommended that the threshold for Brachytherapy APCs be increased to fewer than 500 claims.

Response: We thank the commenters for their support of our proposal. We are not accepting the recommendation to apply our low-volume adjustment to New Technology C-codes with fewer than 100 claims that are not assigned to New Technology APCs. New Technology C-codes are established to describe procedures that utilize emerging technologies that cannot be adequately described by existing CPT/HCPCS codes. We have routinely assigned such procedures to clinical APCs due to resource and clinical similarity of existing technologies described by other CPT/HCPCS codes and we are not convinced that we should utilize a unique ratesetting process for New Technology C-codes with fewer than 100 claims assigned to clinical APCs. We note that we assign new codes to New Technology APCs only if the service cannot be placed in any of the existing clinical APCs based on clinical similarity and resource homogeneity. Further, we believe our policy of addressing payment fluctuations for clinical and brachytherapy APCs due to limited claims data at the APC level rather than the CPT/HCPCS code level would more appropriately address stakeholder concerns and is more consistent with how our low volume policies have previously addressed limited claims data.

Additionally, we are not accepting the recommendation to modify our criteria and apply a low volume adjustment to brachytherapy APCs with fewer than 500 claims that can be used for ratesetting. As discussed previously, under our existing policies, we believe that our definition of low volume as fewer than 100 single claims per year increases the probability that payment data for a procedure may not have a normal statistical distribution. Further, we believe that applying the same per-year limit of fewer than 100 single claims to all brachytherapy APCs, clinical APCs, and procedures assigned to New Technology APCs to determine whether they should qualify as low volume APCs or low volume procedures is the most consistent and equitable approach.

After considering the public comments we received, we are finalizing our proposal without modification to designate clinical and brachytherapy APCs as low volume APCs if the APC has fewer than 100 claims that can be used for ratesetting. We also are finalizing our proposal to designate procedures assigned to New Technology APCs as low volume

procedures if there are fewer than 100 claims for the procedure that can be used for ratesetting for the year. We are also finalizing our low volume APC payment adjustment to determine the APC cost (or procedure cost in the case of a low volume procedure assigned to a New Technology APC) as the greater of the geometric mean cost, arithmetic mean cost, or median cost based on up to 4 years of claims data. For a discussion of the low volume adjustment as it applies to certain procedures assigned to New Technology APCs, see section III.C. of this final rule with comment period.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42181 through 42185), we proposed to designate three clinical APCs and five brachytherapy APCs as low volume APCs. After reviewing updated CY 2019 claims data available for this final rule, APC 5881 (Ancillary Outpatient Services When Patient Dies) had 99 single claims available for CY 2022 ratesetting purposes. Therefore, with the addition of APC 5881, we are finalizing our proposal, with modification, to designate four clinical APCs and five brachytherapy APCs as low volume APCs under the OPPS. The four clinical APCs and five brachytherapy APCs meet our criteria of having fewer than 100 single claims in the claims year (CY 2019 for the CY 2022 OPPS/ASC final rule with comment period) and therefore, we are finalizing our proposal, with modification, to designate these APCs as low volume APCs. Table 49 illustrates the APC geometric mean cost without the low volume APC designation, the median, arithmetic mean, and geometric mean cost using up to four years of claims data, as well as the statistical methodology we are finalizing to use as the APC's cost for ratesetting purposes for CY 2022. As discussed in section X.E of this final rule with comment period, given our concerns with CY 2020 claims data as a result of the PHE, the 4 years of claims data are based on CY 2016 claims through CY 2019 claims.

BILLING CODE 4120–01–P

TABLE 49: COST STATISTICS FOR LOW VOLUME APCS UNDER C-APCS (OPPS) RATESETTING METHODOLOGY FOR CY 2022

APC	APC Description	Geometric Mean Cost without Low Volume APC Designation	Final Median Cost	Final Arithmetic Mean Cost	Final Geometric Mean Cost	Final CY 2022 APC Cost
2632	Iodine I-125 sodium iodide	$26.04	$30.24	$38.52	$34.16	$38.52
2635	Brachytx, non-str, HA, P-103	$44.37	$34.04	$43.53	$36.72	$43.53
2636	Brachy linear, non-str, P-103	$30.59	$24.78	$50.16	$36.43	$50.16
2645	Brachytx, non-str, Gold-198	$280.90	$61.85	$588.31	$131.86	$588.31
2647	Brachytx, NS, Non-HDRIr-192	$275.13	$145.36	$196.38	$94.24	$196.38
5244	Level 4 Blood Product Exchange and Related Services	$30,715.18	$34,182.25	$39,143.97	$34,076.34	$39,143.97
5494	Level 4 Intraocular Procedures	$14,661.77	$16,272.20	$14,980.87	$11,514.65	$16,272.20
5495	Level 5 Intraocular Procedures	$17,414.85	$17,326.04	$23,057.14	$14,446.26	$23,057.14
5881	Ancillary Outpatient Services When Patient Dies	$8,452.56	$6,980.65	$11,798.18	$7,161.05	$11,798.18

Additionally, for this final rule, based on the number of CY 2019 available claims from the standard ratesetting methodology used for ASC ratesetting purposes in this final rule, for CY 2022, under the ASC payment system, we are also finalizing our proposal to designate the APCs in Table 50 as low volume APCs that meet our criteria of having fewer than 100 single claims in the claims year (CY 2019 for the CY 2022 OPPS/ASC proposed rule) and are subject to our new low volume APC payment adjustment under the ASC payment system. Specifically, we are designating five brachytherapy APCs and four clinical APCs as low volume APCs for CY 2022. These are the same brachytherapy APCs we are finalizing as low volume APCs under the OPPS. We are also designating APC 5244, APC 5494, and APC 5495, which are finalizing as low volume under the OPPS, as low volume under the ASC payment system. Additionally, APC 5493—Level 3 Intraocular Procedures meets our criteria to be designated a low volume APC under the ASC payment system for CY 2022. The payment rates for these APCs are established at the highest amount among the geometric mean, median, or arithmetic mean, calculated using up to four years of data, which, in the case of these APCs, are claims data from 2016 through 2019, based on the standard ratesetting methodology. However, as discussed in section XIII.D.1.d of this final rule with comment period, we are finalizing our proposal to limit the ASC payment rate for procedures assigned to low volume APCs at an amount no greater than the procedure's OPPS payment rate.

TABLE 50: COST STATISTICS FOR LOW VOLUME APCS UNDER STANDARD (ASC) RATESETTING METHODOLOGY FOR CY 2022

APC	APC Description	Geometric Mean Cost without Low Volume APC Designation	Final Median Cost	Final Arithmetic Mean Cost	Final Geometric Mean Cost	Final CY 2022 APC Cost
2632	Iodine I-125 sodium iodide	$26.04	$30.24	$38.52	$34.16	$38.52
2635	Brachytx, non-str, HA, P-103	$44.37	$34.04	$43.53	$36.72	$43.53
2636	Brachy linear, non-str, P-103	$30.59	$24.78	$50.16	$36.43	$50.16
2645	Brachytx, non-str, Gold-198	$280.90	$61.85	$588.31	$131.86	$588.31
2647	Brachytx, NS, Non-HDRIr-192	$275.13	$145.36	$196.38	$94.24	$196.38
5244	Level 4 Blood Product Exchange and Related Services	$28,768.44	$34,012.03	$30,048.41	$12,696.84	$34,012.03
5493	Level 3 Intraocular Procedures	$14,361.84	$11,263.39	$11,057.23	$10,306.97	$11,263.39
5494	Level 4 Intraocular Procedures	$3,085.67	$2,983.13	$3,345.12	$2,943.08	$3,345.12
5495	Level 5 Intraocular Procedures	$17,414.85	$17, 326.04	$25,372.70	$15,453.58	$25,372.70

BILLING CODE 4120–01–C

D. Comment Solicitation on Temporary Policies To Address the COVID–19 PHE

In response to the COVID–19 pandemic, CMS issued waivers and undertook emergency rulemaking to implement a number of temporary policies to address the pandemic, including policies to prevent spread of the infection and support diagnosis of COVID–19. Many of these flexibilities were available because certain statutory or regulatory provisions were waived. These waivers will expire at the conclusion of the PHE. In the CY 2022 OPPS/ASC proposed rule (86 FR 42185) we sought comment on the extent to which stakeholders utilized the flexibilities available under these waivers, as well as whether stakeholders believe certain of these temporary policies should be made permanent to the extent possible within our existing authority. Specifically, we sought comment on stakeholders' experience with hospital staff furnishing services remotely to beneficiaries in their homes through use of communications technology; providers furnishing services in which the direct supervision

for cardiac rehabilitation, intensive cardiac rehabilitation, and pulmonary rehabilitation services requirement was met by the supervising practitioner being available through audio/video real-time communications technology; and the need for specific coding and payment to remain available under the OPPS for specimen collection for COVID–19.

1. Mental Health Services Furnished Remotely by Hospital Staff To Beneficiaries in Their Homes

Under the Physician Fee Schedule (PFS), Medicare makes payment to professionals and other suppliers for physicians' services, including certain diagnostic tests and preventive services. Section 1834(m) of the Act specifies the payment amounts and circumstances under which Medicare makes payment for a discrete set of Medicare telehealth services, all of which must ordinarily be furnished in-person, when they are instead furnished using interactive, real-time telecommunications technology. When furnished as Medicare telehealth services under section 1834(m) of the Act, many of these services are still reported using codes that describe ''face-to-face'' services even though they are furnished using audio/video, real-time communications technology instead of in-person (82 FR 53006). Section 1834(m) of the Act specifies the types of health care professionals that can furnish and be paid by Medicare for telehealth services (referred to as distant site practitioners) and the types and locations of settings where a beneficiary can be located when receiving telehealth services (referred to as originating sites). In the CY 2003 PFS final rule with comment period (67 FR 79988), we established a regulatory process for adding services to or deleting services from the Medicare telehealth services list in accordance with section 1834(m)(4)(F)(ii) of the Act (42 CFR 410.78(f)). This process provides the public with an ongoing opportunity to submit requests for adding services, which we consider and review through the annual PFS rulemaking process. The regulation at § 410.78(a)(3) also defines the requirements for the interactive telecommunications systems that may be used to furnish Medicare telehealth services.

Due to the circumstances of the COVID–19 pandemic, particularly the need to maintain physical distance to avoid exposure to the virus, we anticipated that health care practitioners would develop new approaches to providing care using various forms of technology when they are not physically present with the patient. We have established several flexibilities to accommodate these changes in the delivery of care. For Medicare telehealth services, using waiver authority under section 1135(b)(8) of the Act in response to the PHE for the COVID–19 pandemic, we have removed the geographic and site of service originating site restrictions in section 1834(m)(4)(C) of the Act, as well as the restrictions in section 1834(m)(4)(E) of the Act on the types of practitioners who may furnish telehealth services, for the duration of the PHE for the COVID–19 pandemic. We also used waiver authority to allow certain telehealth services to be furnished via audio-only communication technology during the PHE.

According to MedPAC's report, *Telehealth in Medicare after the Coronavirus Public Health Emergency,*[192] there were 8.4 million telehealth services paid under the PFS in April 2020, compared with 102,000 in February 2020. MedPAC also reported that during focus groups held in the summer of 2020, clinicians and beneficiaries supported continued access to telehealth visits with some combination of in-person visits. They cited benefits of telehealth, including improved access to care for those with physical impairments, increased convenience from not traveling to an office, and increased access to specialists outside of a local area. In their annual beneficiary survey, over 90 percent of respondents who had a telehealth visit reported being ''somewhat'' or ''very satisfied'' with their video or audio visit, and nearly two-thirds reported being ''very satisfied.''

Division CC, section 123 of the CAA modified the circumstances under which Medicare makes payment for mental health services furnished via telehealth technology under the PFS following the PHE. Specifically, this legislation removed the geographic originating site restrictions and added the home of the individual as a permissible originating site for Medicare telehealth services when furnished for the purposes of diagnosis, evaluation, or treatment of a mental health disorder.[193] This change correlates with a growing acceptance of the use of technology in the provision of mental health care. According to the Commonwealth Fund,[194] the provision of mental and behavioral health services via communications technology, in particular, has a robust evidence base and numerous studies have demonstrated its effectiveness across a range of modalities and mental health diagnoses (for example, depression, substance use disorders). Clinicians furnishing tele-psychiatry services at Massachusetts General Hospital Department of Psychiatry during the PHE observed several advantages of the virtual format for furnishing psychiatric services, noting that patients with psychiatric pathologies that interfere with their ability to leave home (for example, immobilizing depression, anxiety, agoraphobia, and/or time-consuming obsessive-compulsive rituals) were able to access care more consistently since eliminating the need to travel to a psychiatry clinic can increase privacy and therefore decrease stigma-related barriers to treatment, potentially bringing care to many more patients in need, as well as enhanced ease of scheduling, decreased rate of no-shows, increased understanding of family and home dynamics, and protection for patients and practitioners with underlying health conditions.[195]

These findings are consistent with our analysis of Medicare claims data that indicate that interactive communications technology for mental health care is likely to continue to be in broad use beyond the circumstances of the pandemic. According to our analysis of Medicare Part B claims data for services furnished via Medicare telehealth during the PHE, use of telehealth for many professional services spiked in utilization around April 2020 and diminished over time. In contrast, Medicare claims data suggest that for mental health services added to the Medicare Telehealth list both permanently and temporarily, subsequent to April 2020, the trend is toward maintaining a steady state of usage over time. Given this information, broad acceptance in the public and medical community, and the relatively stable Medicare utilization of mental health services during the COVID–19 pandemic, we believe use of interactive communication technology in furnishing mental health care is becoming an established part of medical practice, very likely to persist after the COVID–19 pandemic, and available

[192] *http://medpac.gov/docs/default-source/reports/mar21_medpac_report_ch14_sec.pdf?sfvrsn=0.*

[193] There is a longstanding statutory payment exclusion that prohibits Medicare payment for services that are not furnished within the United States (see section 1862(a)(4) of the Act). This payment exclusion was not changed by the CAA.

[195] *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7347331/.*

across the country under the Medicare statute for the range of professionals furnishing mental health care and paid under the PFS.

In many cases, hospitals provide hospital outpatient mental health services (including behavioral health), education, and training services that are furnished by hospital-employed counselors or other licensed professionals. Examples of these services include psychoanalysis, psychotherapy, diabetes self-management training, and medical nutrition therapy. With few exceptions, the Medicare statute does not have a benefit category that would allow these types of professionals (for example, mental health counselors and registered nurses) to bill Medicare directly for their services. These services can, in many cases, be billed by providers such as hospitals under the OPPS or by physicians and other practitioners as services incident to their professional services under the PFS. We also note that while partial hospitalization services are paid under the OPPS, section 1861(ff)(3)(A) of the Act explicitly prohibits partial hospitalization services from being furnished in an individual's home or residential setting.

As we explained in the interim final rule with comment period published on May 8, 2020 in the **Federal Register** titled ''Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency and Delay of Certain Reporting Requirements for the Skilled Nursing Facility Quality Reporting Program'' (the May 8th COVID–19 IFC) (85 FR 27550, 27563), outpatient mental health services, education, and training services require communication and interaction. We stated that facility staff can effectively furnish these services using telecommunication technology and, unlike many hospital services, the clinical staff and patient are not required to be in the same location to furnish them. We further explained that blanket waivers in effect during the COVID–19 PHE allow the hospital to consider the beneficiary's home, and any other temporary expansion location operated by the hospital during the COVID–19 PHE, to be a provider-based department (PBD) of the hospital, so long as the hospital can ensure the locations meet all of the conditions of participation, to the extent not waived. In light of the need for infection control and a desire for continuity of behavioral health care and treatment services, we recognized the ability of the hospital's clinical staff to continue to deliver these services even when they are not physically located in the hospital. Therefore, in the May 8th COVID–19 IFC (85 FR 27564), we made clear that when a hospital's clinical staff are furnishing hospital outpatient mental health services, education, and training services to a patient in the hospital (which can include the patient's home so long as it is provider-based to the hospital), and the patient is registered as an outpatient of the hospital, we will consider the requirements of the regulations at § 410.27(a)(1) to be met. We reminded readers that the physician supervision level for the vast majority of hospital outpatient therapeutic services is currently general supervision under § 410.27. This means a service must be furnished under the physician's overall direction and control, but the physician's presence is not required during the performance of the service.

In the May 8th COVID–19 IFC, we emphasized that all services furnished by the hospital still require an order by a physician or qualified NPP and must be supervised by a physician or other NPP appropriate for supervising the service given their hospital admitting privileges, state licensing, and scope of practice, consistent with the requirements in § 410.27 (85 FR 27563). We noted that hospitals may bill for these services as if they were furnished in the hospital and consistent with any specific requirements for billing Medicare in general, including any relevant modifications in effect during the COVID–19 PHE. We also noted that when these services are provided by clinical staff of the physician or other practitioner and furnished incident to their professional services, and are not provided by staff of the hospital, the hospital would not bill for the services. We stated that in those circumstances, the physician or other practitioner should bill for such services incident to their own services and would be paid under the PFS.

Given that the widespread use of communications technology to furnish services during the PHE has illustrated acceptance within the medical community and among Medicare beneficiaries of the possibility of furnishing and receiving care through the use of that technology, we stated that we were interested in information on the role of hospital staff in providing care to beneficiaries remotely in their homes. During the PHE, hospital staff have had the flexibility to provide these kinds of services to beneficiaries in their homes through communications technology; however, this flexibility is tied to waivers and other temporary policies that expire at the end of the PHE. In instances where a beneficiary may be receiving mental health services from a hospital clinical staff member who cannot bill Medicare independently for their professional service, the beneficiary would then need to physically travel to the hospital to continue receiving the services post-PHE. We stated that we were concerned that this could have a negative impact on access to care in areas where beneficiaries may only be able to access mental health services provided by hospital staff and, during the PHE, have become accustomed to receiving these services in their homes. We also noted that the ability to receive mental health services in their homes may help expand access to care for beneficiaries who prefer additional privacy for the treatment of their condition.

We stated that we were concerned that, during the PHE, practice patterns may have shifted to support expanded virtual services. During the PHE, we have not required any claims-based modifier identifying specifically when a service is furnished by clinical staff of the hospital to a beneficiary in their home through communications technology, and therefore we are not able to gauge the magnitude of these practice pattern shifts. Therefore, we sought comment on the extent to which hospitals have been billing for mental health services provided to beneficiaries in their homes through communications technology during the PHE, and whether they would anticipate continuing demand for this model of care following the conclusion of the PHE. As described in preceding paragraphs, billing for Medicare telehealth services has increased dramatically during the PHE, particularly for mental health services. We sought comment on whether hospitals have experienced a similar increase during the PHE in utilization of mental health services provided by hospital staff to beneficiaries in their homes through communications technology. We also sought comment on whether there are changes commenters believe CMS should make to account for shifting patterns of practice that rely on communication technology to provide mental health services to beneficiaries in their homes.

Comment: Commenters expressed support for continuing OPPS payment for mental health services furnished to beneficiaries in their homes by clinical staff of the hospital through the use of communication technology as a permanent policy post-PHE, stating that the expansion of virtual care broadly during the PHE has been instrumental in maintaining and expanding access to mental health services during the PHE

while keeping beneficiaries in their homes and reducing exposure to COVID. A few commenters requested that CMS continue to allow for the beneficiary's home to be reclassified as a PBD post-PHE, while other commenters stated that CMS should ensure that facility-based providers are adequately reimbursed for their services when furnished remotely. A few commenters encouraged CMS to ensure that there are relevant quality and safety measures for services furnished by hospital staff through communication technology.

Additionally, several commenters expressed support for the flexibilities allowing PHP services to be furnished to beneficiaries in their homes via telecommunication technology during the COVID–19 PHE, and encouraged CMS to maintain these flexibilities beyond the PHE or consider making these temporary policies permanent. Commenters expressed that these flexibilities, especially those allowing the use of audio-only telecommunication technology, increase access to vital mental health services amidst a persistent shortage of health care professionals and allow much greater and timelier access to mental health services, especially in rural areas and for vulnerable populations, while also helping drive reductions in the rates at which patients missed appointments. Commenters also shared research and analysis supporting the effectiveness of providing PHP services using telecommunication technology. One academic health center discussed outcomes analysis it conducted of its PHP services and noted that its analysis did not show a decrement in clinical care for patients who received only virtual PHP services. A national association of behavioral healthcare systems shared research showing that the main differences between patients who participated in PHPs via telecommunication technology and those who attended in-person was that those who participated via telecommunication technology had greater lengths of stay and were more likely to stay in treatment until completed.[196]

Response: We thank commenters for their support. We will consider these comments for future rulemaking and, in addition, will continue to explore how hospital payment for virtual services could support access to care in underserved and/or rural areas.

2. Direct Supervision by Interactive Communications Technology

In the interim final rule with comment period titled ''Policy and Regulatory Provisions in Response to the COVID–19 Public Health Emergency'' published on April 6, 2020 (the April 6th COVID–19 IFC) (85 FR 19230, 19246, 19286), we changed the regulation at 42 CFR 410.27(a)(1)(iv)(D) to provide that, during a Public Health Emergency as defined in § 400.200, the presence of the physician for purposes of the direct supervision requirement for pulmonary rehabilitation, cardiac rehabilitation, and intensive cardiac rehabilitation services includes virtual presence through audio/video real-time communications technology when use of such technology is indicated to reduce exposure risks for the beneficiary or practitioner. Specifically, the required direct physician supervision can be provided through virtual presence using audio/video real-time communications technology (excluding audio-only) subject to the clinical judgment of the supervising practitioner. We further amended § 410.27(a)(1)(iv)(D) in the CY 2021 OPPS/ASC final rule with comment period to provide that this flexibility continues until the end of the PHE as defined in § 400.200 or December 31, 2021, whichever is later (85 FR 86113). We noted that the public comments we received, along with feedback we have received since the implementation of the policy in the April 6th COVID–19 IFC allowing for direct supervision through virtual presence (85 FR 19246) have convinced us that we need more information on the issues involved with direct supervision through virtual presence before implementing this policy permanently. We acknowledged that the additional time between the issuance of the CY 2021 OPPS/ASC final rule with comment period and the issuance of the CY 2022 OPPS/ASC proposed rule may have allowed providers to collect more information that could inform CMS' decision making and therefore sought additional comment on whether this policy should be adopted on a permanent basis. While we did not propose to maintain this flexibility after the later of the end of the PHE or December 31, 2021, we did seek comment on whether and to what extent hospitals have relied upon this flexibility during the PHE and whether providers expect this flexibility would be beneficial outside of the PHE. We sought comment on whether we should continue to allow direct supervision for these services to include presence of the supervising practitioner via two-way, audio/video communication technology permanently, or for some period of time after the conclusion of the PHE or beyond December 31, 2021, to facilitate a gradual sunset of the policy. We also sought comment on whether there are safety and/or quality of care concerns regarding adopting this policy beyond the PHE and what policies CMS could adopt to address those concerns if the policy were extended post-PHE. Finally, if this policy were made permanent, we sought comment on whether a service-level modifier should be required to identify when the requirements for direct supervision for pulmonary rehabilitation, cardiac rehabilitation, and intensive cardiac rehabilitation services were met using audio/video real-time communications technology.

Comment: Commenters supported the adoption of the definition of direct supervision for cardiac rehabilitation and pulmonary rehabilitation, and intensive cardiac rehabilitation services to include presence of the supervising practitioner via two-way, audio/video communication technology on a permanent basis, or, if CMS did not wish to adopt this policy permanently, commenters encouraged CMS to maintain it for a period of time following the conclusion of the PHE, such as until the end of 2022. Most commenters supported development of a service-level modifier, stating that this requirement will allow CMS to track and collect data, although a few commenters stated that requiring a service-level modifier would be unnecessary and create additional burden on providers.

Response: We appreciate commenters' input on this policy and will consider these comments for future rulemaking.

3. Payment for COVID–19 Specimen Collection in Hospital Outpatient Departments

Also in the May 8th COVID–19 IFC, we created a new E/M code to support COVID–19 testing during the PHE: HCPCS code C9803 (Hospital outpatient clinic visit specimen collection for severe acute respiratory syndrome coronavirus 2 (sars–cov–2) (coronavirus disease [covid–19]), any specimen source) (85 FR 27604). In our review of available HCPCS and CPT codes for the May 8th COVID–19 IFC, we did not identify a code that explicitly described the exact services of symptom assessment and specimen collection that HOPDs were undertaking to facilitate widespread testing for COVID–19. As stated in the May 8th COVID–19 IFC, we believed that HCPCS code C9803 was necessary to meet the resource requirements for HOPDs to provide

extensive testing for the duration of the COVID–19 PHE. This code was created only to meet the need of the COVID–19 PHE and we stated that we expected to retire this code at the conclusion of the COVID–19 PHE (85 FR 27605).

We assigned HCPCS code C9803 to APC 5731—Level 1 Minor Procedures effective March 1, 2020 for the duration of the COVID–19 PHE in accordance with section 1833(t)(2)(B) of the Act, which requires services classified in an APC to be comparable clinically and in terms of resource use. APC 5731—Level 1 Minor Procedures contains services similar to HCPCS code C9803 and has a payment rate of $24.67 for CY 2021. HCPCS code C9803 was also assigned a status indicator of ''Q1.'' The Q1 status indicator indicates that the OPPS will package services billed under HCPCS code C9803 when billed with a separately payable primary service in the same encounter. When HCPCS code C9803 is billed without another separately payable primary service, we will make separate payment for the service under the OPPS. The OPPS also makes separate payment for HCPCS code C9803 when it is billed with a clinical diagnostic laboratory test with a status indicator of ''A'' in OPPS Addendum B.

In the CY 2022 OPPS/ASC proposed rule we solicited public comments on whether we should keep HCPCS code C9803 active beyond the conclusion of the COVID–19 PHE and whether we should extend or make permanent the OPPS payment associated with specimen collection for COVID–19 tests after the COVID–19 PHE ends, including why commenters believe it would be necessary to continue to provide OPPS payment for this service, as well as how long commenters believe payment should be extended for this code.

Comment: Commenters expressed appreciation for CMS' response to the pandemic, including the creation of HCPCS code C9803. One commenter noted that this code has had a positive impact on the delivery of care during the COVID–19 PHE. We received several comments in support of maintaining OPPS payment for HCPCS code C9803 beyond the conclusion of the COVID–19 PHE, with many commenters in support of making payment for this code permanent. Commenters cited concerns regarding the continuation of COVID–19 cases after the conclusion of the COVID–19 PHE and stressed the importance of continued testing in order to track and control COVID–19 cases. Multiple commenters also requested that CMS continue to pay for HCPCS code C9803 due to concerns regarding the unknown future role COVID–19 will play in our lives and potential increases in cases and new mutations of the virus. One commenter also requested that CMS continue payment for HCPCS code C9803 and reevaluate retiring this code when claims volume becomes low.

One commenter also requested that if CMS were to retire HCPCS code C9803, that we provide significant notice and resources to healthcare providers to prevent disruptions in the delivery of care.

Response: We appreciate the comments regarding payment for COVID–19 specimen collection in hospital-based outpatient departments (HOPDs). We plan to take this feedback into consideration for possible future rulemaking.

E. Use of CY 2019 Claims Data for CY 2022 OPPS and ASC Payment System Ratesetting Due to the PHE

As described in section I.A. of the CY 2022 OPPS/ASC proposed rule (86 FR 42020), section 1833(t) of the Act requires the Secretary to annually review and update the payment rates for services payable under the Hospital OPPS. Specifically, section 1833(t)(9)(A) of the Act requires the Secretary to review not less often than annually and to revise the groups, the relative payment weights, and the wage and other adjustments described in paragraph (2) of the Act to take into account changes in medical practice, changes in technology, the addition of new services, new cost data, and other relevant information and factors.

In updating the OPPS payment rates and system for each rulemaking cycle we primarily use two sources of information: The outpatient Medicare claims data and HCRIS cost report data. The claims data source is the Outpatient Standard Analytic File, which includes final action Medicare outpatient claims for services furnished in a given calendar year. For the OPPS ratesetting process, our goal is to use the best available data for ratesetting so that we can accurately estimate the costs associated with furnishing outpatient services, and thus set appropriate payment rates. Ordinarily, the best available claims data is the set of data from 2 years prior to the calendar year that is the subject of rulemaking. For the CY 2022 OPPS/ASC proposed rule ratesetting, this typically would have been the set of CY 2020 calendar year outpatient claims data processed through December 31, 2020. The cost report data source is typically the Medicare hospital cost report data files from the most recently available quarterly HCRIS file as we begin the ratesetting process. For example, ordinarily, the best available cost report data used in developing the OPPS relative weights would be from cost reports beginning 3-fiscal years prior to the year that is the subject of the rulemaking. For CY 2022 OPPS ratesetting, under ordinary circumstances, that would be cost report data from HCRIS extracted in December 2020, which would contain many cost reports ending in FY 2020 based on each hospital's cost reporting period.

As discussed in section I.F. of the FY 2022 IPPS/LTCH proposed rule and in the CY 2022 OPPS proposed rule, there are a number of issues related to the use of the standard hospital data we would otherwise use for purposes of CY 2022 ratesetting because data from the applicable time period would include the effects of the COVID–19 PHE (86 FR 25086 through 25090). Even though the specific data elements might be slightly different between the inpatient and outpatient hospital settings, the same questions and challenges exist for hospital data from CY/FY 2020. Some of the issues are focused on the source data and the degree to which the utilization of services and cost patterns found in them are affected by the PHE. Other issues are more prospective in nature and concern whether hospital claims data from this time period might be consistent with our expectations for the prospective year, particularly in a changing environment with regards to COVID–19 vaccinations and treatment.

In the FY 2022 IPPS proposed rule, we proposed to use FY 2019 data for FY 2022 IPPS ratesetting based on our determination that the FY 2019 data would be more representative of FY 2022 inpatient hospital experience than the FY 2020 data (86 FR 25089). In section X.E. of the CY 2022 OPPS/ASC proposed rule (86 FR 42188 through 42190) we noted that there are a number of policies that apply and interact across the IPPS and OPPS, in part because they both concern services furnished in the hospital setting. We also discussed how we have previously noted in annual rulemaking, in regards to adopting the fiscal year IPPS wage index into the OPPS, the ''inseparable, subordinate status of the HOPD within the hospital overall'' (85 FR 85908). It is in this context where inpatient and outpatient hospital departments are inherently connected to each other, as parts of the broader hospital setting overall, we identified many of the same reasons to propose to use 2019 data for 2022 ratesetting as discussed in the FY 2022 IPPS proposed rule.

In section X.E. of the CY 2022 OPPS/ASC proposed rule (86 FR 42188 through 42190) we also noted that we

observed a number of changes, likely as a result of the PHE, in the CY 2020 OPPS claims data that we would ordinarily use for ratesetting. The most significant difference compared to prior years is the decrease in the overall volume of outpatient hospital claims—with approximately 20 percent fewer claims usable for ratesetting purposes when compared to the prior year. In addition, this decrease in outpatient claims volume applied to a majority of the clinical APCs in the OPPS.

In some cases, we saw broad changes as a result of the PHE, including in the APCs for hospital emergency department and clinic visits. Among those APCs, the decrease in volume was approximately 30 percent—some of which may be related to changing practice patterns during the PHE. For example, we saw a significant increase in the use of the HCPCS code Q3014 (Telehealth originating site facility fee) in the hospital outpatient claims, with the approximately 35,000 services billed in the CY 2019 OPPS claims increasing to 1.8 million services in the CY 2020 OPPS claims. This example highlights two types of differences we see in the CY 2020 set of claims when comparing it to more typical claims data. One difference is likely due to the degree to which elective procedures/services were not performed as often during the PHE. The other difference is the result of site of service changes due to flexibilities available during the PHE.

In other cases, we saw changes in the claims data that were associated with specific services that were furnished more frequently during the PHE. For example, two notable exceptions to this decrease in claims volume between CY 2019 and CY 2020 are for APC 5731 (Level 1 Minor Procedures) and APC 5801 (Ventilation Initiation and Management). In the case of APC 5731, HCPCS code C9803 was made effective for services furnished on or after March 1, 2020 through the interim final rule with comment period titled ''Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency and Delay of Certain Reporting Requirements for the Skilled Nursing Facility Quality Reporting Program'' (85 FR 27602 through 27605) to describe COVID–19 specimen collection. In the CY 2020 claims, HCPCS C9803 has 1,023,957 single claims available for cost modeling, representing approximately 93 percent of claims used to model the APC cost. While in some cases this would be appropriate in establishing the APC cost, we generally would not expect the same volume of the procedure in the CY 2022 OPPS because we anticipate that specimen collection for COVID–19 testing may be significantly lower than it was in CY 2020. Similarly, the estimated increase in the geometric mean cost of APC 5801 based on the CY 2020 claims data may not be predictive of CY 2022 costs for APC 5801 if there is less use of this service in CY 2022 than in CY 2020.

As a result of a number of COVID–19 PHE-related factors, including the changes in services potentially related to the COVID–19 PHE, the significant decrease in volume suggesting that patients may have been deferring elective care during CY 2020, the changes in APC relative weights for services, and the increasing number of Medicare beneficiaries vaccinated against COVID–19, we believed that CY 2020 data were not the best overall approximation of expected outpatient hospital services in CY 2022. Instead we believed that CY 2019 data, as the most recent complete calendar year of data prior to the COVID–19 PHE, were a better approximation of expected CY 2022 hospital outpatient services.

In the CY 2022 OPPS/ASC proposed rule, we also analyzed the extent to which the decision to use CY 2019 or CY 2020 claims data as the basis for ratesetting differentially impacts the CY 2022 OPPS rates. To do this, we estimated the difference in case-mix under the CY 2019-based weights and the CY 2020-based weights if the CY 2022 outpatient experience ended up being the reverse of the assumption made when calculating that set of relative weights. In other words, we compared estimated case-mix calculated under four different scenarios. For the CY 2019-based weights, we calculated the case-mix using claims from the CY 2019-based claims extract as an approximation of the actual CY 2022 experience (Scenario A), and using claims from the CY 2020 based claims extract as an approximation of the actual CY 2022 experience (Scenario B). For the CY 2020-based weights, we calculated the case-mix using claims from the CY 2020 claims based extract as an approximation of the actual CY 2022 outpatient experience (Scenario C), and using claims from the CY 2019 claims based extract as an approximation of the actual CY 2022 experience (Scenario D). The results are shown in the following Table 51.

TABLE 51: ESTIMATED IMPACT OF CLAIMS BASED ASSUMPTIONS FOR CY 2022 OUTPATIENT EXPERIENCE

Scenario	Assumed CY 2022 Experience for Relative Weights	Actual CY 2022 Experience	Case-mix	Assumption Matched Experience	Percent change in case-mix if Mismatch between Assumption and Actual Experience
A	CY 2019	CY 2019	4.620	Yes	
B	CY 2019	CY 2020	5.056	No	0.10%
C	CY 2020	CY 2020	5.051	Yes	
D	CY 2020	CY 2019	4.600	No	-0.44%

In Scenario A and Scenario C, there is no differential impact as a result of a less accurate assumption made when the OPPS relative weights were calculated: The CY 2022 outpatient experience matches the assumption made when the OPPS relative weights were calculated. In Scenario B and Scenario D, the actual experience is the reverse of the assumption used when the OPPS relative weights were calculated.

In Scenario B, when the CY 2019-based weights were used, but the CY 2022 outpatient experience turns out to be more similar to CY 2020 claims data, the less accurate assumption slightly affects the calculated case-mix, by 0.1 percent. This can be seen by comparing the modeled case mix under Scenario B (5.056) with the modeled case-mix under Scenario C (5.051). In other words, if we use the CY 2019-based weights and CY 2022 outpatient

experience turns out to be more similar to the CY 2020 data, then the modeled case-mix is slightly lower than if we had accurately used the CY 2020-based weights. This suggests that, while there is some impact from using the CY 2019 data if CY 2022 outpatient service utilization ends up being more similar to CY 2020 utilization, that impact would be limited.

In Scenario D, where the CY 2020-based weights were used, but the CY 2022 outpatient experience turns out to be more similar to CY 2019 claims data, this inaccurate assumption has a somewhat more significant effect. In this case, the modeled case-mix is −0.44 percent lower than it would be if we had correctly assumed that CY 2022 outpatient services utilization would be more like CY 2019 than CY 2020. This can be seen by comparing the modeled case-mix under Scenario D (4.600) to the modeled case-mix under Scenario A (4.620). In other words, if we use the CY 2020-based weights and the CY 2022 outpatient experience turns out to be more similar to CY 2019 data, the modeled case-mix is −0.44 percent lower than if we had used the CY 2019-based weights.

In addition to our expectation that CY 2019 is a more likely approximation of the CY 2022 outpatient experience for the reasons discussed earlier, the previous analysis indicates that the differential effect of making an incorrect assumption about which year's data to use to set the CY 2022 OPPS relative weights is more limited if the CY 2019-based weights are used than it is if the CY 2020-based weights are used. While CY 2022 outpatient hospital services data is unlikely to look exactly like either CY 2019 data or CY 2020 data, we believe that it will be more similar to a standard year (not having the effects of the PHE) as pandemic-related issues decline and more of the U.S. population is vaccinated against COVID–19.

Consistent with the proposal to use CY 2019 claims data in establishing the CY 2022 OPPS rates, we also proposed to use cost report data from the same set of cost reports we originally used in final rule 2021 OPPS ratesetting, where we ordinarily would have used the most updated available cost reports available in HCRIS in determining the proposed CY 2022 OPPS APC relative weights (as discussed in greater detail in section II.E. of the CY 2022 OPPS/ASC proposed rule (86 FR 42053)). As discussed previously, if we were to proceed with the standard ratesetting process of using updated cost reports, we would have used approximately 1,000 cost reports with the fiscal year ending in CY 2020 based on each hospital's cost reporting period. We note that Medicare outpatient claims data and cost report data from the HCRIS file are examples of data sources for which we discussed the proposed use of CY 2019 data for CY 2022 OPPS ratesetting. While we are generally using CY 2019 claims data and the data components related to it in establishing the CY 2022 OPPS, we noted in the CY 2022 OPPS/ASC proposed rule the specific cases where we used updated information, such as the ASP data used in determining drug packaging status discussed in section V. of the CY 2022 OPPS/ASC proposed rule (86 FR 42116).

We also considered the alternative of continuing with our standard process of using the most updated claims and cost report data available. To facilitate comment on the alternative proposal for CY 2022, we made available the cost statistics and addenda utilizing the CY 2020 data we would ordinarily have provided in conjunction with the CY 2022 OPPS/ASC proposed rule. We provided a file comparing the budget neutrality and certain other ratesetting adjustments calculated under our proposal with those adjustments calculated under this alternative approach. Finally, we made available other proposed rule supporting data files based on the use of the CY 2020 data that we ordinarily would have provided, including: The OPPS Impact File, cost statistics files, addenda, and budget neutrality factors. We refer the reader to the CMS website for the CY 2022 OPPS/ASC proposed rule for more information on where these supplemental files may be found.

We note that the CY 2022 OPPS/ASC proposed rule appeared in the **Federal Register** on August 4, 2021. In the FY 2022 IPPS/LTCH PPS final rule, which appeared in the August 13, 2021 issue of the **Federal Register**, CMS finalized a policy to use FY 2019 MedPAR data in FY 2022 IPPS ratesetting (rather than FY 2020 MedPAR data) after consideration of public comments, the vast majority of which supported CMS's proposal to use the FY 2019 data for FY 2022 ratesetting for circumstances where the FY 2020 data is significantly impacted by the COVID–19 PHE. Similar to the comments received on the FY 2022 IPPS proposed rule, we received broad support from commenters with many agreeing that CY 2019 claims data would likely be more similar to the CY 2022 outpatient experience.

Comment: Commenters supported the use of CY 2019 claims in CY 2022 OPPS ratesetting, agreeing that the billing patterns found in the CY 2019 claims data would better approximate the outpatient utilization and costs in the CY 2022 OPPS, due to the effect of the PHE on the CY 2020 claims. A commenter noted challenges during the PHE such as increasing labor costs and suggested that an interim wage index adjustment factor be applied. Several stakeholders agreed with using CY 2019 claims for CY 2022 OPPS ratesetting, but noted that their support applied specifically for the CY 2022 OPPS, as similar policies for future years would need to be evaluated separately.

Response: We appreciate the commenters' support for our proposal to use CY 2019 claims in CY 2022 OPPS ratesetting as a result of the impact of the PHE on CY 2020 claims data. We note that we are finalizing the use of CY 2019 claims data in CY 2022 OPPS ratesetting.

With regards to the request for an interim wage index adjustment factor, we currently do not believe an interim wage index adjustment factor is necessary. The wage index that we would apply in the CY 2022 OPPS is not affected in the same way as claims and cost report data due to the PHE, as a result of being on a longer data delay. As cost report information becomes available that reflects changes in labor costs and wage index inputs, we will continue to review and include as appropriate in the OPPS. For more detail regarding the OPPS wage index policy, please see section II.C. of this final rule with comment period. We note that the final policy to use CY 2019 claims data for OPPS ratesetting specifically applies to the CY 2022 OPPS, and we will continue to monitor the claims and cost report data available and their appropriateness for future OPPS ratesetting, as the PHE continues.

Comment: Certain commenters supported the use of CY 2019 claims data for broader OPPS ratesetting but requested specific exceptions that would allow for the use of CY 2020 claims. These suggested exceptions included requests to use:

- CY 2020 claims data for ratesetting purposes for certain HCPCS codes that only have volume or significant volume in the CY 2020 claims but not in the 2019 claims data;
- CY 2020 claims data for establishing the CY 2022 OPPS relative weights for specific APC series;
- CY 2020 claims data for contextual purposes where CY 2019 claims are unavailable to make APC assignments, but to continue to use CY 2019 claims data for broader ratesetting; and
- Either CY 2019 or CY 2020 claims data in identifying which procedures receive device intensive status and to

use the higher of the device offsets between the 2 years of claims data.

Response: We appreciate the commenters' input in determining what data is most appropriate for developing the CY 2022 OPPS relative payment weights. We recognize that there are two important distinct issues raised by these unique requests: (1) The integrity of the OPPS relative payments weights based on the data used, and (2) data availability for ratesetting, particularly as there is different information available in each of the claims and cost report datasets based on the time frame of data they include.

In reviewing the CY 2019 and CY 2020 claims data available for developing the CY 2022 OPPS rates, we noted that we believed the CY 2019 claims would be more reflective of our expectation of the CY 2022 outpatient experience. We do not believe it is appropriate to selectively choose which claims year's data are included or not in establishing the CY 2022 relative payment weights. We note that the relative cost of services used in developing the OPPS relative payment weights is a fundamental part of the OPPS and choosing which claims to use when both CY 2019 and CY 2020 claims are broadly available may inappropriately distort certain components of the OPPS. Further, the choice of different time frames when establishing the claims dataset would raise additional concerns around data consistency and how to mitigate their effects, which may be outsized as a result of the COVID–19 PHE. Potential additional adjustment factors would need to be applied for aspects such as charge inflation, volume adjustments, and CCR adjustments similar to how they are applied for other components of the OPPS, for example, outlier payments. The OPPS relative payment weights affect the budget neutrality calculations because the volume and estimated relative costs of services comprise the budget neutral model. If actual CY 2019 claims were used in some cases and CY 2020 claims in others, we might then inadvertently over or underweight volume or estimated cost, both of which distort not just the specific OPPS payment rates for which they are used but also those of all other services within the budget neutrality model. Based on these data integrity concerns, we continue to believe using CY 2019 claims data—and CY 2019 claims data alone—in establishing the CY 2022 OPPS relative payment weights to the extent possible is the best and most effective policy. We do not believe that it is appropriate to blend use of CY 2020 claims in this process.

In the CY 2022 OPPS/ASC proposed rule, we recognized that there were certain cases in which the CY 2020 claims data may provide additional information around service costs than are available in the CY 2019 claims data, and therefore, may be the best data available for ratesetting. For example, we proposed to make an exception for 11 specific device intensive procedures as described in section IV.B.2. of the CY 2022 OPPS/ASC proposed rule (86 FR 42114) in establishing the procedures' device offsets. In these instances, procedures were previously assigned a default device offset percentage of 31 percent or a device offset percentage based on claims from a clinically similar code, and focusing solely on CY 2019 claims data would yield no changes. However, we recognized that if CY 2020 claims information were available and provided more specific context around device offsets, this updated data would yield better and potentially more specific device offset assignments than the default or clinically similar codes. For more detailed discussion around device intensive status and device offsets, please see section IV.B. of this final rule with comment period.

Along those lines, while we do not believe that it is generally appropriate to include actual CY 2020 OPPS claims data in the process of calculating the OPPS relative weights, we believe that in certain cases it is appropriate to use that cost information as contextual information for APC and device offset assignments in the CY 2022 OPPS. That is, while CY 2019 claims data are more representative of our expectation of the CY 2022 outpatient experience, in cases where there are no CY 2019 claims data available, the CY 2020 claims data may provide additional updated information around the estimated costs for specific services. Therefore, we are establishing an additional limited exception in this final rule with comment period where we will review CY 2020 claims data based on commenter requests and identification of areas where they believe the CY 2020 claims justify alternative placement, if no significant CY2019 claims data is available, as part of our review process for determining CY 2022 APC assignment. It has been our policy for updating OPPS rates annually to use the best available data for ratesetting, and we believe in certain limited, specific circumstances the CY 2020 claims data are the best available for setting CY 2022 rates. We note that throughout this rule, and particularly in section III.C. of this final rule with comment period, where we review the APC-specific policies, we discuss where we have reviewed the CY 2020 claims as part of our evaluation of data for the CY 2022 APC assignments.

With regards to the request that we apply the device intensive policy and device offset calculation based on the higher calculation between that determined by the CY 2019 or CY 2020 claims data, we believe that in cases where claims are available from both years that the CY 2019 claims remain more reflective of actual expected outpatient experience. Based on the issues discussed earlier in this section we believe it is appropriate to use the CY 2019 claims data for establishing the device intensive policy, with the exception of device intensive procedures for which CY 2020 claims remain the only data source. For a more detailed discussion of the CY 2022 device intensive policy and the limited exceptions in which CY 2020 claims data will be used for those purposes, please see section IV.B. of this final rule with comment period.

After consideration of the public comments received, we are finalizing the proposal to use CY 2019 claims data in CY 2022 OPPS ratesetting with modification to allow for review of the CY 2020 claims in determining CY 2022 APC placements based on commenter request and where CY 2019 claims data are unavailable. In addition, we note that we are finalizing the exception to allow for CY 2020 claims data for device offset assignments for the 11 codes for which we proposed exceptions, as discussed in more detail in section IV.B. of this final rule with comment period.

F. Separate Payment in CY 2022 for the Device Category, Drugs, and Biologicals With Transitional Pass-Through Payment Status Expiring Between December 31, 2021 and September 30, 2022

In the CY 2021 OPPS/ASC final rule (85 FR 86012 through 86013), we discussed the public comments we received in response to the comment solicitation we included in the CY 2021 OPPS/ASC proposed rule regarding whether we should utilize our equitable adjustment authority under section 1833(t)(2)(E) of the Act to provide separate payment for some period of time after pass-through status ends for devices with expiring pass-through status in order to account for the period of time that utilization for the devices was reduced due to the PHE.[197] Although we only solicited comments on use of our equitable adjustment authority to pay separately for devices with pass-through status during the PHE, we received public comments both suggesting that drugs, biologicals, and biosimilar biological products with pass-through status during the same time period should also be subject to an adjustment to extend the pass-through period for those products and pointing out that most of these products continue to be separately paid after their pass-through status expires, and therefore, it would be unnecessary to utilize the equitable adjustment authority to ''extend'' pass-through status for these products.

As discussed elsewhere in section X.E. of the CY 2022 OPPS/ASC proposed rule (86 FR 42188 through 42190) and section I.F. of the FY 2022 IPPS/LTCH proposed rule (86 FR 25211 through 25212), our goal is to use the best available data for ratesetting. Ordinarily, the best available claims data is the set of data from 2 years prior to the calendar year that is the subject of rulemaking, and accordingly, we would have used claims data from CY 2020 for calculating proposed rates for the CY 2022 OPPS/ASC proposed rule. As noted in section X.E., however, we proposed to use CY 2019 claims data in establishing the CY 2022 OPPS rates and to use cost report data from the same set of cost reports originally used in the final rule for 2021 OPPS ratesetting. We recognize that due to the effects of the PHE, the CY 2020 claims data may not be the best available data for ratesetting, including for purposes of ratesetting for devices, drugs, and biologicals for which pass-through status expires between December 31, 2021 and September 30, 2022.

For this reason, and after consideration of the public comments we received in response to the comment solicitation included in the CY 2021 OPPS/ASC proposed rule (85 FR 48862), we proposed a one-time equitable adjustment under section 1833(t)(2)(E) of the Act to continue separate payment for the remainder of CY 2022 for devices, drugs, and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022. We have consistently explained that transitional pass-through payment for drugs, biologicals, and devices is intended as an interim measure to allow for adequate payment of certain new technology while we collect the necessary data to incorporate the costs for these items into the procedure APC rate (66 FR 55861). We believe an equitable adjustment to continue separate payment for devices, drugs, and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022 is necessary to ensure that we have full claims data from CY 2021 with which to set payment rates beginning in CY 2023. We also believe it is necessary to pay separately for these products in CY 2022 in a manner that mimics continued pass-through status, rather than having to set rates and make APC assignments and packaging decisions for these products for CY 2022 based on data from CY 2020, which we do not believe is the best available data for this purpose.

For those drugs, biologicals and the device for which payment would be packaged following expiration of their pass-through status, we believe providing separate payment for up to a full year in CY 2022 is warranted to ensure there is a full year of data for ratesetting, including to ensure appropriate APC assignments for the services with which these products are billed. For drugs and biologicals that would generally remain separately payable after their pass-through status expires, we believe providing separate payment for up to a full year in CY 2022 is necessary to ensure that these drugs and biologicals would, in fact, be separately payable when their pass-through status expires or that their payment should be packaged if we determine that the drug's cost is below the per-day packaging threshold. Specifically, for threshold-packaged drugs and biologicals, CMS requires current, appropriate data to determine whether the drug should be packaged and then to determine the impact of that packaging on the associated service rates. We also believe separate payment in CY 2022 is necessary to ensure we have sufficient data in the event payment for the drug is packaged with payment for a primary C–APC service. Finally, consistent with our goal of ensuring that the equitable adjustment provides separate payment for drugs and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022 to mimic pass-through payment to the extent possible, we proposed that separately payable drugs and biologicals that are eligible for this adjustment would not be paid the proposed reduced amount of ASP minus 22.5 percent when they are acquired under the 340B program, and would generally continue to be paid ASP+6 percent for the duration of the time period during which the adjustment applies.

We explained that under our proposal, the device category, drugs, and biologicals that would be affected were as follows. One device category, HCPCS code C1823 (Generator, neurostimulator (implantable), nonrechargeable, with transvenous sensing and stimulation leads), would receive adjusted payment equivalent to an additional four quarters of device pass-through status. There are 27 drugs and biologicals whose pass-through payment status expires between December 31, 2021 and September 30, 2022. Based on CY 2020 data, payment for three of the 27 drugs and biologicals would otherwise be packaged after the expiration of their pass-through status. The remaining 24 drugs and biologicals would be paid separately and would otherwise receive reduced payment at the proposed rate of ASP minus 22.5 percent when they are acquired under the 340B program.

We explained that there are currently six drugs and one device category whose pass-through payment status will expire on December 31, 2021, nine drugs and three biologicals whose pass-through status will expire on March 31, 2022, seven drugs whose pass-through status will expire on June 30, 2022, and two drugs whose pass-through payment status will expire on September 30, 2022. Because pass-through status can expire at the end of a quarter, we proposed that the adjusted payment would be made for between one and four quarters, depending on when the pass-through period expires for the

[197] On January 31, 2020, HHS Secretary Azar determined that a PHE exists retroactive to January 27, 2020, under section 319 of the Public Health Service Act (42 U.S.C. 247d) in response to COVID–19, and on April 21, 2020 Secretary Azar renewed, effective April 26, 2020, and again effective July 25, 2020, the determination that a PHE exists. On March 13, 2020, the President of the United States declared that the COVID–19 outbreak in the U.S. constitutes a national emergency, retroactive to March 1, 2020.

device category, drug, or biological. In particular, we proposed that separate payment would be made a full year for the device category and six drugs for which pass-through status will expire on December 31, 2021, three quarters for the twelve drugs and biologicals for which pass-through status will expire on March 31, 2022, two quarters for the seven drugs for which pass-through status will expire on June 30, 2022, and one quarter for the two drugs for which pass-through status will expire on September 30, 2022.

Table 52 lists pass-through drugs, biologicals and the device category that we proposed would receive adjusted separate payment, their pass-through payment period effective dates and end dates, as well as the number of quarters of separate payment equivalent to an extension of pass-through status that we proposed each drug or device category would receive.

BILLING CODE 4120–01–P

TABLE 52: DEVICE CATEGORY, DRUGS, AND BIOLOGICALS WITH EXPIRING PASS-THROUGH STATUS THAT WOULD RECEIVE SEPARATE PAYMENT FOR ONE TO FOUR QUARTERS IN CY 2022

HCPCS Code	Long Descriptor	Pass-Through Status Effective Date	Pass-Through Status Expiration Date	Proposed Adjustment Equivalent to an Extension of Pass-through Status (number of quarters)
C1823	Generator, neurostimulator (implantable), nonrechargeable, with transvenous sensing and stimulation leads)	01/01/2019	12/31/2021	4

BILLING CODE 4120–01–C

In the CY 2022 OPPS/ASC proposed rule we solicited comments on our proposal to utilize our equitable adjustment authority to pay separately for the remainder of CY 2022 for the device category, drugs, and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022.

Comment: The overwhelming majority commenters generally supported our proposal to utilize our equitable adjustment authority to pay separately for between one and four

quarters for certain devices, drugs, and biologicals whose pass-through status will expire between December 31, 2021 and September 30, 2022. One commenter stated their support for CMS' proposal and added that separate payment for items that will soon lose pass-through status will help ensure beneficiary access to innovative therapies. The commenter added that the COVID–19 pandemic has severely skewed hospital utilization data that is necessary to establish payment rates under the OPPS.

Response: We thank the commenters for their support for our proposal.

Comment: Multiple commenters requested changes to our proposed equitable payment adjustment to either expand or limit its scope. One commenter strongly supported CMS's policy that makes radiopharmaceuticals eligible for pass-through status and added that CMS should apply this pass-through period extension to all radiopharmaceuticals with pass-through status during the COVID–19 PHE. Several other commenters asked that the proposed pass-through extension be expanded to include all pass-through devices, drugs, and biologicals that currently have pass-through status. One commenter acknowledged the requirement in section 1833(t)(2)(E) that equitable adjustments be budget neutral, but nonetheless suggested that to the extent possible, CMS should consider whether the adjustment to continue separate payment could be made in a non-budget neutral manner to minimize the impact of this policy on payment for other items and services under the OPPS.

Another commenter stated that if CMS finalizes use of its equitable adjustment authority to continue separate payment for certain pass-through products, it should not do so for products that have already had more than 3 years of pass-through status. One commenter stated that CMS should not use its equitable adjustment authority to provide separate payments for pass-through drugs, biologicals, and biosimilar biological products after pass-through status expires for these products where the products would continue to receive separate payment under our existing policy. Multiple commenters asked for our proposal to be applied to specific products or HCPCS codes; in some cases the commenters asserted that products on pass-through status experienced claims processing challenges that impacted data collection, ratesetting, and beneficiary access because of the effects of the PHE.

Response: We thank the commenters for the information provided in response to our proposal to utilize our equitable adjustment authority to pay separately for the remainder of CY 2022 for the device category, drugs, and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022. We note that our proposal was limited to an extension for those drugs, biologicals, and devices for which pass-through status is ending between December 31, 2021 and September 30, 2022 and for which we would otherwise use data from CY 2020 for ratesetting for these products in CY 2022. We agree that this proposal should not be applied to pass-through products that have previously received more than three years of pass-through status, however, to our knowledge no such product for which we proposed to provide continued separate payment has already had more than three years of pass-through status. In response to commenters' request that we implement the proposed adjustment in a non-budget neutral manner, we note that the equitable adjustment authority at section 1833(t)(2)(E) requires that any adjustments made under it be budget neutral.

Furthermore, we note that some commenters alleged that CMS is effectively removing 1 year of pass-through data with their decision to use CY 2019 as opposed to CY 2020 data for ratesetting. We note that CMS is required to provide between 2 and 3 years of pass-through payment status and that each drug, device and biological will have had at least 3 years of pass-through status under our proposal. We will continue to assess this issue as it relates to pass-through status and ratesetting in future years.

After considering the public comments, we are finalizing our proposal to utilize our equitable adjustment authority to pay separately for the remainder of CY 2022 for the device category, drugs, and biologicals with pass-through status that expires between December 31, 2021 and September 30, 2022.

XI. CY 2022 OPPS Payment Status and Comment Indicators

A. CY 2022 OPPS Payment Status Indicator Definitions

Payment status indicators (SIs) that we assign to HCPCS codes and APCs serve an important role in determining payment for services under the OPPS. They indicate whether a service represented by a HCPCS code is payable under the OPPS or another payment system, and also whether particular OPPS policies apply to the code.

For CY 2022, we did not propose to make any changes to the existing definitions of status indicators that were listed in Addendum D1 to the CY 2021 OPPS/ASC final rule with comment period available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/Hospital-Outpatient-Regulations-and-Notices*.

We did not receive any comments on the proposed definitions of the OPPS payment status indicators or their definitions for 2022. We believe that the existing definitions of the OPPS status indicators will continue to be appropriate for CY 2022. Therefore, we are finalizing those definitions without modification for CY 2022.

The complete list of payment status indicators and their definitions that would apply for CY 2022 is displayed in Addendum D1 to the CY 2022 OPPS/ASC final rule with comment period, which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/index.html*.

CY 2022 payment status indicator assignments for APCs and HCPCS codes are shown in Addendum A and Addendum B, respectively, to the CY 2022 OPPS/ASC final rule with comment period, which are available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/index.html*.

B. CY 2022 Comment Indicator Definitions

In the CY 2022 OPPS/ASC proposed rule, we proposed to use four comment indicators for the CY 2022 OPPS. These comment indicators, ''CH'', ''NC'', ''NI'', and ''NP'', are in effect for CY 2021 and we proposed to continue their use in CY 2022. The proposed CY 2022 OPPS comment indicators are as follows:

- ''CH''—Active HCPCS code in current and next calendar year, status indicator and/or APC assignment has changed; or active HCPCS code that will be discontinued at the end of the current calendar year.
- ''NC''—New code for the next calendar year or existing code with substantial revision to its code descriptor in the next calendar year, as compared to current calendar year for which we requested comments in the proposed rule, final APC assignment; comments will *not* be accepted on the final APC assignment for the new code.
- ''NI''—New code for the next calendar year or existing code with substantial revision to its code descriptor in the next calendar year, as compared to current calendar year,

interim APC assignment; comments will be accepted on the interim APC assignment for the new code.

• ''NP''—New code for the next calendar year or existing code with substantial revision to its code descriptor in the next calendar year, as compared to current calendar year, proposed APC assignment; comments will be accepted on the proposed APC assignment for the new code.

The definitions of the OPPS comment indicators for CY 2022 are listed in Addendum D2 to the CY 2022 OPPS/ASC final rule with comment period, which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/index.html*.

We did not receive any comments on the proposed definitions of the OPPS comment indicators for 2022.

We believe that the existing CY 2021 definitions of the OPPS comment indicators continue to be appropriate for CY 2022. Therefore, we are finalizing those definitions without modification for CY 2022.

XII. MedPAC Recommendations

The Medicare Payment Advisory Commission (MedPAC) was established under section 1805 of the Act in large part to advise the U.S. Congress on issues affecting the Medicare program. As required under the statute, MedPAC submits reports to the Congress no later than March and June of each year that present its Medicare payment policy recommendations. The March report typically provides discussion of Medicare payment policy across different payment systems and the June report typically discusses selected Medicare issues. We are including this section to make stakeholders aware of certain MedPAC recommendations for the OPPS and ASC payment systems as discussed in its March 2021 report.

A. OPPS Payment Rates Update

The March 2021 MedPAC ''Report to the Congress: Medicare Payment Policy,'' recommended that Congress update Medicare OPPS payment rates by 2 percent, with the difference between this and the update amount specified in current law to be used to increase payments in a new suggested Medicare quality program, the ''Hospital Value Incentive Program (HVIP).'' We refer readers to the March 2021 report for a complete discussion of these recommendations.[198] We appreciate MedPAC's recommendations, but as MedPAC acknowledged in its March 2021 report, the Congress would need to change current law to enable us to implement its recommendations. Comments received from MedPAC for other OPPS policies are discussed in the applicable sections of this final rule with comment period.

B. ASC Conversion Factor Update

In the March 2021 MedPAC ''Report to the Congress: Medicare Payment Policy,'' MedPAC found that, based on its analysis of indicators of payment adequacy, the number of ASCs had increased, beneficiaries' use of ASCs had increased, and ASC access to capital has been adequate.[199] As a result, for CY 2022, MedPAC stated that payments to ASCs are adequate and recommended that, in the absence of cost report data, no payment update should be given for CY 2022 (that is, the update factor would be zero percent).

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59079), we adopted a policy, which we codified at 42 CFR 416.171(a)(2), to apply the productivity-adjusted hospital market basket update to ASC payment system rates for an interim period of 5 years. We refer readers to the CY 2019 OPPS/ASC final rule with comment period for complete details regarding our policy to use the productivity-adjusted hospital market basket update for the ASC payment system for CY 2019 through CY 2023. Therefore, consistent with our policy for the ASC payment system, as discussed in section XIII.G. of the CY 2022 OPPS/ASC proposed rule, we proposed to apply a 2.3 percent productivity-adjusted hospital market basket update factor to the CY 2021 ASC conversion factor for ASCs meeting the quality reporting requirements to determine the CY 2022 ASC payment amounts. The final CY 2022 ASC conversion factor for ASCs meeting quality reporting requirements and the final hospital market basket update factor are discussed in section XIII. of this final rule with comment period.

C. ASC Cost Data

In the March 2021 MedPAC ''Report to the Congress: Medicare Payment Policy,'' MedPAC recommended that Congress require ASCs to report cost data to enable the Commission to examine the growth of ASCs' costs over time and analyze Medicare payments relative to the costs of efficient providers, and that CMS could use ASC cost data to examine whether an existing Medicare price index is an appropriate proxy for ASC costs or whether an ASC-specific market basket should be developed. Further, MedPAC suggested that CMS could limit the scope of the cost reporting system to minimize administrative burden on ASCs and the program but should make cost reporting a condition of ASC participation in the Medicare program.[200]

While we recognize that the submission of cost data could place additional administrative burden on most ASCs, and we did not propose any cost reporting requirements for ASCs in the CY 2022 OPPS/ASC proposed rule, we are interested in public comment on methods that would mitigate the burden of reporting costs on ASCs while also collecting enough data to reliably use such data in the determination of ASC costs. Such cost data would be beneficial in establishing an ASC-specific market basket index for updating payment rates under the ASC payment system.

Comment: MedPAC reiterated its previous recommendation and suggested that CMS should collect cost data from ASCs to set ASC payment rates that accurately reflect the costs of efficient providers and eliminate payment misalignments that exist as well as inform decisions about annual payment rate updates to the ASC payment system. MedPAC stated that it is feasible for ASCs to provide cost information and that smaller providers, such as hospices, currently provide such information to CMS. MedPAC suggested CMS could create a streamlined process of limited cost data with limited cost variables rather than a formal, and more time-consuming, cost report.

Other commenters suggested that CMS work closely with industry associations in developing the methodology for cost reporting. An ASC industry association suggested that CMS recognize that cost experience can differ greatly depending on factors such as the size of the facility, location, and the specialties served. Further, the ASC association suggested that if CMS were to collect ASC cost reports that we consider developing a single market

[198] Medicare Payment Advisory Committee. March 2021 Report to the Congress. Chapter 3: Hospital Inpatient and outpatient services, pp.81–82. Available at: *http://medpac.gov/docs/default-source/reports/mar21_medpac_report_to_the_congress_sec.pdf?sfvrsn=0*.

[200] Medicare Payment Advisory Committee. March 2021 Report to the Congress. Chapter 5: Ambulatory surgical center services, p.157. Available at: *http://medpac.gov/docs/default-source/reports/mar21_medpac_report_to_the_congress_sec.pdf?sfvrsn=0*.

basket update that could be applied to both ASCs as well as HOPDs.

Response: We appreciate MedPAC's comment regarding cost submission and feedback submitted by other commenters and will take them into consideration in future rulemaking. While we did not propose any cost reporting requirements for CY 2022, the comments we did receive are helpful as we continue to explore methods for obtaining cost information in a manner that does not place undue burden on ASCs.

Comments received from MedPAC for other ASC payment system policies are discussed in the applicable sections of this final rule with comment period. The full March 2021 MedPAC Report to Congress can be downloaded from MedPAC's website at: *http://www.medpac.gov*.

XIII. Updates to the Ambulatory Surgical Center (ASC) Payment System

A. Background

1. Legislative History, Statutory Authority, and Prior Rulemaking for the ASC Payment System

For a detailed discussion of the legislative history and statutory authority related to payments to ASCs under Medicare, we refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74377 through 74378) and the June 12, 1998 proposed rule (63 FR 32291 through 32292). For a discussion of prior rulemaking on the ASC payment system, we refer readers to the CYs 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, and 2021 OPPS/ASC final rules with comment period (76 FR 74378 through 74379; 77 FR 68434 through 68467; 78 FR 75064 through 75090; 79 FR 66915 through 66940; 80 FR 70474 through 70502; 81 FR 79732 through 79753; 82 FR 59401 through 59424; 83 FR 59028 through 59080; 84 FR 61370 through 61410, and 85 FR 86121 through 86179, respectively).

2. Policies Governing Changes to the Lists of Codes and Payment Rates for ASC Covered Surgical Procedures and Covered Ancillary Services

Under §§ 416.2 and 416.166 of the Medicare regulations, subject to certain exclusions, covered surgical procedures in an ASC are surgical procedures that are separately paid under the OPPS, are not designated as requiring inpatient care under § 419.22(n) as of December 31, 2020, are not only able to be reported using a CPT unlisted surgical procedure code, and are not otherwise excluded under § 411.15.

In previous years, we identified surgical procedures as those described by Category I CPT codes in the surgical range from 10000 through 69999 as well as those Category III CPT codes and Level II HCPCS codes that directly crosswalk or are clinically similar to procedures in the CPT surgical range that we have determined do not pose a significant safety risk, that we would not expect to require an overnight stay when performed in ASCs, and that are separately paid under the OPPS (72 FR 42478).

Covered ancillary services are specified in § 416.164(b) and, as stated previously, are eligible for separate ASC payment. As provided at § 416.164(b), we make separate ASC payments for the following ancillary items and services when they are provided integral to ASC covered surgical procedures: (1) Brachytherapy sources; (2) certain implantable items that have pass-through payment status under the OPPS; (3) certain items and services that we designate as contractor-priced, including, but not limited to, procurement of corneal tissue; (4) certain drugs and biologicals for which separate payment is allowed under the OPPS; (5) certain radiology services for which separate payment is allowed under the OPPS; and (6) non-opioid pain management drugs that function as a supply when used in a surgical procedure. Payment for ancillary items and services that are not paid separately under the ASC payment system is packaged into the ASC payment for the covered surgical procedure.

We update the lists of, and payment rates for, covered surgical procedures and covered ancillary services in ASCs in conjunction with the annual proposed and final rulemaking process to update the OPPS and the ASC payment system (§ 416.173; 72 FR 42535). We base ASC payment and policies for most covered surgical procedures, drugs, biologicals, and certain other covered ancillary services on the OPPS payment policies, and we use quarterly change requests (CRs) to update services paid for under the OPPS. We also provide quarterly update CRs for ASC covered surgical procedures and covered ancillary services throughout the year (January, April, July, and October). We release new and revised Level II HCPCS codes and recognize the release of new and revised CPT codes by the American Medical Association (AMA) and make these codes effective (that is, the codes are recognized on Medicare claims) via these ASC quarterly update CRs. We recognize the release of new and revised Category III CPT codes in the July and January CRs. These updates implement newly created and revised Level II HCPCS and Category III CPT codes for ASC payments and update the payment rates for separately paid drugs and biologicals based on the most recently submitted ASP data. New and revised Category I CPT codes, except vaccine codes, are released only once a year, and are implemented only through the January quarterly CR update. New and revised Category I CPT vaccine codes are released twice a year and are implemented through the January and July quarterly CR updates. We refer readers to Table 41 in the CY 2012 OPPS/ASC proposed rule for an example of how this process is used to update HCPCS and CPT codes, which we finalized in the CY 2012 OPPS/ASC final rule with comment period (76 FR 42291; 76 FR 74380 through 74384).

In our annual updates to the ASC list of, and payment rates for, covered surgical procedures and covered ancillary services, we undertake a review of excluded surgical procedures, new codes, and codes with revised descriptors, to identify any that we believe meet the criteria for designation as ASC covered surgical procedures or covered ancillary services. Updating the lists of ASC covered surgical procedures and covered ancillary services, as well as their payment rates, in association with the annual OPPS rulemaking cycle is particularly important because the OPPS relative payment weights and, in some cases, payment rates, are used as the basis for the payment of many covered surgical procedures and covered ancillary services under the revised ASC payment system. This joint update process ensures that the ASC updates occur in a regular, predictable, and timely manner.

3. Definition of ASC Covered Surgical Procedures

Since the implementation of the ASC prospective payment system, we have historically defined a ''surgical'' procedure under the payment system as any procedure described within the range of Category I CPT codes that the CPT Editorial Panel of the AMA defines as ''surgery'' (CPT codes 10000 through 69999) (72 FR 42478). We also have included as ''surgical,'' procedures that are described by Level II HCPCS codes or by Category III CPT codes that directly crosswalk or are clinically similar to procedures in the CPT surgical range.

As we noted in the August 7, 2007 final rule that implemented the revised ASC payment system, using this definition of surgery would exclude from ASC payment certain invasive,

''surgery-like'' procedures, such as cardiac catheterization or certain radiation treatment services that are assigned codes outside the CPT surgical range (72 FR 42477). We stated in that final rule that we believed continuing to rely on the CPT definition of surgery is administratively straightforward, is logically related to the categorization of services by physician experts who both establish the codes and perform the procedures, and is consistent with a policy to allow ASC payment for all outpatient surgical procedures.

However, in the CY 2019 OPPS/ASC final rule with comment period (83 FR 59029 through 59030), after consideration of public comments received in response to the CY 2019 OPPS/ASC proposed rule and earlier OPPS/ASC rulemaking cycles, we revised our definition of a surgical procedure under the ASC payment system. In that final rule, we defined a surgical procedure under the ASC payment system as any procedure described within the range of Category I CPT codes that the CPT Editorial Panel of the AMA defines as ''surgery'' (CPT codes 10000 through 69999) (72 FR 42476), as well as procedures that are described by Level II HCPCS codes or by Category I CPT codes or by Category III CPT codes that directly crosswalk or are clinically similar to procedures in the CPT surgical range that we determined met the general standards established in previous years for addition to the ASC CPL. These criteria included that a procedure is not expected to pose a significant risk to beneficiary safety when performed in an ASC, that standard medical practice dictates that the beneficiary would not typically be expected to require an overnight stay following the procedure, and that the procedure is separately paid under the OPPS. In CY 2021, we revised the definition of covered surgical procedures to surgical procedures specified by the Secretary that are separately paid under the OPPS, are not designated as requiring inpatient care under § 419.22(n) as of December 31, 2020, are not only able to be reported using a CPT unlisted surgical procedure code, and are not otherwise excluded under § 411.15 (85 FR 86153). As discussed in section XIII.C.1.d. of this final rule with comment period (below), we are finalizing our proposal for CY 2022 to revise the language in the regulation text at § 416.166 and reinstate the general standards and exclusion criteria in place prior to CY 2021.

B. ASC Treatment of New and Revised Codes

1. Background on Current Process for Recognizing New and Revised HCPCS Codes Payment for ASC procedures, services, and items are generally based on medical billing codes, specifically, HCPCS codes, that are reported on ASC claims. HCPCS codes are used to report procedures, services, items, and supplies under the ASC payment system. Specifically, we recognize the following codes on ASC claims:

- Category I CPT codes, which describe surgical procedures, diagnostic and therapeutic services, and vaccine codes;
- Category III CPT codes, which describe new and emerging technologies, services, and procedures; and
- Level II HCPCS codes (also known as alpha-numeric codes), which are used primarily to identify drugs, devices, supplies, temporary procedures, and services not described by CPT codes.

We finalized a policy in the August 2, 2007 ASC final rule (72 FR 42533 through 42535) to evaluate each year all new and revised Category I and Category III CPT codes and Level II HCPCS codes that describe surgical procedures, and to make preliminary determinations during the annual OPPS/ASC rulemaking process regarding whether or not they meet the criteria for payment in the ASC setting as covered surgical procedures and, if so, whether or not they are office-based procedures. In addition, we identify new and revised codes as ASC covered ancillary services based upon the final payment policies of the revised ASC payment system. In prior rulemakings, we refer to this process as recognizing new codes. However, this process has always involved the recognition of new and revised codes. We consider revised codes to be new when they have substantial revision to their code descriptors that necessitate a change in the current ASC payment indicator. We refer to these codes as new and revised in the CY 2022 OPPS/ASC proposed rule.

We have separated our discussion below based on when the codes are released and whether we proposed to solicit public comments in the CY 2022 OPPS/ASC proposed rule (and respond to those comments in the CY 2022 OPPS/ASC final rule with comment period) or whether we will be soliciting public comments in the CY 2022 OPPS/ASC final rule with comment period (and responding to those comments in the CY 2023 OPPS/ASC final rule with comment period).

We note that we sought public comments in the CY 2021 OPPS/ASC final rule with comment period (85 FR 85866) on the new and revised Level II HCPCS codes effective October 1, 2020 or January 1, 2021. These new and revised codes were flagged with comment indicator ''NI'' in Addenda AA and BB to the CY 2021 OPPS/ASC final rule with comment period to indicate that we were assigning them an interim payment status and payment rate, if applicable, which were subject to public comment following publication of the CY 2021 OPPS/ASC final rule with comment period. In the CY 2022 OPPS/ASC proposed rule, we stated that we will finalize the treatment of these codes under the ASC payment system in this CY 2022 OPPS/ASC final rule with comment period.

2. April 2021 HCPCS Codes for Which We Solicited Public Comments in the Proposed Rule

For the April 2021 update, there was one new CPT code and there were 11 new Level II HCPCS codes. In the April 2021 ASC quarterly update (Transmittal 10702, CR 12183, dated April 1, 2021), we added 11 new Level II HCPCS codes to the list of ASC covered surgical procedures and the list of covered ancillary services. Table 39 of the CY 2022 OPPS/ASC proposed rule displayed the new Level II HCPCS codes that were implemented April 1, 2021, along with their final payment indicators for CY 2022.

We invited public comments on the proposed payment indicators and payment rates for the new HCPCS codes that were recognized as ASC covered surgical procedures and ancillary services in April 2021 through the quarterly update CRs, as listed in Table 53. We proposed to finalize their payment indicators in this CY 2022 OPPS/ASC final rule with comment period.

We did not receive any comments on the proposed ASC payment indicator assignments for the new Level II HCPCS codes implemented in April 2021 and we are finalizing the proposed ASC payment indicator assignments for these codes, as indicated in Table 53. We note that several of the temporary drug HCPCS C-codes have been replaced with permanent drug HCPCS J-codes, effective January 1, 2022. Their replacement codes are also listed in Table 53.

The final comment indicators, payment indicators and payment rates, where applicable, for these April 2021 codes can be found in Addendum BB to this CY 2022 OPPS/ASC final rule with

comment period rule (which is available via the internet on the CMS website). The list of final ASC payment indicators and corresponding definitions can be found in Addendum DD1 to the CY 2022 OPPS/ASC final rule. These new codes that were effective April 1, 2021, were assigned to comment indicator ''NP'' in Addendum BB to the CY 2022 OPPS/ASC proposed rule to indicate that the codes were assigned to an interim APC assignment and that comments would be accepted on their interim APC assignments. Also, the list of final comment indicators and definitions used under the ASC payment system can be found in Addendum DD2 in this final rule with comment period. We note that ASC Addenda AA, BB, DD1, and DD2 are available via the internet on the CMS website.

BILLING CODE 4120–01–P

TABLE 53: NEW LEVEL II HCPCS CODES FOR ASC COVERED SURGICAL PROCEDURES AND COVERED ANCILLARY SERVICES EFFECTIVE ON APRIL 1, 2021

CY 2021 HCPCS Code	CY 2022 HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 PI
A9592	A9592	Copper cu-64, dotatate, diagnostic, 1 millicurie	K2
C9074	J0224	Injection, lumasiran, 0.5 mg	K2
C9776	C9776	Intraoperative near-infrared fluorescence imaging of major extra-hepatic bile duct(s) (e.g., cystic duct, common bile duct and common hepatic duct) with intravenous administration of indocyanine green (icg) (list separately in addition to code for primary procedure)	N1
C9777	C9777*	Esophageal mucosal integrity testing by electrical impedance, transoral, includes esophagoscopy or esophagogastroduodenoscopy	J8
J1427	J1427	Injection, viltolarsen, 10 mg	K2
J1554	J1554	Injection, immune globulin (asceniv), 500 mg	K2
J7402	J7402	Mometasone furoate sinus implant, (sinuva), 10 micrograms	K2
J9037	J9037	Injection, belantamab mafodontin-blmf, 0.5 mg	K2
J9349	J9349	Injection, tafasitamab-cxix, 2 mg	K2

*Effective January 1, 2022, the descriptor for HCPCS code C9777 has been revised to "Esophageal mucosal integrity testing by electrical impedance, transoral, includes esophagoscopy or esophagogastroduodenoscopy" to describe the service associated with performing both an MiVu test and an esophagoscopy or esophagogastroduodenoscopy test. When performed together, ASCs should report only HCPCS code C9777 and not report a separate HCPCS code for the esophagoscopy or esophagogastroduodenoscopy.

BILLING CODE 4120–01–C

3. July 2021 HCPCS Codes for Which We Solicited Public Comments in the Proposed Rule

In the July 2021 ASC quarterly update (Transmittal 10858, Change Request 12341, dated June 25, 2021), we added several separately payable CPT and Level II HCPCS codes to the list of covered surgical procedures and ancillary services. Table 40 of the CY 2022 OPPS/ASC proposed rule displayed the new HCPCS codes that were effective July 1, 2021. In addition, through the July 2021 quarterly update CR, we added 11 new Category III CPT codes to the list of ASC covered ancillary services, effective July 1, 2021. These codes were listed in Table 41 of the CY 2021 OPPS/ASC proposed rule, along with the proposed comment indicators and payment indicators.

We invited public comments on the proposed comment indicators and payment indicators for the new Level II HCPCS codes newly recognized as ASC covered surgical procedures and covered ancillary services and the new Category III CPT codes for covered ancillary services beginning in July 2021 through the quarterly update CRs, as

listed in Tables 40 and 41 of the CY 2022 OPPS/ASC proposed rule. We proposed to finalize the proposed payment indicators in this final rule with comment period.

We did not receive any public comments on the proposed ASC payment indicator assignments for the new Category III CPT codes or Level II HCPCS codes implemented in July 2021 and are finalizing the proposed ASC payment indicator assignments for these codes, as indicated in Tables 54 and 55. We note that several of the HCPCS C-codes have been replaced with HCPCS J-codes, effective January 1, 2022. Their replacement codes are listed in Table 54. The final CY 2022 payment rates for these new codes can be found in Addenda AA and BB to this final rule with comment period.

The list of final ASC payment indicators and corresponding definitions can be found in Addendum DD1 to this final rule with comment period (which is available via the internet on the CMS website). These new codes that were effective July 1, 2021, were assigned comment indicator ''NP'' in Addendum BB to the CY 2022 OPPS/ASC proposed rule to indicate that the codes were assigned to an interim APC assignment and that comments would be accepted on those assignments. The list of final comment indicators and definitions used under the ASC payment system can be found in Addendum DD2 to the CY 2022 OPPS/ASC final rule. We note that ASC Addenda AA, BB, DD1, and DD2 are available via the internet on the CMS website.

BILLING CODE 4120–01–P

TABLE 54: NEW LEVEL II HCPCS CODES FOR ASC COVERED SURGICAL PROCEDURES AND COVERED ANCILLARY SERVICES EFFECTIVE ON JULY 1, 2021

4. October 2021 HCPCS Codes for Which We Are Soliciting Public Comments in This CY 2022 OPPS/ASC Final Rule With Comment Period

In the past, we released new and revised HCPCS codes that are effective October 1 through the October OPPS quarterly update CRs and incorporated these new codes in the final rule with comment period.

For CY 2022, consistent with our established policy, we proposed that the Level II HCPCS codes that will be effective October 1, 2021, would be flagged with comment indicator ''NI'' in Addendum B to this final rule with comment period to indicate that we have assigned the codes an interim OPPS payment status for CY 2022. We did not receive any public comments regarding this proposed process; and, for CY 2022, we are finalizing our proposal, without modification, to continue our established process for recognizing and soliciting public comments on new Level II HCPCS codes that become effective on October 1, 2021. We note all codes flagged with comment indicator ''NI'' in ASC Addenda.

AA and BB to this final rule with comment period, including the codes effective October 1, 2021, will be assigned an interim payment status to indicate that they are subject to public comment.

In the October 2021 ASC quarterly update (Transmittal 11004, Change Request 12451, dated September 17, 2021), we added several separately payable Level II HCPCS codes to the list of covered surgical procedures and ancillary services. We note that because many of the new drug HCPCS J codes effective October 1 have predecessor HCPCS C-codes, they are not completely new to the ASC payment system, and have been paid separately under their predecessor codes. Table 56 shows the interim ASC payment indicators for the new codes effective October 1, 2021, with no predecessor codes. The final comment indicators, payment indicators, and payment rates, where applicable, for these October 2021 codes can be found in Addendum AA and Addendum BB to this CY 2022 OPPS/ASC final rule with comment period rule (which is available via the internet on the CMS website). Because these codes were effective October 1, 2021, we were not able to include them in the CY 2022 OPPS/ASC proposed rule that appeared in the **Federal Register** on August 4, 2021. We note that the definitions for the ASC payment indicators can be found in Addendum DD1 to this final rule with comment period. In addition, the definitions for the ASC comment indicators can be found in Addendum DD2 to this final rule with comment period. We are inviting public comments in this final rule with comment period for the codes listed in Table 56 on the interim payment indicators, which would then be finalized in the CY 2023 OPPS/ASC final rule with comment period.

TABLE 56: NEW LEVEL II HCPCS CODES FOR ASC COVERED SURGICAL PROCEDURES AND COVERED ANCILLARY SERVICES EFFECTIVE ON OCTOBER 1, 2021

CY 2021 HCPCS Code	CY 2022 HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 PI
C1831	C1831	Personalized, anterior and lateral interbody cage (implantable)	J7

BILLING CODE 4120–01–C

5. January 2022 HCPCS Codes

a. Level II HCPCS Codes for Which We Are Soliciting Public Comments in This CY 2022 OPPS/ASC Final Rule With Comment Period

As has been our practice in the past, we incorporate those new Level II HCPCS codes that are effective January 1 in the final rule with comment period, thereby updating the ASC payment system for the calendar year. We note that unlike the CPT codes that are effective January 1 and are included in the OPPS/ASC proposed rules, and except for the G-codes listed in Addendum O to the CY 2022 OPPS/ASC proposed rule, most Level II HCPCS codes are not released until sometime around November to be effective January 1. Because these codes are not available until November, we are unable to include them in the OPPS/ASC proposed rules, however, the codes are flagged with comment indicator ''NI'' in ASC Addenda AA and BB to this final rule with comment period to indicate that we are assigning them an interim payment status, which is subject to public comment. Therefore, as we stated in the CY 2022 OPPS/ASC proposed rule, these Level II HCPCS codes that will be effective January 1, 2022 will be released to the public through the January 2022 ASC Update CR and included on the CMS HCPCS website and in this final rule with comment period.

In addition, for CY 2022, we proposed to continue our established policy of assigning comment indicator ''NI'' in Addendum AA and Addendum BB to the OPPS/ASC final rule with comment period to the new Level II HCPCS codes that will be effective January 1, 2022, to indicate that we are assigning them an interim payment indicator, which is subject to public comment. We are inviting public comments in this final rule with comment period on the payment indicator assignments, which would then be finalized in the CY 2023 OPPS/ASC final rule with comment period.

b. CPT Codes for Which We Solicited Public Comments in the CY 2022 OPPS/ASC Proposed Rule

For new and revised CPT codes effective January 1, 2022, that were received in time to be included in the CY 2022 OPPS/ASC proposed rule, we proposed the appropriate payment indicator assignments, and solicited public comments on those assignments. We stated we would accept comments and finalize the payment indicators in this final rule with comment period. For those new/revised CPT codes that were received too late for inclusion of the CY 2022 OPPS/ASC proposed rule, we stated that we may either make interim final assignments in this final rule with comment period or use HCPCS G codes that mirror the predecessor CPT codes and retain the current APC and status indicator assignments for a year until we can propose APC and status indicator assignments in the following year's rulemaking cycle.

For the CY 2022 ASC update, the new and revised Category I and III CPT codes that will be effective on January 1, 2022, can be found in ASC Addendum AA and Addendum BB to this final rule with comment period (which are available via the internet on the CMS website). The CPT codes are assigned to comment indicator ''NP'' to indicate that the code is new for the next calendar year or the code is an existing code with substantial revision to its code descriptor in the next calendar year as compared to the current calendar year and that comments will be accepted on the proposed payment indicator. Further, we remind readers that the CPT code descriptors that appear in Addendum AA and Addendum BB are short descriptors and do not describe the complete procedure, service, or item described by the CPT code. Therefore, we included the 5-digit placeholder codes and their long descriptors for the new and revised CY 2022 CPT codes in Addendum O to the CY 2022 OPPS/ASC proposed rule (which is available via the internet on the CMS website) so that the public could adequately comment on our proposed payment indicator assignments. The 5-digit placeholder codes were in Addendum O to the CY 2022 OPPS/ASC proposed rule, specifically under the column labeled ''CY 2021 OPPS/ASC Proposed Rule 5-Digit Placeholder Code.'' The final CPT code numbers are included in this final rule with comment period, and can be found in Addendum AA, Addendum BB, and Addendum O.

In summary, we solicited public comments on the proposed CY 2022 payment indicators for the new and revised Category I and III CPT codes that will be effective January 1, 2022. Because these codes are listed in Addenda AA and Addendum BB with short descriptors only, we listed them again in Addendum O with the long descriptors. We also proposed to finalize the payment indicator for these codes (with their final CPT code numbers) in this final rule with comment period. The final payment indicator and comment indicator for these codes can be found in Addendum AA and BB to this final rule with comment period. The list of ASC payment indicators and corresponding definitions can be found in Addendum DD1 to this final rule with comment period. These new CPT codes that will be effective January 1, 2022, were assigned to comment indicator ''NP'' in Addendum AA and BB to the CY 2022 OPPS/ASC proposed rule to indicate that the codes were assigned to an interim payment indicator and that comments would be accepted on their interim ASC payment assignments. Also, the list of comment indicators and definitions used under the ASC can be found in Addendum DD2 of this final rule with comment period. We note that ASC Addenda AA, BB, DD1, and DD2 are available via the internet on the CMS website.

Finally, in Table 57 below, we summarize our process for updating codes through our ASC quarterly update CRs, seeking public comments, and finalizing the treatment of these new codes under the ASC payment system.

BILLING CODE 4120–01–P

TABLE 57: COMMENT AND FINALIZATION TIMEFRAMES FOR NEW AND REVISED HCPCS CODES

BILLING CODE 4120–01–C

C. Update to the List of ASC Covered Surgical Procedures and Covered Ancillary Services

1. Covered Surgical Procedures

a. Covered Surgical Procedures Designated as Office-Based

(1) Background

In the August 2, 2007 ASC final rule, we finalized our policy to designate as ''office-based'' those procedures that are added to the ASC Covered Procedures List (CPL) in CY 2008 or later years that we determine are furnished predominantly (more than 50 percent of the time) in physicians' offices based on consideration of the most recent available volume and utilization data for each individual procedure code and/or, if appropriate, the clinical characteristics, utilization, and volume of related codes. In that rule, we also finalized our policy to exempt all procedures on the CY 2007 ASC list from application of the office-based classification (72 FR 42512). The procedures that were added to the ASC CPL beginning in CY 2008 that we determined were office-based were identified in Addendum AA to that rule with payment indicator ''P2'' (Office-based surgical procedure added to ASC list in CY 2008 or later with MPFS nonfacility PE RVUs; payment based on OPPS relative payment weight); ''P3'' (Office-based surgical procedures added to ASC list in CY 2008 or later with MPFS nonfacility PE RVUs; payment based on MPFS nonfacility PE RVUs); or ''R2'' (Office-based surgical procedure added to ASC list in CY 2008 or later without MPFS nonfacility PE RVUs; payment based on OPPS relative payment weight), depending on whether we estimated the procedure would be paid according to the ASC standard ratesetting methodology based on its OPPS relative payment weight or at the MPFS nonfacility PE RVU-based amount.

Consistent with our final policy to annually review and update the ASC CPL to include all covered surgical procedures eligible for payment in ASCs, each year we identify covered surgical procedures as either temporarily office-based (these are new procedure codes with little or no utilization data that we have determined are clinically similar to other procedures that are permanently office-based), permanently office-based, or nonoffice-based, after taking into account updated volume and utilization data.

Comment: A number of commenters requested that we modify our approach to incorporate PFS nonfacility PE RVUs in response to our proposal to update clinical labor pricing data in the CY 2022 PFS proposed rule. These commenters contended that our proposal to update clinical labor pricing data would cause significant declines in ASC payment for certain office-based services. The commenters recommended we delay or transition the proposed changes in nonfacility PE RVUs under the ASC payment system.

Response: We are not accepting this recommendation. While we acknowledge that certain proposals under the PFS may have a downstream impact on ASC payment rates for office-based procedures, our office-based policy is meant to achieve payment parity between the ASC and physician office settings. Therefore, we believe ASC payment rates for office-based procedures should be consistent with the PFS payment rates where nonfacility PE RVU data is available. Additionally,

under the PFS, we are finalizing a policy to update clinical labor pricing over a four-year transition. For more information on the proposed clinical labor pricing update under the PFS, see 86 FR 39118 through 39123.

(2) Changes for CY 2022 to Covered Surgical Procedures Designated as Office-Based

In developing the CY 2022 OPPS/ASC proposed rule, we followed our policy to annually review and update the covered surgical procedures for which ASC payment is made and to identify new procedures that may be appropriate for ASC payment (described in detail in section XIII.C.1.d. of this final rule with comment period), including their potential designation as office-based. Historically, we would also review the most recent claims volume and utilization data (CY 2020 claims) and the clinical characteristics for all covered surgical procedures that are currently assigned a payment indicator in CY 2020 of ''G2'' (Non office-based surgical procedure added in CY 2008 or later; payment based on OPPS relative payment weight), as well as for those procedures assigned one of the temporary office-based payment indicators, specifically ''P2'', ''P3'', or ''R2'' in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86131 through 86139). However, as discussed in section X.E of the CY 2022 OPPS/ASC proposed rule (86 FR 42188 through 42190), given our concerns with CY 2020 claims data as a result of the PHE, we did not propose to review the most recent claims volume and utilization data from CY 2020 claims and instead we proposed not to assign permanent office-based designations for CY 2022 to any covered surgical procedure currently assigned a payment indicator of ''G2'' (Non office-based surgical procedure added in CY 2008 or later; payment based on OPPS relative payment weight).

Similarly, we also proposed not to use the most recent claims volume and utilization data and other information for procedures designated as temporarily office-based and temporarily assigned one of the office-based payment indicators, specifically ''P2,'' ''P3'' or ''R2''. Instead, we proposed to continue to designate these procedures, shown in Table 58 below, as temporarily office-based for CY 2022. CPT code 0551T (Transperineal periurethral balloon continence device; adjustment of balloon(s) fluid volume) is removed from Table 58 below as this code is being deleted effective January 1, 2022. The procedures we proposed to designate as temporarily office-based for CY 2022 are identified with an asterisk in Addendum AA to this final rule with comment period (which is available via the internet on the CMS website).

BILLING CODE 4120–01–P

TABLE 58: PROPOSED CY 2022 PAYMENT INDICATORS FOR ASC COVERED SURGICAL PROCEDURES DESIGNATED AS TEMPORARILY OFFICE-BASED IN THE CY 2021 OPPS/ASC FINAL RULE

CY 2022 CPT/HCPCS Code	CY 2022 Long Descriptor	CY 2021 ASC Payment Indicator	Final CY 2022 ASC Payment Indicator*
64454	Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches, including imaging guidance, when performed	P3	P3*
65785	Implantation of intrastromal corneal ring segments	P2	P2*
67229	Treatment of extensive or progressive retinopathy, 1 or more sessions, preterm infant (less than 37 weeks gestation at birth), performed from birth up to 1 year of age (e.g., retinopathy of prematurity), photocoagulation or cryotherapy	R2	R2*
0402T	Collagen cross-linking of cornea, including removal of the corneal epithelium and intraoperative pachymetry, when performed (report medication separately)	R2	R2*
0512T	Extracorporeal shock wave for integumentary wound healing, high energy, including topical application and dressing care; initial wound	R2	R2*
0588T	Revision or removal of integrated single device neurostimulation system including electrode array and receiver or pulse generator, including analysis, programming, and imaging guidance when performed, posterior tibial nerve	R2	R2*
93985	Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete bilateral study	P2	P2*
93986	Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete unilateral study	P2	P2*

* Payment indicators are based on a comparison of the final rates according to the ASC standard ratesetting methodology and the CY 2022 PFS final rates. For a discussion of the final PFS rates, we refer readers to the CY 2022 PFS final rule.

BILLING CODE 4120–01–C

As discussed in the August 2, 2007 ASC final rule revised ASC payment system final rule (72 FR 42533 through 42535), we finalized our policy to designate certain new surgical procedures as temporarily office-based until adequate claims data are available to assess their predominant sites of service, whereupon if we confirm their office-based nature, the procedures would be permanently assigned to the list of office-based procedures. In the absence of claims data, we stated we would use other available information, including our clinical advisors' judgment, predecessor CPT and Level II HCPCS codes, information submitted by representatives of specialty societies and professional associations, and information submitted by commenters during the public comment period.

For CY 2022, we proposed to designate two new CY 2022 CPT codes for ASC covered surgical procedures as temporarily office-based. After reviewing the clinical characteristics, utilization, and volume of related procedure codes, we determined that the procedures listed in Table 59 would be predominantly performed in physicians' offices. We believe the procedure described by CPT code 42975

(Drug-induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep-disordered breathing, flexible, diagnostic) is similar to CPT code 31505 (Laryngoscopy, indirect; diagnostic (separate procedure)) which is currently on the list of ASC covered surgical procedures and was assigned a final payment indicator of ''P3''—Office-based surgical procedure added to ASC list in CY 2008 or later with MPFS nonfacility PE RVUs; payment based on MPFS nonfacility PE RVUs—in CY 2021. Additionally, we believe the procedure described by CPT code 53454 (Periurethral transperineal adjustable balloon continence device; percutaneous adjustment of balloon(s) fluid volume) is similar to CPT code 0551T (Transperineal periurethral balloon continence device; adjustment of balloon(s) fluid volume), which is currently on the list of ASC covered surgical procedures and was assigned a final payment indicator of ''R2''—Office-based surgical procedure added to ASC list in CY 2008 or later without MPFS nonfacility PE RVUs; payment based on OPPS relative payment weight—for CY 2021. As such, we proposed to add CPT codes 42975 (CMS placeholder code 42XXX) and 53454 (CMS placeholder code 53XX4) in Table 59 to the list of ASC covered surgical procedures designated as temporarily office-based for CY 2022.

TABLE 59: CY 2022 PAYMENT INDICATORS FOR NEW CY 2022 CPT CODES FOR ASC COVERED SURGICAL PROCEDURES DESIGNATED AS TEMPORARILY OFFICE-BASED

CY 2022 CPT code	CY 2022 OPPS/ASC proposed rule 5-digit CMS placeholder code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator**
42975	42XXX	Drug-induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep-disordered breathing, flexible, diagnostic	R2**
53454	53XX4	Periurethral transperineal adjustable balloon continence device; percutaneous adjustment of balloon(s) fluid volume	R2**

** Payment indicators are based on a comparison of the proposed rates according to the ASC standard ratesetting methodology and the CY 2022 PFS proposed rates. For a discussion of the PFS rates, we refer readers to the CY 2022 PFS proposed rule.

Comment: One commenter recommended that we not assign office-based payment indicator ''P3'' to CPT code 64640 (Destruction by neurolytic agent; other peripheral nerve or branch) and suggested this procedure is not predominantly performed in the office setting.

Response: CPT code 64640 has been assigned permanent office-based status since CY 2008. With the exceptions of procedures assigned temporary office-based status and calendar years for which office-based procedures meet the criteria to be assigned device-intensive status, office-based procedures are not eligible to remove their office-based designation. As discussed previously, these are permanent assignments. While we acknowledge that certain office-based procedures can become more predominantly performed in higher cost settings, such as a hospital outpatient department, we do not believe this suggests that our office-based payment policy is hindering access to care for these procedures in an ASC setting.

Comment: One commenter recommended we reevaluate the permanent office-based designation for CPT code 42975. The commenter suggested that this procedure is more similar to CPT code 31546 (Laryngoscopy, direct, operative, with operating microscope or telescope, with submucosal removal of non-neoplastic lesion(s) of vocal cord; reconstruction with graft(s) (includes obtaining autograft))—a procedure that is not predominantly performed in a physician office setting.

Response: We are not accepting this recommendation. As discussed previously, we believe the procedure described by CPT code 42975 is similar to CPT code 31505 (Laryngoscopy, indirect; diagnostic (separate procedure)), which is predominantly performed in the physician office setting and is currently on the list of ASC covered surgical procedures and was assigned a final payment indicator of ''P3''—Office-based surgical procedure added to ASC list in CY 2008 or later with MPFS nonfacility PE RVUs; payment based on MPFS nonfacility PE RVUs—in CY 2021.

After reviewing the public comments we received, we are finalizing our proposal, without modification, to designate the procedures shown in Tables 58 and 59 above as temporarily office-based. The procedures for which the office-based designation for CY 2022 is temporary are indicated by an asterisk in Addendum AA to this final rule with

comment period (which is available via the internet on the CMS website).

b. Device-Intensive ASC Covered Surgical Procedures

(1) Background

We refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 59040 through 59041), for a summary of our existing policies regarding ASC covered surgical procedures that are designated as device-intensive.

(2) Changes to List of ASC Covered Surgical Procedures Designated as Device-Intensive for CY 2022

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 590401 through 59043), for CY 2019, we modified our criteria for device-intensive procedures to better capture costs for procedures with significant device costs. We adopted a policy to allow procedures that involve surgically inserted or implanted, high-cost, single-use devices to qualify as device-intensive procedures. In addition, we modified our criteria to lower the device offset percentage threshold from 40 percent to 30 percent. Specifically, for CY 2019 and subsequent years, we adopted a policy that device-intensive procedures would be subject to the following criteria:

- All procedures must involve implantable devices assigned a CPT or HCPCS code;
- The required devices (including single-use devices) must be surgically inserted or implanted; and
- The device offset amount must be significant, which is defined as exceeding 30 percent of the procedure's mean cost. Corresponding to this change in the cost criterion we adopted a policy that the default device offset for new codes that describe procedures that involve the implantation of medical devices will be 31 percent beginning in CY 2019. For new codes describing procedures that are payable when furnished in an ASC and involve the implantation of a medical device, we adopted a policy that the default device offset would be applied in the same manner as the policy we adopted in section IV.B.2. of the CY 2019 OPPS/ASC final rule with comment period (83 FR 58944 through 58948). We amended § 416.171(b)(2) of the regulations to reflect these new device criteria.

In addition, as also adopted in section IV.B.2. of CY 2019 OPPS/ASC final rule with comment period, to further align the device-intensive policy with the criteria used for device pass-through status, we specified, for CY 2019 and subsequent years, that for purposes of satisfying the device-intensive criteria, a device-intensive procedure must involve a device that:

- Has received FDA marketing authorization, has received an FDA investigational device exemption (IDE) and has been classified as a Category B device by FDA in accordance with 42 CFR 405.203 through 405.207 and 405.211 through 405.215, or meets another appropriate FDA exemption from premarket review;
- Is an integral part of the service furnished;
- Is used for one patient only;
- Comes in contact with human tissue;
- Is surgically implanted or inserted (either permanently or temporarily); and
- Is not any of the following:

++ Equipment, an instrument, apparatus, implement, or item of this type for which depreciation and financing expenses are recovered as depreciable assets as defined in Chapter 1 of the Medicare Provider Reimbursement Manual (CMS Pub. 15–1); or

++ A material or supply furnished incident to a service (for example, a suture, customized surgical kit, scalpel, or clip, other than a radiological site marker).

Based on these criteria, for 2022, we proposed to update the ASC CPL to indicate procedures that are eligible for payment according to our device-intensive procedure payment methodology, based on the proposed individual HCPCS code device-offset percentages using the CY 2019 OPPS claims and cost report data available for the CY 2022 OPPS/ASC proposed rule.

The ASC covered surgical procedures that we proposed to designate as device-intensive, and therefore subject to the device-intensive procedure payment methodology for CY 2022, are assigned payment indicator ''J8'' and are included in ASC Addendum AA to the CY 2022 OPPS/ASC proposed rule (which is available via the internet on the CMS website). The CPT code, the CPT code short descriptor, the proposed CY 2022 ASC payment indicator, and an indication of whether the full credit/partial credit (FB/FC) device adjustment policy would apply because the procedure is designated as device-intensive are also included in Addendum AA to the proposed rule (which is available via the internet on the CMS website).

Under current policy, the payment rate under the ASC payment system for device-intensive procedures furnished with an implantable or inserted medical device are calculated by applying the device offset percentage based on the ASC standard ratesetting methodology to the OPPS national unadjusted payment based on the ASC standard ratesetting methodology to determine the device cost included in the OPPS payment rate for a device-intensive ASC covered surgical procedure, which we then set as equal to the device portion of the national unadjusted ASC payment rate for the procedure. We calculate the service portion of the ASC payment for device intensive procedures by applying the uniform ASC conversion factor to the service (non-device) portion of the OPPS relative payment weight for the device-intensive procedure. Finally, we sum the ASC device portion and ASC service portion to establish the full payment for the device-intensive procedure under the ASC payment system (82 FR 59409).

In past rulemaking (79 FR 66924), we have stated that the device-intensive methodology for ASCs should align with the device-intensive policies under the OPPS. Further, we have stated that we do not believe that procedures are device-intensive in one setting and not in another setting. We have heard concerns from stakeholders that our methodology does not provide device-intensive status to certain procedures even though the procedures' device offset percentages are greater than our 30 percent threshold when calculated under the standard ASC ratesetting methodology. We have also heard concerns from stakeholders that procedures designated as device-intensive under the OPPS are not assigned device-intensive status under the ASC payment system even though the procedure has significant device costs.

The different ratesetting methodologies used under the OPPS and ASC payment system can create conflicts when determining device-intensive status. For example, procedures with device offset percentages greater than 30 percent under the OPPS may not have device offset percentages greater than 30 percent when calculated under the standard ASC ratesetting methodology. Under current policy, procedures must be device-intensive in the OPPS setting to be eligible for device-intensive status under the ASC payment system. However, this methodology has caused confusion among stakeholders and has denied device-intensive status to procedures with significant device costs. While we believe that device-intensive policies under the ASC payment system should align with device-intensive policies under the OPPS, we believe device-intensive

status under the ASC payment system should, at a minimum, reflect a procedure's estimated device costs under the ASC standard ratesetting methodology. Therefore, for CY 2022 and subsequent years, we proposed to assign device-intensive status to procedures that involve surgically inserted or implanted, high-cost, single-use devices to qualify as device-intensive procedures if their device offset percentage exceeds 30 percent under the ASC standard ratesetting methodology, even if the procedure is not designated as device-intensive under the OPPS.

Further, in situations where a procedure is designated as device-intensive under the OPPS but the procedure's device offset percentage is below the device-intensive threshold under the standard ASC ratesetting methodology, we believe that deference should be given to the OPPS designation to address this conflict in status. Since the comprehensive ratesetting methodology under the OPPS packages a greater amount of non-device costs into the primary procedure and is typically able to use a greater number of claims in its ratesetting methodology, we believe that if a device receives OPPS device-intensive status, the device should also be device-intensive in the ASC setting, given that fewer non-device costs are generally packaged into a procedure's cost under the ASC methodology compared to the OPPS methodology. Therefore, for CY 2022 and subsequent years, we proposed that if a procedure is assigned device-intensive status under the OPPS, but has a device offset percentage below the device-intensive threshold under the standard ASC ratesetting methodology, the procedure will be assigned device-intensive status under the ASC payment system with a default device offset percentage of 31 percent.

We solicited comments on our proposed changes related to designating surgical procedures as device-intensive under the ASC payment system.

Comment: Many commenters supported our proposed changes related to designating surgical procedures as device-intensive under the ASC payment system. One commenter requested that we allow for the continuation of the default device offset percentage of 31 percent for procedures with fewer than 100 claims if the device offset percentage under the comprehensive and standard ratesetting methodology is less than 30 percent.

Response: We thank the commenters for their support of our proposal. We do not believe it would be appropriate to eliminate our device offset calculation for procedures with fewer than 100 claims because it is not our general policy to judge the accuracy of hospital charging and hospital cost reporting practices for purposes of ratesetting. Therefore, we will continue to rely on available claims data for determining device offset percentages for procedures with fewer than 100 claims.

Comment: Many commenters requested that we apply the device offset percentage for several new procedures with the predecessor code's device offset percentage based on CY 2019 claims data. These procedures include:

- The predecessor CPT code 0191T in assigning the device offset percentage for CPT code 66989 (Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (*e.g.,* irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (*e.g.,* iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (*e.g.,* trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more);
- The predecessor CPT code 0191T in assigning the device offset percentage for CPT code 66991 (Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (*e.g.,* irrigation and aspiration or phacoemulsification); with insertion of intraocular (*e.g.,* trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more);
- The predecessor CPT code 0191T in assigning the device offset percentage for CPT code 0671T (Insertion of anterior segment aqueous drainage device into the trabecular meshwork, without external reservoir, and without concomitant cataract removal, one or more);
- The predecessor CPT code 0548T in assigning the device offset percentage for CPT code 53451 (Periurethral transperineal adjustable balloon continence device; bilateral insertion, including cystourethroscopy and imaging guidance);
- The predecessor CPT code 0549T in assigning the device offset percentage for CPT code 53452 (Periurethral transperineal adjustable balloon continence device; unilateral insertion, including cystourethroscopy and imaging guidance); and
- The predecessor HCPCS code C9752 in assigning the device offset percentage for CPT code 64628 (Thermal destruction of intraosseous basivertebral nerve, including all imaging guidance; first 2 vertebral bodies, lumbar or sacral).

Additionally, at the August 18, 2021 HOP Panel Meeting, a presenter requested that we use the predecessor CPT code 64568 (Incision for implantation of cranial nerve (*e.g.,* vagus nerve) neurostimulator electrode array and pulse generator) in assigning the device offset percentage for CPT code 64582 (Open implantation of hypoglossal nerve neurostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array). Based on the information presented at the meeting, the HOP Panel recommended we use CPT code 64568 to assign the device offset percentage for CPT code 64582.

Response: We agree with the commenters and the HOP Panel's recommendation. We note that we inadvertently did not apply device offset percentages to the new HCPCS codes mentioned by commenters and recommended by the HOP Panel where claims data of a predecessor code was available. Therefore, we are revising the device offset percentages for these procedures for this final rule to use CY 2019 claims data from these procedures' predecessor codes.

Comment: One commenter requested that we assign HCPCS code C9778 (Colpopexy, vaginal; minimally invasive extra-peritoneal approach (sacrospinous)) device-intensive status as this procedure meets our device-intensive criteria.

Response: After further review, we agree with the commenter that HCPCS code C9778 meets our criteria for device-intensive status. We are accepting the commenter's recommendation and assigning a default device offset percentage of 31 percent to HCPCS code C9778 under the ASC payment system for CY 2022.

Comment: Commenters requested that we assign device-intensive status to:

- CPT code 0499T (Cystourethroscopy, with mechanical dilation and urethral therapeutic drug delivery for urethral stricture or stenosis, including fluoroscopy, when performed);
- CPT code 58674 (Laparoscopy, surgical, ablation of uterine fibroid(s) including intraoperative ultrasound guidance and monitoring, radiofrequency);

- CPT code 50590 (Lithotripsy, extracorporeal shock wave);
- CPT code 59200 (Insertion of cervical dilator (*e.g.,* laminaria, prostaglandin) (separate procedure));
- CPT code 66174 (Transluminal dilation of aqueous outflow canal; without retention of device or stent);
- CPT code 66175 (Transluminal dilation of aqueous outflow canal; with retention of device or stent);
- CPT code 93571 (Intravascular doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; initial vessel (list separately in addition to code for primary procedure); and
- HCPCS code C9757 (Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and excision of herniated intervertebral disc, and repair of annular defect with implantation of bone anchored annular closure device, including annular defect measurement, alignment and sizing assessment, and image guidance; 1 interspace, lumbar).

Response: Based on CY 2019 claims data available for this final rule, the procedures requested by commenters do not have device offset percentages that exceed the 30-percent threshold required for device-intensive status under the OPPS or ASC payment system and, therefore, are not eligible to be assigned device-intensive status.

Comment: Some commenters recommended that the 30 percent device-intensive threshold be based on the final ASC payment rate and not OPPS costs. Additionally, one commenter requested that we lower the device-intensive threshold to 25 percent.

Response: We do not believe device offset percentages should be determined by dividing the OPPS-derived device offset portion by the final ASC payment rate as this would, in effect, be substantially reducing the device-intensive threshold under the ASC payment system. As we stated in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86015), lowering the device-intensive threshold assigns a greater amount of device costs, which are held constant between the OPPS and ASC payment system, into the prospective year. Lowering the device-intensive threshold, even to 25 percent, would put additional downward pressure on the ASC weight scalar and reduce the nondevice portion of ASC payment rates for surgical procedures. Therefore, for these reasons we are not accepting these recommendations.

Comment: One commenter suggested that we modify the device-intensive criteria to allow packaged procedures that trigger a complexity adjustment under OPPS to be eligible for device-intensive status under the ASC payment system.

Response: We do not believe any changes are warranted to our packaging policies under the ASC payment system at this time. Therefore, we are not accepting this comment but may consider it in future rulemaking.

Comment: One commenter recommended we publish an Addendum to our proposed and final rules that displays the device offset percentages for both device-intensive and nondevice-intensive procedures under the ASC payment system similar to Addendum P for the OPPS.

Response: We are accepting this recommendation. We are creating an Addendum FF for this final rule with comment period and subsequent proposed and final rules that will display the device offset percentages calculated under the standard ASC ratesetting methodology for covered surgical procedures.

After review of the public comments we received, we are finalizing our proposed methodology, without modification, to designate surgical procedures as device-intensive under the ASC payment system. Specifically, for CY 2022 and subsequent years, we are finalizing our proposal to designate procedures as device-intensive procedures if their device offset percentage exceeds 30 percent under the ASC standard ratesetting methodology, even if the procedure is not designated as device-intensive under the OPPS. Additionally, for CY 2022 and subsequent years, we are finalizing our proposal that if a procedure is assigned device-intensive status under the OPPS, but has a device offset percentage below the device-intensive threshold under the standard ASC ratesetting methodology, the procedure will be assigned device-intensive status under the ASC payment system with a default device offset percentage of 31 percent.

Additionally, after reviewing the public comments we received, we are designating the ASC covered surgical procedures displayed in Addendum AA with payment indicator ''J8'' as device-intensive and subject to the device-intensive procedure payment methodology for CY 2022. The full listing of the final CY 2022 device offset percentages under the ASC payment system for covered surgical procedures can be found in Addendum FF to the CY 2022 OPPS/ASC final rule with comment period (which is available via the internet on the CMS website).

c. Adjustment to ASC Payments for No Cost/Full Credit and Partial Credit Devices

Our ASC payment policy for costly devices implanted or inserted in ASCs at no cost/full credit or partial credit is set forth in § 416.179 of our regulations, and is consistent with the OPPS policy that was in effect until CY 2014. We refer readers to the CY 2008 OPPS/ASC final rule with comment period (72 FR 66845 through 66848) for a full discussion of the ASC payment adjustment policy for no cost/full credit and partial credit devices. ASC payment is reduced by 100 percent of the device offset amount when a hospital furnishes a specified device without cost or with a full credit and by 50 percent of the device offset amount when the hospital receives partial credit in the amount of 50 percent or more of the cost for the specified device.

Effective CY 2014, under the OPPS, we finalized our proposal to reduce OPPS payment for applicable APCs by the full or partial credit a provider receives for a device, capped at the device offset amount. Although we finalized our proposal to modify the policy of reducing payments when a hospital furnishes a specified device without cost or with full or partial credit under the OPPS, in the CY 2014 OPPS/ASC final rule with comment period (78 FR 75076 through 75080), we finalized our proposal to maintain our ASC policy for reducing payments to ASCs for specified device-intensive procedures when the ASC furnishes a device without cost or with full or partial credit. Unlike the OPPS, there is currently no mechanism within the ASC claims processing system for ASCs to submit to CMS the amount of the actual credit received when furnishing a specified device at full or partial credit. Therefore, under the ASC payment system, we finalized our proposal for CY 2014 to continue to reduce ASC payments by 100 percent or 50 percent of the device offset amount when an ASC furnishes a device without cost or with full or partial credit, respectively.

Under current ASC policy, all ASC device-intensive covered surgical procedures are subject to the no cost/full credit and partial credit device adjustment policy. Specifically, when a device-intensive procedure is performed to implant or insert a device that is furnished at no cost or with full credit from the manufacturer, the ASC would append the HCPCS ''FB'' modifier on the line in the claim with the procedure

to implant or insert the device. The contractor would reduce payment to the ASC by the device offset amount that we estimate represents the cost of the device when the necessary device is furnished without cost or with full credit to the ASC. We continue to believe that the reduction of ASC payment in these circumstances is necessary to pay appropriately for the covered surgical procedure furnished by the ASC.

Effective in CY 2019 (83 FR 59043 through 59044), for partial credit, we adopted a policy to reduce the payment for a device-intensive procedure for which the ASC receives partial credit by one-half of the device offset amount that would be applied if a device was provided at no cost or with full credit, if the credit to the ASC is 50 percent or more (but less than 100 percent) of the cost of the new device. The ASC will append the HCPCS ''FC'' modifier to the HCPCS code for the device-intensive surgical procedure when the facility receives a partial credit of 50 percent or more (but less than 100 percent) of the cost of a device. To report that the ASC received a partial credit of 50 percent or more (but less than 100 percent) of the cost of a new device, ASCs have the option of either: (1) Submitting the claim for the device-intensive procedure to their Medicare contractor after the procedure's performance, but prior to manufacturer acknowledgment of credit for the device, and subsequently contacting the contractor regarding a claim adjustment, once the credit determination is made; or (2) holding the claim for the device implantation or insertion procedure until a determination is made by the manufacturer on the partial credit and submitting the claim with the ''FC'' modifier appended to the implantation procedure HCPCS code if the partial credit is 50 percent or more (but less than 100 percent) of the cost of the device. Beneficiary coinsurance would be based on the reduced payment amount. As finalized in the CY 2015 OPPS/ASC final rule with comment period (79 FR 66926), to ensure our policy covers any situation involving a device-intensive procedure where an ASC may receive a device at no cost or receive full credit or partial credit for the device, we apply our ''FB''/''FC'' modifier policy to all device-intensive procedures.

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59043 through 59044) we stated we would reduce the payment for a device-intensive procedure for which the ASC receives partial credit by one-half of the device offset amount that would be applied if a device was provided at no cost or with full credit, if the credit to the ASC is 50 percent or more (but less than 100 percent) of the cost of the device. In the CY 2020 OPPS/ASC final rule with comment period, we finalized continuing our existing policies for CY 2020. We note that we inadvertently omitted language that this policy would apply not just in CY 2019 but also in subsequent calendar years. We intended to apply this policy in CY 2019 and subsequent calendar years.

Therefore, we proposed to apply our policy for partial credits specified in the CY 2019 OPPS/ASC final rule with comment period (83 FR 59043 through 59044) in CY 2022 and subsequent calendar years. Specifically, for CY 2022 and subsequent calendar years, we would reduce the payment for a device-intensive procedure for which the ASC receives partial credit by one-half of the device offset amount that would be applied if a device was provided at no cost or with full credit, if the credit to the ASC is 50 percent or more (but less than 100 percent) of the cost of the device. To report that the ASC received a partial credit of 50 percent or more (but less than 100 percent) of the cost of a device, ASCs have the option of either: (1) Submitting the claim for the device intensive procedure to their Medicare contractor after the procedure's performance, but prior to manufacturer acknowledgment of credit for the device, and subsequently contacting the contractor regarding a claim adjustment, once the credit determination is made; or (2) holding the claim for the device implantation or insertion procedure until a determination is made by the manufacturer on the partial credit and submitting the claim with the ''FC'' modifier appended to the implantation procedure HCPCS code if the partial credit is 50 percent or more (but less than 100 percent) of the cost of the device. Beneficiary coinsurance would be based on the reduced payment amount.

We did not receive any comments on our policies related to no/cost full credit or partial credit devices, and we are continuing our existing policies for CY 2022 and subsequent years.

d. Additions to the List of ASC Covered Surgical Procedures

Section 1833(i)(1) of the Act requires us, in part, to specify, in consultation with appropriate medical organizations, surgical procedures that are appropriately performed on an inpatient basis in a hospital but that can also be safely performed in an ASC, a CAH, or an HOPD, and to review and update the list of ASC procedures at least every 2 years. We evaluate the ASC covered procedures list (ASC CPL) each year to determine whether procedures should be added to or removed from the list, and changes to the list are often made in response to specific concerns raised by stakeholders.

From CY 2008 through CY 2020, under our regulations at §§ 416.2 and 416.166, covered surgical procedures furnished on or after January 1, 2008, were surgical procedures that met the general standards specified in § 416.166(b) and were not excluded under the general exclusion criteria specified in § 416.166(c). Specifically, under § 416.166(b), the general standards provided that covered surgical procedures were surgical procedures specified by the Secretary and published in the **Federal Register** and/or via the internet on the CMS website that were separately paid under the OPPS, that would not be expected to pose a significant safety risk to a Medicare beneficiary when performed in an ASC, and for which standard medical practice dictated that the beneficiary would not typically be expected to require active medical monitoring and care at midnight following the procedure. Section 416.166(c) set out the general exclusion criteria used under the ASC payment system to evaluate the safety of procedures for performance in an ASC. The general exclusion criteria provided that covered surgical procedures do not include those surgical procedures that: (1) Generally result in extensive blood loss; (2) require major or prolonged invasion of body cavities; (3) directly involve major blood vessels; (4) are generally emergent or life threatening in nature; (5) commonly require systemic thrombolytic therapy; (6) are designated as requiring inpatient care under § 419.22(n); (7) can only be reported using a CPT unlisted surgical procedure code; or (8) are otherwise excluded under § 411.15. For a discussion of the history of our policies for adding surgical procedures to the ASC CPL, we refer readers to the CY 2021 OPPS/ASC final rule with comment period (85 FR 86143 through 86145).

In the CY 2021 OPPS/ASC final rule with comment period, we significantly revised our policy for adding surgical procedures to the ASC CPL. We revised the definition of covered surgical procedures at 42 CFR 416.166(a) and (b) to add new subparagraphs to provide that, for services furnished on or after January 1, 2021, covered surgical procedures for purposes of the ASC CPL are surgical procedures specified by the Secretary and published in the **Federal Register** and/or via the internet on the

CMS website that: Are separately paid under the OPPS; and are not: Designated as requiring inpatient care as of December 31, 2020; only able to be reported using a CPT unlisted surgical procedure code; or otherwise excluded under § 411.15.

We added a new paragraph (d) to § 416.166 to provide that the general exclusion and general standard criteria that we used to identify covered surgical procedures furnished between January 1, 2008 and December 31, 2020, would, beginning January 1, 2021, be safety factors that physicians consider as to a specific beneficiary when determining whether to perform a covered surgical procedure. We also added a new paragraph (e) to § 416.166 to provide that, on or after January 1, 2021, we add surgical procedures to the list of ASC covered surgical procedures either when we identify a surgical procedure that meets the requirements of paragraph (b)(2) or we are notified of a surgical procedure that could meet the requirements of paragraph (b)(2) and we confirm that such procedure meets those requirements. We added 267 surgical procedures to the ASC CPL that met the revised criteria for covered surgical procedures beginning in CY 2021.

As we explained in the CY 2021 OPPS/ASC final rule with comment period, there were a number of reasons that we made changes to our ASC CPL policy, including that ASCs are increasingly able to safely provide services that meet some of the general exclusion criteria. We explained that we believed it was important that we adapt the ASC CPL in light of significant advances in medical practice, surgical techniques, and ASC capabilities (85 FR 86150). We stated that, while many of the procedures we were adding to the ASC CPL were performed on non-Medicare patients who tend to be younger and have fewer comorbidities than the Medicare population, we believed careful patient selection could identify Medicare beneficiaries who are suitable candidates to receive these services in the ASC setting. We also emphasized the importance of ensuring that the healthcare system has as many access points and patient choices for Medicare beneficiaries as possible, which includes enabling physicians and patients to choose the ASC as the site of care when appropriate. Finally, we reiterated the critical role that physicians play in determining the appropriate site of care for their patients, including whether a surgical procedure can be safely performed in the ASC setting for an individual patient.

1. Proposed Changes to the List of ASC Covered Surgical Procedures for CY 2022

Since the CY 2021 OPPS/ASC final rule was published, we have reexamined our ASC CPL policy and the public comments we received in response to the CY 2021 OPPS/ASC proposed rule, considered the concerns we received from stakeholders since the final rule was published, and conducted an internal clinical review of the 267 procedures we added to the ASC CPL under our revised policy beginning in CY 2021. After examining our revised policy and the feedback we have received, and reviewing the procedures we added to the ASC CPL under our revised policy, we have reconsidered our policy and believe that the policy may not appropriately assess the safety of performing surgical procedures on a typical Medicare beneficiary in an ASC, and that 258 of the 267 surgical procedures we added to the ASC CPL beginning in CY 2021 under our revised policy may not be appropriate to be performed on a typical beneficiary in the ASC setting.

We believe that our current policy—to shift consideration of the general standards and exclusion criteria we have historically used to determine whether a surgical procedure should be added to the ASC CPL from CMS to physicians—needs to be modified to better ensure that surgical procedures added to the ASC CPL under the revised criteria can be performed safely in the ASC setting on the typical Medicare beneficiary. We recognize that appropriate patient selection and physicians' complex medical judgment could help mitigate risks for patient safety. But while we are always striving to balance the goals of increasing physician and patient choice, and expanding site neutral options with patient safety considerations, we nonetheless believe the current policy could be improved with additional patient safety considerations in determining whether a surgical procedure should be added to the ASC CPL.

One issue we identified with our revised policy is that many of the procedures added in CY 2021 would only be appropriate for Medicare beneficiaries who are healthier and have less complex medical conditions than the typical beneficiary. Upon further review, we believe the subset of Medicare beneficiaries who may be suitable candidates to receive these procedures in an ASC setting do not necessarily represent the typical Medicare beneficiary. After evaluating the 267 surgery or surgery-like codes that were added last year, CMS clinicians determined that 258 of these surgical procedures may pose a significant safety risk to a typical Medicare beneficiary when performed in an ASC, including that nearly all would likely require active medical monitoring and care at midnight following the procedure. In the CY 2021 OPPS/ASC final rule with comment period, we established that physicians would consider certain safety factors as to a specific beneficiary when determining whether to perform a covered surgical procedure in an ASC. However, while a physician can make safety determinations for a specific beneficiary, CMS is in the position to make safety determinations for the broader population of Medicare beneficiaries.

While there could be some appropriately selected patient populations for which some of these procedures could be safely performed in the ASC setting, that may not be the case for the typical Medicare beneficiary, due to comorbidities and other health risks that may require more intensive care and monitoring than provided in an ASC setting among this population. We believe it is appropriate to assess the safety of these procedures in the context of the typical Medicare beneficiary, whose health status is representative of the broader Medicare population. Thus, we believe evaluating procedures for their potential to require additional care and monitoring for the typical beneficiary is an appropriate consideration for CMS to make in determining which procedures can safely be performed in an ASC.

We are concerned that, under our current policy, we do not make an active enough determination about whether a procedure is suitable to perform on a typical Medicare beneficiary in an ASC setting. The policy finalized last year allows individual physicians discretion to perform a number of procedures in the ASC setting that would not necessarily be appropriate for the typical Medicare beneficiary in that setting. Clinicians apply appropriate screening criteria to determine either that the procedure should not be performed in the ASC setting because of the risks to the specific beneficiary, or that the specific beneficiary presents a low enough risk profile that the procedure could be safely performed in the ASC setting.

However, we want to reiterate that, in accordance with section 1833(i)(1)(A) of the Act, the Secretary shall specify those surgical procedures that are appropriately (when considered in

terms of the proper utilization of hospital inpatient facilities) performed on an inpatient basis in a hospital but that also can be performed safely on an ambulatory basis in an ambulatory surgical center. That is, if Medicare allows payment for these services in the ASC setting, it means that Medicare has determined that the procedure is safe to perform on the typical Medicare beneficiary.

Accordingly, the addition of a procedure to the ASC CPL can signal to physicians that the procedure is safe to perform on the typical Medicare beneficiary in the ASC setting, even though the current criteria, adopted in CY 2021, for adding procedures to the ASC CPL do not include safety criteria other than ensuring that the procedure was not on the IPO list as of CY 2020. We recognize that, while there are similarities between the ASC and HOPD settings, there are also significant differences between the two care settings. The HOPD setting has additional capabilities, resources, and certifications that are not required for the ASC setting. For example, hospitals operate 24/7 and are subject to EMTALA requirements, while ASCs are not. Therefore, a procedure that can be furnished in the HOPD setting is not necessarily safe and appropriate to perform in an ASC setting simply because we make payment for the procedure when it is furnished in the HOPD setting.

In light of these concerns, in the CY 2022 OPPS/ASC proposed rule, we proposed to revise the criteria and process for adding procedures to the ASC CPL by reinstating the ASC CPL policy and regulation text that were in place in CY 2020. While this approach is a departure from the revised policy we adopted for CY 2021, it is consistent with our policy from CY 2008 through CY 2020 where we gradually expanded the ASC CPL while giving careful consideration to safety concerns and risks to the typical beneficiary. This approach would also continue to support our efforts to maximize patient access to care by, when appropriate, adding procedures to the ASC CPL to further increase the availability of ASCs as an alternative, lower cost site of care. While expanding the ASC CPL offers benefits like preserving the capacity of hospitals to treat more acute patients and promoting site neutrality, it is also essential that any expansion of the ASC CPL be done in a carefully calibrated fashion to ensure that Medicare is appropriately signaling that a procedure is safe to be performed in the ASC setting for a typical Medicare beneficiary.

Accordingly, for CY 2022, we proposed to revise the requirements for covered surgical procedures in the regulation at § 416.166 to reinstate the specifications we had established prior to CY 2021. Specifically, we proposed that, effective for services furnished on or after January 1, 2022, covered surgical procedures are those procedures that meet the general standards and do not meet the general exclusions. We proposed to again provide in paragraph (b) of § 416.166 that, subject to the exclusions we proposed to again include in paragraph (c), covered surgical procedures are surgical procedures specified by the Secretary and published in the **Federal Register** and/or via the internet on the CMS website that are separately paid under the OPPS, that would not be expected to pose a significant safety risk to a Medicare beneficiary when performed in an ASC, and for which standard medical practice dictates that the beneficiary would not typically be expected to require active medical monitoring and care at midnight following the procedure. We proposed to revise paragraph (c) to again include the five criteria currently included in paragraph (d) of the regulation as safety factors physicians consider. We proposed that revised paragraph (c) would provide that, notwithstanding paragraph (b), covered surgical procedures do not include those surgical procedures that: (1) Generally result in extensive blood loss; (2) require major or prolonged invasion of body cavities; (3) directly involve major blood vessels; (4) are generally emergent or life-threatening in nature; (5) commonly require systemic thrombolytic therapy; (6) are designated as requiring inpatient care under § 419.22(n); (7) can only be reported using a CPT unlisted surgical procedure code; or (8) are otherwise excluded under § 411.15. We proposed to remove the physician considerations at § 416.166(d) and change the notification process at § 416.166(e) to a nomination process, which is discussed further in section (d)(2) below.

We stated that we expect that we would continue to expand the ASC CPL in future years under our proposed revised criteria as the practice of medicine and medical technology continue to evolve. We believe that adding appropriate procedures to the ASC CPL that meet the safety criteria that we proposed to reinstate would have beneficial effects for Medicare beneficiaries and healthcare professionals, including increased access, better utilization of existing healthcare resources, and expansion of the capacity of the healthcare system.

Comment: Commenters were largely split on the issue of reinstating the general standards and exclusion criteria at § 416.166 that were in place prior to CY 2021. Many commenters opposed this proposal and recommended that CMS not re-adopt these criteria. These commenters expressed concern at the complete reversal to reinstate the longstanding criteria. Commenters contended that this proposal may substitute administrative criteria for physician clinical judgment, reduce beneficiary choice, and increase costs since the lack of payment for the ASC setting would push these procedures into the higher-cost hospital setting.

However, numerous other commenters supported our proposal to reinstate the general standards and exclusion criteria at § 416.166 that were in place prior to CY 2021 due to patient safety and quality of care concerns. Several commenters urged caution in how CMS modifies criteria and adds procedures to the ASC CPL, as they believe there is not enough information about which procedures are clinically appropriate for the ASC setting. One commenter noted that the general standards and exclusion criteria that were in effect in CY 2020 allowed the ASC CPL to evolve and expand with surgical advancements, while ensuring that procedures that continue to pose significant patient safety risks would only be payable when furnished in the hospital setting.

Several commenters, including providers and professional medical societies, expressed their belief that physicians are best equipped to conduct the clinical evaluation of the safety of procedures and decide whether to perform them on a particular beneficiary in a particular setting.

Response: We thank commenters for their feedback and suggestions. After reviewing the public comments provided, we believe that reinstating the longstanding general standards and exclusion criteria that were in place prior to CY 2021 is the most appropriate way to ensure that procedures that cannot be safely performed on an ambulatory basis for the typical Medicare beneficiary are not added to the ASC CPL and payable under the ASC payment system. The general standards and exclusion criteria identify procedures that typically require overnight stays or require post-operative active medical monitoring and care at midnight following the procedure. When used in conjunction with information from public comments, data from inpatient, outpatient, and

ambulatory sites of service, and medical review, we believe these criteria enable us to make an accurate assessment of whether a procedure can be safely performed in an ASC on the typical Medicare beneficiary. As a result, we are finalizing our proposal to revise the regulatory language at § 416.166 and reinstate the general standards and exclusion criteria in place prior to CY 2021. We will take the additional recommendations suggested by commenters into consideration for future rulemaking.

(1) Comment Solicitation on Procedures That Were Added to the ASC CPL in CY 2021 and Would Not Meet the Proposed Revised CY 2022 Criteria

As stated above, we proposed to remove 258 procedures from the ASC CPL for CY 2022 that were added to the ASC CPL in CY 2021 that we believe do not meet the proposed revised CY 2022 ASC CPL criteria. These procedures were listed in Table 45 of CY 2022 OPPS/ASC proposed rule (86 FR 42210). Based on our internal review of preliminary claims submitted to Medicare, we stated in the proposed rule that we do not believe that ASCs have been furnishing the majority of the 267 procedures finalized in 2021. Because of this, we explained that we believed it is unlikely that ASCs have made practice changes in reliance on the policy we adopted in CY 2021. Therefore, we stated that we do not anticipate that ASCs would be significantly affected by the removal of these 258 procedures from the ASC CPL. We sought input from commenters who believe any of the 258 procedures added to the ASC CPL in CY 2021 meet the proposed revised CY 2022 criteria and, if those revised criteria are finalized, should remain on the ASC CPL for CY 2022. We requested any clinical evidence or literature to support commenters' views that any of these procedures meet the proposed revised CY 2022 criteria and should remain on the ASC CPL for CY 2022.

Comment: Numerous commenters did not support our proposal to remove 258 surgical procedures from the ASC CPL beginning in CY 2022 that had been added to the ASC CPL in CY 2021, but that we proposed would not meet the reinstated general standards and exclusion criteria. These commenters, including several ambulatory surgical center associations, providers, and professional associations, supported retaining all 258 procedures on the ASC CPL and requested that CMS reconsider this proposal. Commenters stated that these procedures are being safely and effectively performed on Medicare beneficiaries in the ASC setting with high levels of patient satisfaction, improved efficiency, and lower cost to both the insurer and the patient. Many noted that CMS's decision to add and then remove hundreds of procedures from the ASC CPL was jarring, as well as lacking in transparency and support from data to justify the decision. Several commenters also noted that access to additional surgical procedures in ASCs during the PHE may be an important and viable option for beneficiaries.

However, many other commenters supported our proposal to remove 258 surgical procedures from the ASC CPL, including hospital associations, professional associations, and device manufacturers. These commenters believed that our proposal, if finalized, would lead to improved patient outcomes and safety with fewer complex procedures being done in the ASC setting. Commenters noted that they believe procedures that would pose a high risk of complications that ASCs are not equipped to handle should remain off the ASC CPL until there is careful consideration of the potential safety risks for beneficiaries and the procedures are determined appropriate to be performed in the ASC setting.

Numerous commenters suggested specific codes or code ranges that they believed should be added to or remain on the ASC CPL. We received 140 surgical procedure recommendations in total, listed in Table 61 below. The majority of these recommendations were not accompanied by any supporting literature or evidence, with some providing only experiential data and simply stating support for CMS paying for the surgical procedures when they are furnished in the ASC setting.

Response: We thank commenters for their input. We assessed the commenters' recommendations to keep 140 surgical procedures on the ASC CPL. The recommendations included 123 codes that were part of the 258 codes proposed for removal, 14 codes that were not on the ASC CPL due to being on the Inpatient Only list or not being surgery-like codes, and 3 codes that have been on the ASC CPL and that we did not propose to remove in CY 2022. We individually assessed each of these 140 procedures, evaluating clinical data on these procedures from multiple sites of services, using literature and experiential data provided in public comments, and ASC claims volume from CY 2021 to determine whether these procedures meet each of the proposed regulatory criteria.

Based on our review of the clinical characteristics of the procedures, claims volume in the ASC setting for CY 2021, and their similarity to other procedures that are currently on the ASC CPL, we believe that six procedures (CPT codes 0499T, 54650, 60512, 69660, 28005, and 27412) out of the 140 procedure recommendations we received can be safely performed for the typical beneficiary in the ASC setting and meet the general standards and exclusion criteria for the ASC CPL that we are reinstating. These codes have few to no inpatient admissions and are largely performed in outpatient settings. We agree with commenters who stated that advancements in clinical practice, less invasive techniques, and patient selection have contributed to allowing these procedures to be safely performed in an ASC setting. Therefore, in this final rule with comment period, we are finalizing keeping each of these six procedures on the ASC CPL. These procedures, listed in Table 60 below, are:

- CPT 0499T (Cystourethroscopy, with mechanical dilation and urethral therapeutic drug delivery for urethral stricture or stenosis, including fluoroscopy, when performed);
- CPT 54650 (Orchiopexy, abdominal approach, for intra-abdominal testis (*e.g.,* fowler-stephens));
- CPT 60512 (Parathyroid autotransplantation (list separately in addition to code for primary procedure));
- CPT 69660 (Stapedectomy or stapedotomy with reestablishment of ossicular continuity, with or without use of foreign material);
- CPT 28005 (Incision, bone cortex (*e.g.,* osteomyelitis or bone abscess), foot), and
- CPT 27412 (Autologous chondrocyte implantation, knee).

Of these six procedures, two of the codes (CPT 69660 and CPT 28005) were already on the ASC CPL prior to CY 2020. One of the codes (CPT 27412) was added in CY 2020, and was determined to meet the general standards and exclusion criteria and was not proposed for removal this year. Three codes (CPT 0499T, CPT 54650, CPT 60512) were added to the ASC CPL under the revised criteria in CY 2021 and proposed for removal this year.

Due to patient safety concerns, for the remaining procedures that we proposed to remove from the ASC CPL but that commenters recommended that we retain on the list, we believe that 255 of 258 codes proposed for removal this year should be removed from the ASC CPL and that the 14 procedures not currently on the ASC CPL not be added because they are on the IPO list or are not surgery-like. In the CY 2022 OPPS/ASC proposed rule, we assessed all 258

codes against the revised criteria and proposed to remove them based upon our determination that they did not meet the criteria we proposed to reinstate. Therefore, for this final rule with comment period, we solely re-reviewed the 140 codes that commenters specifically recommended for review, 123 of which were among the 258 codes proposed for removal from the ASC CPL beginning in CY 2022, one code of which was added in CY 2021 that was not proposed for removal, and 16 of which are new codes, in order to consider the additional information received from public comments to determine whether these codes should remain on or be added to the ASC CPL. We explain below for each anatomical category of the 135 recommended procedures our rationale for not including them on the ASC CPL beginning in CY 2022.

- *35 genitourinary codes*, including laparoscopic ureterolithotomy, nephrectomy, and renal ablation, penis and urethra revision procedures, vaginal repair and removal procedures, and hysterectomy procedures. Many of these procedures have associated inpatient admissions, where the beneficiary requires active medical monitoring and care at midnight following the procedure. Additionally, a number of these procedures would pose a significant safety risk to beneficiaries without post-operative inpatient care.
- *31 musculoskeletal codes*, including total shoulder arthroplasty procedures, incision of hip tendons, amputation through metatarsal, reconstruction of mandibular rami procedures, open treatment of orbital floor blowout fracture procedures, knee arthroscopy meniscal transplantation, and lumbar spine fusion procedures. Although a few of these procedures have some claims volume in the outpatient setting, many of them are also complex procedures with inpatient admissions and multiple post-operative inpatient days, where infections and need for intravenous antibiotics are not uncommon events, indicating that the beneficiary would require active monitoring and care past midnight following the procedure.
- *24 cardiovascular codes*, including procedures like blood vessel lesion repair, implantable defibrillator electrode removal, infected graft excision, arm artery repair, insertion and removal of intravascular vena cava filter, or wireless cardiac stimulator insertion. These procedures are largely performed in inpatient settings and require multiple post-operative inpatient days, indicating that the beneficiary would require active monitoring and care past midnight following the procedure. These procedures also involve major blood vessels, are emergent or life threatening in nature, and require systemic thrombolytic therapy in some cases.
- *10 respiratory codes*, including nasal or sinus endoscopies, laryngoplasties, and windpipe incision. While several of these codes have some outpatient volume, these procedures are largely performed in an inpatient setting. Many of these procedures have associated inpatient admissions and multiple post-operative days, indicating the beneficiary would require active monitoring and care past midnight following the procedure. Additionally, some of these procedures could be emergent or life-threatening in nature.
- *12 gastrointestinal codes*, including paraesophageal hernia repairs, laparoscopic esophagogastric fundoplasty, appendectomy, laparoscopic gastric restrictive procedures, and laparoscopic revision or removal of gastric neurostimulator electrodes. While some of these procedures have outpatient volume, many have inpatient admissions and potential procedure risks (*e.g.* perforation), indicating that the beneficiary would require active monitoring and care past midnight following the procedure. Additionally, these procedures can involve prolonged invasion of body cavities, and be life-threatening or emergent in nature. Additionally, several of these procedures are less commonly done in Medicare patients and more frequently performed in a younger population.
- *13 nervous system codes*, including neck spine disk surgery, laminectomy and laminotomy procedures, spinal cord decompression, spinal lamina removal, spinal disk surgery, and spinal canal catheter implant. These codes have associated inpatient admissions and post-operative days, indicating that the beneficiary would require active monitoring and care past midnight following the procedure. Many of these procedures also pose a significant safety risk to the beneficiary when close post-operative neurosurgical surveillance is not frequently provided.
- *4 endocrine codes* including thyroidectomy and parathyroidectomy procedures. While these procedures have outpatient volume, there are inpatient admissions associated with these procedures, indicating the beneficiary would be expected to stay past midnight following the procedure. Additionally, the intraservice time for these procedures can vary greatly, often becoming a prolonged invasion of body cavities.
- *2 chest and lymphatic codes*, including biopsy or excision of lymph nodes and mediastinoscopy with lymph node biopsy. There are inpatient admissions associated with these procedures, indicating the beneficiary would be expected to stay past midnight following the procedure.
- *1 ear code*, decompression of the internal auditory canal. This procedure is largely performed in the inpatient setting and has associated ICU admissions, indicating the beneficiary would be expected to stay past midnight following the procedure. Additionally, patients often require frequent neurosurgical checks in the post-operative period.
- *1 mastectomy code*, modified radical mastectomy. There are inpatient admissions associated with this procedure, indicating the beneficiary would be expected to stay past midnight following the procedure. Additionally, performing this procedure in an ASC can pose safety risks to the typical beneficiary.
- *2 imaging/study codes*, including esophagus motility study and liver elastography. These codes are not surgical or surgery-like procedures and would not be covered when furnished in an ASC.

Given these considerations, we believe that these 135 codes do not meet the proposed criteria to be included on the ASC CPL due to inpatient admissions, multiple-day stays past midnight, safety risks to the typical beneficiary without active post-operative monitoring, involvement of major blood vessels, or prolonged invasion of a body cavity. We also note that there is insufficient volume data to fully assess concerns about patient safety risks when these procedures are performed in the ASC, with fewer than 25 procedures proposed for removal from ASC CPL having more than 10 claims in the ASC setting during CY 2021.

However, as medical practice continues to evolve, we recognize that there will be additional advancements and improvements that allow these procedures to be safely offered in the ASC setting for the typical Medicare beneficiary. We believe that there is potential for some of the procedures removed this year to be added back to the ASC CPL if there is adequate evidence that these procedures meet our criteria and can be safely performed on the typical Medicare beneficiary in the ASC setting. We encourage stakeholders to continue to submit this information in future rulemaking.

In summary, we added 267 procedures to the ASC CPL in the CY

2021 OPPS/ASC final rule with comment period, based on the revised criteria for the ASC CPL. In the CY 2022 OPPS/ASC proposed rule, we proposed to remove 258 of the 267 procedures, based on our proposed reinstatement of the CY 2020 criteria. We requested comment on whether we should keep any of these procedures on the ASC CPL. During the public comment period, commenters recommended that 140 surgical procedures either remain on or be added to the ASC CPL, including 3 codes that have been on the ASC CPL that we did not propose to remove in CY 2022, 123 codes that were among the 258 we proposed for removal from ASC CPL, and 14 codes that were not on the ASC CPL due to being on the IPO list or not surgery-like.

Therefore, in this CY 2022 OPPS/ASC final rule with comment period, after reviewing those 140 procedure recommendations, we are finalizing retaining six codes that commenters recommended we retain on the ASC CPL, specifically the 3 codes that have been on the ASC CPL that we did not proposed to remove in CY 2022, as well as 3 codes of the 258 codes proposed for removal. Thus, we are removing the remaining 255 of 258 codes proposed for removal. These procedures are listed below in Tables 60, 61, and 62 of this CY 2022 OPPS/ASC final rule with comment period.

Nomination Process Proposal

For CY 2022, we proposed to change the current notification process for adding surgical procedures to the ASC CPL to a nomination process. We proposed that external parties, for example, medical specialty societies or other members of the public, could nominate procedures to be added to the ASC CPL. CMS anticipates that stakeholders, such as specialty societies that specialize in and have a deep understanding of the complexities involved in providing certain procedures, would be able to provide valuable suggestions as to which additional procedures may reasonably and safely be performed in an ASC. While members of the public may already suggest procedures to be added to the ASC CPL through meetings with CMS or through public comments on the proposed rule, we believe it may be beneficial to enable the public, particularly specialty societies who are very familiar with procedures in their specialty, to formally nominate procedures based on the latest evidence available as well as input from their memberships. We proposed to include the nomination process in a new subparagraph (d)(1) of § 416.166. We proposed that the regulation at § 416.166(d)(2) would provide that, if we identify a surgical procedure that meets the requirements at paragraph (a) of this section, including a surgical procedure nominated by an external party under paragraph (d)(1), we will propose to add the surgical procedure to the list of ASC covered surgical procedures in the next available annual rulemaking. Under this proposal, we would propose to add a nominated procedure to the ASC CPL if it meets the proposed general standards for covered surgical procedures at proposed § 416.166(b), and does not meet the general exclusions in proposed § 416.166(c).

Specifically, for the OPPS/ASC rulemaking for a calendar year, we proposed to request stakeholder nominations by March 1 of the year prior to the calendar year for the next applicable rulemaking cycle in order to be included in that rulemaking cycle. For example, stakeholders would need to send in nominations by March 1, 2022, to be considered for the CY 2023 rulemaking cycle and potentially have their nominated procedures added to the ASC CPL effective January 1, 2023. We proposed that we would evaluate procedures nominated by stakeholders based on the applicable statutory and regulatory requirements for ASC covered surgical procedures. We proposed to address nominated procedures beginning in the CY 2023 rulemaking cycle. We proposed to address in rulemaking nominated procedures for which stakeholders have provided sufficient information for us to evaluate the procedure. We proposed to include in the applicable proposed rule, a summary of the justification for proposing to add or not add each nominated procedure, which would allow members of the public to assess and comment on nominated procedures during the public comment period. We proposed that, after reviewing comments provided during the public comment period, we would indicate whether or not we are adding the procedures to ASC CPL in this final rule with comment period. In the event that CMS determines that a nominated procedure does not meet the criteria to be added to the ASC CPL, we would provide our rationale in the rulemaking. We indicated that in certain cases we may need to defer a proposal regarding a nominated procedure to the next regulatory cycle or future rulemaking in order to have sufficient time to evaluate and make an appropriate proposal about the nominated procedure.

We also sought comment on how we might prioritize our review of nominated procedures, in the event we receive an unexpectedly or extraordinarily large volume of nominations for which CMS has insufficient resources to address in the annual rulemaking. For example, if we could not address every nomination in a rulemaking cycle due to a large volume, we may need to prioritize our review such that we would only address in rulemaking those nominations that merit priority. Therefore, we sought comments as to how CMS should prioritize nominations. For example, whether we would prioritize the nominations that have codes nominated by multiple organizations or individuals, codes recently removed from the IPO list, codes accompanied by evidence that other payers are paying for the service on an outpatient basis or in an ASC setting, or a variety of other factors. We stated that, if we were to finalize a prioritization hierarchy for CMS' review of nominated procedures to the ASC CPL, we would indicate in regulation text, likely in proposed § 416.166(d)(2) *Inclusion in Rulemaking:* (1) That CMS would apply a prioritization hierarchy for reviewing nominated procedures if necessary because of an unexpectedly or extraordinarily large volume of nominations; and (2) specify CMS' prioritization hierarchy.

We stated that we believe this nominations proposal allows for the expansion of the ASC CPL in a more gradual fashion, which would better balance the goals of increasing patient choice and expanding site neutral options with patient safety considerations. We stated that we believe a nomination process will take time to develop because we want to incorporate stakeholder input on the most effective way to structure this process. We also acknowledged that stakeholders will need time to consider and evaluate potential surgical procedures to nominate. We proposed to accept nominations for surgical procedures to be added to the ASC CPL beginning in CY 2023.

Comment: The majority of commenters, which included device manufacturers, hospital associations, and ambulatory surgery associations, supported the proposal to establish a process for the public to nominate procedures for addition to the ASC CPL. Stakeholders believed this process would provide more transparency and engagement on procedures earlier in the process, formalize the review process, and allow for more gradual expansion of the ASC CPL. One commenter suggested CMS publish nominations publicly before the proposed rule each year to

allow more opportunity for input, while another requested more information on the data needs related to the nomination process. Two commenters did not support the nomination process as they believe it would cause additional bureaucracy and delay the ASC CPL additions process.

Commenters offered suggestions on different approaches for CMS to consider when approaching criteria including prioritizing procedures endorsed by physician specialty societies, ASC specialty societies, and/or multi-specialty physician organizations that can directly attest to the safety profile of procedures furnished in ASCs; consider real-world evidence when evaluating a procedure for addition to the ASC CPL; consider evidence that commercial payers are paying for a service in the ASC setting for private and/or Medicare Advantage patients; consider procedures that have been successfully performed for Medicare FFS patients during the COVID–19 PHE under the ''Hospital without Walls'' initiative; convene a panel of medical experts to assess the ASC CPL criteria to ensure they reflect contemporary thinking and current medical practice; take into account current length of stay (LOS) requirements of a procedure; determine how procedures promote access for beneficiaries and providing deference to the patient-clinician decision-making process; and develop a framework that combines aspects of cost savings based on site of service, patient safety considerations, and volume of procedures that can and have been performed in an ASC setting.

Response: We thank the commenters for their input on the nomination process. We agree with commenters that a formalized process whereby the public notifies CMS of procedures to be added to the ASC CPL would provide more transparency and increase opportunities for CMS to engage with providers and external stakeholders in adding procedures to the ASC CPL. We intend to provide details on how procedures can be nominated early next year, in order for commenters to be able to send their nominations on March 1, 2022. After consideration of the public comments we received, we are finalizing our proposal to add a nomination process under our current regulations at § 416.166(d)(1), which describes how an external party may nominate a surgical procedure by March 1 of a calendar year for the ASC CPL for the following year. We are also finalizing the regulation text we proposed to add at § 416.166(d)(2), which provides that if CMS identifies a surgical procedure that meets the requirements at § 416.166(a), including a surgical procedure nominated under paragraph (d)(1), it will propose to add the surgical procedure to the ASC CPL in the next available rulemaking.

BILLING CODE 4120–01–P

TABLE 60: SURGICAL PROCEDURES FINALIZED FOR RETENTION ON THE LIST OF ASC COVERED SURGICAL PROCEDURES FOR CY 2022

CY 2022 CPT/HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
0499T	Cystourethroscopy, with mechanical dilation and urethral therapeutic drug delivery for urethral stricture or stenosis, including fluoroscopy, when performed	G2
54650	Orchiopexy, abdominal approach, for intra-abdominal testis (e.g., fowler-stephens)	G2
27412	Autologous chondrocyte implantation, knee	J8
60512	Parathyroid autotransplantation (list separately in addition to code for primary procedure)	N1
69660	Stapedectomy or stapedotomy with reestablishment of ossicular continuity, with or without use of foreign material;	A2
28005	Incision, bone cortex (e.g., osteomyelitis or bone abscess), foot	A2

TABLE 61: 140 SURGICAL PROCEDURE RECOMMENDATIONS RECEIVED FROM COMMENTERS

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
19307	Mastectomy, modified radical, including axillary lymph nodes, with or without pectoralis minor muscle, but excluding pectoralis major muscle	X5
20100	Exploration of penetrating wound (separate procedure); neck	X5
21049	Excision of benign tumor or cyst of maxilla; requiring extra-oral osteotomy and partial maxillectomy (e.g., locally aggressive or destructive lesion[s])	X5
21193	Reconstruction of mandibular rami, horizontal, vertical, c, or l osteotomy; without bone graft	X5
21195	Reconstruction of mandibular rami and/or body, sagittal split; without internal rigid fixation	X5
21256	Reconstruction of orbit with osteotomies (extracranial) and with bone grafts (includes obtaining autografts) (e.g., micro-ophthalmia)	X5
21346	Open treatment of nasomaxillary complex fracture (lefort ii type); with wiring and/or local fixation	X5
21385	Open treatment of orbital floor blowout fracture; transantral approach (caldwell-luc type operation)	X5
21386	Open treatment of orbital floor blowout fracture; periorbital approach	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
21387	Open treatment of orbital floor blowout fracture; combined approach	X5
21395	Open treatment of orbital floor blowout fracture; periorbital approach with bone graft (includes obtaining graft)	X5
21408	Open treatment of fracture of orbit, except blowout; with bone grafting (includes obtaining graft)	X5
21470	Open treatment of complicated mandibular fracture by multiple surgical approaches including internal fixation, interdental fixation, and/or wiring of dentures or splints	X5
22015	Incision and drainage, open, of deep abscess (subfascial), posterior spine; lumbar, sacral, or lumbosacral	X5
22630	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar	X5
22633	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar	X5
22850	Removal of posterior nonsegmental instrumentation (e.g., harrington rod)	X5
23470	Arthroplasty, glenohumeral joint; hemiarthroplasty	X5
23472	Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (e.g., total shoulder))	X5
23473	Revision of total shoulder arthroplasty, including allograft when performed; humeral or glenoid component	X5
23474	Revision of total shoulder arthroplasty, including allograft when performed; humeral and glenoid component	X5
27005	Tenotomy, hip flexor(s), open (separate procedure)	X5
27006	Tenotomy, abductors and/or extensor(s) of hip, open (separate procedure)	X5
27025	Fasciotomy, hip or thigh, any type	X5
27235	Percutaneous skeletal fixation of femoral fracture, proximal end, neck	X5
27412	Autologous chondrocyte implantation, knee	J8
27472	Repair, nonunion or malunion, femur, distal to head and neck; with iliac or other autogenous bone graft (includes obtaining graft)	X5
27486	Revision of total knee arthroplasty, with or without allograft; 1 component	X5
27535	Open treatment of tibial fracture, proximal (plateau); unicondylar, includes internal fixation, when performed	X5
28005	Incision, bone cortex (e.g., osteomyelitis or bone abscess), foot	A2
28805	Amputation, foot; transmetatarsal	X5
29868	Arthroscopy, knee, surgical; meniscal transplantation (includes arthrotomy for meniscal insertion), medial or lateral	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
31241	Nasal/sinus endoscopy, surgical; with ligation of sphenopalatine artery	X5
31292	Nasal/sinus endoscopy, surgical, with orbital decompression; medial or inferior wall	X5
31293	Nasal/sinus endoscopy, surgical, with orbital decompression; medial and inferior wall	X5
31294	Nasal/sinus endoscopy, surgical, with optic nerve decompression	X5
31584	Laryngoplasty; with open reduction and fixation of (e.g., plating) fracture, includes tracheostomy, if performed	X5
31587	Laryngoplasty, cricoid split, without graft placement	X5
31600	Tracheostomy, planned (separate procedure);	X5
31601	Tracheostomy, planned (separate procedure); younger than 2 years	X5
31610	Tracheostomy, fenestration procedure with skin flaps	X5
32551	Tube thoracostomy, includes connection to drainage system (e.g., water seal), when performed, open (separate procedure)	X5
33244	Removal of single or dual chamber implantable defibrillator electrode(s); by transvenous extraction	X5
35045	Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, radial or ulnar artery	X5
35201	Repair blood vessel, direct; neck	X5
35206	Repair blood vessel, direct; upper extremity	X5
35231	Repair blood vessel with vein graft; neck	X5
35236	Repair blood vessel with vein graft; upper extremity	X5
35261	Repair blood vessel with graft other than vein; neck	X5
35903	Excision of infected graft; extremity	X5
37191	Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed	X5
37193	Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed	X5
38531	Biopsy or excision of lymph node(s); open, inguinofemoral node(s)	X5
39402	Mediastinoscopy; with lymph node biopsy(ies) (e.g., lung cancer staging)	X5
43280	Laparoscopy, surgical, esophagogastric fundoplasty (e.g., nissen, toupet procedures)	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
43281	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh	X5
43282	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh	X5
43647	Laparoscopy, surgical; implantation or replacement of gastric neurostimulator electrodes, antrum	X5
43648	Laparoscopy, surgical; revision or removal of gastric neurostimulator electrodes, antrum	X5
43770	Laparoscopy, surgical, gastric restrictive procedure; placement of adjustable gastric restrictive device (e.g., gastric band and subcutaneous port components)	X5
43772	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device component only	X5
43773	Laparoscopy, surgical, gastric restrictive procedure; removal and replacement of adjustable gastric restrictive device component only	X5
43774	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device and subcutaneous port components	X5
44180	Laparoscopy, surgical, enterolysis (freeing of intestinal adhesion) (separate procedure)	X5
44950	Appendectomy;	X5
44970	Laparoscopy, surgical, appendectomy	X5
50020	Drainage of perirenal or renal abscess, open	X5
50541	Laparoscopy, surgical; ablation of renal cysts	X5
50542	Laparoscopy, surgical; ablation of renal mass lesion(s), including intraoperative ultrasound guidance and monitoring, when performed	X5
50543	Laparoscopy, surgical; partial nephrectomy	X5
50544	Laparoscopy, surgical; pyeloplasty	X5
50945	Laparoscopy, surgical; ureterolithotomy	X5
51060	Transvesical ureterolithotomy	X5
51845	Abdomino-vaginal vesical neck suspension, with or without endoscopic control (e.g., stamey, raz, modified pereyra)	X5
51860	Cystorrhaphy, suture of bladder wound, injury or rupture; simple	X5
51990	Laparoscopy, surgical; urethral suspension for stress incontinence	X5
53500	Urethrolysis, transvaginal, secondary, open, including cystourethroscopy (e.g., postsurgical obstruction, scarring)	X5
54332	1-stage proximal penile or penoscrotal hypospadias repair requiring extensive dissection to correct chordee and urethroplasty by use of skin graft tube and/or island flap	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
54336	1-stage perineal hypospadias repair requiring extensive dissection to correct chordee and urethroplasty by use of skin graft tube and/or island flap	X5
54411	Removal and replacement of all components of a multi-component inflatable penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue	X5
54417	Removal and replacement of non-inflatable (semi-rigid) or inflatable (self-contained) penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue	X5
54535	Orchiectomy, radical, for tumor; with abdominal exploration	X5
54650	Orchiopexy, abdominal approach, for intra-abdominal testis (e.g., fowler-stephens)	G2
55866	Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed	X5
55970	Intersex surgery; male to female	X5
55980	Intersex surgery; female to male	X5
57106	Vaginectomy, partial removal of vaginal wall;	X5
57107	Vaginectomy, partial removal of vaginal wall; with removal of paravaginal tissue (radical vaginectomy)	X5
57109	Vaginectomy, partial removal of vaginal wall; with removal of paravaginal tissue (radical vaginectomy) with bilateral total pelvic lymphadenectomy and para-aortic lymph node sampling (biopsy)	X5
57284	Paravaginal defect repair (including repair of cystocele, if performed); open abdominal approach	X5
57285	Paravaginal defect repair (including repair of cystocele, if performed); vaginal approach	X5
57292	Construction of artificial vagina; with graft	X5
57330	Closure of vesicovaginal fistula; transvesical and vaginal approach	X5
57335	Vaginoplasty for intersex state	X5
57423	Paravaginal defect repair (including repair of cystocele, if performed), laparoscopic approach	X5
57555	Excision of cervical stump, vaginal approach; with anterior and/or posterior repair	X5
58270	Vaginal hysterectomy, for uterus 250 g or less; with repair of enterocele	X5
58290	Vaginal hysterectomy, for uterus greater than 250 g;	X5
58291	Vaginal hysterectomy, for uterus greater than 250 g; with removal of tube(s) and/or ovary(s)	X5
58292	Vaginal hysterectomy, for uterus greater than 250 g; with removal of tube(s) and/or ovary(s), with repair of enterocele	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
58294	Vaginal hysterectomy, for uterus greater than 250 g; with repair of enterocele	X5
58925	Ovarian cystectomy, unilateral or bilateral	X5
60252	Thyroidectomy, total or subtotal for malignancy; with limited neck dissection	X5
60260	Thyroidectomy, removal of all remaining thyroid tissue following previous removal of a portion of thyroid	X5
60271	Thyroidectomy, including substernal thyroid; cervical approach	X5
60502	Parathyroidectomy or exploration of parathyroid(s); re-exploration	X5
60512	Parathyroid autotransplantation (list separately in addition to code for primary procedure)	N1
62351	Implantation, revision or repositioning of tunneled intrathecal or epidural catheter, for long-term medication administration via an external pump or implantable reservoir/infusion pump; with laminectomy	X5
63011	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or discectomy (e.g., spinal stenosis), 1 or 2 vertebral segments; sacral	X5
63012	Laminectomy with removal of abnormal facets and/or pars inter-articularis with decompression of cauda equina and nerve roots for spondylolisthesis, lumbar (gill type procedure)	X5
63015	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or discectomy (e.g., spinal stenosis), more than 2 vertebral segments; cervical	X5
63016	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or discectomy (e.g., spinal stenosis), more than 2 vertebral segments; thoracic	X5
63017	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or discectomy (e.g., spinal stenosis), more than 2 vertebral segments; lumbar	X5
63035	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (list separately in addition to code for primary procedure)	X5
63040	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; cervical	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
63043	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; each additional cervical interspace (list separately in addition to code for primary procedure)	X5
63048	Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (list separately in addition to code for primary procedure)	X5
63057	Transpedicular approach with decompression of spinal cord, equina and/or nerve root(s) (e.g., herniated intervertebral disc), single segment; each additional segment, thoracic or lumbar (list separately in addition to code for primary procedure)	X5
63075	Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, single interspace	X5
63076	Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, each additional interspace (list separately in addition to code for primary procedure)	X5
69660	Stapedectomy or stapedotomy with reestablishment of ossicular continuity, with or without use of foreign material;	A2
69960	Decompression internal auditory canal	X5
91010	Esophageal motility (manometric study of the esophagus and/or gastroesophageal junction) study with interpretation and report;	S1
91200	Liver elastography, mechanically induced shear wave (e.g., vibration), without imaging, with interpretation and report	N1
0221T	Placement of a posterior intrafacet implant(s), unilateral or bilateral, including imaging and placement of bone graft(s) or synthetic device(s), single level; lumbar	X5
0499T	Cystourethroscopy, with mechanical dilation and urethral therapeutic drug delivery for urethral stricture or stenosis, including fluoroscopy, when performed	G2
0505T	Endovenous femoral-popliteal arterial revascularization, with transcatheter placement of intravascular stent graft(s) and closure by any method, including percutaneous or open vascular access, ultrasound guidance for vascular access when performed, all catheterization(s) and intraprocedural roadmapping and imaging guidance necessary to complete the intervention, all associated radiological supervision and interpretation, when performed, with crossing of the occlusive lesion in an extraluminal fashion	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
0515T	Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; complete system (includes electrode and generator [transmitter and battery])	X5
0516T	Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; electrode only	X5
0517T	Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; pulse generator component(s) (battery and/or transmitter) only	X5
0518T	Removal of only pulse generator component(s) (battery and/or transmitter) of wireless cardiac stimulator for left ventricular pacing	X5
0519T	Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter)	X5
0520T	Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter), including placement of a new electrode	X5
C9602	Percutaneous transluminal coronary atherectomy, with drug eluting intracoronary stent, with coronary angioplasty when performed; single major coronary artery or branch	X5
C9603	Percutaneous transluminal coronary atherectomy, with drug-eluting intracoronary stent, with coronary angioplasty when performed; each additional branch of a major coronary artery (list separately in addition to code for primary procedure)	X5
C9604	Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of drug-eluting intracoronary stent, atherectomy and angioplasty, including distal protection when performed; single vessel	X5
C9605	Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of drug-eluting intracoronary stent, atherectomy and angioplasty, including distal protection when performed; each additional branch subtended by the bypass graft (list separately in addition to code for primary procedure)	X5
C9606	Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of drug-eluting intracoronary stent, atherectomy	C5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
	and angioplasty, including aspiration thrombectomy when performed, single vessel	
C9607	Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of drug-eluting intracoronary stent, atherectomy and angioplasty; single vessel	X5
C9608	Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of drug-eluting intracoronary stent, atherectomy and angioplasty; each additional coronary artery, coronary artery branch, or bypass graft (list separately in addition to code for primary procedure)	X5

TABLE 62: 255 SURGICAL PROCEDURES FINALIZED FOR REMOVAL FROM THE LIST OF ASC COVERED SURGICAL PROCEDURES FOR CY 2022

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
19307	Mastectomy, modified radical, including axillary lymph nodes, with or without pectoralis minor muscle, but excluding pectoralis major muscle	X5
20100	Exploration of penetrating wound (separate procedure); neck	X5
20101	Exploration of penetrating wound (separate procedure); chest	X5
20102	Exploration of penetrating wound (separate procedure); abdomen/flank/back	X5
20660	Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure)	X5
21049	Excision of benign tumor or cyst of maxilla; requiring extra-oral osteotomy and partial maxillectomy (e.g., locally aggressive or destructive lesion[s])	X5
21172	Reconstruction superior-lateral orbital rim and lower forehead, advancement or alteration, with or without grafts (includes obtaining autografts)	X5
21175	Reconstruction, bifrontal, superior-lateral orbital rims and lower forehead, advancement or alteration (e.g., plagiocephaly, trigonocephaly, brachycephaly), with or without grafts (includes obtaining autografts)	X5
21193	Reconstruction of mandibular rami, horizontal, vertical, c, or l osteotomy; without bone graft	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
21195	Reconstruction of mandibular rami and/or body, sagittal split; without internal rigid fixation	X5
21256	Reconstruction of orbit with osteotomies (extracranial) and with bone grafts (includes obtaining autografts) (e.g., micro-ophthalmia)	X5
21261	Periorbital osteotomies for orbital hypertelorism, with bone grafts; combined intra- and extracranial approach	X5
21263	Periorbital osteotomies for orbital hypertelorism, with bone grafts; with forehead advancement	X5
21346	Open treatment of nasomaxillary complex fracture (lefort ii type); with wiring and/or local fixation	X5
21385	Open treatment of orbital floor blowout fracture; transantral approach (caldwell-luc type operation)	X5
21386	Open treatment of orbital floor blowout fracture; periorbital approach	X5
21387	Open treatment of orbital floor blowout fracture; combined approach	X5
21395	Open treatment of orbital floor blowout fracture; periorbital approach with bone graft (includes obtaining graft)	X5
21408	Open treatment of fracture of orbit, except blowout; with bone grafting (includes obtaining graft)	X5
21470	Open treatment of complicated mandibular fracture by multiple surgical approaches including internal fixation, interdental fixation, and/or wiring of dentures or splints	X5
21601	Excision of chest wall tumor including rib(s)	X5
21742	Reconstructive repair of pectus excavatum or carinatum; minimally invasive approach (nuss procedure), without thoracoscopy	X5
21743	Reconstructive repair of pectus excavatum or carinatum; minimally invasive approach (nuss procedure), with thoracoscopy	X5
22100	Partial excision of posterior vertebral component (e.g., spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; cervical	X5
22101	Partial excision of posterior vertebral component (e.g., spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; thoracic	X5
23470	Arthroplasty, glenohumeral joint; hemiarthroplasty	X5
23473	Revision of total shoulder arthroplasty, including allograft when performed; humeral or glenoid component	X5
24150	Radical resection of tumor, shaft or distal humerus	X5
24935	Stump elongation, upper extremity	X5
25170	Radical resection of tumor, radius or ulna	X5
25909	Amputation, forearm, through radius and ulna; re-amputation	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
27006	Tenotomy, abductors and/or extensor(s) of hip, open (separate procedure)	X5
27027	Decompression fasciotomy(ies), pelvic (buttock) compartment(s) (e.g., gluteus medius-minimus, gluteus maximus, iliopsoas, and/or tensor fascia lata muscle), unilateral	X5
27057	Decompression fasciotomy(ies), pelvic (buttock) compartment(s) (e.g., gluteus medius-minimus, gluteus maximus, iliopsoas, and/or tensor fascia lata muscle) with debridement of nonviable muscle, unilateral	X5
27179	Open treatment of slipped femoral epiphysis; osteoplasty of femoral neck (heyman type procedure)	X5
27235	Percutaneous skeletal fixation of femoral fracture, proximal end, neck	X5
27477	Arrest, epiphyseal, any method (e.g., epiphysiodesis); tibia and fibula, proximal	X5
27485	Arrest, hemiepiphyseal, distal femur or proximal tibia or fibula (e.g., genu varus or valgus)	X5
27722	Repair of nonunion or malunion, tibia; with sliding graft	X5
28360	Reconstruction, cleft foot	X5
28805	Amputation, foot; transmetatarsal	X5
29868	Arthroscopy, knee, surgical; meniscal transplantation (includes arthrotomy for meniscal insertion), medial or lateral	X5
31241	Nasal/sinus endoscopy, surgical; with ligation of sphenopalatine artery	X5
31292	Nasal/sinus endoscopy, surgical, with orbital decompression; medial or inferior wall	X5
31293	Nasal/sinus endoscopy, surgical, with orbital decompression; medial and inferior wall	X5
31294	Nasal/sinus endoscopy, surgical, with optic nerve decompression	X5
31584	Laryngoplasty; with open reduction and fixation of (e.g., plating) fracture, includes tracheostomy, if performed	X5
31587	Laryngoplasty, cricoid split, without graft placement	X5
31600	Tracheostomy, planned (separate procedure);	X5
31601	Tracheostomy, planned (separate procedure); younger than 2 years	X5
31610	Tracheostomy, fenestration procedure with skin flaps	X5
31660	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 1 lobe	X5
31661	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 2 or more lobes	X5
31785	Excision of tracheal tumor or carcinoma; cervical	X5
32551	Tube thoracostomy, includes connection to drainage system (e.g., water seal), when performed, open (separate procedure)	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
32560	Instillation, via chest tube/catheter, agent for pleurodesis (e.g., talc for recurrent or persistent pneumothorax)	X5
32561	Instillation(s), via chest tube/catheter, agent for fibrinolysis (e.g., fibrinolytic agent for break-up of multiloculated effusion); initial day	X5
32562	Instillation(s), via chest tube/catheter, agent for fibrinolysis (e.g., fibrinolytic agent for break-up of multiloculated effusion); subsequent day	X5
32601	Thoracoscopy, diagnostic (separate procedure); lungs, pericardial sac, mediastinal or pleural space, without biopsy	X5
32604	Thoracoscopy, diagnostic (separate procedure); pericardial sac, with biopsy	X5
32606	Thoracoscopy, diagnostic (separate procedure); mediastinal space, with biopsy	X5
32607	Thoracoscopy; with diagnostic biopsy(ies) of lung infiltrate(s) (e.g., wedge, incisional), unilateral	X5
32608	Thoracoscopy; with diagnostic biopsy(ies) of lung nodule(s) or mass(es) (e.g., wedge, incisional), unilateral	X5
32609	Thoracoscopy; with biopsy(ies) of pleura	X5
33244	Removal of single or dual chamber implantable defibrillator electrode(s); by transvenous extraction	X5
33272	Removal of subcutaneous implantable defibrillator electrode	X5
34101	Embolectomy or thrombectomy, with or without catheter; axillary, brachial, innominate, subclavian artery, by arm incision	X5
34111	Embolectomy or thrombectomy, with or without catheter; radial or ulnar artery, by arm incision	X5
34201	Embolectomy or thrombectomy, with or without catheter; femoropopliteal, aortoiliac artery, by leg incision	X5
34203	Embolectomy or thrombectomy, with or without catheter; popliteal-tibio-peroneal artery, by leg incision	X5
34421	Thrombectomy, direct or with catheter; vena cava, iliac, femoropopliteal vein, by leg incision	X5
34471	Thrombectomy, direct or with catheter; subclavian vein, by neck incision	X5
34501	Valvuloplasty, femoral vein	X5
34510	Venous valve transposition, any vein donor	X5
34520	Cross-over vein graft to venous system	X5
34530	Saphenopopliteal vein anastomosis	X5
35011	Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm and associated occlusive disease, axillary-brachial artery, by arm incision	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
35045	Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, radial or ulnar artery	X5
35180	Repair, congenital arteriovenous fistula; head and neck	X5
35184	Repair, congenital arteriovenous fistula; extremities	X5
35190	Repair, acquired or traumatic arteriovenous fistula; extremities	X5
35201	Repair blood vessel, direct; neck	X5
35206	Repair blood vessel, direct; upper extremity	X5
35226	Repair blood vessel, direct; lower extremity	X5
35231	Repair blood vessel with vein graft; neck	X5
35236	Repair blood vessel with vein graft; upper extremity	X5
35256	Repair blood vessel with vein graft; lower extremity	X5
35261	Repair blood vessel with graft other than vein; neck	X5
35266	Repair blood vessel with graft other than vein; upper extremity	X5
35286	Repair blood vessel with graft other than vein; lower extremity	X5
35321	Thromboendarterectomy, including patch graft, if performed; axillary-brachial	X5
35860	Exploration for postoperative hemorrhage, thrombosis or infection; extremity	X5
35879	Revision, lower extremity arterial bypass, without thrombectomy, open; with vein patch angioplasty	X5
35881	Revision, lower extremity arterial bypass, without thrombectomy, open; with segmental vein interposition	X5
35883	Revision, femoral anastomosis of synthetic arterial bypass graft in groin, open; with nonautogenous patch graft (e.g., dacron, eptfe, bovine pericardium)	X5
35884	Revision, femoral anastomosis of synthetic arterial bypass graft in groin, open; with autogenous vein patch graft	X5
35903	Excision of infected graft; extremity	X5
36460	Transfusion, intrauterine, fetal	X5
36838	Distal revascularization and interval ligation (dril), upper extremity hemodialysis access (steal syndrome)	X5
37183	Revision of transvenous intrahepatic portosystemic shunt(s) (tips) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recannulization/dilatation, stent placement and all associated imaging guidance and documentation)	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
37191	Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed	X5
37192	Repositioning of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed	X5
37193	Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed	X5
37195	Thrombolysis, cerebral, by intravenous infusion	X5
37213	Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed;	X5
37214	Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed; cessation of thrombolysis including removal of catheter and vessel closure by any method	X5
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	X5
37565	Ligation, internal jugular vein	X5
37600	Ligation; external carotid artery	X5
37605	Ligation; internal or common carotid artery	X5
37606	Ligation; internal or common carotid artery, with gradual occlusion, as with selverstone or crutchfield clamp	X5
37615	Ligation, major artery (e.g., post-traumatic, rupture); neck	X5
37619	Ligation of inferior vena cava	X5
38120	Laparoscopy, surgical, splenectomy	X5
38207	Transplant preparation of hematopoietic progenitor cells; cryopreservation and storage	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
38208	Transplant preparation of hematopoietic progenitor cells; thawing of previously frozen harvest, without washing, per donor	X5
38209	Transplant preparation of hematopoietic progenitor cells; thawing of previously frozen harvest, with washing, per donor	X5
38210	Transplant preparation of hematopoietic progenitor cells; specific cell depletion within harvest, t-cell depletion	X5
38211	Transplant preparation of hematopoietic progenitor cells; tumor cell depletion	X5
38212	Transplant preparation of hematopoietic progenitor cells; red blood cell removal	X5
38213	Transplant preparation of hematopoietic progenitor cells; platelet depletion	X5
38214	Transplant preparation of hematopoietic progenitor cells; plasma (volume) depletion	X5
38215	Transplant preparation of hematopoietic progenitor cells; cell concentration in plasma, mononuclear, or buffy coat layer	X5
38240	Hematopoietic progenitor cell (hpc); allogeneic transplantation per donor	X5
38531	Biopsy or excision of lymph node(s); open, inguinofemoral node(s)	X5
38720	Cervical lymphadenectomy (complete)	X5
39401	Mediastinoscopy; includes biopsy(ies) of mediastinal mass (e.g., lymphoma), when performed	X5
39402	Mediastinoscopy; with lymph node biopsy(ies) (e.g., lung cancer staging)	X5
42842	Radical resection of tonsil, tonsillar pillars, and/or retromolar trigone; without closure	X5
42844	Radical resection of tonsil, tonsillar pillars, and/or retromolar trigone; closure with local flap (e.g., tongue, buccal)	X5
43020	Esophagotomy, cervical approach, with removal of foreign body	X5
43280	Laparoscopy, surgical, esophagogastric fundoplasty (e.g., nissen, toupet procedures)	X5
43281	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh	X5
43282	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh	X5
43420	Closure of esophagostomy or fistula; cervical approach	X5
43510	Gastrotomy; with esophageal dilation and insertion of permanent intraluminal tube (e.g., celestin or mousseaux-barbin)	X5
43647	Laparoscopy, surgical; implantation or replacement of gastric neurostimulator electrodes, antrum	X5
43648	Laparoscopy, surgical; revision or removal of gastric neurostimulator electrodes, antrum	X5
43651	Laparoscopy, surgical; transection of vagus nerves, truncal	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
43652	Laparoscopy, surgical; transection of vagus nerves, selective or highly selective	X5
43770	Laparoscopy, surgical, gastric restrictive procedure; placement of adjustable gastric restrictive device (e.g., gastric band and subcutaneous port components)	X5
43772	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device component only	X5
43773	Laparoscopy, surgical, gastric restrictive procedure; removal and replacement of adjustable gastric restrictive device component only	X5
43774	Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device and subcutaneous port components	X5
43830	Gastrostomy, open; without construction of gastric tube (e.g., stamm procedure) (separate procedure)	X5
43831	Gastrostomy, open; neonatal, for feeding	X5
44180	Laparoscopy, surgical, enterolysis (freeing of intestinal adhesion) (separate procedure)	X5
44186	Laparoscopy, surgical; jejunostomy (e.g., for decompression or feeding)	X5
44950	Appendectomy;	X5
44955	Appendectomy; when done for indicated purpose at time of other major procedure (not as separate procedure) (list separately in addition to code for primary procedure)	X5
44970	Laparoscopy, surgical, appendectomy	X5
47370	Laparoscopy, surgical, ablation of 1 or more liver tumor(s); radiofrequency	X5
47371	Laparoscopy, surgical, ablation of 1 or more liver tumor(s); cryosurgical	X5
47490	Cholecystostomy, percutaneous, complete procedure, including imaging guidance, catheter placement, cholecystogram when performed, and radiological supervision and interpretation	X5
49185	Sclerotherapy of a fluid collection (e.g., lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (e.g., ultrasound, fluoroscopy) and radiological supervision and interpretation when performed	X5
49323	Laparoscopy, surgical; with drainage of lymphocele to peritoneal cavity	X5
49405	Image-guided fluid collection drainage by catheter (e.g., abscess, hematoma, seroma, lymphocele, cyst); visceral (e.g., kidney, liver, spleen, lung/mediastinum), percutaneous	X5

CY 2022 CPT/ HCPCS Code	CY 2022 Long Descriptor	Final CY 2022 ASC Payment Indicator
49491	Repair, initial inguinal hernia, preterm infant (younger than 37 weeks gestation at birth), performed from birth up to 50 weeks postconception age, with or without hydrocelectomy; reducible	X5
49492	Repair, initial inguinal hernia, preterm infant (younger than 37 weeks gestation at birth), performed from birth up to 50 weeks postconception age, with or without hydrocelectomy; incarcerated or strangulated	X5
50020	Drainage of perirenal or renal abscess, open	X5
50541	Laparoscopy, surgical; ablation of renal cysts	X5
50542	Laparoscopy, surgical; ablation of renal mass lesion(s), including intraoperative ultrasound guidance and monitoring, when performed	X5
50543	Laparoscopy, surgical; partial nephrectomy	X5
50544	Laparoscopy, surgical; pyeloplasty	X5
50945	Laparoscopy, surgical; ureterolithotomy	X5
51060	Transvesical ureterolithotomy	X5
51845	Abdomino-vaginal vesical neck suspension, with or without endoscopic control (e.g., stamey, raz, modified pereyra)	X5
51860	Cystorrhaphy, suture of bladder wound, injury or rupture; simple	X5
51990	Laparoscopy, surgical; urethral suspension for stress incontinence	X5
53500	Urethrolysis, transvaginal, secondary, open, including cystourethroscopy (e.g., postsurgical obstruction, scarring)	X5
54332	1-stage proximal penile or penoscrotal hypospadias repair requiring extensive dissection to correct chordee and urethroplasty by use of skin graft tube and/or island flap	X5
54336	1-stage perineal hypospadias repair requiring extensive dissection to correct chordee and urethroplasty by use of skin graft tube and/or island flap	X5
54411	Removal and replacement of all components of a multi-component inflatable penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue	X5
54417	Removal and replacement of non-inflatable (semi-rigid) or inflatable (self-contained) penile prosthesis through an infected field at the same operative session, including irrigation and debridement of infected tissue	X5
54535	Orchiectomy, radical, for tumor; with abdominal exploration	X5
55866	Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed	X5
55970	Intersex surgery; male to female	X5
55980	Intersex surgery; female to male	X5

0517T	Insertion of wireless cardiac stimulator for left ventricular pacing, including device interrogation and programming, and imaging supervision and interpretation, when performed; pulse generator component(s) (battery and/or transmitter) only	X5
0518T	Removal of only pulse generator component(s) (battery and/or transmitter) of wireless cardiac stimulator for left ventricular pacing	X5
0519T	Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter)	X5
0520T	Removal and replacement of wireless cardiac stimulator for left ventricular pacing; pulse generator component(s) (battery and/or transmitter), including placement of a new electrode	X5

BILLING CODE 4120–01–C

2. Covered Ancillary Services

In the CY 2019 OPPS/ASC final rule (83 FR 59062 through 59063), consistent with the established ASC payment system policy (72 FR 42497), we finalized the policy to update the ASC list of covered ancillary services to reflect the payment status for the services under the CY 2019 OPPS/ASC final rule with comment period. As discussed in prior rulemaking, maintaining consistency with the OPPS may result in changes to ASC payment indicators for some covered ancillary services because of changes that are being finalized under the OPPS for CY 2022. For example, if a covered ancillary service was separately paid under the ASC payment system in CY 2021, but will be packaged under the CY 2022 OPPS, to maintain consistency with the OPPS, we would also package the ancillary service under the ASC payment system for CY 2022. In the CY 2019 OPPS/ASC final rule, we finalized the policy to continue this reconciliation of packaged status for subsequent calendar years. Comment indicator ''CH'', which was discussed in section XIII.F. of the CY 2022 OPPS/ASC proposed rule, is used in Addendum BB to this CY 2022 OPPS/ASC final rule (which is available via the internet on the CMS website) to indicate covered ancillary services for which we are finalizing a change in the ASC payment indicator to reflect a finalized change in the OPPS treatment of the service for CY 2022.

For CY 2022, as discussed in section II.A.3.b. of this final rule with comment period, we are finalizing our proposal to revise 42 CFR 416.164(b)(6) to include, as ancillary items that are integral to a covered surgical procedure and for which separate payment is allowed, non-opioid pain management drugs and biologicals that function as a supply when used in a surgical procedure as determined by CMS in proposed new § 416.174.

New CPT and HCPCS codes for covered ancillary services and their final payment indicators for CY 2022 can be found in section XIII.B of this final rule with comment period. All ASC covered ancillary services and their final payment indicators for CY 2022 are also included in Addendum BB to the CY 2022 OPPS/ASC proposed rule (which is available via the internet on the CMS website).

D. Update and Payment for ASC Covered Surgical Procedures and Covered Ancillary Services

1. ASC Payment for Covered Surgical Procedures

a. Background

Our ASC payment policies for covered surgical procedures under the revised ASC payment system are described in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66828 through 66831). Under our established policy, we use the ASC standard ratesetting methodology of multiplying the ASC relative payment weight for the procedure by the ASC conversion factor for that same year to calculate the national unadjusted payment rates for procedures with payment indicators ''G2'' and ''A2''. Payment indicator ''A2'' was developed to identify procedures that were included on the list of ASC covered surgical procedures in CY 2007 and, therefore, were subject to transitional payment prior to CY 2011. Although the 4-year transitional period has ended and payment indicator ''A2'' is no longer required to identify surgical procedures subject to transitional payment, we retained payment indicator ''A2'' because it is used to identify procedures that are exempted from the application of the office-based designation.

The rate calculation established for device-intensive procedures (payment indicator ''J8'') is structured so only the service portion of the rate is subject to the ASC conversion factor. In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86122 through 86179), we updated the CY 2020 ASC payment rates for ASC covered surgical procedures with payment indicators of ''A2'', ''G2'', and ''J8'' using CY 2019

data, consistent with the CY 2021 OPPS update. We also updated payment rates for device-intensive procedures to incorporate the CY 2021 OPPS device offset percentages calculated under the standard APC ratesetting methodology, as discussed earlier in this section.

Payment rates for office-based procedures (payment indicators ''P2'', ''P3'', and ''R2'') are the lower of the PFS nonfacility PE RVU-based amount or the amount calculated using the ASC standard rate setting methodology for the procedure. In the CY 2021 OPPS/ASC final rule with comment period, we updated the payment amounts for office-based procedures (payment indicators ''P2'', ''P3'', and ''R2'') using the most recent available MPFS and OPPS data. We compared the estimated CY 2021 rate for each of the office-based procedures, calculated according to the ASC standard rate setting methodology, to the PFS nonfacility PE RVU-based amount to determine which was lower and, therefore, would be the CY 2021 payment rate for the procedure under our final policy for the revised ASC payment system (§ 416.171(d)).

In the CY 2014 OPPS/ASC final rule with comment period (78 FR 75081), we finalized our proposal to calculate the CY 2014 payment rates for ASC covered surgical procedures according to our established methodologies, with the exception of device removal procedures. For CY 2014, we finalized a policy to conditionally package payment for device removal procedures under the OPPS. Under the OPPS, a conditionally packaged procedure (status indicators ''Q1'' and ''Q2'') describes a HCPCS code where the payment is packaged when it is provided with a significant procedure but is separately paid when the service appears on the claim without a significant procedure. Because ASC services always include a covered surgical procedure, HCPCS codes that are conditionally packaged under the OPPS are always packaged (payment indicator ''N1'') under the ASC payment system. Under the OPPS, device removal procedures are conditionally packaged and, therefore, would be packaged under the ASC payment system. There would be no Medicare payment made when a device removal procedure is performed in an ASC without another surgical procedure included on the claim; therefore, no Medicare payment would be made if a device was removed but not replaced. To ensure that the ASC payment system provides separate payment for surgical procedures that only involve device removal—conditionally packaged in the OPPS (status indicator ''Q2'')—we continued to provide separate payment since CY 2014 and assigned the current ASC payment indicators associated with these procedures.

b. Update to ASC Covered Surgical Procedure Payment Rates for CY 2022

We proposed to update ASC payment rates for CY 2022 and subsequent years using the established rate calculation methodologies under § 416.171 and using our definition of device-intensive procedures, as discussed in section XII.C.1.b. of the CY 2022 OPPS/ASC proposed rule. Because the proposed OPPS relative payment weights are generally based on geometric mean costs, we proposed that the ASC payment system would generally use the geometric mean cost to determine proposed relative payment weights under the ASC standard methodology. We proposed to continue to use the amount calculated under the ASC standard ratesetting methodology for procedures assigned payment indicators ''A2'' and ''G2''.

We proposed to calculate payment rates for office-based procedures (payment indicators ''P2'', ''P3'', and ''R2'') and device-intensive procedures (payment indicator ''J8'') according to our established policies and to use our proposed modified definition to identify device-intensive procedures, as discussed in section XII.C.1.b. of the CY 2022 OPPS/ASC proposed rule. Therefore, we proposed to update the payment amount for the service portion of the device-intensive procedures using the standard ASC ratesetting methodology and the payment amount for the device portion based on the proposed CY 2022 device offset percentages that have been calculated using the standard OPPS APC ratesetting methodology. We proposed that payment for office-based procedures would be at the lesser of the proposed CY 2022 MPFS nonfacility PE RVU-based amount or the proposed CY 2022 ASC payment amount calculated according to the ASC standard ratesetting methodology.

As we did for CYs 2014 through 2021, for CY 2022 we proposed to continue our policy for device removal procedures, such that device removal procedures that are conditionally packaged in the OPPS (status indicators ''Q1'' and ''Q2'') would be assigned the current ASC payment indicators associated with those procedures and would continue to be paid separately under the ASC payment system.

Comment: Several commenters recommended that Medicare allow ASCs to bill procedures with an unlisted code, particularly new technologies and innovative techniques in the ASC setting. They noted that many new procedures are performed in the ASC setting before procedure-specific CPT codes are established. These commenters also mentioned that codes include the narrowly defined anatomic region of the service, which could provide the basis for a safety determination, and noted there is not a clear safety rationale for the policy on unlisted codes in the ASC setting. Another commenter requested that MACs be able to price unlisted codes. Commenters requested that CMS eliminate the restriction on billing with unlisted codes in the ASC setting.

Response: Under § 416.166(c)(7), covered surgical procedures do not include procedures that can only be reported using a CPT unlisted surgical procedure code. As discussed in the August 2, 2007 ASC final rule (72 FR 42485), it is not possible to know what specific procedure would be represented by an unlisted code. Additionally, although the code may include the narrowly defined anatomic region of the service, this information is not sufficient to fully assess the procedure against the applicable regulatory criteria at § 416.166. Therefore, as it is not possible to appropriately evaluate procedures reported by unlisted CPT codes, we are not accepting this recommendation.

We are finalizing our proposed policies without modification to calculate the CY 2022 payment rates for ASC covered surgical procedures according to our established rate calculation methodologies under § 416.171 and using the modified definition of device-intensive procedures as discussed in section XIII.C.1.b. of this CY 2022 OPPS/ASC final rule with comment period. For covered office-based surgical procedures, the payment rate is the lower of the final CY 2022 MPFS nonfacility PE RVU-based amount or the final CY 2022 ASC payment amount calculated according to the ASC standard ratesetting methodology. The final payment indicators and rates set forth in this final rule with comment period are based on a comparison using the PFS PE RVUs and the conversion factor effective January 1, 2022. For a discussion of the PFS rates, we refer readers to the CY 2022 PFS final rule with comment period, which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

c. Limit on ASC Payment Rates for Procedures Assigned to Low Volume APCs

As stated in section XIII.D.1.b. of the CY 2022 OPPS/ASC proposed rule, the ASC payment system generally uses OPPS geometric mean costs under the standard methodology to determine proposed relative payment weights under the standard ASC ratesetting methodology. However, for low-volume device-intensive procedures, the proposed relative payment weights are based on median costs, rather than geometric mean costs, as discussed in section IV.B.5. of the CY 2022 OPPS/ASC proposed rule.

In the CY 2020 OPPS/ASC final rule with comment period (84 FR 61400), we finalized our policy to limit the ASC payment rate for low-volume device-intensive procedures to a payment rate equal to the OPPS payment rate for that procedure. Under this policy, where the ASC payment rate based on the standard ASC ratesetting methodology for low volume device-intensive procedures would exceed the rate paid under the OPPS for the same procedure, we establish an ASC payment rate for such procedures equal to the OPPS payment rate for the same procedure.

As discussed in section X.C of the CY 2022 OPPS/ASC proposed rule (86 FR 42181 through 42185), we proposed a low volume APC policy for CY 2022 and subsequent calendar years. Under our proposal, we expanded the low volume adjustment policy that is applied to procedures assigned to New Technology APCs and applied such policy to clinical and brachytherapy APCs. Specifically, a clinical APC or brachytherapy APC with fewer than 100 claims per year would be designated as a low volume APC. For items and services assigned to APCs we proposed to designate as low volume APCs as well as procedures assigned to New Technology APCs with fewer than 100 claims, we proposed to use up to four years of claims data to establish a payment rate for each item or service as we currently do for low volume services assigned to New Technology APCs. The payment rate for a low volume APC or a low volume New Technology procedure would be based on the highest of the median cost, arithmetic mean cost, or geometric mean cost calculated using multiple years of claims data. Because we proposed to adopt a low volume APC policy, we also proposed to eliminate our low volume device-intensive procedure policy and address ratesetting for HCPCS code 0308T—the only code designated as a low volume device-intensive procedure—within our broader low volume APC proposal. Consequently, we proposed to modify our existing regulations at § 416.171(b)(4) to apply our ASC payment rate limitation to services assigned to low volume APCs rather than low volume device-intensive procedures.

We sought comments on our proposal to modify our existing regulations at § 416.171(b)(4) and limit the ASC payment rate for services assigned to low volume APCs to the payment rate for the OPPS.

Comment: One commenter recommended that we not finalize our proposal to apply a limit to the ASC payment rate for services assigned to low volume APCs to the payment rate for the OPPS. The commenter argued that only comprehensive APCs would be affected by our proposal and that the comprehensive ratesetting methodology generally is able to utilize a greater number of claims than under the ASC standard ratesetting methodology. The commenter stated that such additional claims may include claims that are inaccurately coded for other services and thus produce less accurate payment rates.

Response: We disagree. We do not believe ASCs incur greater costs than hospitals and that the ASC payment rate should be greater than the payment rate under the OPPS. We believe such situations represent a data anomaly and that the ASC payment rate should be limited to the OPPS payment rate for procedures assigned to low volume APCs.

After reviewing the public comment we received, we are finalizing our proposal, without modification, to modify our existing regulations at § 416.171(b)(4) and limit the ASC payment rate for services assigned to low volume APCs to the payment rate for the OPPS.

d. Changes to Beneficiary Coinsurance for Certain Colorectal Cancer Screening Tests

Section 122 of the Consolidated Appropriations Act (CAA) of 2021 (Pub. L. 116–260), Waiving Medicare Coinsurance for Certain Colorectal Cancer Screening Tests, amends section 1833(a) of the Act to offer a special coinsurance rule for screening flexible sigmoidoscopies and screening colonoscopies, regardless of the code that is billed for the establishment of a diagnosis as a result of the test, or for the removal of tissue or other matter or other procedure, that is furnished in connection with, as a result of, and in the same clinical encounter as the colorectal cancer screening test. The reduced coinsurance will be phased-in beginning January 1, 2022. Detailed discussions on implementing this legislation are included in the CY 2022 PFS final rule and section X.B., ''Changes to Beneficiary Coinsurance for Certain Colorectal Cancer Screening Tests'' of this final rule with comment period.

After considering public comments, we are finalizing the proposals made in the CY 2022 OPPS/ASC proposed rule to implement section 122 of the CAA without modification. Specifically, we are finalizing that all surgical services furnished on the same date as a planned screening colonoscopy or planned flexible sigmoidoscopy would be viewed as being furnished in connection with, as a result of, and in the same clinical encounter as the screening test for purposes of determining the coinsurance required of Medicare beneficiaries for planned colorectal cancer screening tests that result in additional procedures furnished in the same clinical encounter. Providers must continue to report HCPCS modifier ''PT'' to indicate that a planned colorectal cancer screening service converted to a diagnostic service. We will examine the claims data, monitor for any increases in surgical services unrelated to the colorectal cancer screening test performed on the same date as the screening test, and consider revising our policy through rulemaking if there is a notable increase or abuse of this policy.

2. Payment for Covered Ancillary Services

a. Background

Our payment policies under the ASC payment system for covered ancillary services generally vary according to the particular type of service and its payment policy under the OPPS. Our overall policy provides separate ASC payment for certain ancillary items and services integrally related to the provision of ASC covered surgical procedures that are paid separately under the OPPS and provides packaged ASC payment for other ancillary items and services that are packaged or conditionally packaged (status indicators ''N'', ''Q1'', and ''Q2'') under the OPPS. In the CY 2013 OPPS/ASC rulemaking (77 FR 45169 and 77 FR 68457 through 68458), we further clarified our policy regarding the payment indicator assignment for procedures that are conditionally packaged in the OPPS (status indicators ''Q1'' and ''Q2''). Under the OPPS, a conditionally packaged procedure describes a HCPCS code where the

payment is packaged when it is provided with a significant procedure but is separately paid when the service appears on the claim without a significant procedure. Because ASC services always include a surgical procedure, HCPCS codes that are conditionally packaged under the OPPS are generally packaged (payment indictor ''N1'') under the ASC payment system (except for device removal procedures, as discussed in section IV. of the CY 2022 OPPS/ASC proposed rule). Thus, our policy generally aligns ASC payment bundles with those under the OPPS (72 FR 42495). In all cases, in order for ancillary items and services also to be paid, the ancillary items and services must be provided integral to the performance of ASC covered surgical procedures for which the ASC bills Medicare.

Our ASC payment policies generally provide separate payment for drugs and biologicals that are separately paid under the OPPS at the OPPS rates and package payment for drugs and biologicals for which payment is packaged under the OPPS. However, as discussed in section XIII.D.3. of the CY 2022 OPPS/ASC proposed rule, for CY 2022, we proposed a policy to unpackage and pay separately at ASP plus 6 percent for the cost of non-opioid pain management drugs and biologicals that function as a supply when used in a surgical procedure as determined by CMS under proposed new § 416.174. We generally pay for separately payable radiology services at the lower of the PFS nonfacility PE RVU-based (or technical component) amount or the rate calculated according to the ASC standard ratesetting methodology (72 FR 42497). However, as finalized in the CY 2011 OPPS/ASC final rule with comment period (75 FR 72050), payment indicators for all nuclear medicine procedures (defined as CPT codes in the range of 78000 through 78999) that are designated as radiology services that are paid separately when provided integral to a surgical procedure on the ASC list are set to ''Z2'' so that payment is made based on the ASC standard ratesetting methodology rather than the MPFS nonfacility PE RVU amount (''Z3''), regardless of which is lower (§ 416.171(d)(1)).

Similarly, we also finalized our policy to set the payment indicator to ''Z2'' for radiology services that use contrast agents so that payment for these procedures will be based on the OPPS relative payment weight using the ASC standard ratesetting methodology and, therefore, will include the cost for the contrast agent (§ 416.171(d)(2)).

ASC payment policy for brachytherapy sources mirrors the payment policy under the OPPS. ASCs are paid for brachytherapy sources provided integral to ASC covered surgical procedures at prospective rates adopted under the OPPS or, if OPPS rates are unavailable, at contractor-priced rates (72 FR 42499). Since December 31, 2009, ASCs have been paid for brachytherapy sources provided integral to ASC covered surgical procedures at prospective rates adopted under the OPPS.

Our ASC policies also provide separate payment for: (1) Certain items and services that CMS designates as contractor-priced, including, but not limited to, the procurement of corneal tissue; and (2) certain implantable items that have pass-through payment status under the OPPS. These categories do not have prospectively established ASC payment rates according to ASC payment system policies (72 FR 42502 and 42508 through 42509; § 416.164(b)). Under the ASC payment system, we have designated corneal tissue acquisition and hepatitis B vaccines as contractor-priced. Corneal tissue acquisition is contractor-priced based on the invoiced costs for acquiring the corneal tissue for transplantation. Hepatitis B vaccines are contractor-priced based on invoiced costs for the vaccine.

Devices that are eligible for pass-through payment under the OPPS are separately paid under the ASC payment system and are contractor-priced. Under the revised ASC payment system (72 FR 42502), payment for the surgical procedure associated with the pass-through device is made according to our standard methodology for the ASC payment system, based on only the service (non-device) portion of the procedure's OPPS relative payment weight if the APC weight for the procedure includes other packaged device costs. We also refer to this methodology as applying a ''device offset'' to the ASC payment for the associated surgical procedure. This ensures that duplicate payment is not provided for any portion of an implanted device with OPPS pass-through payment status.

In the CY 2015 OPPS/ASC final rule with comment period (79 FR 66933 through 66934), we finalized that, beginning in CY 2015, certain diagnostic tests within the medicine range of CPT codes for which separate payment is allowed under the OPPS are covered ancillary services when they are integral to an ASC covered surgical procedure. We finalized that diagnostic tests within the medicine range of CPT codes include all Category I CPT codes in the medicine range established by CPT, from 90000 to 99999, and Category III CPT codes and Level II HCPCS codes that describe diagnostic tests that crosswalk or are clinically similar to procedures in the medicine range established by CPT. In the CY 2015 OPPS/ASC final rule with comment period, we also finalized our policy to pay for these tests at the lower of the PFS nonfacility PE RVU-based (or technical component) amount or the rate calculated according to the ASC standard ratesetting methodology (79 FR 66933 through 66934). We finalized that the diagnostic tests for which the payment is based on the ASC standard ratesetting methodology be assigned to payment indicator ''Z2'' and revised the definition of payment indicator ''Z2'' to include a reference to diagnostic services and those for which the payment is based on the PFS nonfacility PE RVU-based amount be assigned payment indicator ''Z3,'' and revised the definition of payment indicator ''Z3'' to include a reference to diagnostic services.

Comment: One commenter recommended that we publish guidance on how MACs are to calculate transitional pass-through payments under the ASC payment system for devices that are eligible for pass-through payment under the OPPS similar to how such guidance is provided under the OPPS.

Response: As previously discussed, devices that are eligible for pass-through payment under the OPPS are separately paid under the ASC payment system and are contractor-priced. Transitional pass-through payments under the OPPS utilize hospital cost-to-charge ratios to reduce the pass-through device to cost and provide the hospital an additional payment of the amount by which the cost of the pass-through device exceeds the applicable device offset amount. ASCs do not submit cost reports and, as such, we are unable to replicate the transitional pass-through payment under the ASC payment system. Currently, MACs have been instructed to pay for such devices in the ASC setting based on invoice or cost. We are unaware of a compelling reason, at this time, to provide additional guidance or clarification on this process, beyond that provided in Section 40, Chapter 14 of the Medicare Claims Processing Manual.

b. Final Payment for Covered Ancillary Services for CY 2022

We are finalizing our proposal to update the ASC payment rates and to make changes to ASC payment

indicators, as necessary, to maintain consistency between the OPPS and ASC payment system regarding the packaged or separately payable status of services and the final CY 2022 OPPS and ASC payment rates and subsequent year's payment rates. We are also finalizing our proposal to continue to set the CY 2022 ASC payment rates and subsequent year's payment rates for brachytherapy sources and separately payable drugs and biologicals equal to the OPPS payment rates for CY 2022 and subsequent year's payment rates.

Covered ancillary services and their final payment indicators for CY 2022 are listed in Addendum BB of this final rule with comment period (which is available via the internet on the CMS website). For those covered ancillary services where the payment rate is the lower of the rate under the ASC standard rate setting methodology and the PFS final rates (similar to our office-based payment policy), the final payment indicators and rates set forth in the final rule are based on a comparison using the proposed PFS rates effective January 1, 2022. For a discussion of the PFS rates, we refer readers to the CY 2022 PFS final rule, which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

3. CY 2022 ASC Packaging Policy for Non-Opioid Pain Management Drugs and Biologicals

Please refer to Section II.A.3.b for a discussion of the final CY 2022 OPPS/ASC for payment for non-opioid pain management drugs and biologicals.

E. New Technology Intraocular Lenses (NTIOLs)

New Technology Intraocular Lenses (NTIOLs) are intraocular lenses that replace a patient's natural lens that has been removed in cataract surgery and that also meet the requirements listed in § 416.195.

1. NTIOL Application Cycle

Our process for reviewing applications to establish new classes of NTIOLs is as follows:

- Applicants submit their NTIOL requests for review to CMS by the annual deadline. For a request to be considered complete, we require submission of the information requested in the guidance document titled ''Application Process and Information Requirements for Requests for a New Class of New Technology Intraocular Lenses (NTIOLs) or Inclusion of an IOL in an Existing NTIOL Class'' posted on the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ASCPayment/NTIOLs.html*.
- We announce annually, in the proposed rule updating the ASC and OPPS payment rates for the following calendar year, a list of all requests to establish new NTIOL classes accepted for review during the calendar year in which the proposal is published. In accordance with section 141(b)(3) of Public Law 103–432 and our regulations at § 416.185(b), the deadline for receipt of public comments is 30 days following publication of the list of requests in the proposed rule.
- In the final rule updating the ASC and OPPS payment rates for the following calendar year, we—

++ Provide a list of determinations made as a result of our review of all new NTIOL class requests and public comments.

++ When a new NTIOL class is created, identify the predominant characteristic of NTIOLs in that class that sets them apart from other IOLs (including those previously approved as members of other expired or active NTIOL classes) and that is associated with an improved clinical outcome.

++ Set the date of implementation of a payment adjustment in the case of approval of an IOL as a member of a new NTIOL class prospectively as of 30 days after publication of the ASC payment update final rule, consistent with the statutory requirement.

++ Announce the deadline for submitting requests for review of an application for a new NTIOL class for the following calendar year.

2. Requests To Establish New NTIOL Classes for CY 2022

We did not receive any requests for review to establish a new NTIOL class for CY 2022 by March 1, 2021, the due date published in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86173).

3. Payment Adjustment

The current payment adjustment for a 5-year period from the implementation date of a new NTIOL class is $50 per lens. Since implementation of the process for adjustment of payment amounts for NTIOLs in 1999, we have not revised the payment adjustment amount, and we did not propose to revise the payment adjustment amount for CY 2022.

The comments and our responses to the comments are set forth below.

Comment: Some commenters requested that we re-evaluate our payment adjustment for a new NTIOL class. Commenters noted that our $50 payment adjustment has not been adjusted since CY 1999 and that the stagnant payment adjustment has been a barrier to intraocular lens innovation. One commenter requested that the $50 be inflated to 2022 dollars and updated by inflation in subsequent years. Another commenter requested that the $50 payment adjustment be increased to $100.

Response: We thank the commenter for their recommendations. We did not propose revising the payment adjustment amount for CY 2022. However, we will take the commenters' recommendations into consideration in future rulemaking.

4. Announcement of CY 2022 Deadline for Submitting Requests for CMS Review of Applications for a New Class of NTIOLS

In accordance with § 416.185(a) of our regulations, CMS announces that in order to be considered for payment effective beginning in CY 2023, requests for review of applications for a new class of new technology IOLs must be received by 5:00 p.m. EST, on March 1, 2022. Send requests via email to *outpatientpps@cms.hhs.gov* or by mail to ASC/NTIOL, Division of Outpatient Care, Mailstop C4–05–17, Centers for Medicare and Medicaid Services, 7500 Security Boulevard, Baltimore, MD 21244–1850. To be considered, requests for NTIOL reviews must include the information requested on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ASCPayment/NTIOLs*.

F. ASC Payment and Comment Indicators

1. Background

In addition to the payment indicators that we introduced in the August 2, 2007 ASC final rule, we created final comment indicators for the ASC payment system in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66855). We created Addendum DD1 to define ASC payment indicators that we use in Addenda AA and BB to provide payment information regarding covered surgical procedures and covered ancillary services, respectively, under the revised ASC payment system. The ASC payment indicators in Addendum DD1 are intended to capture policy-relevant characteristics of HCPCS codes that may receive packaged or separate payment in ASCs, such as whether they were on the ASC CPL prior to CY 2008; payment designation, such as device-intensive or office-based, and the corresponding ASC payment

methodology; and their classification as separately payable ancillary services, including radiology services, brachytherapy sources, OPPS pass-through devices, corneal tissue acquisition services, drugs or biologicals, or NTIOLs.

We also created Addendum DD2 that lists the ASC comment indicators. The ASC comment indicators included in Addenda AA and BB to the proposed rules and final rules with comment period serve to identify, for the revised ASC payment system, the status of a specific HCPCS code and its payment indicator with respect to the timeframe when comments will be accepted. The comment indicator ''NI'' is used in the OPPS/ASC final rule to indicate new codes for the next calendar year for which the interim payment indicator assigned is subject to comment. The comment indicator ''NI'' also is assigned to existing codes with substantial revisions to their descriptors such that we consider them to be describing new services, and the interim payment indicator assigned is subject to comment, as discussed in the CY 2010 OPPS/ASC final rule with comment period (74 FR 60622).

The comment indicator ''NP'' is used in the OPPS/ASC proposed rule to indicate new codes for the next calendar year for which the proposed payment indicator assigned is subject to comment. The comment indicator ''NP'' also is assigned to existing codes with substantial revisions to their descriptors, such that we consider them to be describing new services, and the proposed payment indicator assigned is subject to comment, as discussed in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70497).

The ''CH'' comment indicator is used in Addenda AA and BB to the proposed rule (these addenda are available via the internet on the CMS website) to indicate that the payment indicator assignment has changed for an active HCPCS code in the current year and the next calendar year, for example if an active HCPCS code is newly recognized as payable in ASCs; or an active HCPCS code is discontinued at the end of the current calendar year. The ''CH'' comment indicators that are published in this final rule with comment period are provided to alert readers that a change has been made from one calendar year to the next, but do not indicate that the change is subject to comment.

In the CY 2021 OPPS/ASC final rule with comment period, we finalized the addition of ASC payment indicator ''K5''—Items, Codes, and Services for which pricing information and claims data are not available. No payment made.—to ASC Addendum DD1 (which is available via the internet on the CMS website) to indicate those services and procedures that CMS anticipates will become payable when claims data or payment information becomes available.

2. ASC Payment and Comment Indicators for CY 2022

For 2022, we proposed new and revised Category I and III CPT codes as well as new and revised Level II HCPCS codes. Therefore, proposed Category I and III CPT codes that are new and revised for CY 2022 and any new and existing Level II HCPCS codes with substantial revisions to the code descriptors for CY 2022, compared to the CY 2021 descriptors, are included in ASC Addenda AA and BB to the CY 2022 OPPS/ASC proposed rule and labeled with proposed comment indicator ''NP'' to indicate that these CPT and Level II HCPCS codes are open for comment as part of the CY 2022 OPPS/ASC proposed rule. Proposed comment indicator ''NP'' meant a new code for the next calendar year or an existing code with substantial revision to its code descriptor in the next calendar year, as compared to the current calendar year; and denoted that comments would be accepted on the proposed ASC payment indicator for the new code.

We noted in the CY 2022 OPPS/ASC proposed rule that we would respond to public comments on ASC payment and comment indicators and finalize them in this CY 2022 OPPS/ASC final rule with comment period. We refer readers to Addenda DD1 and DD2 of the CY 2022 OPPS/ASC proposed rule (these addenda are available via the internet on the CMS website) for the complete list of ASC payment and comment indicators proposed for the CY 2022 update. Addenda DD1 and DD2 to this final rule with comment period (these addenda are available via the internet on the CMS website) contain the complete list of ASC payment and comment indicators for CY 2022.

We did not receive any public comments on the proposed ASC payment and comment indicators and we are finalizing their use as proposed without modification. Addenda DD1 and DD2 to this CY 2022 OPPS/ASC final rule (theses addenda are available via the internet on the CMS website) contain the complete list of ASC payment and comment indicators for CY 2022.

G. Calculation of the ASC Payment Rates and the ASC Conversion Factor

1. Background

In the August 2, 2007 ASC final rule (72 FR 42493), we established our policy to base ASC relative payment weights and payment rates under the revised ASC payment system on APC groups and the OPPS relative payment weights. Consistent with that policy and the requirement at section 1833(i)(2)(D)(ii) of the Act that the revised payment system be implemented so that it would be budget neutral, the initial ASC conversion factor (CY 2008) was calculated so that estimated total Medicare payments under the revised ASC payment system in the first year would be budget neutral to estimated total Medicare payments under the prior (CY 2007) ASC payment system (the ASC conversion factor is multiplied by the relative payment weights calculated for many ASC services in order to establish payment rates). That is, application of the ASC conversion factor was designed to result in aggregate Medicare expenditures under the revised ASC payment system in CY 2008 being equal to aggregate Medicare expenditures that would have occurred in CY 2008 in the absence of the revised system, taking into consideration the cap on ASC payments in CY 2007, as required under section 1833(i)(2)(E) of the Act (72 FR 42522). We adopted a policy to make the system budget neutral in subsequent calendar years (72 FR 42532 through 42533; § 416.171(e)).

We note that we consider the term ''expenditures'' in the context of the budget neutrality requirement under section 1833(i)(2)(D)(ii) of the Act to mean expenditures from the Medicare Part B Trust Fund. We do not consider expenditures to include beneficiary coinsurance and copayments. This distinction was important for the CY 2008 ASC budget neutrality model that considered payments across the OPPS, ASC, and MPFS payment systems. However, because coinsurance is almost always 20 percent for ASC services, this interpretation of expenditures has minimal impact for subsequent budget neutrality adjustments calculated within the revised ASC payment system.

In the CY 2008 OPPS/ASC final rule with comment period (72 FR 66857 through 66858), we set out a step-by-step illustration of the final budget neutrality adjustment calculation based on the methodology finalized in the August 2, 2007 ASC final rule (72 FR 42521 through 42531) and as applied to updated data available for the CY 2008 OPPS/ASC final rule with comment

period. The application of that methodology to the data available for the CY 2008 OPPS/ASC final rule with comment period resulted in a budget neutrality adjustment of 0.65.

For CY 2008, we adopted the OPPS relative payment weights as the ASC relative payment weights for most services and, consistent with the final policy, we calculated the CY 2008 ASC payment rates by multiplying the ASC relative payment weights by the final CY 2008 ASC conversion factor of $41.401. For covered office-based surgical procedures, covered ancillary radiology services (excluding covered ancillary radiology services involving certain nuclear medicine procedures or involving the use of contrast agents, as discussed in section XII.D.2. of the CY 2022 OPPS/ASC proposed rule), and certain diagnostic tests within the medicine range that are covered ancillary services, the established policy is to set the payment rate at the lower of the MPFS unadjusted nonfacility PE RVU-based amount or the amount calculated using the ASC standard ratesetting methodology. Further, as discussed in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66841 through 66843), we also adopted alternative ratesetting methodologies for specific types of services (for example, device-intensive procedures).

As discussed in the August 2, 2007 ASC final rule (72 FR 42517 through 42518) and as codified at § 416.172(c) of the regulations, the revised ASC payment system accounts for geographic wage variation when calculating individual ASC payments by applying the pre-floor and pre-reclassified IPPS hospital wage indexes to the labor-related share, which is 50 percent of the ASC payment amount based on a GAO report of ASC costs using 2004 survey data. Beginning in CY 2008, CMS accounted for geographic wage variation in labor costs when calculating individual ASC payments by applying the pre-floor and pre-reclassified hospital wage index values that CMS calculates for payment under the IPPS, using updated Core Based Statistical Areas (CBSAs) issued by OMB in June 2003.

The reclassification provision in section 1886(d)(10) of the Act is specific to hospitals. We believe that using the most recently available pre-floor and pre-reclassified IPPS hospital wage indexes results in the most appropriate adjustment to the labor portion of ASC costs. We continue to believe that the unadjusted hospital wage indexes, which are updated yearly and are used by many other Medicare payment systems, appropriately account for geographic variation in labor costs for ASCs. Therefore, the wage index for an ASC is the pre-floor and pre-reclassified hospital wage index under the IPPS of the CBSA that maps to the CBSA where the ASC is located.

Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. On February 28, 2013, OMB issued OMB Bulletin No. 13–01, which provides the delineations of all Metropolitan Statistical Areas, Metropolitan Divisions, Micropolitan Statistical Areas, Combined Statistical Areas, and New England City and Town Areas in the United States and Puerto Rico based on the standards published on June 28, 2010 in the **Federal Register** (75 FR 37246 through 37252) and 2010 Census Bureau data. (A copy of this bulletin may be obtained at: *https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/bulletins/2013/b13-01.pdf*). In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963), we implemented the use of the CBSA delineations issued by OMB in OMB Bulletin 13–01 for the IPPS hospital wage index beginning in FY 2015.

OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. On July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provides updates to and supersedes OMB Bulletin No. 13–01 that was issued on February 28, 2013. OMB Bulletin No. 15–01 made changes that are relevant to the IPPS and ASC wage index. We refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79750) for a discussion of these changes and our implementation of these revisions. (A copy of this bulletin may be obtained at *https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/bulletins/2015/15-01.pdf*).

On August 15, 2017, OMB issued OMB Bulletin No. 17–01, which provided updates to and superseded OMB Bulletin No. 15–01 that was issued on July 15, 2015. We refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 58864 through 58865) for a discussion of these changes and our implementation of these revisions. (A copy of this bulletin may be obtained at *https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/bulletins/2017/b-17-01.pdf*).

On April 10, 2018, OMB issued OMB Bulletin No. 18–03 which superseded the August 15, 2017 OMB Bulletin No. 17–01. On September 14, 2018, OMB issued OMB Bulletin 18–04 which superseded the April 10, 2018 OMB Bulletin No. 18–03. A copy of OMB Bulletin No. 18–04 may be obtained at *https://www.whitehouse.gov/wpcontent/uploads/2018/90/Bulletin-18-04.pdf*. We are utilizing the revised delineations as set forth in the April 10, 2018 OMB Bulletin No. 18–03 and the September 14, 2018 OMB Bulletin No. 18–04 to calculate the CY 2021 ASC wage index effective beginning January 1, 2021.

On March 6, 2020, OMB issued Bulletin No. 20–01, which provided updates to and superseded OMB Bulletin No. 18–04 that was issued on September 14, 2018. The attachments to OMB Bulletin No. 20–01 provided detailed information on the updates to statistical areas since September 14, 2018, and were based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2017, and July 1, 2018. (For a copy of this bulletin, we refer readers to the following website: *https://www.whitehouse.gov/wp-content/uploads/2020/03/Bulletin-20-01.pdf*). In OMB Bulletin No. 20–01, OMB announced one new Micropolitan Statistical Area, one new component of an existing Combined Statistical Area and changes to New England City and Town Area (NECTA) delineations. In the CY 2022 OPPS/ASC proposed rule (86 FR 42228 through 42229), we inadvertently failed to note that OMB Bulletin No. 20–01 had revised certain statistical area delineation; however, after reviewing OMB Bulletin No. 20–01, we have determined that the changes in Bulletin 20–01 encompassed delineation changes that had no effect on the ASC wage index for CY 2022. Specifically, the updates consisted of changes to NECTA delineations and the redesignation of a single rural county into a newly created Micropolitan Statistical Area. The ASC wage indexes do not utilize NECTA definitions, and we include hospitals located in Micropolitan Statistical Areas in each state's rural wage index. Therefore, we note that these OMB updates would not affect any geographic areas for purposes of the ASC wage index calculation for CY 2022.

The final CY 2022 ASC wage indexes fully reflects the OMB labor market area delineations (including the revisions to the OMB labor market delineations discussed above, as set forth in OMB Bulletin Nos. 15–01, 17–01, 18–03, 18–04, and 20–01). We note that, in certain instances, there might be urban or rural areas for which there is no IPPS hospital that has wage index data that could be used to set the wage index for that area.

For these areas, our policy has been to use the average of the wage indexes for CBSAs (or metropolitan divisions as applicable) that are contiguous to the area that has no wage index (where ''contiguous'' is defined as sharing a border). For example, for CY 2022, we are applying a proxy wage index based on this methodology to ASCs located in CBSA 25980 (Hinesville-Fort Stewart, GA).

When all of the areas contiguous to the urban CBSA of interest are rural and there is no IPPS hospital that has wage index data that could be used to set the wage index for that area, we determine the ASC wage index by calculating the average of all wage indexes for urban areas in the state (75 FR 72058 through 72059). In other situations, where there are no IPPS hospitals located in a relevant labor market area, we have continued our current policy of calculating an urban or rural area's wage index by calculating the average of the wage indexes for CBSAs (or metropolitan divisions where applicable) that are contiguous to the area with no wage index.

Comment: Several commenters recommended that we refrain from wage-adjusting the device portion of device-intensive procedures by the wage index for that particular area and only wage-adjust non device portions of the ASC payment rate. The commenters contend that wage-adjusting 50 percent of the ASC payment rate by the wage index for a particular area can reduce ASC payment rates below the cost of certain devices.

Response: We appreciate the commenters recommendation. We did not propose such a change to our application of the ASC wage index but, as we stated in the CY 2019 OPPS/ASC final rule with comment period (83 FR 59042), we will consider the feasibility of this change and take this comment into consideration for future rulemaking.

2. Calculation of the ASC Payment Rates

a. Updating the ASC Relative Payment Weights for CY 2022 and Future Years

We update the ASC relative payment weights each year using the national OPPS relative payment weights (and PFS nonfacility PE RVU-based amounts, as applicable) for that same calendar year and uniformly scale the ASC relative payment weights for each update year to make them budget neutral (72 FR 42533). The OPPS relative payment weights are scaled to maintain budget neutrality for the OPPS. We then scale the OPPS relative payment weights again to establish the ASC relative payment weights. To accomplish this, we hold estimated total ASC payment levels constant between calendar years for purposes of maintaining budget neutrality in the ASC payment system. That is, we apply the weight scalar to ensure that projected expenditures from the updated ASC payment weights in the ASC payment system are equal to what would be the current expenditures based on the scaled ASC payment weights. In this way we ensure budget neutrality and that the only changes to total payments to ASCs result from increases or decreases in the ASC payment update factor.

Where the estimated ASC expenditures for an upcoming year are higher than the estimated ASC expenditures for the current year, the ASC weight scalar is reduced, in order to bring the estimated ASC expenditures in line with the expenditures for the baseline year. This frequently results in ASC relative payment weights for surgical procedures that are lower than the OPPS relative payment weights for the same procedures for the upcoming year. Therefore, over time, even if procedures performed in the HOPD and ASC receive the same update factor under the OPPS and ASC payment system, payment rates under the ASC payment system would increase at a lower rate than payment for the same procedures performed in the HOPD as a result of applying the ASC weight scalar to ensure budget neutrality.

As discussed in section II.A.1.a of the CY 2022 OPPS/ASC proposed rule, given our concerns with CY 2020 claims data as a result of the PHE, we are using the CY 2019 claims data to be consistent with the OPPS claims data for the CY 2022 OPPS/ASC proposed rule. Consistent with our established policy, we proposed to scale the CY 2022 relative payment weights for ASCs according to the following method. Holding ASC utilization, the ASC conversion factor, and the mix of services constant from CY 2019, we proposed to compare the total payment using the CY 2021 ASC relative payment weights with the total payment using the CY 2022 ASC relative payment weights to take into account the changes in the OPPS relative payment weights between CY 2021 and CY 2022. We proposed to use the ratio of CY 2021 to CY 2022 total payments (the weight scalar) to scale the ASC relative payment weights for CY 2022. The proposed CY 2022 ASC weight scalar is 0.8591. Based on updated data for this final rule with comment period, the final CY 2022 ASC weight scalar is 0.8552. Consistent with historical practice, we would scale the ASC relative payment weights of covered surgical procedures, covered ancillary radiology services, and certain diagnostic tests within the medicine range of CPT codes, which are covered ancillary services for which the ASC payment rates are based on OPPS relative payment weights.

Scaling would not apply in the case of ASC payment for separately payable covered ancillary services that have a predetermined national payment amount (that is, their national ASC payment amounts are not based on OPPS relative payment weights), such as drugs and biologicals that are separately paid or services that are contractor-priced or paid at reasonable cost in ASCs. Any service with a predetermined national payment amount would be included in the ASC budget neutrality comparison, but scaling of the ASC relative payment weights would not apply to those services. The ASC payment weights for those services without predetermined national payment amounts (that is, those services with national payment amounts that would be based on OPPS relative payment weights) would be scaled to eliminate any difference in the total payment between the current year and the update year.

For any given year's ratesetting, we typically use the most recent full calendar year of claims data to model budget neutrality adjustments. While we would ordinarily use CY 2020 claims data to model the budget neutrality adjustment for the CY 2022 OPPS/ASC final rule, as discussed in Section X.E. of this final rule, we are finalizing our proposal to use, in general, CY 2019 claims data to model our budget neutrality adjustment. At the time of the CY 2022 OPPS/ASC proposed rule, we had available 100 percent of CY 2019 ASC claims data.

b. Updating the ASC Conversion Factor

Under the OPPS, we typically apply a budget neutrality adjustment for provider-level changes, most notably a change in the wage index values for the upcoming year, to the conversion factor. Consistent with our final ASC payment policy, for the CY 2017 ASC payment system and subsequent years, in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79751 through 79753), we finalized our policy to calculate and apply a budget neutrality adjustment to the ASC conversion factor for supplier-level changes in wage index values for the upcoming year, just as the OPPS wage index budget neutrality adjustment is calculated and applied to the OPPS conversion factor. For CY

2022, we calculated the proposed adjustment for the ASC payment system by using the most recent CY 2019 claims data available and estimating the difference in total payment that would be created by introducing the proposed CY 2022 ASC wage indexes. Specifically, holding CY 2019 ASC utilization, service-mix, and the proposed CY 2022 national payment rates after application of the weight scalar constant, we calculated the total adjusted payment using the CY 2021 ASC wage indexes and the total adjusted payment using the proposed CY 2022 ASC wage indexes. We used the 50-percent labor-related share for both total adjusted payment calculations. We then compared the total adjusted payment calculated with the CY 2021 ASC wage indexes to the total adjusted payment calculated with the proposed CY 2022 ASC wage indexes and applied the resulting ratio of 0.9999 (the proposed CY 2022 ASC wage index budget neutrality adjustment) to the CY 2021 ASC conversion factor to calculate the proposed CY 2022 ASC conversion factor.

Section 1833(i)(2)(C)(i) of the Act requires that, if the Secretary has not updated amounts established under the revised ASC payment system in a calendar year, the payment amounts shall be increased by the percentage increase in the Consumer Price Index for all urban consumers (CPI–U), U.S. city average, as estimated by the Secretary for the 12-month period ending with the midpoint of the year involved. The statute does not mandate the adoption of any particular update mechanism, but it requires the payment amounts to be increased by the CPI–U in the absence of any update. Because the Secretary updates the ASC payment amounts annually, we adopted a policy, which we codified at § 416.171(a)(2)(ii)), to update the ASC conversion factor using the CPI–U for CY 2010 and subsequent calendar years.

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59075 through 59080), we finalized our proposal to apply the productivity-adjusted hospital market basket update to ASC payment system rates for an interim period of 5 years (CY 2019 through CY 2023), during which we will assess whether there is a migration of the performance of procedures from the hospital setting to the ASC setting as a result of the use of a productivity-adjusted hospital market basket update, as well as whether there are any unintended consequences, such as less than expected migration of the performance of procedures from the hospital setting to the ASC setting. In addition, we finalized our proposal to revise our regulations under § 416.171(a)(2), which address the annual update to the ASC conversion factor. During this 5-year period, we intend to assess the feasibility of collaborating with stakeholders to collect ASC cost data in a minimally burdensome manner and could propose a plan to collect such information. We refer readers to that final rule for a detailed discussion of the rationale for these policies.

The proposed hospital market basket update for CY 2022 was projected to be 2.5 percent, as published in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25435), based on IHS Global Inc.'s (IGI's) 2020 fourth quarter forecast with historical data through the third quarter of 2020.

Section 1886(b)(3)(B)(xi)(II) of the Act, defines the productivity adjustment to be equal to the 10-year moving average of changes in annual economy-wide private nonfarm business multifactor productivity (MFP). We finalized the methodology for calculating the productivity adjustment in the CY 2011 PFS final rule with comment period (75 FR 73394 through 73396) and revised it in the CY 2012 PFS final rule with comment period (76 FR 73300 through 73301) and the CY 2016 OPPS/ASC final rule with comment period (80 FR 70500 through 70501). The proposed productivity adjustment for CY 2022 was projected to be 0.2 percentage point, as published in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25435) based on IGI's 2020 fourth quarter forecast.

For 2022, we proposed to utilize the hospital market basket update of 2.5 percent reduced by the productivity adjustment of 0.2 percentage point, resulting in a productivity-adjusted hospital market basket update factor of 2.3 percent for ASCs meeting the quality reporting requirements. Therefore, we proposed to apply a 2.3 percent productivity-adjusted hospital market basket update factor to the CY 2021 ASC conversion factor for ASCs meeting the quality reporting requirements to determine the CY 2022 ASC payment amounts. The ASCQR Program affected payment rates beginning in CY 2014 and, under this program, there is a 2.0 percentage point reduction to the update factor for ASCs that fail to meet the ASCQR Program requirements. We refer readers to section XIV.E. of the CY 2019 OPPS/ASC final rule with comment period (83 FR 59138 through 59139) and section XIV.E. of the CY 2022 OPPS/ASC proposed rule for a detailed discussion of our policies regarding payment reduction for ASCs that fail to meet ASCQR Program requirements. We proposed to utilize the hospital market basket update of 2.5 percent reduced by 2.0 percentage points for ASCs that do not meet the quality reporting requirements and then reduced by the 0.2 percentage point productivity adjustment. Therefore, we proposed to apply a 0.3 percent productivity-adjusted hospital market basket update factor to the CY 2021 ASC conversion factor for ASCs not meeting the quality reporting requirements. We also proposed that if more recent data are subsequently available (for example, a more recent estimate of the hospital market basket update or productivity adjustment), we would use such data, if appropriate, to determine the CY 2022 ASC update for this final rule with comment period.

For 2022, we proposed to adjust the CY 2021 ASC conversion factor ($48.952) by the proposed wage index budget neutrality factor of 0.9993 in addition to the productivity-adjusted hospital market basket update of 2.3 percent discussed above, which results in a proposed CY 2022 ASC conversion factor of $50.043 for ASCs meeting the quality reporting requirements. For ASCs not meeting the quality reporting requirements, we proposed to adjust the CY 2021 ASC conversion factor ($48.952) by the proposed wage index budget neutrality factor of 0.9993 in addition to the quality reporting/productivity-adjusted hospital market basket update of 0.3 percent discussed above, which results in a proposed CY 2022 ASC conversion factor of $49.064.

The comments we received on our proposals for updating the CY 2022 ASC conversion factor and our responses are set forth below.

Comment: Commenters supported continued use of the hospital market basket for updating ASC payments on an annual basis and suggested that using the hospital market basket better aligns the OPPS and ASC payment system. One commenter requested that we permanently use the hospital market basket to update ASC payment rates rather than limiting such update factor through CY 2023.

Response: We thank the commenters for their support of our proposal. We believe using the same update factor to calculate payments to ASC and hospital outpatient departments encourages the migration of services from the hospital setting to the ASC setting, and could potentially increase the presence of ASCs in health care markets or geographic areas where previously there were none or few. The migration of services from the higher cost hospital

outpatient setting to the ASC setting is likely to result in savings to beneficiaries and the Medicare program. This policy will also further our goal of giving both physicians and beneficiaries a greater choice in selecting the care setting that best suits their needs.

As we discussed in the CY 2019 OPPS/ASC final rule with comment period (83 FR 59075 through 59080), we finalized our policy to apply the hospital market basket update to ASC payment system rates for an interim period of 5 years (CY 2019 through CY 2023), during which we will assess whether there is a migration of the performance of procedures from the hospital setting to the ASC setting as a result of the use of a hospital market basket update, as well as whether there are any unintended consequences, such as less than expected migration of the performance of procedures from the hospital setting to the ASC setting. We intend to publish our assessment of service migration and other factors as a result of the hospital market basket update and any proposals related to our results in the CY 2023 OPPS/ASC proposed rule.

After consideration of the public comments we received, consistent with our proposal that if more recent data are subsequently available (for example, a more recent estimate of the hospital market basket update and productivity adjustment), we would use such data, if appropriate, to determine the CY 2022 ASC update for the CY 2022 OPPS/ASC final rule with comment period, we are incorporating more recent data to determine the final CY 2022 ASC update. Therefore, for this final rule with comment period, the hospital market basket update for CY 2022 is 2.7 percent, as published in the FY 2022 IPPS/LTCH PPS final rule (86 FR 42343), based on IGI's 2021 second quarter forecast with historical data through the first quarter of 2021. The productivity adjustment for this CY 2022 OPPS/ASC final rule with comment period is 0.7 percentage point, as published in the FY 2022 IPPS/LTCH PPS final rule (84 FR 42343) based on IGI's 2021 second quarter forecast.

For CY 2022, we are finalizing the hospital market basket update of 2.7 percent minus the productivity adjustment of 0.7 percentage point, resulting in a productivity-adjusted hospital market basket update factor of 2.0 percent for ASCs meeting the quality reporting requirements. Therefore, we apply a 2.0 percent productivity-adjusted hospital market basket update factor to the CY 2021 ASC conversion factor for ASCs meeting the quality reporting requirements to determine the CY 2022 ASC payment rates. We are finalizing the hospital market basket update of 2.7 percent reduced by 2.0 percentage points for ASCs that do not meet the quality reporting requirements and then subtract the 0.7 percentage point productivity adjustment. Therefore, we apply a 0.0 percent productivity -adjusted hospital market basket update factor to the CY 2021 ASC conversion factor for ASCs not meeting the quality reporting requirements.

For CY 2022, we are adjusting the CY 2021 ASC conversion factor ($48.952) by a wage index budget neutrality factor of 0.9997 in addition to the productivity-adjusted hospital market basket update of 2.0 percent, discussed above, which results in a final CY 2022 ASC conversion factor of $49.916 for ASCs meeting the quality reporting requirements. For ASCs not meeting the quality reporting requirements, we are adjusting the CY 2021 ASC conversion factor ($48.952) by the wage index budget neutrality factor of 0.9997 in addition to the quality reporting/productivity-adjusted hospital market basket update of 0.0 percent discussed above, which results in a final CY 2022 ASC conversion factor of $48.937.

3. Display of CY 2022 ASC Payment Rates

Addenda AA and BB to this final rule with comment period (which are available on the CMS website) display the final ASC payment rates for CY 2022 for covered surgical procedures and covered ancillary services, respectively. Historically, for those covered surgical procedures and covered ancillary services where the payment rate is the lower of the final rates under the ASC standard ratesetting methodology and the MPFS final rates, the final payment indicators and rates set forth in this final rule with comment period are based on a comparison using the PFS rates that would be effective January 1, 2022. For a discussion of the PFS rates, we refer readers to the CY 2022 PFS final rule that is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

The final payment rates included in addenda AA and BB to this final rule with comment period reflect the full ASC payment update and not the reduced payment update used to calculate payment rates for ASCs not meeting the quality reporting requirements under the ASCQR Program. These addenda contain several types of information related to the final CY 2022 payment rates. Specifically, in Addendum AA, a ''Y'' in the column titled ''To be Subject to Multiple Procedure Discounting'' indicates that the surgical procedure would be subject to the multiple procedure payment reduction policy. As discussed in the CY 2008 OPPS/ASC final rule with comment period (72 FR 66829 through 66830), most covered surgical procedures are subject to a 50-percent reduction in the ASC payment for the lower-paying procedure when more than one procedure is performed in a single operative session.

Comment: One commenter recommended that we remove the ''Y'' indicator for CPT code 64582 and not apply the multiple procedure discount as the predecessor code, CPT code 64568, was not subject to the multiple procedure discounting policy.

Response: We agree with the commenter that the predecessor code CPT code 64568 was not subject to multiple procedure discounting and that applying our discounting policy to this procedure would be inappropriate due to its high device costs. Therefore, we are removing the ''Y'' indicator for CPT code 64582 for CY 2022.

Display of the comment indicator ''CH'' in the column titled ''Comment Indicator'' indicates a change in payment policy for the item or service, including identifying discontinued HCPCS codes, designating items or services newly payable under the ASC payment system, and identifying items or services with changes in the ASC payment indicator for CY 2022. Display of the comment indicator ''NI'' in the column titled ''Comment Indicator'' indicates that the code is new (or substantially revised) and that comments will be accepted on the interim payment indicator for the new code. Display of the comment indicator ''NP'' in the column titled ''Comment Indicator'' indicates that the code is new (or substantially revised) and that comments will be accepted on the ASC payment indicator for the new code.

In Addendum BB, the column titled ''Drug Pass-Through Expiration during Calendar Year'' flags, through the use of an asterisk, each drug for which pass-through payment is expiring during the calendar year (that is, on a date other than December 31st).

The values displayed in the column titled ''Final CY 2022 Payment Weight'' are the final relative payment weights for each of the listed services for CY 2022. The final relative payment weights for all covered surgical procedures and covered ancillary services where the ASC payment rates are based on OPPS relative payment weights were scaled for budget neutrality. Therefore, scaling was not

applied to the device portion of the device-intensive procedures, services that are paid at the MPFS nonfacility PE RVU-based amount, separately payable covered ancillary services that have a predetermined national payment amount, such as drugs and biologicals and brachytherapy sources that are separately paid under the OPPS, or services that are contractor-priced or paid at reasonable cost in ASCs. This includes separate payment for non-opioid pain management drugs.

To derive the final CY 2022 payment rate displayed in the ''Final CY 2022 Payment Rate'' column, each ASC payment weight in the ''Final CY 2022 Payment Weight'' column was multiplied by the final CY 2022 conversion factor of $49.916. The conversion factor includes a budget neutrality adjustment for changes in the wage index values and the annual update factor as reduced by the productivity adjustment. The final CY 2022 ASC conversion factor uses the CY 2022 productivity-adjusted hospital market basket update factor of 2.0 percent (which is equal to the projected hospital market basket update of 2.7 percent reduced by a projected productivity adjustment of 0.7 percentage point).

In Addendum BB, there are no relative payment weights displayed in the ''Final CY 2022 Payment Weight'' column for items and services with predetermined national payment amounts, such as separately payable drugs and biologicals. The ''Final CY 2022 Payment'' column displays the final CY 2022 national unadjusted ASC payment rates for all items and services. The final CY 2022 ASC payment rates listed in Addendum BB for separately payable drugs and biologicals are based on ASP data used for payment in physicians' offices in 2020.

Addendum EE provides the HCPCS codes and short descriptors for surgical procedures that are proposed to be excluded from payment in ASCs for CY 2022.

In response to public comments we received, we are finalizing an Addendum FF to this final rule with comment period as well as subsequent OPPS/ASC proposed and final rules. Addenda FF to this final rule with comment period displays the OPPS payment rate (based on the standard ratesetting methodology), the device offset percentage, and the device portion of the ASC payment rate for CY 2022 for covered surgical procedures.

XIV. Advancing to Digital Quality Measurement and the Use of Fast Healthcare Interoperability Resources (FHIR) in Outpatient Quality Programs—Request for Information

We aim to move fully to digital quality measurement in the Centers for Medicare & Medicaid Services (CMS) quality reporting and value-based purchasing (VBP) programs by 2025. As part of this modernization of our quality measurement enterprise, in the CY 2022 OPPS/ASC proposed rule (86 FR 42234) we issued a request for information (RFI). The purpose of this RFI was to gather broad public input solely for planning purposes for our transition to digital quality measurement. Any updates to specific program requirements related to providing data for quality measurement and reporting provisions would be addressed through future rulemaking, as necessary. This RFI contains five parts:

- Background. This part provides information on our quality measurement programs and our goal to move fully to digital quality measurement by 2025. This part also provides a summary of recent HHS policy developments that are advancing interoperability and could support our move towards full digital quality measurement.
- Definition of Digital Quality Measures (dQMs). This part provides a potential definition for dQMs. Specific requests for input are included in the section.
- Use of Fast Healthcare Interoperability Resources (FHIR®) for Current Electronic Clinical Quality Measures (eCQMs). This part provides information on current activities underway to align CMS eCQMs with the FHIR standard and support quality measurement via application programming interfaces (APIs), and contrasts this approach to current eCQM standards and practice.
- Changes Under Consideration to Advance Digital Quality Measurement: Potential Actions in Four Areas to Transition to dQMs by 2025. This part introduces four possible steps that would enable transformation of CMS' quality measurement enterprise to be fully digital by 2025. Specific requests for input are included in the section.
- Solicitation of Comments. This part lists all requests for input we had included in the sections of this RFI.

A. Background

As required by law, we implement quality measurement and VBP programs across a broad range of inpatient acute care, outpatient, and post-acute care (PAC) settings consistent with our mission to improve the quality of health care for Americans through measurement, transparency, and increasingly, value-based purchasing. These quality programs are foundational for incentivizing value-based care, contributing to improvements in health care, enhancing patient outcomes, and informing consumer choice. In October 2017, we launched the Meaningful Measures Framework. This framework for quality measurement captures our vision to better address health care quality priorities and gaps, including emphasizing digital quality measurement, reducing measurement burden, and promoting patient perspectives, while also focusing on modernization and innovation. The scope of the Meaningful Measures Framework evolves as the health care environment continues to change.[201] Consistent with the Meaningful Measures Framework, we aim to move fully to digital quality measurement by 2025. We acknowledge facilities within the various care and practice settings covered by our quality programs may be at different stages of readiness and, therefore, the timeline for achieving full digital quality measurement across our quality reporting programs may vary.

[201] Meaningful Measures 2.0: Moving from Measure Reduction to Modernization. Available at: *https://www.cms.gov/meaningful-measures-20-moving-measure-reduction-modernization.*

We also continue to evolve the Medicare Promoting Interoperability Program's focus on the use of certified electronic health record (EHR) technology, from an initial focus on electronic data capture to enhancing information exchange and expanding quality measurement (83 FR 41634). However, reporting data for quality measurement via EHRs remains burdensome, and our current approach to quality measurement does not readily incorporate emerging data sources such as patient-reported outcomes (PRO) and patient-generated health data (PGHD).[202] There is a need to streamline our approach to data collection, calculation, and reporting to fully leverage clinical and patient-centered information for measurement, improvement, and learning.

Additionally, advancements in technical standards and associated regulatory initiatives to improve interoperability of healthcare data are creating an opportunity to significantly improve our quality measurement systems. In May 2020, we finalized interoperability requirements in the CMS Interoperability and Patient Access final rule (85 FR 25510) to support beneficiary access to data held by certain payers. At the same time, the Office of the National Coordinator for Health Information Technology (ONC) finalized policies in the ONC 21st Century Cures Act final rule (85 FR 25642) to advance the interoperability of health information technology (IT) as defined in section 4003 of the 21st Century Cures Act, including the ''complete access, exchange, and use of all electronically accessible health information.'' Closely working with ONC, we collaboratively identified Health Level 7 (HL7®) FHIR Release 4.0.1 as the standard to support API policies in both rules. ONC, on behalf of HHS, adopted the HL7 FHIR Release 4.0.1 for APIs and related implementation specifications at 45 CFR 170.215. We believe the FHIR standard has the potential to be a more efficient and modular standard to enable APIs. We also believe this standard enables collaboration and information sharing, which is essential for delivering high-quality care and better outcomes at a lower cost. By aligning technology requirements for payers, health care facilities, and health IT developers HHS can advance an interoperable health IT infrastructure that ensures healthcare facilities and patients have access to health data when and where it is needed.

In the ONC 21st Century Cures Act final rule, ONC adopted a ''Standardized API for Patient and Population Services'' certification criterion for health IT that requires the use of FHIR Release 4 and several implementation specifications. Health IT certified to this criterion will offer single patient and multiple patient services that can be accessed by third party applications (85 FR 25742).[203] The ONC 21st Century Cures Act final rule also requires health IT developers to update their certified health IT to support the United States Core Data for Interoperability (USCDI) standard.[204] The scope of patient data identified in the USCDI and the data standards that support this data set are expected to evolve over time, starting with data specified in Version 1 of the USCDI. In November 2020, ONC issued an interim final rule with comment period extending the date when health IT developers must make technology meeting updated certification criteria available under the ONC Health IT Certification Program until December 31, 2022 (85 FR 70064).[205]

The CMS Interoperability and Patient Access final rule (85 FR 25510) and program policies build on the ONC 21st Century Cures Act final rule (85 FR 25642). The CMS Interoperability and Patient Access final rule and policies require certain payers (for example, Medicare Advantage organizations, Medicaid and Child Health Insurance Program (CHIP) Fee-for-Service (FFS) programs, Medicaid managed care plans, CHIP managed care entities, and issuers of certain Qualified Health Plan (QHP) on the Federally-facilitated Exchanges (FFEs)) to implement and maintain a standards-based Patient Access API using HL7 FHIR Release 4.0.1 to make available claims and encounter data to their enrollees and beneficiaries (called ''patients'' in the CMS interoperability rule) with the intent of ensuring enrollees and beneficiaries have access to their own health care information through third-party software applications.

The CMS Interoperability and Patient Access final rule also established new conditions of participation for Medicare and Medicaid participating hospitals and critical access hospitals (CAHs), requiring them to send electronic notifications to another healthcare facility or community provider or practitioner when a patient is admitted, discharged, or transferred (85 FR 25603).

In the calendar year (CY) 2021 Physician Fee Schedule (PFS) final rule (85 FR 84472), we finalized a policy to align the certified EHR technology required for use in the Promoting Interoperability Programs and the Merit-based Incentive Payment System (MIPS) Promoting Interoperability performance category with the updates to health IT certification criteria finalized in the ONC 21st Century Cures Act final rule. Under this policy, MIPS eligible clinicians, and eligible hospitals and CAHs participating in the Promoting Interoperability Programs, must use technology meeting the updated certification criteria for performance and reporting periods beginning in 2023 (85 FR 84825).

The use of APIs can also reduce long-standing barriers to quality measurement. Currently, health IT developers are required to implement individual measure specifications within their health IT products. The health IT developer must also accommodate how that product connects with the unique variety of systems within a specific care setting.[206] This may be further complicated by systems that integrate a wide range of data schemas. This process is burdensome and costly, and it is difficult to reliably obtain high quality data across systems. As health IT developers map their health IT data to the FHIR standard and related implementation specifications, APIs can enable these structured data to be easily accessible for quality measurement or other use cases, such as care coordination, clinical decision support, and supporting patient access.

We believe the emerging data standardization and interoperability enabled by APIs will support the transition to full digital quality measurement by 2025, and are committed to exploring and seeking input on potential solutions for the transition to digital quality measurement as described in this RFI.

B. Definition of Digital Quality Measures

In the proposed rule, we sought to refine the definition of digital quality measures (dQMs) to further operationalize our objective of fully transitioning to dQMs by 2025. We previously noted dQMs use ''sources of health information that are captured and can be transmitted electronically and via interoperable systems'' (85 FR 84845). In the RFI, we sought input on future elaboration that would define a dQM as a software that processes digital data to produce a measure score or measure scores. Data sources for dQMs may include administrative systems, electronically submitted clinical assessment data, case management systems, EHRs, instruments (for example, medical devices and wearable devices), patient portals or applications (for example, for collection of patient-generated health data), health information exchanges (HIEs) or registries, and other sources. We also note that dQMs are intended to improve the patient experience including quality of care, improve the health of populations, and/or reduce costs.

We discussed one potential approach to developing dQM software in section XIV.D.2. of the preamble of the CY 2022 OPPS/ASC proposed rule (86 FR 42235) and in this final rule with comment period. In that section, we sought comment on the potential definition of dQMs in this RFI.

We also sought feedback on how leveraging advances in technology (for example, FHIR-based APIs) to access and electronically transmit interoperable data for dQMs could reinforce other activities to support quality measurement and improvement (for example, the aggregation of data across multiple data sources, rapid-cycle feedback, and alignment of programmatic requirements).

The transition to dQMs relies on advances in data standardization and interoperability. As providers and payers work to implement the required advances in interoperability over the next several years, we will continue to support reporting of eCQMs through CMS quality reporting programs and through the Promoting Interoperability Programs.[207] These fully digital measures continue to be important drivers of interoperability advancement and learning. As discussed in the CY 2022 OPPS/ASC proposed rule and the next section of this final rule with comment period, we are currently re-specifying and testing these measures to use FHIR rather than the currently adopted Quality Data Model (QDM) in anticipation of the wider use of FHIR standards. We intend to apply significant components of the output of this work, such as the re-specified measure logic and the learning done through measure testing with FHIR-based APIs, to define and build future dQMs that take advantage of the expansion of standardized, interoperable data.

C. Use of FHIR for Current eCQMs

Since we adopted eCQMs in our hospital and clinician quality programs, we have heard from stakeholders about the technological challenges, burden, and related costs of reporting eCQM data. The CMS eCQM Strategy Project engaged with stakeholders through site visits and listening sessions with health systems and provider organizations to learn about their experiences. This stakeholder feedback identified recommendations to improve processes related to alignment; development; implementation and reporting; certification; and communication, education, and outreach. Over the past 2 years, we have focused on opportunities to streamline and modernize quality data collection and reporting processes, such as exploring FHIR (*http://hl7.org/fhir*) as a framework for measure structure and data submission for quality reporting programs, specifically for eCQMs. FHIR is a free and open source standards framework (in both commercial and government settings) created by HL7 International that establishes a common language and process for all health information technology. FHIR allows systems to communicate and information to be shared seamlessly, with a lower burden for hospitals, providers, clinicians, vendors, and quality measurement stakeholders. Specifically, for quality reporting, FHIR enables representing the data in eCQMs as well as provides a structure for eCQMs and reporting, using FHIR as the standard for all. Whereas today, multiple standards being used to report eCQMs is challenging and burdensome.

We are working to convert current eCQMs to the FHIR standard. We are currently testing the exchange of data elements represented in FHIR to CMS through ongoing HL7 Connectathons and integrated system testing by using and refining implementation guides (IGs). Submitting data through FHIR-based APIs has the potential to improve data exchange by providing consistent security, performance, scalability, and structure to all users. In addition, development of FHIR-based APIs could decrease provider burden by automating more of the measure data collection process. We continue to explore and expand potential applications of the FHIR standard and testing with eCQM use cases, and we are strongly considering a transition to FHIR-based quality reporting with the use of the FHIR standard for eCQMs in quality and value-based reporting programs. As we move to an all-dQM format for quality programs, we are depending on testing results and community readiness to improve interoperability, reduce burden, and facilitate better patient care. We will continue to consider how to leverage the interoperability advantages offered by the FHIR standards and API-based data submission, including digital quality measurement.

D. Changes Under Consideration To Advance Digital Quality Measurement: Potential Actions in Four Areas To Transition to Digital Quality Measures by 2025

Building on the advances in interoperability and learning from testing of FHIR-converted eCQMs, we aim to move fully to dQMs, originating from sources of health information that are captured and can be transmitted electronically via interoperable systems, by 2025.

To enable this transformation, we are considering further modernization of the quality measurement enterprise in four major ways: (1) Leverage and advance standards for digital data and obtain all EHR data required for quality measures via provider FHIR-based APIs; (2) redesign our quality measures to be self-contained tools; (3) better support data aggregation; and (4) work to align measure requirements across our reporting programs, other Federal programs and agencies, and the private sector where appropriate.

These changes would enable us to collect and utilize more timely, actionable, and standardized data from diverse sources and care settings to improve the scope and quality of data used in quality reporting and payment programs, reduce quality reporting burden, and make results available to stakeholders in a rapid-cycle fashion. Data collection and reporting efforts would become more efficient, supported by advances in interoperability and data standardization. Aggregation of data from multiple sources would allow assessments of costs and outcomes to be measured across multiple care settings for an individual patient or clinical conditions. We believe that aggregating data for measurement can incorporate a more holistic assessment of an individual's health and health care and produce the rich set of data needed to

[207] eCQI Resource Center. Available at: *https://ecqi.healthit.gov/*.

enable patients and caregivers to make informed decisions by combining data from multiple sources (for example, patient reported data, EHR data, and claims data) for measurement.

Perhaps most importantly, these steps would help us deliver on the full promise of quality measurement and drive us toward a learning health system that transforms healthcare quality, safety, and coordination and effectively measures and achieves value-based care. The shift from a static to a learning health system hinges on the interoperability of healthcare data, and the use of standardized data. The dQMs would leverage this interoperability to deliver on the promise of a learning health system wherein standards-based data sharing and analysis, rapid-cycle feedback, and quality measurement and incentives are aligned for continuous improvement in patient-centered care. Similarly, standardized, interoperable data used for measurement can also be used for other use cases, such as clinical decision support, care coordination and care decision support, which impacts health care and care quality.

We requested comments on four potential future actions that would enable transformation to a fully digital quality measurement enterprise by 2025.

1. Leveraging and Advancing Standards for Digital Data and Obtaining All EHR Data Required for Quality Measures via Provider FHIR-Based APIs

We are considering targeting the data required for our quality measures that utilize EHR data to be data retrieved via FHIR-based APIs based on standardized, interoperable data. Utilizing standardized data for EHR-based measurement (based on FHIR and associated IGs) and aligning where possible with interoperability requirements can eliminate the data collection burden providers currently experience with required chart-abstracted quality measures and reduce the burden of reporting digital quality measure results. We can fully leverage this advance to adapt eCQMs and expand to other dQMs through the adoption of interoperable standards across other digital data sources. We are considering methods and approaches to leverage the interoperability data requirements for APIs in certified health IT set by the ONC 21st Century Cures Act final rule to support modernization of CMS quality measure reporting. As discussed previously, these requirements will be included in certified technology in future years (85 FR 84825) including availability of data included in the USCDI via standards-based APIs, and we will require clinicians and hospitals participating in MIPS and the Promoting Interoperability Programs, respectively, to transition to use of certified technology updated consistent with the 2015 Cures Edition Update (85 FR 84825).

Digital data used for measurement could also expand beyond data captured in traditional clinical settings, administrative claims data, and EHRs. Many important data sources are not currently captured digitally, such as survey and PGHD. We intend to work to innovate and broaden the digital data used across the quality measurement enterprise beyond the clinical EHR and administrative claims. Agreed upon standards for these data, and associated implementation guides will be important for interoperability and quality measurement. We will consider developing clear guidelines and requirements for these digital data that align with interoperability requirements, for example, requirements for expressing data in standards, exposing data via standards-based APIs, and incentivizing technologies that innovate data capture and interoperability.

High quality data are also essential for reliable and valid measurement. Hence, in implementing the shift to collect all clinical EHR data via FHIR-based APIs, we would support efforts to strengthen and test the quality of the data obtained through FHIR-based APIs for quality measurement. We currently conduct audits of eCQM data submitted under our quality programs, including the Hospital Inpatient Quality Reporting (IQR) Program, with functions including checks for data completeness and data accuracy, confirmation of proper data formatting, alignment with standards, and appropriate data cleaning (82 FR 38398 through 38402). These functions would continue and be applied to dQMs and further expanded to automate the manual validation of the data compared to the original data source (for example, the medical record) where possible. Analytic advancements such as natural language processing, big data analytics, and artificial intelligence, can support this evolution. These techniques can be applied to validating observed patterns in data and inferences or conclusions drawn from associations, as data are received, to ensure high quality data are used for measurement.

We sought feedback on the goal of aligning data needed for quality measurement with interoperability requirements and the strengths and limitations of this approach. We also sought feedback on the importance of and approaches to supporting inclusion of PGHD and other currently non-standardized data. We also welcomed comment on approaches for testing data quality and validity.

2. Redesigning Quality Measures To Be Self-Contained Tools

We are considering approaches for including quality measures that take advantage of standardized data and interoperability requirements that have expanded flexibility and functionality compared to CMS' current eCQMs. We are considering defining and developing dQM software as end-to-end measure calculation solutions that retrieve data from primarily FHIR-based resources maintained by providers, payers, CMS, and others; calculate measure score(s); and produce reports. In general, we believe to optimize the use of standardized and interoperable data, the software solution for dQMs should do the following:

- Have the flexibility to support calculation of single or multiple quality measure(s).
- Perform three functions—

++ Obtain data via automated queries from a broad set of digital data sources (initially from EHRs, and in the future from claims, PRO, and PGHD);

++ Calculate the measure score according to measure logic; and

++ Generate measure score report(s).

- Be compatible with any data source systems that implement standard interoperability requirements.
- Exist separately from digital data source(s) and respect the limitations of the functionality of those data sources.
- Be tested and updated independently of the data source systems.
- Operate in accordance with health information protection requirements under applicable laws and comply with governance functions for health information exchange.
- Have the flexibility to be deployed by individual health systems, health IT vendors, data aggregators, and health plans; and/or run by CMS depending on the program and measure needs and specifications.
- Be designed to enable easy installation for supplemental uses by medical professionals and other non-technical end-users, such as local calculation of quality measure scores or quality improvement.
- Have the flexibility to employ current and evolving advanced analytic approaches such as natural language processing.
- Be designed to support pro-competitive practices for development, maintenance, and implementation as

well as diffusion of quality measurement and related quality improvement and clinical tools through, for example, the use of open-source core architecture.

We sought comment on these suggested functionalities and other additional functionalities that quality measure tools should ideally have particularly in the context of the possible expanding availability of standardized and interoperable data (for example, standardized EHR data available via FHIR-based APIs).

We were also interested whether and how this more open, agile strategy may facilitate broader engagement in quality measure development, the use of tools developed for measurement for local quality improvement, and/or the application of quality tools for related purposes such as public health or research.

3. Building a Pathway to Data Aggregation in Support of Quality Measurement

Using multiple sources of collected data to inform measurement would reduce data fragmentation (or, different pieces of data regarding a single patient stored in many different places). Additionally, we are considering expanding and establishing policies and processes for data aggregation and measure calculation by third-party aggregators that include, but are not limited to, HIEs and clinical registries. Qualified Clinical Data Registries and Qualified Registries that report quality measures for eligible clinicians in the MIPS program are potential examples [208] at 42 CFR 414.1440(b)(2)(iv) and (v) and (c)(2)(iii) and (iv) and can also support measure reporting. We are considering establishing similar policies for third-party aggregators to maintain the integrity of our measure reporting process and to encourage market innovation.

We sought feedback on aggregation of data from multiple sources to inform measurement and potential policy considerations. We also sought feedback on the role data aggregators can and should play in CMS quality measure reporting in collaboration with providers, and how we can best facilitate and enable aggregation.

4. Potential Future Alignment of Measures Across Reporting Programs, Federal and State Agencies, and the Private Sector

We are committed to using policy levers and working with stakeholders to solve the issue of interoperable data exchange and to transition to full digital quality measurement. We are considering the future potential development and multi-staged implementation of a common portfolio of dQMs across our regulated programs, agencies, and private payers. This common portfolio would require alignment of: (1) Measure concepts and specifications including narrative statements, measure logic, and value sets; and (2) the individual data elements used to build these measure specifications and calculate the measure logic. Further, the required data elements would be limited to standardized, interoperable data elements to the fullest extent possible; hence, part of the alignment strategy will be the consideration and advancement of data standards and IGs for key data elements. We would coordinate closely with quality measure developers, Federal and state agencies, and private payers to develop and to maintain a cohesive dQM portfolio that meets our programmatic requirements and that fully aligns across Federal and state agencies and payers to the extent possible.

We intend for this coordination to be ongoing and allow for continuous refinement to ensure quality measures remain aligned with evolving healthcare practices and priorities (for example, PROs, disparities, and care coordination), and track with the transformation of data collection, alignment with health IT module updates including capabilities and standards adopted by ONC (for example, standards to enable APIs). This coordination would build on the principles outlined in HHS' National Health Quality Roadmap.[209] It would focus on the quality domains of safety, timeliness, efficiency, effectiveness, equitability, and patient-centeredness. It would leverage several existing Federal and public-private efforts including our Meaningful Measures 2.0 Framework; the Federal Electronic Health Record Modernization (Department of Defense and Veterans Affairs (DoD/VA)); the Agency for Healthcare Research and Quality's (AHRQ) Clinical Decision Support Initiative; the Centers for Disease Control and Prevention's (CDC) Adapting Clinical Guidelines for the Digital Age initiative; Core Quality Measure Collaborative, which convenes stakeholders from America's Health Insurance Plans (AHIP), CMS, National Quality Forum (NQF), provider organizations, private payers, and consumers and develops consensus on quality measures for provider specialties; and the NQF-convened Measure Applications Partnership (MAP), which recommends measures for use in public payment and reporting programs. We would coordinate with HL7's ongoing work to advance FHIR resources in critical areas to support patient care and measurement such as social determinants of health. Through this coordination, we would identify which existing measures could be used or evolved to be used as dQMs, in recognition of current healthcare practice and priorities.

This multi-stakeholder, joint Federal, state, and industry effort, made possible and enabled by the pending advances towards true interoperability, would yield a significantly improved quality measurement enterprise. The success of the dQM portfolio would be enhanced by the degree to which the measures achieve our programmatic requirements for measures as well as the requirements of other agencies and payers.

We sought feedback on initial priority areas for the dQM portfolio given evolving interoperability requirements (for example, measurement areas, measure requirements, tools, and data standards). We also sought to identify opportunities to collaborate with other Federal agencies, states, and the private sector to adopt standards and technology-driven solutions to address our quality measurement priorities across sectors.

E. Solicitation of Comments

As noted previously, we sought input on the future development of the following in the CY 2022 OPPS/ASC proposed rule (86 FR 42232):

- Definition of Digital Quality Measures. We sought feedback on the following as described in section XIV.2. of the CY 2022 OPPS/ASC proposed rule:

++ Do you have feedback on the potential future dQM definition?

++ Does this approach to defining and deploying dQMs to interface with FHIR-based APIs seem promising? We also welcomed more specific comments on the attributes or functions to support such an approach of deploying dQMs.

- Use of FHIR for Current eCQMs. We sought feedback on the following as described in section XIV.3. of the

[208] CY 2021 Physician Fee Schedule Final Rule: Finalized (New and Updated) Qualified Clinical Data Registry (QCDR) and Qualified Registry Policies, *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/1362/QCDR%20and%20QR%20Updates%202021%20Final%20Rule%20Fact%20Sheet.pdf.*

[209] Department of Health and Human Services, National Health Quality Roadmap (May 2020). Available at: *https://www.hhs.gov/sites/default/files/national-health-quality-roadmap.pdf.*

preamble of the CY 2022 OPPS/ASC proposed rule:

++ Would a transition to FHIR-based quality reporting reduce burden on health IT vendors and providers? Please explain.

++ Would access to near real-time quality measure scores benefit your practice? How so?

++ What parts of the current CMS Quality Reporting Data Architecture (QRDA) IGs cause the most burden (please explain the primary drivers of burden)?

++ In what ways could CMS FHIR Reporting IG be modified to reduce burden on providers and vendors?

• Changes Under Consideration to Advance Digital Quality Measurement: Actions in Four Areas to Transition to Digital Quality Measures by 2025.

++ We sought feedback on the following as described in section XIV.4.a. of the preamble of the CY 2022 OPPS/ASC proposed rule:

—Do you agree with the goal of aligning data needed for quality measurement with interoperability requirements? What are the strengths and limitations of this approach? Are there specific FHIR IGs suggested for consideration?

—How important is a data standardization approach that also supports inclusion of PGHD and other currently non-standardized data?

—What are possible approaches for testing data quality and validity?

++ We sought feedback on the following as described in section XIV.4.b. of the preamble of the CY 2022 OPPS/ASC proposed rule:

—What functionalities, described in section (4)(b) or others, should quality measure tools ideally have in the context of the pending availability of standardized and interoperable data (for example, standardized EHR data available via FHIR-based APIs)?

—How would this more open, agile strategy for end-to-end measure calculation facilitate broader engagement in quality measure development, the use of tools developed for measurement for local quality improvement, and/or the application of quality tools for related purposes such as public health or research?

++ We sought feedback on the following as described in section XIV.4.c. of the preamble of the CY 2022 OPPS/ASC proposed rule:

—What are key policy considerations for aggregation of data from multiple sources being used to inform measurement?

—What role can or should data aggregators play in CMS quality measure reporting in collaboration with providers? How can CMS best facilitate and enable aggregation?

++ We sought feedback on the following as described in section XIV.4.d. of the preamble of the CY 2022 OPPS/ASC proposed rule:

—What are initial priority areas for the dQM portfolio given evolving interoperability requirements (for example, measurement areas, measure requirements, tools)?

—We also sought to identify opportunities to collaborate with other Federal agencies, states, and the private sector to adopt standards and technology-driven solutions to address our quality measurement priorities and across sectors.

We requested commenters to consider provisions in the CMS Interoperability and Patient Access final rule (85 FR 25510), CMS CY 2021 PFS final rule (85 FR 84472), and the ONC 21st Century Cures Act final rule (85 FR 25642).

We plan to continue working with other agencies and stakeholders to coordinate and to inform any potential transition to dQMs by 2025. While we will not be responding to specific comments submitted in response to this Request for Information in this final rule with comment period, we will actively consider all input as we develop future regulatory proposals or future subregulatory policy guidance. Any updates to specific program requirements related to quality measurement and reporting provisions would be addressed through separate and future notice-and-comment rulemaking, as necessary.

We received comments on these topics:

Comment: There was widespread support among commenters for digital quality measurement in general. Many commenters specifically expressed support for CMS' transition to digital quality measurement. Some commenters noted digital quality measurement holds promise to improve the quality measurement enterprise, and patient outcomes and experience; reduce administrative burden; and make meaningful data more readily available for quality improvement. Commenters encouraged CMS to set up incentives for those who participate in digital measurement to help prepare their facilities' technology for the change, as well as incentives for reporting their quality data. Commenters noted CMS must plan for and design digital quality measure requirements while considering the availability of data standards, data security, and technical infrastructure and capabilities.

However, a few commenters did not fully support CMS' transition to digital measurement, for example, due to lack of readiness, technical capabilities, or specificity from CMS about the transition plan. The commenters expressed concerns with the readiness of ASCs and their informational technology capabilities. Another commenter strongly opposed CMS' access to a facility's EHR for measurement. The commenter noted technological challenges in the outpatient setting and administrative burdens as made evident and exacerbated by the COVID–19 public health emergency.

Regarding the timeline for the transition to digital quality measurement, while some commenters agreed the 2025 timeline is feasible, some questioned the feasibility of the full transition by 2025. Commenters who were hesitant about the 2025 timeline noted the timeline is ambitious or aggressive. Some noted the timeline is ambitious due to the burden facilities have incurred through the COVID–19 public health emergency. Others noted the timeline is impractical for ASCs since ASCs were not included in the provisions of the American Recovery and Reinvestment Act of 2009, which established provisions to encourage adoption of EHRs, and ASCs' current use of EHRs is limited. Some commenters suggested delaying the transition until after the COVID–19 Public Health Emergency (for example, 2 years after its end), while others suggested CMS revert back to the 2030 goal or delay transition until CMS can provide further guidance to stakeholders on their plans for the transition to digital measurement. Other commenters noted CMS' transition will need to account for real-world testing to ensure the availability of data, technical infrastructure, and alignment with other requirements such as ONC's CEHRT. The commenters noted CMS will need to plan for this, coordinate efforts, and encourage adoption by stakeholders particularly in underserved communities.

Response: We appreciate all of the comments on this topic. We believe that this input is very valuable in the continuing development of our transition to digital quality measurement in CMS quality reporting and value-based purchasing programs by 2025. We will continue to take all comments into account as we develop future regulatory proposals or other guidance for our digital quality measurement efforts.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42232), we clarified a

potential future definition of dQMs as a software that processes digital data to produce a measure score or measure scores.

Comment: Several commenters noted appreciation for CMS' clarifications of the potential dQM definition. While some commenters supported the broad definition of dQMs and the ability of dQMs to promote rapid-cycle feedback for quality reporting, some commenters found the definition to still be too broad. A few commenters appreciated the broad range of digital data sources included in the definition and noted the definition captures the evolving availability of digital data. A few commenters who also supported the broad definition noted dQMs should and could capture data from across the continuum of care.

Some commenters who did not support the broad definition noted not all of the digital data sources in the definition have been adequately vetted or tested. The commenters noted not all of the digital data sources are currently ready to be used as reliable and valid sources for digital measurement (for example, data from wearable devices, patient-generated health data), although they hold promise for the future. Another commenter who also opposed CMS' transition to digital measurement did not support the use of emerging digital data sources, such as patient-generated health data, without specific details about CMS' plans to incorporate digital data sources in dQMs and ensuring the data would be understandable to beneficiaries.

Several commenters sought additional information and clarification regarding the definition. Specifically, several stakeholders requested further clarification on the potential definition of dQMs, how CMS envisions the future of dQMs, and how the future use of dQMs would differ from the current state. Some stakeholders requested clarification about the use of the term ''software'' in the potential dQM definition and suggested refinements to the definition. For example, one commenter who noted software development does not align with the current specification or structure of quality measures, suggested using alternative terms in the dQM definition such as ''computer readable'' or ''computer executable.'' Some commenters suggested CMS better define goals and expectations for dQM use. Some commenters requested a specific roadmap of implementation for providers to better understand how to prepare for dQMs.

Response: We appreciate all of the comments on and interest in this topic. We believe that this input is very valuable in the continuing development of our transition to digital quality measurement in CMS quality reporting and value-based purchasing programs by 2025. We will continue to take all comments into account as we develop future regulatory proposals or other guidance for our digital quality measurement efforts.

As noted above, we requested input on the use of FHIR for eCQMs and actions in four areas to transition to dQMs by 2025 including:

(1) Leveraging and advancing standards for digital data and obtaining all EHR data required for quality measures via provider FHIR-based APIs.

(2) Redesigning quality measures to be self-contained tools.

(3) Building a pathway to data aggregation in support of quality measurement.

(4) Potential future alignment of measures across reporting programs, Federal and state agencies, and the private sector.

Comment: Some commenters agreed FHIR-based quality reporting would reduce burden on providers. Commenters acknowledged FHIR provides a standardized way of sharing information and agreed the use of FHIR would increase interoperability and harmonization of data standards across providers and care settings. However, some commenters noted not all EHR or health IT vendors have adopted FHIR. Commenters encouraged CMS to evaluate the adoption of FHIR standard as well as understand the potential burden and costs associated with its adoption before requiring its use for digital measurement. Some commenters also requested CMS provide guidance to measure developers, vendors, and other stakeholders on the transition to FHIR-based eCQMs (for example, which version of FHIR to implement and which implementation guides will be used) and ensure sufficient testing prior to widespread adoption. One commenter agreed with incentivizing the use of FHIR but not requiring it as to not place undue burden on hospital or other providers who are not yet ready to adopt FHIR. Another commenter who did not agree with using the FHIR standard cautioned relying on any single approach or standard (for example, FHIR) until successful model elements can be identified.

Some commenters agreed with the goal of aligning data needed for quality measurement with interoperability requirements, and those data necessary for clinical care. For example, one commenter suggested using data elements in quality measures that conform to the data elements and classes in the United States Core Data for Interoperability (USCDI), where possible, to reduce measure complexity and improve data quality. A few commenters noted challenges with managing health information from unstructured data fields for digital measurement in the outpatient setting. The commenters noted some health information in the outpatient setting (for example, for anesthesia and imaging) is contained in unstructured data fields, and this would pose a challenge for FHIR-based quality measurement. Some commenters also expressed concerns about inclusion of data from sources outside of the EHR in measurement due to privacy and validity concerns. Other commenters noted that broader data sources used in measurement will improve measurement but may need to be phased in.

Regarding building a pathway to data aggregation, some commenters agreed that data aggregation will become easier with more aligned and interoperable data, and aggregation of data will strengthen measurement and provide a better understanding of population health. Other commenters requested more clarity on how third-party aggregators will be incorporated into the quality measurement ecosystem. A commenter also noted the need for a national strategy to improve patient identification and matching to facilitate more accurate data aggregation. One commenter identified the potential measure development and testing burden when combining data from multiple sources. Commenters also noted the need for increased data security as data sharing and aggregation is broadly implemented; one commenter recommended the Trusted Exchange Framework and Common Agreement (TEFCA) as a framework to support secure data sharing.

Some commenters supported using provider FHIR-based APIs for quality measurement and agreed with obtaining all EHR data captured for quality measure via provider FHIR-based APIs as a stride towards interoperability. Some commenters also requested CMS provide expectations and clarifications to ensure privacy and data security (for example, security transfer guidelines and security procedures).

However, some commenters expressed concerns about the use of FHIR-based APIs such as the technical infrastructure and financial readiness, and providers' unfamiliarity with or varied uptake of FHIR. For example, as noted above, some commenters pointed out the limited use of EHRs by ASCs. They noted that the technological

hurdles created by FHIR may prove problematic for some ASCs. Because ASCs are not required to use EHRs, stakeholders voiced that many do not use EHRs or they use EHRs that are certified. The commenters encouraged any regulations of applications be backwards compatible so as to allow more ASCs to participate. Commenters also identified the need for significant support for small ASCs or ASCS in rural or underserved areas that do not have the resource to have dedicated health IT staff. For support, commenters requested CMS provide technical assistance, advanced notice of requirements, and adequate time for rollout. A few commenters encouraged CMS to rigorously test any programs they implement to ensure patient safety and security as well as checking that systems do not cause accidental bias.

Some commenters agreed with redesigning quality measures as self-contained tools and agreed with their functionalities necessary to achieve digital quality measurement. The recommended CMS work with stakeholders to identify how and when the functionalities of the self-contained tools could be sequenced (for example, which could be achievable by 2025) and scaled. Further, commenters noted the tools should be tested and validated.

Many commenters expressed support for alignment of measurement areas, specifications, data elements used to build the specifications, and tools across reporting programs and payers. Several commenters noted alignment will require input from stakeholders and leadership across federal agencies. Some commenters recommended CMS work with other federal agencies and stakeholders such as patients to understand their role as an active EHR end-user, the National Quality Forum (NQF), the health IT community, the Core Quality Measures Collaborative (CQMC), and others. Some commenters encouraged CMS to partner with ONC on data standards and interoperability requirements (for example, health IT certification requirements) to plan for validating dQMs and ensure alignment across agencies.

Several commenters supported the development of a common dQM portfolio. Some commenters suggested initial priority areas for the common dQM portfolio. For example, some commenters noted the importance of standardizing social risk factor data collection and use of social risk factor data in measurement. Some commenters suggested CMS prioritize dQMs with clinical relevance, dQMs focusing on immunizations, and dQMs for anesthesia care as well as ensure dQMs would be available to cover all medical specialties and practitioners. Some commenters encouraged CMS to identify which existing measures could be used as dQMs while concurrently identifying future priority areas. Commenters also noted alignment could leverage data routinely captured during and across the continuum of clinical care, simplify quality reporting, and help address challenges associated with managing various standards and formats.

Several commenters supported a phased approach to dQM implementation. Several commenters requested CMS allow adequate time for setting up capabilities for implementation, testing, and validation to ensure successful transition to and use of dQMs. Several commenters requested CMS provide a plan for transition to digital quality measurement and consider program incentives, flexibilities in reporting, and technical assistance for providers. One commenter suggested CMS incorporate this plan as part of their creation of the common dQM portfolio. Another commenter recommended CMS develop a staged long-term plan on digital measurement in conjunction with a long-term plan on equity. One commenter, however, expressed concern about the phased approach and noted alignment should be a priority alongside interoperability.

Many commenters expressed they are committed to working with CMS in supporting the transition to digital quality measurement.

Response: We appreciate all of the comments on this topic. We believe that this input is very valuable in the continuing development of our transition to digital quality measurement in CMS quality reporting and value-based purchasing programs by 2025. We will continue to take all comments into account as we develop future regulatory proposals or other guidance for our digital quality measurement efforts.

XV. Requirements for the Hospital Outpatient Quality Reporting (OQR) Program

A. Background

1. Overview

CMS seeks to promote higher quality and more efficient healthcare for Medicare beneficiaries. Consistent with these goals, CMS has implemented quality reporting programs for multiple care settings including the quality reporting program for hospital outpatient care, known as the Hospital Outpatient Quality Reporting (OQR) Program.

2. Statutory History of the Hospital OQR Program

We refer readers to the CY 2011 OPPS/ASC final rule with comment period (75 FR 72064 through 72065) for a detailed discussion of the statutory history of the Hospital OQR Program. The Hospital OQR Program regulations are codified at 42 CFR 419.46. In the CY 2021 OPPS/ASC final rule (85 FR 86179), we finalized updates to the regulations to include a reference to the statutory authority for the Hospital OQR Program. Section 1833(t)(17)(A) of the Social Security Act (the Act) states that subsection (d) hospitals (as defined under section 1886(d)(1)(B) of the Act) that do not submit data required for measures selected with respect to such a year, in the form and manner required by the Secretary, will incur a 2.0 percentage point reduction to their annual Outpatient Department (OPD) fee schedule increase factor. In the CY 2021 OPPS/ASC final rule (85 FR 86179) we codified the Hospital OQR Program's statutory authority at § 419.46(a).

3. Regulatory History of the Hospital OQR Program

We refer readers to the CY 2008 through 2021 OPPS/ASC final rules with comment period for detailed discussions of the regulatory history of the Hospital OQR Program:

- The CY 2008 OPPS/ASC final rule (72 FR 66860 through 66875);
- The CY 2009 OPPS/ASC final rule (73 FR 68758 through 68779);
- The CY 2010 OPPS/ASC final rule (74 FR 60629 through 60656);
- The CY 2011 OPPS/ASC final rule (75 FR 72064 through 72110);
- The CY 2012 OPPS/ASC final rule (76 FR 74451 through 74492);

- The CY 2021 OPPS/ASC final rule (85 FR 86179 through 86187).

We have codified certain requirements under the Hospital OQR

Program at 42 CFR 419.46. We refer readers to section XV.E. of this final rule with comment period for a detailed discussion of the payment reduction for hospitals that fail to meet Hospital OQR Program requirements for the CY 2024 payment determination.

B. Hospital OQR Program Quality Measures

1. Considerations in Selecting Hospital OQR Program Quality Measures

We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74458 through 74460) for a detailed discussion of the priorities we consider for the Hospital OQR Program quality measure selection. We did not propose any changes to these policies in the proposed rule.

2. Retention of Hospital OQR Program Measures Adopted in Previous Payment Determinations

We previously finalized and codified at § 419.46(h)(1) a policy to retain measures from a previous year's Hospital OQR Program measure set for subsequent years' measure sets, unless removed (77 FR 68471 and 83 FR 59082). We did not propose any changes to these policies in the proposed rule.

3. Removal of Quality Measures From the Hospital OQR Program Measure Set

a. Immediate Removal

We previously finalized and codified at § 419.46(i)(2) and (3) a process for removal and suspension of Hospital OQR Program measures, based on evidence that the continued use of the measure as specified raises patient safety concerns (74 FR 60634 through 60635, 77 FR 68472, and 83 FR 59082).[210] We did not propose any changes to these policies in the proposed rule.

b. Consideration Factors for Removing Measures

We previously finalized and codified at § 419.46(i)(3) policies to use the regular rulemaking process to remove a measure for circumstances for which we do not believe that continued use of a measure raises specific patient safety concerns (74 FR 60635 and 83 FR 59082).[211] We did not propose any changes to these policies in the proposed rule.

c. Measure Removals Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination: OP–02 (Fibrinolytic Therapy Received Within 30 Minutes of ED Arrival) and OP–03 (Median Time To Transfer to Another Facility for Acute Coronary Intervention)

In CY 2022 OPPS/ASC proposed rule (86 FR 42237), we proposed to remove two chart-abstracted measures under removal Factor 4—the availability of a more broadly applicable (across settings, populations, or conditions) measure for the particular topic:

- Fibrinolytic Therapy Received Within 30 Minutes of Emergency Department (ED) Arrival (OP–2); and
- Median Time to Transfer to Another Facility for Acute Coronary Intervention (OP–3).

The OP–2 measure assesses the number of acute myocardial infarction (AMI) patients with: (a) ST-segment elevation on the electrocardiogram closest to arrival time receiving fibrinolytic therapy during the ED visit; and (b) a time from hospital arrival to fibrinolysis of 30 minutes or less. For more details on this measure, we refer readers to the CY 2008 OPPS/ASC final rule with comment period (72 FR 66865), where this measure was designated as ED–AMI–3, and the CY 2009 OPPS/ASC final rule with comment period (73 FR 68761), where this measure was relabeled as OP–2 (for the CY 2010 payment determination and subsequent years). The OP–3 measure assesses the median number of minutes before outpatients with chest pain or possible heart attack who needed specialized care were transferred to another hospital capable of offering such specialized care. For more details on this measure, we refer readers to the CY 2008 OPPS/ASC final rule with comment period (72 FR 66865), where this measure was designated as ED–AMI–5, and the CY 2009 OPPS/ASC final rule with comment period (73 FR 68761), where this measure was relabeled as OP–3 (for the CY 2010 payment determination and subsequent years).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42237), we proposed to remove these two measures (Fibrinolytic Therapy Received Within 30 Minutes of Emergency Department (ED) Arrival (OP–2) and Median Time to Transfer to Another Facility for Acute Coronary Intervention (OP–3)) beginning with the CY 2023 reporting period/CY 2025 payment determination due to the availability of a more broadly applicable measure. Specifically, in the CY 2022 OPPS/ASC proposed rule (86 FR 42237), we proposed to adopt the ST-Segment Elevation Myocardial Infarction (STEMI) electronic clinical quality measure (eCQM) into the Hospital OQR Program measure set, which would serve as a replacement for these two measures. We refer readers to section XV.B.4.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42244) and section XV.B.4.c. of this final rule with comment period for further discussion of the STEMI eCQM, including the measure overview, data sources, and measure calculation.

OP–2 and OP–3 measure the proportion of eligible STEMI patients who receive timely fibrinolytic therapy and timely transfer from an ED to another facility to receive appropriate care, respectively. The STEMI eCQM is an electronic process measure that includes both the populations of OP–2 and OP–3. It measures the percentage of ED patients diagnosed with STEMI that received timely fibrinolytic therapy (within 30 minutes) or timely transfer to a percutaneous coronary intervention (PCI)-capable facility (within 45 minutes). Additionally, the STEMI eCQM (OP–40) captures transfer and non-transfer patients at a PCI-capable facility who receive PCI (within 90 minutes). Pursuant to removal Factor 4, we believe that the adoption of the STEMI eCQM would capture the OP–2 and OP–3 measure populations and expand beyond these populations to comprehensively measure the timeliness and appropriateness of STEMI care.

Furthermore, the OP–2 and OP–3 measures are chart-abstracted measures, which result in greater provider burden due to manual abstraction. The STEMI eCQM (OP–40) allows for the retrieval of data directly from the electronic health record (EHR) using patient-level data. As a result, in the proposed rule we stated our belief that the STEMI eCQM (OP–40) is a more broadly applicable measure and transitions the Hospital OQR Program toward the use of EHR data for quality measurement. We noted in the CY 2022 OPPS/ASC proposed rule (86 FR 42237) that removal of these measures was contingent on the finalization of the STEMI eCQM. We invited public comment on our proposals to remove these measures.

The following is a summary of the comments we received on these proposals and our responses.

Comment: Many commenters supported the proposal to remove the two chart-abstracted measures, Fibrinolytic Therapy Received Within

[210] We refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68472 through 68473) for a discussion of our reasons for changing the term ''retirement'' to ''removal'' in the Hospital OQR Program.

[211] We initially referred to this process as ''retirement'' of a measure in the 2010 OPPS/ASC proposed rule, but later changed it to ''removal'' during final rulemaking.

30 Minutes of ED Arrival (OP–2) and Median Time To Transfer to Another Facility for Acute Coronary Intervention (OP–3), and they were favor of adopting the ST-Segment Elevation Myocardial Infarction (STEMI) eCQM. These commenters also believed that the STEMI eCQM would reduce data collection burden and be more useful than OP–2 and OP–3.

Response: We thank the commenters for their support of our proposal to remove OP–2 and OP–3. We agree that adopting the STEMI eCQM would reduce data collection burden and would be a more broadly applicable measure that transitions the Hospital OQR Program toward the use of EHR data for quality measurement.

Comment: A few commenters supported removing OP–2 and OP–3 in favor of introducing the ST-Segment Elevation Myocardial Infarction (STEMI) eCQM, but expressed concerns about the transition to the STEMI eCQM. One commenter noted that the STEMI eCQM had not yet been endorsed by the NQF and recommended delaying the proposed removal of OP–2 and OP–3 and the addition of the STEMI eCQM until 2024 to allow for completion of NQF review. Another commenter suggested that CMS delay removing OP–2 and OP–3 so that hospitals have time to implement the new STEMI eCQM for an additional year.

Response: We thank the commenters for their support and acknowledge their concerns. We note that, in regard to the endorsement status of the STEMI eCQM, the MAP voted to conditionally support the measure, pending NQF endorsement.[212] CMS is in the process of seeking NQF endorsement for the STEMI eCQM. We refer the reader to section XV.B.4.c. of this final rule with comment period for additional information on the adoption of the STEMI eCQM, including our rationale for adopting the measure when it has not yet been endorsed by the NQF. In response to the suggestion that removing OP–2 and OP–3 should be delayed to allow additional time for transitioning to eCQM reporting, we believe that, as we proposed the reporting of this measure to be voluntary for the CY 2023, hospitals would have sufficient time to practice and operationalize reporting in order to transition from OP–2 and OP–3 to the STEMI eCQM.

Comment: One commenter did not support removing OP–2 and OP–3 from the measure set and believed that it would increase burden for hospitals that are not equipped for electronic reporting, especially smaller and more rural facilities. The commenter stated that reporting requirements for eCQMs exceed those for chart-abstracted measures and that introducing an eCQM will require training or hiring new staff.

Response: We thank the commenter for their input. While we acknowledge that removing two chart-abstracted measures and transitioning to an eCQM may pose certain short-term challenges for hospitals, we reiterate the value of transitioning to an eCQM. That is, we believe that this transition aligns with our overall efforts to reduce regulatory burden on hospitals, lower health care costs, and enhance patient care by streamlining the quality reporting and value-based purchasing programs as stated in the Meaningful Measures Framework. We note, OP–2 and OP–3 measures are chart-abstracted measures, which generally places greater burden on the provider due to the labor and cost of manual abstraction. In contrast, the STEMI eCQM would allow for the retrieval of data directly from the electronic health record (EHR) using patient-level data, thus reducing provider burden.

We believe adoption of this proposal would place limited burden on smaller and more rural facilities. Small hospitals and facilities that do not have the volume of data required for reporting of the eCQMs will be exempt from reporting of those measures based on the case threshold exemptions outlined in section XV.D.6.d.(3) of this final rule with comment period. Additionally, the Medicare and Medicaid EHR Incentive Programs, established by the Health Information Technology for Economic and Clinical Health Act of 2009 (HITECH), authorized HHS to provide financial incentives to hospitals and eligible professionals for the ''meaningful use'' of certified EHR technology to improve patient care.[213] These financial incentives assisted hospitals in transitioning to the use of EHR technology.[214] Successful demonstration of meaningful use included, among other requirements, using certified EHR technology to meet specified thresholds for a number of objectives and measures and reporting clinical quality measures (CQMs). Given the exemption for facilities that do not meet case thresholds and past efforts to assist with the transition to EHR, we believe that the value added by streamlining the quality reporting and value-based purchasing programs justifies the burden these standards may place on facilities. We refer readers to section XXII.B. of this final rule with comment period for additional information on the burden calculations for removing OP–2 and OP–3 and adopting the STEMI eCQM.

After consideration of the public comments we received, we are finalizing this provision as proposed.

4. Adoption of New Measures for the Hospital OQR Program Measure Set

In the CY 2022 OPPS/ASC proposed rule (86 FR 42238), we proposed to adopt three new measures: (1) COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) measure, beginning with the CY 2022 reporting period; (2) Breast Cancer Screening Recall Rates measure, beginning with the CY 2022 reporting period; and (3) STEMI eCQM, beginning as a voluntary measure for the CY 2023 reporting period, and then as a mandatory measure beginning with the CY 2024 reporting period.

a. Adoption of the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) Measure Beginning With the CY 2022 Reporting Period/CY 2024 Payment Determination

(1) Background

On January 31, 2020, the Secretary declared a public health emergency (PHE) for the United States (U.S.) in response to the global outbreak of SARS-CoV–2, a novel (new) coronavirus that causes a disease named ''coronavirus disease 2019'' (COVID–19).[215] COVID–19 is a contagious respiratory infection [216] that can cause serious illness and death. Older individuals, some racial and ethnic minorities, and those with underlying medical conditions are considered to be at higher risk for more serious

complications from COVID–19.[217] [218] As of July 2, 2021, the U.S. reported over 33 million cases of COVID–19 and over 600,000 COVID–19 deaths.[219] As of October 14, 2021, the U.S. reported over 44 million cases and over 718,000 COVID–19 deaths.[220] Hospitals and health systems saw significant surges of COVID–19 patients as community infection levels increased.[221] Between December 2, 2020 and January 30, 2021, more than 100,000 Americans with COVID–19 were hospitalized at the same time.[222]

Evidence indicates that COVID–19 primarily spreads when individuals are in close contact with one another.[223] Ongoing research indicates that fully vaccinated people without immunocompromising conditions are able to engage in most activities with very low risk of acquiring or transmitting SARS–CoV–2, and the Centers for Disease Control and Prevention (CDC) issued new guidance for fully vaccinated individuals on May 28, 2021.[224] The virus is typically transmitted through respiratory droplets or small particles created when someone who is infected with the virus coughs, sneezes, sings, talks or breathes.[225] Thus, the CDC advises that infections mainly occur through exposure to respiratory droplets when a person is in close contact with someone who has COVID–19.[226] Experts believe that COVID–19 spreads less commonly through contact with a contaminated surface [227] and that in certain circumstances, infection can occur through airborne transmission.[228] According to the CDC, those at greatest risk of infection are persons who have had prolonged, unprotected close contact (that is, within 6 feet for 15 minutes or longer) with an individual with confirmed COVID–19 infection, regardless of whether the individual has symptoms.[229] Although personal protective equipment (PPE) and other infection control- precautions can reduce the likelihood of transmission in health care settings, COVID–19 can spread between HCP and patients or from patient to patient given the close contact that may occur during the provision of care.[230] The CDC has emphasized that health care settings, including long-term care (LTC) settings, can be high-risk places for COVID–19 exposure and transmission.[231]

Vaccination is a critical part of the nation's strategy to effectively counter the spread of COVID–19 and ultimately help restore societal functioning.[232] On December 11, 2020, the Food and Drug Administration (FDA) issued the first Emergency Use Authorization (EUA) for a COVID–19 vaccine in the U.S.[233] Subsequently, FDA issued EUAs for additional COVID–19 vaccines.[234] [235] Following the publication of the proposed rule, FDA granted full approval to Comirnaty, the Pfizer-BioNTech COVID–19 vaccine on August 23, 2021 for individuals 16 years of age and older.[236]

As part of its national strategy to address COVID–19, the White House stated on March 25, 2021 that it would work with states and the private sector to execute an aggressive vaccination strategy and has outlined a goal of administering 200 million shots in 100 days.[237] On April 21, 2021, it was announced that this goal had been achieved.[238] Although the goal of the U.S. Government is to ensure that every American who wants to receive a COVID–19 vaccine can receive one, the Department of Health and Human Services (HHS), the Department of Defense (DoD), and the CDC, recommended that early vaccination efforts focus on those critical to the PHE response, including HCP, and individuals at highest risk for developing severe illness from COVID–19.[239] For example, the CDC's Advisory Committee on Immunization Practices (ACIP) recommended that HCP should be among those individuals prioritized to receive the initial, limited supply of the COVID–19 vaccination, given the potential for transmission in health care

settings and the need to preserve health care system capacity.[240] Research suggests most states followed this recommendation,[241] and HCP began receiving the vaccine in mid-December of 2020.[242]

Frontline healthcare workers, such as those employed in hospitals, have been prioritized for vaccination in most locations. There are approximately 18 million healthcare workers in the U.S.[243] A survey of HCP found that 66 percent of hospital HCP and 64 percent of outpatient clinic HCP reported receiving at least one dose of the vaccine.[244] As of July 2, 2021, the CDC reported that over 328 million doses of COVID–19 vaccine have been administered and approximately 155.9 million people were fully vaccinated.[245] Subsequently, the CDC reported that as of October 14, 2021, over 405 million doses of COVID–19 vaccine have been administered and approximately 188.3 million people had received full doses.[246] The White House indicated on April 6, 2021, that the U.S. retains sufficient vaccine supply, and every adult became eligible to receive the vaccine beginning April 19, 2021.[247] Finally, as part of the Biden Administration's efforts to vaccinate those who are still unvaccinated through increasing the number of Americans covered by vaccination requirements,[248] on September 9, 2021, the Biden Administration announced that COVID–19 vaccination will be required of all staff within Medicare and Medicaid-certified facilities to protect both patients and HCP against COVID–19.[249]

We believe it is important to require that hospital outpatient departments (HOPDs) report HCP vaccination information for health care facilities to assess whether these facilities are taking steps to limit the spread of COVID–19 among their health care workers and to help sustain the ability of HOPDs to continue serving their communities throughout the PHE and beyond. Therefore, we proposed to adopt a new measure, COVID–19 Vaccination Coverage Among HCP beginning with the CY 2024 payment determination. For that payment year, hospitals would be required to report data quarterly on the measure for the January 2022 through December 2022 reporting period. The measure would assess the proportion of a hospital's health care workforce that has been vaccinated against COVID–19.

HCP are at risk of transmitting COVID–19 infection to patients, experiencing illness or death as a result of COVID–19 themselves, and transmitting it to their families, friends, and the general public. We believe HOPDs should report the level of vaccination among their HCP as part of their efforts to assess and reduce the risk of transmission of COVID–19 within their facilities. HCP vaccination can reduce illness that leads to work absence and limit disruptions to providing care [250] with major reductions in SARS–CoV–2 infections among those receiving two dose COVID–19 vaccine despite a high community infection rate.[251] Data from influenza vaccination demonstrates that provider vaccination is associated with that provider recommending vaccination to patients,[252] and we believe HCP COVID–19 vaccination in HOPDs could similarly increase uptake among that patient population. We also believe that publicly reporting the HCP vaccination rates would be helpful to many patients, including those who are at high risk-for developing serious complications from COVID–19, as they choose HOPDs for treatment. Under CMS' Meaningful Measures Framework, the COVID–19 measure addresses the quality priority of ''Promote Effective Prevention and Treatment of Chronic Disease'' through the Meaningful Measures Area of ''Preventive Care.''

(2) Overview of Measure

The COVID–19 Vaccination Coverage Among HCP measure (''COVID–19 HCP vaccination measure'') is a process measure developed by the CDC to track COVID–19 vaccination coverage among HCP in non-LTC facilities including outpatient hospitals.

(a) Measure Specifications

The denominator for the HCP measure is the number of HCP eligible to work in the hospital for at least 1 day during the self-selected week, excluding persons with contraindications to COVID–19 vaccination that are described by the CDC.[253]

[240] Dooling, K, McClung, M, et al. ''The Advisory Committee on Immunization Practices' Interim Recommendations for Allocating Initial Supplies of COVID–19 Vaccine—United States, 2020.'' Morb. Mortal Wkly Rep. 2020; 69(49): 1857–1859. ACIP also recommended that long-term care residents be prioritized to receive the vaccine, given their age, high levels of underlying medical conditions, and congregate living situations make them high risk for severe illness from COVID–19.

The numerator for the HCP measure is the cumulative number of HCP eligible to work in at the hospital for at least 1 day during the self-selected week and who received a complete vaccination course against COVID–19.[254] [255] [256] [257] [258] A complete vaccination course is defined under the specific manufacturer and may require multiple doses or regular revaccination.[259] Vaccination coverage for purposes of this measure is defined as the estimated percentage (given the potential for week-to-week variation) of HCP eligible to work at the hospital for at least 1 day who received a COVID–19 vaccine. Acute care facilities would count HCP working in all inpatient or outpatient units that are physically attached to the inpatient acute care facility site and share the same CMS certification number (CCN), regardless of the size or type of unit. Facilities would also count HCP working in inpatient and outpatient departments that are affiliated with the specific acute care facility (such as sharing medical privileges or patients), regardless of distance from the acute care facility and also share the same CCN. The decision to include or exclude HCP from the acute care facility's HCP vaccination counts would be based on whether individuals meet the specified National Healthcare Safety Network (NHSN) criteria and are physically working in a location that is considered any part of the on-site acute care facility that is being monitored.[260] The proposed specifications for the COVID–19 vaccination coverage among HCP measure are available on the NQF website at: *https://www.cdc.gov/nhsn/nqf/index.html*.

(b) Review by the Measure Applications Partnership

The COVID–19 HCP vaccination measure was included on the publicly available ''List of Measures Under Consideration for December 21, 2020,'' [261] a list of measures under consideration for use in various Medicare programs. The Measure Applications Partnership (MAP) hospital workgroup convened on January 11, 2021, and it reviewed the list of Measures Under Consideration (MUC) including the COVID–19 HCP vaccination measure. The MAP hospital workgroup agreed that the proposed measure represents a promising effort to advance measurement for an evolving national pandemic and that it could bring value to the Hospital OQR Program measure set by providing transparency about an important COVID–19 intervention to help prevent infections in HCP and patients.[262] The MAP hospital workgroup also stated in its preliminary recommendations that collecting information on COVID–19 vaccination coverage among HCP and providing feedback to hospitals would allow hospitals to benchmark coverage rates and improve coverage in their facility, and that reducing COVID–19 infection rates in HCP may reduce transmission among patients and reduce instances of staff shortages due to illness.[263]

In its preliminary recommendations, the MAP hospital workgroup did not support this measure for rulemaking, subject to the potential for mitigation.[264] To mitigate its concerns, the MAP hospital workgroup believed that the measure needed well-documented evidence, finalized specifications, testing, and National Quality Forum (NQF) endorsement prior to implementation.[265] Subsequently, the MAP Coordinating Committee met on January 25, 2021, and reviewed the COVID–19 HCP vaccination measure. In its 2020–2021 MAP Final Recommendations, the MAP offered conditional support for rulemaking contingent on CMS bringing the measure back to the MAP once the specifications were further refined. The MAP specifically stated, ''the incomplete specifications require immediate mitigation and further development should continue.'' [266] In its final report, the MAP noted that the measure would add value by providing visibility into an important intervention to limit COVID–19 infections in HCP and the patients for whom they provide care.[267] The spreadsheet of final recommendations no longer cited concerns regarding evidence, testing, or NQF endorsement.[268] In response to the MAP final recommendation request that CMS bring the measure back to the MAP once the specifications are further refined, CMS and the CDC met with the MAP Coordinating Committee on March 15, 2021. Additional information was provided to address vaccine availability, alignment of the COVID–19 HCP vaccination measure as closely as possible with the data collection for the Influenza HCP vaccination measure (NQF #0431), and clarification related to how HCP are defined. CMS and the CDC also presented preliminary findings from the testing of the numerator of the COVID–19 HCP vaccination measure, which was in process. These preliminary findings showed numerator data should be feasible to collect and reliable. Testing of the measure numerator (the number of HCP vaccinated) involved a comparison of the data collected through the NHSN and independently reported through the Federal pharmacy partnership program for delivering vaccination to LTC facilities. These are two completely independent data collection systems. In initial analyses of the first month of vaccination, the number of healthcare workers vaccinated in approximately 1,200 facilities for which data from both systems was available, the number of healthcare personnel vaccinated was highly correlated between the two systems with a correlation coefficient of nearly 90 percent in the second two weeks of reporting.[269] Because of the high correlation across a large number of facilities and high number of HCP within those facilities receiving at least one dose of the COVID–19 vaccine, we believe the measure is feasible and

reliable for use in HOPDs. After reviewing this additional information, the MAP retained its final recommendation of conditional support, and expressed support for CMS' efforts to use the measure as part of the solution for the COVID–19 public health crisis.[270]

Section 1890A(a)(4) of the Act, as added by section 3014(b) of the Affordable Care Act, requires the Secretary to take into consideration input from multi-stakeholder groups in selecting certain quality and efficiency measures. While we value input from the MAP, we believe it is important to propose the measure as quickly as possible to address the urgency of the COVID–19 PHE and its impact on high risk populations, including hospitals. CMS continues to engage with the MAP to mitigate concerns and appreciates the MAP's conditional support for the measure.

(c) Measure Endorsement

Under section 1833(t)(17)(C)(i) of the Act, unless the exception of subclause (ii) applies, measures selected for the Hospital OQR Program must have been set forth by the entity with a contract under section 1890(a) of the Act. The NQF currently holds this contract. Under section 1833(t)(17)(C)(ii) of the Act, the Secretary shall develop measures that the Secretary determines to be appropriate for the measurement of the quality of care furnished by hospitals in outpatient settings and that reflect consensus among affected parties and, to the extent feasible and practicable, shall include measures set forth by one or more national consensus building entities.

In general, we prefer to adopt measures that have been endorsed by the NQF because it is a national multi-stakeholder organization with a well-documented and rigorous approach to consensus development. However, as we have noted in previous rulemaking (for example, 75 FR 72065 and 76 FR 74494 for the Hospital OQR and ASCQR Programs, respectively), the requirement that measures reflect consensus among affected parties can be achieved in other ways, including through the measure development process, through broad acceptance, use of the measure(s), and through public comment.

The COVID–19 HCP vaccination measure is not NQF-endorsed; however, the CDC submitted the measure for consideration in the NQF Fall 2021 measure cycle.

Because this measure is not NQF-endorsed, we considered whether there are other available measures that assess COVID–19 vaccination rates among HCP. We found no other feasible and practical measures on the topic of COVID–19 vaccination among HCP.

(d) Data Collection, Submission, and Reporting

Given the time sensitive nature of this measure considering the current PHE, we proposed that hospitals would be required to begin reporting data on the COVID–19 HCP vaccination measure (OP–38) beginning January 1, 2022, for the CY 2024 payment determination for the Hospital OQR Program. Thereafter, we proposed quarterly reporting periods. While we considered annual reporting periods for the Hospital OQR Program, we proposed quarterly reporting periods given the immediacy of the PHE and the importance of alignment across quality payment programs that have since finalized this measure.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42241), we stated that if our proposal to adopt this measure is finalized, hospitals would report the measure through the CDC's NHSN web-based surveillance system.[271] While the Hospital OQR Program does not currently require use of the NHSN web-based surveillance system, we have previously required use of this system for submitting data. We refer readers to the CY 2014 OPPS/ASC final rule with comment period in which we adopted the Influenza Vaccination Coverage Among Health Care Personnel (NQF #0431) measure (OP–38) (78 FR 75096 through 75099), section XV.D.5.b.(1) of the CY 2022 OPPS/ASC proposed rule (86 FR 42259), and this final rule for additional information on reporting through the NHSN web-based surveillance system under the Hospital OQR Program. Hospitals also have experience reporting acute care hospital measures to the CDC's NHSN under the Hospital IQR Program.

To report this measure, we proposed that hospitals would collect the numerator and denominator for the COVID–19 HCP vaccination measure for at least one, self-selected week during each month of the reporting quarter and submit the data to the NHSN Healthcare Personal Safety (HPS) Component before the quarterly deadline to meet Hospital OQR Program requirements. While we believe that it would be ideal to have HCP vaccination data for every week of each month, we are mindful of the time and resources that hospitals would need to report the data. Thus, in collaboration with the CDC, we determined that data from at least one week of each month would be sufficient to obtain a reliable snapshot of vaccination levels among a hospital's HCP while balancing the costs of reporting. If a hospital submits more than one week of data in a month, the most recent week's data would be used to calculate the measure. For example, if first and third week data are submitted, the third week data would be used. If first, second, and fourth week data are submitted, fourth week data would be used. For each quarter, we proposed that the CDC would calculate a single quarterly COVID–19 HCP vaccination coverage rate for each hospital, which would be calculated by taking the average of the data from the three submission periods submitted by the hospital for that quarter. If finalized, CMS would publicly report each quarterly COVID–19 HCP vaccination coverage rate as calculated by the CDC.

Hospitals would submit the number of HCP eligible to have worked at the facility during the self-selected week that the hospital reports data in NHSN (denominator) and the number of those HCP who have received a complete course of a COVID–19 vaccination (numerator) during the same self-selected week. As previously stated, acute care facilities would count HCP working in all inpatient or outpatient units that share the same CCN, regardless of the size or type of unit.[272]

We received comments on these topics.

Comment: Many commenters supported our proposal to adopt the COVID19 Vaccination Coverage Among HCP Measure and expressed the importance of vaccination in the fight against COVID–19. Several commenters noted that their facilities have already implemented COVID–19 vaccination requirements and that the measure bolsters their efforts to promote vaccination among HCP. Some commenters stated that, given the surge of the Delta variant, the implementation of this measure should not be delayed as widespread vaccination is critical to prevent the spread and further variants of COVID–19. Other commenters noted that the measure has already been approved in other Medicare quality reporting programs and its inclusion in outpatient programs is appropriate and consistent. Some commenters also stated that reporting the measure will ensure transparency and accountability in infection prevention and control for

[270] *Ibid.*

[272] *Ibid.*

vulnerable populations and communities. Still other commenters appreciated that the measure would make COVID–19 vaccination information available to the public to make informed health care decisions.

Response: We thank commenters for their support of the measure and agree that the measure is critically important in the ongoing fight against COVID–19.

Comment: Several commenters expressed concern that COVID–19 vaccines are authorized under EUA and the measure should not be adopted until such time that a vaccine has received full FDA approval. One commenter stated that all three currently available vaccinations should be fully approved by FDA prior to adoption of this measure because the commenter believes that this will reduce vaccine hesitancy.

Response: On August 23, 2021, subsequent to the publication of the CY 2022 OPPS/ASC proposed rule (86 FR 42240), FDA granted full approval to Comirnaty, formerly known as the Pfizer-BioNTech COVID–19 vaccine.[273] While we recognize that there are differences between EUA authorization and full FDA approval, we note that the process for each is scientifically rigorous. We refer readers to information related to FDA's process for evaluating an Emergency Use Authorization (EUA) request at *https://www.fda.gov/vaccines-blood-biologics/vaccines/emergency-use-authorization-vaccines-explained*.[274] Each vaccine manufacturer that received EUA authorization enrolled tens of thousands of participants in randomized clinical trials, which is similar to what is required for full FDA approval.[275] Manufacturers submit robust and rigorous data for both an EUA authorization and full FDA approval, and more than 380 million doses of COVID–19 vaccines have been administered.[276] We believe all COVID–19 vaccines with either full approval or EUA authorization to be proven safe and effective. Thus, we believe it is appropriate to include the measure in the Hospital OQR Program.

We further note that the COVID–19 Vaccination Coverage Among HCP measure does not itself require HCP to receive the vaccination, nor does this measure reward or penalize HOPDs for the rate of HCP who have received a COVID–19 vaccine. The COVID–19 Vaccination Coverage Among HCP measure requires HOPDs to collect and report COVID–19 vaccination data that would support public health tracking and provide beneficiaries and their caregivers information to support informed decision making.

Comment: Several commenters expressed concern that this measure should not be adopted until there is clarity around the impact of future booster recommendations. One commenter stated that the numerator requirement of a completed vaccination course may change over time and recommended that CMS establish a definition of completed vaccination course using the national guidelines as of the date the OPPS Final Rule is published each year. Some commenters noted that supply disruptions could have an impact on vaccination coverage among HCP. Some commenters observed that tracking whether HCP have received a complete vaccination course when there are individual differences regarding what is considered a complete vaccination course increases reporting burden. Another commenter questioned how COVID–19 vaccinations will be financed in the future, and whether HCP will be required to pay out of pocket for vaccines and boosters which could impact the numerator requirement for the measure and lead HCP to decline future required doses of the vaccine. Other commenters recommended that reporting for the measure should be optional or delayed until a completed vaccination course can be more clearly and specifically defined. Several commenters recommended that CMS issue guidance on how the measure addresses boosters after booster recommendations have been issued by FDA and the CDC.

Response: The COVID–19 Vaccination Coverage Among HCP measure is a measure of a completed vaccination course (as defined in section XV.B.4.a.2. of the CY 2022 OPPS/ASC proposed rule (86 FR 42240)) and does not address booster shots. On August 12, 2021, FDA amended the emergency use authorizations (EUAs) for both the Pfizer-BioNTech COVID–19 Vaccine and the Moderna COVID–19 Vaccine to allow for the use of an additional dose in certain immunocompromised individuals, specifically, solid organ transplant recipients or those who are diagnosed with conditions that are considered to have an equivalent level of immunocompromise.[277] The Centers for Disease Control on September 27, 2021 further recommended Pfizer-BioNTech boosters for individuals who completed their initial series at least six months ago and are 65 years of age or older; 18 years of age or older with underlying medical conditions; and 18 years of age or older living and working in high-risk settings, which includes healthcare workers.[278] We acknowledge commenter concerns that hospitals may be required to collect additional information from HCP on booster doses. However, we believe that the numerator is sufficiently broad to include future boosters as part of a ''complete vaccination course''.

Comment: A few commenters expressed concern about the burden of accurately capturing the number of eligible HCP in the facility for the measure specifications and believed that the total population intended to be captured in the denominator is unclear. Some of these commenters further noted that capturing data such as contraindications would further increase the burden. Commenters further requested CMS clarify the measure specifications of the denominator.

One commenter discussed the challenge for systems or facilities with multiple locations that share the same CCN, facilities located on the same physical site that do not share the same CCN, or systems with many HCP that provide care in more than one setting during a calendar year including physicians who provide most of their services at an outpatient hospital or facility but also provide inpatient care for a few days per year. The commenter stated that in the example of a HCP who primarily practices at an outpatient hospital, but sometimes provides inpatient care, a review of charge-level details for each provider would be necessary to determine if the physicians provided services at the hospital during a specific reporting period, which would be burdensome. The commenter further discussed their system's policy to require vaccination of all HCP as a

[278] Ibid.

condition of employment and noted that this alternative approach was more administratively feasible than the proposed measure specifications. To alleviate the challenge of collecting the denominator of eligible HCP working in the facility during the reporting period, the commenter requested CMS define ''eligible'' HCP and further recommended that CMS offer an attestation alternative for reporting by which an institution would receive 100 percent compliance for the measure if the institution attests that there is a COVID–19 Vaccine Policy which requires that all current employees, students, residents, volunteers, and contractors be fully vaccinated on or before December 31, 2021, and furthermore requires that all new employees receive their first COVID–19 vaccination before starting work and the new employee must be fully vaccinated within 60 days of the hire date. If an institution does not have a policy that meets these criteria, the commenter suggested the institution would be required to report the numerator and denominator as specified in the proposed measure. One commenter requested clarification of whether reporting data for IQR meets the requirements to report for the OQR program.

Response: We recognize commenters' concerns regarding reporting burden associated with the specifications of this measure specifically around the definition of HCP. We note that given the highly infectious nature of the COVID–19 virus, we believe it is important to encourage all personnel within the hospital, regardless of patient contact, role, or employment type, to receive the COVID–19 vaccination to prevent outbreaks within the hospital which may affect resource availability and have a negative impact on patient access to care.

We also note that the measure specifications define ''eligible'' HCP as all persons receiving a direct paycheck from the reporting facility (that is, on the facility's payroll), regardless of clinical responsibility or patient contact, licensed independent practitioners, and adult students, trainees and volunteers.[279] CDC's guidance for entering data requires submission of HCP count at the facility level,[280] and the measure requires reporting consistent with that guidance. Hospitals should count HCP working in all inpatient or outpatient units that are physically attached to the inpatient site and share the same CCN, regardless of the size or type of unit.[281] Hospitals should also count HCP working in inpatient and outpatient departments that are affiliated with the specific hospital (such as sharing medical privileges or patients), regardless of distance from the hospital and also share the same CCN.[282] The decision to include or exclude HCP from the hospital's HCP vaccination counts should be based on whether individuals meet the specified NHSN criteria and are physically working in a location that is considered any part of the on-site hospital that is being monitored.[283]

The CDC has provided a number of resources including a tool called the Data Tracking Worksheet for COVID–19 Vaccination among Healthcare Personnel to help hospitals log and track the number of HCP who are vaccinated for COVID–19. Hospitals would enter COVID–19 vaccination data for each HCP in the tracking worksheet, and select a reporting week, and the data to be entered into the NHSN will automatically be calculated on the Reporting Summary.[284] Using the CDC Data Tracking Worksheet and Reporting Summary, hospitals would only be required to report information once to capture inpatient and outpatient HCP as long as the HCP included in the report work at facilities that share the same CCN. Therefore, hospitals would be required to submit once for both the Hospital IQR and Hospital OQR Programs so long as the HCP included in the report work at facilities that share the same CCN. If HCP work at multiple facilities that do not share the same CCN, those individuals must be counted under each facility's CCN where they work during the week of data collection.[285]

Comment: A few commenters noted that, while vaccination plays an important role in ending the COVID–19 pandemic, the measure is not currently endorsed by the National Quality Forum and they believed it should not be adopted until it receives such an endorsement. One commenter observed that NQF endorsement improves credibility and affords patients certainty that the measure data is reliable. One commenter recommended that CMS clarify that the adoption of a measure prior to NQF endorsement is only due to the exigency of the current circumstances.

Response: We believe that in the context of the current COVID–19 PHE and continued monitoring and surveillance following the PHE, it is important to adopt this measure as quickly as possible to allow tracking and reporting of COVID–19 Vaccination Coverage Among HCP. This tracking would allow hospitals to identify the appropriateness and effectiveness of their initiatives to improve vaccination coverage and would provide patients and consumers with important information. We therefore believe it is appropriate to use our authority pursuant to section 1833(t)(17)(C)(i) of the Act to develop this measure. That provision permits the Secretary to develop measures that the Secretary determines to be appropriate for the measurement of the quality of care furnished by hospitals in outpatient settings and that reflect consensus among affected parties and, to the extent feasible and practicable, shall include measure set forth by one or more national consensus building entities. As described above, we believe that consensus among affected parties regarding a measure can be achieved through the measure development process, through broad acceptance, use of the measure(s), and through public comment.

Here, we note our efforts to build consensus regarding this measure through our coordination with the CDC, the use of this measure across quality programs, and the pressing need to better track and report COVID–19 vaccination coverage among HCP. There is no National Quality Forum endorsed measure on the topic of COVID–19 vaccination coverage among healthcare personnel, let alone any such measure that is feasible or practical for CMS to implement. We also note that the CDC has submitted this measure for consideration in the NQF Fall 2021 measure cycle.

Separately, we believe that the Secretary's selection of this measure is additionally supported by section 1833(t)(17)(C)(ii) of the Act, which permits the Secretary to select measures that are the same as (or a subset of) the measure for which data are required to

be submitted under the Hospital Inpatient Quality Reporting (IQR) Program. The Hospital IQR Program recently adopted the COVID–19 Vaccination Coverage Among HCP measure (86 FR 45382).

Comment: One commenter recommended that CMS monitor for unintended consequences associated with the COVID–19 Vaccination Coverage Among HCP measure due to its short development and adoption timeline.

Response: We appreciate the commenter's suggestion. As previously stated, the COVID–19 vaccines have received rigorous scientific review and FDA has determined that the known and potential benefits outweigh the known and potential risks. Additionally, as the measure steward, the CDC continuously monitors reporting of COVID–19 vaccination data via the NHSN to improve infection control and help target facility-level improvement efforts.[286]

We acknowledge the commenter's concern regarding the development timeline of COVID–19 vaccines. However, as stated previously, we believe all authorized COVID–19 vaccines to be proven safe and effective and believe it is appropriate to include the measure in the Hospital OQR Program.

Comment: A few commenters supported the use of NHSN to report measure data and noted that reporting via NHSN is likely to reduce burden for hospitals.

Response: We thank the commenters for their support.

Comment: Several commenters cited Equal Employment Opportunity Commission (EEOC) guidelines, which state that employers must provide a reasonable accommodation if an employee's sincerely held religious belief, practice, or observance prevents them from receiving the vaccination. The commenters requested CMS and the CDC to revise the measure exclusions to align with EEOC guidance.

Response: We recognize that there are reasons, including religious objections or concerns regarding an individual provider's specific health status, that may lead an individual HCP to decline vaccination. We emphasize that this measure does not mandate vaccines; it only requires reporting of vaccination rates for successful program participation. However, we believe that accurate vaccination rates of HCP are meaningful data for patients and beneficiaries to use when choosing a hospital. The CDC, the measure's steward, offers guidance to hospitals that may decide to report HCP who decline vaccination due to religious reasons.[287] Those HCP, however, would be included in the measure denominator along with other HCP who have not received a completed vaccination course.[288] We further note that the Equal Employment Opportunity Commission (EEOC) released updated and expanded technical assistance on May 28, 2021, stating that Federal equal employment opportunity (EEO) laws do not prevent an employer from requiring all employees physically entering the workplace to be vaccinated for COVID–19, so long as the employer complies with the reasonable accommodation provisions of the Americans with Disabilities Act (ADA) and Title VII of the Civil Rights Act of 1964 and other EEOC considerations.[289] In summary, we do not believe that this measure conflicts with any EEOC guidance and believe that it is appropriate to require hospitals to report these data.

Comment: A few commenters stated that they do not believe the measure is appropriate for quality reporting programs at this time. One commenter stated that the COVID–19 Vaccination Coverage Among HCP measure is dissimilar to the Influenza Vaccination Coverage Among HCP (NQF #0431) measure and the discrepancy between time and resources required for reporting renders the proposed COVID–19 Vaccination Coverage Among HCP measure inappropriate for hospitals at this time. Another commenter stated that the COVID–19 pandemic is ongoing, and the evolving nature of the vaccination effort indicates the measure is not yet mature enough for inclusion in the program. Another commenter observed that it is inappropriate to base this measure on the influenza vaccination measure due to the lack of evidence that COVID vaccines and influenza vaccines are clinically similar.

Response: We thank the commenters for their feedback. We acknowledge that while the CDC, the measure's steward, has sought to align this measure with the Influenza Vaccination Coverage Among HCP measure (NQF #0431), these are different public health initiatives, and different vaccines, and therefore the measure specifications are not in complete alignment. For example, influenza is seasonal while SARS–CoV–2 has circulated continuously since the first cases were reported in the U.S. in January 2020.

With regard to commenters stating that it is premature to adopt the measure, we believe that COVID–19 vaccines are a crucial tool for slowing the spread of disease and death among patients, hospital staff, and the general public. Based on FDA's review, evaluation of the data, and its decision to authorize three vaccines for emergency use and to provide full approval to one vaccine, these vaccines meet FDA's applicable standards for safety and effectiveness to prevent COVID–19, including hospitalization and death.[290] The combination of vaccination, universal source control (that is, wearing masks), social distancing, and handwashing offers further protection from COVID–19.[291] Since the publication of the proposed rule, the emergence of coronavirus variants have resulted in 8.9 million new virus cases.[292] Given the EUA and full approval decisions by FDA and the continued PHE, we do not believe that adoption of the measure is premature. We believe our proposal to adopt the COVID–19 Vaccination Coverage among HCP measure to the Hospital OQR Program is appropriate and necessary for patient safety and to better inform patient decision-making.

Comment: Some commenters stated that it is inappropriate to use payment policies to drive vaccination coverage among HCP. Some commenters expressed concern that this measure could lead facilities to mandate vaccines for staff, with potential unintended consequences (specifically, staff quitting or legal risk for facilities for staff experiencing adverse events).

Response: We thank commenters for their feedback and. understand their

concerns. We emphasize that this measure does not require a hospitals to enforce staff vaccination in order for the hospital to successfully participate in the Hospital OQR Program; instead, the hospital must report the rate of its staff that have completed a complete vaccination course.

We noted in the CY 2022 OPPS/ASC proposed rule (86 FR 42239) that a survey of HCP from April 2021 found that 66 percent of hospital HCP and 64 percent of outpatient department HCP reported receiving at least one dose of the vaccine.[293] Subsequent to the publication of the CY 2022 OPPS/ASC proposed rule, research from August 2021 suggests that nearly 73 percent of HCP across all health care facilities have received at least one dose of the vaccine.[294] Based on the findings, we understand that HCP have been receiving the COVID–19 vaccine prior to the adoption of this measure and we do not believe that there is a negative relationship between vaccine uptake among HCP and vaccine requirements. We further emphasize the importance of HCP vaccination to reduce transmission of COVID–19 among hospital staff and patients, and we believe the measure is appropriate for inclusion in the Hospital OQR program.

Comment: Many commenters expressed concern that the measure reporting requirements are duplicative of other state and federal COVID–19 vaccination reporting requirements and that inclusion of the measure in quality reporting programs is unnecessarily burdensome for hospitals. Some commenters questioned the purpose of the measure given the CMS announcement on September 9, 2021 that the agency will require COVID–19 vaccination of staff within all Medicare and Medicaid-certified facilities.[295] Other commenters noted that they are currently required to report COVID–19 vaccination information to HHS and requested that such reporting might be considered a substitute to reporting proposed for the measure. A few commenters recommended a change to attestation-based reporting to reduce resources and burden required for reporting based on the proposed measure specifications. One commenter observed that time spent on multiple reporting requirements would take away from time available for efforts to improve vaccination coverage. Another commenter requested an analysis of burden and feasibility of data collection prior to adoption of the measure.

Response: We appreciate commenters' feedback. We note that most Immunization Information Systems do not include the information needed to determine if an immunized person is a resident of a nursing home, a dialysis patient, or a healthcare worker. Using the NHSN COVID–19 Vaccination Modules allows tracking vaccination coverage among the residents, patients, or healthcare personnel in your facilities.[296] We do recognize that this measure may lead to duplicative reporting if hospitals voluntarily report COVID–19 HCP vaccination information to other data reporting systems in addition to this measure requirement via the NHSN, and we are collaborating with other HHS agencies, including the CDC to minimize reporting burden to the extent feasible. We believe that the COVID–19 vaccination of HCP information submitted for this measure is important as it will be made publicly available for use by Medicare beneficiaries and others in making informed decisions regarding their care including facility choice.

With regard to measure burden analysis, we refer the commenter to section XXII.B.3.a. of this final rule with comment period, where we discuss the burden associated with the measure. We thank the commenters for the suggestion that the measure be attestation-based and note that any changes to the measure specifications would be proposed through future rulemaking.

Comment: A few commenters recommended that CMS reduce reporting frequency from quarterly to twice-yearly or annually to limit reporting burden. One characterized the reporting requirements to be weekly and recommended less frequent reporting requirements. Another commenter stated that the measure is duplicative with other requirements from the CDC and recommended that CMS not adopt the measure but instead collect the information directly from the CDC. Another commenter observed that there are not likely to be large changes in performance at quarterly intervals and recommended less frequent reporting.

Response: As stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42270), we believe that it would be ideal to have HCP vaccination data for every week of each month, we are mindful of the time and resources that some facilities would need to report the data. Thus, in collaboration with the CDC, we determined that data from at least one week of each month would be sufficient to obtain a reliable estimate of vaccination levels among an ASC's HCP while balancing the costs of reporting. We believe that reporting at a lower frequency may result in data that is less meaningful and timely to consumers who want to consider HCP vaccination rates as part of their health care decision-making process. As stated previously, we are collaborating with other HHS agencies, including the CDC to minimize reporting duplication to the extent feasible.

Comment: One commenter recommended development of a validation process for the COVID–19 Vaccination Coverage Among HCP measure.

Response: We thank the commenter for the suggestion and note that, as stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42241), the measure has been tested and shown to be feasible and reliable.

Comment: One commenter supported public reporting of this measure, and specifically noted support for early publication through the initial shortened reporting period.

Response: We thank the commenter for its support.

Comment: A few commenters did not support publicly reporting the measure data. One commenter stated that, all HCP should be vaccinated; however, reporting this information for payment purposes could create incentives for hospital employers to coerce and intimidate HCP who decline the vaccine. Some commenters recommended providing confidential feedback reports to hospitals instead of publicly reporting the data. One commenter recommended delaying public reporting until the underlying evidence is stable and hospitals have had opportunity to report data for several years.

Response: We thank commenters for their feedback. We believe that HCP vaccination is important to prevent the spread of COVID–19 and encourage HCP to disclose their vaccination status to facilitate reporting of the measure. We

do not believe public reporting of vaccination data will incentivize coercion or intimidation on the part of hospitals. We noted previously in this section as well as in the CY 2022 OPPS/ASC proposed rule (86 FR 42239), a survey of HCP from April 2021 found that 66 percent of hospital HCP and 64 percent of outpatient department HCP reported receiving at least one dose of the vaccine. Subsequent to the publication of the CY 2022 OPPS/ASC proposed rule, research from August 2021 suggests that nearly 73 percent of HCP across all health care facilities have received at least one dose of the vaccine.[297] Based on this data, we understand that HCP have been receiving the COVID–19 vaccine prior to the adoption of this measure and do not believe that this represents performance that suggests negative relationship between vaccine uptake among HCP and employer vaccination requirements. We believe that publicly reporting the data will be useful to consumers in choosing healthcare providers, including by making comparisons between hospitals.

Comment: One commenter recommended aligning with the policy finalized in the FY 2022 IPPS/LTCH PPS final rule in which only the most recent quarter of data will be used for public reporting (as opposed to a rolling 12-month report).

Response: We agree with the commenter and note that, in alignment with the FY 2022 IPPS/LTCH PPS final rule (86 FR 45382), we will not finalize our plan to add one additional quarter of data during each advancing refresh, until the point that four full quarters of data is reached and then report the measure using four rolling quarters of data. Instead, we will only report the most recent quarter of data. This would result in more meaningful information that is up to date and not diluted with older data. We emphasize that this modification of our proposal does not affect the data collection schedule established for submitting data to NHSN for the COVID–19 vaccination measure. This would simply update the data that are displayed for the public reporting purposes.

After consideration of the public comments we received, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (Newly designated as OP–38) with modification to the quarterly reporting deadlines beginning with the CY 2022 reporting period/CY 2024 payment determination and subsequent years. Based on the comments we have received, it is our belief that reporting a single HCP count for each healthcare facility enrolled in NHSN would reduce burden. Therefore, in collaboration with the CDC, facilities will report data to NHSN by enrolled facility (also known as OrgID). Similar to the data submission process used previously for the Influenza Vaccination Coverage Among Healthcare Personnel (OP–27) (79 FR 66945), the CDC will then translate and submit the data to CMS on behalf of the facilities by CCN.

Additionally, in order to reduce reporting burden, we are finalizing our proposal that facilities must count HCP working in all inpatient or outpatient units that are physically attached to the inpatient site and share the same CCN, regardless of the size or type of unit.[298] Facilities must also count HCP working in inpatient and outpatient departments that are affiliated with the specific hospital (such as sharing medical privileges or patients), regardless of distance from the hospital and also share the same CCN. Reporting data in this way will allow healthcare facilities with multiple care settings to simplify data collection and submit a single count applicable across the inpatient and outpatient settings. We will then publicly report the percentage of HCP who received a complete course of the COVID–19 vaccination per CCN. This single HCP count per CCN will inform the public of the percentage of vaccinated HCP at a particular healthcare facility, which will provide meaningful data and help to improve the quality of care while reducing the burden of reporting.

We are also finalizing our proposal to publicly report the measure, which will begin with the October 2022 Care Compare refresh, or as soon as technically feasible, using data collected from Q1 2022 (January 1, 2022 through March 31, 2022). However, based on public comment, we are finalizing a modification to our proposal. We will not finalize our plan to add one additional quarter of data during each advancing refresh, until the point that four full quarters of data is reached and then report the measure using four rolling quarters of data. Instead, we will only report the most recent quarter of data. This would result in more meaningful information that is up to date and not diluted with older data.

b. Adoption of the Breast Cancer Screening Recall Rates Measure Beginning With the CY 2023 Payment Determination

(1) Background

Performing breast imaging in the outpatient setting facilitates early detection of malignancies.[299] However, performing diagnostic mammography or digital breast tomosynthesis (DBT) as a result of a false-positive screening study or other errant data has the potential to expose women to unnecessary follow-up.[300] This could result in increased prevalence of radiation-induced cancers in younger individuals including those carrying related gene mutations, such as BRCA–1 and BRCA–2 [301] [302] or additional imaging and biopsies, which could lead to unnecessary procedures for individuals who do not have breast cancer.[303] [304] In contrast, recalling too few women for follow-up imaging may lead to delayed diagnoses, higher stages at diagnosis, and/or undetected cases of breast cancer.[305] Given the potential

negative consequences associated with too many or too few diagnostic mammography and DBT studies performed within the population, evidence from the clinical literature suggests appropriate recall rates should fall between five to 12 percent.[306] [307]

To address the health and clinical risks associated with too many or too few breast cancer screening recalls, in the CY 2022 OPPS/ASC proposed rule (86 FR 42242), we proposed to adopt the Breast Cancer Screening Recall Rates measure beginning with the CY 2023 payment determination using a data collection period of July 1, 2020, to June 30, 2021, and then data collection periods from July 1 through June 30 of the following year starting 3 years before the applicable payment calendar year for subsequent years. We intend for this measure to move facilities toward the 5 to 12 percent range of recall rates. Facilities that are above or below the range should consider implementation of internal quality-improvement procedures to ensure they are not missing cases or recalling individuals unnecessarily. This measure would fill the gap in women's health and oncology care that was left in the Hospital OQR Program portfolio following the removal of the Mammography Follow Up Rates measure (OP–9).[308] More specifically, this measure would directly address the reason OP–9 was removed from the Hospital OQR Program by bringing the measure into alignment with current clinical practice and emerging scientific evidence through the addition of screening and diagnostic DBT (83 FR 59096).[309] [310] [311] [312] [313] [314] [315] [316] The Breast Cancer Screening Recall Rates measure would be added to a measure set focused on imaging efficiency. While this measure, as currently specified, would not provide data on outcomes (that is, the number of patients who were recalled and subsequently diagnosed with cancer), it would give facilities information to use in examining their own imaging practices. Results from the measure could be used to identify opportunities for improving the efficiency and quality of care provided and would be added to a measure set focused on imaging efficiency.

(2) Overview of Measure

This claims-based process measure documents breast cancer screening recall rates at the facility level. The Breast Cancer Screening Recall Rates measure would calculate the percentage of Medicare fee-for-service (FFS) beneficiaries for whom a traditional mammography or DBT screening study was performed that was then followed by a diagnostic mammography, DBT, ultrasound of the breast, or magnetic resonance imaging (MRI) of the breast in an outpatient or office setting on the same day or within 45-calendar days of the index image. In assessing this measure based on clinical quality and efficiency, there are potential negative consequences of high and low mammography and DBT recall rates. A middle-range number is the ideal value for this measure. A high cumulative dose of low-energy radiation can be a consequence of too many false-positive mammography and DBT recall studies. Alternatively, inappropriately low recall rates may lead to delayed diagnoses or undetected cases of breast cancer. The inclusion of DBT in evaluating recall care may improve recall rates and positive predictive values compared to metrics that focus solely on mammography.

Although this measure is not based on a specific clinical guidelines, expert clinical consensus and support from publications in the peer-reviewed literature emphasize the importance of appropriate recall rates.[317] [318] The adoption of this measure could potentially fill a gap in breast cancer screening measures for the Hospital OQR Program. This measure would address the Meaningful Measure priority area of ''Making Care Safer.'' The measure addresses this Meaningful Measure area by: (1) Promoting appropriate use of breast cancer screening and diagnostic imaging by encouraging facilities to aim for a performance score within the target recall range; (2) reducing the harms associated with too many recalls, which can lead to unnecessary radiation exposure, anxiety and distress, and increased costs or resource utilization; [319] [320] and (3) addressing the issue of inappropriately low recall rates, which may lead to delayed diagnoses, diagnoses at a later stage, or undetected cases of breast cancer.[321]

The measure was included on the publicly available ''List of Measures Under Consideration for December 21, 2020,'' a list of measures under consideration for use in various

Medicare programs.[322] In January 2021, the Breast Cancer Screening Recall Rates measure was reviewed by both the MAP's rural health workgroup and hospital workgroup, overseen by the Coordinating Committee (MUC20–0005).[323] Both groups and the Coordinating Committee voted to conditionally support the measure, pending NQF endorsement.[324] Concerns cited during the January 2021 MAP review included: (1) The proposed recall range is not based on clinical practice guidelines, but rather expert consensus and synthesis of findings from the scientific literature; (2) use of a range (as opposed to a targeted high or low value) may be difficult for clinicians, patients, and other stakeholders to interpret; (3) the measure does not address social determinants of health, which may impact the rate of recall at some facilities; and (4) the measure does not provide complementary information about patient outcomes (for example, breast cancer detection rate), which could aid in the interpretation and usefulness of the measure's data.[325] Despite these concerns, some members of the rural health workgroup, hospital workgroup, and Coordinating Committee expressed support of the Breast Cancer Screening Recall Rates measure and noted that feedback provided by the MAP did not preclude measure implementation, given its importance to the clinical community and the public.[326] As a part of measure implementation, we noted that we would develop a suite of education and outreach materials to aid stakeholders in the interpretation of measure performance data (86 FR 42243). These materials would explain the measure structure (including use of a range representing ideal performance) to ensure stakeholders understand values within and outside of the target range. Once implemented, the measure would be re-evaluated annually, which would include a consideration of changes to the evidence base and potential integration of social determinants of health (that is, stratification); updates to the measure specifications would be made iteratively, as appropriate, on an annual basis.

Section 1833(t)(17)(C)(i) of the Act directs the Secretary to develop measures that the Secretary determines to be appropriate for the measurement of the quality of care (including medication errors) furnished by hospitals in outpatient settings and that reflect consensus among affected parties and, to the extent feasible and practicable, shall include measures set forth by one or more national consensus building entities.

In general, we prefer to adopt measures that have been endorsed by the NQF because it is a national multi-stakeholder organization with a well-documented and rigorous approach to consensus development. However, as we have noted in previous rulemaking (for example, 75 FR 72065 and 76 FR 74494 for the Hospital OQR and ASCQR Programs, respectively), the requirement that measures reflect consensus among affected parties can be achieved in other ways, including through the measure development process, through broad acceptance, use of the measure(s), and through public comment.

We have reviewed those NQF-endorsed measures that are related to breast imaging and have not identified any that are appropriate for the measurement of mammography or DBT recall rates specifically. As such, we proposed to adopt this measure for use in the Hospital OQR Program because of its importance to women's health and its ability to fill a gap in CMS' Meaningful Measure portfolio even though it has not yet been reviewed by NQF. Submission for NQF endorsement would be considered for this measure in the future.

(3) Measure Calculation

This claims-based process measure documents breast cancer screening recall rates at the facility level. The Breast Cancer Screening Recall Rates measure would calculate the percentage of Medicare FFS beneficiaries for whom a traditional mammography or DBT screening study was performed that was then followed by a diagnostic mammography, DBT, ultrasound of the breast, or MRI of the breast in an outpatient or office setting on the same day or within 45 days of the index image. Specifically, the measure denominator includes Medicare FFS beneficiaries who received a screening mammography or DBT study at a facility paid under the OPPS. The numerator consists of individuals from the denominator who had a diagnostic mammography study, DBT, ultrasound of the breast, or MRI of the breast following a screening mammography or DBT study on the same day or within 45 days of the screening study. The Breast Cancer Screening Recall Rates measure does not have any exclusions. This measure is not risk adjusted. As a process-of-care measure, the decision to image a beneficiary should not be influenced by sociodemographic status factors; rather, risk adjustment for such sociodemographic factors could potentially mask important inequities in care delivery for beneficiaries seen at facilities providing data for this measure. If performance scores for this measure vary across populations, this may be reflective of differences in the quality of care provided to the diverse populations included in the measure's denominator.

Although this measure is not based on a specific clinical guideline, expert clinical consensus and support from the peer-reviewed literature emphasize the importance of appropriate recall rates.[327] We refer readers to the QualityNet website at *https://qualitynet.cms.gov* for the full measure specifications.

(4) Data Sources

The Breast Cancer Screening Recall Rates measure would be calculated using data from final claims that facilities submit for Medicare beneficiaries enrolled in Medicare FFS. As such, facilities would not have to submit any additional data for this measure. The measurement period for the Breast Cancer Screening Recall Rates measure is 12 months. As noted previously, we would use final claims data from July 1, 2020 to June 30, 2021 to calculate the measure for the CY 2023 payment determination and then data collection periods from July 1 through June 30 of the following year starting 3 years before the applicable payment calendar year for subsequent years.

Accessed on May 14, 2021 at: *https://www.qualityforum.org/Publications/2021/03/MAP_2020-2021_Considerations_for_Implementing_Measures_Final_Report_-_Clinicians,_Hospitals,_and_PAC-LTC.aspx*.

[327] Nelson, H.D., Tyne, K., Naik, A., Bougatsos, C., Chan, B.K., & Humphrey, L. (2009). Screening for breast cancer: Systematic evidence review update for the U.S. Preventive Services Task Force. *Ann Intern Med,* 151(10):727–W242.

Please note that claims for the initial patient population would be identified from July 1 through May 17 of each year, with numerator cases occurring from July 1 through June 30 annually. The data would be calculated only for facilities paid under the OPPS for mammography and DBT screening in the hospital outpatient setting. Data from the hospital outpatient and carrier files would be used to determine beneficiary inclusion (for example, a mammography follow-up study can occur in any location and be eligible for inclusion in the measure's numerator).

The following is a summary of the comments we received on this proposal and our responses.

Comment: One commenter supported implementation of the Breast Cancer Screening Recall Rates measure into the Hospital OQR Program but encouraged CMS to rename the metric to Breast Cancer Screening Recall Rates.

Response: We thank the commenter for their suggestion. We are refining the name of the measure to the Breast Cancer Screening Recall Rates measure, as this name more accurately describes what this measure assesses.

Comment: Many commenters supported the addition of Breast Cancer Screening Recall Rates measure to the Hospital OQR Program as proposed. A few commenters believe the Breast Cancer Screening Recall Rates measure fills a measurement gap left in the Hospital OQR Program by the removal of Mammography Follow-Up Rates (OP–9) in the CY 2019 OPPS/ASC PPS final rule with comment period (83 FR 59096 through 59097). One commenter acknowledged the low level of burden associated with reporting of claims-based measures.

Response: We thank the commenters for their support.

Comment: A few commenters did not support the addition of Breast Cancer Screening Recall Rates measure to the Hospital OQR Program based on the removal of the Mammography Follow-Up Rates measure (OP–9) in the CY 2019 OPPS/ASC PPS final rule (83 FR 59096 through 59097). The commenters highlight that the measure would not be useful to patients, as it is not based on a clinical practice guideline, systematic review, meta-analysis, or other experimental form of evidence to demonstrate a connection between public reporting of the measure score and its impact on patient outcomes, which is similar to the reason why the OP–9 measure was removed from the Hospital OQR program.

Many commenters provided input on the usability of the Breast Cancer Screening Recall Rates measure's performance scores, suggesting that patients may not be able to fully interpret a facility's performance score presented in comparison to a target range. Commenters also expressed concern about the evidence-base for the measure's 5 percent to 12 percent target range.

Response: We appreciate the commenters' input on the removal of OP–9 from the Hospital OQR Program. We elected to remove OP–9 as it did not align with current clinical practice. The Breast Cancer Screening Recall Rates measure improves upon the OP–9 technical specifications, which had been in use for nearly 10 years, incorporating digital breast tomosynthesis (DBT) as a screening and diagnostic imaging modality to the measure's denominator and numerator, respectively, and refining guidance for interpretation the measure score by presenting a target performance range. OP–9 provided a ceiling for appropriate rates of recall at 14 percent, but did not present a lower bound (due to a lack of evidence at the time of specification). Thus, we believe that the 5 percent to 12 percent range is more interpretable and useful for patients and other consumers than the previously used metric. We will continue to monitor and evaluate the usefulness and usability of the Breast Cancer Screening Recall Rates measure specifications, and specifically the range, during routine measure reevaluation. Additionally, we will ensure education and outreach materials provide meaningful information on data interpretation for our stakeholders.

We acknowledge commenters' concern about the evidence base on which the Breast Cancer Screening Recall Rates measure is based. We convened a technical expert panel (TEP) to gather input from a breadth of stakeholders while specifying this measure; we also collected feedback from additional members of the clinical community through a listening session during which the measure's draft technical specifications were discussed. Based on these qualitative data, we defined the range for appropriate imaging based on the 2013 Breast Imaging Reporting and Data System (BIRADS) Atlas.[328]

Comment: Several commenters provided feedback on the Breast Cancer Screening Recall Rate measure's technical specifications. One commenter questioned why a benchmark value for the measure's range was not provided. Several commenters disagreed with use of the five percent to 12 percent range for appropriate imaging. A few commenters encouraged CMS to consider exclusion of individuals for whom patient or clinical factors necessitate more frequent recall following screening for breast cancer. A few commenters asked why CMS did not include the Breast Cancer Screening Recall Rates measure in a composite of breast cancer measures. A few commenters encouraged CMS to risk adjust the measure to account for potential inequities in care among racial and ethnic minorities. A commenter suggested the incorporation of additional imaging modalities into the measure's technical specifications.

Response: We appreciate the commenters' recommendations on ways to improve the Breast Cancer Screening Recall Rates measure technical specifications. Rather than providing a single benchmark, we used guidance from the American College of Radiology's 2013 BIRADS Manual to define appropriate recall as between five percent and 12 percent of patients for whom follow-up imaging was performed. If, in the future, a single benchmark value is more appropriate for use in public reporting than a range (based on the release of guidance that appears in a clinical practice guideline or other documentation), we will consider revisions to the measure's specifications accordingly.

With respect to the comments that encourage we risk-adjust the measure to account for potential inequities in care around racial and ethnic minorities, we believe risk adjustment for the Breast Cancer Screening Recall Rates measure could have the effect of masking true differences in care provided to patients of different races, ethnicities, and genders. We will continue to monitor and evaluate results for the Breast Cancer Screening Recall Rates measure to ensure high-quality care is provided to all Medicare fee-for-service patients, regardless of their racial, ethnic or gender identities.

We appreciate input on the structure of the Breast Cancer Screening Recall Rates measure and the composition of its data elements. We will continue to monitor the peer-reviewed evidence and feedback from stakeholders to identify future changes to the technical specifications, including the potential need to exclude individuals with certain clinical or patient-focused characteristics. We will also review the additional imaging modalities suggested by commenters to identify if they are appropriate to include in either the

[328] D'Orsi, C.J., Sickles, E.A., Mendelson, E.B., Morris EA, et al. (2013). ACR BI–RADS® atlas, breast imaging reporting and data system. Reston, VA: American College of Radiology.

measure's denominator or numerator or both. We will consider ways to maximize the value of the Breast Cancer Screening Recall Rates measure including incorporation of facility performance scores into a composite evaluating other types of breast-cancer care.

Comment: One commenter encouraged CMS to engage the clinical community and medical societies in the creation of documentation for implementation of the Breast Cancer Screening Recall Rates measure, including files for education and outreach to its members.

Response: We thank the commenter for their support and welcome feedback from the clinical community and medical societies on the creation of education and outreach resources that would be beneficial for measure implementation.

Comment: One commenter encouraged CMS to perform a dry run of facility performance data prior to implementation of the Breast Cancer Screening Recall Rates measure into the Hospital OQR Program. Another commenter asked CMS to make public reporting of the Breast Cancer Screening Recall Rates measure optional. A third commenter asked CMS to delay implementation of the Breast Cancer Screening Recall Rates measure into the Hospital OQR Program until CY 2025.

Response: We appreciate the feedback received on timing for implementation of the Breast Cancer Screening Recall Rates measure. Because this measure builds upon results presented for OP–9 (prior to its retirement from the Hospital OQR Program in CY 2019), we do not believe a dry run is needed prior to implementation As the Breast Cancer Screening Recall Rates measure closely mirrors the OP–9 technical specifications that were in use within the Hospital OQR Program from 2010 to 2018 and as the measure was publicly reported through April 2020, stakeholders are anticipated to have some familiarity with the measure, Thus, we do not believe data for public reporting of the measure need to be delayed to future years. Further, facilities will receive their claims data, to be used in calculation of the Breast Cancer Screening Recall Rates measure, through a claims detail report (CDR) in 2022, which will allow facilities to identify any errors in processed claims and/or plan for future quality-improvement efforts following implementation of the measure into Hospital OQR.

Comment: A few commenters expressed concern about using data in calculation of the Breast Cancer Screening Recall Rates measure that were processed during the COVID–19 pandemic and encouraged CMS to monitor trends in imaging use during this time.

Response: We appreciate commenters' concern about the impact of COVID–19 pandemic, including delays in care resulting from availability of imaging services and changes in the ways patients accessed care since March 2020. In response to the COVID–19 pandemic, we will not use data from January 1, 2020, through June 30, 2020, for performance calculation.[329] We will continue to monitor trends in utilization and impacts of the COVID–19 pandemic as we implement the Breast Cancer Screening Recall Rates measure.

Comment: Many commenters encouraged CMS to seek National Quality Forum (NQF) endorsement prior to implementation of the Breast Cancer Screening Recall Rates measure into the Hospital OQR Program.

Response: We appreciate commenters' input on the need for NQF endorsement of Breast Cancer Screening Recall Rates measure and will consider how best to leverage NQF endorsement review of the measure following its implementation. We believe the Breast Cancer Screening Recall Rates measure addresses a gap area within the Hospital OQR Program for both cancer care and women's health, and think that addition of this measure to the Program before pursuing NQF endorsement will ensure that the quality of services provided is monitored by CMS.

After consideration of the public comments we received, we are finalizing the adoption Breast Cancer Screening Recall Rates measure (newly designated as OP–39) as proposed.

c. Adoption of the ST-Segment Elevation Myocardial Infarction (STEMI) eCQM Beginning With Voluntary Reporting for the CY 2023 Reporting Period and Mandatory for the CY 2024 Reporting Period/CY 2026 Payment Determination and Subsequent Years

(1) Background

An ST-segment elevation myocardial infarction (STEMI) is a form of heart attack in which there is a complete occlusion of one of the heart arteries.[330] Each year over 250,000 Americans experience a STEMI, approximately 50 percent of whom are Medicare beneficiaries.[331] [332] This is represented on the electrocardiogram as an elevation of the ST segment—the interval between ventricular depolarization and repolarization (which represents the duration of an average ventricular contraction).[333] Time is of the essence in STEMI treatment, and the prompt identification of STEMI and restoration of blood flow to the heart (reperfusion therapy) is a key determinant of health outcomes.[334] [335] [336] Primary percutaneous coronary intervention (PCI), which is the use of balloons and stents to restore blood flow, is the preferred reperfusion modality.[337] The 2013 American College of Cardiology Foundation (ACCF)/American Heart Association (AHA) guidelines recommend the initiation of PCI within 120 minutes from first medical contact (FMC).[338] Specifically, if a patient presents to a PCI-capable facility, primary PCI is recommended within 90 minutes of FMC.[339] If a patient presents to a non-PCI-capable facility, the patient should be expeditiously transported to a PCI-capable facility and receive PCI

[339] *Ibid.*

within a total of 120 minutes.[340] However, in care settings where it is not possible for a patient to receive PCI or be transferred and receive primary PCI within the 120-minute timeframe, fibrinolytic therapy (medications to dissolve blood clots and restore flow) should be administered rapidly for reperfusion in the absence of contraindications.[341] The guidelines recommend that eligible patients should receive fibrinolytic therapy within 30 minutes of hospital arrival.

(2) Overview of Measure

The STEMI eCQM measures the percentage of ED patients with a diagnosis of STEMI who received timely delivery of guideline-based reperfusion therapies appropriate for the care setting and delivered in the absence of contraindications. The Meaningful Measures Framework aims to address issues that are most vital to delivering quality, value-based care to improve patient outcomes.[342] In alignment with the Meaningful Measures quality priority of promoting effective prevention and treatment of chronic disease, we believe this STEMI eCQM encourages timely, effective and appropriate treatment using clinical data available in certified electronic health record technology (CEHRT) and that this measure has the potential to reduce adverse health outcomes.

The measure was included on the publicly available ''List of Measures Under Consideration for December 21, 2020,'' a list of measures under consideration for use in various Medicare programs.[343] In January 2021, the STEMI eCQM was reviewed by the MAP's rural health workgroup, hospital workgroup, and Coordinating Committee (MUC20–0004) [344] The MAP rural health workgroup conducted discussions regarding the appropriate treatment time for STEMI and how this may be impacted in rural settings due to proximity and transportation issues, especially with getting someone to a PCI-capable facility, and supported the STEMI eCQM (OP–40) [345] for rural providers in the Hospital OQR Program.[346] The MAP voted to conditionally support the measure, pending NQF endorsement. We note that on-site facilities can perform a PCI (if they have the capability to do so), use fibrinolysis, or they can transfer a patient to a facility that provides PCI. These three treatment scenarios are all captured by the measure, including relative treatment times (non-transfer patients receiving PCI at a PCI capable facility within 90 minutes of arrival and patients transferred from a non-PCI-capable to a PCI-capable facility within 45 minutes).

Section 1833(t)(17)(C)(i) of the Act requires the Secretary to develop measures that the Secretary determines to be appropriate for the measurement of the quality of care (including medication errors) furnished by hospitals in outpatient settings and that reflect consensus among affected parties and, to the extent feasible and practicable, shall include measures set forth by one or more national consensus building entities (for example, NQF). We note that section 1833(t)(17) of the Act does not require that each measure we adopt for the Hospital OQR Program be endorsed by a national consensus building entity. We have reviewed and identified two related NQF-endorsed chart-abstracted measures—OP–2 (Fibrinolytic Therapy Received within 30 Minutes of ED Arrival) and OP–3 (Median Time to Transfer to Another Facility for Acute Coronary Intervention).

In section XV.B.3.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42237), we proposed to remove these two related chart abstracted measures—OP–2 (Fibrinolytic Therapy Received within 30 Minutes of ED Arrival) and OP–3 (Median Time to Transfer to Another Facility for Acute Coronary Intervention)—and replace them with this eCQM. The use of the STEMI eCQM measure, in lieu of the OP–2 and OP–3 measures, would eliminate the need for manual chart-abstraction. It would also broaden the group of measured STEMI patients included in the measure to include patients who present to and receive primary PCI at a PCI-capable facility, which is the vast majority of STEMI patients. The OP–2 and OP–3 measures only include patients presenting to non-PCI-capable facilities who either receive fibrinolytics or are transferred to a PCI-capable facility. The STEMI eCQM better supports compliance with the full group of STEMI patients covered in the 2013 ACCF and AHA guidelines for the management of STEMI by measuring timeliness and appropriateness of care for STEMI.[347] We believe that the STEMI eCQM (OP–40) would efficiently and comprehensively measure timeliness of STEMI care by reducing the burden on facilities currently reporting these two chart-abstracted measures, broadening the STEMI population for which performance scores could be publicly reported, and incorporating contraindications to enhance the clinical applicability of the measure. We refer readers to section XV.B.3.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42237) and section XV.B.3.c. of this final rule with comment period for further discussion on our proposal to remove the OP–2 and OP–3 measures from the Hospital OQR Program.

As such, in the CY 2022 OPPS/ASC proposed rule (86 FR 42244), we proposed to adopt the STEMI eCQM for use in the Hospital OQR Program because of its importance in measuring timely delivery of guideline-based reperfusion therapies appropriate for the care of ED patients with a diagnosis of STEMI and its ability to fill a gap in CMS' Meaningful Measure portfolio. The measure was submitted to NQF in January 2021 and is under review.

(3) Measure Calculation

The STEMI eCQM is a process measure that assesses the percentage of ED patients aged 18 years or older with a diagnosis of STEMI who received appropriate treatment. The denominator includes all ED patients 18 years or older diagnosed with STEMI who do not have contraindications to fibrinolytic, antithrombotic, and anticoagulation therapies.

The numerator includes:

• ED-based STEMI patients whose time from ED arrival to fibrinolytic therapy is 30 minutes or fewer; or

• Non-transfer ED-based STEMI patients who received PCI at a PCI-capable hospital within 90 minutes of arrival; or

• ED-based STEMI patients who were transferred to a PCI-capable hospital within 45 minutes of ED arrival at a non-PCI-capable hospital.

For more information on the STEMI eCQM, we refer readers to the full measure specifications available on the Electronic Clinical Quality Improvement (eCQI) Resource Center website, available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-oqr-ecqms*.

(4) Data Sources

This measure is an eCQM that uses data routinely collected through the EHR and is designed to be calculated by the hospitals' CEHRT using patient-level data and submitted to CMS. In 2020, using data from 2018, the STEMI eCQM was tested at two hospital systems (20 EDs in total) with two different EHR platforms for feasibility, validity, and reliability testing, based on the endorsement criteria outlined by NQF.[348] The feasibility testing showed that the measure is feasible and the key features of the eCQM, such as the code sets and measure logic, were readily interpreted by both sites as assessed by the feasibility scorecard and exit interviews conducted at the two sites. The validity testing results showed a wide range of agreement among data elements between the electronic and manual data extracts. Some data elements were collected but not fully interoperable within providers' EHRs. However, as hospitals and EHR vendors meet ONC requirements for interoperability under the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) and map data elements for interoperability via the FHIR-based API required by December 31, 2022 (85 FR 70075), these data elements would be accessible without special effort.

(5) Implementation

In the CY 2022 OPPS/ASC proposed rule (86 FR 42246), we proposed to start with voluntary reporting beginning with the CY 2023 reporting period and then with mandatory reporting beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years. We believe that taking an incremental approach to implementing this measure would allow hospitals time to implement workflow changes as necessary to better prepare for submitting data and to increase familiarity with data submission with the introduction of an eCQM into the Hospital OQR Program. We refer readers to section XV.D.6. of the CY 2022 OPPS/ASC proposed rule (86 FR 42259) and section XV.D.6. of this final rule with comment period for additional information related to eCQM data submission and reporting requirements under the Hospital OQR Program.

The following is a summary of the comments we received on this proposal and our responses.

Comment: Many commenters supported the addition of the STEMI eCQM to the Hospital OQR Program as proposed. Two commenters appreciated the phased implementation approach, which would allow facilities the ability to make the necessary adjustments for data submission over time. A commenter specifically cited the transition from voluntary to mandatory reporting of the STEMI eCQM as a preferred strategy for implementation. Another commenter suggested phasing the STEMI eCQM (OP–40) into Hospital OQR concurrent to the OP–2 and OP–3 removal would give facilities sufficient time to adjust workflows in how care is provided and documented within sites' EHRs. An additional commenter pointed out the importance of ensuring the STEMI eCQM is implemented concurrent to the removal of OP–2 and OP–3, ensuring the transition is seamless. Commenters noted the adoption of the STEMI eCQM is consistent with CMS' move to modernization and use of meaningful measures.

Many commenters expressed support for CMS' plan to remove Fibrinolytic Therapy Received within 30 Minutes of Emergency Department (ED) Arrival (OP–2) and Median Time to Transfer to Another Facility for Acute Coronary Intervention (OP–3), replacing them with the STEMI eCQM as proposed. Several commenters asserted that the STEMI eCQM is less burdensome for collection and reporting. They noted the replacement of OP–2 and OP–3 with the STEMI eCQM would reduce burden on facilities to abstract information about a sample of cases for each measure quarterly and would provide more precise, evidence-based guidance for how to interpret the STEMI eCQM's quality actions in the numerator.

Response: We thank the commenters for their support.

Comment: One commenter encouraged CMS to delay removal of OP–2 and OP–3 from the Hospital OQR Program until the STEMI eCQM is implemented and data are available for public reporting. Another commenter recommended CMS retain OP–2 and OP–3 in the Hospital OQR Program as optional measures for facilities with limited resources for eCQM reporting.

Response: We appreciate commenters' position on retention of OP–2 and OP–3 as optional measures or for additional years. However, we believe the incremental approach we proposed for implementation of the STEMI eCQM will give facilities sufficient time to meet requirements under the ONC's requirements for interoperability through the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) and to map data elements for interoperability via the FHIR based API (85 FR 70075). Additionally, to delay removal of OP–2 and OP–3 or to retain them as optional measures would undermine the incremental nature of our implementation. Retaining these measures may cause hospitals to delay their implementation of the STEMI eCQM until the last minute. Thus, we believe that the delayed implementation or retention of OP–2 and OP–3 is not necessary.

Comment: Several commenters encouraged CMS to delay implementation of the STEMI eCQM until the measure obtains endorsement by the NQF.

Response: We appreciate commenters' concern about delaying implementation of this measure into the Hospital OQR program until they are endorsed by NQF. We submitted the STEMI eCQM for endorsement review through NQF's Cardiovascular Project in spring 2021. The NQF Cardiovascular Standing Committee passed the measure on all criteria and on overall suitability for endorsement.[349] At the close of comment period for the CY 2022 OPPS/ASC PPS proposed rule, the STEMI eCQM was undergoing public comment through NQF and would receive review by NQF's Consensus Standards Advisory Committee (CSAC) in fall 2021. Should it be approved by the CSAC, the STEMI eCQM will be endorsed by NQF as #3613e.

As noted in section XV.D.4.a.(2)(c). of this final rule with comment period, CMS is not limited by section 1833(t)(17) of the Act to select measures for the Hospital OQR Program that have been approved by a consensus base

[348] National Quality Forum. What NQF Endorsement Means. Available at: *https://www.qualityforum.org/Measuring_Performance/ABCs/What_NQF_Endorsement_Means.aspx*.

[349] National Quality Forum. (2021). Cardiovascular Spring 2021 Cycle: CDP Report: Draft Report for Comment. Accessed on September 21, 2021, at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=96018*.

entity such as NQF. Given the broad support for the measure obtained during development, including support from the TEP, during measure development public comment, and by the MAP's Rural Health Advisory group, Hospital Workgroup, Coordinating Committee, and MAP public comment, as well as the benefits of the STEMI eCQM over the OP–2 and OP–3 measures, we believe it is critical to implement this measure on the timeline discussed above even if the measure does not obtain NQF endorsement in fall 2021.

Comment: Several commenters recommended CMS support facilities, vendors, and other stakeholders during the implementation of the STEMI eCQM into the Hospital OQR program, as it would be the first eCQM added to the program. Specifically, a few commenters expressed concern about the costs associated with initial implementation of eCQMs (for example, building eCQM logic, validation, certification, etc.) and the timing by which EHR standards must be in place to meet the deadline for voluntary reporting.

Response: We appreciate commenters' concern regarding the start-up costs and requirements for eCQM reporting. However, data elements for the STEMI eCQM are all readily available in structured fields (or will be, based on the FHIR-based API, which is required for implementation by December 31, 2022 (85 FR 70075)). The proposed measure also aligns with interoperability guidance from the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) published May 1, 2020, therefore facilities and vendors have received advanced notice and guidance on FHIR API standardization that will support the transition to eCQMs. We also note that many facilities have operationalized and gained experience in reporting eCQM for the Hospital IQR Program. Thus, we believe that many facilities have demonstrated readiness in reporting eCQM and the implementation burden will not exceed requirements from other federal regulation already in place.

Additionally, we will provide assistance to facilities, vendors, and other stakeholders through the release of education and outreach materials following adoption of the measure in the program.

Comment: One commenter expressed concern about external factors (such as delays in resuscitation or a family's decision to not pursue aggressive care) that could affect facility performance through no fault of the clinician. This commenter encouraged CMS to exclude these cases to avoid penalization of the facility for care that does not meet the numerator's quality action.

Response: We appreciate the commenter's feedback on measure exclusions and considered these issues during measure development. Certain delays in resuscitation, such as cardiopulmonary arrest, are contraindicated and therefore excluded from the measure. We found that family refusal is not consistently captured in a structured data field. For this reason, we believe that family refusal cannot be reliably used an exclusion criterion at this time.

Comment: One commenter questioned how patients for whom a contraindication to fibrinolytic therapy would be excluded from the STEMI eCQM's initial patient population.

Response: We thank the commenter for their question. To clarify, we specified the measure's exclusions to remove a patient if the patient presents with any of a breadth of clinical diagnoses that reflect a contraindication to fibrinolytic therapy (such as suspected aortic dissection, ischemic stroke, intracranial or intraspinal surgery, etc.); a full list of exclusions for the STEMI eCQM is available on HealthIT.gov (*https://ecqi.healthit.gov/ecqm/eh/pre-rulemaking/1/cms996v2*).

We will monitor and evaluate additional clinical reasons for not using fibrinolytics to treat a myocardial infarction as this information becomes available.

Comment: One commenter asked how CMS would use data from third-party electrocardiograms (ECGs) in identifying patients for inclusion in the measure's initial population.

Response: We thank the commenter for their feedback. At this time, data from ECGs are not used to identify the STEMI eCQM's initial patient population. Rather, individuals are identified for inclusion in the measure if they were diagnosed with a myocardial infarction and did not have documentation of one or more excluded condition. The full technical specifications for the measure are available on *HealthIT.gov*.[350]

Comment: A commenter encouraged CMS to perform larger-scale testing and a feasibility assessment for implementation, expanding upon the two sites at which electronic health record (EHR) testing occurred previously, to ensure the measure is truly reliable and valid.

Response: We appreciate the commenter's concern about measure testing. With regards to measure reliability and validity, the NQF Cardiovascular Project's Standing Committee performed an evaluation of the measure's reliability and validity. They concluded that the results represented a moderate level of scientific acceptability. The measure was tested using data from two large hospital systems (with 20 EDs), whereby one system treated a large number, and the second system treated a smaller number of STEMI patients during the data period used for testing. As noted in section XV.B.4.c.(4) of this final rule with comment period, the feasibility testing showed that the measure is feasible and the key features of the eCQM, such as the code sets and measure logic, were readily interpreted by both sites as assessed by the feasibility scorecard and exit interviews conducted at two systems. The validity testing results showed a wide range of agreement among data elements between the electronic and manual data extracts. Statistical methods indicate equivalent agreement that the denominator value is expected by chance in the first system and slight agreement in the second system, with a moderate indication of denominator exclusion values in both EHR systems.[351] With regards to the test sites and EHR systems tested, the two EHR vendors utilized by the two hospital systems tested constitute the vast majority of EHRs.

After consideration of the public comments we received, we are finalizing the adoption of STEMI eCQM (Newly designated as OP–40) as proposed.

5. Modifications to Previously Adopted Measures

a. Requiring OP–37a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-Based Measures Beginning With Voluntary Reporting for the CY 2023 Reporting Period and Mandatory Reporting Beginning With the CY 2024 Reporting Period/CY 2026 Payment Determination and for Subsequent Years

We previously adopted the OP–37a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) measures to assess patient experience with care following a procedure or surgery in a HOPD. These survey-based

[350] (*https://ecqi.healthit.gov/ecqm/eh/pre-rulemaking/1/cms996v2*).

[351] National Quality Forum. (2021). Cardiovascular Spring 2021 Cycle: CDP Report: Draft Report for Comment. Accessed on September 21, 2021, at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=96018*.

measures rate patient experience as a means for empowering patients and improving the quality of their care (82 FR 59432). For further details on these measures, we refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79771 through 79784), in which we adopted these measures beginning with the CY 2020 payment determination.

Subsequently, in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59432 through 59433), we delayed implementation of OP–37a–e for the Hospital OQR Program beginning with the CY 2020 payment determination due to lack of sufficient operational and implementation data. At that time, we believed that our ongoing National OAS CAHPS voluntary reporting program for the survey measures, which began in January 2016 [352] and is unrelated to either the Hospital OQR Program or ASCQR Program, would provide valuable information moving forward. Specifically, we wanted to use the information from the National OAS CAHPS voluntary reporting program to: (1) Ensure that the survey measures appropriately account for patient response rates, both aggregate and by survey administration method; (2) reaffirm the reliability of national implementation of OAS CAHPS Survey data; and (3) appropriately account for the burden associated with administering the survey in the outpatient setting of care.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42246), we proposed to restart the OP–37a–e measure by requiring the measure in the Hospital OQR Program beginning with the CY 2024 reporting period/CY 2026 payment determination. Specifically, for the Hospital OQR Program, we proposed voluntary data collection and reporting beginning with the CY 2023 reporting period, followed by mandatory data collection and reporting beginning with the CY 2024 reporting period/CY 2026 payment determination. As noted previously, the National OAS CAHPS voluntary reporting program is independent of the Hospital OQR Program and the ASCQR Program. As proposed in the CY 2022 OPPS/ASC proposed rule (86 FR 42246), our intent is to make the distinction that HOPDs that voluntarily report the OAS CAHPS Survey-based measures during the CY 2023 reporting period would do so as part of the Hospital OQR Program until mandatory reporting begins. The reporting process for HOPDs to submit OAS CAHPS Survey data would remain unchanged. That is, HOPDs would submit OAS CAHPS Survey data through their vendors, who would submit these data to CMS as appropriate. We refer readers to section XV.D.4.b. of the preamble of the CY 2022 OPPS/ASC proposed rule (86 FR 42258) and of this final rule with comment period for our related proposals regarding the form, manner, and timing for reporting the OP–37a–e Survey-based measures.

Having had the opportunity during the delayed implementation to investigate the concerns about patient response rates and data reliability, we believe that patients are able to respond to OAS CAHPS Survey questions, and that those responses are reliable based on our prior experiences collecting voluntary data for public reporting since CY 2016 (available at *https://data.cms.gov/provider-data/*). We reaffirm that the OAS CAHPS Survey-based measures assess important aspects of care where the patient is the best or only source of information (81 FR 79771). Furthermore, in section XV.D.4.b.(1). of the CY 2022 OPPS/ASC proposed rule (86 FR 42258), we proposed additional collection modes using a web-based module (web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents) for administering the survey, which would be available beginning in CY 2023 under the Hospital OQR Program and for subsequent years.[353] We believe this would address some burden concerns raised during the CY 2017 OPPS/ASC final rule with comment period (81 FR 79777) because the web-based modules would produce similar results but at lower costs of collection.[354] We also continue to believe that the benefits of this measure, such as giving patients the opportunity to compare and assess quality of care in the outpatient setting in a standardized and comparable manner, outweigh the burdens (81 FR 79778). As we stated in the CY 2018 OPPS/ASC final rule with comment period, we continue to believe that implementation of these measures will enable objective and meaningful comparisons between hospital outpatient departments (82 FR 59432) and rating patient experience still provides important information to hospital outpatient departments and patients and enables objective and meaningful comparisons between hospital outpatient departments (82 FR 59432).

We refer readers to section XV.D.4.b. of the CY 2022 OPPS/ASC proposed rule (86 FR 42258) and of this final rule with comment period for our related proposals regarding form, manner, and timing for reporting the OP–37a–e Survey-based measures.

We received comments on these topics.

Comment: A few commenters supported the voluntary collection of OAS CAHPS Survey in the Hospital OQR Program beginning in CY 2023 reporting period.

Response: We thank the commenters for their support.

Comment: A few commenters supported voluntary collection of the OAS CAHPS Survey and recommended releasing additional information regarding operational or technical knowledge learned during the voluntary period prior to the start of mandatory reporting.

Response: We agree that information learned during the OAS CAHPS Survey voluntary reporting period and the National OAS CAHPS Survey voluntary reporting program should be disseminated to HOPDs to help improve their performance and patient safety. For information about the National OAS CAHPS Survey voluntary reporting, we encourage hospitals to visit: *https://oascahps.org/General-Information/National-Implementation*. We believe the information learned through this prior voluntary reporting timeframe can inform practice during the voluntary reporting period and eventually mandatory reporting as part of the Hospital OQR Program. Specifically, as part of the National OAS CAHPS Survey voluntary reporting, a summary report that includes information about patient-mix adjustments for each quarter is updated and posted before each quarterly data submission period. Preview reports for each facility participating voluntarily is posted on the OAS CAHPS website two weeks prior to public reporting. The Protocols and Guidelines Manual is updated annually with any necessary clarifications about participation requirements and protocols. Training has been provided annually to approved

[352] Participation in the program is open to any interested Medicare-certified Hospital Outpatient Departments (HOPDs) and free-standing ambulatory surgery centers (ASCs). More information on the National OAS CAHPS voluntary reporting program is available at: *https://oascahps.org/General-Information/National-Implementation* and *https://www.cms.gov/Research-Statistics-Data-and-Systems/Research/CAHPS/OAS-CAHPS*.

[353] We note that the mixed modes will be available as part of the National OAS CAHPS voluntary reporting program beginning in CY 2022.

[354] Bergeson SC, Gray J, Ehrmantraut LA, Laibson T, Hays RD. Comparing Web-based with Mail Survey Administration of the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Clinician and Group Survey. Prim Health Care. 2013;3:1000132. doi:10.4172/2167–1079.1000132.

vendors to clarify administration protocols. We refer reader to *https://oascahps.org/Training/Training-Materials* for more information.

Comment: Several commenters supported the mandatory collection of the OAS CAHPS Survey in the Hospital OQR Program. One commenter stated that the OAS CAHPS Survey will help HOPDs strategically identify strengths, weaknesses, and areas for improvement related for patient experience.

Response: We appreciate the support of mandatory reporting of OAS CAHPS Survey as part of the Hospital OQR program. We believe that these survey-based measures will be useful to assess aspects of care where the patient is the best or only source of information, and to enable objective and meaningful comparisons between HOPDs. We also believe this feedback will help HOPDs identify and improve patient related experiences.

Comment: A few commenters expressed concern with the OAS CAHPS Survey use of CPT codes. These commenters also expressed concern that these codes were not consistent with certain IT vendor support. Another recommended that OAS CAHPS Survey patient eligibility should not rely on CPT codes. A commenter expressed concern surrounding the timeframe around submission of claims and coding information simply does not match—meaning that coding may not be completed to accommodate the 21- to 60-day survey timeframe and recommended that CMS to eliminate the use of CPT codes to trigger survey distribution.

Response: We appreciate this feedback. We interpret the commenters' concern to be that there may be confusion over which patients would be eligible to be surveyed as part of the OAS CAHPS Survey reporting. We note that the OAS CAHPS Survey is administered to all eligible patients, or a random sample thereof, who had at least one outpatient surgery/procedure during the applicable month. Many CPT codes have been excluded from inclusion in the OAS CAHPS Survey, including services like application of a cast or splint, in order to ensure that only patients receiving applicable procedures are surveyed.[355]

With regard to the timing of the availability of CPT codes for sample selection, we recognize in some cases there could be delays in getting the CPT codes updated in the patient record and transmitted to the survey vendor in a timely manner. Under the current protocol for survey administration, we allow survey vendors to work with HOPD and ASC facilities to identify alternative ways to identify the patient records for outpatient surgery or diagnostic procedures that were performed in eligible HOPDs or ASCs (as identified by the facility-level eligibility criteria). Vendors can submit exception requests to request alternative methods for identifying the eligible population. We also note that the current protocol for survey administration allows for late start requests for situations in which the complete patient records are not available within the target window of time for survey administration. Vendors can submit late start requests when the patient data file is received more than 26 days after the sample month. This allows for flexibility in situations when the CPT codes are not available initially but can be updated. Further, sampling is allowed to proceed if 90 percent of the patient records have CPT codes. Updates to the Survey Specifications and Guidelines will be available on the OAS CAHPS Survey website.[356] We will take all comments under consideration as we consider future refinements for the OAS CAHPS Survey.

Comment: A few commenters expressed concern that there is little variation in performance scores for this measure.

Response: We thank the commenters for their feedback. Performance scores are measured and reported publicly at the facility, state, and national levels through the Provider Data Catalog (PDC) datasets (*https://data.cms.gov/provider-data/*). OAS CAHPS Survey results are publicly reported as ''top-box'', ''bottom-box'', ''middle-box'', and ''linear scaled scores''. The scores are adjusted for patient mix within each quarter to account for facility differences in patient mix. During voluntary participation, facilities may choose to have their survey results published or only reported privately through preview reports. Variation in performance scores is expected to increase as more facilities participate. We believe that the OAS CAHPS Survey-based measures will be useful to assess aspects of care where the patient is the best or only source of information, and to enable objective and meaningful comparisons between HOPDs.

Comment: A commenter opposed mandatory reporting for OAS CAHPS Survey, expressing concern regarding its reliability. This commenter also expressed the belief that many of the issues from when the measure was originally delayed have not yet been resolved, namely the potential for low patient response rate, administration burden on providers and lack of reliable national OAS CAHPS Survey data.

Response: We thank the commenter for their feedback and acknowledge their concern. We believe that OAS CAHPS Survey is reliable and that our prior concerns that resulted in the delay of the OAS CAHPS Survey implementation have been resolved. HOPDs have been able to report OAS CAHPS Survey data as part of the National OAS CAHPS Survey since 2016. Based on our experience through this reporting, we are able to: (1) Ensure that the survey measures appropriately account for patient response rates, both aggregate and by survey administration method; (2) reaffirm the reliability of national implementation of OAS CAHPS Survey data; and (3) appropriately account for the burden associated with administering the survey in the outpatient setting of care. We also note that, unit-level reliability analysis of the publicly reported composites for OAS CAHPS are well above the .70 cut-off typically used to assess reliability of a measure.

Comment: A few commenters opposed mandatory reporting and expressed concern regarding the financial burden of OAS CAHPS Survey vendors, and IT resource strain. Several commenters opposed mandatory reporting due to the operational burden on patients and facilities, as well as the repetitive nature of this extensive and complex outpatient survey.

Response: We thank these commenters for their feedback and acknowledge their concerns. While there are administrative and financial burdens associated with implementing the OAS CAHPS Survey and OAS CAHPS Survey-based measures in the Hospital OQR Program, we believe the benefits of capturing patient experience of care data in the HOPD setting outweigh the burdens. In selecting measures for the Hospital OQR Program, we weigh the relevance and utility of measures against the potential burden to HOPDs resulting from the measure's adoption, and we believe the OAS CAHPS Survey is a vital source of information in assessing the quality of care provided at an HOPD.

We post the list of the approved OAS CAHPS Survey vendors on *https://oascahps.org* and we encourage HOPDs to contact vendors for cost and service information pertaining to OAS CAHPS Survey as there may be differences among vendors and multiple modes of

[355] Updates on OAS CAHPS Survey specifications and guidelines are available at *https://oascahps.org/General-Information/Announcements.*

[356] *https://oascahps.org/.*

conducting the survey provide greater economical choice.

In addition, we address additional modes to collect OAS CAHPS Survey data in section XVI.D.4.b.(1) of the CY 2022 ASC/OPPS proposed rule (86 FR 42258) which we expect to reduce the future cost of administration. We refer readers to the Protocols and Guidelines Manual for the OAS CAHPS Survey (*https://oascahps.org/Survey-Materials*) for materials for each mode of survey administration.

With respect to the burden on patients, we believe that patients appreciate the opportunity to provide feedback to their providers and that the information learned from their responses has the potential to improve communication and care that HOPDs provide and can simply opt not to respond to the survey if so inclined.

Further, while we did not propose a solely digital mode of conducting the OAS CAHPS Survey, we will continue to analyze whether a web-only or digital-only format would be appropriate for the OAS CAHPS Survey, which could potentially further reduce the costs of administering the survey.

Comment: A few commenters opposed mandatory reporting and cited staffing shortages and the ongoing COVID–19 crisis as reasons for opposing the mandatory adoption of OAS CAHPS Survey at this time.

Response: We understand the commenters' concerns and the aim to accommodate HOPDs while our nation works through the unprecedented COVID–19 pandemic. However, we believe the OAS CAHPS Survey is a critical measure of patient experience at this time. We also note that, since many hospitals already have vendors in place and are successfully reporting the HCAHPS Survey in the IQR program, the burden of finding a vendor and operationalizing the OAS CAHPS is minimal.

Comment: A commenter expressed concern that there is overlap between CAHPS Surveys that would be administered by Clinician Groups, Outpatient/ASCs, as well as from Surgical Care teams and that there is potential for patients to receive multiple requests to complete CAHPS Surveys in connection with a single episode of care, causing confusion and survey fatigue.

Response: While we understand the commenter's concerns regarding resources needed to collect the survey, and survey administration burden for hospitals, the OAS CAHPS Survey was developed for use in assessing patient experience of care for select outpatient surgical procedures. We are dedicated to improving the quality of care provided to patients, and believe patients are a vital source of information in assessing the quality of care provided at a hospital outpatient department. We believe that the benefits of this measure, such as giving patients the opportunity to compare and assess quality of care in the outpatient setting in a standardized and comparable manner, outweigh the burdens.

Regarding confusion among patients and multiple overlapping survey tools, we note that other CAHPS Surveys, such as the HCAHPS Survey, are tailored to different aspects of care provided by hospitals, such as inpatient care. In addition, the survey introduction (and letter) provided to patients includes the date and location of the surgery or procedure that the patient received at the facility. Furthermore, patients will also be reminded of the date and location of the surgery or procedure they received during the telephone interviews. For these reasons, we do not believe there will be issues associated with overlap or confusion for these surveys.

Comment: A commenter expressed concern that departments may have multiple sets of patient experience results and recommended applying the OAS CAHPS Survey for only people who have a day surgery where anesthesia is used.

Response: We thank the commenter for their suggestion; however, we believe that the OAS CAHPS Survey is appropriately scoped to provide patients and facilities meaningful data on the services provided by HOPDs and not just those that require anesthesia.

Comment: A few commenters opposed the OAS CAHPS Survey measures because the OAS CAHPS is not endorsed by the NQF. The commenters encouraged CMS to pursue NQF endorsement of these measures before the OAS CAHPS Survey is required in order to ensure all stakeholders are given insight into the measure and to ensure it is fair and accurate.

Response: We thank commenters for their feedback. We note, section 1833(t)(17) of the Act does not require that each measure we select for the Hospital OQR Program be endorsed by a national consensus building entity, or the NQF specifically. Under this paragraph, the Secretary has the authority to select non-endorsed measures. While we strive to develop NQF-endorsed measures, including when feasible and practicable, we believe the requirement that measures developed by the Secretary for use in the Hospital OQR Program reflect consensus among affected parties can be achieved in other ways, including through the measure development process, which often includes stakeholder input via a Technical Expert Panel (TEP), review by the MAP, broad acceptance and use of the measure, and public comments.

We also believe that lack of NQF endorsement does not limit insight into whether the measures portray hospital performance in a fair and accurate manner. The survey was tested in both the outpatient and ASC settings in 2014 (field testing) and 2015 and 2019 (mode testing) was found to be reliable. We refer readers to *https://oascahps.org/* for more information about field and mode testing for these measures. The OAS CAHPS Survey development process followed the principles and guidelines outlined by AHRQ and its CAHPS Consortium.[357] This process included: (1) Reviewing existing literature; (2) reviewing surveys submitted under a public call for measures; (3) conducting focus groups with patients who had recent outpatient surgery; (4) conducting cognitive interviews with patients to assess their understanding and ability to answer survey questions; (5) obtaining stakeholder input on the draft survey and other issues that may affect implementation; conducting a field test; and (6) conducting a test of the various data collection mode effects on survey responses.

Comment: One commenter strongly recommended that CMS reconsider its position on respondent confidentiality and remove the requirement to include the question on consent to share identifying information from the OAS CAHPS Survey if the facility is interested in receiving patient-level response data connected to the patient's identifying data. Another commenter explained that if facilities understood the patient, they could more easily provide their employees immediate, and targeted improvement training. One commenter recommended that CMS align the OAS CAHPS patient confidentiality rules with HCAHPS, which allows for the release of patient-level data for quality improvement purposes with the stipulation that the patient identity should not be shared with direct care staff. Another commenter expressed concern about a question on the OAS CAHPS Survey that seeks information on ''Consent to Share Identifying Information'', believing that the question limits the

[357] Agency for Healthcare Research and Quality. ''The CAHPS Program.'' Available at: *https://ahrq.gov/cahps/index.html.*

ability to identify trends and thereby limits opportunities.

Response: We thank these commenters for their feedback. While the desire to have patient identifying information to develop responsive training and remediation steps is admirable, we believe that patient confidentiality is an important aspect of the OAS CAHPS Survey to help encourage accurate reporting. The administration protocols for the OAS CAHPS Survey follow protocols for CAHPS® Surveys, restricting the release of patient-level data if the patient has not consented. We note that for the Hospital IQR Program, we do not state that patients' responses and identifying information will not be shared with the hospital because hospitals can self-administer the HCAHPS Survey. However, for surveys administered via a third-party vendor, the survey is not linked to a sample patient's name unless the patient gives his or her consent. We note that facilities may choose to add the ''Consent to Share'' question to the OAS CAHPS Survey, which asks whether a patient gives permission for their name to be linked to their survey responses. However, we note that each facility should consult with its own counsel to ensure compliance with applicable privacy and security laws.

Comment: A requester sought clarification on whether the OAS CAHPS Survey will be mandated in CY 2024 if outpatient surgery is included in their HCAHPS submission.

Response: The Hospital OQR Program is an independent quality reporting program, and as part of its requirements, HOPDs will be required to meet the reporting requirement for the OAS CAHPS Survey once the OAS CAHPS Survey begins mandatory reporting in CY 2024 reporting period/CY 2026 payment determination.

Comment: A commenter requested that CMS do more to ensure correct attribution of experience and requested CMS provide evidence of the survey's reliability before it requires survey administration, which the commenter believes could reduce the reliability of the results and negatively impact data-driven decision making.

Response: We thank the commenter for their feedback. The purpose of the OAS CAHPS Survey is to obtain data on a patient's experience of care received from a hospital/facility, specifically from an HOPD. While there is always potential that a patient gets confused, we believe that the OAS CAHPS Survey is focused on patients' experience of care received for their ambulatory surgery or procedure. A physician/surgeon who performs surgeries/procedures at a facility is a member of that facility with both rights and responsibilities. We believe it is the facility's responsibility to ensure that someone—whether the doctor, nurse, or other facility staff member—provide patients with information about preparing for their procedure, about the procedure itself, as well as what to expect following the procedure/surgery. Therefore, we believe it is appropriate to include these important communications with patients in the OAS CAHPS Survey and believe experience with the provider attributed to the facility is appropriate.

Further, we believe that the information provided in the OAS CAHPS Survey ''Instructions'' is sufficient to inform the patient regarding the purpose of the OAS CAHPS Survey and provides sufficient instruction and details for the patient to correctly identify and relate the survey to the facility and procedure that patient received. We began developing the Outpatient and Ambulatory Surgery Survey in 2012 using the principles and guidelines established by the Agency for Healthcare Research and Quality's (AHRQ) CAHPS program and AHRQ approved this instrument as a CAHPS Survey in February 2015.[358]

We reiterate that based on our experience through the National OAS CAHPS voluntary reporting program, we can confirm the OAS CAHPS Survey reliability and (1) ensure that the survey measures appropriately account for patient response rates, both aggregate and by survey administration method; (2) reaffirm the reliability of national implementation of OAS CAHPS Survey data; and (3) appropriately account for the burden associated with administering the survey in the outpatient setting of care. We also note that, unit-level reliability analysis of the publicly reported composites for OAS CAHPS are well above the .70 cut-off typically used to assess reliability of a measure. Based on this reliability, we believe that the information learned from the survey data will allow hospitals to make more informed decisions to improve care.

Comment: Many commenters expressed concern regarding the length of the survey and recommended that the survey should be significantly shortened to focus on actionable aspects of the patient experience and to encourage higher response rates amongst patients. Specifically, some commenters recommended that a revised OAS CAHPS Survey should include five to ten questions.

Response: The OAS CAHPS Survey is comparable in length and survey response rate to other patient experience of care surveys. The survey instrument was developed in order to provide a more complete picture of patients' experience of care in the HOPD setting. We believe allowing facilities to administer a selection of the survey items, or greatly reducing the questions to patients would impair the assessment of a facility's quality of care and would also inhibit the comparison of performance across facilities and the reliability of a facility's scores. In addition, the 24 core questions of the OAS CAHPS Survey are either directly actionable (that is, give feedback to hospitals) or inform the need for patients to answer subsequent questions that are actionable. We note that the survey results to date do not show that respondents are terminating the interview before the last question, which would be an indication of respondent fatigue for a survey that is too long. Based on the most recently received national implementation data for voluntary reporting, the nonresponse due to terminated interviews is less than one percent.

Implementing the OAS CAHPS Survey in the Hospital OQR Program will enable patients to compare patient experience of care data across multiple HOPDs as part of their healthcare decision-making. In addition, we believe implementing the OAS CAHPS Survey in the Hospital OQR Program will incentivize HOPDs to factor patient experience of care into their quality improvement efforts more proactively. Implementing a shorter ''sample survey'' would not enable the same type of comparison as a fully tested survey.

However, we also acknowledge these commenters' concerns about the length of the OAS CAHPS Survey and will continue to consider whether refinement would be appropriate.

Comment: A commenter sought more information regarding the future of the ''Preparations for Discharge and Recovery'' domain of the OAS CAHPS Survey and whether CMS will publicly report data collected from the domain.

Response: We plan to report information from ''Preparations for Discharge and Recovery'' beginning with the data collected in 2022 as part of National OAS CAHPS voluntary reporting and address public reporting OAS CAHPS data as part of the Hospital OQR Program in future rulemaking.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

[358] *See https://www.ahrq.gov/cahps/surveys-guidance/oas/index.html.*

We also refer readers to section XVI.B.4.c. of this final rule with comment period where we are also finalizing this measure in the ASCQR program with modification.

b. OP–31: Cataracts: Improvement in Patient's Visual Function Within 90 Days Following Cataract Surgery (NQF #1536) Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination

(1) Background

In the CY 2014 OPPS/ASC final rule with comment period (78 FR 75102 through 75104) we finalized the adoption of the OP–31: Cataracts: Improvement in Patient's Visual Function with 90 Days Following Cataract Surgery [359] measure beginning with the CY 2016 payment determination. This measure assesses the percentage of patients aged 18 years and older who had cataract surgery and had improvement in visual function achieved within 90 days following the cataract surgery (78 FR 75102) via the administration of pre-operative and post-operative visual function surveys.

During the CY 2014 OPPS/ASC proposed rule, some commenters expressed concern about the burden of collecting pre-operative and post-operative visual function surveys (78 FR 75103). In response to those comments, we modified and finalized our implementation strategy in a manner that we believed would significantly minimize collection and reporting burden (78 FR 75103). Specifically, we applied a sampling scheme and a low case threshold exemption to address commenters' concerns regarding burden (78 FR 75114). With those changes, we intended to decrease burden and facilitate data reporting by allowing random sampling of cases when volume is high, instead of collecting information for all eligible patients (78 FR 75114). For further details, we refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75102 through 75104).

Shortly thereafter, we became concerned about the use of inconsistent surveys to assess visual function. The measure specifications allowed for the use of any validated survey and we were not positive about the impact the use of varying surveys might have. Therefore, we issued guidance stating that we would delay the implementation of OP–31.[360] Subsequently, in the CY 2015 OPPS/ASC final rule with comment period (79 FR 66947 through 66948), we finalized our proposal to exclude OP–31 from the CY 2016 payment determination measure set, and for subsequent years. In addition, we finalized allowing hospitals to voluntarily report OP–31 data for the CY 2015 reporting period/CY 2017 payment determination and subsequent years (79 FR 66948).

(2) OP–31 Measure Beginning With the CY 2025 Reporting Period/CY 2027 Payment Determination and for Subsequent Years

In the CY 2022 OPPS/ASC proposed rule (86 FR 42247), we stated that we believed it would be appropriate to require hospitals to report on OP–31. We stated that hospitals have had the opportunity for several years to familiarize themselves with OP–31, prepare to operationalize it, and opportunity to practice reporting the measure since the CY 2015 reporting period/CY 2017 payment determination. We noted that a small number of facilities have consistently reported data for this measure and these data have been made publicly available. While we previously had concerns regarding the use of different surveys to assess visual function (79 FR 66947), we believe that using different surveys will not result in inconsistencies, as the allowable surveys are scientifically validated and provide comparable results.[361] Research has demonstrated that of 16 different cataract surgery outcome questionnaires, it has been demonstrated that all were able to detect clinically important change.[362]

In the CY 2022 OPPS/ASC proposed rule (86 FR 42247), we proposed to require reporting of the OP–31 measure beginning with the CY 2023 reporting period/CY 2025 payment determination and for subsequent years. As we stated in the CY 2014 OPPS/ASC final rule with comment period, as well as the CY 2015 OPPS/ASC final rule with comment period, and consistent with the MAP recommendation, we continue to maintain that this measure ''addresses a high-impact condition'' that is not otherwise adequately addressed in our current measure set (78 FR 75103 and 79 FR 66947, respectively). Moreover, OP–31 serves to improve patient-centered care by representing an important patient reported outcome (78 FR 75103). This measure provides opportunities for care coordination as well as direct patient feedback.

We refer readers to section XV.D.5.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42259) and section XV.D.5.a.(1). of this final rule with comment period for information about submitting data via a CMS web-based tool.

We received comments on these topics.

Comment: Several commenters expressed support for mandatory reporting of OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery.

Response: We thank the commenters for their support. The implementation of this measure underwent a number of changes aimed to address previous concerns regarding burden and the usage of various surveys to assess visual function. However, after review of public comments, which are discussed in this section, we are finalizing to require the OP–31 measure beginning with the CY 2025 reporting period/CY 2027 payment determination, instead of our originally proposed data collection beginning with the CY 2023 reporting period.

Comment: A few commenters expressed concern about making this measure mandatory, stating that because the OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure is not currently mandatory, many facilities have not been ''practicing'' reporting it even though it is voluntary in the Hospital OQR Program measure set.

Response: We thank the commenters for their feedback. We note that even though a small number of facilities have reported data for this measure, those that have reported on this measure have done so successfully and consistently. We believe the 2-year extension from our originally proposed timeline of the CY 2023 reporting period/CY 2025

[359] We note that this measure was endorsed by the NQF under NQF #1536 at the time of adoption but has subsequently had its endorsement removed.

[360] The implementation was first delayed by 3 months—from January 1, 2014 to April 1, 2014, for the CY 2016 payment determination, via guidance issued December 31, 2013. Available at: *https://qualitynet.cms.gov/files/5d3792e74b6d1a256059d87d?filename=2013-40-OP.pdf*. Because of continuing concerns, on April 2, 2014, we issued additional guidance stating that we would further delay the implementation of the measure from April 1, 2014 to January 1, 2015 for the CY 2016 payment determination. Available at: *https://qualitynet.cms.gov/files/5d3793174b6d1a256059d8e3?filename=2014-14-OP,0.pdf*.

[361] McAlinden C, Gothwal VK, Khadka J, Wright TA, Lamoureux EL, Pesudovs K. A head-to-head comparison of 16 cataract surgery outcome questionnaires. Ophthalmology. 2011 Dec;118(12):2374–81. doi: 10.1016/j.ophtha.2011.06.008. Epub 2011 Sep 25. PMID: 21945088.

[362] McAlinden C, Gothwal VK, Khadka J, Wright TA, Lamoureux EL, Pesudovs K. A head-to-head comparison of 16 cataract surgery outcome questionnaires. Ophthalmology. 2011 Dec;118(12):2374–81. doi: 10.1016/j.ophtha.2011.06.008. Epub 2011 Sep 25. PMID: 21945088.

payment determination will provide facilities with sufficient time to provide staff training and operationalize the measure for successful reporting in the Hospital OQR program.

Comment: Many commenters did not support the requirement for mandatory reporting of OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery and cited concerns about the operational complexity of collection and sharing data for the measure across physicians and outpatient settings. Many commenters believed administering surveys and tracking responses for the OP–31 measure would be burdensome. Specifically, many commenters were concerned that EHR systems were not compatible across physicians and outpatient settings, and were concerned by the potential burden their clinics and staff might face in extracting and sharing patient data. Several commenters were also concerned that requiring OP–31 would increase reporting burden during the ongoing COVID–19 pandemic and asked CMS to delay implementation.

Response: We thank the commenters for their input, and we acknowledge their concerns. We highly encourage hospitals, ophthalmologists, and other clinicians to actively and routinely engage in exchanging information to better communicate and coordinate the care of patients to promote quality of care. However, we acknowledge the complexity of administering and sharing data for OP–31 across different settings. In response to these concerns, we are finalizing the requirement to report the OP–31 measure beginning with the CY 2025 reporting period/CY 2027 payment determination instead of our originally proposed data collection beginning with the CY 2023 reporting period. We believe the 2-year extension will provide facilities with sufficient time for clinics and staff to address potential issues with extracting and sharing patient data. The 2-year extension will also allow facilities to prepare and update systems and technology, and prevent additional reporting burden during the COVID–19 pandemic.

Comment: A few commenters raised concerns with measure specifications, especially the lack of specificity around administration of the survey to ensure consistency between the pre- and post-operative surveys as well as comparability of the measure across hospitals. Several commenters requested additional guidance and education from CMS regarding measure specifications and survey instruments. Several commenters expressed their belief that this measure would be better suited to the Physician Quality Reporting System as it was developed as a physician-level measure. A few commenters expressed concern and confusion about administering a 90-day post-op examination. One of the commenters disagreed with the use of the study cited, noting that it reviewed responsiveness of different questionnaires and not comparison of agreement across different questionnaires. One commenter believed that surveys would have a low response rate and that results would not be reliable.

Response: We thank commenters for their feedback. We recognize commenters' concerns related to the measure specifications. However, we continue to believe the assessment of the McAlinden et al. study demonstrated that the use of different surveys did not result in inconsistencies [363] and we maintain that it is appropriate for inclusion in the Hospital OQR Program measure set. We also acknowledge that this measure has been tested at the physician-level and not the facility-level. We would like to clarify, in response to concerns about the administering a 90-day post-op examination, OP–31 is based on a patient survey to assess visual function and not a post-op examination, which tests for visual acuity. We reiterate our belief that OP–31 provides a valuable opportunity for patient feedback on visual function outside of the clinical setting.

Comment: Several commenters believed OP–31 has a limited use in evaluating patient improvement. A few commenters noted that cataract operations already have high rates of success. A few commenters noted that cataract surgeries are performed for other medical reasons beyond improving visual function. One commenter noted its belief that there is not just one measure that can be used to assess improved visual function.

Response: We thank commenters for their input. However, even if cataract procedures have high rates of success, this does not preclude facilities from reporting on OP–31 or continuously working to improve patient outcomes. We agree with the commenters that there is no one measure that can assess all possible medical needs and possible visual function outcomes; however, we continue to believe that OP–31 is a valuable and appropriate measure to close the gap for a high impact, frequently performed procedure.

After consideration of the public comments we received, we are finalizing the proposal to require OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery with modification. To address commenters' concerns, we are finalizing to require OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery beginning with the CY 2025 reporting period/CY 2027 payment determination, instead of our originally proposed data collection beginning with the CY 2023 reporting period. We believe the 2-year extension from our originally proposed timeline of the CY 2023 reporting period/CY 2025 payment determination will provide facilities with additional time to implement coordination strategies between the surgeon and the ophthalmologist, to provide staff training, and operationalize the measure for successful reporting in the Hospital OQR Program.

6. Summary of Previously and Newly Finalized Hospital OQR Program Measure Sets

a. Summary of Previously and Newly Finalized Hospital OQR Program Measure Set for the CY 2023 Payment Determination

We refer readers to the CY 2021 OPPS/ASC final rule with comment period (85 FR 86180 through 86181) for a summary of the previously adopted Hospital OQR Program measure set for the CY 2023 payment determination and subsequent years. As discussed previously, we are finalizing adoption of the Breast Cancer Screening Recall Rates measure in this final rule for the CY 2023 payment determination and subsequent years (OP–39). Table 63 summarizes the previously and newly finalized Hospital OQR Program measure set for the CY 2023 payment determination:

BILLING CODE 4120–01–P

2687	OP-36: Hospital Visits after Hospital Outpatient Surgery
None	OP-37a: OAS CAHPS – About Facilities and Staff*
None	OP-37b: OAS CAHPS – Communication About Procedure*
None	OP-37c: OAS CAHPS – Preparation for Discharge and Recovery*
None	OP-37d: OAS CAHPS – Overall Rating of Facility*
None	OP-37e: OAS CAHPS – Recommendation of Facility*
None	OP-39: Breast Cancer Screening Recall Rates
None	OP- 38: COVID-19 Vaccination Coverage Among Health Care Personnel
None	OP-40: ST-Segment Elevation Myocardial Infarction (STEMI) eCQM**

† We note that NQF endorsement for this measure was removed.

* In this final rule with comment period, we finalizing voluntary reporting beginning with the CY 2023 reporting period/CY 2025 payment determination; and mandatory reporting beginning with the CY 2024 reporting period/CY 2026 payment determination.

** The STEMI eCQM (OP-40) was proposed in the CY 2022 OPPS/ASC proposed rule (86 FR 42244), beginning with voluntary reporting for the CY 2023 reporting period/CY 2025 payment determination and for mandatory reporting beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years. We refer readers to section XV.B.4.c. of the preamble of the CY 2022 OPPS/ASC proposed rule and of this final rule with comment period rule for more detail on finalizing adoption of this measure.

d. Summary of Previously and Newly Finalized Hospital OQR Program Measure Set for the CY 2026 Payment Determination and Subsequent Years

Table 66 summarizes the previously and newly finalized Hospital OQR Program measure set for the CY 2026 payment determination and subsequent years, which includes the mandatory reporting of the ST-Segment Elevation Myocardial Infarction (STEMI) eCQM (OP–40) and the requirement of the OAS CAHPS measures (OP–37a–e):

TABLE 66: Hospital OQR Program Measure Set for the CY 2026 Payment Determination and Subsequent Years

NQF #	Measure Name
0514	OP-8: MRI Lumbar Spine for Low Back Pain†
None	OP-10: Abdomen CT – Use of Contrast Material
0669	OP-13: Cardiac Imaging for Preoperative Risk Assessment for Non-Cardiac, Low-Risk Surgery
0496	OP-18: Median Time from ED Arrival to ED Departure for Discharged ED Patients
0499	OP-22: Left Without Being Seen†
0661	OP-23: Head CT or MRI Scan Results for Acute Ischemic Stroke or Hemorrhagic Stroke who Received Head CT or MRI Scan Interpretation Within 45 minutes of ED Arrival
0658	OP-29: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients
1536	OP-31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery*
2539	OP-32: Facility 7-Day Risk-Standardized Hospital Visit Rate after Outpatient Colonoscopy
None	OP-35: Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy
2687	OP-36: Hospital Visits after Hospital Outpatient Surgery
None	OP-37a: OAS CAHPS – About Facilities and Staff
None	OP-37b: OAS CAHPS – Communication About Procedure
None	OP-37c: OAS CAHPS – Preparation for Discharge and Recovery
None	OP-37d: OAS CAHPS – Overall Rating of Facility
None	OP-37e: OAS CAHPS – Recommendation of Facility
None	OP-39: Breast Cancer Screening Recall Rates
None	OP-38: COVID-19 Vaccination Coverage Among Health Care Personnel
None	OP-40: ST-Segment Elevation Myocardial Infarction (STEMI) eCQM

† We note that NQF endorsement for this measure was removed.

*OP-31 measure voluntarily collected as set forth in the CY 2015 OPPS/ASC final rule with comment period (79 FR 66946 through 66947).

BILLING CODE 4120–01–C

7. Hospital OQR Program Measures and Topics for Future Considerations

a. Request for Comment on Potential Adoption of Future Measures for the Hospital OQR Program

We seek to adopt a comprehensive set of quality measures for widespread use to inform decision-making regarding care and for quality improvement efforts in the hospital outpatient setting. In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86083 through 86110), under the OPPS we finalized the elimination of the Inpatient Only (IPO) list over a 3-year transitional period, beginning with the removal of approximately 300 primarily musculoskeletal-related services, with the list to be completely phased out by CY 2024.[364] As discussed in section IX. of the CY 2022 OPPS/ASC proposed rule (86 FR 42155) and section IX. of this final rule with comment period, we have continued to receive stakeholder requests to reconsider the elimination of the IPO list, to reevaluate services removed from the IPO list due to safety and quality concerns, and to, at a minimum, extend the timeframe for eliminating the list. After further consideration and review of the additional feedback from stakeholders, we believe that the timeframe we adopted for removing services from the IPO list does not give us a sufficient

[364] Centers for Medicare & Medicaid Services. (2020, December 2). CY 2021 Medicare Hospital Outpatient Prospective Payment System and Ambulatory Surgical Center Payment System Final Rule (CMS–1736–FC). Retrieved from *www.cms.gov/newsroom*: *https://www.cms.gov/newsroom/fact-sheets/cy-2021-medicare-hospital-outpatient-prospective-payment-system-and-ambulatory-surgical-center-0*.

opportunity to carefully assess whether a procedure can be removed from the IPO list while still ensuring beneficiary safety. In the CY 2022 OPPS/ASC proposed rule (86 FR 42155), for CY 2022, we proposed to halt the elimination of the IPO list and, after clinical review of the services removed from the IPO list in CY 2021, we proposed to add the 298 services removed from the IPO list in CY 2021 back to the IPO list beginning in CY 2022.

However, as technology and surgical techniques advance, services will continue to transition off of the IPO list, becoming payable in the outpatient setting. We recognize that there may be a need for more measures that inform decision-making regarding care and for quality improvement efforts, particularly focused on the behaviors of services that become newly eligible for payment in the outpatient setting. In light of this, in the CY 2022 OPPS/ASC proposed rule (86 FR 42251), we sought comment on potential future adoption of measures that would allow better tracking of the quality of care for services that transition from the IPO list and become eligible for payment in the outpatient setting.

Therefore, we invited public comment on the potential future adoption of measures for our consideration that address care quality in the hospital outpatient setting given the transition of procedures from inpatient settings to outpatient settings of care.

We received comments on these topics and provide a summary of these comments below.

Comment: Many commenters offered suggestions in response to the Request for Comment on potential adoption of future measures in the Hospital OQR program. Several commenters encouraged CMS to work with stakeholders to identify a balanced set of high-quality, safe, and patient-centered measures that would be appropriate and useful across care settings particularly as procedures transition from the inpatient only list to outpatient settings. The commenters recommended that the measures should also address reporting challenges before proposing to adopt new measures into the OQR program. Several commenters believed CMS should explore additional measures addressing nutrition, breast cancer screening and diagnostic exams, structural equity related to disparity impact and the development of service-specific quality measures. One commenter also strongly recommended that CMS align with Leapfrog and its purchaser constituency by publicly reporting data in a way that puts the needs of consumers first.

Response: We thank commenters for their feedback. We will continue to work with stakeholders and take recommendations into consideration as we determine future updates to the Hospital OQR measure set. We will also explore the program need and feasibility of the commenters' measure recommendations as we consider measures for inclusion in future rulemaking.

Comment: A few commenters recommended that CMS should focus on developing Patient Reported Outcome (PROs) and patient experience measures to gather feedback directly from the patient without interpretation from a third-party source. Commenters stated that these measures can be broadly applied across the surgical domain and other procedures. Furthermore, they believed that prioritizing measures that focus on patients' feeling of inclusivity and developing patient reported metrics of inclusion in the care process is also an important step in addressing systemic bias in health care delivery.

Response: We appreciate the commenters' recommendations. We believe in the importance of patients having a greater role in their healthcare decision making. Accordingly, placing an emphasis on PRO measures directly aligns with our goals to modernize and drive value-based care. We will consider commenters' recommendations as we gather information for future rulemaking efforts.

Comment: Many commenters recommended that CMS consider adopting measures that are currently in the ASCQR Program measure set into the Hospital OQR Program's measure set. The measures commenters recommended for inclusion were: ASC–1, ASC–2, ASC–3, ASC–4, ASC–13, and ASC–14. Commenters noted that moving to adopt measures similar to these in the Hospital OQR Program would increase the alignment of measures between the Hospital OQR and ASCQR Programs and would allow consumers more opportunities to compare quality and safety across settings of care.

Additionally, a few commenters suggested that CMS should consider adopting the Toxic Anterior Segment Syndrome (TASS) measure and the Ambulatory Breast Procedure Surgical Site Infection Outcome Measure in the Hospital OQR Program.

Lastly, one commenter suggested that CMS should consider measures that focus on access to surgical care. The commenter suggests that these measures can provide information on whether patients gained timely access to a surgeon when/if they needed surgery.

Response: We thank the commenters for this valuable feedback. We recognize the need to consider measures that enhance quality improvement efforts moving forward. We also continue to explore ways to address measure gaps, reduce burden and increase efficiency through alignment and streamlining our programs. The information provided in response to this request for comment may inform future Hospital OQR Program rulemaking.

b. Request for Comment on Potential Future Adoption and Inclusion of a Hospital-Level, Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA)

As described in section XV.B.7.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42251), we sought comment on priorities for quality measurement in outpatient settings due to changes to the IPO procedure list (82 FR 59385 and 84 FR 61355) and the ASC covered procedures list (CPL) (84 FR 61388 and 85 FR 86146) announced in the CY 2021 OPPS/ASC final rule with comment period.

We also requested comment on the potential future adoption of a respecified version of a patient-reported outcome-based performance measure (PRO–PM) for two such procedures—elective primary total hip arthroplasty (THA) and total knee arthroplasty (TKA), which were removed from the IPO list effective with CY 2020 and CY 2018, respectively. We recently solicited public comment on the potential future inclusion of a Hospital-Level Risk-Standardized Patient-Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (Hospital-Level THA/TKA PRO–PM (NQF #3559)) in the FY 2022 IPPS/LTCH PPS proposed rule for the inpatient hospital setting (86 FR 25589). We refer readers to the FY 2022 IPPS/LTCH PPS final rule for a summary of public comments (86 FR 45408). This measure reports the hospital-level risk-standardized improvement rate (RSIR) in patient-reported outcomes (PROs) following elective primary THA/TKA for Medicare FFS beneficiaries aged 65 years and older. Substantial clinical improvement is measured by achieving a pre-defined improvement in score on one of the two validated joint-specific PRO instruments measuring hip or knee pain and functioning: (1) The Hip dysfunction and Osteoarthritis Outcome Score for Joint Replacement (HOOS, JR)

for completion by THA recipients; and (2) the Knee injury and Osteoarthritis Outcome Score for Joint Replacement (KOOS, JR) for completion by TKA recipients. Improvement is measured from the preoperative assessment (data collected 90 to 0 days before surgery) to the postoperative assessment (data collected 300 to 425 days following surgery). Improvement scores are risk adjusted to account for differences in patient case mix. Potential non-response bias in measure scores due to the voluntary nature of PROs is incorporated in the measure calculation with stabilized inverse probability weighting based on likelihood of response.

Currently, the volume of THA and TKA procedures performed is lower among HOPDs than in the inpatient setting. Given the relatively recent removal of TKA and THA from the IPO list, we expect that the volume of THA and TKA procedures will continue to increase in HOPDs, and that significant numbers of Medicare beneficiaries 65 and older will potentially undergo these procedures in the outpatient setting in future years.

We recognize that potential future adoption and implementation of a respecified version of the THA/TKA PRO–PM in the Hospital OQR Program would require sufficient numbers of procedures for each measured HOPD to ensure a reliable measure score. Additionally, implementing a THA/TKA PRO–PM would require providers to successfully collect pre- and post-operative PRO data for each procedure. Specifically, the inpatient THA/TKA PRO–PM discussed in the FY 2022 IPPS/LTCH PPS proposed rule would require a minimum of 25 cases with completed pre- and post-operative PRO data per hospital to ensure a reliable measure score. For more details on the inpatient THA/TKA PRO–PM, we refer readers to the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25589) and the PROs Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

We will continue to monitor the number of THA and TKA procedures in the outpatient setting and when we believe there is a sufficient number of such procedures performed in these settings to reliably measure a meaningful number of facilities, we may consider expanding the PRO–PM to these settings. We also note that, as finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79764 through 79771), the Hospital OQR Program currently includes a Hospital Visits after Hospital Outpatient Surgery (OP–36) measure using claims data, which provides facilities with important information on patient outcomes for Medicare FFS beneficiaries following surgery at HOPDs and is publicly reported on CMS' *Care Compare* website (*https://www.medicare.gov/care-compare/*). The measure calculates a facility-specific risk-standardized hospital visit ratio within 7 days of hospital outpatient surgery, and has as outcomes of interest unplanned hospital admissions, ED visits, and observation stays thereby providing valuable quality information as these procedures are increasingly conducted as outpatient surgeries.

As described in our Meaningful Measures 2.0 Framework, we aim to promote better collection and integration of patients' voices by developing PRO measures as an additional tool for measuring and improving quality. Given the unique challenges and opportunities for PRO–PMs for THA and TKA procedures in the outpatient setting, we invited public comment on the potential future adoption of a respecified version of PRO measures for elective THA/TKA PRO–PM for the Hospital OQR Program in the CY 2022 OPPS/ASC proposed rule (86 FR 42252). Specifically, we invited public comment on the following:

- Input on the mechanism of PRO data collection and submission, including anticipated barriers and solutions to data collection and submission.
- Usefulness of having an aligned set of PRO–PMs across settings where elective THA/TKA are performed, that is, hospital inpatient setting, hospital outpatient departments, and ASCs for patients, providers, and other stakeholders. Specifically, usefulness and considerations for a hospital that performs both inpatient and outpatient elective THA/TKAs.
- Considerations unique to THA/TKAs performed in the hospital outpatient setting such as the volume of procedures performed or the measure cohort, outcome, or risk adjustment approach.

We received comments on these topics.

Comment: Many commenters supported inclusion of a Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA) measure in the OQR program. As these procedures move from inpatient to outpatient settings, commenters noted it was important to monitor quality outcomes and publicly report results. Additionally, commenters stated that the proposed measure is aligned with patient values, being presented in a manner that is easy to understand. Commenters supported use of the HOOS, JR and the KOOS, JR as they are a widely used and less burdensome subset of the HOOS and KOOS surveys.

Response: We thank the commenters for their support of the potential future adoption of a respecified version of PRO measures for elective THA/TKA PRO–PM for the Hospital OQR Program.

Comment: Several commenters expressed concern regarding data collection burden. Commenters noted the increasing reporting threshold for hospitals voluntary participating in PRO collection in the Comprehensive Care for Joint Replacement (CJR) Model made it difficult for participants to meet the threshold. These commenters encouraged CMS to consider whether a lower rate of response is sufficient for measuring performance and asked that CMS cite specific reasons for the thresholds. A few commenters also raised concerns about patient burden, noting that completing patient-reported outcome surveys is burdensome for patients and may compete with other surveys, such as the OAS CAHPS Survey. Although commenters felt it was beneficial to have multiple options for collecting patient data, one commenter shared that their facility still struggled to collect patient-reported outcomes data despite using different modes that best fit their patient population.

Response: We thank the commenters for their feedback and would like to clarify the reporting thresholds. Through the CJR final rules (80 FR 73273 and 86 FR 23496), we finalized a data submission requirement that strategically increased with each performance year. To be successful, a hospital needed to submit PRO data for 50 percent or 50 eligible procedures in the first year of the Model. By performance year 8, hospitals will need to submit PRO data for 90 percent or 500 eligible procedures to be successful. The incremental increase over time allows hospitals to gradually build up their infrastructure and processes for collecting and storing data. While patient-reported outcome-based performance measures require providers to integrate data collection into clinical workflows, this integration provides opportunity for PROs to inform clinical decision making and benefit patients by

engaging them in discussions about potential outcomes.

We do not expect this PRO–PM to contribute to survey fatigue or to negatively impact other PRO–PMs. The Patient-Reported Outcome Measure (PROM) instruments used to calculate pre- and postoperative scores for this THA/TKA PRO–PM were carefully selected, with extensive stakeholder input, to be low burden for patients. We appreciate the feedback regarding challenges experienced in collecting PRO data; we encourage providers to incorporate data collection approaches that make PRO survey responses available to patients and providers for clinical decision making, for increased patient investment in PRO response.

Comment: A few commenters recommended using the American Joint Replacement Registry (AJRR) for implementation, citing that participation in the AJRR is a requirement for certification as a center of excellence by The Joint Commission. The commenters felt that using the AJRR would allow facilities to pool their resources for lowest costs. They also noted that as the AJRR incorporates Medicare Administrative Data for populating the database, its use would allow for robust risk adjustment, improved research, and independent reporting for participating facilities to normalize quality. Commenters noted that implementation through the AJRR infrastructure would be efficient for providers while minimizing duplication of reporting.

Response: We appreciate commenters' recommendations regarding the AJRR and we will consider the feasibility and appropriateness of using this registry for future implementation if we proceed with development of an HOPD THA/TKA PRO–PM. We agree that leveraging existing resources, such as registries, will help decrease data collection burden.

Comment: A few commenters provided feedback on differences related to having a joint replacement in the inpatient versus the outpatient setting. Specifically, these commenters noted that patients who undergo joint replacement in the inpatient setting tend to be sicker and more complex, which could result in an inappropriate comparison of quality amongst inpatient settings and outpatient settings. Commenters encouraged CMS to take this into consideration when developing a risk-adjustment strategy. Commenters also noted that caregiver support plays an important role in patient outcomes for procedures performed in the outpatient setting. Commenters also noted that it may be challenging for outpatient facilities to meet the minimum reporting threshold. To alleviate cohort concerns, one commenter encouraged CMS to consider implementing this measure with a three-year measurement period and to include all patients ages 18 and older.

Response: We thank commenters for their insights on the differences between inpatient and outpatient settings. With regards to facilities' ability to meet the reporting threshold, we agree that there must be a sufficient number of procedures in these settings to reliably measure a meaningful number of facilities, and we anticipate an increase in the number of THA/TKA procedures performed in the outpatient setting in future years. We will continue to monitor the cohort specification (including age) and the number of procedures captured during the specified measurement period to ensure meaningful measure results can be calculated. We appreciate the commenters' insight on the differences in patient complexity across different care settings, the need for having support at home, and the impact it may have on risk adjustment. We will continue to take this into consideration if we move forward with respecifying the measure for use in the HOPD setting. Any proposals to implement the measure will be announced through future rulemaking.

Comment: A few commenters expressed concern about the risk adjustment strategy for the measure. Commenters noted the risk adjustment model does not include a variable for Medicare dual eligibility status, nor does it take into consideration a patient's spoken language and other social risk factors that could impact survey completion. Commenters noted that PRO–PMs have the potential to provide valuable insights into health care disparities related to lower extremity arthroplasty and encouraged CMS to further stratify the results by additional social risk factors.

Response: We thank the commenters for their concern and would like to clarify the risk adjustment approach. For the development of the hospital measure, we assessed the impact of Medicare dual eligibility, the Agency for Health Research and Quality (AHRQ) socioeconomic status (SES) Index (socioeconomic status), and non-white race. The addition of each of these three social risk variables provided no statistically significant change to the risk model performance, variable coefficients, or the model outcome. As such, these variables were not included in the hospital risk model. These social risk variables were, however, statistically significantly associated with response to PRO surveys—whether patient-reported outcomes were obtained for patients undergoing primary elective THA/TKA—and so were included in the calculation of stabilized inverse probability weights used to account for potential response-bias. These variables, along with other social risk variables that may become available over time, will be reassessed as part of the respecification process if we proceed with developing an HOPD version of the measure as part of CMS' commitment to improving health equity.

Comment: A few commenters provided feedback for developing and implementing patient-reported outcomes. One commenter encouraged CMS to collect multi-stakeholder input throughout the development process. In addition to the KOOS, one commenter recommended the visual analog scale (VAS), and mobility, self-care, usual activities, pain/discomfort, and anxiety/depression (EQ–5D–3L) scales. Lastly, a commenter recommended incentivized, phased implementation as hospitals who were not part of the CJR Model will need to build up infrastructure to support patient-reported outcome measures.

Response: We thank commenters for their feedback. As part of the inpatient hospital measure development process, the measure developer engaged extensively with technical expert panels and patient working groups to obtain feedback on key measure decisions. We thank the commenter for their suggestion to utilize an incentivized, phased implementation approach. We will continue to engage with stakeholders around these issues of additional survey instruments, phased implementation, and infrastructure improvements during any future development or implementation of an outpatient version of this measure, which would also be announced through notice and comment rulemaking.

Comment: A few commenters recommended measuring patient-reported outcomes at the provider-level as the provider has a strong influence on outcomes and a more direct relationship with the patient.

Response: We thank commenters for their recommendation to measure patient-reported outcomes at the clinician-level. Any future proposals to implement such a measure will be announced through notice and comment rulemaking.

Comment: A few commenters did not support the inclusion of a Risk-Standardized Patient Reported Outcomes Measure Following Elective

Primary THA/TKA measure in the OQR program. They cited the burden of collecting patient-reported outcomes data as the reason for not supporting this measure. Another commenter noted that although the procedures were removed from the IPO List, they did not agree that there will be a shift to the HOPD setting. The commenter questioned the validity of patient-reported outcomes data, noting that because a patient did not improve as he/she expected after surgery does not mean the patient did not receive quality care from the hospital. The commenter stated that determining clinical improvement after joint replacement is best determined by the orthopedist who is caring for the patient both pre- and post-procedure.

Response: We reiterate that the PROM instruments that are used to calculate pre- and postoperative scores for this THA/TKA PRO–PM were carefully selected, with extensive stakeholder input, to be low burden for patients and to capture information clinicians deemed essential to understanding response to THA/TKA. We believe that patient-reported outcome-based performance measures provide critical quality information and reflect outcomes that are meaningful to patients. Between January 1, 2018 and September 30, 2020, 264,997 total hip and/or total knee arthroplasties were performed in the outpatient setting. Developing a patient-reported outcomes measure for the Hospital OQR program would ensure these procedures benefit patients undergoing surgery by achieving meaningful improvement. The hospital-level measure was developed with considerable input from stakeholders including patients and orthopedic surgeons. In addition to the patient-reported outcome-based performance measure, CMS publicly reports results related to hospital readmission and complications following these procedures in the inpatient setting and the Hospital Visits after Hospital Outpatient Surgery (OP–36) measure covers these procedures in the outpatient setting.

Comment: One commenter recommended CMS consider measures that evaluate patient and caregiver engagement in decision-making, outcome measures that assess pain and functional status 3, 6, and 9-months post-procedure, and timely public reporting of comparative quality information about surgeons, surgical facilities, rehabilitation services, and home health services.

Response: We appreciate the commenter's recommendations regarding patient engagement, follow-up period, and public reporting. We engaged patients and patient advocates throughout the development of the Hospital-Level THA/TKA PRO–PM (NQF #3559). We will continue to engage patients and patient advocates, as appropriate, if this measure is respecified for the HOPD setting. We agree that timely public reporting of quality information is important for informed patient decision-making.

We appreciate all of the comments submitted in response to this request for comment. These comments may inform future policy development.

c. Request for Comment on Potential Future Efforts To Address Health Equity in the Hospital OQR Program

(1) Introduction and Expansion of the CMS Disparity Methods to Hospital OQR Program Setting

Significant and persistent inequities in health care outcomes exist in the U.S.[365] Belonging to a racial or ethnic minority group; living with a disability; being a member of the lesbian, gay, bisexual, transgender, and queer (LGBTQ+) community; living in a rural area; and being near or below the poverty level, are often associated with worse health outcomes.[366 367 368 369 370 371 372 373] Such disparities in health outcomes are the result of number of factors, including social, economic, and environmental factors, but importantly for CMS programs, although not the sole determinant, negative experiences, poor access, and provision of lower quality health care can contribute to health inequities. For instance, numerous studies have shown that among Medicare beneficiaries, racial and ethnic minority individuals often receive lower quality of care, report lower experiences of care, and experience more frequent hospital readmissions and procedural complications.[374 375 376 377 378 379] Readmission rates for common conditions in the Hospital Readmissions Reduction Program (HRRP) are higher for Black Medicare beneficiaries and higher for Hispanic Medicare beneficiaries with congestive heart failure and acute myocardial infarction.[380 381 382 383 384] Studies have also shown that African Americans are significantly more likely than White Americans to die prematurely from heart disease and stroke.[385] The COVID–19 pandemic has further highlighted

many of these longstanding health inequities with higher rates of infection, hospitalization, and mortality among Black, Latino, and Indigenous and Native American persons relative to White persons.[386] [387] As noted by the CDC, ''long-standing systemic health and social inequities have put many people from racial and ethnic minority groups at increased risk of getting sick and dying from COVID–19.'' [388] One important strategy for addressing these important inequities is by improving data collection to allow for better measurement and reporting on equity across our programs and policies.

We are committed to achieving equity in health care outcomes for our beneficiaries by supporting providers in quality improvement activities to reduce health inequities, enabling them to make more informed decisions, and promoting provider accountability for health care inequities.[389] For the purposes of the RFI in the CY 2022 OPPS/ASC PPS proposed rule (86 FR 42232), we used a definition of equity established in Executive Order 13985, issued on January 25, 2021, as ''the consistent and systematic fair, just, and impartial treatment of all individuals, including individuals who belong to underserved communities that have been denied such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and other persons of color; members of religious minorities; LGBTQ+ persons; persons with disabilities; persons who live in rural areas; and persons otherwise adversely affected by persistent poverty or inequality.'' [390] We noted that this definition was recently established and provides a useful, common definition for equity across different areas of government, although numerous other definitions of equity exist.

Our ongoing commitment to closing the equity gap in CMS quality programs is demonstrated by a portfolio of programs aimed at making information on the quality of health care providers and services, including disparities, more transparent to consumers and providers. The CMS Equity Plan for Improving Quality in Medicare outlines a path to equity which aims to support Quality Improvement Network Quality Improvement Organizations (QIN–QIOs); Federal, state, local, and tribal organizations; providers; researchers; policymakers; beneficiaries and their families; and other stakeholders in activities to achieve health equity.[391]

We refer readers to the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25070) and the FY 2022 IPPS/LTCH PPS final rule (86 FR 42252) which summarizes our existing initiatives aimed at closing the equity gap in outcomes for Medicare beneficiaries, including the CMS Disparity Methods. The methods were finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38405 through 38407) and the FY 2020 IPPS/LTCH PPS final rule (84 FR 42496 through 42500), and results are currently reported confidentially across six quality measures in the HRRP stratified by dual eligibility status. As described in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25070) and the FY 2022 IPPS/LTCH PPS final rule (86 FR 42252), we are considering further expanding the confidential reporting to include measurement of racial and ethnic disparities for one measure in the Hospital IQR Program, the Hospital-Wide All-Cause Unplanned Readmission Measure (NQF #1789).

We have developed two complementary disparity methods to report stratified measure results for outcome measures. The first method (the Within-Hospital Disparity Method) promotes quality improvement by calculating differences in outcome rates among patient groups within a hospital while accounting for their clinical risk factors. This method also allows for a comparison of the magnitude of disparity across hospitals at a given point in time, so hospitals could assess how well they are closing disparity gaps compared to other hospitals. The second methodological approach (the Across-Hospital Disparity Method) is complementary to the first method and assesses hospitals' outcome rates for patients with a given risk factor, across facilities, allowing for a comparison among hospitals on their performance caring for their patients with social risk factors. These methods were first confidentially reported for the inpatient setting in 2019 for the Pneumonia Readmission (NQF #0506) and Pneumonia Mortality (NQF #0468) measures, stratified dual eligibility for Medicare and Medicaid, and confidential reporting for hospitals has since expanded to include additional measures. For additional information on the two disparity methods, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38405 through 38407) and the 2020 Disparity Methods Updates and Specifications Report.[392] As discussed in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41599) and the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25070), the two disparity methods do not place any additional collection or reporting burden on hospitals because social risk factor data are readily available in claims data.

We received high-level comments on CMS' larger aforementioned plans to address health equity in quality reporting programs.

Comment: Many comments provided general support for efforts to improve equity through quality improvement programs and payment policies but not specific to the measurement considerations in the OQR and ASCQR RFIs. Commenters had varied recommendations for advancing equity through measurement and payment programs. Comments included statements that while there are numerous social risk factors, it is critical to prioritize equity as an emergent issue for Black, Hispanic/Latino, Indigenous and Asian communities and noted that systemic racism, not race, is a social risk factor.

Commenters recommended expanding the portfolio of programs and resources to support the related work of health care providers including data analyses and quality improvement activities to bridge hospital-level efforts with post-acute and community-based programs and models to close health equity gaps. A commenter noted that there are inadequate healthcare-based solutions for addressing social determinants of health. Another stated that working to solve the problems requires federal leadership, and a major aspect of that leadership needs to be addressing the inequities in resources these hospitals experience that have helped lead to the health care disparities in the communities in question. One commenter recommended that CMS build programs for addressing inequities from existing efforts from the public and private sector.

[392] *https://qualitynet.cms.gov/inpatient/measures/disparity-methods/methodology.*

A number of commenters recommended that CMS engage in a robust stakeholder engagement process to discuss the input that was received.

Finally, on the broader use of measures to address health equity, one commenter stated CMS should not use equity health care quality metrics to rank hospitals on health equity because it could create competition rather than collaboration, while another stated that it would be helpful to see the disparities reported at the national level.

Response: We appreciate the feedback provided by the commenters regarding additional approaches to improving health equity outside of the specific topics covered in our OQR and ASCQR health equity RFIs. We will take commenters' feedback into consideration in future policy development.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42252), we sought comment on expanding our efforts to provide results of the disparity methods to promote health equity and improve healthcare quality. Specifically, we sought comment on the idea of stratifying the performance results in the hospital outpatient setting. We have identified six priority measures included in the Hospital OQR Program as candidate measures for disparities reporting stratified by dual eligibility:

- MRI Lumbar Spine for Low Back Pain (OP–8);
- Abdomen CT—Use of Contract Material (OP–10);
- Cardiac Imaging for Preoperative Risk Assessment for Non-Cardiac Low Risk Surgery (OP–13);
- Facility 7-Day Risk-Standardized Hospital Visit Rate after Outpatient Colonoscopy (OP–32);
- Admissions and ED Visits for Patients Receiving Outpatient Chemotherapy (OP–35); and
- Hospital Visits after Hospital Outpatient Surgery (OP–36).

To identify these measures, we considered evidence of existing disparities, procedure volume, and statistical reliability. For more information about these measures, we refer readers to the Hospital Outpatient Quality Reporting Specifications Manual available on the QualityNet website.[393] We sought public comment on potential future confidential reporting of the six aforementioned measures, as well as other potential measures described in section XV.B.4. of the CY 2022 OPPS/ASC proposed rule (86 FR 42238) and of this final rule with comment period, stratified by dual eligibility status, if technically feasible, adequately representative, and statistically reliable.

The Within- and Across-Facility Disparity Methods would be applied to the selected measures. The methods offer two different, but complementary metrics of a facility's disparity. The Within-Facility method reports a difference in performance for patient populations at a specific facility (where a score of zero indicates equal outcomes), while the Across-Facility method reports a risk-standardized rate for the measure for only the target population, which shows facilities how they compare to the national average.

(2) Additional Social Risk Factors

We are committed to advancing health equity by improving data collection to better measure and analyze disparities across programs and policies.[394] As we described earlier, we have been considering, among other things, expanding our efforts to stratify data by additional social risk factors and demographic variables, optimizing the ease-of-use of the results, enhancing public transparency of equity results, and building towards provider accountability for health equity. Following potential confidential reporting using dual eligibility as an indicator of social risk, we are exploring the possibility of further expanding stratified reporting to include race and ethnicity.

We refer readers to the ''Closing the Health Equity Gap in CMS Hospital Quality Programs'' section of the FY 2022 IPPS/LTCH PPS proposed rule which summarizes the existing challenges in accurately determining race and ethnicity in our administrative data, and the need for using advanced statistical methods for enhancing the accuracy of race and ethnicity disparity estimates (86 FR 25554). We also refer readers to the FY 2022 IPPS/LTCH PPS final rule for a summary of public comments (86 FR 45349).

As we stated in the ''Closing the Health Equity Gap in CMS Hospital Quality Programs'' section of the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25554), because development of sustainable and consistent programs to collect demographic information related to health disparities, such as race and ethnicity, can be considerable undertakings, we recognize that another method to identify more accurate race and ethnicity disparities is needed in the short term. In working with our contractors, two algorithms have been developed to indirectly estimate the race and ethnicity of Medicare beneficiaries (as described further in the next section). We believe that using indirect estimation can help to overcome some of the current limitations of demographic information and enable timelier reporting of equity results until longer term collaborations to improve demographic data quality across the health care sector materialize. The use of indirectly estimated race and ethnicity for conducting stratified reporting does not place any additional collection or reporting burdens on facilities as these data are derived using existing administrative and census-linked data.

Indirect estimation relies on a statistical imputation method for inferring a missing variable or improving an imperfect administrative variable using a related set of information that is more readily available.[395] Indirectly estimated data are most commonly used at the population level (such as the hospital or health plan-level) where aggregated results form a more accurate description of the population than existing, imperfect data sets. For missing race and ethnicity information, these methods use a combination of other data sources which estimate self-identified race and ethnicity, such as language preference, information about race and ethnicity in our administrative records, first and last names matched to validated lists of names correlated to specific national origin groups, and the racial and ethnic composition of the surrounding neighborhood. Indirect estimation has been used in other settings to support population-based equity measurement when self-identified data are not available.[396]

As described previously, we have previously supported the development of two such methods of indirect estimation of race and ethnicity of Medicare beneficiaries. One indirect estimation approach developed by our contractor uses Medicare administrative data, first name and surname matching, derived from the U.S. Census and other sources, with beneficiary language preference, state of residence, and the

source of the race and ethnicity code in Medicare administrative data to reclassify some beneficiaries as Hispanic or Asian/Pacific Islander (API).[397] In recent years, we have also worked with another contractor to develop a new approach, the Medicare Bayesian Improved Surname Geocoding (MBISG), which combines Medicare administrative data, first and surname matching, geocoded residential address linked to the 2010 U.S. Census data, applying both Bayesian updating and multinomial logistic regression to estimate the probability of belonging to each of the six racial/ethnic groups.[398]

The MBISG model is currently used to conduct the national, contract-level, stratified reporting of Medicare Part C & D performance data for Medicare Advantage Plans by race and ethnicity.[399] Validation testing reveals concordances between 0.88–0.95 between indirectly estimated and self-reported race and ethnicity among those who identify as White, Black, Hispanic, and API for the MBISG version 2.0 and concordances with self-reported race and ethnicity of 0.96–0.99 for these same groups for MBISG version 2.1.[400] [401] [402] The algorithms under consideration are considerably less accurate for individuals who self-identify as American Indian/Alaskan Native or multiracial.[403] Indirect estimation is a statistically reliable approach for calculating aggregate results for groups of individuals (such as the facility-level) and is not intended, nor being considered, as an approach for predicting the race and ethnicity of individuals.

Despite the high degree of accuracy of the indirect estimation algorithms under consideration there remains the small risk of introducing measurement bias. For example, if the indirect estimation is not as accurate in correctly estimating race and ethnicity in certain geographies or populations it could lead to some bias in the method results. Such bias might result in slight overestimation or underestimation of the quality of care received by a given group. We believe this risk of bias is considerably less than would be expected if stratified reporting were conducted using the race and ethnicity currently contained in our administrative data. Indirect estimation of race and ethnicity is envisioned as an intermediate step, filling the pressing need for more accurate demographic information for the purposes of exploring inequities in service delivery, while allowing newer approaches, as described in the next section, for improving demographic data collection to progress. We are interested in learning more about, and soliciting comments about, the potential benefits and challenges associated with measuring facility equity using indirect estimation to enhance existing administrative data quality for race and ethnicity until self-reported information is sufficiently available.

(a) Improving Demographic Data Collection

Stratified facility-level reporting using indirectly estimated race and ethnicity would represent an important advance in our ability to provide accurate equity reports to facilities. However, self-reported race and ethnicity data remain the gold standard for classifying an individual according to race or ethnicity. The CMS Quality Strategy outlines our commitment to strengthening infrastructure and data systems by ensuring that standardized demographic information is collected to identify disparities in health care delivery outcomes.[404] Collection and sharing of a standardized set of social, psychological, and behavioral data by hospitals, including race and ethnicity, using electronic data definitions which permit nationwide, interoperable health information exchange, can significantly enhance the accuracy and robustness of our equity reporting.[405] This could potentially include expansion of stratified reporting to additional social risk factors, such as language preference and disability status, where accuracy of administrative data is currently limited. We are mindful that additional resources, including data collection and staff training may be necessary to ensure that conditions are created whereby all patients are comfortable answering demographic questions, and that individual preferences for non-response are maintained.

We note that facilities participating in the Medicare Promoting Interoperability Program must use CEHRT that has been certified to the 2015 Edition of health IT certification criteria as defined at 45 CFR 170.102. As noted earlier, the certification criterion for Demographics under the 2015 Edition (45 CFR 170.315(a)(5)) supports collection of data using both the OMB standards for collecting data on race and ethnicity as well as the more granular ''Race & Ethnicity—CDC'' standard. In the 2020 ONC 21st Century Cures Act final rule, ONC also adopted a new framework for the core data set which certified health IT products must exchange, called the USCDI (85 FR 25669). The USCDI incorporates the demographic data and associated code sets finalized for the 2015 Edition certification criteria.

As noted previously, ONC also finalized a certification criterion in the 2015 Edition which supports a certified health IT product's ability to collect social, psychological, and behavioral data (45 FR 170.315(a)(15)). However, this functionality is not included as part of the CEHRT required by the Medicare Promoting Interoperability Program. While the technical functionality exists to achieve the gold standard of data collection, we understand challenges and barriers exist in using the technologies with these capabilities.

We solicited comment on current data collection practices by facilities to

[405] The Office of the National Coordinator for Health Information Technology. United State Core Data for Interoperability Draft Version 2. 2021. Available at: *https://www.healthit.gov/isa/sites/isa/files/2021-01/Draft-USCDI-Version-2-January-2021-Final.pdf*.

capture demographic data elements (such as race, ethnicity, sex, sexual orientation and gender identity (SOGI), primary language, and disability status). Further, we are interested in potential challenges facing facility collection, on the day of service, of a minimum set of demographic data elements in alignment with national data collection standards (such as the standards finalized by the Affordable Care Act) [406] and standards for interoperable exchange (such as the USCDI incorporated into certified health IT products as part of the 2015 Edition of health IT certification criteria).[407] Advancing data interoperability through collection of a minimum set of demographic data collection, and incorporation into quality measure specifications, has the potential for improving the robustness of the disparity method results, potentially permitting reporting using more accurate, self-reported information, such as race and ethnicity, and expanding reporting to additional dimensions of equity, including stratified reporting by disability status.

(b) Solicitation of Public Comments

In the CY 2022 OPPS/ASC proposed rule (86 FR 42252), we sought comment on the possibility of expanding our current disparities methods to include reporting by race and ethnicity using indirect estimation. We also sought comment on the possibility of facility collection of standardized demographic information for the purposes of potential future quality reporting and measure stratification to permit more robust equity measurement. Additionally, we sought comment on the design of a Facility Equity Score for presenting combined results across multiple social risk factors and measures, including race/ethnicity and disability. Any data pertaining to these areas that are recommended for collection for measure reporting for a CMS program and potential public disclosure on *Care Compare* or successor website would be addressed through a separate and future notice-and-comment rulemaking. We plan to continue working with the Office of the Assistant Secretary for Planning and Evaluation, facilities, the public, and other key stakeholders on this important issue to identify policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences.

Specifically, we invited public comment on the following:

- The potential future application to the Hospital OQR Program measures of the two disparity methods currently used to confidentially report stratified measures in HRRP.
- The possibility of reporting stratified results confidentially in Facility-Specific Reports (FSRs) using dual eligibility as a proxy for social risk.
- The possibility of reporting stratified results using dual eligibility as the proxy for social risk publicly on *Care Compare* in future years.
- The potential future application of an algorithm to indirectly estimate race and ethnicity to permit stratification of measures (in addition to dual-eligibility) for facility-level disparity reporting until more accurate forms of self-identified demographic information are available.
- The possibility of facility collection, on the day of service, of a minimum set of demographic data using standardized and interoperable electronic health record standards.

We received comments on these program-specific topics to address health equity.

Comment: Many commenters expressed support for the potential future application of the two disparity methods to the Hospital OQR Program, noting appreciation for CMS' recognition of the importance of closing the health equity gap. Commenters noted the importance of addressing health equity gaps in the outpatient settings and of providing hospitals with detailed data on their patient's dual eligibility status to enable tracking as procedures shift from acute care to outpatient. A few commenters expressed support for confidential reporting of stratified results in facility specific reports as it would result in actionable data for quality improvement. Several commenters stressed the importance of continued stakeholder engagement in projects designed to address structural and socioeconomic barriers to health, particularly to help policymakers understanding current practice trends and data collection challenges. Other commenters also recommended engagement through advisory groups and subject matter experts to test and pilot the application of the disparity methods to the Hospital OQR program to thoughtfully scale initiatives and promote nationwide standardization. One commenter requested CMS communicate their goals for future application of the disparity methods and inquired whether the goals are for accountability or resource assessment.

Some commenters expressed concern with any potential administrative burden placed onto providers and requested time to implement data collection efforts. A few commenters noted that many contributors to health inequities and related disparities are outside of the control of the health care system. Two commenters urged CMS to invest resources for data collection and in software upgrading.

While several commenters supported the proposed six measures as high-priority for stratified reporting, several commenters recommended thoughtful consideration of measurement gaps in identifying measures to be stratified, in addition to quality outcome benchmarks being developed prior to stratifying overused measure to avoid unintended consequences. Several commenters also recommended additional measure types for future stratification from additional data sources, such as experience surveys, or measurement domains, such as resource utilization/cost, access to surgical care, time of diagnosis or those that consider referrals to specialty care from a primary care setting. One commenter requested procedure-specific disparity reporting related to endoscopy, chemotherapy, or outpatient surgeries. One commenter recommended considering reinstating some quality measures where performance is felt to already be high, and to stratify these by social risk factors to assess additional room for improvement.

Response: We appreciate the feedback provided by the commenters regarding the potential future application of the two disparity methods in the Hospital OQR Program. We continue to prioritize minimizing provider burdened in efforts to improve equity, and to ensure stakeholder involvement in all initiatives. Confidential reporting of the disparity methods for the proposed six measures would use existing administrative records to calculate facility-level results, and as such, the provider burden would be minimal. In the upcoming year, we intend to begin confidential reporting for a number of the aforementioned measures stratified by dual eligibility status, if technically feasible, adequately representative, and statistically reliable.

Comment: Many commenters were generally supportive of our health equity initiatives and provided helpful recommendations on improving disparity measurement. Two commenters recommended structural and process measures to drive health equity improvement. One commenter recommended stratification methodologies compare safety net

[406] *https://minorityhealth.hhs.gov/assets/pdf/checked/1/Fact_Sheet_Section_4302.pdf.*

[407] *https://www.healthit.gov/sites/default/files/2020-08/2015EdCures_Update_CCG_USCDI.pdf.*

systems solely with other safety net systems to allow for a fairer comparison between hospitals treating similar patients and that are subject to similar levels of available resources. One commenter noted that current hospital-specific reports are based on outdated data and suggested data should be timely.

One commenter recommended leveraging technology, such as machine learning and artificial intelligence (AI), to analyze quality-of-care and outcomes using both patient demographics and clinical data to identify and address disparities. One commenter, however, disagreed noting that bias can manifest in machine learning and artificial learning if the AI algorithm is trained with incomplete data, and recommended a framework to guide the development and validation of algorithms to reduce bias. One commenter provided examples of how their organization has developed a social determinants of health framework to facilitate implementation of robust interventions through multi-stakeholder engagement. Another commenter discussed a local program that leverages data-driven approaches to confront and overcome health disparities.

Response: We appreciate the feedback provided by the commenters regarding future potential approaches to investigate disparities in our quality programs, and analyze outcomes data, and agree that adequate attention must be paid to limit the potential for unintended consequences. We will take commenters' feedback into consideration in future policy development.

Comment: Several commenters supported the expansion of the CMS Disparity Methods beyond dual eligibility for the potential future application of an algorithm to indirectly estimate race and ethnicity in the Hospital OQR Program. A few commenters requested that stratification by race and ethnicity begin with confidential reporting, as it would allow healthcare organizations an opportunity to improve planning for needed services; understand patterns in access and outcomes for different patients; and engage in quality improvement for new policies to reduce disparities. Two commenters preferred any stratified data be publicly available to allow stakeholders to assess the diverse needs of different patient populations.

While some commenters acknowledged that it is important to understand disparity by race and ethnicity, several commenters noted concern with the validity of using race and ethnicity data identified through indirect estimation, adding that it could lead to misleading results and introduce measurement bias. Three commenters noted concern with the use of first and last names to impute data as the results may be unreliable due to the various naming conventions commonly, noting that some beneficiaries, women or children in particular, may take the name of their husband or father, or an adopted individual may take their adoptive family's surname. Another commenter raised concerns with the use of the proposed indirect estimation MBISG approach, sharing an opinion that this method may raise questions about informed consent and that if the approach were to measure smaller racial/ethnic groups it may lose accuracy. Another commenter suggested that the existing limitations in using race-estimation algorithms outweigh the potential benefit of their use. Another commenter noted concern with the application of the indirect estimation of race and ethnicity data to MIPS measures due to the different levels of measurement, adding that imputed data can only be attributed to groups, while measures are often at the patient- or encounter-level. Several commenters did not support the confidential reporting of measure results by race and ethnicity as there was concern with the accuracy and actionability of the data. Three commenters did not support the use of indirect estimation of ethnicity and race in public reporting, however two commenters supported use in confidential reporting.

A few commenters recommended that CMS pursue standardized collection of race and ethnicity since there variation exists in the race and ethnicity categories collected by institutions and suggested advisory stakeholder engagement to inform a unified approach. Some commenters recommended that standards include more granular information about race and ethnicity. Several commenters requested CMS indicate short-term and long-term objectives for stratification by race and ethnicity to reduce inequities through heath care payment and delivery. One commenter suggested that the use of place-based risk factors may be a better approach. Another stated it was important that hospitals have the opportunity to address self-identified inaccuracies and a process to appeal data and outcomes.

Response: We appreciate the feedback provided by the commenters regarding stratification by race and ethnicity, the use of a model to estimate patient race and ethnicity and expanded disparity stratification. We will take commenters' feedback into consideration in future policy development.

We are sensitive to the concerns raised by stakeholders about indirect estimation. As referenced in the CY 2022 OPPS/ASC proposed rule (86 FR 42018) and summarized in the FY 2022 IPPS final rule (86 FR 25070), the Medicare program does not directly collect information from beneficiaries on race and ethnicity, instead relying on data collected by the Social Security Administration. A number of barriers contribute to this information being insufficiently accurate to examine hospital-level disparities. For example, prior to 1980, only three categories (White, Black, and Other) were available for individuals to self-report race, and respondents were not able to indicate other identities such as Asian, American Indian/Alaska Native, Hispanic, or Pacific Islander. As a result of these constrained response options, many current beneficiaries may not have had the opportunity to accurately self-report their race and ethnicity. Although we have undertaken significant efforts to update incorrect race and ethnicity information many inaccuracies remain limiting our ability to measure disparities.

In recent years we have sponsored the development of two indirect estimation algorithms, both intended to correct and improve administrative information on race and ethnicity. Indirect estimation methods such as these can generally be used in two different ways: (a) To estimate race/ethnicity in the absence of self-reported data; or (b) to improve administrative data in which beneficiaries provided a self-report of race/ethnicity but were not permitted a full set of response options (post-1980). While there is evidence supporting the validity of both approaches, accuracy and performance is particularly high in situation (b), where indirect estimation allows the administrative variables to better match the responses people would give when permitted a full set of response options. The approach for indirect estimation we intend to apply is situation (b), which uses an algorithm to augment existing data to allow a constrained administrative self-reported variable to better match what Medicare beneficiaries themselves may have chosen when given a comprehensive set of response options on race and ethnicity.

The Medicare Bayesian Improved Surname Geocoding Version 2.1 (MBISG 2.1) uses the original beneficiary self-report, but uses additional information supplied by Medicare beneficiaries and information about neighborhood composition, to make this variable

better match what Medicare beneficiaries themselves self-report when given a full set of response options. With respect to Asian and Pacific Islander, Black, Hispanic, and White Medicare beneficiaries, the improved version of the administrative variable has 96–99 percent concordance with what Medicare beneficiaries themselves report when allowed a full set of response options, matching much better than the original self-reported variable in which most Medicare beneficiaries were not allowed to indicate Asian, American Indian/Alaska Native, Hispanic, or Pacific Islander identities. The MBISG 2.1 also offers distinct advantages because it generates probabilities of identification in each racial and ethnic group for each beneficiary, rather than assigning a single identification.

The MBISG 2.1 incorporates multiple sources of information to develop racial and ethnic probabilities. In addition to the information on race and ethnicity which that person reported to the SSA, the model also considers the person's first and last name, the composition of the census block group where they live, and other demographic information that Medicare beneficiary shared. Through such a holistic approach, the MBISG 2.1 can make accurate comparisons between groups of Medicare beneficiaries regarding the quality of care received, including people whose surnames are common among several racial and ethnic groups, and people who changed their surnames upon marriage. The MBISG 2.1 is also designed to consider those who identify as Multiracial and allows measurement in Census categories that distinguish those who chose single or multiple racial identity, as well as considering endorsement of Hispanic ethnicity separately. Notably, we only intend to use the MBISG 2.1 to make inferences about aggregated groups at the hospital level, and do not intend to use it to make inferences about any single individual, validation studies indicate that these aggregate estimates further improve upon the higher predictive accuracy of the model.

We believe that use of statistical imputation models, such as the MBISG 2.1 will permit us to provide more accurate, less biased information on disparities in hospital outcomes when reported confidentially. We plan to report results confidentially to facilities in Spring 2022 where results are technically feasible, meaningful, and statistically reliable. Any potential future proposal to publicly display the disparity results on *Care Compare* would be made through future rulemaking. We are sensitive to the concerns raised by stakeholders and will continue to evaluate the validity of the readmission measures when stratified by indirect estimation during the confidential reporting period.

We appreciate the feedback provided by the commenters regarding measuring health equity in our hospital outpatient and ambulatory surgical center quality measurement programs. We will continue to take all concerns, comments, and suggestions into account in our future policies.

Comment: Several commenters supported the facility collection of patient demographics. Many commenters recommended healthcare workforce education regarding data collection to ensure accurate and culturally sensitive collection of patients' demographic information. Other commenters urged education to beneficiaries on the need to share sensitive and personal information and the use of such data. Three commenters recommended use of EHR capabilities to facilitate data collection and routinely collect race, ethnicity, and language preference data, noting that the use of these capabilities can reduce administrative burden on healthcare facilities. One commenter recommended CMS engage nurses to identify and capture demographics for data collection to address health equity. A few commenters encouraged alternative collection methods such as updating the common working file (CWF) or utilizing HIPAA transaction sets to capture race and ethnicity. Other commenters recommended development of additional billing codes for social needs and evaluation of existing social determinants of health (SDOH) billing codes and International Classification of Diseases, Tenth Revision (ICD–10) Z codes, which identify non-medical factors that may influence a patients' health status. Further, commenters recommended using screening tools such as the Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences (PRAPARE) tool or the Accountable Health Communities Health-Related Social Needs Screening Tool developed by CMS.

Commenters urged CMS to expand data collection to include factors such as sexual orientation, gender identity, language preference, tribal membership, disability status, socioeconomic status (SES), education, social support, food security, transportation access, and housing stability to provide a more comprehensive assessment of health equity. A few commenters included the need for information on language spoken, health literacy, incarceration status and veteran status. Other commenters expressed support for expanding stratification to additional social risk factors and demographic variables, such as primary language, geographic location, socioeconomic status, gender identity, sexual orientation, age, and ability status. Additionally, a few commenters recommended CMS require data collection methods that rely only on self-reported data. Another commenter asserted that emerging evidence suggests that healthcare disparities may be rooted in lived experiences and recommended CMS include questions specific to experiences of certain racial or ethnic groups within the healthcare system, such as mistrust of the healthcare system and providers, experiences of microaggression and perceived discrimination or injustices. Additionally, a few commenters encouraged improvement of hospital data collection by mandating a minimum data collection threshold. Similarly, one suggested limiting the number of social risk factors collected to ensure consistent reliable data prior to expanding the number of factors. Others recommended CMS set reasonable goals and timelines for the collection of self-reported demographic data. Finally, a commenter suggested that CMS work with state Medicaid agencies to improve the consistency of data collection at the time of Medicaid enrollment and another noted unique challenges to collecting data from certain sub-populations of beneficiaries such as homeless patients.

Two commenters did not support an expanded data collection, noting concern with the burden and costs that would impact hospitals, or providers in QPP. Three commenters urged for alternative methods of capturing patient demographics via facility collection to reduce administrative burden on providers and encouraged leveraging of data in certified electronic medical records, adding that physicians should not have to invest resources for any modifications. A few commenters encouraged investment in interoperable and secure data infrastructure. One commenter suggested rather than health systems, payers such as CMS take the lead in collecting demographic data as a more efficient approach.

Several commenters urged CMS to develop information technology standards and consistent guidance across programs for the capture, use, and exchange of relevant data such as the use of electronic health records and FHIR standards. Three commenters recommended CMS adopt the Office of the National Coordinator for Health Information Technology's (ONC) 2015

Edition Health Information Technology Certification standards across all CMS quality programs including the Promoting Interoperability Program, to leverage existing infrastructures for data collection.

While supportive of collecting and utilizing demographic and SDOH data to measure and improve health equity, several commenters expressed concerns about protecting patient privacy. One of these commenters recommended CMS increase beneficiary education on the sharing of their sensitive health information with their providers. Another of these commenters asked that CMS address privacy considerations related to privacy, confidentiality and alignment with other federal standards related to data sharing and interoperability.

Response: We appreciate the feedback provided by the commenters regarding expanded demographic and social risk factor data collection. We will take commenters' feedback into consideration in future policy development.

Comment: We received mixed feedback from commenters about a potential facility equity score. A few commenters supported a facility equity score, noting a composite score is helpful to gauge disparities in large populations. One commenter noted that the composite equity score, however, depends on the comprehensiveness of the data and requires a broad spectrum of factors to avoid inaccuracies and undermining of the scoring methodology. One commenter recommended a patient-level equity score to identify patient populations that require additional services such as nutritional counseling, access to healthy foods, or transportation. Additional commenters suggested using tools such as the Health Equity Report Card or developing an SDOH report based on U.S Department of Health and Human Services (HHS') Health People 2030 framework. One commenter also suggested CMS consider the recommendations that identified by the American Hospital Association for improving care for vulnerable communities, such as including screening patients for social needs, offering navigation services to help patients access community services, and partnering with community stakeholders to align with local needs.

A majority of commenters did not believe a facility equity score would provide actionable information to the patients or hospitals and encouraged other mechanisms for health equity advancement be developed, such as further stratification of quality measures by race, ethnicity, and dual eligibility. Several commenters noted concern that a facility equity score may inadvertently obscure lower performances on quality measures or impact reimbursements of facilities with greater proportions of vulnerable populations. Other commenters were concerned with the accuracy of facility scores that use data which may not be uniformly collected across hospitals. One commenter requested local customization of the hospital health equity score that would allow an accurate reflection of hospital's commitment to its community, and a hospital-specific methodology, versus the application of the Medicare Advantage hospital health equity score.

Response: We appreciate the feedback provided by the commenters regarding the potential creation of a facility equity score. We will take commenters' feedback into consideration in future policy development.

Comment: Commenters also provided broad feedback to us around other approaches, beyond quality measurement, that we may undertake to ensure more equitable care for Medicare beneficiaries in the hospital outpatient setting. One commenter suggested CMS consider developing and implementing measures that are stratified by access to healthcare, access to primary care, and quality of care. Three commenters noted that many safety net systems operate with limited resources that can impact patient access to care, forcing patients to wait months for screening and prevention or advanced imaging, adding that to improve the care of this population both acute and primary care must improve care coordination and CMS must provide necessary resources.

Response: We appreciate the feedback provided by the commenters regarding equitable access to care in the outpatient setting. We will take commenters' feedback into consideration in future policy development.

8. Maintenance of Technical Specifications for Quality Measures

CMS maintains technical specifications for previously adopted Hospital OQR Program measures. These specifications are updated as we modify the Hospital OQR Program measure set. The manuals that contain specifications for the previously adopted measures can be found on the QualityNet website at: *https://qualitynet.cms.gov/outpatient/specifications-manuals*. We refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 59104 through 59105), where we changed the frequency of the Hospital OQR Program Specifications Manual release beginning with CY 2019 and subsequent years, such that we will release a manual once every 12 months and release addenda as necessary. We did not propose any changes to these policies in the CY 2022 OPPS/ASC proposed rule.

In section XV.B.4. of the CY 2022 OPPS/ASC proposed rule (86 FR 42244), we proposed the adoption of eCQMs into the Hospital OQR Program measure set beginning with the CY 2023 reporting period. Therefore, we also proposed the manner to update the technical specifications for eCQMs. We proposed that the technical specifications for eCQMs used in the Hospital OQR Program would be contained in the CMS Annual Update for the Hospital Quality Reporting Programs (Annual Update). The Annual Update and implementation guidance documents are available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/*. For eCQMs, we would generally update the measure specifications on an annual basis through the Annual Update which includes code updates, logic corrections, alignment with current clinical guidelines, and additional guidance for hospitals and EHR vendors to use in order to collect and submit data on eCQMs from hospital EHRs.

Hospitals would be required to register and submit quality data through the Hospital Quality Reporting (HQR) System (formerly referred to as the QualityNet Secure Portal). The HQR System is safeguarded in accordance with the HIPAA Privacy and Security Rules to protect submitted patient information. See 45 CFR parts 160 and 164, subparts A, C, and E, for more information.

We received comments on these topics.

Comment: A few commenters supported our proposal, expressing agreement with the alignment of the Hospital OQR Program's eCQM technical specification updates with other quality reporting programs, specifically, the Hospital IQR Program.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

We also refer readers to section XIV. of the CY 2022 OPPS/ASC proposed rule (86 FR 42232) where we requested information on potential actions and priority areas that would enable the continued transformation of our quality measurement enterprise toward greater digital capture of data and use of the FHIR standard (as described in that section).

9. Public Display of Quality Measures

a. Background

We refer readers to the CY 2009, CY 2014, and CY 2017 OPPS/ASC final rules with comment period (73 FR 68777 through 68779, 78 FR 75092, and 81 FR 79791, respectively) for our previously finalized policies regarding public display of quality measures. We did not propose any changes to these policies in the proposed rule.

b. Overall Hospital Quality Star Rating

In the CY 2021 OPPS/ASC final rule (85 FR 86182), we finalized a methodology to calculate the Overall Hospital Quality Star Rating (Overall Star Rating). We refer readers to section XVI. (''Overall Hospital Quality Star Rating Methodology for Public Release in CY 2021 and Subsequent Years'') of the CY 2021 OPPS/ASC final rule with comment period for details. We did not propose any changes to this policy in the proposed rule.

C. Administrative Requirements

1. QualityNet Account and Security Administrator/Security Official

a. Background

The previously finalized QualityNet security administrator requirements, including setting up a QualityNet account and the associated timelines, are described in the CY 2014 OPPS/ASC final rule with comment period (78 FR 75108 through 75109). We codified these procedural requirements at § 419.46(b) in that final rule with comment period. In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86182), we finalized to use the term ''security official'' instead of ''security administrator'' to denote the exercise of authority invested in the role. The term ''security official'' would refer to ''the individual(s)'' who have responsibilities for security and account management requirements for a hospital's QualityNet account. This update in terminology did not change the individual's responsibilities or add burden. We did not propose any changes to this policy in the CY 2022 OPPS/ASC proposed rule.

b. Active Security Official Account and Maintenance Requirements for Data Submission

The previously finalized QualityNet security administrator (now referred to as a security official) requirements, including those for setting up a QualityNet account and the associated timelines, are described in the CY 2014 OPPS/ASC final rule with comment period (78 FR 75108 through 75109).

In the CY 2011 OPPS/ASC final rule with comment period (75 FR 72099) and the CY 2012 OPPS/ASC final rule with comment period (76 FR 74479), we indicated that hospitals would be required to maintain a current QualityNet security administrator (now referred to as a security official) for as long as the hospital participates in the Program. In the CY 2022 OPPS/ASC proposed rule (86 FR 42257), we clarified that failing to maintain an active QualityNet security official once a hospital has successfully registered to participate in the Hospital OQR Program will not result in a finding that the hospital did not successfully participate in the Hospital OQR Program. Again, we refer readers to requirements at § 419.46(b).

2. Requirements Regarding Participation Status

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75108 through 75109), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70519), and the CY 2019 OPPS/ASC final rule with comment period (83 FR 59103 through 59104) for requirements for participation and withdrawal from the Hospital OQR Program. We codified these requirements at § 419.46(b) and (c). We did not propose any changes to these policies in the proposed rule.

D. Form, Manner, and Timing of Data Submitted for the Hospital OQR Program

1. Hospital OQR Program Annual Submission Deadlines

We refer readers to the CYs 2014, 2016, and 2018 OPPS/ASC final rules with comment period (78 FR 75110 through 75111; 80 FR 70519 through 70520; and 82 FR 59439, respectively) where we finalized our policies for clinical data submission deadlines. We codified these submission requirements at § 419.46(d). The clinical data submission deadlines for the CY 2024 payment determination are illustrated in Table 67.

TABLE 67: CY 2024 Payment Determination*

Patient Encounter Quarter	Clinical Data Submission Deadline
Q2 2022 (April 1 - June 30)	11/1/2022
Q3 2022 (July 1 – September 30)	2/1/2023
Q4 2022 (October 1 - December 31)	5/1/2023
Q1 2023 (January 1 - March 31)	8/1/2023

* All deadlines occurring on a Saturday, Sunday, or legal holiday, or on any other day all or part of which is declared to be a nonwork day for Federal employees by statute or Executive order would be extended to the first day thereafter.

We did not propose any changes to these policies in the proposed rule.

2. Requirements for Chart-Abstracted Measures Where Patient-Level Data Are Submitted Directly to CMS for the CY 2024 Payment Determination and Subsequent Years

We refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68481 through 68484) for a discussion of the form, manner, and timing for data submission requirements of chart-abstracted measures for the CY 2014 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

The following previously finalized Hospital OQR Program chart-abstracted measures will require patient-level data to be submitted for the CY 2023 payment determination and subsequent years:

- OP–2: Median Time from ED Arrival to ED Departure for Discharged ED Patients (NQF #0496); [408]

[408] In the CY 2022 OPPS/ASC proposed rule (86 FR 42237) we proposed to remove OP–2 beginning

- OP–3: Median Time from ED Arrival to ED Departure for Discharged ED Patients (NQF #0496); [409]
- OP–18: Median Time from ED Arrival to ED Departure for Discharged ED Patients (NQF #0496); and
- OP–23: Head CT Scan Results for Acute Ischemic Stroke or Hemorrhagic Stroke Patients who Received Head CT Scan Interpretation Within 45 Minutes of ED Arrival (NQF #0661).

3. Claims-Based Measure Data Requirements for the CY 2024 Payment Determination and Subsequent Years

Currently, in addition to the proposed Breast Cancer Screening Recall Rates measure (OP–39), the following previously finalized Hospital OQR Program claims-based measures are required for the CY 2023 payment determination and subsequent years:

- OP–8: MRI Lumbar Spine for Low Back Pain (NQF #0514);
- OP–10: Abdomen CT—Use of Contrast Material;
- OP–13: Cardiac Imaging for Preoperative Risk Assessment for Non-Cardiac, Low Risk Surgery (NQF #0669);
- OP–32: Facility 7-Day Risk-Standardized Hospital Visit Rate after Outpatient Colonoscopy (NQF #2539);
- OP–35: Admissions and Emergency Department Visits for Patients Receiving Outpatient Chemotherapy;
- OP–36: Hospital Visits after Hospital Outpatient Surgery (NQF #2687); and
- OP–39: Breast Cancer Screening Recall Rates.[410]

We refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 59106 through 59107), where we established a 3-year reporting period for OP–32: Facility 7-Day Risk-Standardized Hospital Visit Rate after Outpatient Colonoscopy beginning with the CY 2020 payment determination and for subsequent years. In that final rule with comment period (83 FR 59136 through 59138), we established a similar policy under the ASCQR Program. We did not propose any changes to these policies in the proposed rule. We refer readers to section XV.B.4.b. of this final rule with comment period where we are finalizing a 3-year reporting period for the Breast Cancer Screening Recall Rates measure (OP–39).

4. Data Submission Requirements for the OP–37a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-Based Measures for the CY 2024 Reporting Period/CY 2026 Payment Determination and Subsequent Years

a. Background

We refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79792 through 79794) for a discussion of the previously finalized requirements related to survey administration and vendors for the OAS CAHPS Survey-based measures. In addition, we refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59432 through 59433), where we finalized a policy to delay implementation of the OP–37a–e OAS CAHPS Survey-based measures beginning with the CY 2020 payment determination (2018 reporting period) until further action in future rulemaking.

b. Form, Manner, and Timing for OP–37a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-Based Measures Beginning With the CY 2024 Reporting Period/CY 2026 Payment Determination

As discussed in section XV.B.5.a. of this final rule with comment period, we are finalizing to begin data collection of five survey-based measures derived from the OAS CAHPS Survey beginning with voluntary data collection and reporting for the CY 2023 reporting period/CY 2025 payment determination,[411] followed by mandatory reporting beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years. The OAS CAHPS Survey contains three OAS CAHPS composite survey-based measures and two global survey-based measures. In this section, we proposed requirements related to survey administration, vendors, and oversight activities.

In the CY 2017 OPPS/ASC final rule with comment period (81 FR 79792 through 79794), we previously discussed the form, manner, and timing of this survey. In the CY 2022 OPPS/ASC proposed rule (86 FR 42258), we reaffirmed our approach to the form, manner, and timing which OAS CAHPS information will be submitted and proposed to add two additional data collection modes (web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents),[412] beginning with voluntary data collection for the CY 2023 reporting period/CY 2025 payment determination and continuing for mandatory reporting for subsequent years. For more information about the modes of administration, we refer readers to the OAS CAHPS Survey website: *https://oascahps.org*. We reiterated our clarification from when we adopted these measures in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79773) that, when implemented, hospital outpatient departments that anticipate receiving more than 300 surveys would be required to either: (1) Randomly sample their eligible patient population; or (2) survey their entire OAS CAHPS eligible patient population. We also refer readers to section XVI.D.1.d. of this final rule with comment period where we are finalizing similar policies for the ASCQR Program.

(1) Survey Requirements

The data collection modes as currently specified for the survey include three administration modes: (1) Mail-only; (2) telephone-only; and (3) mixed mode (mail with telephone follow-up of non-respondents). We refer readers to the Protocols and Guidelines Manual for the OAS CAHPS Survey (*https://oascahps.org/Survey-Materials*) for materials for each mode of survey administration. In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59433), we expressed interest in investigating the feasibility of offering the OAS CAHPS Survey using a web-based format. As a result, we designed a mode experiment to assess the impact of adding web-based survey administration. This mode experiment tested five administration modes with patients who receive outpatient surgical care: (1) Mail-only; (2) telephone-only; (3) web-only; (4) web with mail follow-up; and (5) web with a telephone follow-up. Data collection was completed in the fall of 2019. Response rates by mode in the experiment were: 35 percent (mail-only); 19 percent (telephone-only); 29 percent (web-only); 39 percent (web with mail follow-up);

with the CY 2023 reporting period/CY 2025 payment determination. We are finalizing this proposal in this final rule with comment period.

[409] In CY 2022 OPPS/ASC proposed rule (86 FR 42237), we proposed to remove OP–3 beginning with the CY 2023 reporting period/CY 2025 payment determination. We are finalizing this proposal in this final rule with comment period.

[410] We note that that we are finalizing our proposal as proposed for the inclusion of OP–39: Breast Cancer Screening Recall Rates into the Hospital OQR Program measure set.

[411] As stated in section XV.B.5.a. of this final rule with comment period, we note that National OAS CAHPS voluntary reporting program is independent of the Hospital OQR Program, but the submission process will otherwise remain unchanged. This proposal is intended to clarify that voluntary reporting of OAS CAHPS would begin as part of the Hospital OQR Program in the CY 2023 reporting period until mandatory reporting would begin in the CY 2024 reporting period/CY 2026 payment determination and for subsequent years, if both proposals are finalized.

[412] The two additional modes will be available as part of National OAS CAHPS voluntary reporting program in 2022.

and 35 percent (web with telephone follow-up).

Based on these results, in addition to the three previously established modes, in the CY 2022 OPPS/ASC proposed rule (86 FR 42258), we proposed to incorporate two more administration methods: (1) Mixed mode web with mail follow-up of non-respondents, and (2) mixed mode web with telephone follow-up of non-respondents. This would allow a total of five methods of survey administration for reporting beginning with voluntary data collection and reporting as part of the Hospital OQR Program for the CY 2023 reporting period/CY 2025 payment determination [413] and mandatory reporting for the CY 2024 reporting period/CY 2026 payment determination—the first year the survey would be required. We did not propose a purely web-based format at this time because the use of a web-based mode is included in the two mixed modes options being proposed and the purely web-based format would create response bias since not all patients have the ability to respond by web.

For all five proposed modes of administration as part of the Hospital OQR Program, we proposed that data collection must be initiated no later than 21-calendar days after the month in which a patient has a surgery or procedure at a hospital and completed within 6 weeks (42 days) after initial contact of eligible patient begins, beginning with voluntary reporting in the CY 2023 reporting period/CY 2025 payment determination and subsequent years. Under this proposal, hospitals, via their CMS-approved vendors (discussed in section XV.D.4.b.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42259)), must make multiple attempts to contact eligible patients unless the patient refuses or the vendor learns that the patient is ineligible to participate in the survey. In addition, we proposed that hospitals, via their CMS-approved survey vendor, collect survey data for eligible patients using the established quarterly deadlines to report data to CMS for each data collection period unless the hospital has been exempted from the OAS CAHPS Survey requirements under the low volume exemption. We refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79774) where we previously established the low volume exemption, which exempts hospital outpatient departments with fewer than 60 survey-eligible patients during the ''eligibility period,'' (which is the calendar year before the data collection period), that submit the participation exemption request form, which would be made available on the OAS CAHPS Survey website (*https://oascahps.org*) on or before May 15 of the data collection year. As finalized previously, all exemption requests would be reviewed and evaluated by CMS (81 FR 79774). For hospitals that do not have an exemption, the submission deadlines would be posted on the OAS CAHPS Survey website (*https://oascahps.org*). Late submissions would not be accepted.

As discussed in more detail in this section, compliance with the OAS CAHPS Survey protocols and guidelines, including this monthly data collection requirement as part of each quarterly data submission, would be overseen by CMS or its contractor who would receive approved vendors' monthly submissions, review the data, and analyze the results. We previously finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79774) all data collection and submission for the OAS CAHPS Survey measures would be reported at the Medicare participating hospital level, as identified by its CCN. Once data collection and reporting become mandatory beginning with the CY 2024 reporting period as finalized in section XV.B.5.a of this final rule with comment period, all locations that offer outpatient services of each eligible Medicare participating hospital would be required to participate in the OAS CAHPS Survey finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79793) except for those that meet and receive an exception for having fewer than 60 survey-eligible patients during the year preceding the data collection period as finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79773). Therefore, the survey data reported using a Medicare participating hospital's CCN must include all eligible patients from all outpatient locations (whether the hospital outpatient department is on campus or off campus) of an eligible Medicare participating hospital; or if more than 300 completed surveys are anticipated, a hospital can choose to randomly sample their eligible patient population as finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79784).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42259), we also proposed that survey vendors acting on behalf of hospitals must submit data by the specified data submission deadlines, which generally would be posted on the OAS CAHPS Survey website located at *https://oascahps.org/Data-Submission/Data-Submission-Deadlines*. If a hospital's data are submitted after the data submission deadline, it would not fulfill the OAS CAHPS Survey quality reporting requirements. Therefore, in regard to any OAS CAHPS Survey reporting, we would strongly encourage hospitals to be fully apprised of the methods and actions of their survey vendors—especially the vendors' full compliance with OAS CAHPS Survey administration protocols—and to carefully inspect all data warehouse reports in a timely manner.

We reiterate that the use of predictive or auto dialers in telephonic survey administration is governed by the Telephone Consumer Protection Act (TCPA) (47 U.S.C. 227) and subsequent regulations promulgated by the Federal Communications Commission (FCC) (47 CFR 64.1200) and the Federal Trade Commission. We refer readers to the FCC's declaratory ruling released on July 10, 2015 further clarifying the definition of an auto dialer, available at: *https://apps.fcc.gov/edocs_public/attachmatch/FCC-15-72A1.pdf*. In the telephone-only and mixed mode survey administration methods involving telephone, hospitals and vendors must comply with the regulations and any other applicable regulations. To the extent that any existing CMS technical guidance conflicts with the TCPA or its implementing regulations regarding the use of predictive or auto dialers, or any other applicable law, CMS would expect vendors to comply with applicable law.

We received comments on these topics.

Comment: A commenter supported the proposal that the CAHPS data collection must be ''initiated no later than 21-calendar days after the month in which a patient has a surgery or procedure at a hospital and completed within 6 weeks (42 days) after initial contact of eligible patient begins, beginning with voluntary reporting in the CY 2023 reporting period/CY 2025 payment determination and subsequent years.''

Response: We thank the commenter for its support.

Comment: A commenter recommended that CMS consider adopting ''real time surveys'' or surveys performed within 48 hours as a survey option for OAS CAHPS Survey.

[413] As stated in section XV.B.5.a. of the CY 2020 OPPS/ASC proposed rule, we note that the two modes (web with mail follow-up of non-respondents; and web with telephone follow-up of non-respondents) will be available beginning in CY 2022 for National OAS CAHPS voluntary reporting, and then if finalized, available as part of OQR Program's reporting beginning in the CY 2023 reporting period and subsequent years (86 FR 42258).

Response: Under the current guidelines, HOPDs can request to do continuous sampling to receive more ''real time'' feedback, which could include initiating their own surveys within 48 hours.

Comment: Many commenters supported the two additional survey administration modes taking advantage of web-based technology: Web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents. Among the reasons for support were the belief that these additional modes will enable providers to reach a larger patient population, to receive more and timelier information to improve patient experience, to reduce burden associated with this measure, and to provide greater flexibility for providers to collect data and patients to respond. A few commenters encouraged CMS to monitor the data and patient response rates, particularly of the two additional web-based survey modes, and data.

Response: We thank the commenters for their support. We agree that as we expand the use of additional OAS CAHPS Survey modes, it will be important to monitor data, patient responses and ensure that the OAS CAHPS Survey is refined as appropriate. We will continue to monitor and evaluate methods available to assess and collect patient experience feedback in a reliable manner.

Comment: Many commenters appreciated the proposal for the additional two new mixed mode options that include web-based collection, but expressed the belief that there needs to be a web-only or additional digital modes to reduce financial burden of the survey and make the survey easier for patients to complete. Several commenters recommended that CMS should permit a web-only survey administration mode and noted that web-only would likely be popular form of administration, has a better response rate and could achieve minimum surveys more efficiently than telephone only and would also reduce the financial burden of administration. One commenter specifically noted that these modes of survey distribution could help reach younger and minority populations.

Response: We agree that the web-based mode interactions with smart phones, email, texting and other electronic distribution create the potential for new and engaging ways to connect with patients, especially to traditionally underserved communities. We believe that the potential to expand and increase access to patient feedback is of the utmost importance and will continue to evaluate the potential refinement to methods of contact for the OAS CAHPS Survey. However, as we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42258), we did not propose a purely web-based format at this time because the purely web-based format would create response bias since not all patients have access and the ability to respond via website. Additionally, the use of a web-based mode is included in the two mixed modes options being proposed and we believe that providing the additional follow-up provides patients with a greater opportunity to respond to the OAS CAHPS Survey, if they so choose.

Comment: A few commenters expressed concern that patients may be confused by web-based surveys and CMS should ensure that patients understand the survey.

Response: We note that an objective of the OAS CAHPS Survey is to obtain data on a patient's experience of care received from a facility, specifically from an HOPD. While there is always potential that a patient gets confused, we believe that the OAS CAHPS Survey is focused on patients' experience of care received for their ambulatory surgery or procedure. A physician/surgeon who performs surgeries/procedures at a facility is a member of that facility with both rights and responsibilities. We believe it is the facility's responsibility to ensure that someone—whether the doctor, nurse, or other facility staff member—provide patients with information about preparing for their procedure, about the procedure itself, as well as what to expect following the procedure/surgery. Therefore, we believe it is appropriate to include these important communications with patients in the OAS CAHPS Survey and believe experience with the provider attributed to the facility is appropriate.

Further, we believe that the information provided in the OAS CAHPS Survey ''Instructions'' is sufficient to inform the patient regarding the purpose of the OAS CAHPS Survey and provides sufficient instruction and details for the patient to correctly identify and relate the survey to the facility and procedure that patient received. CMS began developing the Outpatient and Ambulatory Surgery Survey in 2012 using the principles and guidelines established by the Agency for Healthcare Research and Quality's (AHRQ) CAHPS program and AHRQ approved this instrument as a CAHPS Survey in February 2015.[414]

After consideration of the public comments we received, we are finalizing this proposal as proposed.

(2) Vendor Requirements

We did not propose any new vendor requirements in the CY 2022 OPPS/ASC proposed rule (86 FR 42018), but reiterate the vendor requirements finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79793 through 79794) to ensure that patients respond to the survey in a way that reflects their actual experiences with outpatient care, and is not influenced by the hospital. We finalized that hospitals must contract with a CMS-approved OAS CAHPS Survey vendor to conduct or administer the survey. We believe that a neutral third-party should administer the survey for hospitals, and it is our belief that an experienced survey vendor would be best able to ensure reliable results. CAHPS Survey-approved vendors are also already used or required in the following CMS quality programs: The Hospital IQR Program (71 FR 68203 through 68204); the Hospital VBP Program (76 FR 26497, 26502 through 26503, and 26510); the End Stage Renal Disease Quality Improvement Program (76 FR 70269 through 70270); the Home Health QRP (80 FR 68709 through 68710); and the Hospice QRP (80 FR 47141 through 47207).

Information about the list of approved survey vendors and how to authorize a vendor to collect data on a hospital's behalf is available through the OAS CAHPS Survey website at: *https://oascahps.org*. The web portal has both public and secure (restricted access) sections to ensure the security and privacy of selected interactions. As mentioned previously, requirements for survey vendors were previously finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79793 through 79794) and codified at § 419.46(h)(2). Hospitals will need to register on the OAS CAHPS Survey website (*https://oascahps.org*) in order to authorize the CMS-approved vendor to administer the survey and submit data on their behalf. Each hospital must then administer (via its vendor) the survey to all eligible patients (or for those anticipating more than 300 completed surveys, randomly sample their eligible patient population) treated during the data collection period on a monthly basis according to the

[414] Agency for Healthcare Research and Quality. ''The CAHPS Program.'' Available at: *https://ahrq.gov/cahps/index.html*.

guidelines in the Protocols and Guidelines Manual (*https://oascahps.org*) and report the survey data to CMS on a quarterly basis by the deadlines posted on the OAS CAHPS Survey website.

Comment: A few commenters opposed the use of third-party survey vendors to administer OAS CAHPS data and stated the belief that many organizations have the capacity to build more secure, more patient-friendly, more community focused surveying platforms and questions, and that the financial expense of third-party vendors is not needed as evidenced by HCAHPS.

Response: In order to meet the survey administration requirements for these measures, the HOPD must administer the OAS CAHPS Survey in accordance with the requirements listed in the OAS CAHPS Survey Protocols and Guidelines Manual.[415]

OAS CAHPS Survey requires that the survey be administered by an approved survey vendor to ensure that patients respond to the survey in a way that reflects their actual experiences with outpatient surgical care and is not influenced by the facility. If vendors were removed as neutral third parties, there could be concerns of objectivity and bias.

We believe that OAS CAHPS Survey vendors have gained experience during the voluntary reporting as part of the voluntary National OAS CAHPS program, and approved vendors will be able to support HOPDs. We post the list of the approved OAS CAHPS vendors on *https://oascahps.org*, and we encourage HOPDs to contact vendors for cost and service information pertaining to OAS CAHPS as there may be differences among vendors and multiple modes of conducting the survey provide greater economical choice.

Comment: A commenter requested clarification on the ramifications if a HOPD does not receive enough completed surveys despite vendor attempts to collect information from eligible patients.

Response: We agree with commenters that patient response is largely out of the control of the facility. We clarify we did not propose to penalize HOPDs for patients' decision not to complete the survey. An HOPD will not receive a payment reduction as long as it participates in the survey, its vendor administers the survey according to the OAS CAHPS Survey Protocol and Guidelines Manual, and submits that data to CMS by the data submission deadline.

[415] *https://oascahps.org/Survey-Materials* Current Survey Materials (*oascahps.org*).

5. Data Submission Requirements for Measures Submitted via a Web-Based Tool for the CY 2023 Payment Determination and Subsequent Years

a. Data Submission Requirements for Measures Submitted via a CMS Web-Based Tool

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75112 through 75115), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70521), and the QualityNet website available at: *https://qualitynet.cms.gov* for a discussion of the requirements for measure data submitted via the HQR System (formerly referred to as the QualityNet Secure Portal) for the CY 2017 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

The following previously adopted quality measures require data to be submitted via a CMS web-based tool for the CY 2022 reporting period/CY 2024 payment determination and subsequent years:

- OP–22: Left Without Being Seen (NQF #0499); and
- OP–29: Endoscopy/Polyp Surveillance: Appropriate Follow-up Interval for Normal Colonoscopy in Average Risk Patients (NQF #0658).

(1) Form, Manner, and Timing for Reporting OP–31: Cataracts: Improvement in Patient's Visual Function Within 90 Days Following Cataract Surgery (NQF #1536)

In the CY 2022 OPPS/ASC Proposed rule (86 FR 42259) we proposed that this measure be submitted according to our existing policies for data submitted via the HQR System (formerly referred to as the QualityNet Secure Portal). As noted earlier, we did not propose changes to those policies in the proposed rule.

We received no comments on this proposal regarding the form, manner, and timing for the OP–31: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure be submitted through the HQR System. As discussed in section XV.B.5.b. of this final rule with comment period, we are finalizing our proposal to require the reporting of the OP–31 measure with modification.

b. Data Submission Requirements for Measures Submitted via the CDC NHSN Website

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75097 through 75100) for a discussion of the previously finalized requirements for measure data submitted via the CDC NHSN website. While we did not propose any changes to those policies in the CY 2022 OPPS/ASC proposed rule (86 FR 42018), we did propose policies specific to the proposed COVID–19 Vaccination Coverage Among HCP measure (OP–38), which will be submitted via the CDC NHSN website.

(1) Form, Manner, and Timing for the COVID–19 Vaccination Coverage Among HCP Measure (OP–38) Beginning With the CY 2022 Reporting Period/CY 2024 Payment Determination and Subsequent Years

For the COVID–19 Vaccination Coverage Among HCP measure (OP–38), in the CY 2022 OPPS/ASC proposed rule (86 FR 86 FR 42260), we proposed to require reporting data on the number of HCP who have received the completed vaccination course of a COVID–19 vaccine by each individual facility's CCN.

For the COVID–19 Vaccination Coverage Among HCP measure (OP–38), we proposed that facilities would report COVID–19 vaccination data to the NHSN for at least one week each month, beginning with the January 1, 2022 through December 31, 2022 reporting period affecting the CY 2024 payment determination and continuing with quarterly reporting deadlines for subsequent years. If facilities report more than one week of data in a month, the most recent week's data would be used for measure calculation purposes. We proposed that hospitals would report the measure through the NHSN web-based surveillance system.[416] Specifically, hospitals would use the COVID–19 vaccination data reporting modules in the NHSN Healthcare Personnel Safety (HPS) Component to report the number of HCP eligible to have worked at the facility that week (denominator) and the number of those HCP who have received COVID–19 vaccination (numerator). Specific details on data submission for this measure can be found in the CDC's Overview of the Healthcare Safety Component, available at *https://www.cdc.gov/nhsn/PDFs/slides/NHSN-Overview-HPS_Aug2012.pdf*. We refer readers to the CY 2014 OPPS/ASC final rule (78 FR 75097 through 75100) for details about requirements for measure data submitted via the NHSN. In the CY 2022 OPPS/ASC proposed rule (86 FR 42260), we contemplated each quarter, the CDC would calculate a summary measure of

[416] Centers for Disease Control and Prevention. Surveillance for Weekly HCP COVID–19 Vaccination. Accessed at: *https://www.cdc.gov/nhsn/hps/weekly-covid-vac/index.html* on February 10, 2021.

COVID–19 vaccination coverage from the reporting periods for the quarter in four-quarter increments, when four quarters of data are available.

We refer readers to section XV.B.4.a.2. of this final rule with comment period received on the COVID–19 Vaccination Coverage Among HCP Measure (OP–38). We did not receive public comments on the form, manner, and timing for the COVID–19 Vaccination Coverage Among HCP Measure (OP–38); as such, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (OP–38) beginning with the CY 2022 reporting period/FY 2024 payment determination and subsequent years with the modifications described in section XV.B.4.a. of this final rule with comment period.

6. eCQM Reporting and Submission Requirements

a. Background

We believe that collection and reporting of data through health information technology would greatly simplify and streamline reporting for many CMS quality reporting programs. Through electronic reporting, hospitals will be able to leverage EHRs to capture, calculate, and electronically submit quality data to CMS for the Hospital OQR Program.

We believe that automated electronic extraction and reporting of clinical quality data would significantly reduce the administrative burden on hospitals for the Hospital OQR Program. We believe that the use of CEHRT can effectively and efficiently help providers improve internal care delivery practices, support management of patient care across the continuum, and support the reporting of eCQMs. In previous rules, we stated our intent and assessment of the inclusion of eCQMs into the Hospital OQR Program, and we have sought public comment on the addition of such measures into the measure set. We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75106 through 75107), the CY 2015 OPPS/ASC final rule with comment period (79 FR 66956 through 66961), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70516 through 70518), the CY 2017 OPPS/ASC final rule with comment period (81 FR 79785 through 79790), and the CY 2018 OPPS/ASC final rule with comment period (82 FR 59435 through 59438) for more details on previous discussion regarding future measure concepts related to eCQMs and electronic reporting of data for the Hospital OQR Program, including stakeholder support for the introduction of eCQMs into the Program. Measure stewards and developers have worked to advance eCQMs that would be reported in the outpatient setting and we believe the introduction of eCQMs in the Hospital OQR Program is timely. We also believe this is important in aligning the Hospital OQR Program with the Medicare Promoting Interoperability Program and the Hospital IQR Program.

b. eCQM Reporting and Data Submission Requirements Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination

In section XV.B.4.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42244) and in section XV.B.4.c. of this final rule with comment period, we discuss adoption of the STEMI eCQM (OP–40). In the CY 2022 OPPS/ASC proposed rule (86 FR 42260), we proposed a progressive increase in the number of quarters for which hospitals report eCQM data. Increasing the number of reported quarters to be reported has several benefits. Primarily, a single quarter of data is not enough to capture trends in performance over time. Evaluating multiple quarters of data would provide a more reliable and accurate picture of overall performance. Further, reporting multiple quarters of data would provide hospitals with a more continuous information stream to monitor their levels of performance. Ongoing, timely data analysis can better identify a change in performance that may necessitate investigation and potentially corrective action.

However, we believe that starting with limited voluntary reporting would give hospitals more time to gain experience with reporting data (including time to implement the eCQM and provide training to support eCQM reporting, if necessary). Similar to what was established for the Hospital IQR Program (82 FR 38355), we believe that increasing the number of quarters for which hospitals report eCQM data would produce more comprehensive and reliable quality measure data for patients and providers. In section XV.B.4.c. of this final rule with comment period, we are finalizing the adoption of the STEMI eCQM (OP–40) with voluntary reporting beginning with the CY 2023 reporting period. For the CY 2023 reporting period, we proposed that hospitals submit STEMI eCQM (OP–40) data during this reporting period voluntarily for any quarter. Hospitals that chose to submit data voluntarily must submit in compliance with the eCQM certification requirements in sections XV.D.6.c., XV.D.6.d, and XV.D.6.e. of this final rule with comment period.

For the CY 2024 reporting period/CY 2026 payment determination, we proposed that hospitals report one self-selected calendar quarter of data for the STEMI eCQM (OP–40). We note that in section XV.B.4.c. of this final rule with comment period, we are finalizing that the STEMI eCQM (OP–40) is required beginning with the CY 2024 reporting period/CY 2026 payment determination.

For the CY 2025 reporting period/CY 2027 payment determination, we proposed to increase the amount of data required. We proposed that hospitals report two self-selected calendar quarters of data for the required STEMI eCQM (OP–40).

For the CY 2026 reporting period/CY 2028 payment determination, we proposed to further increase the amount of data required for the STEMI eCQM (OP–40). Specifically, we proposed to require that hospitals report three self-selected calendar quarters of data for the CY 2026 reporting period/CY 2028 payment determination for the required STEMI eCQM (OP–40). Beginning with the CY 2027 reporting period/CY 2029 payment determination, we proposed to require that hospitals report all four calendar quarters (one calendar year) of data for the required STEMI eCQM (OP–40).

We also refer readers to Table 68 for a summary of the finalized quarterly data increase in eCQM reporting beginning with the CY 2023 reporting period.

TABLE 68: Progressive Increase in eCQM Reporting Beginning with the CY 2023 Reporting Period/CY 2025 Payment Determination and for Subsequent Years

Calendar Year Period	Calendar Quarters of Reporting	Reporting
CY 2023 Reporting Period/CY 2025 Payment Determination	Any quarter(s)	Voluntary
CY 2024 Reporting Period/CY 2026 Payment Determination	One self-selected quarter	Mandatory
CY 2025 Reporting Period/CY 2027 Payment Determination	Two self-selected quarters	Mandatory
CY 2026 Reporting Period/CY 2028 Payment Determination	Three self-selected quarters	Mandatory
CY 2027 Reporting Period/CY 2029 Payment Determination and Subsequent Years	Four quarters (one calendar year)	Mandatory

We received comments on these topics.

Comment: One commenter suggested that we require hospitals submit one year of data instead of the incremental approach of increasing the number of quarters of data yearly.

Response: We thank the commenter for its feedback. We interpret the commenter's suggestion to mean that we should require hospitals to begin the initial data submission with one calendar year (four quarters) of eCQM data instead of the initial requirement to submit one quarter of data beginning with the CY 2024 reporting period/CY 2026 payment determination. While we appreciate the suggestion, we respectfully note that we proposed an incremental increase of data submission requirements to provide hospitals with a phased approach that would reduce reporting burden as eCQMs are new to the Hospital OQR Program.

We believe that hospitals should be given an opportunity to gain experience with reporting data (including time to implement the eCQM and provide training to support eCQM reporting, if necessary). Additionally, we aligned our approach with that of the Hospital IQR Program (82 FR 38355). In the FY 2018 IPPS/LTCH PPS final rule, we received public comment that resulted in the modification of the Hospital IQR Program's requirements to this incremental increase to alleviate stakeholder concerns and challenges with eCQM reporting (82 FR 38356). We believe it is important to learn from our approach and the public comments received regarding eCQMs in previous rulemaking for the Hospital IQR Program when proposing and finalizing equivalent requirements for the Hospital OQR Program. We believe our finalized policy to progressively increase the number of quarters of data collected over three years balances the benefit of additional eCQM data reported and allow adequate time for successful reporting experience. Any changes to eCQM reporting and submission requirements will be addressed in future notice and comment rulemaking.

Comment: One commenter recommended that we identify the time period of data submission instead of allowing hospitals to self-select which quarters of data to submit (prior to the requirement of one calendar year of data submission beginning with the CY 2027 reporting period/CY 2029 payment determination).

Response: We thank the commenter for the recommendation. We believe that allowing the flexibility to self-select quarter(s) of eCQM data to report, beginning with the CY 2024 reporting period/CY 2026 payment determination, will allow hospitals to gradually transition toward more robust electronic quality measure reporting. We believe that the ability to self-select quarters of data will provide the necessary time for quality, health IT, and clinical teams to gain experience and operationalize integration of eCQMs in the Hospital OQR Program. Additionally, we believe that smaller hospitals may require more time to become proficient in all the parameters (mapping, new workflows, education, etc.) associated with eCQM reporting. Therefore, we believe that following this same incremental approach for the Hospital OQR Program allows us to remain consistent across hospital quality reporting programs and reduce provider burden.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

c. Electronic Quality Measure Certification Requirements for eCQM Reporting

(1) Requiring Use of 2015 Edition Cures Update Certified Technology Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination

In May 2020, the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) finalized updates to the 2015 Edition of health IT certification criteria (hereto referred to as the ''2015 Edition Cures Update''). These updates included revisions to the clinical quality measurement certification criterion at 45 CFR 170.315(c)(3) to refer to CMS Quality Reporting Data Architecture (QRDA) IGs and remove the Health Level 7 (HL7®) QRDA standard from the relevant health IT certification criteria (85 FR 25645). The ONC 21st Century Cures Act final rule provided health IT developers up to 24 months from May 1, 2020 to make technology certified to the updated and/or new criteria available to their customers (85 FR 25670). In November 2020, ONC issued an interim final rule with comment (85 FR 70064) which extended the compliance deadline for the update to the Clinical Quality Measures-Report criterion until December 31, 2022 (85 FR 70075). These updates were finalized to reduce burden on health IT developers under the ONC Health IT certification program (85 FR 25686) and have no impact on providers' existing reporting practices for CMS programs.

For the Hospital OQR Program, in the CY 2022 OPPS/ASC proposed rule (86 FR 42261), we proposed to require hospitals to utilize certified technology updated consistent with the 2015 Edition Cures Update for the CY 2023 reporting period/CY 2025 payment determination and subsequent years, which includes both the voluntary period and required submissions. We noted that this proposal is in alignment

with the Hospital IQR Program proposal in the FY 2022 IPPS/LTCH PPS proposed rule that requires use of technology updated consistent with 2015 Edition Cures Update beginning with the CY 2023 reporting period/FY 2025 payment determination (86 FR 25595), and which has since been finalized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45418).

We received no comments on this proposal. Therefore, we are finalizing this proposal as proposed.

d. File Format for EHR Data, Zero Denominator Declarations, and Case Threshold Exemptions

(1) File Format for EHR Data

Data can be collected in EHRs and health information technology systems using standardized formats to promote consistent representation and interpretation, as well as to allow for systems to compute data without needing human interpretation. As described in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49701), these standards are referred to as content exchange standards because the standard details how data should be represented and the relationships between data elements. This allows the data to be exchanged across EHRs and health IT systems while retaining their meaning. Commonly used content exchange standards include the QRDA. The QRDA standard provides a document format and standard structure to electronically report quality measure data. We believe electronically reporting data elements formatted according to the QRDA standard would promote consistent representation and more efficient calculation of eCQM measure results.

Therefore, in alignment with the Hospital IQR Program file format requirements (85 FR 58940), in the CY 2022 OPPS/ASC proposed rule (86 FR 42262), we proposed that, beginning with the CY 2023 reporting period/CY 2025 payment determination, hospitals: (1) Must submit eCQM data via the QRDA Category I (QRDA I) file format; [417] (2) may use third parties to submit QRDA I files on their behalf; and (3) may either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I. Hospitals could meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemptions. We discuss the zero denominator declaration and case threshold exemptions in the subsequent sections. We also refer readers to section XV.B.8. of the CY 2022 OPPS/ASC proposed rule (86 FR 42256) and in this section of this final rule with comment period where we outline the maintenance of technical specifications including those for eCQMs.

Under this proposal, we expect QRDA I files to reflect data for one patient per file per quarter with five key elements necessary to identify the file:

- CMS Certification Number (CCN);
- CMS Program Name;
- EHR Patient ID;
- Reporting period specified in the Reporting Parameters Section; and
- EHR Submitter ID.

We received comments on these topics.

Comment: One commenter supported our alignment of these requirements with other quality reporting programs, particularly the Hospital IQR Program.

Response: We thank the commenter for their support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

(2) Zero Denominator Declarations

We understand there may be situations in which a hospital does not have data to report on a particular eCQM. Therefore, in the CY 2022 OPPS/ASC proposed rule (86 FR 42262), we proposed if the hospital's EHR is certified to an eCQM, but the hospital does not have patients that meet the denominator criteria of that eCQM, the hospital can submit a zero in the denominator for that eCQM. Submission of a zero in the denominator for an eCQM counts as a successful submission for that eCQM for the Hospital OQR Program. For example, if the hospital within the previously mentioned health system does not provide fibrinolytic therapy, but one of the eCQMs the health system's EHR is certified to is a fibrinolytic therapy measure, that hospital's EHR may render a zero in the denominator for that eCQM. The hospital will therefore report a zero denominator for that fibrinolytic therapy eCQM, and this will count toward the required eCQMs for the Hospital OQR Program. Hospitals within that health system for which that fibrinolytic therapy eCQM does apply will provide data on that measure.

We received one comment on these topics.

Comment: One commenter supported our alignment of these requirements with other quality reporting programs, particularly the Hospital IQR Program.

Response: We thank the commenter for its support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

(3) Case Threshold Exemptions

We understand that in some cases, a hospital may not meet the case threshold of discharges for a particular eCQM. In the CY 2022 OPPS/ASC proposed rule (86 FR 42262), we proposed to align with the case threshold exemption from the Medicare Promoting Interoperability Program (77 FR 54080) and the Hospital IQR Program (79 FR 50324). As stated for the Hospital IQR Program, the case threshold exemption means that for each quality measure for which hospitals do not have a minimum number of patients that meet the patient population denominator criteria for the relevant reporting period, hospitals would have the ability to declare a ''case threshold exemption'' if they have five or fewer applicable discharges. Specifically, for the Hospital OQR Program we propose that beginning with the CY 2023 reporting period/CY 2025 payment determination, if a hospital's EHR system is certified to report an eCQM and the hospital experiences 5 or fewer outpatient discharges per quarter or 20 or fewer outpatient discharges per year (Medicare and non-Medicare combined), as defined by an electronic clinical quality measure's denominator population, that hospital could be exempt from reporting on that electronic clinical quality measure. Case threshold exemptions are entered on the Denominator Declaration screen within the HQR System (formerly referred to as the QualityNet Secure Portal) available during the submission period.[418] The exemption would not have to be used; hospitals could report those individual cases if they would like to.

We received one comment on these topics.

Comment: One commenter supported our alignment of these requirements with other quality reporting programs, particularly the Hospital IQR Program.

Response: We thank the commenter for its support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

[417] QRDA I is an individual patient-level quality report that contains quality data for one patient for one or more eCQMs. QRDA creates a standard method to report quality measure results in a structured, consistent format and can be used to exchange eCQM data between systems. For further detail on QRDA I, the most recently available QRDA I specifications and Implementation Guides (IGs) can be found at: *https://ecqi.healthit.gov/qrda.*

[418] CMS Adds New Features to Denominator Declaration Screen for eCQM Reporting, available at: *https://qualitynet.cms.gov/news/5fa161829314190021d3c262.*

e. Submission Deadlines for eCQM Data

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), the Hospital IQR Program aligned their eCQM submission deadline with that of the Medicare Promoting Interoperability Program. The eCQM submission deadline for those two programs is the end of two months following the close of the CY (beginning with the CY 2017 reporting period/FY 2019 payment determination and for subsequent years).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42262), for the Hospital OQR Program, we proposed to require eCQM data submission by the end of 2 months following the close of the calendar year for the CY 2023 reporting period/CY 2025 payment determination and for subsequent years. We believe that by aligning with the Hospital IQR and Promoting Interoperability Programs' deadlines, we would not add unnecessary burden. For example, for the CY 2023 reporting period/CY 2025 payment determination, hospitals that choose to voluntarily report that calendar year would be required to submit eCQM data by February 29, 2024, which is the end of 2 months following the close of the calendar year (December 31, 2023).

In developing this policy, we also considered proposing a submission deadline of May 15 to align with the submission deadline for Hospital OQR web-based measures. Under the Hospital OQR Program, the data submission period for web-based measures (for example, OP–29 and OP–31) extends through May 15 (we note the submission deadline may be moved to the next business day if it falls on a weekend or Federal holiday). However, we ultimately proposed instead to align eCQM data submission deadlines across quality reporting programs, because we believe that it would be less burdensome for hospitals.

We received comments on these topics.

Comment: One commenter supported our alignment of the submission deadline requirements across quality reporting programs.

Response: We thank the commenter for their support.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42262), we indicated that we considered a deadline of May 15. To allow more time for data submission and for hospitals to review their data, we believe that a May 15 deadline is more appropriate. Additionally, this is consistent with the Hospital OQR Program data submission deadline for web-based measures which provides inter-program alignment. Therefore, after consideration of public comments, we are finalizing this proposal with modification, establishing May 15 as the data submission deadline for eCQMs for the CY 2023 reporting period/CY 2025 payment determination and for subsequent years. We note the submission deadline may be moved to the next business day if it falls on a weekend or Federal holiday.

7. Population and Sampling Data Requirements for the CY 2022 Payment Determination and Subsequent Years

We refer readers to the CY 2011 OPPS/ASC final rule with comment period (75 FR 72100 through 72103) and the CY 2012 OPPS/ASC final rule with comment period (76 FR 74482 through 74483) for discussions of our population and sampling requirements. We did not propose any changes to these policies in the proposed rule. We note that we did not propose any population and sampling data policies related to eCQM reporting, because we would expect data for all patients who meet the patient population denominator criteria to be reported.

8. Review and Corrections Period for Measure Data Submitted to the Hospital OQR Program

a. Chart-Abstracted Measures

We refer readers to the CY 2015 OPPS/ASC final rule with comment period (79 FR 66964 and 67014) where we formalized a review and corrections period for chart-abstracted measures in the Hospital OQR Program. We did not propose any changes to these policies in the proposed rule.

b. Web-Based Measures

In the CY 2021 OPPS/ASC final rule (85 FR 86184), we finalized and codified to expand our review and corrections policy to apply to measure data submitted via the CMS web-based tool beginning with data submitted for the CY 2023 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

c. Electronic Clinical Quality Measures (eCQMs)

In the CY 2022 OPPS/ASC proposed rule (86 FR 42263), we proposed that hospitals would have a review and corrections period for eCQM data submitted to the Hospital OQR Program. We proposed a review and corrections period for eCQM data which would run concurrently with the data submission period. The review and corrections period is from the time the submission period opens to the submission deadline. In the HQR System (formerly referred to as the QualityNet Secure Portal), providers can submit QRDA Category I test and production data files and can correct QRDA Category I test and production data files before production data is submitted for final reporting. We encourage early testing and the use of pre-submission testing tools to reduce errors and inaccurate data submissions in eCQM reporting. The HQR System does not allow data to be submitted or corrected after the annual deadline. We refer readers to the HQR System website (available at: *https://hqr.cms.gov/hqrng/login*) and the eCQI Resource Center (available at: *https://ecqi.healthit.gov/*) for more resources on eCQM reporting.

We received no comments on this proposal. Therefore, we are finalizing this proposal as proposed.

d. OAS CAHPS Measures

Each hospital administers (via its vendor) the survey for all eligible patients treated during the data collection period on a monthly basis according to the guidelines in the Protocols and Guidelines Manual (*https://oascahps.org*) and report the survey data to CMS on a quarterly basis by the deadlines posted on the OAS CAHPS Survey website as stated in section XV.D.4.b.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42259) and this final rule. As finalized in the CY 2017 OPPS/ASC final rule with comment period, data cannot be altered after the data submission deadline but can be reviewed prior to the submission deadline (81 FR 79793).

9. Hospital OQR Program Validation Requirements

a. Background

We refer readers to the CY 2011 OPPS/ASC final rule with comment period (75 FR 72105 through 72106), the CY 2013 OPPS/ASC final rule with comment period (77 FR 68484 through 68487), the CY 2015 OPPS/ASC final rule with comment period (79 FR 66964 through 66965), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70524), the CY 2018 OPPS/ASC final rule with comment period (82 FR 59441 through 59443), and 42 CFR 419.46(f) for our policies regarding validation.

b. Use of Electronic File Submissions for Chart-Abstracted Measure Medical Records Requests Beginning With the CY 2022 Reporting Period/CY 2024 Payment Determination and Subsequent Years

Currently, hospitals may choose to submit paper copies of medical records for chart-abstracted measure validation, or they may submit copies of medical

records for validation by securely transmitting electronic versions of medical information (79 FR 66965 through 66966). Submission of electronic versions can either entail downloading or copying the digital image of the medical record onto Compact Disc (CD), Digital Video Disc (DVD), or flash drive, or submission of Portable Document Format (PDF) using a secure file transmission process after logging into the HQR System (formerly referred to as the QualityNet Secure Portal) (79 FR 66966). We reimburse hospitals at $3.00 per chart (FY 2016 IPPS/LTCH PPS final rule (80 FR 49763)).

We strive to provide the public with accurate quality data while maintaining alignment with hospital recordkeeping practices. We appreciate that hospitals have rapidly adopted EHR systems as their primary source of information about patient care, which can facilitate the process of producing electronic copies of medical records. Additionally, we monitor the medical records submissions to the CMS Clinical Data Abstraction Center (CDAC) contractor and have found that almost two-thirds of hospitals already use the option to submit PDF copies of medical records as electronic files. In our assessment based on this monitoring, we believe requiring electronic file submissions can be a more effective and efficient process for hospitals selected for validation.

Therefore, in the CY 2022 OPPS/ASC proposed rule (86 FR 42263), we proposed to discontinue the option for hospitals to send paper copies of, or CDs, DVDs, or flash drives containing medical records for validation affecting the CY 2024 payment determination (that is, beginning with data submission for Q1 of CY 2022). We proposed to require hospitals to instead submit only electronic files when submitting copies of medical records for validation of chart-abstracted measures, beginning with validation affecting the CY 2024 payment determination (that is, Q1 of CY 2022) and for subsequent years. Under this proposal, hospitals would be required to submit PDF copies of medical records using direct electronic file submission via a CMS-approved secure file transmission process as directed by CDAC. We would continue to reimburse hospitals at $3.00 per chart, consistent with the current reimbursement amount for electronic submissions of charts. We note that this process would align with that for the Hospital IQR Program (FY 2016 IPPS/LTCH PPS final rule (85 FR 58949)).

Requiring electronic file submissions reduces the burden of not only coordinating numerous paper-based pages of medical records, but also of having to then ship the papers or physical digital media storage to the CDAC. Therefore, we believe it is appropriate to require that hospitals use electronic file submissions via a CMS-approved secure file transmission process.

We received comments on these topics.

Comment: Several commenters supported the proposed changes to require the use of electronic file submissions and remove the paper submission option beginning with the CY 2022 reporting period/CY2024 payment determination and for subsequent years because this change will align the data validation process for chart abstracted measures with the Hospital IQR Program.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

c. Time Period for Chart-Abstracted Measure Data Validation for Validations Affecting the CY 2024 Payment Determination and Subsequent Years

We refer readers to the chart-abstracted validation requirements and methods we adopted in the CY 2014 OPPS/ASC final rule with comment period (78 FR 75117 through 75118) and codified at 42 CFR 419.46(f)(1) for the CY 2024 payment determination and subsequent years. In previous years, charts were requested by the CMS CDAC contractor and hospitals were given 45-calendar days from the date of the request to submit the requested records. If any record(s) were not received by the 45-day requirement, the CMS CDAC contractor assigned a ''zero'' validation score to each measure in a missing record. Using data from the CDAC, we have found that a large majority of hospitals that have participated in Hospital OQR Program data validation efforts have submitted their records prior to 30 calendar days in the current process. Furthermore, outpatient records typically contain significantly fewer pages than the inpatient records that hospitals have been submitting to the Hospital IQR Program for several years, which suggests that outpatient records could be gathered in less time and use less resources.

Therefore, in the CY 2022 OPPS/ASC proposed rule (86 FR 42263), we proposed to revise § 419.46(f)(1) to change the time period given to hospitals to submit medical records to the CDAC contractor from 45-calendar days to 30-calendar days, beginning with medical record submissions for encounters in Q1 of CY 2022/validations affecting the CY 2024 payment determination and for subsequent years. We proposed this deadline modification to reduce the time needed to complete validation, provide hospitals with feedback on their abstraction accuracy in a timelier manner, and to further align with the Hospital IQR Program's validation policy (76 FR 51645).

We received comments on these topics.

Comment: Several commenters supported this change to the time period given to hospitals to submit medical records to the CDAC contractor from 45-calendar days to 30-calendar days, beginning with medical record submissions for encounters in Q1 of CY 2022/validations affecting the CY 2024 payment determination and for subsequent years.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern with the proposal to reduce the submission time for validation from 45 to 30-calendar days. A few commenters noted that it takes time to review copied charts and recompile them for CDAC review. Commenters also noted that the time allotted for preparation of files will be even more important as measures move to eCQMs. A few other commenters mentioned that they do not support reducing hospital response times to validation requests without assurances from CMS that hospitals will receive timely feedback as a result. One commenter had concerns that given the scarce resources in health care currently, this proposal will present increased hardship to many facilities. The commenters requested that CMS continue to allow 45 days for submission of medical records to CDAC.

Response: As previously noted, the majority of participating hospitals in the Hospital OQR program have submitted their records prior to 30 calendar days in the current process according to the CDAC data. Given this, we believe that this adjusted timeline will not impose hardship on those hospitals. Additionally, our findings show that outpatient records contain less pages than inpatient records therefore, we do not anticipate that HOPDs will require additional time, resources, or administrative burden compared to inpatient hospitals, which already complete this process within the 30-day timeframe. We acknowledge that the reduction in time may require some hospitals to adjust their procedures to meet the new deadline, but this

proposal does not change the number of records requested, and we believe that a majority of hospitals have already shown the 30-day timeframe is feasible. Furthermore, as stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42263 through 42264), this proposal would allow us to reduce the time needed to complete validation and provide hospitals with valuable and timely feedback of their results.

We also thank the commenters for their concern about the timing of this proposal as CMS shifts focus to eCQMs. As we gain more experience with eCQMs we will continue to monitor any potential challenges and adjust our validation requirements in future rulemaking if necessary.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

d. Targeting Criteria

(1) Background

In the CY 2012 OPPS/ASC final rule with comment period (76 FR 74485), we finalized a validation selection process in which we select a random sample of 450 hospitals for validation purposes and select an additional 50 hospitals based on specific criteria. We finalized a policy in the CY 2013 OPPS/ASC final rule with comment period (77 FR 68485 through 68486), that for the CY 2014 payment determination and subsequent years, a hospital will be preliminarily selected for validation based on targeting criteria if it fails the validation requirement that applies to the previous year's payment determination. We also refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68486 through 68487) for a discussion of finalized policies regarding our medical record validation procedure requirements. We codified at § 419.46(f)(3) that we select a random sample of 450 hospitals for validation purposes, and select an additional 50 hospitals for validation purposes based on the following criteria:

- The hospital fails the validation requirement that applies to the previous year's payment determination; or
- The hospital has an outlier value for a measure based on the data it submits. An ''outlier value'' is a measure value that is greater than 5 standard deviations from the mean of the measure values for other hospitals and indicates a poor score.

In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59441), we clarified that an ''outlier value'' for purposes of this targeting is defined as a measure value that appears to deviate markedly from the measure values for other hospitals.

(2) Addition of Targeting Criteria

Beginning with validations affecting the CY 2022 reporting period/CY 2024 payment determination and subsequent years, in the CY 2022 OPPS/ASC proposed rule (86 FR 42264), we proposed to add to the two established targeting criteria used to select the 50 additional hospitals. Specifically, we proposed to revise § 419.46(f)(3) to add the following criteria for targeting the additional 50 hospitals:

- Any hospital that has not been randomly selected for validation in any of the previous 3 years.
- Any hospital that passed validation in the previous year, but had a two-tailed confidence interval that included 75 percent.

We stated in the proposed rule our belief that these proposals would allow more hospitals the opportunity for validation. First, by adding targeting criteria for any hospital that has not been randomly selected for validation in any of the previous 3 years, we can ensure that hospitals are eligible to be validated on a regular basis even if they are not selected under the randomly selected sample. Second, the option to selectively review hospitals that have a confidence interval that includes 75 percent is important because hospitals whose confidence interval includes 75 percent indicates a higher level of uncertainty as to the reliability of data for that particular hospital. By adding the targeting criteria for hospitals with two-tailed confidence interval that includes 75 percent, we can target those hospitals that are in the statistical margin of error for their accuracy (which includes hospitals that both pass and fail on this level). These proposals also align Hospital OQR Program validation with additional aspects of Hospital IQR Program validation (77 FR 53553). We believe that these proposed additional criteria would improve data quality by increased targeting of hospitals with possible or confirmed past data quality issues. Additionally, the proposal would respond to concerns that CMS does not have a methodology to address hospitals for which both passing and falling levels of accuracy were included for the statistical margin of error.[419]

We received comments on these topics.

Comment: A few commenters supported the proposed changes to the targeting criteria used in the data validation process beginning with the CY 2022 reporting period/CY 2024 payment determination and subsequent years.

Response: We thank the commenters for their support.

Comment: One commenter did not support targeting a hospital that passed validation in the previous year with a two-tailed confidence interval that includes 75 percent.

Response: We appreciate the commenters feedback and reiterate that validation continues to be an integral part of maintaining data integrity. We believe that finalizing these additional targeting criteria will provide more hospitals the opportunity to be selected for validation and ensure data integrity.

Comment: A few commenters provided recommendations to CMS regarding the targeting criteria for validation policies. One commenter urged CMS to coordinate validation requirements between the Hospital OQR and Hospital IQR programs to ensure that hospitals that are selected for validation are only required to validate data for the Hospital OQR or Hospital IQR program, instead of both programs. Another commenter noted that validation is an intense year long process for facilities and recommended that the administration should not repeatedly require administrative processes for validation efforts in order to create additional availability for important quality improvement initiatives.

Response: We appreciate the commenters' feedback and reiterate that validation is an important part of ensuring data integrity and that the finalization of these policies will help ensure data integrity and align validation policies across quality reporting programs. Each year there are only 10–15 hospitals that overlap in selection for validation. We closely review the selected hospitals to ensure there is no overlap in the record requests between the Hospital OQR and Hospital IQR programs. This review also allows us to ensure that hospitals have sufficient time to fulfill one request at a time. These policies are intended to align the Hospital OQR Program validation process with the Hospital IQR Program, which furthers overall cross-program alignment goals.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

e. Educational Review Process and Score Review and Correction Period for Chart-Abstracted Measures

We refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59441 through 59443) and

[419] Government Accountability Office. ''Hospital Quality Data. CMS needs more rigorous methods to ensure reliability of publicly released data''. GAO–06–54, January 2006.

the CY 2021 OPPS/ASC final rule with comment period (85 FR 86185), where we finalized and codified a policy to formalize the Educational Review Process for Chart-Abstracted Measures, including Validation Score Review and Correction.

We did not propose any changes to these policies in the proposed rule.

10. Extraordinary Circumstances Exception (ECE) Process for the CY 2022 Payment Determination and Subsequent Years

a. Background

We refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68489), the CY 2014 OPPS/ASC final rule with comment period (78 FR 75119 through 75120), the CY 2015 OPPS/ASC final rule with comment period (79 FR 66966), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70524), the CY 2017 OPPS/ASC final rule with comment period (81 FR 79795), the CY 2018 OPPS/ASC final rule with comment period (82 FR 59444), and 42 CFR 419.46(e) for a complete discussion of our extraordinary circumstances exception (ECE) process under the Hospital OQR Program.

b. Expanding the Extraordinary Circumstances Exemption to eCQMs

As part of our proposed policies in support of the introduction of eCQMs into the Hospital OQR Program, beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years, in the CY 2022 OPPS/ASC proposed rule (86 FR 42264), we proposed to expand our established Extraordinary Circumstances Exceptions policy to allow hospitals to request an exception from the Hospital OQR Program's eCQM reporting requirements based on hardships preventing hospitals from electronically reporting. We note that our proposal aligns with the Hospital IQR Program's Extraordinary Circumstances Exceptions policy for eCQMs (80 FR 49695, 42 CFR 412.140(c)(2)).

Under this proposal, applicable hardships could include, but are not limited to, infrastructure challenges (hospitals must demonstrate that they are in an area without sufficient internet access or face insurmountable barriers to obtaining infrastructure) or unforeseen circumstances, such as vendor issues outside of the hospital's control (including a vendor product losing certification). In addition, under the Hospital OQR Program, we may consider being a newly participating hospital as undergoing hardship such that newly participating hospitals can apply for an exemption for the applicable program year. Newly participating hospitals are required to begin data submission under the Hospital OQR Program procedural requirements at § 419.46(d)(1), which describes submission and validation of Hospital OQR Program data.

We also proposed that a hospital participating in the Hospital OQR Program that wishes to request an exception must submit its request to CMS by April 1 following the end of the reporting calendar year in which the extraordinary circumstances occurred. For example, if an extraordinary circumstance occurred on or by December 31, 2024, the ECE request must be submitted by April 1, 2025. Specific requirements for submission of a request for an exception would be available on the QualityNet website available at: *https://qualitynet.cms.gov/*. We received comments on these topics.

Comment: A few commenters expressed support for the expansion of the ECE policy to cover eCQMs under the Hospital OQR Program.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing this proposal as proposed.

11. Hospital OQR Program Reconsideration and Appeals Procedures for the CY 2022 Payment Determination and Subsequent Years

We refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68487 through 68489), the CY 2014 OPPS/ASC final rule with comment period (78 FR 75118 through 75119), the CY 2016 OPPS/ASC final rule with comment period (80 FR 70524), the CY 2017 OPPS/ASC final rule with comment period (81 FR 79795), the CY 2021 OPPS/ASC final rule with comment period (85 FR 68185), and 42 CFR 419.46(g) for our reconsideration and appeals procedures. We did not propose any changes to these policies in the proposed rule.

E. Payment Reduction for Hospitals That Fail To Meet the Hospital OQR Program Requirements for the CY 2022 Payment Determination

1. Background

Section 1833(t)(17) of the Act, which applies to subsection (d) hospitals (as defined under section 1886(d)(1)(B) of the Act), states that hospitals that fail to report data required to be submitted on measures selected by the Secretary, in the form and manner, and at a time, specified by the Secretary will incur a 2.0 percentage point reduction to their Outpatient Department (OPD) fee schedule increase factor; that is, the annual payment update factor. Section 1833(t)(17)(A)(ii) of the Act specifies that any reduction applies only to the payment year involved and will not be taken into account in computing the applicable OPD fee schedule increase factor for a subsequent year.

The application of a reduced OPD fee schedule increase factor results in reduced national unadjusted payment rates that apply to certain outpatient items and services provided by hospitals that are required to report outpatient quality data in order to receive the full payment update factor and that fail to meet the Hospital OQR Program requirements. Hospitals that meet the reporting requirements receive the full OPPS payment update without the reduction. For a more detailed discussion of how this payment reduction was initially implemented, we refer readers to the CY 2009 OPPS/ASC final rule with comment period (73 FR 68769 through 68772).

The national unadjusted payment rates for many services paid under the OPPS equal the product of the OPPS conversion factor and the scaled relative payment weight for the APC to which the service is assigned. The OPPS conversion factor, which is updated annually by the OPD fee schedule increase factor, is used to calculate the OPPS payment rate for services with the following status indicators (listed in Addendum B to the proposed rule, which is available via the internet on the CMS website): ''J1'', ''J2'', ''P'', ''Q1'', ''Q2'', ''Q3'', ''R'', ''S'', ''T'', ''V'', or ''U''. In the CY 2017 OPPS/ASC final rule with comment period (81 FR 79796), we clarified that the reporting ratio does not apply to codes with status indicator ''Q4'' because services and procedures coded with status indicator ''Q4'' are either packaged or paid through the Clinical Laboratory Fee Schedule and are never paid separately through the OPPS. Payment for all services assigned to these status indicators will be subject to the reduction of the national unadjusted payment rates for hospitals that fail to meet Hospital OQR Program requirements, with the exception of services assigned to New Technology APCs with assigned status indicator ''S'' or ''T''. We refer readers to the CY 2009 OPPS/ASC final rule with comment period (73 FR 68770 through 68771) for a discussion of this policy.

The OPD fee schedule increase factor is an input into the OPPS conversion factor, which is used to calculate OPPS

payment rates. To reduce the OPD fee schedule increase factor for hospitals that fail to meet reporting requirements, we calculate two conversion factors—a full market basket conversion factor (that is, the full conversion factor), and a reduced market basket conversion factor (that is, the reduced conversion factor). We then calculate a reduction ratio by dividing the reduced conversion factor by the full conversion factor. We refer to this reduction ratio as the ''reporting ratio'' to indicate that it applies to payment for hospitals that fail to meet their reporting requirements. Applying this reporting ratio to the OPPS payment amounts results in reduced national unadjusted payment rates that are mathematically equivalent to the reduced national unadjusted payment rates that would result if we multiplied the scaled OPPS relative payment weights by the reduced conversion factor. For example, to determine the reduced national unadjusted payment rates that applied to hospitals that failed to meet their quality reporting requirements for the CY 2010 OPPS, we multiplied the final full national unadjusted payment rate found in Addendum B of the CY 2010 OPPS/ASC final rule with comment period by the CY 2010 OPPS final reporting ratio of 0.980 (74 FR 60642).

We note that the only difference in the calculation for the full conversion factor and the calculation for the reduced conversion factor is that the full conversion factor uses the full OPD update and the reduced conversion factor uses the reduced OPD update. The baseline OPPS conversion factor calculation is the same since all other adjustments would be applied to both conversion factor calculations. Therefore, our standard approach of calculating the reporting ratio as described earlier in this section is equivalent to dividing the reduced OPD update factor by that of the full OPD update factor. In other words:

Full Conversion Factor = Baseline OPPS conversion factor * (1 + OPD update factor)

Reduced Conversion Factor = Baseline OPPS conversion factor * (1 + OPD update factor − 0.02)

Reporting Ratio = Reduced Conversion Factor/Full Conversion Factor

Which is equivalent to:

Reporting Ratio = (1 + OPD Update factor − 0.02)/(1 + OPD update factor)

In the CY 2009 OPPS/ASC final rule with comment period (73 FR 68771 through 68772), we established a policy that the Medicare beneficiary's minimum unadjusted copayment and national unadjusted copayment for a service to which a reduced national unadjusted payment rate applies would each equal the product of the reporting ratio and the national unadjusted copayment or the minimum unadjusted copayment, as applicable, for the service. Under this policy, we apply the reporting ratio to both the minimum unadjusted copayment and national unadjusted copayment for services provided by hospitals that receive the payment reduction for failure to meet the Hospital OQR Program reporting requirements. This application of the reporting ratio to the national unadjusted and minimum unadjusted copayments is calculated according to § 419.41 of our regulations, prior to any adjustment for a hospital's failure to meet the quality reporting standards according to § 419.43(h). Beneficiaries and secondary payers thereby share in the reduction of payments to these hospitals.

In the CY 2009 OPPS/ASC final rule with comment period (73 FR 68772), we established the policy that all other applicable adjustments to the OPPS national unadjusted payment rates apply when the OPD fee schedule increase factor is reduced for hospitals that fail to meet the requirements of the Hospital OQR Program. For example, the following standard adjustments apply to the reduced national unadjusted payment rates: The wage index adjustment, the multiple procedure adjustment, the interrupted procedure adjustment, the rural sole community hospital adjustment, and the adjustment for devices furnished with full or partial credit or without cost. Similarly, OPPS outlier payments made for high cost and complex procedures will continue to be made when outlier criteria are met. For hospitals that fail to meet the quality data reporting requirements, the hospitals' costs are compared to the reduced payments for purposes of outlier eligibility and payment calculation. We established this policy in the OPPS beginning in the CY 2010 OPPS/ASC final rule with comment period (74 FR 60642). For a complete discussion of the OPPS outlier calculation and eligibility criteria, we refer readers to section II.G. of this final rule with comment period.

2. Reporting Ratio Application and Associated Adjustment Policy for CY 2022

We proposed to continue our established policy of applying the reduction of the OPD fee schedule increase factor through the use of a reporting ratio for those hospitals that fail to meet the Hospital OQR Program requirements for the full CY 2022 annual payment update factor. For the CY 2022 OPPS/ASC proposed rule, the proposed reporting ratio is 0.9805, which, when multiplied by the proposed full conversion factor of $84.457, equals a proposed conversion factor for hospitals that fail to meet the requirements of the Hospital OQR Program (that is, the reduced conversion factor) of $82.810. We proposed to continue to apply the reporting ratio to all services calculated using the OPPS conversion factor. We proposed to continue to apply the reporting ratio, when applicable, to all HCPCS codes to which we have proposed status indicator assignments of ''J1'', ''J2'', ''P'', ''Q1'', ''Q2'', ''Q3'', ''R'', ''S'', ''T'', ''V'', and ''U'' (other than new technology APCs to which we have proposed status indicator assignment of ''S'' and ''T''). We proposed to continue to exclude services paid under New Technology APCs. We proposed to continue to apply the reporting ratio to the national unadjusted payment rates and the minimum unadjusted and national unadjusted copayment rates of all applicable services for those hospitals that fail to meet the Hospital OQR Program reporting requirements. We also proposed to continue to apply all other applicable standard adjustments to the OPPS national unadjusted payment rates for hospitals that fail to meet the requirements of the Hospital OQR Program. Similarly, we proposed to continue to calculate OPPS outlier eligibility and outlier payment based on the reduced payment rates for those hospitals that fail to meet the reporting requirements. In addition to our proposal to implement the policy through the use of a reporting ratio, we also proposed to calculate the reporting ratio to four decimals (rather than the previously used three decimals) to more precisely calculate the reduced adjusted payment and copayment rates.

For CY 2022, the proposed reporting ratio is 0.9805, which, when multiplied by the final full conversion factor of 84.457, equals a proposed conversion factor for hospitals that fail to meet the requirements of the Hospital OQR Program (that is, the reduced conversion factor) of 82.810.

Comment: Two commenters asserted that the proposed reduced conversion factor of $82.810 and the proposed reporting ratio of 0.9805 are incorrect. Both commenters claim the proposed reduced conversion factor should be $83.227 and the proposed reporting ratio should be 0.9854. The commenters did not provide detailed calculations to support these assertions.

Response: We reviewed our calculations from the proposed rule after receiving these comments, and we were able to reconfirm our findings from the proposed rule that the reduced conversion factor was correctly calculated at $82.810 and the reporting ratio was correctly calculated at 0.9805. We would refer the commenters to the earlier text in this section (section XV.E.1. of this final rule with comment period) that provides a detailed description of the calculations we perform to generate the reduced conversion factor and the reporting ratio. In addition, we refer readers to the Conversion Factor calculation described in Part 2 of the OPPS Claims Accounting narrative, included with each proposed and final OPPS rule, available on the CMS website at: *https://www.cms.gov/*.

For this final rule with comment period, the final reporting ratio is 0.9804, which, when multiplied by the final full conversion factor of 84.177, equals a final conversion factor for hospitals that fail to meet the requirements of the Hospital OQR Program (that is, the reduced conversion factor) of 82.526. We are finalizing our proposal to continue to calculate OPPS outlier eligibility and outlier payment based on the reduced payment rates for those hospitals that fail to meet the reporting requirements. We are also finalizing our proposals to implement the policy through the use of a reporting ratio, and to calculate the reporting ratio to four decimals (rather than the previously used three decimals) to more precisely calculate the reduced adjusted payment and copayment rates for hospitals that fail to meet the Hospital OQR Program requirements for CY 2022 payment.

XVI. Requirements for the Ambulatory Surgical Center Quality Reporting (ASCQR) Program

A. Background

1. Overview

We refer readers to section XIV.A.1. of this final rule with comment period (84 FR 61410) for a general overview of our quality reporting programs and to the CY 2019 OPPS/ASC final rule with comment period (83 FR 58820 through 58822) where we previously discussed our Meaningful Measures Framework.

2. Statutory History of the ASCQR Program

We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74492 through 74494) for a detailed discussion of the statutory history of the ASCQR Program.

3. Regulatory History of the ASCQR Program

We refer readers to the CY 2014 through 2021 OPPS/ASC final rules with comment period for an overview of the regulatory history of the ASCQR Program:

- CY 2014 OPPS/ASC final rule (78 FR 75122);
- CY 2015 OPPS/ASC final rule (79 FR 66966 through 66987);
- CY 2016 OPPS/ASC final rule (80 FR 70526 through 70538);
- CY 2017 OPPS/ASC final rule (81 FR 79797 through 79826);
- CY 2018 OPPS/ASC final rule (82 FR 59445 through 59476);
- CY 2019 OPPS/ASC final rule (83 FR 59110 through 59139);
- CY 2020 OPPS/ASC final rule (84 FR 61420 through 61434); and
- CY 2021 OPPS/ASC final rule (85 FR 86187 through 86193).

We have codified requirements under the ASCQR Program at 42 CFR, part 16, subpart H (42 CFR 416.300 through 416.330).

B. ASCQR Program Quality Measures

1. Considerations in the Selection of ASCQR Program Quality Measures

We refer readers to the CY 2013 OPPS/ASC final rule with comment period (77 FR 68493 through 68494) for a detailed discussion of the priorities we consider for the ASCQR Program quality measure selection. We did not propose any changes to these policies in the proposed rule.

2. Retention and Removal of Quality Measures From the ASCQR Program

a. Retention of Previously Adopted ASCQR Program Measures

We previously finalized a policy that quality measures adopted for an ASCQR Program measure set for a previous payment determination year be retained in the ASCQR Program for measure sets for subsequent payment determination years, except when such measures are removed, suspended, or replaced as indicated (76 FR 74494 and 74504; 77 FR 68494 through 68495; 78 FR 75122; and 79 FR 66967 through 66969). We did not propose any changes to this policy in the proposed rule.

b. Removal Factors for ASCQR Program Measures

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59111 through 59115), we clarified, finalized, and codified at § 416.320 an updated set of factors [420] and the process for removing measures from the ASCQR Program. We did not propose any changes to the measure removal factors in the proposed rule.

3. Proposal To Adopt a New Measure for the ASCQR Program Measure Set

In the CY 2022 OPPS/ASC proposed rule (86 FR 42267), we proposed to adopt one new measure: COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) measure (to be designated ASC–20) beginning with the CY 2022 reporting period/2024 payment determination.

a. Adoption of the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) Measure (ASC–20) Beginning With the CY 2022 Reporting Period/CY 2024 Payment Determination

(1) Background

On January 31, 2020, the Secretary declared a public health emergency (PHE) for the United States (U.S.) in response to the global outbreak of SARS–CoV–2, a novel coronavirus that causes a disease named ''coronavirus disease 2019'' (COVID–19).[421] COVID–19 is a contagious respiratory infection [422] that can cause serious illness and death. Older individuals, some racial and ethnic minorities, and those with underlying medical conditions are considered to be at higher risk for more serious complications from COVID–19.[423] [424] As of July 2, 2021, the U.S. reported over 33 million cases of COVID–19- and over 600,000 COVID–19 deaths.[425] As of October 14, 2021, the U.S. reported over 44 million cases and over 718,000

[420] We note that we previously referred to these factors as ''criteria'' (for example, 79 FR 66967 through 66969); we now use the term ''factors'' to align the ASCQR Program terminology with the terminology we use in other CMS quality reporting and pay-for-performance (value-based purchasing) programs.

[425] Centers for Disease Control and Prevention. (2021). CDC COVID Data Tracker. Available at: *https://covid.cdc.gov/covid-data-tracker/#cases_casesper100klast7days*.

COVID–19 deaths.[426] Hospitals and health systems have seen significant surges of COVID–19 patients as community infection levels increased.[427] From December 2, 2020 through January 30, 2021, more than 100,000 Americans with COVID–19- were hospitalized at the same time.[428]

Evidence indicates that COVID–19 primarily spreads when individuals are in close contact with one another.[429] Ongoing research indicates that fully vaccinated people without immunocompromising conditions are able to engage in most activities with very low risk of acquiring or transmitting SARS–CoV–2, and the Centers for Disease Control and Prevention (CDC) issued new guidance for fully vaccinated individuals on May 28, 2021.[430] The virus is typically transmitted through respiratory droplets or small particles created when someone who is infected with the virus coughs, sneezes, sings, talks or breathes.[431] Thus, the CDC advises that infections mainly occur through exposure to respiratory droplets when a person is in close contact with someone who has COVID–19.[432] Experts believe that COVID–19 spreads less commonly through contact with a contaminated surface [433] and that in certain circumstances, infection can occur through airborne transmission.[434] According to the CDC, those at greatest risk of infection are persons who have had prolonged, unprotected close contact (that is, within 6 feet for 15 minutes or longer) with an individual with confirmed COVID–19 infection, regardless of whether the individual has symptoms.[435] Although personal protective equipment (PPE) and other infection-control precautions can reduce the likelihood of transmission in health care settings, COVID–19 can spread between HCP and patients or from patient to patient given the close contact that may occur during the provision of care.[436] The CDC has emphasized that health care settings can be high-risk places for COVID–19 exposure and transmission.[437]

Vaccination is a critical part of the nation's strategy to effectively counter the spread of COVID–19 and ultimately help restore societal functioning.[438] On December 11, 2020, the Food and Drug Administration (FDA) issued the first Emergency Use Authorization (EUA) for a COVID–19 vaccine in the U.S.[439] Subsequently, FDA issued EUAs for additional COVID–19 vaccines.[440] [441] Following the publication of the proposed rule, FDA granted full approval to Comirnaty®, the Pfizer-BioNTech COVID–19 vaccine, on August 23, 2021.[442]

As part of its national strategy to address COVID–19, the White House stated on March 25, 2021 that it would work with states and the private sector to execute an aggressive vaccination strategy and outlined a goal of administering 200 million shots in 100 days.[443] On April 21, 2021, it was announced that this goal had been achieved.[444] Although the goal of the U.S. Government is to ensure that every American who wants to receive a COVID–19 vaccine can receive one, the Department of Health and Human Services, the Department of Defense, and the CDC, recommended that early vaccination efforts focus on those critical to the PHE response, including HCP, and individuals at highest risk for developing severe illness from COVID–19.[445] The CDC's Advisory Committee on Immunization Practices (ACIP) recommended that HCP should be among those individuals prioritized to receive the initial, limited supply of the COVID–19 vaccination, given the potential for transmission in health care settings and the need to preserve health care system capacity.[446] Reportedly most states followed this recommendation,[447] and HCP began

[426] This information has been updated from the proposed rule to reflect current data from the Centers for Disease Control and Prevention. (2021). CDC COVID Data Tracker. Available at: *https://covid.cdc.gov/covid-data-tracker/#cases_casesper100klast7days*.

receiving the vaccine in mid-December of 2020.[448]

Frontline healthcare workers, such as those employed in ASCs, have been prioritized for vaccination in most locations. There are approximately 18 million healthcare workers in the U.S.[449] A survey of HCP found that 66 percent of hospital HCP and 64 percent of outpatient clinic HCP reported receiving at least one dose of the vaccine.[450] As of July 2, 2021, the CDC reported that over 328 million doses of COVID–19 vaccine have been administered and approximately 155.9 million people had received full doses.[451] Subsequently, the CDC reported that as of October 14, 2021, over 405 million doses of COVID–19 vaccine have been administered and approximately 188.3 million people had received full doses.[452] The White House indicated on April 6, 2021 that the U.S. retains sufficient vaccine supply, and every adult became eligible to receive the vaccine beginning April 19, 2021.[453] Finally, as part of the efforts to vaccinate those who are still unvaccinated through increasing the number of Americans covered by vaccination requirements,[454] on September 9, 2021, the Biden Administration announced that COVID–19 vaccination will be required of all staff within Medicare and Medicaid-certified facilities to protect both patients and HCP against COVID–19.[455]

We believe it is important to require that ASCs report HCP vaccination information for health care facilities to assess whether these facilities are taking this step to limit the spread of COVID–19 among their health care workers and to help sustain the ability of ASCs to continue serving their communities throughout the PHE and beyond. Therefore, we proposed adoption of a new measure, COVID–19 Vaccination Coverage Among HCP (ASC–20), beginning with the CY 2024 payment determination. For that payment year, ASCs would be required to report data quarterly on the measure for the January 2022 through December 2022 reporting period. The measure would assess the proportion of an ASC's health care workforce that has been vaccinated against COVID–19.

HCP are at risk of transmitting COVID–19 infection to patients, experiencing illness or death as a result of COVID–19 infection themselves, and transmitting it to their families, friends, and the general public. We believe ASCs should report the level of vaccination among their HCP as part of their efforts to assess and reduce the risk of transmission of COVID–19 within their facilities. HCP vaccination can reduce illness that leads to work absence and limit disruptions to providing care[456] with major reductions in SARS–CoV–2 infections among those receiving a two dose COVID–19 vaccine despite a high community infection rate.[457] Data from influenza vaccination demonstrate that provider vaccination is associated with that provider recommending vaccination to patients[458] and we believe HCP COVID–19 vaccination in ASCs could similarly increase vaccination among that patient population. We also believe that publishing the HCP vaccination rates will be helpful to many patients, particularly those who are at high-risk for developing serious complications from COVID–19, as they choose among ASCs for treatment. Under CMS' Meaningful Measures Framework, the COVID–19 measure addresses the quality priority of ''Promote Effective Prevention and Treatment of Chronic Disease'' through the Meaningful Measures Area of ''Preventive Care.''

(2) Overview of Measure

The COVID–19 Vaccination Coverage Among HCP measure (''COVID–19 HCP vaccination measure'') (ASC–20) is a process measure developed by the CDC to track COVID–19 vaccination coverage among HCP in non-LTC facilities including ASCs.

(a) Measure Specifications

The denominator for the HCP measure is the number of HCP eligible to work in the ASC for at least 1 day during the reporting period, excluding persons with contraindications to COVID–19 vaccination that are described by the CDC.[459]

The numerator for the HCP measure is the cumulative number of HCP eligible to work in at the ASC for at least 1 day during the reporting period and who received a complete vaccination course against COVID–19.[460] [461] [462] [463] A complete vaccination course may require multiple doses or regular revaccination.[464] Vaccination coverage for purposes of this measure is defined

as the estimated percentage (given the potential for week-to-week variation) of HCP eligible to work at the ASC for at least 1 day who received a COVID–19 vaccine. For reporting, facilities would count HCP working in all facilities that share the same CMS certification number (CCN).[465] The specifications for the COVID–19 HCP vaccination measure (ASC–20) are available on the NQF website at: *https://www.cdc.gov/nhsn/nqf/index.html*.[466]

(b) Review by the Measure Applications Partnership

The COVID–19 HCP vaccination measure (ASC–20) was included on the publicly available ''List of Measures Under Consideration for December 21, 2020,'' [467] a list of measures under consideration for use in various Medicare programs. The Measure Applications Partnership (MAP) hospital workgroup convened on January 11, 2021 and reviewed the Measures Under Consideration (MUC) List including the COVID–19 HCP vaccination measure (ASC–20). The MAP hospital workgroup agreed that the proposed measure represents a promising effort to advance measurement for an evolving national pandemic and that it could bring value to the ASCQR Program measure set by providing transparency about an important COVID–19 intervention to help prevent infections in HCP and patients.[468] The MAP hospital workgroup also stated in its recommendations that collecting information on COVID–19 vaccination coverage among HCP and providing feedback to facilities will allow facilities to benchmark coverage rates and improve coverage in their facility, and that reducing COVID–19 infection rates in HCP may reduce transmission among patients and reduce instances of staff shortages due to illness.[469]

In its preliminary recommendations, the MAP hospital workgroup did not support this measure for rulemaking, subject to potential for mitigation.[470] To mitigate its concerns, the MAP hospital workgroup believed that the measure needed well-documented evidence, finalized specifications, testing, and National Quality Forum (NQF) endorsement prior to implementation.[471] Subsequently, the MAP Coordinating Committee met on January 25, 2021 and reviewed the COVID–19 HCP vaccination measure (ASC–20). In the 2020 and 2021 MAP Final Recommendations, the MAP offered conditional support for rulemaking contingent on CMS bringing the measures back to MAP once the specifications are further refined.[472] The MAP stated, ''the incomplete specifications require immediate mitigation and further development should continue.'' [473] In its final report, the MAP noted that the measure would add value by providing visibility into an important intervention to limit COVID–19 infections in HCP and the patients for whom they provide care.[474] The spreadsheet of final recommendations no longer cited concerns regarding evidence, testing, or NQF endorsement.[475] In response to the MAP final recommendation request that CMS bring the measure back to the MAP once the specifications are further refined, CMS and the CDC met with the MAP Coordinating Committee on March 15, 2021. CMS and CDC provided additional information to address vaccine availability, alignment of the COVID–19 HCP vaccination measure (ASC–20) as being as closely as possible with the data collection for the Influenza HCP vaccination measure (NQF #0431), and provided clarification on how HCP are defined. CMS and the CDC also presented preliminary findings from the testing of the numerator of the COVID–19 HCP vaccination measure, which is currently in process. These preliminary findings show numerator data should be feasible to collect and reliable. Testing of the measure numerator (the number of HCP vaccinated) involves a comparison of the data collected through the National Healthcare Safety Network (NHSN) and independently reported through the Federal pharmacy partnership program for delivering vaccination to LTC facilities. These are two independent data collection systems. In initial analyses of the first month of vaccination, the number of healthcare workers vaccinated in approximately 1,200 facilities for which data from both systems were available, the number of healthcare personnel vaccinated was highly correlated between the two systems with a correlation coefficient of nearly 90 percent in the second 2 weeks of reporting.[476] Because of the high correlation across a large number of facilities and high number of HCP within those facilities receiving at least one dose of the COVID–19 vaccine, we believe the measure is feasible and reliable for use in ASCs. After reviewing this additional information, the MAP retained its final recommendation of conditional support, and expressed support for CMS' efforts to use the measure as part of the solution for the COVID–19 public health crisis.[477]

Section 1890A(a)(4) of the Act, as added by section 3014(b) of the Affordable Care Act, requires the Secretary to take into consideration input from multi-stakeholder groups in selecting certain quality and efficiency measures. While we value input from the MAP, we believe it is important to propose the measure as quickly as possible to address the urgency of the COVID–19 PHE and its impact on vulnerable populations. CMS continues to engage with the MAP to mitigate concerns and appreciates the MAP's conditional support for the measure.

(c) Measure Endorsement

Section 1833(i)(7)(B) of the Act states that section 1833(t)(17) of the Act shall apply with respect to ASC services in a similar manner in which it applies to hospitals for the Hospital OQR Program, except as the Secretary may otherwise provide. The requirements at section 1833(t)(17)(C)(i) of the Act state that measures developed shall ''be appropriate for the measurement of the quality of care (including medication errors) furnished by hospitals in outpatient settings and that reflect consensus among affected parties and, to the extent feasible and practicable, shall include measures set forth by one or more national consensus building entities.''

In general, we prefer to adopt measures that have been endorsed by the NQF because it is a national multi-stakeholder organization with a well-documented and rigorous approach to

[477] *Ibid.*

consensus development. However, as we have noted in previous rulemaking (for example, 75 FR 72065 and 76 FR 74494 for the Hospital OQR and ASCQR Programs, respectively), the requirement that measures reflect consensus among affected parties can be achieved in other ways, including through the measure development process, through broad acceptance, use of the measure(s), and through public comment.

The COVID–19 HCP vaccination measure (ASC–20) is not NQF-endorsed and has not been submitted to NQF for endorsement consideration. The CDC, in collaboration with CMS, is planning to submit the measure for consideration in the NQF Fall 2021 measure cycle. However, we found no other feasible and practicable measures on the topic of COVID–19 vaccination among HCP.

Section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practicable measure has not been endorsed by the entity with a contract under section 1890(a) (currently the NQF), the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Therefore, with the above considerations, we believe there is sufficient basis to propose the adoption of this measure at this time.

(d) Data Collection, Submission, and Reporting

Given the time sensitive nature of this measure considering the current PHE, we proposed that ASCs would be required to begin reporting data on the COVID–19 HCP vaccination measure (ASC–20) beginning January 1, 2022, for the CY 2024 payment determination for the ASCQR Program. Thereafter, we proposed quarterly reporting periods. While we considered annual reporting periods for the ASCQR Program, we proposed quarterly reporting periods given the immediacy of the PHE and the importance of alignment across quality payment programs that proposed this measure.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42270), we stated that ASCs would report the measure through the CDC NHSN web-based surveillance system.[478] While the ASCQR Program does not currently require use of the NHSN web-based surveillance system, we previously required use of this system for submitting program data. We refer readers to the CY 2014 OPPS/ASC final rule with comment period in which we adopted the Influenza Vaccination Coverage Among HCP (NQF #0431) measure (78 FR 75110 through 75117) and section XVI.D.1.c.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42282) for additional information on reporting through the NHSN web-based surveillance system under the ASCQR Program. The Influenza Vaccination Coverage Among HCP (NQF #0431) measure was removed from the ASCQR Program in the CY 2019 OPPS/ASC final rule with comment period as CMS observed that reporting measure data through the NHSN could be more burdensome for ASCs compared to the relative burden for hospitals participating in the Hospital IQR Program and the HAC Reduction Program and especially for freestanding ASCs (83 FR 59115 through 59117). However, the COVID–19 pandemic and associated PHE have had a more significant effect on more aspects of society than influenza, including availability of the healthcare system. With respect to reporting for the COVID–19 HCP vaccination measure (ASC–20), CDC guidance for entering data requires submission of HCP count at the facility level[479] and the measure requires reporting consistent with that guidance. We believe that the public health benefits to having these data available outweigh the burden of reporting for systems with multiple facilities or locations. While we recognize that there may be some elements of the measure specifications that increase burden for some ASCs, given the impact that the COVID–19 PHE has had on society and the healthcare system, we believe that the benefits outweigh this reporting burden. For more information on the associated burden of this measure, we refer readers to XXV.C.5.b. of the CY 2022 OPPS/ASC proposed rule.

To report this measure, we proposed that ASCs would collect the numerator and denominator for the COVID–19 HCP vaccination measure (ASC–20) for at least one, self-selected week during each month of the reporting quarter and submit the data to the NHSN Healthcare Personal Safety (HPS) Component before the quarterly deadline to meet ASCQR Program requirements. While we believe that it would be ideal to have HCP vaccination data for every week of each month, we are mindful of the time and resources that ASCs would need to report the data. Thus, in collaboration with the CDC, we determined that data from at least 1 week of each month would be sufficient to obtain a reliable estimate of vaccination levels among an ASC's HCP while balancing the costs of reporting. If an ASC submits more than 1 week of data in a month, the most recent week's data would be used to calculate the measure. For example, if first and third week data are submitted, third week data would be used. If first, second, and fourth week data are submitted, fourth week data would be used. Each quarter, we proposed that the CDC would calculate a single quarterly COVID–19 HCP vaccination coverage rate for each ASC, which would be calculated by taking the average of the data from the three submission periods submitted by the ASC for that quarter. CMS would publicly report each quarterly COVID–19 HCP vaccination coverage rate as calculated by the CDC.

ASCs would submit the number of HCP eligible to have worked at the facility during the self-selected week that the ASC reports data in NHSN (denominator) and the number of those HCP who have received a complete course of a COVID–19 vaccination (numerator) during the same self-selected week. As previously stated, facilities would count HCP working in all facilities that share the same CCN.[480]

We received comments on these topics. We note that this measure was also proposed for the Hospital Outpatient Quality Reporting Program; comments specific to hospitals and this program are discussed in section XV.B.4.a. of this final rule with comment period.

Comment: Many commenters supported our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) and expressed the importance of vaccination in the fight against COVID–19. Some commenters stated that reporting the measure will ensure transparency and accountability in infection prevention and control for vulnerable populations and communities. Other commenters appreciated that the measure would make COVID–19 vaccination information available to the public in health care decisions.

Response: We thank commenters for their support of the measure and agree that the measure is critically important in the ongoing fight against COVID–19. Additionally, we agree with the commenter that reporting and

[478] Centers for Disease Control and Prevention. Surveillance for Weekly HCP COVID–19 Vaccination. Accessed at: *https://www.cdc.gov/nhsn/hps/weekly-covid-vac/index.html* on February 10, 2021.

[479] Centers for Disease Control and Prevention. COVID–19 Vaccination Non-LTC Healthcare Personnel TOI *https://www.cdc.gov/nhsn/index.html.*

[480] *Ibid.*

publication of this measure would assist the public in making more informed health care decisions.

Comment: A few commenters expressed concern that COVID–19 vaccines are authorized under EUA, and the measure should not be adopted until such time that a vaccine has received full FDA approval. One commenter observed that all three currently available vaccines should be fully approved by FDA prior to adoption of this measure to reduce vaccine hesitancy.

Response: On August 23, 2021, subsequent to the publication of the CY 2022 OPPS/ASC proposed rule (86 FR 42267), FDA granted full approval to Comirnaty®, which has been known as the Pfizer-BioNTech COVID–19 vaccine.[481] While we recognize there are differences between EUA authorization and full FDA approval, we note that the process for each is scientifically rigorous and we refer readers to information related to FDA's process for evaluating an Emergency Use Authorization (EUA) request at *https://www.fda.gov/vaccines-blood-biologics/vaccines/emergency-use-authorization vaccines-explained*. Each vaccine manufacturer that received EUA authorization enrolled tens of thousands of participants in randomized clinical trials, which is similar to what is required for full FDA approval.[482] Manufacturers submit robust and rigorous data for both an EUA authorization and full FDA approval, and more than 404 million doses of COVID–19 vaccines have been administered.[483] We believe all COVID–19 vaccines granted full approval and EUA authorization to be proven safe and effective and we believe it is appropriate to include the measure in the ASCQR Program.

We further note that the COVID–19 Vaccination Coverage Among HCP measure does not itself require HCP to receive the vaccination, nor does this measure reward or penalize HOPDs for the rate of HCP who have received a COVID–19 vaccine. The COVID–19 Vaccination Coverage Among HCP measure requires HOPDs to collect and report COVID–19 vaccination data that would support public health tracking and provide beneficiaries and their caregivers information to support informed decision making.

Comment: Several commenters opposed adoption of the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) due to a lack of evidence that ASCs contribute to the spread of COVID–19. These commenters cited a survey that found that, despite ASCs performing essential outpatient surgeries during March and April 2020, patients faced virtually no increase to the risk of contracting COVID–19.[484]

Response: We appreciate the commenters' feedback. Patient safety is a top priority of the ASCQR Program, and we believe that the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) will promote infection prevention and control for patients as well as HCP and other staff working in ASCs. We acknowledge that there is evidence that ASCs previously experienced low rates of COVID–19 among patients. The survey cited by the commenter and conducted by the ASC Quality Collaboration surveyed 709 ASCs in eight states about outpatient surgical procedures performed on 84,446 patients in March and April 2020; only 16 patients tested positive for COVID–19 within 14 days after the procedure.[485] We note that incidence of new cases and the nation's capacity to test for new cases during the March and April 2020 time frame cited in the survey shared by the commenters is not representative of current conditions. At the time, new cases per day did not exceed 35,000. More recently, COVID–19 cases and deaths nationally have continued to rise. Comparatively in recent months, new cases per day have reached more than 189,000 with seven-day average case rates exceeding 100,000 during most of August and September 2021.[486] Since the publication of the proposed rule, the emergence of coronavirus variants have resulted in 8.9 million new virus cases.[487] Thus, we believe it is appropriate to adopt the COVID–19 Vaccination Coverage Among HCP measure in the ASCQR Program as soon as possible to further infection control efforts and to increase transparency regarding vaccination status of HCP.

Comment: Some commenters stated that it is inappropriate to use payment policies to drive vaccination coverage among HCP. Some commenters expressed concern that this measure could lead facilities to mandate vaccines for staff, with potential unintended consequences (specifically, staff quitting or legal risk for facilities for staff experiencing adverse events).

Response: We note that this measure does not financially reward or punish ASCs for their vaccine coverage rate. As part of the ASCQR Program, an ASC's payment is affected only if it fails to report the requisite measures, not by the rate it reports. As such, we do not believe that the adoption of this measure uses Medicare payment policies to drive vaccination coverage among HCP. Additionally, we believe that publicly reporting the data will be useful to consumers in choosing healthcare providers, including by making comparisons between ASCs. We noted in the CY 2022 OPPS/ASC proposed rule (86 FR 42239), a survey of HCP from April 2021 found that 66 percent of hospital HCP and 64 percent of outpatient clinic HCP reported receiving at least one dose of the vaccine.[488] Subsequent to the publication of the CY 2022 OPPS/ASC proposed rule, research from August 2021 suggests that nearly 73 percent of HCP across all health care facilities have received at least one dose of the vaccine.[489] Based on these findings, we understand that HCP have been receiving the COVID–19 vaccine prior to the adoption and we believe that this measure encourages continued vaccination within ASCs.

Comment: One commenter requested clarification on the definition of ''health care personnel.'' Several commenters expressed a preference for data collection at the NPI level instead of by CCN.

Response: We recognize commenters' concerns regarding the reporting burden associated with the specifications of this measure, specifically around the definition of HCP. We note that given the highly infectious nature of the COVID–19 virus, we believe it is important to encourage all personnel within the hospital, regardless of patient contact, role, or employment type, to receive the COVID–19 vaccination to prevent outbreaks within the hospital which may affect resource availability and have a negative impact on patient access to care. We also note that the measure specifications define ''eligible'' HCP as all persons receiving a direct paycheck from the reporting facility (that is, on the facility's payroll), regardless of clinical responsibility or patient contact, licensed independent practitioners, and adult students/trainees and volunteers.[490] We recognize that ASCs utilize their NPIs for billing and are more familiar with this identifier; whereas, the NHSN system has been constructed to use the CCN as the facility identifier. A look-up tool mapping NPI to CCN is available for ASCs at *https://www.qualityreportingcenter.com/en/ascqr-program/data-dashboard/ccn/*.

Comment: Several commenters expressed concern that this measure should not be adopted until there is clarity around the impact of future booster recommendations. One commenter stated that the numerator requirement of a completed vaccination course may change over time and recommended that CMS establish a definition of completed vaccination course using the national guidelines as of the date the OPPS final rule is published each year. Other commenters recommended that reporting for the measure should be optional or delayed until a completed vaccination course can be more clearly and specifically defined.

Response: The COVID–19 Vaccination Coverage Among HCP measure (ASC–20) is a measure of a completed vaccination course (as defined in section XVI.B.3.a.2. of the CY 2022 OPPS/ASC proposed rule (86 FR 42268)) and does not address booster shots. On August 12, 2021, FDA amended the EUAs for both the Pfizer-BioNTech COVID–19 Vaccine and the Moderna COVID–19 Vaccine to allow for the use of an additional dose in certain immunocompromised individuals, specifically, solid organ transplant recipients or those who are diagnosed with conditions that are considered to have an equivalent level of immunocompromise.[491] The Centers for Disease Control on September 27, 2021 further recommended Pfizer-BioNTech boosters for individuals who completed their initial series at least six months ago and are 65 years of age or older; 18 years of age or older with underlying medical conditions; and 18 years of age or older living and working in high-risk settings, which includes healthcare workers.[492] We acknowledge commenter concerns that ASCs will be required to collect additional information from HCP on booster doses. However, we believe that the numerator is sufficiently broad to include future boosters as part of a ''complete vaccination course.''

Comment: Several commenters cited Equal Employment Opportunity Commission (EEOC) guidelines, which state that employers must provide a reasonable accommodation if an employee's sincerely held religious belief, practice, or observance prevents them from receiving the vaccination. The commenters requested that CMS and the CDC revise the measure exclusions to align with EEOC guidance. One commenter expressed concern that the measure may lead to violation of individual employee's rights to choose whether to receive the vaccine.

Response: We recognize that there are reasons, including religious objections or concerns regarding an individual's specific health status, that may lead individual HCP to decline vaccination. We emphasize that this measure does not mandate vaccines, it only requires reporting of vaccination rates for successful program participation. However, we believe that accurate vaccination rates of HCP are meaningful data for patients and beneficiaries to use when choosing an ASC. The CDC, the measure's steward, offers guidance regarding the reporting on HCP who decline vaccination due to religious reasons. Those HCP, however, would be included in the measure denominator along with other HCP who have not received a completed vaccination course.[493]

We further note that the EEOC released updated and expanded technical assistance on May 28, 2021, stating that Federal equal employment opportunity (EEO) laws do not prevent an employer from requiring all employees physically entering the workplace to be vaccinated for COVID–19, so long as the employer complies with the reasonable accommodation provisions of the Americans with Disabilities Act (ADA) and Title VII of the Civil Rights Act of 1964 and other EEOC considerations.[494] Thus, we do not believe that this measure conflicts with any EEOC guidance and believe it is appropriate to require facilities to report these data.

Comment: A few commenters noted that, while vaccination plays an important role in ending the COVID–19 pandemic, the measure is not currently endorsed by the National Quality Forum and these commenters believed it should not be adopted until it receives such an endorsement. One commenter observed that NQF endorsement improves credibility and affords patients certainty that the measure data is reliable. One commenter recommended that CMS clarify that the adoption of a measure prior to NQF endorsement is only due to the exigency of the current circumstances. One commenter expressed a preference for measures that have been thoroughly tested and reviewed.

Response: We acknowledge that the COVID vaccination of HCP measure is not NQF endorsed. However, as discussed in section XVI.B.3.a.(2).(c). of this final rule with comment period and below, we believe it is appropriate to develop and select this measure and that such development and selection is consistent with section 1833(i)(7)(B) of the Act. While we prefer to develop measures endorsed by a consensus building entity such as the NQF, we note that sections 1833(i)(7)(B) and 1833(t)(17)(C) of the Act do not limit CMS to developing and selecting such measures.

[493] Centers for Disease Control and Prevention. Reporting Weekly COVID–19 Vaccination Data for Healthcare Personnel Using the National Healthcare Safety Network (NHSN). September 2021. Available at: *https://www.cdc.gov/nhsn/pdfs/hps/covidvax/weekly-covid-reporting-508.pdf*.

[494] U.S. Equal Employment Opportunity Commission. What You Should Know About COVID–19 and the ADA, the Rehabilitation Act, and Other EEO Laws. May 28, 2021. Available at: *https://www.eeoc.gov/wysk/what-you-should-know-about-covid-19-and-ada-rehabilitation-act-and-other-eeo-laws*.

At this time, there is no NQF endorsed measure addressing the COVID–19 vaccination rate of HCP. Further, we believe that in the context of the current COVID–19 PHE and continued monitoring and surveillance following the PHE, it is important to adopt this measure as quickly as possible to allow tracking and reporting of COVID–19 Vaccination Coverage Among HCP. This tracking would allow facilities to identify the appropriateness and effectiveness of their infection control efforts, their initiatives to improve vaccination coverage, and would provide patients and consumers with important information for them to make more informed health care decisions. As such, it is neither feasible nor practical for CMS to delay the adoption of this measure until the NQF has endorsed it. We do note, nonetheless, that the CDC recently submitted the quarterly reported HCP COVID–19 vaccination measure for the NQF Fall 2021 measure cycle and intends to submit a biannual reporting version of the COVID–19 vaccination measure for HCP in January 2022.

In addition to the above, we note that the adoption of this measure is consistent with sections 1833(t)(17)(C)(ii) and 1886(b)(3)(B)(viii) of the Act, as incorporated into section 1833(i)(7)(B) of the Act. Pursuant to this authority, the ASCQR Program may select measures that are the same as (or a subset of) the measures for which data are required to be submitted under the Hospital IQR Program. We note that the Hospital IQR Program recently adopted a COVID–19 HCP Vaccination measure for which this data is required to be submitted (86 FR 45374 through 45382).

Comment: One commenter recommended development of a validation process for the COVID–19 Vaccination Coverage Among HCP measure (ASC–20).

Response: We appreciate the commenter's suggestion; we interpret the comment's referral to ''validation'' as what is done under our quality reporting programs where data reported is verified against data contained in original documentation, usually medical records. As discussed in section XVI.3.a.(2).(b). of the CY 2022 OPPS/ASC proposed rule (86 FR 42269), a comparison of two independent databases indicate that the measure is highly reliable and feasible. We agree that it would be preferable to validate COVD–19 vaccination data and will investigate how this could be done in balance with potential burden on ASCs and other facility types for any such process.

Comment: One commenter supported public reporting of this measure and specifically noted support for early publication through the initial shortened reporting period.

Response: We thank the commenter for the support.

Comment: A few commenters expressed concern about reporting frequency. One commenter recommended that CMS reduce reporting frequency from quarterly to twice-yearly or annually to limit reporting burden. Another commenter stated that the reporting frequency would be time-intensive for ASCs with more than one location as those ASCs would need to collect information for staff across multiple facilities.

Response: As stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42270), we believe that it would be ideal to have HCP vaccination data for every week of each month, and we are mindful of the time and resources that ASCs would need to report the data. Thus, in collaboration with the CDC, we determined that data from at least 1 week of each month would be sufficient to obtain a reliable estimate of vaccination levels among an ASC's HCP while balancing the costs of reporting. We believe that reporting at a lower frequency may result in data that is less meaningful and timely to consumers who want to consider HCP vaccination rates as part of their health care decision-making process. Additionally, the CDC has provided a number of resources including a tool called the Data Tracking Worksheet for COVID–19 Vaccination among Healthcare Personnel to help facilities log and track the number of HCP who are vaccinated for COVID–19, which may reduce burden for ASCs. COVID vaccination data would be entered for each HCP in the tracking worksheet, and select a reporting week, and the data to be entered into the NHSN will automatically be calculated on the Reporting Summary.

Comment: One commenter observed that it is difficult for consumers to locate ASC quality data through CMS websites and recommended that CMS prioritize simplifying access to data on this measure due to the ongoing PHE.

Response: We acknowledge the commenters concern regarding availability of ASCQR Program data located currently on the CMS Provider Data Catalog rather than on the Care Compare site and intend to investigate alternate sites for making these data publicly available on a more expedient basis.

Comment: Many commenters expressed concern that the measure reporting requirements are duplicative of other state and federal COVID–19 vaccination reporting requirements and that inclusion of the measure in quality reporting programs is unnecessarily burdensome for ASCs. Some commenters questioned the purpose of the measure given the CMS announcement on September 9, 2021 that the agency will require COVID–19 vaccination of staff within all Medicare and Medicaid-certified facilities.[495] Other commenters noted that they are currently required to report COVID–19 vaccination information to HHS and requested that such reporting might be considered a substitute to reporting proposed for the measure. A few commenters recommended a change to attestation-based reporting to reduce resources and burden required for reporting based on the proposed measure specifications. One commenter observed that time spent on multiple reporting requirements would take away from time available for efforts to improve vaccination coverage. Another commenter requested an analysis of burden and feasibility of data collection prior to adoption of the measure. One commenter recommended re-evaluating the burden of data collection after measure data has been collected for one year.

Response: We appreciate commenters' feedback. We believe that the COVID–19 vaccination of HCP information submitted for this measure will be important as it will be made publicly available for use by Medicare beneficiaries and others in making informed decisions regarding their care including facility choice. We note that most Immunization Information Systems through which commenters may already be required to report vaccination information to HHS do not include the information needed to determine if an immunized person is a healthcare worker. Using the NHSN COVID–19 Vaccination Modules allows tracking vaccination coverage among the patients or HCP in ASCs.[496] We do recognize that this measure may lead to duplicative reporting if ASCs voluntarily report COVID–19 HCP vaccination information to other data reporting systems in addition to this measure requirement via the NHSN, and

[495] Centers for Medicare & Medicaid Services. Biden-Harris Administration to Expand Vaccination Requirements for Health Care Settings. September 9, 2021. Available at: *https://www.cms.gov/newsroom/press-releases/biden-harris-administration-expand-vaccination-requirements-health-care-settings.*

[496] Centers for Disease Control and Prevention. FAQs on Reporting COVID–19 Vaccination Data. August 2021. Available at: *https://www.cdc.gov/nhsn/hps/weekly-covid-vac/faqs.html.*

we are collaborating with other HHS agencies, including the CDC to minimize reporting burden to the extent feasible.

With regard to measure burden analysis, we refer the commenter to section XXIII.C. of this final rule with comment period, where we discuss the burden associated with the measure. We thank the commenters for the suggestion that the measure be attestation-based and note that any changes to the measure specifications would be proposed through future rulemaking.

Comment: Several commenters observed that there are no currently required measures in the ASCQR Program measure set that require use of NHSN. These commenters observed that this significantly increases reporting burden for this measure because ASCs will be required to enroll in NHSN to submit data for this measure, and NHSN enrollment and account maintenance is a burdensome process. Some of these commenters recommended postponing implementation of the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) to provide more time for ASCs to enroll in NHSN.

Response: We recognize commenters' concerns about operational requirements of reporting and reiterate the availability of resources from the CDC.[497] We believe that given the current COVID–19 PHE as well as the need for continued monitoring and surveillance, it is important to adopt this measure as quickly as possible to allow tracking and reporting of COVID–19 Vaccination Coverage Among HCP measure (ASC–20). As we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42270) and initially discussed in the CY 2019 OPPS/ASC final rule (83 FR 59115 through 59117), we further recognize that reporting measure data through the NHSN could be more burdensome for ASCs compared to the relative burden for hospitals participating in the Hospital IQR Program and the HAC Reduction Program and especially for freestanding ASCs. We believe, nonetheless, that the public health benefits to having these data available justify the burden of reporting for systems with multiple facilities or locations. While we recognize that there may be some elements of the measure specifications that increase burden for some ASCs, given the impact that the COVID–19 PHE has had on society and the healthcare system, we believe that the benefits, including equity, justify this reporting burden.

Comment: One commenter observed that requiring collection of data at least once monthly is burdensome for ASCs, many of which are small businesses. This commenter further observed that this frequency of data collection does not support the goal of providing patient information because the data will only be publicly reported on a quarterly basis. This commenter recommended aligning data requirements with public reporting frequency.

Response: As stated previously and in the CY 2022 OPPS/ASC proposed rule (86 FR 42270), we believe that it would be ideal to have HCP vaccination data for every week of each month, but are mindful of the time and resources that ASCs would need to report the data. Some COVID–19 vaccines require multiple doses over a period of weeks or months, and we believe that a lower frequency of reporting as recommended by the commenter would likely undercount fully vaccinated HCP within the ASC. Thus, in collaboration with the CDC, we determined that data from at least one week of each month would be sufficient to obtain a reliable estimate of vaccination levels among an ASC's HCP while balancing the costs of reporting.

Comment: One commenter recommended aligning with the policy finalized in the FY 2022 IPPS/LTCH PPS final rule in which only the most recent quarter of data will be used for public reporting (as opposed to a rolling 12-month report). Another commenter recommended against averaging monthly data points and suggested only reporting the most recent month's vaccination data to provide the most up-to-date information for patient decision making.

Response: We agree with the commenters; in alignment with the FY 2022 IPPS/LTCH PPS final rule (86 FR 45382) we will not finalize our plan to add one additional quarter of data during each advancing refresh until the point that four full quarters of data is reached and then report the measure using four rolling quarters of data. Instead, we will only report the most recent quarter of data. This would result in more meaningful information that is up to date and not diluted with older data. We emphasize that this modification of our proposal does not affect the data collection schedule established for submitting data to NHSN for the COVID–19 vaccination measure. This would simply update the data that are displayed for the public reporting purposes.

After consideration of the public comments we received, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) with a modification to publicly report only the most recent quarter of data. Additionally, data will also be available for preview by ASCs for 30 days prior to being made publicly available. This will result in more meaningful information that is up to date and not diluted with older data.

4. Changes to Previously Adopted Measures in the ASCQR Program Measure Set

We previously adopted the following measures into the ASCQR measure set: ASC–1: Patient Burn; ASC–2: Patient Fall; ASC–3: Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant; ASC–4: All-Cause Hospital Transfer/Admission; ASC–11: Cataracts—Improvement in Patient's Visual Function with 90 Days Following Cataract Surgery; and ASC–15a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems. For various reasons discussed in sections XVI.B.4.a., XVI.B.4.b., and XVI.B.4.c. of this final rule with comment period, these measures were either paused or suspended from the ASCQR Program.

a. Requirement of Previously Suspended ASC–1, ASC–2, ASC–3, and ASC–4 Measures Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination and Subsequent Years

(1) Background

We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74497 through 74498) where we adopted ASC–1: Patient Burn beginning with the CY 2014 payment determination. This outcome measure assesses the percentage of ASC admissions experiencing a burn prior to discharge. We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74498) where we adopted ASC–2: Patient Fall beginning with the CY 2014 payment determination (NQF #0266). This measure assesses the percentage of ASC admissions experiencing a fall at the ASC. We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74498 through 74499) where we adopted ASC–3: Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant beginning with the CY 2014 payment determination (NQF #0267). This outcome measure assesses the percentage of ASC admissions

[497] Centers for Disease Control and Prevention. Reporting Weekly COVID–19 Vaccination Data for Healthcare Personnel Using the National Healthcare Safety Network (NHSN). September 2021. Available at: *https://www.cdc.gov/nhsn/pdfs/hps/covidvax/weekly-covid-reporting-508.pdf.*

experiencing a wrong site, wrong side, wrong patient, wrong procedure, or wrong implant. We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74499) where we adopted ASC–4: All-Cause Hospital Transfer/Admission beginning with the CY 2014 payment determination (NQF #0265). This outcome measure assesses the rate of ASC admissions requiring a hospital transfer or hospital admission upon discharge from the ASC.

In the CY 2019 OPPS/ASC proposed rule, we proposed to remove ASC–1, ASC–2, ASC–3, and ASC–4 under measure removal Factor 1—measure performance among ASCs is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made—for the CY 2021 payment determination and subsequent years (83 FR 37198 through 37199). We noted that the ASCQR Program had previously finalized two criteria for determining when a measure is ''topped-out,'' including: (1) When there is statistically indistinguishable performance at the 75th and 90th percentiles of national facility performance; and (2) when the measure's truncated coefficient of variation (TCOV) is less than or equal to 0.10.[498] We presented data demonstrating that each of these four measures met the criteria for topped-out status and stated that we believed their removal from the ASCQR Program measure set was appropriate as there was little room for improvement. In addition, we stated that removal would alleviate the maintenance costs and administrative burden to ASCs associated with retaining the measures. As such, we believed the burden associated with reporting these measures outweighed the benefits of keeping them in the program (83 FR 37198 through 37199).

However, in the CY 2019 OPPS/ASC final rule with comment period, we stated that we had re-evaluated the data due to public comments and reviewed many studies demonstrating the importance of measuring and reporting the data for these measures (83 FR 59118). It became clear to us that these measures are more valuable to stakeholders than we had initially perceived. We agreed that it was important to continue to monitor these types of events, considering the potential negative impacts to patients' morbidity and mortality, to continue to prevent their occurrence and ensure that they remain rare. We acknowledged that these measures provided critical data to beneficiaries and were valuable to the ASC community. We also acknowledged that having measures that apply to all ASCs provides beneficiaries with the most comprehensive patient safety data to use when making decisions about a site of care. Therefore, in the CY 2019 OPPS/ASC final rule with comment period, we did not finalize our proposals to remove ASC–1, ASC–2, ASC–3, and ASC–4 (83 FR 59118). We believed it was more prudent to keep them in the measure set.

However, we also stated in the CY 2019 OPPS/ASC final rule with comment period that we were concerned about some of the data submitted for these measures (83 FR 59119). We explained that the data submission method for these measures, which involved adding specific QDCs onto eligible claims, may impact the completeness and accuracy of the data. Specifically, we were concerned that ASCs lacked the ability to correct the QDC codes that are used to calculate these measures from Medicare FFS claims (83 FR 59119) if the claim had been submitted and processed for payment. We stated that we believed that revising the data submission method for the measures, such as via QualityNet, would address this issue and allow facilities to correct any data submissions errors, resulting in more complete and accurate data (83 FR 59119).

Therefore, we suspended the data collection of ASC–1, ASC–2, ASC–3, and ASC–4 beginning with the CY 2019 reporting period/CY 2021 payment determination (83 FR 59119), but retained these measures in the measure set. Starting with the CY 2021 payment determination, facilities were not required to submit data for these four measures as part of ASCQR Program requirements, even though the measures remained in the ASCQR Program measure set. We stated that as we developed future revisions for the data collected for these measures, we would take into consideration other data submission methods that may allow for the reporting of adverse events across payers and would consider commenters' feedback toward the future updates to the measures (83 FR 59119).

(2) Requirement of ASC–1, ASC–2, ASC–3, and ASC–4 Measures Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination and Subsequent Years

In the CY 2022 OPPS/ASC proposed rule (86 FR 42271 through 42272), we proposed to again require and resume data collection for ASC–1, ASC2, ASC–3, and ASC–4 beginning with the CY 2023 reporting period/CY 2025 payment determination and subsequent years. We proposed that providers would submit data via the HQR System (formerly referred to as the QualityNet Secure Portal). We believe that web-based submission will make reporting easier and more efficient for facilities and will allow facilities to review and correct submitted data until the data submission deadline; our review and corrections policy is discussed in more detail at section XVI.D.2.f. of this final rule with comment period.

We stated that we believed that revising the data submission method for the measures, such as via QualityNet (now known as the HQR System) would address this issue and allow facilities to correct any data submissions errors, resulting in more complete and accurate data (83 FR 59119). Facilities would be able to review and correct their data submissions up to the data submission deadline. As we stated above, we also believe that while these measures have been ''topped-out'', the public continues to believe that it is important to monitor these types of events, considering the potential negative impacts to patients' morbidity and mortality, to continue to prevent their occurrence and ensure that they remain rare.

We refer readers to section XVI.D.1.c.(1). of the CY 2022 OPPS/ASC proposed rule (86 FR 42281), where we discussed the data submission process for web-based measures, for more detail on how ASCs would be expected to submit data.

We received comments on these topics.

Comment: Many commenters supported resuming ASC–1, ASC–2, ASC–3, and ASC–4. Commenters noted that the measures will help improve care and patient experience while minimizing unnecessary burden. Commenters further stated that the measures focus on areas of critical importance for the safety of patients treated in ASCs. One commenter specifically stated the importance of ASC–2 as virtually all patients having outpatient procedures or surgery receive sedatives, anesthetics and/or pain

[498] In the CY 2019 OPPS/ASC proposed rule, we also clarified how we calculated the TCOV for ASC–1, ASC–2, ASC–3, and ASC–4, which assess the rate of rare, undesired events for which a lower rate is preferred. Typically, for measures for which a higher rate is preferred, we determine the TCOV by calculating the truncated standard deviation (SD) in performance divided by the truncated mean of performance (the mean of positive events). For these four measures, we employed an alternate methodology utilizing the mean of *non-adverse* events in our calculation of the TCOV. This substitution resulted in a TCOV that was comparable to that calculated for other measures and allowed us to assess rare event measures by still generally using our previously finalized topped-out criteria. For more information, see 83 FR 37196 through 37197.

medications as a routine part of their care, which in turn increases the likelihood of a fall. This commenter also expressed the importance of ASC–4 and agreed that the rate of such transfers and admissions should be monitored to flag where improvements in practices or patient selection criteria are needed, given that ASCs can take steps to reduce the incidence of such events. One commenter supported the measures and recommended that physical therapists be consulted for falls as part of ASC–2.

Response: We thank the commenters for their support and agree that resuming ASC–1, ASC–2, ASC–3, and ASC–4 so that collecting information on the incidence of these patient safety events and making the information publicly available is important.

Comment: A few commenters did not support resuming reporting of the measures. Some commenters noted that the measures no longer maintain NQF endorsement and recommended that NQF endorsement be restored before reporting resumes. A few commenters stated that the measures were no longer required for reporting because they were topped out and rare, and their reintroduction into the program is unlikely to offer meaningful or actionable data for ASCs.

Response: While it is true that these measures are no longer NQF endorsed, endorsement was not removed, but instead lapsed as the measure steward made the decision not to submit the measures for reconsideration of endorsement. Data for these measures continues to be collected and reported under the Ambulatory Surgical Center Association (ASCA)'s benchmarking effort for their members. Thus, we believe that these measures continue to meet the statutory requirement of consensus.

With regard to the measures being topped out, as we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42271) and initially discussed in the CY 2019 OPPS/ASC final rule with comment period (83 FR 59118), we re-evaluated the measure data and reviewed many studies demonstrating the importance of measuring and reporting the data for these measures. ASC–1, ASC–2, ASC–3, and ASC–4 are measures that provide information to consumers about overall quality and safety within an ASC compared to other measures in the ASCQR Program measure set that focus on the quality and safety of specific procedures or events that may take place in an ASC setting. Therefore, we believe these measures are valuable and that it is important to continue to monitor these types of events, given the potential negative impacts to patients' morbidity and mortality, in order to continue to prevent their occurrence and ensure that they remain rare.

Comment: Some commenters requested clarification on the reporting population and noted that previously, these claims-based measures were reported only for Medicare FFS patients, but could be expanded to all patients. A few of these commenters recommended expanding reporting to all patients to increase transparency and accountability of the measures. One commenter stated that there have been problems with the batch submission function for reporting the measure data in the HQR platform and requested an update from CMS on how this issue has been addressed. One commenter requested clarification on what is meant by CY 2023 reporting period/CY 2025 payment determination. The commenter noted that it understood the first year of reporting was data collection, the second year was data reporting, and the third year was payment impact. If data collection is required to resume in January 2022, the commenter notes this would be challenging to implement. One commenter expressed a preference for reporting the measures via QualityNet instead of HQR.

Response: We appreciate commenter questions regarding the reporting population. As commenters noted, these measures were previously claims-based measures and applied to Medicare FFS patients. However, we would like to clarify that because the measures have been reintroduced as web-based, they will apply to all ASC patients in accordance with the measure developer's specifications, which define the denominator as all ASC admissions.[499] As stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42281), ASC–1, ASC–2, ASC–3, and ASC–4 were proposed for reintroduction as measures submitted via an online data submission tool. In the CY 2014 OPPS/ASC final rule (78 FR 75113), we discussed data submission for measures submitted via web-based reporting tools and stated that hospitals and ASCs would submit aggregate-level data through the CMS web-based tools for measures with such specifications. We agree with the commenters that reporting for all ASC patients will promote transparency and accountability for the measure data. With regard to batch submission issues, we appreciate the comment and note that systems changes are in progress for restoring the batch submission functionality that was compromised with the implementation of new infrastructure. We acknowledge the commenter's concern about reporting beginning in January 2022 and note that data collection will resume beginning CY 2023 with reporting in CY 2024 and payment in CY 2025. Many ASCs are familiar with reporting for these measures and we believe it is appropriate to finalize the measures for inclusion in the ASCQR Program beginning CY 2023. We clarify that for reporting purposes, reporting via the HQR System and QualityNet are equivalent. Reporting via HQR allows ASCs to make corrections during the data submission period which was not possible in the past if an ASC identified an erroneous or missing QDC on a claim that had already been submitted and processed, reduces the amount of time and resources required to submit measure data, and simplifies the requirements of the ASCQR Program by streamlining the number of methods required for quality measure data submission.

After consideration of the public comments we received, we are finalizing this proposal as proposed with the clarification regarding the population for which data will be collected.

b. ASC–11: Cataracts—Improvement in Patient's Visual Function Within 90 Days Following Cataract Surgery (NQF #1536) Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination

(1) Background

In the CY 2014 OPPS/ASC final rule with comment period (78 FR 75124 through 75129) we finalized the adoption of the ASC–11: Cataracts—Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure.[500] This measure assesses the percentage of patients aged 18 years and older who had cataract surgery and had improvement in visual function achieved within 90 days following the cataract surgery (78 FR 75129) via the administration of pre-operative and post-operative visual function surveys.

During the CY 2014 OPPS/ASC rule cycle, some commenters expressed concern about the burden of collecting pre-operative and post-operative visual

[499] Ambulatory Surgical Center Quality Collaboration. Quality measures developed and tested by the ASC Quality Collaboration (ASC QC). Accessed at: *https://higherlogicdownload.s3.amazonaws.com/ASCACONNECT/1b34f1a1-0180-4005-9507-902fdf8f242e/UploadedImages/ASC_Quality_Collaboration/Documents/2019-Summary-ASC-QC-Measures.pdf.*

[500] We note that this measure was endorsed by the NQF under NQF #1536 at the time of adoption but has subsequently had its endorsement removed.

function surveys (78 FR 75129 and 75138). In response to those comments, we modified our implementation strategy in a manner that we believed would significantly minimize collection and reporting burden (78 FR 75129). Specifically, we applied a sampling scheme and a low case threshold exemption to address commenters' concerns regarding burden (78 FR 75138 through 75139). With those changes, we intended to decrease burden and facilitate data reporting by allowing random sampling of cases when volume is high, instead of collecting information for all eligible patients (78 FR 75138 through 75139). For further details, we refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75129; 75138 through 75139).

Shortly thereafter, we became concerned about the use of what we believed at the time were inconsistent surveys to assess visual function. The measure specifications allowed for the use of any validated survey and we were unclear about the impact the use of varying surveys might have. Therefore, we issued guidance stating that we would delay the implementation of ASC–11.[501]

Subsequently, in the CY 2015 OPPS/ASC final rule with comment period (79 FR 66984 through 66985), we finalized our proposal to exclude ASC–11 from the CY 2016 payment determination measure set, and for subsequent years (79 FR 66984). In addition, we finalized allowing ASCs to voluntarily report ASC–11 data for the CY 2015 reporting period/CY 2017 payment determination and subsequent years (79 FR 66984).

(2) ASC–11 Measure Beginning With the CY 2023 Reporting Period/CY 2025 Payment Determination and for Subsequent Years

In the CY 2022 OPPS/ASC proposed rule (86 FR 42272 through 42273), we stated that we believed it would be appropriate to require that ASCs report on ASC–11. We stated that ASCs have had the opportunity for several years to familiarize themselves with ASC–11, prepare to operationalize it, and opportunity to practice reporting the measure since the CY 2015 reporting period/CY 2017 payment determination. We noted that a small number of facilities have consistently reported data for this measure and these data have been made publicly available. While we previously had concerns regarding the use of different surveys to assess visual function (79 FR 66984), using different surveys has been found to not result in inconsistencies; the allowable surveys are scientifically validated and provide comparable results.[502] Of 16 different cataract surgery outcome questionnaires it has been demonstrated that all were able to detect clinically important change.[503]

In the CY 2022 OPPS/ASC proposed rule (86 FR 42272 through 42273), we proposed to require reporting for the NQF-endorsed ASC–11 measure beginning with the CY 2023 reporting period/CY 2025 payment determination and subsequent years. As we stated in the CY 2014 OPPS/ASC final rule with comment period, as well as the CY 2015 OPPS/ASC final rule with comment period and consistent with the MAP recommendation, we continue to believe that this measure ''addresses a high-impact condition'' that is not otherwise adequately addressed in our current measure set (78 FR 75129 and 79 FR 66984, respectively). Moreover, ASC–11 serves to drive coordination of care (78 FR 75129 and 79 FR 66984) in multiple ways, including the operational requisites for conducting and sharing the results of the surveys as well as providing opportunities for care coordination as well as direct patient feedback.

We refer readers to section XVI.D.1.c.(1). of this final rule with comment period for information about submitting data via a CMS web-based tool.

We received comments on these topics.

Comment: A few commenters supported our proposal to require the reporting of the ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure.

Response: We thank the commenters for their support. We agree that this measure has considerable merit as a patient-reported outcome measure for a large volume procedure for the ASC setting. We emphasize the value of this measure and continue to believe that ASC–11 addresses a high-impact condition and that it provides opportunities for care coordination and direct patient feedback.

Comment: Many commenters expressed concern about making this measure mandatory, stating that because the ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure is not currently mandatory, many facilities have not been ''practicing'' reporting it. One commenter additionally noted that this measure would be difficult to coordinate between physicians and ASCs.

Response: We thank the commenters for their feedback. We recognize from the challenges shared in the public comments, and discussed herein, that while the measure has been voluntary and available for reporting since the CY 2015 reporting period, a number of facilities have reported data for this measure and those that have reported it have done so consistently. To address commenters' concerns, we are finalizing to require ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery beginning with the CY 2025 reporting period/CY 2027 payment determination, instead of our originally proposed data collection beginning with the CY 2023 reporting period. We believe the 2-year extension from our originally proposed timeline of the CY 2023 reporting period/CY 2025 payment determination, will provide facilities with sufficient time to provide staff training and operationalize the measure for successful reporting in the ASCQR Program.

Comment: Many commenters did not support the requirement for mandatory reporting of the ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure, citing concerns about the operational complexity of collection and sharing data for the measure across physician and ASC settings. Many commenters believed administering surveys and tracking responses for the ASC–11 measure would be burdensome. Specifically, many commenters were concerned that this measure was developed as a physician-level measure, and related data would be generated and obtained in a physician's medical record and/or EHR that is not necessarily accessible by ASCs. One commenter expressed concern about being able to

[501] The implementation was first delayed by 3 months—from January 1, 2014 to April 1, 2014, for the CY 2016 payment determination, via guidance issued December 31, 2013. Available at: *https://qualitynet.cms.gov/asc/notifications*. Because of continuing concerns, on April 2, 2014, we issued additional guidance stating that we would further delay the implementation of the measure from April 1, 2014 to January 1, 2015 for the CY 2016 payment determination. Available at: *https://qualitynet.cms.gov/asc/notifications*.

[502] McAlinden C, Gothwal VK, Khadka J, Wright TA, Lamoureux EL, Pesudovs K. A head-to-head comparison of 16 cataract surgery outcome questionnaires. Ophthalmology. 2011 Dec;118(12):2374–81. doi: 10.1016/j.ophtha.2011.06.008. Epub 2011 Sep 25. PMID: 21945088.

[503] McAlinden C, Gothwal VK, Khadka J, Wright TA, Lamoureux EL, Pesudovs K. A head-to-head comparison of 16 cataract surgery outcome questionnaires. Ophthalmology. 2011 Dec;118(12):2374–81. doi: 10.1016/j.ophtha.2011.06.008. Epub 2011 Sep 25. PMID: 21945088.

share data between facilities and clinicians within the bounds of HIPAA.

Response: We thank the commenters for their input, and we acknowledge their concerns. Our overarching goal for proposing the adoption of the ASC–11 measure is to encourage the coordination of care across health care settings, providers, and suppliers as frequently as possible (78 FR 75126). We aim to see ASCs, ophthalmologists, and other clinicians such as optometrists, actively and routinely engaged in exchanging information to better communicate and coordinate the care of patients. We understand, however, that it may be difficult and complex to share data generated in different settings. We believe the 2-year extension from our originally proposed timeline of the CY 2023 reporting period/CY 2025 payment determination will provide ASCs with sufficient time for clinics and staff to address potential issues regarding extracting and sharing patient data. The 2-year extension will also allow facilities to prepare and update systems and technology, and prevent additional reporting burden during the COVID–19 pandemic. Additionally, we recognize that the ASC–11 measure is currently tested at the clinician-level and not at the facility-level. We will continue to monitor this measure and will address potential updates, as appropriate.

We note that the HIPAA Privacy Rule permits a covered entity to disclose PHI to another covered entity for certain health care operations of the recipient covered entity. Additionally, a covered entity may disclose PHI to a business associate and to allow a business associate to create, receive, maintain, or transmit PHI on its behalf, provided that the parties have a Business Associate Agreement (BAA) that meets the requirements of 45 CFR 164.504(e) and permits the business associate to use or disclose PHI only as permitted or required by its BAA or as required by law. The BAA must, among other things, establish the permitted and required uses and disclosures of PHI by the business associate.

Comment: A few commenters requested the measure remain voluntary because they believe that obtaining the data 90 days after outpatient surgery would be difficult. Commenters raised concerns that surveying patients and getting appropriate responses in this timeline may result in a resource burden for ASCs.

Response: We thank the commenters for their feedback and acknowledge their concerns. We highly encourage hospitals, ophthalmologists, and other clinicians to actively and routinely engage in exchanging information to better communicate and coordinate the care of patients to promote quality of care. We acknowledge complexity of administering and sharing data for ASC–11 across different settings; however, we emphasize the value of this measure and continue to believe that ASC–31 addresses a high-impact condition and provides opportunities for care coordination and direct patient feedback. We believe the 2-year extension from our originally proposed timeline of the CY 2023 reporting period/CY 2025 payment determination, will provide facilities with sufficient amount of time to provide staff training and operationalize the measure for successful reporting in the ASCQR Program, including implementing methods to procure appropriate data 90 days after outpatient surgery.

Comment: A few commenters raised concerns with measure specifications, especially the lack of specificity around administration of the survey to ensure consistency between the pre- and post-operative surveys as well as comparability of the measure across ASCs. One of these commenters disagreed with the use of the study cited, noting that it reviewed responsiveness of different questionnaires and not comparison of agreement across different questionnaires.

Response: We thank commenters for their feedback. We recognize commenter concerns related to the measure specifications. However, we respectfully disagree with the assessment of the McAlinden et al. study cited.[504] While that study indicated that the use of one survey is ideal for measuring visual function outcomes, we reiterate that their findings showed that the use of different surveys did not result in inconsistencies and we maintain that it is appropriate for inclusion in the ASCQR Program measure set. We reiterate our belief that ASC–11 provides a valuable opportunity to hear patient feedback on visual function outside of the clinical setting. After consideration of the public comments we received, we are finalizing the proposal to require ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery with modification. To address commenters' concerns, we are finalizing to require ASC–11: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery beginning with the CY 2025 reporting period/CY 2027 payment determination, instead of our originally proposed data collection beginning with the CY 2023. We believe the two-year extension from our originally proposed timeline of the CY 2023 reporting period/CY2025 payment determination, will provide ASCs with sufficient amount of time to implement coordination strategies between the surgeon and the ophthalmologist, provide staff training, and operationalize the measure for successful reporting in the ASCQR Program.

c. Requirement of ASC–15a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-Based Measures Beginning With Voluntary Reporting in CY 2023 Reporting Period and Mandatory Reporting Beginning With the CY 2024 Reporting Period/CY 2026 Payment Determination and for Subsequent Years

(1) Background

We previously adopted the ASC–15a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-based measures to assess patient experience with care following a procedure or surgery in an ASC. These survey-based measures rate patient experience as a means for empowering patients and improving the quality of their care (82 FR 59450). For further details on this measure, we refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79803 through 79817), in which we adopted these measures beginning with the CY 2020 payment determination.

Subsequently, in the CY 2018 OPPS/ASC final rule with comment period (82 FR 49450 through 49451), we delayed implementation of ASC–15a–e for the ASCQR Program beginning with the CY 2020 payment determination due to lack of sufficient operational and implementation data. At that time, we believed that our ongoing National OAS CAHPS Survey voluntary reporting program for the survey, which began in January 2016 [505] and is unrelated to

[504] McAlinden C, Gothwal VK, Khadka J, Wright TA, Lamoureux EL, Pesudovs K. A head-to-head comparison of 16 cataract surgery outcome questionnaires. Ophthalmology. 2011 Dec;118(12):2374–81. doi: 10.1016/j.ophtha.2011.06.008. Epub 2011 Sep 25. PMID: 21945088.

[505] Participation in the program is open to any interested Medicare-certified Hospital Outpatient Departments (HOPDs) and free-standing ambulatory surgery centers (ASCs). More information on the National OAS CAHPS Survey voluntary reporting program is available at: *https://oascahps.org/General-Information/National-Implementation* and *https://www.cms.gov/Research-Statistics-Data-and-Systems/Research/CAHPS/OAS-CAHPS.*

either the Hospital OQR Program or ASCQR Program, would provide valuable information moving forward. Specifically, we wanted to use the information from the National OAS CAHPS Survey voluntary reporting program to: (1) Ensure that the survey measures appropriately account for patient response rates, both aggregate and by survey administration method; (2) reaffirm the reliability of national implementation of OAS CAHPS Survey data; and (3) appropriately account for the burden associated with administering the survey in the outpatient care setting.

Having had the opportunity during the delayed implementation to investigate the concerns about patient response rates and data reliability, we believe that patients are able to respond to OAS CAHPS Survey questions, and that those responses are reliable based on experience collecting voluntary data for public reporting since CY 2016 (available at *https://www.medicare.gov/care-compare/*). We reaffirm that the OAS CAHPS Survey-based measures assess important aspects of care where the patient is the best or only source of information (81 FR 79803). Regarding the burden associated with the survey, we believe that measuring patient experience provides important information to ASCs and patients, especially for assessing the quality of care provided at an ASC (82 FR 59450). Furthermore, in section XVI.D.1.d.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42282 through 42284), we proposed additional collection modes using a web-based module (web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents) for administering the survey, which would be available beginning in CY 2023 under the ASCQR Program and for subsequent years.[506] We believe these additional collection modes would further address some burden concerns raised during the CY 2017 OPPS/ASC final rule with comment period (81 FR 59450) because the web-based modules may produce similar results, but at lower costs of collection.[507] As we stated in the CY 2018 OPPS/ASC final rule with comment period, we continue to believe that implementation of these measures will enable objective and meaningful comparisons between ASCs (82 FR 59450) and that patient experience of care data are valuable in assessing the quality of care provided at an ASC and assisting patients in selecting a provider for their care (82 FR 59450).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42273), we proposed to restart the ASC–15a–e measures by proposing to link reporting of measure data with payment determinations as part of the ASCQR Program beginning with the CY 2024 reporting period/CY 2026 payment determination. Specifically, for the ASCQR Program, we proposed voluntary data collection and reporting beginning with the CY 2023 reporting period, followed by mandatory data collection and reporting beginning with the CY 2024 reporting period/CY 2026 payment determination. As noted above, the National OAS CAHPS Survey voluntary reporting program is independent of the ASCQR Program and the Hospital OQR Program. ASCs that voluntarily report the OAS CAHPS Survey-based measures during the CY 2023 reporting period would do so as part of the ASCQR Program until mandatory reporting begins. The reporting process for ASCs to submit OAS CAHPS Survey data would remain unchanged, that is, ASCs would submit OAS CAHPS Survey data through their vendors who would submit these data to CMS as appropriate. We refer readers to section XVI.D.1.d. of this final rule with comment period for additional information regarding the form, manner, and timing for reporting the ASC–15a–e survey-based measures.

We initially considered a 2-year voluntary period, that is, the CY 2023 and CY 2024 reporting periods, because we believed that ASCs may require additional preparation time for OAS CAHPS Survey implementation including contracting with OAS CAHPS vendors. We also considered the challenges that many ASCs may have experienced during the COVID–19 pandemic and the additional operational constraints that they may still be experiencing. However, since voluntary reporting, including the two new modes of data collection we proposed in section XVI.D.1.d.(2) of the CY 2022 OPPS/ASC proposed rule (86 FR 42282 through 42284), will be available in 2022 as part of the National OAS CAHPS voluntary reporting program, we proposed 1 year of voluntary reporting as part of the ASCQR Program for the CY 2023 reporting period. As described in the NPRM, we believed that ASCs would have sufficient time to familiarize themselves with OAS CAHPS measures and OAS CAHPS vendors prior to mandatory reporting in the CY 2024 reporting period/CY 2026 payment determination and for subsequent years.

We refer readers to section XVI.D.1.d. of the CY 2022 OPPS/ASC proposed rule (86 FR 42282) for our related proposals regarding the form, manner, and timing for reporting the ASC–15a–e Survey-based measures.

We also refer readers to section XV.B.5.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42246 through 42247) where we proposed to restart this measure in the Hospital OQR Program. We received comments on these topics.

Comment: A few of commenters supported voluntary reporting of the ASC–15a–e: OAS CAHPS Survey-based measures for the CY 2023 reporting period/CY 2025 payment determination for the ASCQR Program. One commenter expressed support for CMS' efforts to develop the OAS CAHPS Survey-based measures and is pleased the OAS CAHPS Survey addresses the experience of surgical care received at both HOPDs and ASCs, which the commenter believes will support consumers' ability to compare facilities.

Response: We thank the commenters for their support for the voluntary reporting of the OAS CAHPS Survey-based measures as part of the ASCQR Program. We believe that these survey-based measures will be useful to assess aspects of care where the patient is the best or only source of information, and to enable objective and meaningful comparisons between ASCs. We believe reporting for these measures as part of the ASCQR Program would provide meaningful information to patients and provide ASCs the opportunity to experience reporting as part of the ASCQR Program. As the OAS CAHPS Survey results are available, they will be made publicly available along with other ASCQR measure data (currently on the CMS Provider Data Catalog), which is made available to inform consumers and encourage healthcare facilities to make continued improvements in care quality.

Comment: One commenter did not support the 1-year voluntary reporting period, but generally supported the inclusion of the OAS CAHPS Survey and recommended the 2-year period that CMS had initially considered. Another commenter urged CMS to delay voluntary implementation under the ASCQR Program until CY 2024. These commenters expressed concerns about staffing shortages and the cost and time to update systems to accommodate the measure during the unprecedented challenges posed by the COVID–19

[506] We note that the mixed modes will be available as part of the National OAS CAHPS voluntary reporting program beginning in CY 2022.

[507] Bergeson SC, Gray J, Ehrmantraut LA, Hays RD. Comparing Web-based with Mail Survey Administration of the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Clinician and Group Survey. Prim Health Care. 2013 Sept; doi: 10.4172/2167–1079.1000132. Available at: *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3783026/*.

pandemic, and the requirements imposed by other federal regulations, which they believe warrant extended preparation time for OAS CAHPS Survey implementation.

Response: We thank the commenters for their general support for inclusion of the OAS CAHPS Survey-based measures in the ASCQR Program and understand preference to delay the start of voluntary reporting based on concerns about COVID–19 and the need to accommodate ASCs while our nation works through the unprecedented COVID–19 pandemic. We also understand how delaying the implementation of the OAS CAHPS Survey-based measures as part of the ASCQR Program will afford ASCs additional time to address staffing shortages, prepare for additional federal regulations, and respond to the public health emergency caused by COVID–19. Due to the impact of the ongoing PHE for COVID–19 on ASC facilities, we are delaying the start of mandatory reporting by one year, to begin with the CY 2025 reporting period/CY 2027 payment determination under the ASCQR Program. Voluntary reporting will still be available as part of the ongoing program for voluntarily reporting the National OAS CAHPS Survey.

Comment: A couple commenters supported CMS' proposal to require mandatory reporting of the OAS CAHPS Survey-based measures within the ASCQR Program beginning with the CY 2024 reporting period/CY 2026 payment determination. One commenter noted the belief that the OAS CAHPS Survey-based measures will help facilities identify areas of strengths and areas of improvement for patient experience, while another believed the OAS CAHPS Survey-based measures would provide more real time quality data to inform ASCs' decision-making.

Response: We thank the commenters for their support for mandatory reporting of the OAS CAHPS Survey-based measures. We believe the measures will provide facilities with important feedback and support their ability to improve patient experience.

Comment: A few commenters recommended delaying mandatory implementation of the survey-based measures. Among commenters concerns were the ongoing COVID–19 pandemic and current staffing shortages.

Response: We thank the commenters for their feedback. We understand the commenters' requests to delay the mandatory implementation of the OAS CAHPS Survey-based measures and their concerns regarding the on-going public health emergency and staffing. We agree that delaying mandatory reporting of the OAS CAHPS Survey-based measures while ASCs respond to the COVID–19 pandemic and related staffing shortages is appropriate. As a result, we are delaying the start of mandatory reporting as part of the ASCQR Program until the CY 2025 reporting period/CY 2027 payment determination. Voluntary reporting will still be available as part of voluntary National OAS CAHPS Survey reporting.

Comment: A few commenters opposed mandatory reporting of the OAS CAHPS Survey-based measures and expressed concern regarding the financial and administrative burden of OAS CAHPS on ASCs. One commenter expressed concern that the cost of implementing the survey-based measures could exceed the 2 percent penalty for failing to meet the ASCQR Program requirements. Another commenter believed that ASCs may decide to stop providing services due to the cost of survey implementation. Other commenters opposed the OAS CAHPS Survey-based measure because they believe that ASCs are inadequately compensated by CMS to support the additional cost of the administration of the survey and OAS CAHPS Survey could force ASCs to reconsider remaining open or closing. Another commenter suggested that mandatory reporting of OAS CAHPS Survey may cause some small ASCs to stop reporting.

Response: We thank the commenters for their feedback. While there are administrative and financial burdens associated with implementing the OAS CAHPS Survey-based measures in the ASCQR Program, we believe the benefits of capturing patient experience of care data in the ASC setting outweigh the burdens. In selecting measures for the ASCQR Program, we weigh the relevance and utility of measures against the potential burden to ASCs resulting from the measure's adoption, and we believe the OAS CAHPS Survey-based measures are a vital source of information in assessing the quality of care provided at ASCs.

We post the list of the approved OAS CAHPS Survey vendors on *https://oascahps.org*, and we encourage ASCs to contact vendors for cost and service information pertaining to survey administration as there may be differences among vendors and multiple modes of conducting the survey provide greater economic choice.

In addition, we proposed additional modes to collect the OAS CAHPS Survey-based measures, which we expect to reduce the future cost of administration. We refer readers to the Protocols and Guidelines Manual for the OAS CAHPS Survey (*https://oascahps.org/Survey-Materials*) for materials for each mode of survey administration.

While we did not propose solely digital modes of conducting the OAS CAHPS Survey in the CY 2022 OPPS/ASC proposed rule, we are analyzing whether a web-only or digital-only format would be appropriate for the OAS CAHPS Survey-based measures, which could potentially further reduce the costs of administering the survey. We also refer to readers to section XVI.D.1.d.(2).(a) of this final rule with comment period and below where we finalize a reduced number of required surveys to meet the time, form and manner requirements, which should further reduce the expected burden on ASCs.

Comment: A few commenters requested we delay mandatory reporting of the OAS CAHPS Survey-based measures because of perceived issues with the CPT coding consistency across vendors and the IT requirements to maintain CPT and DRG code lists.

Response: We thank the commenters for their feedback. We interpret the commenters' concern to mean that there may be confusion over which patients would be eligible to be surveyed as part of the OAS CAHPS Survey reporting. The OAS CAHPS Survey is administered to all eligible patients—or a random sample thereof—who had at least one outpatient surgery/procedure during the applicable month. We acknowledge the concern about the use of CPT codes, including those for procedures that patients may not perceive as surgery. However, we note that many CPT codes have been excluded from inclusion in the OAS CAHPS Survey, including services like application of a cast or splint, in order to ensure that only patients receiving applicable procedures are surveyed.[508]

CMS recognizes in some cases there could be delays in getting the CPT codes updated in the patient record and transmitted to the survey vendor in a timely manner. Under the current protocol for survey administration, CMS allows survey vendors to work with HOPD and ASC facilities to identify alternatives ways to identify the patient records for outpatient surgery or diagnostic procedures that were performed in eligible HOPDs or ASCs (as identified by the facility-level eligibility criteria). Vendors can submit exception requests to request alternative

[508] *See* Announcements (*oascahps.org*) where updates on Survey specifications and guidelines are available.

methods for identifying the eligible population. We also note that the current protocol for survey administration allows for late start requests for situations in which the complete patient records are not available within the target window of time for survey administration. Vendors can submit late start requests when the patient data file is received more than 26 days after the sample month. This allows for flexibility in situations when the CPT codes are not available initially but can be updated. Further, sampling is allowed to proceed if 90 percent of the patient records have CPT codes.

Any updates to the Survey Specifications and Guidelines will be available on the OAS CAHPS Survey website (*https://oascahps.org/*).

Comment: Many commenters expressed concern regarding the length of the survey, recommending that the survey should be significantly shortened to focus on actionable aspects of the patient experience and to encourage higher response rates amongst patients. Specifically, some commenters recommended that a revised survey should include 5–10 questions.

Response: The OAS CAHPS Survey is comparable in length and survey response rate to other patient experience of care surveys. The survey instrument was developed to provide a more complete picture of the patients' experience of care in the ASC setting. The 24 core questions of the OAS CAHPS Survey are either directly actionable (that is, give feedback to ASCs/hospitals) or inform the need for patients to answer subsequent questions that are actionable. We note that the survey results to date do not show that respondents are terminating the interview before the last question, which would be an indication of respondent fatigue for a survey that is too long. Based on the most recently received national implementation data for voluntary reporting, the nonresponse due to terminated interviews is less than 1 percent.

Implementing the OAS CAHPS Survey-based measures in the ASCQR Program will enable patients to compare patient experience of care data across multiple ASCs as part of their healthcare decision-making. In addition, we believe implementing these measures in the ASCQR Program will incentivize ASCs to factor patient experience of care into their quality improvement efforts more proactively. However, we also acknowledge these commenters' concerns about the length of the OAS CAHPS Survey and will continue to consider whether refinement would be appropriate.

Comment: A commenter opposed mandatory reporting and expressed concern about the national data reliability of the OAS CAHPS Survey.

Response: We thank the commenter for its comments. We disagree that OAS CAHPS Survey does not have national data reliability. OAS CAHPS Survey data has been collected as part of the voluntary National OAS CAHPS Survey since 2016. Based on our experience through this reporting, we are able to: (1) Ensure that the survey measures appropriately account for patient response rates, both aggregate and by survey administration method; (2) reaffirm the reliability of national implementation of OAS CAHPS Survey data; and (3) appropriately account for the burden associated with administering the survey in the outpatient setting. Unit-level reliability analysis of the publicly reported composites for OAS CAHPS are well above the .70 cut-off typically used to assess reliability of a measure.

Comment: One commenter expressed concern that the OAS CAHPS Survey uses the Top-Box methodology rather than the net promoter score (NPS) to measure patient satisfaction, which the commenter believes provides less meaningful data on measuring patient satisfaction. Another commenter noted that the response scale and compact scoring distribution may limit the ability for consumers to differentiate high and low quality providers.

Response: We thank the commenters for their feedback. In 2014, field-tested data were evaluated and analyzed to identify item-level refinements necessary for the survey instrument. The field test psychometric analysis included evaluations of individual items and composite item sets. Individual items were analyzed to report item-level missing data and item response distributions (including ceiling and floor effects), which included response variance. Composite item sets were analyzed using factor analysis and item response theory (IRT) analysis to assess dimensionality, discriminability, dimensional coverage, and subgroup response differences. Internal consistency statistics (reliability) and correlational checks for composite validity were performed to evaluate the final composite item sets. The item-level recommendations for the field test were based on the findings from the factor analyses, the internal consistency checks, and the IRT analysis. As a result, 10 questions were recommended for deletion. Reliability of the remaining measures was assessed using the Cronbach's alpha coefficient, with an estimate range from zero to one. An estimate of zero indicated no measurement consistency and one indicates perfect consistency. The cutoff criterion for the examination was 0.70, which indicated adequate consistency.[509] The composites analytically derived maintained adequate internal consistency even when reduced to Top-Box scoring and across the facility types and modes of administration. Based on the rigorous testing that was undertaken during the development process, we believe the OAS CAHPS Survey, and measure scores derived therefrom, are both reliable and valid. Therefore, we believe that the scoring used in the OAS CAHPS Survey measures is appropriate. Updated unit-level reliability analysis of the publicly reported composites during voluntary national implementation continues to be well above the .70 cut-off for reliability.

Comment: A couple of commenters opposed the OAS CAHPS Survey-based measures due to the lack of NQF endorsement. The commenters encouraged CMS to pursue NQF endorsement of these measures before the OAS CAHPS Survey is required in order to ensure all stakeholders are given insight into the measure and to guarantee that it is fair and accurate.

Response: We thank the commenters for their comments. As we have stated in prior rules (81 FR 79808 and 82 FR 59433), section 1833(t)(17)(C)(i) of the Act does not require that each measure we adopt for the ASCQR Program be endorsed by a national consensus building entity, or the NQF specifically. Further, under section 1833(i)(7)(B) of the Act, section 1833(t)(17)(C)(i) of the Act applies to the ASCQR Program, except as the Secretary may otherwise provide. Under this provision, the Secretary has further authority to adopt non-endorsed measures. While we strive to adopt NQF-endorsed measures when feasible and practicable, we believe the requirement that measures reflect consensus among affected parties can be achieved in other ways, including through the measure development process, stakeholder input via a Technical Expert Panel (TEP), review by the MAP, broad acceptance and use of the measure, and public comments.

We refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79803 through 79824) for a fuller discussion of the rigorous testing applied to the OAS CAHPS Survey and our belief that it is appropriate for the ASCQR Program.

[509] Dillman, D. A. 1978. Mail and Telephone Surveys: The Total Design Method. New York: Wiley & Sons.

Comment: A commenter expressed concern regarding the ophthalmology-specific ASCs and the number of OAS CAHPS Survey questions regarding ophthalmology as many ophthalmology patients are unable to regularly check their email due to their limited vision.

Response: We appreciate the commenters concern regarding the well-being of patients who undergo eye procedures. However, we do not believe completing the survey poses an additional hardship on ophthalmology patients. After a patient has a surgery or procedure, the survey can be completed up to 6 weeks (42 days) following the invitation to complete the survey. Additionally, we provide different modes of survey administration that would allow for greater accessibility by patients completing the survey, including telephonic surveying, which may provide greater accessibility to individuals with limited vision. We believe that the OAS CAHPS Survey assesses patient experience of care for outpatient surgical procedures, and therefore, takes the outpatient/ambulatory setting into account and captures information about the appropriate experiences of care for this setting, including ophthalmology patients. Based on the results of the 2019 OAS CAHPS mode experiment, the response rates for ophthalmology patients were not significantly different from other types of outpatients. However, we will monitor this issue to ensure that the response data does not indicate that ophthalmology patients are not outliers to the rest of patients surveyed.

Comment: A few commenters opposed mandatory reporting of the OAS CAHPS Survey because of concerns regarding the patient response rate.

Response: We thank the commenters for their feedback. We agree with commenters that patient response is largely out of the control of the facility. However, we note that we did not propose to penalize ASCs for patients' decision not to complete the survey. Payment implications under the ASCQR Program are tied to the successful and timely reporting of required quality measure data. An ASC will not receive a payment reduction based on performance under the OAS CAHPS Survey-based measures if the ASC administers the survey according to the OAS CAHPS Survey Protocol and Guidelines Manual [510] and submits that data to CMS by the data submission deadline, regardless of the number of completed surveys the facility receives. Results will be used for public reporting only.

Comment: A commenter expressed concern for ASC departments that will incur multiple sets of patient experience results and recommended that the OAS CAHPS Survey only apply to services where anesthesia is used.

Response: We thank the commenter for its suggestion; however, we believe that the OAS CAHPS Survey is appropriately scoped to provide patients and facilities meaningful data on the services provided by ASCs and not just those that require anesthesia.

Comment: A commenter requested that we do more to ensure correct attribution of the patient experience and requested we provide evidence of the OAS CAHPS Survey's reliability before it requires survey administration, which could reduce the reliability of the results and negatively impact data-driven decision making.

Response: We thank the commenter for its feedback. The OAS CAHPS Survey is used to obtain data on a patient's experience of care received from a facility. While there is always potential that a patient gets confused, we believe that the OAS CAHPS Survey is focused on patients' experience of care received for their ambulatory surgery or procedure. A physician/surgeon who performs surgeries/procedures at a facility is a member of that facility with both rights and responsibilities. We believe it is the facility's responsibility to ensure that someone whether the doctor, nurse, or other facility staff member, provide patients with information about preparing for their procedure, about the procedure itself, as well as what to expect following the procedure/surgery. Therefore, we believe it is appropriate to include these important communications with patients in the OAS CAHPS Survey and believe experience with the provider attributed to the facility is appropriate.

Further, we believe that the information provided in the OAS CAHPS Survey ''Instructions'' is sufficient to inform the patient regarding the purpose of the OAS CAHPS Survey and provides sufficient instruction and details for the patient to correctly identify and relate the survey to the facility and from which that patient received the procedure. CMS began developing the OAS CAHPS Survey in 2012 using the principles and guidelines established by the Agency for Healthcare Research and Quality's (AHRQ) CAHPS program and AHRQ approved this instrument as a CAHPS survey in February 2015.[511]

Comment: A commenter sought information on whether the OAS CAHPS Survey may have a positive, indirect effect on the way physicians communicate with patients and recommended an on-going evaluation of the effectiveness of the survey to understand the benefit and whether the survey data is informing improvements in care delivery. The commenter also requested additional information on patient experience of care in the HOPD and ASC settings, and we believe patient experience the effect the OAS CAHPS Survey has on care delivery and quality improvement. Another commenter stated that the money spent on OAS CAHPS Survey would be less effective than spending money directly on patient care.

Response: We thank the commenters for their comments. Studies show a relationship between the clinical quality of care provided at a facility and patients' experience of care.*512 513* The OAS CAHPS Survey is specifically designed to measure of care is an important indicator of the quality of care provided at a facility. As noted above, patients are the best source for certain information about the quality of care. Additionally, we believe that the insights provided by the OAS CAHPS Survey enable objective and meaningful information to ASCs about patient experience, which will help facilities identify areas to improve patient experience and to increase communication with patients.

Comment: A commenter recommended that for the most meaningful and user-centric approach to public reporting, we should not use CCN-level reporting and instead use NPI-based reporting method because it would allow the public to directly correlate quality measure data with an individual facility.

Response: We thank the commenter for the feedback. The OAS CAHPS Survey results are collected and reported at the CCN level. However, we thank the commenter for its recommendation to report OAS CAHPS

[513] Anhang, P. et al. Examining the Role of Patient Experience Surveys in Measuring Health Care Quality. Med Care Res Rev. 2014;71(5):552–554.

Survey-based measures data at the NPI level for patient ease and individual facility performance improvement purposes. We will consider the feasibility of requiring ASCs to collect and report OAS CAHPS Survey data at the NPI level and will put forward any proposals in future notice and comment rulemaking, but note that CCN level reporting can reduce burden for ASCs with multiple facilities under a single CCN.

After consideration of the public comments we received, we are finalizing this proposal with modification. We are finalizing voluntary reporting as part of the ASCQR Program, modified to begin in CY 2024 reporting period/CY 2026 payment determination period and mandatory reporting of the OAS CAHPS Survey-based measures, modified to begin in the CY 2025 reporting period/CY 2027 payment determination.

5. Summary of Previously and Newly Finalized ASCQR Program Quality Measure Set

a. Summary of Previously and Newly Finalized ASCQR Program Quality Measure Set for the CY 2022 Reporting Period/CY 2024 Payment Determination

Table 69 summarizes the previously and newly finalized ASCQR Program measure set for the CY 2022 reporting period/CY 2024 payment determination.

BILLING CODE 4120–01–P

TABLE 69: ASCQR Program Measure Set for the CY 2022 Reporting Period/CY 2024 Payment Determination

ASC #	NQF #	Measure Name
ASC-9	0658	Endoscopy/Polyp Surveillance: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients
ASC-11	1536†	Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery*

BILLING CODE 4120–01–C

6. ASCQR Program Measures and Topics for Future Consideration

a. Potential Adoption of Future Measures for the ASCQR Program

We continue to seek to adopt a comprehensive set of quality measures for widespread use to inform decision-making regarding care and for quality improvement efforts in the ASC setting. In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86083 through 86110), under the OPPS we finalized the elimination of the Inpatient Only (IPO) list over a 3-year transitional period, beginning with the removal of approximately 300 primarily musculoskeletal-related services, with the list to be completely phased out by CY 2024.[514] As discussed in section IX of the CY 2022 OPPS/ASC proposed rule (86 FR 42155), we have continued to receive stakeholder requests to reconsider the elimination of the IPO list, to reevaluate services removed from the IPO list due to safety and quality concerns, and to, at a minimum, extend the timeframe for eliminating the list. After further consideration and review of the additional feedback from stakeholders, we believe that the timeframe we adopted for removing services from the IPO list does not give us a sufficient opportunity to carefully assess whether a procedure can be removed from the IPO list while still ensuring beneficiary safety. For CY 2022, we proposed to halt the elimination of the IPO list and, after clinical review of the services removed from the IPO list in CY 2021, we proposed to add the 298 services removed from the IPO list in CY 2021 back to the IPO list beginning in CY 2022.

We also proposed to reinstate the CY 2020 criteria used to add procedures to the ASC Covered Procedures List (CPL) and remove 258 of the additional 267 surgical procedures that were added to the ASC CPL beginning in CY 2021, under the CY 2021 revised criteria[515] with additional procedures being proposed for addition for CY 2022.

However, as technology and surgical techniques advance, services will continue to transition off of the IPO list, becoming payable in the outpatient hospital setting and being eligible for addition to the ASC covered procedures list in subsequent years. We recognize that there may be a need for more measures that inform decision-making regarding care and for quality improvement efforts, particularly focused on the behaviors of services that become newly eligible for payment in the ASC setting. In light of this, we sought comment on potential future adoption of measures that would allow better tracking of the quality of care for services that transition from the IPO list and may subsequently become eligible for addition to the ASC CPL.

Therefore, we invited public comment on the potential future adoption of measures for our consideration that address care quality in the ASC setting given the transition of procedures from inpatient settings to outpatient settings of care.

We received comments on these topics.

Comment: Many commenters supported the future development of measures that would allow for a comparison of outcomes across care settings, particularly as procedures transition from the inpatient only list to the outpatient and ASC settings. The commenters encouraged CMS to work with stakeholders to improve measure alignment and reporting between hospital outpatient surgery centers and ambulatory surgery centers and also identify new measures that address

[514] Centers for Medicare & Medicaid Services. (2020, December 2). CY 2021 Medicare Hospital Outpatient Prospective Payment System and Ambulatory Surgical Center Payment System final rule (CMS–1736–FC). Retrieved from: *https://www.cms.gov/newsroom/fact-sheets/cy-2021-medicare-hospital-outpatient-prospective-payment-system-and-ambulatory-surgical-center.*

reporting challenges in the ASCQR Program.

A few commenters recommended that CMS require all accredited ASCs to submit comprehensive safety and quality data to a nonprofit organization with extensive experience in collecting and reporting ASC quality data on a public website to ensure the data is trusted and useful for purchasers and consumers. Commenters also suggested the reporting should utilize consensus-based nationally endorsed standards. The commenters stated their belief that patients and purchasers do not have access to enough information to be able to make an informed decision on care.

Response: We thank commenters for their feedback. As mentioned in section XVI.B.6.a. of the final rule with comment period, we seek to adopt a comprehensive set of quality measures for widespread use to inform decision-making regarding care and for quality improvement efforts. We will continue to work with stakeholders as we consider measures for inclusion in future rulemaking. Additionally, we agree on the importance of measure alignment. It is our goal to continue to explore ways to address measurement gaps, reduce burden and increase efficiency through measure alignment.

We also agree with commenters on the importance of submitting safety and quality data publicly to promote transparency, accountability as well as providing a means of delivering important healthcare information to consumers. Our public websites, including the Provider Data Catalog, were launched with the purpose of providing public facing quality data to help inform consumer care and to encourage healthcare facilities to make continued improvements to the quality of care provided. We will consider the feasibility of the commenters' recommendations and take them into consideration in future rulemaking.

Comment: Commenters encouraged CMS to work with stakeholders to identify measures that would be appropriate and useful across programs and to address reporting challenges before proposing to adopt new measures into the program. Several commenters suggested that CMS re-introduce measures previously proposed in the CY 2018 OPPS/ASC proposed rule including the Toxic Anterior Segment Syndrome (TASS), Endoscopy/Polyp Surveillance: Colonoscopy Interval for Patients with a History of Adenomatous Polyps and the Ambulatory Breast Procedure Surgical Site Infection Outcome measure. Commenters stated that these measures fill an important gap in the ASCQR Program related to addressing HAIs, colonoscopy services, and Ophthalmic devices. Commenters also noted that these measures would be appropriate for the Hospital OQR Program which would expand alignment between the Hospital OQR and ASCQR Programs and would allow consumers more opportunities to compare quality and safety across settings of care.

Additionally, one commenter recommended that CMS should improve mechanisms for comparison between hospital outpatient surgery centers and ASCs. The commenter stated that surgical procedures should produce ratings that allow for comparisons of the same procedure regardless of setting.

Response: We thank the commenters for their recommendations. We are committed to working with stakeholders to identify appropriate and useful measures across our programs and address any measurement gaps to reduce burden. Concerning the creation of ratings that would allow for comparisons of the same procedure regardless of setting, we are committed to looking for more effective ways to align our programs and will monitor this concern for future rulemaking. We thank commenters for their input on additional ASCQR Program measures and topics for future consideration and will take this feedback into account for future measure development in the ASCQR Program.

b. Potential Future Adoption and Inclusion of an ASC-Level, Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA)

As described in section XVI.B.6.a. of this final rule with comment period and above, we sought comment on priorities for quality measurement in outpatient settings due to changes to the IPO procedure list (82 FR 59385 and 84 FR 61355) and the ASC CPL (84 FR 61388 and 85 FR 86146).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42276 through 42277), we also requested comment on the potential future adoption of a re-specified version of a patient-reported outcome-based performance measure (PRO–PM) for two such procedures, elective primary total hip arthroplasty (THA) and total knee arthroplasty (TKA), which were removed from the IPO list effective for CY 2020 and CY 2018, respectively, and added to the ASC CPL effective for CY 2021 and CY 2020, respectively. We recently solicited public comment on the potential future inclusion of a Hospital-level THA/TKA PRO–PM (NQF #3559) in the FY 2022 IPPS/LTCH PPS proposed rule for the inpatient hospital setting (86 FR 25589) and responded to public comments received in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45408). This measure reports the hospital-level risk-standardized improvement rate (RSIR) in patient-reported outcomes (PROs) following elective primary THA/TKA for Medicare fee-for-service (FFS) beneficiaries aged 65 years and older. Substantial clinical improvement is measured by achieving a pre-defined improvement in score on one of the two validated joint-specific PRO instruments measuring hip or knee pain and functioning: (1) The Hip dysfunction and Osteoarthritis Outcome Score for Joint Replacement (HOOS, JR) for completion by THA recipients; and (2) the Knee Injury and Osteoarthritis Outcome Score for Joint Replacement (KOOS, JR) for completion by TKA recipients. Improvement is measured from the preoperative assessment (data collected 90 to 0 days before surgery) to the postoperative assessment (data collected 300 to 425 days following surgery). Improvement scores are risk adjusted to account for differences in patient case mix. Potential non-response bias in measure scores due to the voluntary nature of PROs is incorporated in the measure calculation with stabilized inverse probability weighting based on likelihood of response.

Given the recent changes in the ASC CPL, we expect that THA and TKA procedures will increasingly be performed in ASCs and that the volume of these procedures on Medicare beneficiaries 65 and older will also increase in ASCs in future years.

We recognize that potential future adoption and implementation of a re-specified version of the THA/TKA PRO–PM in the ASCQR Program would require sufficient numbers of procedures for each measured ASC to ensure a reliable measure score. As only a subset of ASCs performs orthopedic procedures, the measure would likely apply to a minority of ASCs. Additionally, implementing a THA/TKA PRO–PM would require providers to successfully collect pre- and post-operative PRO data for each procedure. Specifically, the inpatient THA/TKA PRO–PM discussed in the FY 2022 IPPS/LTCH PPS proposed rule requires a minimum of 25 cases with completed pre- and post-operative PRO data per hospital to ensure a reliable facility-level score. For more details on the inpatient THA/TKA PRO–PM, we refer readers to the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25589), the FY 2022 IPPS/LTCH PPS final rule (86 FR

45408) and the PROs Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available on the CMS website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

We will continue to monitor the number of THA and TKA procedures in ASCs and when we believe there is a sufficient number of such procedures performed in ASCs to reliably measure a meaningful number of facilities, we may consider expanding the PRO–PM to this setting. We also note that, as finalized in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59455 through 59463), the ASCQR Program currently includes a Hospital Visits After Orthopedic Ambulatory Surgical Center Procedures (ASC–17) measure using claims data which provides facilities with important information on patient outcomes for Medicare FFS beneficiaries following orthopedic surgery at ASCs and this measure includes THA and TKA procedures. The ASC–17 measure calculates a facility-specific risk-standardized hospital visit ratio within 7 days of an orthopedic procedure performed at an ASC and has as outcomes of interest unplanned hospital admissions, emergency department (ED) visits, and observation stays, thereby, providing valuable quality information for these procedures as they expand into the ASC setting.

As described in our Meaningful Measures 2.0 Framework, we aim to promote better collection and integration of patients' voices by developing PRO measures as an additional tool for measuring and improving quality. Given the unique challenges and opportunities for PRO–PMs for THA and TKA procedures in the ASC setting, we invited public comment on the potential future adoption of a respecified version of PRO measures for elective THA/TKA PRO–PM for the ASCQR Program. Specifically, we invited public comment on the following:

- Input on the mechanism of PRO data collection and submission, including anticipated barriers and solutions to data collection and submission.
- Usefulness of having an aligned set of PRO–PMs across settings where elective THA/TKAs are performed, that is, hospital inpatient setting, hospital outpatient departments, and ASCs for patients, providers, and other stakeholders. Specifically, usefulness and considerations for a healthcare system that performs inpatient and/or outpatient and ASC elective THA/TKAs.
- Considerations unique to THA/TKAs performed in the ASC setting such as the volume of procedures performed or the measure cohort, outcome, or risk adjustment approach.

We received comments on these topics.

Comment: Several commenters expressed support for the potential future adoption and inclusion of an ASC-Level, Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA). Commenters noted that as procedures shift to the outpatient setting, it is important for quality programs to reflect the settings in which beneficiaries receive surgical care and agreed that PROs are the best available means for a patient-centered measurement of functional status improvement. Commenters expressed support for this measure across multiple settings, including hospitals, outpatient departments, and ambulatory surgical centers. Additionally, a few commenters expressed support for the patient-reported outcome surveys used to collect preoperative and postoperative data. The Hip dysfunction and Osteoarthritis Outcome Score for Joint Replacement (HOOS, JR) and the Knee injury and Osteoarthritis Outcome Score for Joint Replacement (KOOS, JR) are widely used across the country and are lower burden compared to the HOOS and KOOS. Commenters also supported use of either the Patient-Reported Outcomes Measurement Information System (PROMIS)-Global or the Veterans RAND 12-Item Health Survey (VR–12) for risk adjustment and felt that measure development was responsive to stakeholder feedback.

Response: We thank the commenters for their support and will consider these comments for future policy development.

Comment: A few commenters expressed concern about data collection and reporting thresholds. Commenters encouraged CMS to explore ways to reduce the burden of collecting patient-reported outcomes data and support hospitals in their efforts to increase responsiveness. Some commenters expressed concern over the increasing threshold for submitting data, noting that the threshold within the Comprehensive Care for Joint Replacement (CJR) model incrementally increased over time and fewer hospitals have been able to meet the thresholds. Commenters asked CMS to explain the rationale behind the chosen thresholds and consider whether a lower rate of response is sufficient for measuring performance. One commenter recommended phased implementation of the measure to allow facilities time to coordinate collection and reporting of PRO data. They recommended a two-year voluntary reporting period to allow facilities who were not part of the CJR model to build up infrastructure to collect data and further research to determine exemption criteria for low volume facilities. One commenter also expressed concern about patient burden, noting that patient response rates to various surveys across the continuum of care are dropping, and increasing the number of surveys may result in fewer completed surveys overall.

Response: We thank the commenters for their feedback and would like to provide more explanation regarding the reporting thresholds as described in prior rules. Through the CJR final rules, we finalized a data submission requirement that strategically increased with each performance year. To be successful, a hospital needed to submit PRO data for 50 percent or 50 eligible procedures in the first year of the model. By performance year 8, hospitals will need to submit PRO data for 90 percent or 500 eligible procedures to be successful. The incremental increase over a set period of time allows hospitals to gradually build up their infrastructure and processes for collecting and storing data. Future proposals for implementation and reporting of this measure will be announced through notice and comment rulemaking. While patient-reported outcome-based performance measures require providers to integrate data collection into clinical workflows, this integration provides opportunity for PROs to inform clinical decision making and benefit patients by engaging them in discussions about potential outcomes. We do not expect this PRO–PM to contribute to survey fatigue or to negatively impact other PRO–PMs. The Patient-Reported Outcome Measure (PROM) instruments that are used to calculate preoperative and postoperative data scores for this THA/TKA PRO–PM were carefully selected, with extensive stakeholder input, to be low burden for patients and to capture information clinicians deemed essential to understanding response to THA/TKA.

Comment: A few commenters called for robust risk adjustment for this measure. They noted patients who receive these procedures in the inpatient setting will tend to be sicker and more complex compared to patients who receive these procedures in the outpatient or ASC setting. Commenters encouraged CMS to take the differences

in patient complexity into account when developing a risk adjustment strategy and to do so in a way that minimizes lag between the procedure and reporting. Commenters also encouraged CMS to consider incorporating sociodemographic factors, such as dual eligibility status and preferred language, and stratifying results by proportions of dual-eligible patients similar to the approach now used by the CMS Hospital Readmission Reduction Program.

Response: We thank the commenters for their insights on the differences in patient complexity across different care settings and the impact it may have on risk adjustment. We will continue to take this into consideration if we move forward with re-specifying this measure for use in ASCs. With respect to sociodemographic factors, we would like to clarify the risk adjustment approach. For the development of the hospital-level measure, we assessed the impact of dual eligibility, the Agency for Health Research and Quality (AHRQ) socioeconomic status (SES) Index (socioeconomic status), and non-white race. The addition of each of these three social risk variables provided no statistically significant change to the risk model performance, variable coefficients, or the model outcome. As such, these variables were not included in the hospital risk model. These social risk variables were, however, statistically significantly associated with response to PRO surveys—whether patient-reported outcomes were obtained for patients undergoing primary elective THA/TKA—and so were included in the calculation of stabilized inverse probability weights used to account for potential response-bias. These variables, along with other sociodemographic variables that may become available over time, will be reassessed as part of the respecification process if CMS proceeds with developing a version of the measure for the ASC setting as part of CMS' commitment to addressing improving health equity.

Comment: A few commenters recommended use of the American Joint Replacement Registry (AJRR) for future implementation of this measure citing that participation in the AJRR is a requirement for certification as a center of excellence by The Joint Commission. The commenters felt that using the AJRR would allow facilities to pool their resources for lowest costs. They also noted that as the AJRR incorporates Medicare Administrative Data for populating the database, its use would allow for robust risk adjustment, improved research, and independent reporting for participating facilities to normalize quality. The AJRR is widely used by providers in the United States and implementing the measure through the AJRR will minimize duplication of reporting efforts. Commenters felt this approach would be faster, more efficient, and would incentivize use of Qualified Clinical Data Registries (QCDRs).

Response: We appreciate commenters' recommendations regarding the AJRR and we will consider the feasibility and appropriateness of using this registry for future implementation, if we proceed with development of a THA/TKA PRO–PM in ASCs. We agree that leveraging existing resources, such as registries, will help decrease patient and provider data collection burden.

Comment: A few commenters provided feedback on future implementation of this measure. One commenter recommended a benchmark approach to facility measure scores, where CMS would evaluate success by establishing a benchmark percentage of THA/TKA procedures reaching a significant clinical improvement, rather than requiring providers to compete for percentile rankings of success rates across tightly bunched score rates. Another commenter recommended that CMS consider incentivized, phased implementation that would allow facilities to build up their processes and infrastructure to collect and report on patient-reported outcomes data. They also encouraged CMS to reevaluate the minimum number of cases that would trigger reporting as low volume can lead to wider variances in outcomes for smaller volume hospitals.

Response: We appreciate commenters' recommendations regarding future implementation of the measure. With regards to facilities' ability to meet the reporting threshold, we agree that there must be a sufficient number of procedures in these settings to reliably measure a meaningful number of facilities, and we anticipate an increase in the number of THA/TKA procedures performed in ASCs in future years. We will continue to take this into consideration if we move forward with respecifying the measure for use in ASCs. Any future proposals to implement the measure will be announced through notice and comment rulemaking.

Comment: A few commenters did not support potential future adoption and inclusion of an ASC-Level, Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary THA/TKA. Commenters noted that ASC regulations limit the scope of ASC services and the timeframe during which ASCs are permitted to be involved in patient care. As such, ASCs are limited in their preoperative, intraoperative, and postoperative services.

Response: We acknowledge the commenter's concern and will consider the impact of regulatory requirements on any future measurement, but we believe it is important to monitor quality in all settings where these procedures are performed. As performance of THAs and TKAs shift into the outpatient and ASC settings, it is important for quality measurement programs to adapt to the changing care settings.

Comment: One commenter recommended development of a surgical site infection measure following THA and TKA.

Response: We thank the commenter for their suggestion. Surgical site bleeding and surgical site complications during the index admission or a subsequent inpatient admission within 30 days from the start of the index admission are captured in the hospital-level risk-standardized complication rates (RSCRs) following an elective primary THA and/or TKA measure in the Hospital Value-Based Purchasing Program. Hospital admissions within seven days of the surgery are captured in the Hospital Visits after Hospital Outpatient Surgery (OP–36) measure for procedures performed in the outpatient setting. Any future measure development or respecification proposals for ASCs will be announced through notice and comment rulemaking. We thank commenters for their input on the potential future adoption of an ASC-Level, Risk-Standardized Patient Reported Outcomes Measure Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA) and will take this input into account for future measure development in the ASCQR Program.

c. Potential Future Efforts To Address Health Equity in the ASCQR Program

(1) Background

Significant and persistent inequities in health care outcomes exist in the U.S. Belonging to racial or ethnic minority group; living with a disability; being a member of the lesbian, gay, bisexual, transgender, and queer (LGBTQ+) community; living in a rural area; and being near or below the poverty level, are often associated with worse health

[516] Joynt KE, Orav E, Jha AK. Thirty-Day Readmission Rates for Medicare Beneficiaries by Race and Site of Care. JAMA. 2011;305(7):675–681.

outcomes.[516] [517] [518] [519] [520] [521] [522] [523] Such disparities in health outcomes are the result of number of factors, but importantly for CMS programs, although not the sole determinant, negative experiences, poor access, and provision of lower quality health care contribute to health disparities. For instance, numerous studies have shown that among Medicare beneficiaries, racial and ethnic minority individuals often receive lower quality of care, report lower experiences of care, and experience more frequent hospital readmissions and procedural complications.[524] [525] [526] [527] [528] [529] Readmission rates for common conditions in the Hospital Readmissions Reduction Program (HRRP) are higher for Black Medicare beneficiaries and higher for Hispanic Medicare beneficiaries with Congestive Heart Failure and Acute Myocardial Infarction.[530] [531] [532] [533] [534] Studies have also shown that African Americans are significantly more likely than White Americans to die prematurely from heart disease and stroke.[535] The COVID–19 pandemic has further highlighted many of these longstanding health inequities with higher rates of infection, hospitalization, and mortality among Black, Latino, and Indigenous and Native American persons relative to White persons.[536] [537] As noted by the CDC, ''long-standing systemic health and social inequities have put many people from racial and ethnic minority groups at increased risk of getting sick and dying from COVID–19.'' [538] One important strategy for addressing these important inequities is by improving data collection to allow for better measurement and reporting on equity across our programs and policies.

We are committed to achieving equity in health care outcomes for our beneficiaries by supporting providers in quality improvement activities to reduce health inequities, enabling them to make more informed decisions, and promoting provider accountability for health care disparities.[539] In the CY 2022 OPPS/ASC proposed rule (86 FR 42277 through 42279), we used a definition of equity established in Executive Order 13985, issued on January 25, 2021, as ''the consistent and systematic fair, just, and impartial treatment of all individuals, including individuals who belong to underserved communities that have been denied such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and other persons of color; members of religious minorities; LGBTQ+ persons; persons with disabilities; persons who live in rural areas; and persons otherwise adversely affected by persistent poverty or inequality.'' [540] We noted that this definition was recently established and provides a useful, common definition for equity across different areas of government, though numerous other definitions of equity exist.

Our ongoing commitment to closing the equity gap in CMS quality programs is demonstrated by a portfolio of programs aimed at making information on the quality of health care providers and services, including disparities, more transparent to consumers and providers. The CMS Equity Plan for Improving Quality in Medicare outlines a path to equity which aims to support Quality Innovation Network-Quality Improvement Organizations (QIN–QIOs); Federal, state, local, and tribal organizations; providers; researchers; policymakers; beneficiaries and their families; and other stakeholders in activities to achieve health equity.[541]

We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45349) which summarizes our existing initiatives aimed at closing the equity gap in outcomes for Medicare beneficiaries. We also refer readers to section XV.B.7.c.(1). of the CY 2022

OPPS/ASC proposed rule (86 FR 42253) which describes the policy and statute which have informed the creation of the CMS Disparity Methods to provide confidential stratified results for measures in the hospital inpatient setting using dual eligibility as a proxy for social risk. Our efforts to stratify outcome measures by dual eligibility are supported by national recommendations from the Assistant Secretary for Planning and Evaluation (ASPE) and the National Academies of Sciences, Engineering, and Medicine, which identified dual eligibility, an indicator of social risk, as a powerful predictor of poor health outcomes among the social risk factors that were tested.[542] [543]

To date, we have not expanded disparities reporting to the ASC setting. Internally testing the two disparities methods (Within- and Across-Hospital Disparity Methods) on ASCQR Program quality measures calculated using Medicare FFS claims revealed several unique challenges to measuring disparities for dually eligible individuals in the ASC setting, principally, relatively low volumes of dual eligible patients in many facilities, and large diversity in the types and patient mix between ASCs as these facilities tend to specialize. In our initial analysis, few facilities met the minimum sample size required to yield technically feasible, adequately representative, and statistically reliable disparity results. We are considering social risk factors, including neighborhood-level social determinants of health, such as the poverty, education, and housing quality, which can adversely influence health outcomes, contributing to health inequities, in order to report more information regarding equity gaps in the care provided in the ASC setting. There are several different approaches for quantifying the health impacts of adverse neighborhood level socioeconomic factors. One approach is the Agency for Healthcare Research and Quality (AHRQ) neighborhood Socioeconomic Status (SES) Index, which uses information from the U.S. Census at the census block-group level to estimate the range of socioeconomic status in the beneficiary's neighborhood.[544] In the CY 2022 OPPS/ASC proposed rule (86 FR 42279), we sought comment on and were interested in learning more about the potential for measuring disparities in care provided in this setting.

(2) Solicitation of Public Comments

In the CY 2022 OPPS/ASC proposed rule (86 FR 42279), we sought comment on the possibility of providing equity reporting in the ASCQR Program in a way that maximally supports facilities in improving the quality of care for all Medicare beneficiaries, regardless of their socioeconomic status or other risk factors. We were particularly interested in learning about measurement approaches or social risk factors which may permit illuminating social-based disparities in facilities which have relatively few individuals who possess social risk factors. Specifically, we invited public comment on the following:

- Ways to address the unique challenges of measuring disparities in the ASC setting, such as small sample sizes, ASC specialization, and the relatively smaller proportion of patients with social risk factors.
- The utility of neighborhood-level socioeconomic factors toward measuring disparities in quality-of-care outcomes for ASCs.
- Ways social risk factors influence the access to care, quality of care and outcomes for ASC patients in general or for specific ASC services.

We received comments on these topics.

Comment: Many commenters expressed support for CMS' commitment to address health disparities and closing the health equity gap. Some commenters specifically supported collection and reporting of stratified disparities information in the ASC setting and recommended specific data that CMS should collect. One commenter expressed strong support for data collection and measurement by characteristics including race, ethnicity, sex, sexual orientation, gender identity, language preference, tribal membership, and disability status. This commenter urged CMS to avoid using indirect estimation methods for race and ethnicity data, and instead establish a timeframe for meeting specific direct data collection goals, including data completeness and accuracy requirements.

Another commenter asserted that emerging evidence suggests that healthcare disparities may be rooted in lived experiences, and recommended CMS include questions that specifically address the experiences of racialized minorities within the healthcare system, such as trust of the healthcare system and providers, experiences of microaggression, and perceived discrimination or injustices. The commenter also recommended CMS accommodate the literacy needs and linguistic barriers of patients during these data collection efforts. Another commenter recommended CMS and providers collect data on nutritional status and specifically malnutrition to understand and improve health equity, since malnutrition is a risk factor for worse outcomes after surgery or trauma. An additional commenter supported stratification initially by race and ethnicity, but suggested future expansion to primary language, geographic location, socioeconomic status, gender identity, sexual orientation, age, and ability status.

An additional commenter described working on a Health Equity Report Card tool to reduce racial disparities in other care settings. Another commenter described developing a social determinants of health (SDOH) report based on the U.S. Department of Health and Human Services (HHS) Health People 2030 framework that recommends developing a standard set of SDOH definitions, utilizing community-based organizations, and building a national clearinghouse of program information and best practices, all aimed at reducing health disparities. This commenter also recommended CMS consider the three general paths that have been identified by the American Hospital Association in vulnerable communities including screening patients for social needs, offering navigation services to help patients access community services, and partnering with community stakeholders to align with local needs.

Response: We appreciate the feedback provided by the commenters regarding approaches for incorporating other demographic characteristics and social risk factors into analyses that address and advance health equity. We will continue to take all concerns, comments, and suggestions into account in our future policies.

We are also sensitive to the concerns raised by stakeholders about indirect estimation. As referenced in the

[542] Office of the Assistant Secretary for Planning and Evaluation. Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs. Available at: *https://aspe.hhs.gov/reports/report-congress-social-risk-factors-performance-under-medicares-value-based-purchasing-programs*.

[543] National Academies of Sciences, Engineering, and Medicine. 2017. Accounting for social risk factors in Medicare payment. Washington, DC: The National Academies Press.

[544] Bonito AJ, Bann C, Eicheldinger C, Carpenter L. Creation of New Race-Ethnicity Codes and Socioeconomic Status (SES) Indicators for Medicare Beneficiaries. Final Report, Sub-Task 2. (Prepared by RTI International for the Centers for Medicare and Medicaid Services through an interagency agreement with the Agency for Healthcare Research and Policy, under Contract No. 500–00–0024, Task No. 21) AHRQ Publication No. 08–0029–EF. Rockville, MD, Agency for Healthcare Research and Quality. January 2008.

proposed rule (86 FR 42018) and summarized in the 2022 IPPS final rule (86 FR 25070), the Medicare program does not directly collect information from beneficiaries on race and ethnicity, instead relying on data collected by the Social Security Administration. A number of barriers contribute to this information being insufficiently accurate to examine hospital-level disparities. For example, prior to 1980, only three categories (White, Black, and Other) were available for individuals to self-report race, and respondents were not able to indicate Asian, American Indian/Alaska Native, Hispanic, or Pacific Islander identities. As a result of these constrained response options, many current beneficiaries may not have had the opportunity to accurately self-report their race and ethnicity. Although we have undertaken significant efforts to update incorrect race and ethnicity information many inaccuracies remain limiting our ability to measure disparities.

In recent years we have sponsored the development of two indirect estimation algorithms, both intended to correct and improve administrative information on race and ethnicity. Indirect estimation methods such as these can generally be used in two different ways: (a) To estimate race/ethnicity in the absence of self-reported data; or (b) to improve administrative data in which beneficiaries provided a self-report of race/ethnicity but were not permitted a full set of response options (post-1980). While there is evidence supporting the validity of both approaches, accuracy and performance is particularly high in situation (b), where indirect estimation allows the administrative variables to better match the responses people would give when permitted a full set of response options. The approach for indirect estimation we intend to apply is situation (b), which uses an algorithm to augment existing data to allow a constrained administrative self-reported variable to better match what Medicare beneficiaries themselves may have chosen when given a comprehensive set of response options on race and ethnicity.

The Medicare Bayesian Improved Surname Geocoding Version 2.1 (MBISG 2.1) uses the original beneficiary self-report, but uses additional information supplied by Medicare beneficiaries and information about neighborhood composition, to make this variable better match what Medicare beneficiaries themselves self-report when given a full set of response options. With respect to Asian and Pacific Islander, Black, Hispanic, and White Medicare beneficiaries, the improved version of the administrative variable has 96–99% concordance with what Medicare beneficiaries themselves report when allowed a full set of response options, matching much better than the original self-reported variable in which most Medicare beneficiaries were not allowed to indicate Asian, American Indian/Alaska Native, Hispanic, or Pacific Islander identities. The MBISG 2.1 also offers distinct advantages because it generates probabilities of identification in each racial and ethnic group for each beneficiary, rather than assigning a single identification.

The MBISG 2.1 incorporates multiple sources of information to develop racial and ethnic probabilities. In addition to the information on race and ethnicity which that person reported to the SSA, the model also considers the person's first and last name, the composition of the census block group where they live, and other demographic information that Medicare beneficiary shared. Through such a holistic approach, the MBISG 2.1 can make accurate comparisons between groups of Medicare beneficiaries regarding the quality of care received, including people whose surnames are common among several racial and ethnic groups, and people who changed their surnames upon marriage. The MBISG 2.1 is also designed to consider those who identify as Multiracial and allows measurement in Census categories that distinguish those who chose single or multiple racial identity, as well as considering endorsement of Hispanic ethnicity separately. Notably, we only intend to use the MBISG 2.1 to make inferences about aggregated groups at the hospital level, and do not intend to use it to make inferences about any single individual, validation studies indicate that these aggregate estimates further improve upon the higher predictive accuracy of the model.

We believe that use of statistical imputation models, such as the MBISG 2.1 would permit us to provide more accurate, less biased information on disparities in hospital outcomes when reported confidentially. We plan to report results confidentially to facilities in Spring 2022 where results are technically feasible, meaningful, and statistically reliable. Any potential future proposal to publicly display the disparity results would be made through future rulemaking. We are sensitive to the concerns raised by stakeholders and will continue to evaluate the validity of the readmission measures when stratified by indirect estimation during the confidential reporting period.

Comment: Several commenters noted the difficulty of collecting data related to health disparities and reliable patient demographic information and recommended CMS support facilities with data collection efforts. One commenter noted provider time constraints as an impediment to collecting demographic and social risk factor data and recommended CMS considering developing and reimbursing for billable encounters related to social determinants of health screening. A few commenters also recommended CMS standardize collection and reporting of social risk factor data. Commenters recommended using screening tools such as the Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences (PRAPARE) tool or the Accountable Health Communities Health-Related Social Needs Screening Tool developed by CMS. Another commenter asserted that without standardized tools, providers lack the necessary information to uniformly assess and identify potential social risk factors among patients. Several commenters urged CMS to develop information technology standards and consistent guidance across programs for the capture, use, and exchange of relevant data such as the use of electronic health records and FHIR standards. One commenter noted that facilities have had difficulty collecting demographic information for other quality measurement programs and should not be penalized for submission of data that is inaccurate or incomplete for reasons beyond their control.

Response: We appreciate the feedback provided by the commenters regarding standardization of demographic data collection to additional social risk factors for the purposes of illuminating health inequities. We will continue to take all concerns, comments, and suggestions into account in our future policies.

Comment: Several commenters provided helpful insights into the unique challenges of measuring disparities in ASCs and potential ways to address these challenges. With regards to small sample size, several commenters recommended facility-level instead of measure-specific equity measurement, such as utilizing outcome measures that are applicable across multiple procedures with adjustment by procedure type or aggregating the ASCQR measures for each facility. A commenter also recommended addressing upstream access challenges that can lead to the smaller proportion of patients with social risk factors receiving care in ASCs, such as by developing and utilizing access measures. The commenter also suggested CMS consider developing and

implementing measures that directly assess health equity, such as structural measures that assess an organization's commitment to equity, collecting demographic data, and ensuring training on best practices; and measuring areas such as access, community partnerships, and patient experiences centered on identifying discrimination and structural racism. A commenter requested CMS support facilities in accessing and collecting socioeconomic data in the future.

Response: We appreciate the feedback provided by the commenters regarding the unique challenges of measuring disparities in ASCs. We will take commenters' feedback into consideration in future policy development.

Comment: A few commenters expressed support for incorporating neighborhood-level socioeconomic factors into methods for measuring disparities, especially when there are limitations in sample size or availability of more granular data. One commenter asserted that neighborhood-level socioeconomic factors can tell important information about the conditions in which people live, work, and play, and understanding them is vital to improving health outcomes. The commenter noted that since such data is less accurate than patient-level data, they recommended that CMS initially use results stratified by neighborhood-level factors for confidential reporting. If CMS chooses to publicly report results stratified by neighborhood-level factors, the commenter recommended we demonstrate the statistical soundness of the results prior to public reporting. Similarly, another commenter expressed concern that the approach of using neighborhood-level socioeconomic factors is susceptible to an ecologic fallacy which could vary greatly across different regions. One commenter recommended that standardizing CMS' SDOH data collection and measurement initiatives will not be enough—they must also incorporate tools that help clinicians connect patients with the community resources they need in order to improve outcomes.

Response: We appreciate the feedback provided by the commenters regarding the potential incorporation of neighborhood-level socioeconomic factors into methods for measuring disparities in ASCs, and for additional measures of equity in this setting. We will take commenters' feedback into consideration in future policy development.

Comment: Several commenters discussed the incorporation of existing codes into risk adjustment. One commenter recommended CMS evaluate the use of existing SDOH billing codes and the International Classification of Diseases, 10th Revision (ICD–10) Z codes which identify non-medical factors that may influence a patient's health status and recommended CMS consider developing additional codes for social needs care across payers to promote screening and referrals for social services. Another commenter recommended incorporating social risk adjustment into traditional hierarchical condition categories (HCCs)/clinical risk adjustment models. However, another commenter provided an example of how incorporating social risk factors such as dual eligibility, the AHRQ SES index, or non-white race into a hospital measure risk model didn't provide evidence of significant differences in outcomes and encouraged CMS to test such factors in current or future ASCQR Program measures.

Response: We appreciate the feedback provided by the commenters regarding risk adjustment for social risk and demographic variables in ASC quality measurement. We will take commenters' feedback into consideration in future policy development.

Comment: While supportive of collecting and utilizing demographic and SDOH data to measure and improve health equity, several commenters expressed concerns about protecting patient privacy. One of these commenters recommended CMS increase beneficiary education on the sharing of their sensitive health information with their providers. Another of these commenters asked that CMS answer privacy questions such as where the data will be kept, what happens if a patient declines to answer these questions for providers and/or do not wish to share the data with CMS? This commenter also questioned whether utilizing EHRs to data-mine patient data would comply with HIPPA and the OIG's provisions regarding interoperability and information blocking.

Response: We are very sensitive to data privacy, and of patient education and empowerment. We appreciate the feedback provided by the commenters on these topics, and we will take commenters' feedback into consideration in future policy development.

Comment: Several commenters noted that social factors broadly influence access to care at ASCs, including for example, reimbursement differences between Medicaid and other forms of insurance, federal and state policies regarding ASCs, access to specialty care, and transportation barriers. One commenter encouraged measurement of access to care barriers, community factors, and patient experiences centered on identifying discrimination and structural racism could help address barriers to receiving care in an ASC.

Response: We appreciate the feedback provided by the commenters on the unique challenges of providing care to patients with social risk factors at ASCs. We will take commenters' feedback into consideration in future policy development.

We thank commenters for their input on the potential future efforts to address health equity in the ASCQR Program and will take this input into account for future measure development in the ASCQR Program.

d. Future Development and Inclusion of a Pain Management Measure

Chronic pain is linked to a number of adverse physical and mental conditions [545] [546] [547] [548] and contributes to increased health care costs.[549] An estimated 20.4 percent (50 million) of U.S. adults have chronic pain.[550] As patients with acute and chronic pain continue to face challenges in obtaining adequate care,[551] Congress has advanced policies to improve the treatment of pain and substance use disorders. The Comprehensive Addiction and Recovery Act of 2016

(CARA) (Pub. L. 114–198), the 21st Century Cures Act (Pub. L. 114–225), and the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment for Patients and Communities Act (SUPPORT Act) (Pub. L. 115–271) outline evidence-based national strategies and prevention toward reducing opioid dependence. In conjunction with the opioid epidemic efforts, the SUPPORT Act also provides guidelines for providers to be prepared to discuss pain management risks and options with patients, including providing referrals to a pain management specialist.[552] As a result of the opioid epidemic and as pain management procedures become more advanced, pain management practices and surgery centers have become increasingly viewed as feasible for the initial treatment of pain as well as for the expansion of non-opioid treatments for pain management.[553] Based on a growing body of evidence on the risks of opioid misuse, we have developed a strategy to impact the national opioid misuse epidemic by combating nonmedical use of prescription opioids, opioid use disorder, and overdose through the promotion of safe and appropriate opioid utilization, improved access to treatment for opioid use disorders, and evidence-based practices for acute and chronic pain management.[554]

With advances in techniques and growing recognition by providers that pain is a treatable condition, pain management services have seen rapid growth as a form of early intervention [555] and more such procedures are being performed in ASCs.[556] ASCs specializing in pain management services are also growing as a share of overall ASCs.[557] The most common multispecialty ASCs that focused on two specialties in 2017 were those specializing in pain management and either neurology or orthopedic services.[558]

We internally analyzed CY 2019 and CY 2020 Medicare FFS claims data using the methodology previously adopted for the ASC–7: ASC Facility Volume Data on Selected ASC Surgical Procedures measure (76 FR 74507 through 74509), which identifies procedure categories for the top 100 current procedural terminology (CPT®) codes reimbursed (we refer readers to Table 73). In our analyses of the Medicare FFS claims data from CY 2019 and CY 2020, we found that overall, the number of procedures declined 22 percent, likely reflecting conditions imposed by the COVID–19 PHE. The rank ordering of the types of procedures performed remained constant for the most part with pain management procedures (contained in the Nervous System category) being the third most commonly performed procedure category with 22.3 percent and 22.6 percent in CY 2019 and CY 2020, respectively.

TABLE 73: ASC Procedures from Medicare FFS Claims for CY 2019 and CY 2020 Based on CPT Codes

CY 2019				CY 2020				% Decline CY 2019 to CY 2020
Procedure Category	# of CPTs	# of Procedures	% of Total Procedures	Procedure Category	# of CPTs	# of Procedures	% of Total Procedures	
Gastrointestinal	15	1,895,911	32.9%	Gastrointestinal	15	1,479,220	32.5%	22.0%
Eye	19	1,864,585	32.3%	Eye	19	1,469,128	32.2%	21.2%
Nervous System	22	1,287,131	22.3%	Nervous System	22	996,813	21.9%	22.6%
Musculoskeletal	14	265,967	4.6%	Musculoskeletal	15	233,791	5.1%	12.1%
Genitourinary	8	169,470	2.9%	Genitourinary	8	143,894	3.2%	15.1%
Skin	8	119,329	2.1%	Skin	9	95,001	2.1%	20.4%
Imaging	7	89,075	1.5%	Imaging	6	66,939	1.5%	24.9%
Dialysis-related	3	51,102	0.9%	Dialysis-related	3	54,749	1.2%	-7.1%
Respiratory	3	20,330	0.4%	Respiratory	2	11,562	0.3%	43.1%
Anesthesia	1	6,635	0.1%	Anesthesia	1	6,062	0.1%	NA
Total	100	5,769,535	100.0%		100	4,557,159	100.0%	22.0%

Thus, we see pain management surgical procedures as a significant portion of procedures performed in the ASC setting and that an applicable measure would provide important quality of care information for a specialty not included in the current ASCQR Program measure set.

We received comments on these topics.

Comment: Many commenters supported this request for comment to

assess the future inclusion of a pain management surgical procedures measure. The commenters encouraged CMS to continue to implement policies that will incentivize and promote nonopioid, nonpharmacological treatment of pain and innovative pain management therapies. They also encouraged CMS to work with pain specialty societies, CRNAs and ASC industry representatives on the development of future pain management specialty measures.

A few commenters offered additional pain management measurement recommendations including: tracking health equity issues in pain management, and adding patient reported outcome performance measures (PRO–PM) to include service delivery. One commenter also recommend that PRO–PM measures are the best measurement type to gauge a patient's status prior to health service intervention. Lastly, one commenter recommended that CMS facilitate an open forum to discuss ASCQR measures.

Response: We thank the commenters for their suggestions. As discussed in the RFC on THA/TKA PRO–PM measure, we are considering the future implementation of PRO–PM measures across the quality reporting programs. We thank commenters for their input on the potential future development and adoption of a pain management measure and will take the feedback received into account for future measure development in the ASCQR Program.

7. Maintenance of Technical Specifications for Quality Measures

We refer readers to the CYs 2012, 2013, 2014, 2015, and 2016 OPPS/ASC final rules with comment period (76 FR 74513 through 74514; 77 FR 68496 through 68497; 78 FR 75131; 79 FR 66981; and 80 FR 70531, respectively) for detailed discussion of our policies regarding the maintenance of technical specifications for the ASCQR Program which are codified at 42 CFR 416.325. We did not propose any changes to these policies in the proposed rule.

We also refer readers to section XIV. of the CY 2022 OPPS/ASC proposed rule (86 FR 42232 through 42237) where we requested information on potential actions and priority areas that would enable the continued transformation of our quality measurement enterprise toward greater digital capture of data and use of the Fast Healthcare Interoperability Resources (FHIR) standard (as described in that section).

8. Public Reporting of ASCQR Program Data

We refer readers to the CYs 2012, 2016, 2017, and 2018 OPPS/ASC final rules with comment period (76 FR 74514 through 74515; 80 FR 70531 through 70533; 81 FR 79819 through 79820; and 82 FR 59455 through 59470, respectively) for detailed discussion of our policies regarding the public reporting of ASCQR Program data, which are codified at 42 CFR 416.315 (80 FR 70533). We did not propose any changes to these policies in the proposed rule.

C. Administrative Requirements

1. Requirements Regarding QualityNet Account and Security Administrator

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75132 through 75133) for a detailed discussion of the QualityNet security administrator requirements, including setting up a QualityNet account and the associated timelines for the CY 2014 payment determination and subsequent years. In the CY 2016 OPPS/ASC final rule with comment period (80 FR 70533), we codified the administrative requirements regarding the maintenance of a QualityNet account (now referred to as the HQR system HCQIS Access Roles and Profiles (HARP) ID) and security administrator for the ASCQR Program at § 416.310(c)(1)(i). In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86189), we finalized the use of the term ''security official'' instead of ''security administrator'' to denote the exercise of authority invested in the role. The term ''security official'' refers to ''the individual(s)'' who have responsibilities for security and account management requirements for a facility's QualityNet account. We did not propose any changes to this policy in the proposed rule.

2. Requirements Regarding Participation Status

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75133 through 75135) for a complete discussion of the participation status requirements for the CY 2014 payment determination and subsequent years. In the CY 2016 OPPS/ASC final rule with comment period (80 FR 70533 through 70534), we codified these requirements regarding participation status for the ASCQR Program at § 416.305. We did not propose any changes to these policies in the proposed rule.

D. Form, Manner, and Timing of Data Submitted for the ASCQR Program

1. Data Collection and Submission

a. Background

We previously codified our existing policies regarding data collection and submission under the ASCQR Program at § 416.310.

b. Requirements for Claims-Based Measures

(1) Requirements Regarding Data Processing and Collection Periods for Claims-Based Measures Using Quality Data Codes (QDCs)

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75135) for a complete summary of the data processing and collection periods for the claims-based measures using QDCs for the CY 2014 payment determination and subsequent years. In the CY 2016 OPPS/ASC final rule with comment period (80 FR 70534), we codified the requirements regarding data processing and collection periods for claims-based measures using QDCs for the ASCQR Program at § 416.310(a)(1) and (2). We note that the previously finalized data processing and collection period requirements will apply to any future claims-based-measures using QDCs adopted in the ASCQR Program. We did not propose any changes to these requirements in the CY 2022 OPPS/ASC proposed rule.

(2) Minimum Threshold, Minimum Case Volume, and Data Completeness for Claims-Based Measures Using QDCs

We refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59472) (and the previous rulemakings cited therein), as well as 42 CFR 416.310(a)(3) and 42 CFR 416.305(c) for our policies about minimum threshold, minimum case volume, and data completeness for claims-based measures using QDCs. As noted in section XVI.D.1.b. of this final rule with comment period, our policies for minimum threshold, minimum case volume, and data completeness requirements will apply to any future claims-based-measures using QDCs adopted in the ASCQR Program. We did not propose any changes to these policies in the proposed rule.

(3) Requirements Regarding Data Processing and Collection Periods for Non-QDC Based, Claims-Based Measure Data

We refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 59136 through 59138) for a complete summary of the data

processing and collection requirements for the non-QDC based, claims-based measures. We codified the requirements regarding data processing and collection periods for non-QDC, claims-based measures for the ASCQR Program at § 416.310(b). We note that these requirements for non-QDC based, claims-based- measures apply to the following previously adopted measures:

- ASC–12: Facility 7-Day Risk-Standardized Hospital Visit Rate after Outpatient Colonoscopy; and
- ASC–19: Facility-Level 7-Day Hospital Visits after General Surgery Procedures Performed at Ambulatory Surgical Centers (NQF #3357).

We did not propose any changes to these requirements in the proposed rule.

c. Requirements for Data Submitted via an Online Data Submission Tool

(1) Requirements for Data Submitted via a CMS Online Data Submission Tool

We refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59473) (and the previous rulemakings cited therein) and 42 CFR 416.310(c)(1) for our requirements regarding data submitted via a CMS online data submission tool. We are currently using the HQR System (formerly referred to as the QualityNet Secure Portal) to host our CMS online data submission tool, available at: *https://qualitynet.cms.gov/*. We note that in the CY 2018 OPPS/ASC final rule with comment period (82 FR 59473), we finalized expanded submission via the CMS online tool to also allow for batch data submission and made corresponding changes at § 416.310(c)(1)(i). We did not propose any changes to these policies for data submitted via a CMS online data submission tool in the proposed rule.

The following previously finalized measures require data to be submitted via a CMS online data submission tool for the CY 2021 payment determination and subsequent years:

- ASC–9: Endoscopy/Polyp Surveillance: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients;
- ASC–11: Cataracts: Improvement in Patients' Visual Function within 90 Days Following Cataract Surgery;
- ASC–13: Normothermia Outcome; and
- ASC–14: Unplanned Anterior Vitrectomy.

As discussed in section XVI.B.4.a.(2). of the CY 2022 OPPS/ASC proposed rule (86 FR 42271 through 42272), we proposed to require and resume data collection beginning with the CY 2023 reporting period/CY 2025 payment determination and subsequent years for the following four measures:

- ASC–1: Patient Burn;
- ASC–2: Patient Fall;
- ASC–3: Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant; and
- ASC–4: All-Cause Hospital Transfer/Admission.

Measure data for these measures would be submitted via the HQR System (formerly referred to as the QualityNet Secure Portal).

(2) Requirements for Data Submitted via a Non-CMS Online Data Submission Tool

We refer readers to the CY 2014 OPPS/ASC final rule with comment period (78 FR 75139 through 75140) and the CY 2015 OPPS/ASC final rule with comment period (79 FR 66985 through 66986) for our requirements regarding data submitted via a non-CMS- online data submission tool (specifically, the CDC NHSN website). We codified our existing policies regarding the data collection periods for measures involving online data submission and the deadline for data submission via a non-CMS online data submission tool at § 416.310(c)(2). While we did not propose any changes to those policies in the CY 2022 OPPS/ASC proposed rule, we did propose policies specific to the proposed COVID–19 Vaccination Coverage Among HCP measure (ASC–20), for which data would be submitted via the CDC NHSN website.

(a) Form, Manner, and Timing for the COVID–19 Vaccination Coverage Among HCP Measure (ASC–20) Beginning With the CY 2022 Reporting Period/CY 2024 Payment Determination and Subsequent Years

For the COVID–19 Vaccination Coverage Among HCP measure (ASC–20), we proposed to require reporting data on the number of HCP who have received the completed vaccination course of a COVID–19 vaccine by each individual facility's CMS CCN.

We proposed that ASCs would report the measure through the NHSN web-based surveillance system.[559] Specifically, ASCs would use the COVID–19 vaccination data reporting modules in the NHSN HPS Component to report the number of HCP eligible to have worked at the ASC that week (denominator) and the number of those HCP who have received COVID–19 vaccination (numerator). Specific details on data submission for this measure can be found in the CDC's Overview of the Healthcare Safety Component, available at: *https://www.cdc.gov/nhsn/PDFs/slides/NHSN-Overview-HPS_Aug2012.pdf*.

For the COVID–19 Vaccination Among HCP measure (ASC–20), we proposed that ASCs would report the measure to the NHSN for at least one week each month, beginning with the January 1, 2022 through December 31, 2022, reporting period affecting CY 2024 payment determination and continuing with quarterly reporting deadlines for subsequent years. If ASCs report more than one week of data in a month, the most recent week's data would be used for measure calculation purposes. Each quarter, the CDC would calculate a summary measure of COVID–19 vaccination coverage from the reporting periods for the quarter.

With respect to public reporting, this quarterly average COVID–19 vaccination coverage would be publicly reported in four-quarter increments, when four quarters of data are available. Once four quarters are available, data will be refreshed on a quarterly basis with the most recent four quarters publicly displayed. For each CMS CCN, a percentage of the HCP who received a complete course of the COVID–19 vaccine would be calculated and publicly reported.

We did not receive comments on the form, manner, and timing for the COVID–19 Vaccination Coverage Among HCP Measure (ASC–20). We refer readers to section XVI.B.3.a.2. of this final rule with comment period for public comments received on the COVID–19 Vaccination Coverage Among HCP Measure (ASC–20).

After consideration of the public comments, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) with a modification to only publicly report the most recent quarter of data. Additionally, data will also be available for preview by ASCs for 30 days prior to being made publicly available. This would result in more meaningful information that is up to date and not diluted with older data.

d. Form, Manner, and Timing for Reporting the ASC–15a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey-Based Measures

(1) Background

We refer readers to the CY 2017 OPPS/ASC final rule with comment period (81 FR 79822 through 79824) for

[559] Centers for Disease Control and Prevention. Surveillance for Weekly HCP COVID–19 Vaccination. Accessed at: *https://www.cdc.gov/nhsn/hps/weekly-covid-vac/index.html* on February 10, 2021.

a discussion of the previously finalized requirements related to survey administration and vendors for the OAS CAHPS Survey-based measures. In addition, we refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59450 through 59451), where we finalized a policy to delay implementation of the ASC–15a–e OAS CAHPS Survey-based measures beginning with the CY 2020 payment determination (2018 reporting period) until further action in future rulemaking.

(2) Addition of Data Collection Survey Modes of OAS CAHPS Measures Collection to Existing Three Modes

As discussed in section XVI.B.4.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42273), we proposed to begin data collection of five survey-based measures derived from the OAS CAHPS Survey for the ASCQR Program beginning with voluntary reporting for the CY 2023 reporting periods/CY 2025 payment determination,[560] followed by mandatory data collection and reporting beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years. The OAS CAHPS Survey contains three OAS CAHPS composite survey-based measures and two global survey-based measures. We proposed requirements related to survey administration, vendors, and oversight activities.

In the CY 2017 OPPS/ASC final rule with comment period (81 FR 79822 through 79825), we previously discussed the time, form, and manner in which OAS CAHPS information will be submitted. In the CY 2022 OPPS/ASC proposed rule (86 FR 42282 through 42284) we proposed two additional data collection modes (web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents) [561] beginning with voluntary data collection and reporting for the CY 2023 reporting/CY 2025 payment determination and continuing for mandatory reporting beginning with the CY 2024 reporting period/CY 2026 payment determination and for subsequent years. For more information about the modes of administration, we refer readers to the OAS CAHPS website: *https://oascahps.org*. We reiterate our clarification from when we adopted these measures in the CY 2017 OPPS/ASC final rule that, when implemented, ASCs that anticipate receiving more than 300 surveys would be required to either: (1) Randomly sample their eligible patient population; or (2) survey their entire OAS CAHPS eligible patient population (81 FR 79809). We also refer readers to section XV.D.4.b of this CY 2022 OPPS/ASC proposed rule where we describe our similar policy for the Hospital OQR Program.

(a) Survey Requirements

The data collection for the survey currently has three administration methods: (1) Mail-only; (2) telephone-only; and (3) mixed mode (mail with telephone follow-up of nonrespondents). We refer readers to the Protocols and Guidelines Manual for the OAS CAHPS Survey (*https://oascahps.org/Survey-Materials*) for materials for each mode of survey administration. In the CY 2018 OPPS/ASC final rule with comment period, we expressed interest in investigating the feasibility of offering the OAS CAHPS Survey using a web-based format (82 FR 59451). As a result, we designed a mode experiment to assess the impact of adding web-based survey administration. This mode experiment tested five administration modes with patients who receive outpatient surgical care: (1) Mail-only; (2) telephone-only; (3) web-only; (4) web with mail follow-up; and (5) web with a telephone follow-up. Data collection was completed in the fall of 2019. Response rates by mode in the experiment were: 35 percent (mail-only); 19 percent (telephone-only); 29 percent (web-only); 39 percent (web with mail follow-up); and 35 percent (web with telephone follow-up).

Based on these results, in addition to the three previously established modes, in the CY 2022 OPPS/ASC proposed rule (86 FR 42282 through 42283) we proposed to incorporate two additional administration methods: (1) Web with mail follow-up of non-respondents; and (2) web with telephone follow-up of non-respondents. This would allow a total of five modes of survey administration for reporting beginning with voluntary data collection and reporting as part of the ASCQR Program for the CY 2023 reporting period [562] and continuing for mandatory data collection and reporting for the CY 2024 reporting period/CY 2026 payment determination—the first year the survey would be required—and thereafter. We did not propose a purely web-based format at this time because the use of a web-based mode is included in the two mixed modes options being proposed and the purely web-based format would create response bias since not all patients have the ability to respond by web.

For all five proposed modes of administration as part of the ASCQR Program, we proposed that data collection must be initiated no later than 21-calendar days after the month in which a patient has a surgery or procedure at an ASC and completed within 6 weeks (42 days) after initial contact of eligible patients begins, beginning with voluntary data collection and reporting in the CY 2023 reporting period/CY 2025 payment determination and subsequent years. Under this policy, ASCs, via their CMS-approved survey vendors, must make multiple attempts to contact eligible patients unless the patient refuses or the ASC/vendor learns that the patient is ineligible to participate in the survey. In addition, we proposed that ASCs, via their CMS-approved- survey vendor, collect survey data for eligible patients using the established quarterly deadlines to report data to CMS for each data collection period, unless the ASC has been exempted from the OAS CAHPS Survey requirements under our minimum case volume for program participation [563] or our OAS CAHPS low-volume exemption policy, which exempts ACS that treat fewer than 60 survey-eligible patients during the ''eligibility period,'' (which is the calendar year before the data collection period (81 FR 79806)), that submit the participation exemption request form, which will be made available on the OAS CAHPS Survey website (*https://oascahps.org*) on or before May 15 of the data collection year. As finalized previously, all exemption requests would be reviewed and evaluated by CMS (81 FR 79806). For ASCs with minimum case volumes, but without a low-volume exemption, these

[560] As stated in section XVI.B.4.c. of the CY 2022 OPPS/ASC proposed rule, ''we note that National OAS CAHPS voluntary reporting is independent of the ASCQR Program, but the submission process will otherwise remain unchanged. This proposal is intended to clarify that voluntary reporting of OAS CAHPS would begin as part of the ASCQR program in the CY 2023 reporting period until mandatory reporting would begin in the CY 2024 reporting period, if both proposals are finalized''.

[561] The two additional modes will be available as part of National OAS CAHPS voluntary reporting in 2022.

[562] As stated in section XVI.B.4.c. of the CY 2022 OPPS/ASC proposed rule, ''we note that the two modes (web with mail follow-up of non-respondents; and web with telephone follow-up of non-respondents) will be available beginning in CY 2022 for National OAS CAHPS voluntary reporting, and then if finalized, available as part of ASCQR Program beginning in the CY 2023 reporting period and subsequent years''.

[563] ASCs with fewer than 240 Medicare claims (Medicare primary and secondary payer) per year during an annual reporting period for a payment determination year are not required to participate in the ASCQR Program for the subsequent annual reporting period for that subsequent payment determination year. See 42 CFR 416.305.

submission deadlines would be posted on the OAS CAHPS Survey website (*https://oascahps.org*). Late submissions would not be accepted.

As discussed in more detail below, compliance with the OAS CAHPS Survey protocols and guidelines, including this monthly data collection requirement as part of each quarterly data submission, would be overseen by CMS or its contractor who would receive approved vendors' monthly submissions, review the data, and analyze the results. As stated previously (81 FR 79805), all data collection and submission for the OAS CAHPS Survey measures would be reported at the CCN level, and if data collection and reporting becomes mandatory in CY 2024 reporting period/CY 2026 payment determination as proposed, under this proposal, all eligible ASCs in a CCN would be required to participate in the OAS CAHPS Survey, except for those that meet and receive an exception for having fewer than 60 survey-eligible-patients during the year preceding the data collection period (81 FR 79806). Therefore, we previously finalized the survey data reported for a CCN must include eligible patients from all eligible ASCs covered by the CCN; or if more than 300 completed surveys are anticipated, an ASC can choose to randomly sample their eligible patient population (81 FR 79817).

In the CY 2022 OPPS/ASC proposed rule (86 FR 42283 through 42284), we also proposed that survey vendors acting on behalf of ASCs must submit data by the specified data submission deadlines, which generally would be posted on the Outpatient and Ambulatory Surgery CAHPS Survey website located at *https://oascahps.org/Data-Submission/Data-Submission-Deadlines*. If an ASC's data are submitted after the data submission deadline, it would not fulfill the OAS CAHPS quality reporting requirements. Therefore, in regard to any OAS CAHPS reporting, we would strongly encourage ASCs to be fully appraised of the methods and actions of their survey vendors, especially the vendors' full compliance with OAS CAHPS Survey administration protocols, and to carefully inspect all data warehouse reports in a timely manner.

We reiterate that the use of predictive or auto dialers in telephonic survey administration is governed by the Telephone Consumer Protection Act (TCPA) (47 U.S.C. 227) and subsequent regulations promulgated by the Federal Communications Commission (FCC) (47 CFR 64.1200) and Federal Trade Commission. We refer readers to the FCC's declaratory ruling released on July 10, 2015 further clarifying the definition of an auto dialer, available at: *https://apps.fcc.gov/edocs_public/attachmatch/FCC-15-72A1.pdf*. In the telephone-only and mixed mode survey administration methods involving telephone, ASCs and vendors must comply with the regulations discussed above, and any other applicable regulations. To the extent that any existing CMS technical guidance conflicts with the TCPA or its implementing regulations regarding the use of predictive or auto dialers, or any other applicable law, CMS would expect vendors to comply with applicable law.

We received comments on these topics.

Comment: A commenter supported the proposal that the OAS CAHPS Survey data collection must be initiated no later than 21-calendar days after the month in which a patient has a surgery or procedure at a hospital/facility and completed within 6 weeks (42 days) after initial contact of eligible patient begins, beginning with voluntary reporting in the CY 2023 reporting period/CY 2025 payment determination and for subsequent years.

Response: We thank the commenter for its support.

Comment: Many commenters supported the two additional survey administration modes taking advantage of web-based technology: Web with mail follow-up of non-respondents and web with telephone follow-up of non-respondents. Among the reasons for support were the belief that these additional modes will enable providers to reach a larger patient population, to receive more and timelier information to improve patient experience, to reduce burden associated with this measure, and to provide greater flexibility for providers to collect data and patients to respond. A few commenters encouraged CMS to monitor the data and patient response rates, particularly of the two additional web-based survey modes, and data.

Response: We thank the commenters for their support. We agree that as we expand the use of additional OAS CAHPS Survey modes, it will be important to monitor data, patient responses, and ensure that the OAS CAHPS Survey is refined as appropriate.

Comment: A few commenters recommended clarifying how CMS could distribute the web-based mode and suggested addressing how smart phones, email and texting could promote distribution of the survey.

Response: We thank the commenters for their feedback. Information regarding how OAS CAHPS Survey vendors may utilize the two web-based modes with telephone or mail follow-up, respectively, will be available on the OAS CAHPS website (*https://oascahps.org/*).

Comment: Many commenters appreciated the proposal for the additional two new mixed mode options that include web-based collection, but believe that there needs to be a web-only or additional digital modes to reduce financial burden of the survey and make the survey easier for patients to complete. Several commenters recommended that CMS should permit a web-only survey administration mode and noted that web-only would likely be popular form of administration, has a better response rate, could achieve minimum surveys more efficiently than telephone only, and would also reduce the financial burden of administration. One commenter specifically noted that these modes of survey distribution could help reach younger and minority populations.

Response: We thank the commenters for their feedback. We agree that the web-based mode interactions with smart phones, email, texting, and other electronic distribution create the potential for new and engaging ways to connect with patients, especially to traditionally underserved communities. We believe that the potential to expand and increase access to patient feedback is of the utmost importance and will continue to study potential refinement to methods of contact for the OAS CAHPS Survey.

Comment: A few commenters supported a web-only administration and noted that access to the internet should not limit the adoption of a web-only mode because neither telephone nor physical mail are available to everyone, and there is increasing access to technological resources.

Response: We thank the commenters for their feedback. We agree that no one mode of administration will work for every patient, which is why we are going to include five modes of survey administration. As we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42283), we did not propose a purely web-based format at this time because the use of a web-based mode is included in the two mixed modes options being proposed and the purely web-based format would create response bias since not all patients have access and the ability to respond via website. These two modes offer respondents the opportunity to respond via web-modes, but we believe that providing the additional follow-up provides patients with a greater opportunity to respond to the OAS CAHPS Survey, if they so choose. We will continue to review

digital-only modes of administration and seek to propose additional modes that are supported by research.

Comment: A commenter supported the use of web-based survey modes as an important survey option, but recommended that CMS ensure that patients are clear what information the OAS CAHPS Survey is seeking.

Response: We appreciate the commenters support for the web-based survey modes. We believe that patients will understand the web-based modes and be able to respond to the OAS CAHPS Survey. We also think patients will be able to associate the OAS CAHPS Survey with the appropriate facility and service that they received. As we stated in response to commenters who opposed mandatory reporting of the OAS CAHPS Survey in section XVI.B.4.c.(1) of this final rule with comment period, we believe that the information provided in the OAS CAHPS Survey ''Instructions'' is sufficient to inform the patient regarding the purpose of the OAS CAHPS Survey and provides sufficient instruction and details for the patient to correctly identify and relate the survey to the facility and procedure that patient received. CMS began developing the Outpatient and Ambulatory Surgery Survey in 2012 using the principles and guidelines established by the Agency for Healthcare Research and Quality's (AHRQ) CAHPS program and AHRQ approved this instrument as a CAHPS survey in February 2015.[564]

Comment: Many commenters opposed the requirement of 300 completed surveys as burdensome and requested that CMS set the initial requirement at 100 surveys.

Response: We are committed to ensuring high reliability in publicly reported OAS CAHPS Survey results. Acceptable methods of sampling survey-eligible patients can be found in Chapter IV-Sampling Procedures of the Protocols and Guidelines Manual at *https://oascahps.org/Survey-Materials*. We refer readers to our discussion on the reliability criterion that resulted in the 300 completed survey and 60-patient eligible threshold in the CY 2017 OPPS/ASC final rule (81 FR 79809 through 79810).

Currently, the target number of completed interviews for ASCs is 300 annually, or 25 per month. The target of 300 completed surveys for analysis is derived from the formula for the precision of a proportion with the estimate at 0.5, the confidence interval of about ±0.05, and a confidence level of 95 percent. If a facility's patient volume is too small to yield 300 completed surveys per year, a census of patients is surveyed and participation in public reporting is possible. If participation drops below 100 completed surveys, a footnote is applied to the publicly reported data indicating that the scores should be used with caution as the number of surveys may be too low to accurately reflect the facility's performance.

If the target number of completed interviews for ASCs were reduced to 200 completes annually, or about 17 per month, the precision of the estimate would be lower. The confidence interval would be ±7 percent. Given the smaller size of ASCs and specialization of services, we are finalizing a revised target number of completes, reducing it to 200 completes annually. We now believe that the 200 surveys will provide the appropriate balance of ensuring sufficient confidence in the results of the OAS CAHPS Survey, such that facilities will receive important patient feedback, while still reducing the overall burden of the OAS CAHPS Survey. We believe that this burden reduction is important as ASCs continue to respond to COVID–19. While we expect this reduction from 300 to 200 completed to be permanent, we will continue to assess whether the 200 completed surveys amount ensures appropriate levels of confidence in the OAS CAHPS Survey results and propose additional further modifications in future rulemaking.

As a reminder, under the current protocol, Medicare-certified HOPDs and ASCs that treat fewer than 60 survey-eligible patients during the same 12-month eligibility period have the option to submit a request for exemption from participating in the OAS CAHPS Survey. Also, ASCs that qualifies for an exemption from the ASCQR Program because they had fewer than 240 Medicare claims (Medicare primary and secondary payer) in the year prior to the data collection year for the applicable payment determination would also qualify for the exemption from the OAS CAHPS Survey for the same time period. These ASCs are not required to submit a participation exemption request form for the OAS CAHPS Survey for the same time period.

Comment: A commenter requested additional information on whether ASCs will be penalized for failure to reach the minimum number of required surveys because patients simply choose not to respond to OAS CAHPS.

Response: We agree with commenters that patient response is largely out of the control of the facility. We note that we did not propose to penalize ASCs for patients' decision not to complete the survey. An ASC will not receive a payment reduction as long as it participates in the survey, its vendor administers the survey according to the OAS CAHPS Survey Protocol and Guidelines Manual and submits that data to CMS by the data submission deadline.

Comment: A commenter strongly recommended that CMS reconsider their position on respondent confidentiality and remove the requirement to include the question on consent to share identifying information from the OAS CAHPS Survey if the facility is interested in receiving patient-level response data connected to the patient's identifying data. Another commenter explained that if facilities understood the patient, they could more easily provide their employees immediate, and targeted improvement training. The commenter recommended that CMS align the OAS CAHPS patient confidentiality rules with HCAHPS, which allows for the release of patient-level data for quality improvement purposes with the stipulation that the patient identity should not be shared with direct care staff. A commenter expressed concern about a question on the OAS CAHPS Survey that seeks information on ''Consent to Share Identifying Information'' because they believe it limits the ability to identify trends and thereby limits opportunities.

Response: While the desire to have patient identifying information to develop responsive training and remediation steps is admirable, we believe that patient confidentiality is an important aspect to the OAS CAHPS Survey. The administration protocols for OAS CAHPS follow protocols for CAHPS® Surveys, restricting the release of patient-level data if the patient has not consented. We note that, for the Hospital IQR Program, because hospitals can self-administer the HCAHPS Survey, we do not state that patients' responses and identifying information will not be shared with the hospital. However, for surveys administered via a third-party vendor, the survey is not linked to a sample patient's name unless the patient gives his or her consent. We note that facilities may choose to add the ''Consent to Share'' question to the OAS CAHPS Survey. This question asks whether a patient gives permission for their name to be linked to their survey responses. However, we note that each facility should consult with its own

[564] *See* CAHPS Outpatient and Ambulatory Surgery Survey. Content last reviewed July 2019. Agency for Healthcare Research and Quality, Rockville, MD. *https://www.ahrq.gov/cahps/surveys-guidance/oas/index.html.*

counsel to ensure compliance with applicable privacy and security laws.

Comment: A commenter recommended that CMS revise the OAS CAHPS patient eligibility definition such that it is based on a set of consistently knowable criteria and does not rely on Current Procedural Terminology (CPT) codes as the primary method to determine eligibility.

Response: The OAS CAHPS Survey is administered to all eligible patients or a random sample thereof who had at least one outpatient surgery/procedure during the applicable month. We acknowledge the concern about the use of CPT codes, including those for procedures that patients may not perceive as surgery, and note that we will consider this issue. We note that many CPT codes have been excluded from inclusion in the OAS CAHPS Survey, including services like application of a cast or splint, in order to ensure that only patients receiving applicable procedures are surveyed.[565] We thank the commenters and will take all comments under consideration as we craft future policy for the OAS CAHPS Survey. As materials are updated, they will be posted here: *https://oascahps.org/General-Information/Announcements*.

After consideration of the public comments we received, we are finalizing this proposal with modification. The annual required number of surveys that must be reported for an ASC to successfully complete the measure is reduced from 300 to 200, and if more than 200 completed surveys are anticipated, an ASC can choose to randomly sample their eligible patient population.

(b) Vendor Requirements

We did not propose new vendor requirements, but reiterate the vendor requirements finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79823 through 79824) to ensure that patients respond to the survey in a way that reflects their actual experiences with outpatient care, and is not influenced by the ASC. We finalized that ASCs must contract with a CMS-approved OAS CAHPS Survey vendor to conduct or administer the survey. We believe that a neutral third-party should administer the survey for ASCs, and it is our belief that an experienced survey vendor will be best able to ensure reliable results. CAHPS Survey-approved vendors are also already used or required in the following CMS quality programs: The Hospital Inpatient Quality Reporting Program (71 FR 68203 through 68204); the Hospital Value-Based Purchasing (VBP) Program (76 FR 26497, 26502 through 26503, and 26510); the End Stage Renal Disease Quality Improvement Program (76 FR 70269 through 70270); the Home Health QRP (80 FR 68709 through 68710); and the Hospice QRP (80 FR 47141 through 47207).

Information about the list of approved survey vendors and how to authorize a vendor to collect data on an ASC's behalf is available through the OAS CAHPS Survey website, available at: *https://oascahps.org*. The web portal has both public and secure (restricted access) sections to ensure the security and privacy of selected interactions. As mentioned earlier, requirements for survey vendors were previously finalized in the CY 2017 OPPS/ASC final rule with comment period (81 FR 79793 through 79794) and codified at § 416.310(e)(2). ASCs will need to register on the OAS CAHPS Survey website (*https://oascahps.org*) in order to authorize the CMS-approved vendor to administer the survey and submit data on their behalf. Each ASC must then administer (via its vendor) the survey to eligible patients treated during the data collection period on a monthly basis according to the guidelines in the Protocols and Guidelines Manual (*https://oascahps.org*) and report the survey data to CMS on a quarterly basis by the deadlines posted on the OAS CAHPS Survey website.

Comment: Several commenters opposed the requirement that OAS CAHPS Survey be administered by third party vendors. Reasons given included that requiring third-party vendors increases the expense of the survey, vendors may not be fiduciaries for ASCs, the use of vendors adds unnecessary bureaucracy, vendor errors could negatively impact ASCs results and that ASCs are capable of collecting information and reporting data. Another commenter stated that of the number of approved vendors may not be prepared to accept the additional volume of work from the nation's ASCs. Another commenter stated its belief that the False Claims Act is sufficient to ensure compliance.

Response: In order to meet the survey administration requirements for these measures, the ASC must administer the OAS CAHPS Survey in accordance with the requirements listed in the OAS CAHPS Survey Protocols and Guidelines Manual.[566]

OAS CAHPS Survey requires that the survey be administered by an approved survey vendor to ensure that patients respond to the survey in a way that reflects their actual experiences with outpatient surgical care and is not influenced by the facility. If vendors were removed as neutral third parties, there could be concerns of objectivity and bias.

We believe that OAS CAHPS Survey vendors have gained experience during the voluntary reporting as part of the voluntary National OAS CAHPS program, and approved vendors will be able to support ASCs. We post the list of the approved OAS CAHPS Survey vendors on *https://oascahps.org*, and we encourage ASCs to contact vendors for cost and service information pertaining to OAS CAHPS Survey as there may be differences among vendors and multiple modes of conducting the survey provide greater economical choice.

We acknowledge that it is possible an ASC could fail to meet the requirements under the ASC–15a–e Survey-based measures if its vendor fails to administer the survey properly or submit the required data to CMS by the data submission deadline. However, we continue to believe that a neutral third party should administer the survey for ASCs, and it is our belief that an experienced survey vendor will be best able to ensure reliable results. We encourage all ASCs to be fully apprised of the methods and actions of their survey vendors—especially the vendors' full compliance with the OAS CAHPS Survey Administration protocols—and to carefully inspect all data warehouse reports in a timely manner. After the survey vendor submits the data to the OAS CAHPS Data Center, we strongly recommend that ASCs promptly review their two OAS CAHPS feedback reports and submit corrections under the process outlined in the OAS CAHPS Protocol and Guidelines Manual.[567] These reports enable an ASC to ensure that its survey vendor has submitted the data on time, the data has been accepted into the OAS CAHPS Data Center, and the data accepted into the OAS CAHPS Data Center are complete and accurate. Finally, we note that submission of complete, accurate, and timely data is the responsibility of the ASC. ASCs should check-in regularly with survey vendors to ensure that vendors are properly submitting timely survey data.

[565] *https://oascahps.org/General-Information/Announcements*.

[566] Current Survey Materials (*oascahps.org*).

[567] OAS CAHPS Survey Materials, including the OAS CAHPS Protocol and Guidelines Manual are available at Current Survey Materials (*oascahps.org*).

e. ASCQR Program Data Submission Deadlines

In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86191) we finalized that all program deadlines falling on a nonwork day be moved forward consistent with section 216(j) of the Act, 42 U.S.C. 416(j), ''Periods of Limitation Ending on Nonwork Days.'' Specifically, the Act indicates that all deadlines occurring on a Saturday, Sunday, or legal holiday, or on any other day, all or part of which is declared to be a nonwork day for Federal employees by statute or Executive order, shall be extended to the first day thereafter which is not a Saturday, Sunday or legal holiday or any other day all or part of which is declared to be a nonwork day for Federal employees by statute or Executive order (42 U.S.C. 416(j)). We codified this policy at § 416.310(f). We did not propose any changes to this policy in the proposed rule.

f. Review and Corrections Period for Measure Data Submitted to the ASCQR Program

(1) Review and Corrections Period for Data Submitted via a CMS Online Data Submission Tool

Under the ASCQR Program, for measures submitted via a CMS online data submission tool, ASCs submit measure data to CMS from January 1 through May 15 during the calendar year subsequent to the current data collection period (84 FR 61432).[568] For example, ASCs collect measure data from January 1, 2020 through December 31, 2020 and submit these data to CMS from January 1, 2021 through May 15, 2021. ASCs may begin submitting data to CMS as early as January 1. ASCs are encouraged, but not required, to submit data early in the submission period so that they can identify errors and resubmit data before the established submission deadline.

In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86191 through 86192), we finalized the formalization of that process and established a review and corrections period similar to what was finalized for the Hospital OQR Program in the CY 2021 OPPS/ASC final rule with comment period (85 FR 86184) for data submitted via the CMS web-based tool. For the ASCQR Program, we finalized the implementation of a review and corrections period which runs concurrently with the data submission period beginning with the effective date of this rule. During this review and corrections period, ASCs may enter, review, and correct data submitted directly to CMS. However, after the submission deadline, ASCs are not allowed to change these data. We codified this review and corrections period at § 416.310(c)(1)(iii). We did not propose any changes to this policy in the proposed rule.

(2) Review and Corrections Period for the OAS CAHPS Measures

Each ASC administers (via its vendor) the survey to all eligible patients treated during the data collection period on a monthly basis according to the guidelines in the Protocols and Guidelines Manual (available at: *https://oascahps.org*) and report the survey data to CMS on a quarterly basis by the deadlines posted on the OAS CAHPS Survey website as stated above in section XVI.D.1.d.(2).(b). of this final rule with comment period. Data cannot be altered after the data submission deadline but can be reviewed prior to the submission deadline (81 FR 79822 through 79823).

g. ASCQR Program Reconsideration Procedures

We refer readers to the CY 2016 OPPS/ASC final rule with comment period (82 FR 59475) (and the previous rulemakings cited therein) and 42 CFR 416.330 for the ASCQR Program's reconsideration policy. We did not propose any changes to this policy in the proposed rule.

h. Extraordinary Circumstances Exception (ECE) Process for the CY 2021 Payment Determination and Subsequent Years

We refer readers to the CY 2018 OPPS/ASC final rule with comment period (82 FR 59474 through 59475) (and the previous rulemakings cited therein) and 42 CFR 416.310(d) for the ASCQR Program's policies for extraordinary circumstance exceptions (ECE) requests. In the CY 2018 OPPS/ASC final rule with comment period (82 FR 59474 through 59475), we: (1) Changed the name of this policy from ''extraordinary circumstances extensions or exemption'' to ''extraordinary circumstances exceptions'' for the ASCQR Program, beginning January 1, 2018; and (2) revised § 416.310(d) of our regulations to reflect this change. We will strive to complete our review of each request within 90 days of receipt. We did not propose any changes to this policy in the proposed rule.

E. Payment Reduction for ASCs That Fail To Meet the ASCQR Program Requirements

1. Statutory Background

We refer readers to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74492 through 74493) for a detailed discussion of the statutory background regarding payment reductions for ASCs that fail to meet the ASCQR Program requirements.

2. Policy Regarding Reduction to the ASC Payment Rates for ASCs That Fail To Meet the ASCQR Program Requirements for a Payment Determination Year

The national unadjusted payment rates for many services paid under the ASC payment system are equal to the product of the ASC conversion factor and the scaled relative payment weight for the APC to which the service is assigned. For CY 2022, the ASC conversion factor is equal to the conversion factor calculated for the previous year updated by the productivity-adjusted hospital market basket update factor. The productivity adjustment is set forth in section 1833(i)(2)(D)(v) of the Act. The productivity-adjusted hospital market basket update is the annual update for the ASC payment system for a 5-year period (CY 2019 through CY 2023). Under the ASCQR Program, in accordance with section 1833(i)(7)(A) of the Act and as discussed in the CY 2013 OPPS/ASC final rule with comment period (77 FR 68499), any annual increase in certain payment rates under the ASC payment system shall be reduced by 2.0 percentage points for ASCs that fail to meet the reporting requirements of the ASCQR Program. This reduction applied beginning with the CY 2014 payment rates (77 FR 68500). For a complete discussion of the calculation of the ASC conversion factor and our finalized proposal to update the ASC payment rates using the inpatient hospital market basket update for CYs 2019 through 2023, we refer readers to the CY 2019 OPPS/ASC final rule with comment period (83 FR 59073 through 59080).

In the CY 2013 OPPS/ASC final rule with comment period (77 FR 68499 through 68500), in order to implement the requirement to reduce the annual update for ASCs that fail to meet the ASCQR Program requirements, we finalized our proposal that we would calculate two conversion factors: A full update conversion factor and an ASCQR Program reduced update conversion factor. We finalized our proposal to calculate the reduced national

[568] ASCQR Program Data Submission Deadlines. Available at: *https://qualitynet.cms.gov/asc/data-submission#tab2.*

unadjusted payment rates using the ASCQR Program reduced update conversion factor that would apply to ASCs that fail to meet their quality reporting requirements for that calendar year payment determination. We finalized our proposal that application of the 2.0 percentage point reduction to the annual update may result in the update to the ASC payment system being less than zero prior to the application of the productivity adjustment.

The ASC conversion factor is used to calculate the ASC payment rate for services with the following payment indicators (listed in Addenda AA and BB to the proposed rule, which are available via the internet on the CMS website): ''A2'', ''G2'', ''P2'', ''R2'' and ''Z2'', as well as the service portion of device-intensive procedures identified by ''J8'' (77 FR 68500). We finalized our proposal that payment for all services assigned the payment indicators listed above would be subject to the reduction of the national unadjusted payment rates for applicable ASCs using the ASCQR Program reduced update conversion factor (77 FR 68500).

The conversion factor is not used to calculate the ASC payment rates for separately payable services that are assigned status indicators other than payment indicators ''A2'', ''G2'', ''J8'', ''P2'', ''R2'' and ''Z2.'' These services include separately payable drugs and biologicals, pass-through devices that are contractor-priced, brachytherapy sources that are paid based on the OPPS payment rates, and certain office-based procedures, radiology services and diagnostic tests where payment is based on the PFS nonfacility PE RVU-based amount, and a few other specific services that receive cost-based payment (77 FR 68500). As a result, we also finalized our proposal that the ASC payment rates for these services would not be reduced for failure to meet the ASCQR Program requirements because the payment rates for these services are not calculated using the ASC conversion factor and, therefore, not affected by reductions to the annual update (77 FR 68500).

Office-based surgical procedures (generally those performed more than 50 percent of the time in physicians' offices) and separately paid radiology services (excluding covered ancillary radiology services involving certain nuclear medicine procedures or involving the use of contrast agents) are paid at the lesser of the PFS nonfacility PE RVU-based amounts or the amount calculated under the standard ASC ratesetting methodology. Similarly, in the CY 2015 OPPS/ASC final rule with comment period (79 FR 66933 through 66934), we finalized our proposal that payment for certain diagnostic test codes within the medical range of CPT codes for which separate payment is allowed under the OPPS will be at the lower of the PFS nonfacility PE RVU-based (or technical component) amount or the rate calculated according to the standard ASC ratesetting methodology when provided integral to covered ASC surgical procedures. In the CY2013 OPPS/ASC final rule with comment period (77 FR 68500), we finalized our proposal that the standard ASC ratesetting methodology for this type of comparison would use the ASC conversion factor that has been calculated using the full ASC update adjusted for productivity. This is necessary so that the resulting ASC payment indicator, based on the comparison, assigned to these procedures or services is consistent for each HCPCS code, regardless of whether payment is based on the full update conversion factor or the reduced update conversion factor.

For ASCs that receive the reduced ASC payment for failure to meet the ASCQR Program requirements, we have noted our belief that it is both equitable and appropriate that a reduction in the payment for a service should result in proportionately reduced coinsurance liability for beneficiaries (77 FR 68500). Therefore, in the CY 2013 OPPS/ASC final rule with comment period (77 FR 68500), we finalized our proposal that the Medicare beneficiary's national unadjusted coinsurance for a service to which a reduced national unadjusted payment rate applies will be based on the reduced national unadjusted payment rate.

In that final rule with comment period, we finalized our proposal that all other applicable adjustments to the ASC national unadjusted payment rates would apply in those cases when the annual update is reduced for ASCs that fail to meet the requirements of the ASCQR Program (77 FR 68500). For example, the following standard adjustments would apply to the reduced national unadjusted payment rates: The wage index adjustment; the multiple procedure adjustment; the interrupted procedure adjustment; and the adjustment for devices furnished with full or partial credit or without cost (77 FR 68500). We believe that these adjustments continue to be equally applicable to payment for ASCs that do not meet the ASCQR Program requirements (77 FR 68500).

In the CY 2015 through CY 2021 OPPS/ASC final rules with comment period we did not make any other changes to these policies. We proposed the continuation of these policies for CY 2022 in the CY 2022 OPPS/ASC proposed rule (86 FR 42284 through 42285), did not receive any public comments on these policies, and are finalizing the continuation of these policies for CY 2022.

XVII. Radiation Oncology Model

A. Introduction

The purpose of this final rule with comment period is to finalize provisions related to the delay of the Radiation Oncology (RO) Model and finalize modifications to certain policies proposed in the CY 2022 OPPS/ASC proposed rule.

Section 1115A of the Act authorizes the Center for Medicare and Medicaid Innovation (Innovation Center) to test innovative payment and service delivery models expected to reduce Medicare, Medicaid, and Children's Health Insurance Program (CHIP) expenditures while preserving or enhancing the quality of care furnished to the beneficiaries of such programs. Under the Medicare fee-for-service (FFS) program, Medicare generally makes a separate payment to providers and suppliers for each item or service furnished to a beneficiary during the course of treatment. Because the amount of payments received by a provider or supplier for such items and services varies with the volume of items and services furnished to a beneficiary, some providers and suppliers may be financially incentivized to inappropriately increase the volume of items and services furnished to receive higher payments. Medicare FFS may also detract from a provider's or supplier's incentive to invest in quality improvement and care coordination activities if it means those activities will result in payment for fewer items and services. As a result, care may be fragmented, unnecessary, or duplicative.

The RO Model is designed to test whether prospective episode-based payments for radiotherapy (RT) services (also referred to as radiation therapy services) will reduce Medicare program expenditures and preserve or enhance quality of care for beneficiaries. As radiation oncology is highly technical and furnished in well-defined episodes, and because patient comorbidities generally do not influence treatment delivery decisions, we believe that radiation oncology is well-suited for testing a prospective episode payment model. Under the RO Model, Medicare will pay participating providers and suppliers a site-neutral, episode-based payment for specified professional and

technical RT services furnished during a 90-day episode to Medicare FFS beneficiaries diagnosed with certain cancer types. The RO Model will include approximately 30 percent of all eligible RO episodes nationally. Under the RO Model, the episode payment amounts for included cancer types that are treated with RT services included in the RO Model will be the same for hospital outpatient departments (HOPDs) and freestanding radiation therapy centers.

The RO Model will offer RO participants the opportunity to examine and better understand their own care processes and patterns with regard to RO beneficiaries receiving included RT services for included cancer types. We believe that RO participants in the RO Model will have a significant opportunity to redesign care and improve the quality of care furnished to RO beneficiaries receiving these services. We believe the RO Model will further the agency's goal of increasing the extent to which CMS initiatives pay for value and outcomes, rather than for volume of services alone, by promoting the alignment of financial and other incentives for health care providers caring for beneficiaries receiving treatment for cancer. Payments that are made to health care providers for assuming financial accountability for the cost and quality of care create incentives for the implementation of care redesign among model participants and other providers and suppliers.

B. Background

CMS is committed to promoting higher quality of care and improving outcomes for Medicare beneficiaries while reducing costs. Accordingly, as part of that effort, we have in recent years undertaken a number of initiatives to improve the care of cancer patients, most notably with our Oncology Care Model. We believe that a model in radiation oncology will further these efforts to improve cancer care for Medicare beneficiaries and reduce Medicare expenditures. RT is a common treatment, received by nearly two thirds of all patients undergoing cancer treatment, and it is typically furnished by a radiation oncologist. As described in the 2017 Report to Congress: ''Episodic Alternative Payment Model for Radiation Therapy Services'', and also in the ''Specialty Care Models to Improve Quality of Care and Reduce Expenditures'' (84 FR 34490) (hereinafter referred to as the ''Specialty Care Models proposed rule''), because there are differences in the underlying methodologies used for rate setting in the OPPS and Physician Fee Schedule (PFS), there often are differences in the payment rate for the same RT service depending on whether the service is furnished in a freestanding radiation therapy center paid under the PFS, or an HOPD paid under the OPPS. This is called the site-of-service payment differential, and stakeholders from freestanding radiation therapy centers have asserted that such differentials between HOPDs and freestanding radiation therapy centers are unwarranted because the actual treatment and care received by patients for a given modality is the same in each setting. For these reasons, the RO Model is designed to test whether making site-neutral, prospective, episode-based payments to HOPDs, physician group practices (PGPs), and freestanding radiation therapy centers for RT episodes of care preserves or enhances the quality of care furnished to Medicare beneficiaries while reducing or maintaining Medicare program spending.

On September 29, 2020, we published in the **Federal Register** the final rule titled ''Specialty Care Models to Improve Quality of Care and Reduce Expenditures'' (85 FR 61114) (hereinafter referred to as the ''Specialty Care Models final rule'') and codified policies at 42 CFR part 512. Due to the state of the public health emergency (PHE) for the Coronavirus disease 2019 (COVID–19) pandemic in Fall 2020, CMS revised the RO Model's model performance period to begin on July 1, 2021, and to end December 31, 2025, in the CY 2021 Hospital Outpatient Prospective Payment (OPPS) and Ambulatory Surgical Center (ASC) Payment Systems and Quality Reporting Programs final rule with comment period (85 FR 85866) (hereinafter referred to as ''CY 2021 OPPS/ASC final rule''), giving RO participants an additional 6 months to prepare for the RO Model. As we stated at 85 FR 86261, the delay was intended to give RO participants additional time to learn the RO billing requirements and train staff on new procedures. It was also intended to give more time to RO participants to understand their participant-specific case mix and historical experience adjustments and the payment they expect to receive under the RO Model. It was not CMS' intention to delay the RO Model until the COVID–19 PHE ended. In the CY 2021 OPPS/ASC final rule, we changed the duration of the model performance period from 5 years to 4.5 years, changed the timelines for the submission of clinical data elements (CDEs), quality measures and Certified Electronic Health Record Technology (CEHRT) requirements, and modified the eligibility dates of the RO Model as an Advanced Alternative Payment Model (APM) and Merit-based Incentive Payment System (MIPS) APM (85 FR 85866).

Section 133 of the Consolidated Appropriations Act (CAA), 2021 (Pub. L. 116–260) (hereinafter referred to as ''CAA, 2021''), enacted on December 27, 2020, includes a provision that prohibits implementation of the RO Model before January 1, 2022. This Congressional action supersedes the RO Model delayed model performance period established in the CY 2021 OPPS/ASC final rule with comment period. To respond to the congressionally mandate delay, we proposed provisions related to the additional delayed implementation of the RO Model due to the CAA, 2021, including a proposed model performance period starting on January 1, 2022, with a 5-year model performance period, as well as modifications to certain RO Model policies not related to the delay, in the CY 2022 OPPS/ASC proposed rule.

We proposed to modify §§ 512.205, 512.210, 512.217, 512.220, 512.230, 512.240, 512.245, 512.250, 512.255, 512.275, 512.280, and 512.285 and add §§ 512.292 and 512.294. We received approximately 554 timely pieces of correspondence in response to our solicitation of public comments on the proposed rule from 143 commenters. We are finalizing the majority of the proposals without modification, and there are two proposals that we are finalizing with modification. These include the definitions for RO Track One and RO Track Two, as well as the extreme and uncontrollable circumstances (EUC) policy. There were a few sections where we asked for comments but noted we would not respond to those comments in the rule. There were also points of clarification that we did not ask for comments on. We will not be responding to comments in either of those cases in this rule. We also note that some of the public comments were outside of the scope of the proposed rule. These out-of-scope public comments are not addressed in this final rule with comment period. Many were previously addressed in the Specialty Care Models final rule (85 FR 61114) and/or a set of Frequently Asked Questions on the RO Model website. Summaries of the public comments that are within the scope of the proposed rule and our responses to those public comments are set forth in the various sections of this final rule with comment period under the appropriate heading.

C. RO Model Regulations

1. Model Performance Period

In the Specialty Care Models final rule, we specified at § 512.205 that the model performance period would last five performance years, beginning January 1, 2021, and ending December 31, 2025 (85 FR 61367). We finalized that each PY is the 12-month period beginning on January 1 and ending on December 31 of each CY during the model performance period, and no new RO episodes may begin after October 3, 2025, in order for all RO episodes to end by December 31, 2025.

In the CY 2021 OPPS/ASC final rule, we amended the definition of model performance period, specifying that it would begin July 1, 2021 and end on December 31, 2025, and we amended the definition of PY to mean the 6-month period beginning on July 1, 2021 and ending on December 31, 2021, and the 12-month period beginning on January 1 and ending on December 31 of each subsequent year (2022 through 2025) during the model performance period (85 FR 86261).

The CAA, 2021, enacted on December 27, 2020, includes a provision that prohibits implementation of the RO Model prior to January 1, 2022. In the CY 2022 OPPS/ASC proposed rule, CMS proposed to begin the RO Model as soon as we are permitted to do so by law, on January 1, 2022, as we continue to believe that a prospective episode payment model is needed and well suited to be tested in the radiation oncology space. CMS also proposed to modify the model performance period to begin on January 1, 2022, and end December 31, 2026, as described in the proposed definitions in section XVIII.C.2 of the CY 2022 OPPS/ASC proposed rule (86 FR 42290). If finalized as proposed, no new RO episodes would begin after October 3, 2026, in order for all RO episodes to end by December 31, 2026. We also proposed that each PY would be a 12-month period beginning on January 1 and ending on December 31 of each year during the model performance period, unless the initial model performance period starts mid-year, in which case PY1 would begin on that date and end on December 31 of that year (86 FR 42290).

We solicited public comments on our proposal in section XVIII.C.1 of the CY 2022 OPPS/ASC proposed rule (86 FR 42290).

The following is a summary of the public comments received on this proposal and our responses:

Comment: A few commenters supported the model performance period beginning on January 1, 2022. One of these commenters stated that the extra 12-month delay from the original implementation date of January 1, 2021 has provided sufficient time for RO Model participants to prepare and be able to meet the requirements for participation in the RO Model. Another commenter noted that the agency has been working on proposals for the RO Model for a number of years, stakeholders have provided comprehensive feedback, and they urged CMS to proceed with implementation on January 1, 2022. A commenter supported CMS' proposal to align each 12-month performance year with the calendar year, starting in 2022, as that will simplify the RO Model for RO participants.

Response: We thank these commenters for their support.

Comment: Many commenters commented that the model performance period should be further delayed. Of the commenters who suggested an alternative model performance period for the RO Model, a few commenters recommended delaying until mid-2022, some commenters recommended delaying until 2023, a couple commenters recommended delaying until the COVID–19 PHE has ended, and a few commenters suggested delaying until the calendar year after the PHE has ended. Many commenters noted that the extension of the COVID–19 PHE and the financial and operational challenges brought on by the COVID–19 PHE warrant an additional delay.

Response: We thank commenters for their comments on the model performance period for the RO Model. CMS proposed the earliest model performance period permitted under the CAA, 2021 because we believe in prioritizing a prospective episode payment model in the radiation oncology space in order to provide payment stability and promote high quality care for Medicare beneficiaries. Further, we do not find that it is appropriate to further delay the model performance period due to the COVID–19 PHE because it will be nearly 2 years into the COVID–19 PHE by January 1, 2022, when the RO Model is slated to begin. RO participants have been aware that they have been selected for participation in the RO Model since September 2020. Therefore, we believe that RO participants have had sufficient time to prepare for the RO Model and to adjust their workflows in light of the COVID–19 PHE. We also believe that delaying the model performance period further would penalize those RO participants who have been preparing to implement the RO Model, would further postpone RO participants' ability to participate in an Advanced APM and MIPS APM, and has the potential to generate confusion.

To address concerns related to the start of the model and the effects of the COVID–19 PHE, we are finalizing in section XVII.C.10. of this final rule with comment period an Extreme and Uncontrollable Circumstances (EUC) policy, codified at § 512.294, that would allow CMS flexibility in responding to national, regional, or local circumstances that adversely impact RO participants' ability to deliver care in accordance with the RO Model's requirements, including the COVID–19 PHE. As we proposed in section XVIII.C.10 of the CY 2022 OPPS/ASC proposed rule, in a national, regional, or local event, we would apply EUC policy only if the magnitude of the event calls for the use of special authority to help providers respond to the emergency and continue providing care. We stated that we would not use a bright-line test to assess all types of public health emergencies, disasters, or other extraordinary circumstances; application of the policy would be tailored to the specific circumstance and to the affected geographic areas. CMS will continue to monitor the impact of the COVID–19 PHE on RO participants. As proposed, if CMS invokes any of the EUC policies, related to the COVID–19 PHE or otherwise, we will communicate this decision via the RO Model website and written correspondence to RO participants.

Comment: Many commenters stated that they would not have sufficient time to prepare for the implementation of the RO Model, as there will be approximately two months between the publication of the CY 2021 OPPS/ASC final rule and the beginning of the proposed model performance period. A commenter noted that January 1, 2022 is fewer than 4 months away, and physician practices and their medical center administrations should have at least 12 months of notification of the final model requirements and definitions to prepare for their clinical implementation and related billing changes.

Response: We will have already delayed the model performance period twice: From January 1, 2021 to July 1, 2021, in the CY 2021 OPPS/ASC final rule (85 FR 85866); and from July 1, 2021 to January 1, 2022, in this final rule. CMS posted the RO Model's participating ZIP Code list in September of 2020 and noted in a subsequent rule (85 FR 85866) that the CBSAs selected for participation in the RO Model would not change due to the revised model performance periods. We also reiterated

our intent that the CBSAs selected for participation in the RO Model would not change due to the revised model performance period in the CY 2022 OPPS/ASC proposed rule (86 FR 42290). We believe that RO participants have had sufficient time to prepare for the implementation of the RO Model, as they have known that they would be required to be in the RO Model since the publication of the Specialty Care Model final rule in September of 2020 (85 FR 61149 through 61151). We also note that none of the modifications to the RO Model finalized in this final rule will change how the RO Model is operationalized. RO participants have therefore had over a year to prepare for the implementation of the RO Model, which we believe is sufficient.

Comment: A commenter noted that it may be challenging for some hospitals to prepare for a model performance period beginning January 1, 2022, particularly given the impact of the COVID–19 PHE, and encouraged CMS to be mindful of this strain and to monitor its impacts on model participants.

Response: We appreciate this commenter's concern regarding the COVID–19 PHE. We will have already delayed the model performance period twice, from January 1, 2021 to July 1, 2021 due to the COVID–19 PHE in the CY 2021 OPPS/ASC final rule (85 FR 85866), and subsequently to January 1, 2022 in this final rule, as required by the CAA, 2021. We will continue to monitor the RO Model's impacts on RO participants, as finalized in 85 FR 61257 through 61258.

Comment: A few commenters requested a delay to the model performance period to allow more time for radiation oncology Electronic Health Records (EHR) vendors to comply with the RO Model requirements and to test the functionality of these new software systems. These commenters stated that nearly all radiation oncology practices have separate management systems in addition to their practice's EHR; there are only two vendors nationwide that provide these EHR systems for radiation oncology; a new software build to capture the relevant fields can take between 12 and 18 months; and there are a limited number of vendor IT support staff whose services are necessary to facilitate these upgrades.

Response: As we discussed in the Specialty Care Models final rule (85 FR 61136), we agree with commenters' concerns that EHR vendors will need time to design, develop, build, test, validate, and implement the software to allow RO participants to fulfill the requirements of the RO Model in a streamlined manner through their EHR platforms. We understand that successful implementation of the RO Model may require many RO participants as well as software vendors to change EHR configurations, organizational policies, and end user workflows. However, we believe that we have provided sufficient time, since the publication of the Specialty Care Models final rule in September 2020, for RO participants and their EHR vendors to implement the software that RO participants may need to adhere to the RO Model requirements. We also note that although an RO participant may document these requirements using their EHR system if they wish, no changes to EHR systems are required for tracking compliance with RO Model requirements.

Comment: Many commenters requested delaying the model performance period to have more time to meet quality and CDE requirements. Many commenters stated that RO Model participants are only now learning additional details on quality and CDE requirements, which may require significant practice changes in order to ensure compliance. A couple commenters also asked that if the model performance period were to begin January 1, 2022, we delay some of the requirements, including quality measure and CDE reporting, and implement them after PY1.

Response: We thank commenters for their comments around delaying some of the requirements of the RO Model. RO participants were notified of their inclusion in the RO Model upon publication of the Specialty Care Models final rule in September 2020. RO participants have had more than a year to prepare for their participation in the RO Model, which we believe is sufficient.

In July 2021, CMS released the Quality Measure and Clinical Data Elements Guide on the RO Model website, along with the associated CDE templates. We have provided education and outreach support to encourage the efficient collection and submission of this data, including a webinar related to Model requirements in September 2021 to help participants prepare for the various requirements, and we have additional webinars planned specifically on the Quality Payment Program (QPP) and quality measures and CDEs. We believe we have provided RO participants with this information in sufficient time for them to prepare for the quality and reporting requirements.

Comment: Many commenters requested a delay to the model performance period in order to have more time to implement the billing processes required for the Model, which may require significant practice changes. Many commenters stated that RO Model participants are only now learning additional details on the billing requirements under the RO Model. A couple commenters recommended postponing the model performance period because providers need additional clarification around appropriate billing, which they believe CMS has not yet provided. One of these commenters maintained that the education seminars and tools CMS has provided to date were insufficient to prepare RO participants to execute the billing process under the RO Model.

Response: We believe that we have created a billing process that will be easily implemented within current systems because it is based on how FFS claims are currently submitted, which all RO participants should have experience submitting. We provided information on billing and coding changes under the RO Model in the Specialty Care Models final rule (85 FR 61205 through 61211). The RO Model-specific HCPCS codes were made public July 19, 2021. And the three modifiers and one condition code used for billing previously existed in the current PFS and OPPS claims systems and have addressed related questions in FAQs. We also hosted a RO Model Billing webinar on August 24, 2021, of which the slides and recording can be found on the RO Model website, *https://innovation.cms.gov/innovation-models/radiation-oncology-model*, and we hosted RO Model Billing Office Hours on August 31, 2021. Finally, we would encourage RO participants to access a billing guide document that restates the information provided in the aforementioned webinar available on the RO Model website in mid-November. We believe these resources provide sufficient guidance on implementing the billing process to RO participants, as we endeavored to explain the process in detail and answer RO participants' billing questions through these resources. We will continue to answer any billing questions RO participants may have, which can be submitted to *RadiationTherapy@cms.hhs.gov*. Further, we believe that RO participants have had adequate time to operationalize the Model's billing requirements, which are based on the current FFS claims systems, as RO participants have known they would be required to participate in the RO Model since the publication of the Specialty Care Models final rule in September of 2020 (85 FR 61149 through 61151).

Comment: A couple commenters offered an alternative proposal that the

RO Model should establish an implementation year, or ''PY0'', before the actual start of the model performance period to allow CMS to address complexities in the billing design, and allow participants to change workflows to align with the RO Model, utilize performance data from CMS to identify areas for transformation, receive additional education from CMS on RO Model parameters and meeting objectives, and allow providers and vendors additional time to operationalize data collection and reporting requirements.

Response: We appreciate the commenters' suggestions but, as discussed above, we will have already revised the model performance period twice. RO participants have known they would be required to participate in the RO Model since the publication of the Specialty Care Models final rule in September of 2020 (85 FR 61149 through 61151), so we believe that RO participants have had adequate time to prepare for the Model. We believe that a PY0 is unnecessary because RT providers and RT suppliers have had more than a year to prepare for the RO Model and its requirements and a PY0 would only further delay the model.

After considering public comments, we are finalizing as proposed that the model performance period will begin January 1, 2022 and end December 31, 2026. We are also finalizing as proposed that no new RO episodes may begin after October 3, 2026, in order for all RO episodes to end by December 31, 2026. We are also finalizing as proposed that each PY will be a 12-month period beginning on January 1 and ending on December 31 of each year during the model performance period, unless the initial model performance period starts mid-year, in which case PY1 will begin on that date and end on December 31 of that year.

We are also finalizing our proposed definition that the model performance period means the five PYs during which RO episodes must initiate and terminate. The model performance period begins on January 1, 2022 and ends on December 31, 2026, unless the RO Model is prohibited by law from starting on January 1, 2022, in which case the model performance period begins on the earliest date permitted by law that is January 1, April 1, or July 1.

Finally, we received no comments on our proposed definition for PY (performance year) to be each 12-month period beginning on January 1 and ending on December 31 during the model performance period, unless the model performance period begins on a date other than January 1, in which case PY1 will begin on that date and end on December 31 of that year. We are finalizing as proposed to codify this definition at § 512.205.

2. Definitions

Definitions for the RO Model are codified at § 512.205. We proposed to modify some of these definitions and add several new terms and definitions as described in section XVIII. of the CY 2022 OPPS/ACS proposed rule.

We proposed to modify the definition of the ''model performance period'' to mean the five PYs during which RO episodes must initiate and terminate. The model performance period would begin on January 1, 2022 and end on December 31, 2026, unless the RO Model is prohibited by law from starting on January 1, 2022, in which case the model performance period would begin on the earliest date permitted by law that is January 1, April 1, or July 1.

We proposed to modify the definition of ''PY'' (performance year) to mean each 12-month period beginning on January 1 and ending on December 31 during the model performance period, unless the model performance period begins on a date other than January 1, in which case, the first performance year (PY1) would begin on that date and end on December 31 of the same year.

We proposed to modify the definition of ''stop-loss reconciliation amount'' to mean the amount set forth in § 512.285(f) owed by CMS for the loss incurred under the Model to RO participants that have fewer than 60 episodes during the baseline period and were furnishing included RT services any time before the start of the model performance period in the CBSAs selected for participation.

We proposed to add a definition for ''EUC'' (extreme and uncontrollable circumstances) to correspond with the proposed EUC policy described in section XVIII.C.10 of the CY 2022 OPPS/ACS proposed rule. To describe how changes in CMS Certification Numbers (CCNs) and Tax Identification Numbers (TINs) are treated under the RO Model, which was described in section XVIII.C.5.g. of the CY 2022 OPPS/ACS proposed rule, we also proposed to add definitions for ''legacy CCN'' and ''legacy TIN''. And, to clarify how RO Model requirements align with the Quality Payment Program (QPP), we proposed to add definitions for ''Track One'' and ''Track Two'' as described in section XVIII.C.7. of the CY 2022 OPPS/ACS proposed rule.

We proposed to add a definition for ''baseline period'', specifying which episodes (dependent on the model performance period) are used in the pricing methodology. We proposed to define ''baseline period'' to mean the three calendar year (CY) period that begins on January 1 no fewer than 5 years but no more than 6 years prior to the start of the model performance period during which episodes must initiate in order to be used in the calculation of the national base rates, participant-specific professional and technical historical experience adjustments for the model performance period, and the participant-specific professional and technical case mix adjustments for PY1. The baseline period would be January 1, 2017 through December 31, 2019, unless the RO Model is prohibited by law from starting in CY 2022, in which case the baseline period would be adjusted according to the new model performance period (that is, if the model performance period starts any time in CY 2023, then the baseline period would be CY 2018 through CY 2020).

In the CY 2022 OPPS/ASC proposed rule, we solicited public comments on our proposed definitions. To the extent we have received comments relating to the definitions that we had proposed, we have responded to those comments in context throughout section XVII.C. of this final rule with comment period.

3. RO Model Participant Exclusions

At § 512.210(b), we exclude from the RO Model any PGP, freestanding radiation therapy center, or HOPD that furnishes RT only in Maryland; furnishes RT only in Vermont; furnishes RT only in United States (U.S.) Territories; is classified as an ambulatory surgical center (ASC), critical access hospital (CAH), or Prospective Payment System (PPS)-exempt cancer hospital; or participates in or is identified by CMS as eligible to participate in the Pennsylvania Rural Health Model (PARHM).

a. Pennsylvania Rural Health Model (PARHM)

We proposed in the CY 2022 OPPS/ASC proposed rule (86 FR 42290 through 42291) to modify § 512.210(b)(5) to exclude from the RO Model only the HOPDs that are participating in PARHM, rather than excluding both HOPDs that are participating in PARHM and those that have been identified by CMS as eligible to participate in PARHM. As we stated in the proposed rule, we continue to believe that HOPDs that are participating in PARHM should be excluded from the RO Model because these hospitals receive global budgets, and these global budgets would include payments for RT services and as such

would overlap with the RO Model payment. In the Specialty Care Models final rule, we also excluded HOPDs that are eligible to participate in the PARHM from the RO Model on the grounds that additional hospitals and CAHs may join PARHM in the future or may be included in the evaluation comparison group for that model (see 85 FR 61144).

However, as we stated in the CY 2022 OPPS/ACS proposed rule, after further consideration, we believe that including in the RO Model those HOPDs that have been identified as eligible to participate in PARHM, but that are not actually participating in PARHM because they are not currently a party to a PARHM participation agreement with CMS, would not affect the PARHM evaluation. First, such HOPDs do not receive global budgets under PARHM, so including these hospitals in the RO Model would not result in an overlap between PARHM payments and RO Model payments. Second, while we initially explored the potential for HOPDs that are eligible to participate in PARHM being included in that model's evaluation comparison group, we now expect that the PARHM comparison group will consist only of hospitals located outside of Pennsylvania because of selection constraints. Thus, we stated in the CY 2022 OPPS/ACS proposed rule that it is now our expectation that HOPDs that have been identified as eligible to participate in PARHM—all of which are located within the Commonwealth of Pennsylvania—would not be selected for the comparison group for the PARHM evaluation. Accordingly, we do not expect that including in the RO Model those HOPDs that have been identified as eligible to participate, but not actually participating in PARHM would affect the ability to detect the impact of PARHM on the cost and quality of care.

In addition, while it remains the case that hospitals and CAHs may join PARHM on an ongoing basis, hospitals and CAHs generally join PARHM at the start of a given CY. As described in the CY 2022 OPPS/ASC proposed rule, because the RO Model's PYs would align with CYs, we concluded in the CY 2022 OPPS/ACS proposed rule that it would be possible to update the RO Model exclusions for a given PY if an HOPD leaves or joins PARHM. For instance, we stated in the CY 2022 OPPS/ACS proposed rule that if a rural hospital identified as eligible to participate in PARHM later initiates its participation in PARHM by signing a PARHM participation agreement with CMS, then the HOPDs participating in PARHM as part of that participating rural hospital would be excluded from participation in the RO Model as of the start of the next CY quarter that follows the date that the HOPD begins participating in PARHM. (As we discuss further in response to comments in this section, we are clarifying in this final rule that the HOPDs participating in PARHM as part of that participating rural hospital would be excluded from participation in the RO Model as of the start of the CY quarter that includes the HOPD's start date in PARHM.) Similarly, we stated that if an HOPD no longer participates in PARHM as part of a participating rural hospital, and the HOPD otherwise meets the definition of an RO participant, then the HOPD would be required to participate in the RO Model as of the start of the next CY quarter.

We stated in the CY 2022 OPPS/ACS proposed rule that we would continue to use the list on the PARHM website at *https://innovation.cms.gov/initiatives/pa-rural-health-model/*, which is updated quarterly, to identify the hospitals that are participating in PARHM, and therefore identify the specific HOPDs excluded from participation in the RO Model. We therefore proposed that HOPDs that are identified as eligible to participate in PARHM, but that are not current PARHM participants, should be included in the RO Model if they are located in a CBSA selected for participation in the RO Model and that this exclusion of HOPDs associated with hospitals that participate in PARHM from the RO Model would apply only during the period of such participation.

We solicited public comments on our proposal to include HOPDs eligible to participate in PARHM, but that are not current PARHM participants in the RO Model (86 FR 42291).

The following is a summary of the public comments received on this proposal and our responses:

Comment: A few commenters supported our proposal to exclude from the RO Model only the HOPDs that are participating in PARHM, rather than excluding both HOPDs that are participating in PARHM and those that have been identified by CMS as eligible to participate in PARHM.

Response: We thank commenters for their support.

Comment: Some commenters opposed the inclusion in the RO Model of only HOPDs participating in PARHM, stating that they believe that participation in the RO Model should be voluntary, and thus no new PGPs or HOPDs, including HOPDs identified as eligible to participate in PARHM, should be required to participate in the RO Model.

Response: We did not solicit comments on mandatory participation under the RO Model in the CY 2022 OPPS/ASC proposed rule. We did, however, respond to comments requesting voluntary participation in the RO Model in the Specialty Care Models final rule. As discussed in the Specialty Care Models final rule, mandatory participation avoids the selection bias inherent to any model in which providers and suppliers may choose whether or not to participate (85 FR 61141). Such a design ensures sufficient proportional participation of both HOPDs and freestanding radiation therapy centers, which is necessary to obtain a diverse, representative sample of RT providers and RT suppliers that will allow a statistically robust test of the prospective episode payments made under the RO Model (85 FR 61141). Mandatory participation also facilitates a comparable evaluation comparison group (85 FR 61138). We therefore maintain, as we did in the Specialty Care Models final rule, that the mandatory design for the RO Model is necessary to enable CMS to detect change reliably in a generalizable sample of RT providers and RT suppliers to support a potential model expansion (85 FR 61138).

In terms of our proposal to include HOPDs that have been identified as eligible to participate in PARHM, but that are not actually participating in PARHM, in the RO Model, as we noted in the CY 2022 OPPS/ASC proposed rule, we no longer believe that including these hospitals in the RO Model will impact the PARHM evaluation because such HOPDs do not receive global budgets under PARHM, so including these hospitals in the RO Model would not result in an overlap between PARHM payments and RO Model payments. In addition, as described above, we now expect that the PARHM evaluation's comparison group will consist only of hospitals located outside of Pennsylvania. Thus, it is now our expectation that HOPDs that have been identified as eligible to participate in PARHM—all of which are located within the Commonwealth of Pennsylvania—would not be selected for the comparison group for the PARHM evaluation. Accordingly, we do not expect that including in the RO Model those HOPDs that have been identified as eligible to participate, but not actually participating in, PARHM would affect the ability to detect the impact of PARHM on the cost and quality of care.

In addition, as we stated in the proposed rule, while it remains the case that hospitals and CAHs may join

PARHM on an ongoing basis, hospitals and CAHs generally join PARHM at the start of a given CY. Because the RO Model's PYs would align with CYs, we stated in the CY 2022 OPPS/ACS proposed rule that we concluded it would be possible to update the RO Model exclusions for a given PY if an HOPD leaves or joins PARHM. In the CY 2022 OPPS/ACS proposed rule, we provided an example of a rural hospital identified as eligible to participate in PARHM that later initiates its participation in PARHM by signing a PARHM participation agreement with CMS (86 FR 42291). In the CY 2022 OPPS/ACS proposed rule, we inadvertently stated that the HOPDs participating in PARHM as part of that participating rural hospital would be excluded from participation in the RO Model as of the start of the next CY quarter that follows the date that the HOPD begins participating in PARHM. This statement was inaccurate. Rather, consistent with the exclusion from the RO Model of hospitals participating in PARHM, because these hospitals receive global budgets that would include payments for RT services and as such would overlap with the RO Model, we are clarifying that the HOPDs participating in PARHM as part of that participating rural hospital would be excluded from participation in the RO Model as of the start of the CY quarter that includes the HOPD's start date in PARHM. Specifically, to avoid overlapping participation between the RO Model and PARHM, in the rare circumstance that an HOPD begins its participation in PARHM on a date other than the first day of a CY quarter, that HOPD would be excluded from participation in the RO Model as of the start of the CY quarter when the HOPD joins PARHM—rather than as of the start of the following CY quarter. We similarly stated that, if an HOPD no longer participates in PARHM as part of a participating rural hospital, and the HOPD otherwise meets the definition of an RO participant, then the HOPD would be required to participate in the RO Model as of the start of the next CY quarter; we further clarify that, to avoid any overlap between the global budget payments and the RO Model payment, the HOPD would be required to participate in the RO Model as of the start of the CY quarter following the former PARHM participant's final global budget payment.

After considering public comments, we are finalizing the proposal to exclude only those HOPDs that are participating in the PARHM from the RO Model as opposed to all HOPDs that are eligible to participate in the PARHM. We are codifying this policy at our regulation at § 512.210(b)(5). As stated in the proposed rule (86 FR 42291), we will continue to use the list on the PARHM website at *https://innovation.cms.gov/initiatives/pa-ruralhealth-model/*, which is updated quarterly, to identify the hospitals that are participating in PARHM, and therefore identify the specific HOPDs excluded from participation in the RO Model.

We are further finalizing that HOPDs that are identified as eligible to participate in PARHM, but that are not current PARHM participants, will included in the RO Model if they are located in a CBSA selected for participation in the RO Model and that this exclusion of HOPDs associated with hospitals that participate in PARHM from the RO Model would apply only during the period of such participation. As previously described, if an HOPD begins its participation in PARHM on a date other than the first day of a CY quarter, that HOPD would be excluded from participation in the RO Model as of the start of the CY quarter when the HOPD joins PARHM, not of the start of the following CY quarter.

b. Community Health Access and Rural Transformation (CHART)

We also proposed to modify the exclusions from the RO Model at § 512.210(b)(6) so that the HOPD of any participating hospital in the Community Transformation Track of the Community Health Access and Rural Transformation (CHART) Model would be excluded from the RO Model. Specifically, for any CHART Community Transformation Track performance period during which a hospital is participating in the CHART Model, the HOPD would be excluded from the RO Model. We proposed to exclude these ''CHART HOPDs'' because these hospitals will receive prospective capitated payments, including HOPD-based RT services, that are not retrospectively reconciled based on experience during the CHART performance year, rather future payments are adjusted based on changes in population and proportion of services that participating HOPDs provide. We proposed to exclude CHART HOPDs to avoid double payment for the same services. The participating hospitals will be listed and updated on the CHART Model website at *https://innovation.cms.gov/innovation-models/chart-model*. For the CHART ACO Transformation Track, we proposed that we would follow the same policy for overlap between the RO Model and the Medicare Shared Savings Program ACOs, which was finalized at 85 FR 61260.

We solicited public comments on our proposal in section XVIII.C.3.B. of the CY 2022 OPPP/ASC proposed rule (86 FR 42291).

The following is a summary of the public comments received on this proposal and our responses:

Comment: We received some comments about the exclusion of HOPDs of any participating hospital in the Community Transformation Track of the CHART Model from the RO Model. All of these commenters supported this exclusion. A commenter also supported that for the CHART ACO Transformation Track we will follow the same policy for overlap between the RO Model and the Medicare Shared Savings Program ACOs, which is described at 85 FR 61260. A couple of commenters commented that exclusion from the RO Model of an HOPD of any participating hospital in the Community Transformation track of the CHART Model will have minimal impact, as 15 lead organizations will be selected for participation in the Community track CHART out of all specialties and it is unlikely that a radiation oncology practice would be selected to participate in CHART.

Response: We thank commenters for their support. We agree that the overlap between RO Model participants and participating hospitals in the Community Track of the CHART Model will be minimal. However, we need to account for any overlap that could potentially exist between the RO Model and CHART. We believe the best way to account for this overlap is to exclude HOPDs participating in the CHART Community Transformation track and for the CHART ACO Transformation track to follow the same policy that applies for overlap between the RO Model and the Medicare Shared Savings Program ACOs.

After considering public comments, we are finalizing as proposed to exclude HOPDs participating in the CHART Community Transformation track from the RO Model. We are codifying this policy at § 512.210(b)(6). We are clarifying in this final rule that HOPDs furnishing included RT services selected for participation in the CHART Community Transformation track will be RO participants in PY1 of the RO Model and are only excluded once the CHART Community Transformation track model performance period begins.

And, for the CHART ACO Transformation track, we are finalizing as proposed that we will follow the same policy for overlap as exists for overlap between the RO Model and the

Medicare Shared Savings Program ACOs.

c. Low Volume Opt-Out

We codified under § 512.210(c) that a PGP, freestanding radiation therapy center, or HOPD, which would otherwise be required to participate in the RO Model may choose to opt out of the RO Model for a given PY if it has fewer than 20 episodes of RT services across all CBSAs selected for participation in the most recent year with claims data available prior to the applicable PY. In the CY 2021 OPPS/ASC final rule (85 FR 86261), we amended this policy at § 512.210(c) to clarify the type of episodes used to determine eligibility for the low volume opt-out in each performance year, where episodes, as defined at § 512.205, are used to determine eligibility in PY1 and PY2 and RO episodes, as defined at § 512.205 and described at § 512.245(a), are used to determine eligibility in PY4 and PY5, and both episodes and RO episodes are used to determine eligibility in PY3. Specifically, for PY3, eligibility for the low volume opt-out is determined by counting episodes from January 1, 2021 through June 30, 2021 and RO episodes from July 1, 2021 through December 31, 2021. We codified at § 512.210(c)(6) that at least 30 days prior to the start of each PY, CMS will notify RO participants eligible for the low volume opt-out for the upcoming PY. If the eligible RO participant wishes to opt out, it must attest that it intends to do so prior to the start of the upcoming PY.

Because section 133 of the CAA, 2021 prohibits implementation of the RO Model prior to January 1, 2022, we proposed to modify the dates of the data used to determine eligibility for the low volume opt-out in the CY 2022 OPPS/ASC proposed rule to align with the requirements of the CAA, 2021. We proposed that a PGP, freestanding radiation therapy center, or HOPD, which would otherwise be required to participate in the RO Model may choose to opt out of the RO Model for a given PY if it has fewer than 20 episodes or RO episodes, as applicable, depending on the PY, across all CBSAs selected for participation in the most recent year with claims data available, which is 2 years prior to the applicable PY. We further proposed that episodes furnished prior to the start of the model performance period in CBSAs selected for participation will be used to determine the eligibility of the low volume opt-out for PY1 and PY2. If PY1 begins on January 1, RO episodes will be used to determine the eligibility of the low volume opt-out for PY3. If PY1 begins on any date other than January 1, both RO episodes of PY1 and episodes occurring in the CY of PY1 (but occurring prior to the start of PY1 in that year) in CBSAs selected for participation will be used to determine the eligibility of the low volume opt-out for PY3. RO episodes of PY2 and PY3 will be used to determine the eligibility of the low volume opt-out for PY4 through PY5, respectively.

We proposed definitions for legacy CCN and legacy TIN as follows. A legacy CCN means a CCN that an RO participant that is a hospital outpatient department, or its predecessor(s), previously used to bill Medicare for included RT services but no longer uses to bill Medicare for included RT services. We proposed that a legacy TIN means a TIN that an RO participant that is a PGP, or a freestanding radiation therapy center, or its predecessor(s), previously used to bill Medicare for included RT services but no longer uses to bill Medicare for included RT services.

We proposed to add at § 512.210(c)(7) that during the model performance period, an entity would not be eligible for the low volume opt-out if its legacy TIN or legacy CCN was used to bill Medicare for 20 or more episodes or RO episodes, as applicable, of RT services in the 2 years prior to the applicable PY across all CBSAs selected for participation.

We solicited public comments on the proposed definitions of legacy TIN and legacy CCN, as well as the proposal for how to address low volume opt-out eligibility in the case of an entity that has a change in TIN or CCN (86 FR 42291).

The following is a summary of the public comments received on these proposals and our responses:

Comment: One commenter requested clarification on how the low volume opt-out policy will be applied to completely new entities or for existing CCNs or TINs that add a radiation therapy service line. This commenter stated that CMS indicated in prior communications that such entities would not be eligible for the opt-out policy since they would have no historical claims to determine if they are eligible for the policy. This commenter asked CMS to establish a process by which new entities or entities adding a new service line that anticipate having low volume in the performance year could apply for the low volume opt-out.

A couple of the commenters noted that the low volume opt-out will not protect all small and rural facilities as many will not be eligible to opt out under this policy. These commenters stated that the RO Model's provisions may prove to be unexpectedly burdensome or financially infeasible for these RO participants. One commenter specifically disagreed with the threshold of fewer than 20 episodes or RO episodes, claiming that the threshold is exceedingly low and does not exempt radiation oncologists working less than half-time. This commenter explained that in small and rural counties, older adults (65+) make up a larger share of the population compared to urban and suburban areas, resulting in a large Medicare population to serve, thus making the 20-episode threshold impractical. This commenter suggested that a more realistic approach would be to use the low-volume threshold used in MIPS of 200 or fewer Medicare fee-for-service encounters.

One commenter recommended CMS allow RO participants to retrospectively request to opt out of a PY if it furnished fewer than 20 episodes in that PY. In this instance, an RO participant that retrospectively opts out would have its payments adjusted based on the FFS amount the RO participant would have been paid had it not been included in the RO Model.

Response: We thank these commenters for their comments. We finalized in the Specialty Care Models final rule (85 FR 61188) that a PGP, freestanding radiation therapy center, or HOPD which would otherwise be required to participate in the RO Model under § 512.210(c) may choose to opt-out of the RO Model on an annual basis if the PGP, freestanding radiation therapy center, or HOPD furnishes fewer than 20 episodes across all CBSAs selected for participation in the most recent calendar year with available claims data. We codified this policy at § 512.210(c) of that final rule.

As discussed in the Specialty Care Models final rule (85 FR 61188), the low volume opt-out option is intended to allow RO participants furnishing a small volume of RT services in the CBSAs selected for participation in the Model to opt out if they so choose, given the investment required to implement the RO Model versus the benefit of participating in the RO Model for a limited frequency of RT services. We note that prospective payments in general, including episode-based payment rates of the RO Model, are not designed to reflect specific investment decisions of individual RT providers and RT suppliers, such as practice-specific technology acquisition of new service lines.

We believe that requiring those RO participants eligible to opt-out of the RO Model to attest to the intention of opting

out of the RO Model prior to the start of the applicable PY (that is, on or before December 31 of the prior PY in which the opt-out would occur), and to do so before every PY for which the RO participant is eligible to opt out, is less disruptive to these RO participants than allowing them to opt out of the RO Model retrospectively. They can continue to bill and operate as they do under FFS without needing to meet additional RO Model requirements. Allowing RO participants to opt out of the RO Model retrospectively would be operationally complex. We also believe that it would not make sense to allow for RO participants to opt out retrospectively, since these RO participants would have prepared for the RO Model, billed RO episodes and carried out their requirements only to be paid under FFS for the few RO episodes they furnished.

In response to concerns from commenters concerning rural RT providers and RT suppliers, we did further analysis concerning the rural and urban landscape of the ZIP Codes linked to CBSAs selected for participation in the Model. We used the U.S. Department of Agriculture's Economic Research Service's ''2010 Rural-Urban Commuting Area (RUCA) Code, ZIP Code file'' last updated in August 2020 (*https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.aspx*) to analyze the population density, urbanization, and daily commuting patterns of the RO Model's participating ZIP Codes that are linked to CBSAs selected to participate in the RO Model. The Primary RUCA classification contains whole numbers (1–10) to delineate metropolitan, micropolitan, small town, and rural commuting areas based on the size and direction of the primary (largest) commuting flows, where RUCA category 1 is highly urban and RUCA category 10 is highly rural. RUCA category 1 is described in the ZIP Code file as having a metropolitan area core with primary flow within an urbanized area. RUCA category 10 is described in the code file as having a primary flow to a tract outside an urbanized area or urban cluster. RUCA category 4 is defined as having a micropolitan area core with primary flow within a large urban cluster of 10,000 to 49,999.

Among RT providers and RT suppliers eligible to participate in the RO Model, we found that approximately 98 percent of their 2020 episodes furnished in participating ZIP Codes were furnished in RUCA categories classified as 1 and 4, with approximately 85 percent in RUCA category 1 and 13 percent in RUCA category 4. We found that approximately less than 2 percent of 2020 episodes furnished in participating ZIP Codes were furnished by those RT providers or RT suppliers billing in RUCA category classified as 2. No 2020 episodes were furnished in participating ZIP Codes by those RT providers or RT suppliers in RUCA category classified as 3. Less than 1 percent of 2020 episodes furnished in participating ZIP Codes were furnished by RT providers or RT suppliers billing in RUCA categories classified as 5 through 10.

We then examined the range of the combined adjustments, reflecting the RO participant's historical experience and case mix values, for both the PC and TC based on our proposed policies where the historical experience and case mix adjustments for PY1 would be based on 2017–2019 episodes. We found similar patterns of adjustment values across those RT providers and RT suppliers in RUCA category 1 and 4. Although we also found similar patterns of adjustment values across RT providers and RT suppliers furnishing episodes in the remaining RUCA categories, the number of those RT providers and RT suppliers and their corresponding episodes in the other RUCA categories are too small to draw reliable conclusions. We uncovered no evidence that rural providers have sufficiently different patterns of adjustment values than non-rural providers to indicate participation in the RO Model may be burdensome or financially infeasible for RO participants that furnish RT care in rural areas such that a change in our low volume opt-out policy specific to rural areas is warranted. We also note that any RO participant, regardless of the RUCA category within which they are furnishing RO episodes, can opt out of the RO Model if they are so eligible due to low volume.

As we stated in the Specialty Care Models final rule (85 FR 61147), we believe that allowing entities with fewer than 20 episodes to opt-out achieves the right balance of allowing very small entities to opt-out if they believe the burden from participation in the RO Model would outweigh the possibility of benefits from model participation (for example, potential for care improvements or increased payments), while also maintaining a variety of RO participant types in the RO Model to promote generalizability (to the extent possible) of any impact results. We do not believe it is necessary to allow RO participants adding new service lines to choose to opt out of the RO Model for a given PY if it has fewer than 20 episodes of RT services across all CBSAs selected for participation in the most recent year with claims data available prior to the applicable PY. The trend factor will reflect updates to input prices as reflected in updated PFS and OPPS rates. As we stated in the Specialty Care Models final rule (85 FR 61188), prospective payments in general, including episode-based payment rates of the RO Model, are not designed to reflect specific investment decisions of individual providers and suppliers. We do not currently classify episodes based on whether they are related to an existing service line or a service line that was not furnished and billed by the RO participant historically, and therefore, whether an RO participant has added a new service line or not is not relevant to our payment methodology or low volume opt-out policy. We did note in the Specialty Care Models final rule (85 FR 61188) that we may consider revising this policy in the future.

Please note that any new TIN or new CCN, regardless of whether it is result of a merger, acquisition, or other business relationship, must opt out of a PY prior to the start of that PY, if it is so eligible. If a PGP, freestanding radiation therapy center, or HOPD begins furnishing included RT services in a CBSA selected for participation in the RO Model during a PY, that entity would be unable to opt out of the PY that is currently underway.

After considering public comments, we are finalizing as proposed that a PGP, freestanding radiation therapy center, or HOPD, which would otherwise be required to participate in the RO Model may choose to opt out of the RO Model for a given PY if it has fewer than 20 episodes or RO episodes, as applicable, depending on the PY, across all CBSAs selected for participation in the most recent year with claims data available, which is 2 years prior to the applicable PY. We are finalizing that episodes furnished prior to the start of the model performance period in CBSAs selected for participation will be used to determine the eligibility of the low volume opt-out for PY1 and PY2. If PY1 begins on January 1, RO episodes will be used to determine the eligibility of the low volume opt-out for PY3. If PY1 begins on any date other than January 1, both RO episodes of PY1 and episodes occurring in the CY of PY1 (but occurring prior to the start of PY1 in that year) in CBSAs selected for participation will be used to determine the eligibility of the low volume opt-out for PY3. RO episodes of PY2 and PY3 will be used to determine the eligibility of the low volume opt-out for PY4 and

PY5, respectively. We are codifying this policy at our regulation at § 512.210(c).

We received no comments on the definitions of legacy TIN and legacy CCN, and therefore we are finalizing these definitions at § 512.205 with one technical change to the proposed definition of legacy CCN. We are changing ''radiotherapy services'' to ''RT services'' because that is the defined term in the regulations. After considering public comments, we are also finalizing the policy that CMS will include episodes and RO episodes, as applicable, associated with the RO participant's current CCN or TIN and episodes and RO episodes, as applicable, attributed to the RO participant's legacy CCN(s) or legacy TIN(s), in determining whether the participant is eligible for the low volume opt out. We are finalizing as proposed that an entity will not be eligible for the low volume opt-out if its legacy TIN or legacy CCN was used to bill Medicare for 20 or more episodes or RO episodes, as applicable, of RT services in the 2 years prior to the applicable PY across all CBSAs selected for participation. We are codifying these definitions and this policy at our regulation at § 512.205 and § 512.210(c)(7) respectively.

4. Certain Changes to RO Model Episodes

a. Criteria for Determining Included Cancer Types

The criteria for cancer types to be included in the RO Model are set forth at § 512.230(a). CMS proposed to reorganize § 512.230(a) and (b) to improve the clarity and internal consistency of the regulatory text. We proposed to amend § 512.230(a) and (b) such that to be included in the RO Model, a cancer type must be commonly treated with radiation per nationally recognized, evidence-based clinical treatment guidelines; associated with current ICD–10 codes that have demonstrated pricing stability, which is determined by analyzing the interquartile ranges of the episode prices across cancer types as described in the Specialty Care Models final rule at 85 FR 61155; and the Secretary must not have determined that the cancer type is not suitable for inclusion in the RO Model. We proposed that CMS would remove from the RO Model a cancer type that does not meet all three of these criteria or for which CMS discovers a greater than 10 percent error in the established national base rates.

Comment: We received a few comments in support of the RO Model's current policy, including support for including radiation therapy treatments that are commonly used for multiple cancer types. A few commenters noted that the list of included cancer types is still too broad and CMS should limit the number of cancers to those cancers where there is strong clinical evidence for a range of treatment alternatives, such as prostate cancer, breast cancer, and lung cancer. We received a comment expressing support for including only cancer types with evidence of effective use of hypofractionation to ensure delivery of clinically appropriate care and value. A separate commenter asked that CMS reduce the 15 cancer types to a smaller number for the initial rollout of the RO Model.

Response: We appreciate the comments. We note that we did not propose any substantive changes to our policy that determines what cancer types are included in the RO Model, but instead simply reorganized the content in § 512.230(a) and (b). The included cancer types are determined by the following criteria as stated in the proposed reorganization for § 512.230(a): All are commonly treated with radiation per nationally recognized, evidence-based clinical treatment guidelines; all cancer types have one or more associated current ICD–10 codes that have demonstrated pricing stability; and the Secretary has not determined that the cancer type is not suitable for inclusion.

As we noted at 85 FR 61157, the cancer types that are included in the RO Model are cancers commonly treated with RT, and we exclude those cancers that are rarely treated with radiation. CMS believes that limiting or phasing in the number of included cancer types would be more burdensome for most RO participants. For most RO participants, limiting or phasing in cancer types would mean that the RO Model requirements and billing guidance would apply to a subset of their RT services rather than to than to the majority of their RT services for a significant portion of the model performance period (or if cancer types were further limited, for the entire model performance period).

Further, as we stated in the Specialty Care Models final rule at 85 FR 61157, CMS believes that phasing in the included cancer types would prevent a robust evaluation because doing so would reduce the amount of available data for any cancer types phased in at a later time. We believe that a model performance period of at least 5 years is sufficient to obtain data to compute a reliable impact estimate.

As we stated in the Specialty Care Models final rule at 85 FR 61156, the RO Model is designed to be disease-specific and agnostic to treatment and modality type. That is, we do not require that multiple treatment alternatives exist for a given cancer type, or that hypofractionation be an option for treating the cancer type, to be included in the RO Model because the purpose of the RO Model is to test an episode-based payment that is not specific to how many treatments or which modalities are furnished, which would retain FFS incentives. Rather than these types of requirements, our criteria for the included cancer types includes the requirement that each cancer type demonstrate pricing stability. As we described in the Specialty Care Models final rule at 85 FR 61157, although individual episodes may deviate from the average number of fractions for the cancer type (depending on the clinical profile of the individual patient), we have determined that all of the included cancer types have pricing stability, which allows them to be accurately priced to support the RO Model test.

We will continue to review whether the included cancer types meet the criteria at § 512.230. As we recently did with liver cancer, we will update the included cancer types as is detailed in § 512.230 when a cancer type needs to be added to the RO Model or excluded from the RO Model.

Comment: We received one comment in which the commenter expressed concern about the inclusion of bone and brain metastases because the treatments of both cancers can vary widely in the approach and technology used depending on the specific patient and disease progression.

Response: We appreciate this comment. CMS has determined that brain and bone metastases meet all three criteria for inclusion. As we stated in the Specialty Care Models final rule (85 FR 61188), we believe that treatment patterns as reflected in the episode file represent the variation in care patterns currently delivered nationally for all included cancer types. The case mix model incorporates cancer type and so the participant-specific case mix adjustment for the PC and/or the TC of the RO Models reflects the case mix of the RO participant's population, including those with bone and brain metastases. The same is true for the approach taken for the historical experience adjustment.

We are finalizing our proposal to reorganize our regulations at § 512.230(a) and (b) without modification.

b. Removal of Liver Cancer From Included Cancer Types

In section XVIII.C.4.b. of the CY 2022 OPPS/ASC proposed rule we stated that liver cancer met the criteria for exclusion set forth in regulatory language in § 512.230(a) and (b), regulatory text that we also proposed to reorganize as described above. While we did not request comment on removing liver cancer from the RO Model, we received supportive comments related to removing liver cancer from the list of included cancer types. See Table 74 below, for the current list of included cancer types.

BILLING CODE 4120–01–P

TABLE 74: Included Cancer Types and Corresponding ICD-10 Codes

Cancer Type	ICD-10 Codes
Anal Cancer	C21.xx
Bladder Cancer	C67.xx
Bone Metastases	C79.51
Brain Metastases	C79.3x

BILLING CODE 4120–01–C

c. Removal of Brachytherapy From Included RT Services

We codified at § 512.240 the modalities that are included under the RO Model: 3-dimensional conformal radiotherapy (3DCRT), intensity-modulated radiotherapy (IMRT), stereotactic radiosurgery (SRS), stereotactic body radiotherapy (SBRT), proton beam therapy (PBT), image-guided radiation therapy (IGRT), and brachytherapy. We proposed to amend § 512.240 to remove brachytherapy as an included modality in the RO Model.

We finalized a waiver of section 1833(t)(2)(H) of the Act under the authority of section 1115A(d)(1) of the Act, because it was necessary for the purposes of testing the RO Model when we were including brachytherapy as part of the RO Model, as discussed in the Specialty Care Models final rule at 85 FR 61242 and codified at § 512.280(f)(4). Given that our proposal to remove brachytherapy from the RO Model, if finalized, would render our waiver of section 1833(t)(2)(H) of the Act moot, we proposed to withdraw this waiver if our proposal to remove brachytherapy is finalized as proposed, because it would no longer be necessary solely for the purposes of testing the RO Model.

We solicited public comments on our proposal in section XVIII.C.4.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42293).

The following is a summary of the public comments received on this proposal and our responses:

Comment: CMS received many comments in support of the proposed policy to remove brachytherapy from the RO Model's list of included modalities; no commenters opposed removing brachytherapy. One commenter noted that the removal of brachytherapy will significantly lessen the number of RO Model claims that will be incorrectly paid. Another commenter supported removal because of the frequency in which brachytherapy is being furnished at PPS-exempt hospitals. One commenter noted that historically, brachytherapy has been under-reimbursed compared to other forms of radiotherapy, and its utilization in the United States has declined in recent years, and that this trend has not been observed in other countries. This commenter supported the potential for including brachytherapy services in future iterations of the RO Model. A couple commenters asked that CMS work with stakeholders to find a way to include brachytherapy in later model performance periods.

A few commenters stated that they did not support including brachytherapy within the RO Model's bundled payment in the future. One commenter did not support including brachytherapy during the model performance period given the commenter's perception that the RO Model's pricing and payment mechanism are complex. This commenter opposed inclusion because it would increase the Model's complexity.

One commenter stated that brachytherapy sources are vastly different than other included modalities. This commenter stated that brachytherapy sources are more similar to drugs and radiopharmaceuticals that are also excluded from the bundled payments under the RO Model. This commenter also stated that external beam radiation often requires less variation in resource use among patients with similar types of cancer who are treated by the same radiation oncology provider than do those who receive brachytherapy treatment. A couple commenters supported the removal of brachytherapy because they did not believe the episode payments adequately covered brachytherapy sources, pointing to low dose rate brachytherapy sources such as Cesium-131 as an example.

Some commenters supporting the brachytherapy exclusion stated their belief that the RO pricing methodology is insufficient for multimodality episodes, such as those that include brachytherapy. Many of these commenters noted that although they are supportive of the proposal to remove brachytherapy, it does not address what commenters perceived to be the inadequate payment for brachytherapy services under FFS Medicare, which they argued has created access to care issues for this particular modality for years.

Response: We appreciate the feedback. CMS seeks to neither incentivize nor discourage the use of one modality over another, but rather to encourage RT providers and RT suppliers to choose RT services that are the most clinically appropriate for RO beneficiaries under their care. The exclusion of a modality from the RO Model is not meant to imply anything about the value of such modality. Published clinical evidence suggests brachytherapy is a high-value RT service, which could warrant its inclusion in the RO Model. However, we acknowledge the concerns stakeholders have about possible unintended consequences for beneficiaries' access to care were brachytherapy to remain in the RO Model under the existing pricing methodology.

We note that we are not responding at this time to comments related to how we might include brachytherapy as a single modality or as multimodality episodes in the future. We are also not addressing comments about the perceived inadequate payment for brachytherapy services under FFS Medicare. We appreciate these comments and will consider them in future rulemaking.

Comment: Many commenters noted that if CMS finalizes the removal of brachytherapy, we should consider removing the incorrect payment withhold from the RO Model's pricing methodology. These commenters argued that without brachytherapy in the RO Model, this withhold is unnecessary.

Response: There are additional payment scenarios (such as incomplete episodes and duplicate services) beyond a multimodality episode with brachytherapy that require reconciliation and payment from the incorrect payment withhold. Therefore, we are not removing the incorrect payment withhold from the RO Model's pricing methodology.

Comment: We received a few comments in support of withdrawing our waiver of section 1833(t)(2)(H) of the Act in § 512.280(f)(4). A few commenters urged CMS to continue to uphold the safeguards that Congress established for paying for brachytherapy sources under the hospital OPPS under section 1833(t)(2)(H) of the Act and refrain from waiving the safeguards in the future.

Response: We thank commenters for their support.

We are finalizing the removal of brachytherapy from the list of included modalities in the RO Model codified at § 512.240 and are amending § 512.280(f)(4) to remove 1833(t)(2)(H).

d. Exclusion of IORT

We finalized in the Specialty Care Models final rule (85 FR 61114) that IORT would not be included as a modality in the RO Model. We asked for comments on how we might include IORT in future years at XVIII.C.4.d. of the CY 2022 OPPS/ASC proposed rule and we noted at 86 FR 42296 that we did not intend to respond to these comments in this final rule. We received some comments related to this issue and appreciate these comments. We will consider these comments in future rulemaking.

5. Pricing Methodology

a. Assignment of Cancer Types to an Episode

We finalized at 85 FR 61179 our process for assigning a cancer type to an episode as follows: First, we identify ICD–10 diagnosis codes during an episode from: (1) Medicare PFS claims for evaluation and management (E&M) services with an included cancer diagnosis code with a date of service during the 30 days before the episode start date, on the episode start date, or during the 29 days after the episode start date; and (2) Medicare PFS claims for treatment planning and delivery services with an included cancer diagnosis code (See Table 57), or Medicare OPPS claims for treatment delivery services with an included cancer diagnosis code on the claim header, with a date of service on the episode start date or during the 29 days after the episode start date. The cancer diagnosis code from OPPS claims must be the principal diagnosis to count toward cancer type assignment, and treatment delivery services that concern image guidance do not count toward cancer type assignment as we determined that image guidance was not an important indicator of cancer type. Then, we analyze and count these ICD–10 diagnosis codes across the claim lines to determine the episode's cancer type assignment according to the algorithm described in (1) through (3):

(1) If two or more claim lines fall within brain metastases or bone

metastases or secondary malignancies (per the mapping of ICD–10 diagnosis code to cancer type described in Table 57 of Identified Cancer Types and Corresponding ICD–10 Codes), we set the episode cancer type to the type (either brain metastases or bone metastases) with the highest count. If the count is tied, we assign the episode in the following order of precedence: Brain metastases; bone metastases; other secondary malignancies.

(2) If there are fewer than two claim lines for brain metastases, bone metastases or other secondary malignancies, we assign the episode the cancer type with the highest claim line count among all other cancer types. We exclude the episode if the cancer type with the highest claims line count among other cancer types is not an included cancer type.

(3) If there are no claim lines with a cancer diagnosis meeting the previously discussed criteria, then no cancer type is assigned to that episode and therefore, that episode is excluded from the national base rate calculations.

Since the publication of the Specialty Care Models final rule, a stakeholder has asked for clarification on how to identify when there are fewer than two claim lines for brain metastases, bone metastases or other secondary malignancies. In response to the stakeholder's request, in the proposed rule, we clarified paragraph (2) at 86 FR 42296. Specifically, if there are not at least two claim lines for brain metastases or at least two claim lines for bone metastases or at least two claim lines for any other secondary malignancy, then we assign the episode the cancer type with the highest line count among all other cancer types. For example, one bone metastases claim line and one secondary metastasis claim line will not qualify as two or more claim lines that fall within brain metastases or bone metastases or secondary malignancies. Instead, the episode will be assigned whatever cancer type had the highest line count among all other cancers.

We clarified in the CY 2022 OPPS/ASC proposed rule that we use a broad list of cancer diagnoses (those included in the RO Model and those not included) to assign cancer type to episodes in the baseline period. This broad list of cancer diagnoses is posted on the RO Model website at *https://innovation.cms.gov/innovationmodels/radiation-oncology-model*. We identify ICD–10 diagnosis codes for cancer during an episode from E&M services, and treatment planning and delivery services that have a cancer diagnosis code from that broad cancer diagnosis list. We assign a cancer type to the episode as described in this proposed rule. We then exclude those episodes that are not assigned an included cancer type. We do not exclude claims of excluded cancer types prior to episode construction, as this could lead to an episode being included in the RO Model where most of the RT services were related to treating an excluded cancer type.

We did not solicit public comments on this clarification in section XVIII.C.5.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42296).

b. Constructing Episodes Using Medicare FFS Claims and Calculation of Episode Payment

We proposed to update how we describe our pricing methodology. We proposed to remove references to specific CYs from the definition of baseline period, but we would still construct episodes based on dates of service for Medicare FFS claims paid during the baseline period as well as claims that are included under an episode where the initial treatment planning service occurred during the baseline period. Furthermore, although we proposed to remove references to specific CYs, we would continue to weigh the most recent observations more heavily than those that occurred in earlier years, as previously finalized. We would continue to weigh episodes that initiated in the first year of the baseline period at 20 percent, episodes that initiated in second year of the baseline period at 30 percent, and episodes that initiated in the third year of the baseline period at 50 percent. We invited comment on the proposal to weigh the most recent episodes more heavily than those that occurred in earlier years in the baseline period. We solicited public comments on our proposal in section XVIII.C.5.b. of the CY 2022 OPPS/ASC proposed rule (86 FR 42297).

The following is a summary of the public comments received on this proposal and our responses:

Comment: A couple of commenters agreed with CMS's proposed policy to weigh the most recent episodes more heavily than those that occurred in earlier years in the baseline. One of those commenters added that this weighting scheme is appropriately balanced giving more weight to the most recent data while using multiple years in the baseline period provides year-to-year stability.

Response: We thank these commenters for their support.

After considering public comments, we are finalizing as proposed to weigh the most recent episodes more heavily than those that occurred in earlier years in the baseline period. We received no comments on our proposed modification to the definition of baseline period, and therefore, we are also finalizing as the definition of baseline period without modification and codifying the definition at § 512.205.

We codified at § 512.255(c)(13) that for sequestration, we deduct 2 percent from each episode payment after applying the trend factor, geographic adjustment, case mix and historical experience adjustments, discount, withholds, and coinsurance to the national base rate. At times, the requirements for sequestrations are modified by legislation or regulation. For example, section 3709(a) of division A of the Coronavirus Aid, Relief and Economic Security (CARES) Act (Pub. L. 116–136) included a temporary moratorium on sequestration for all Medicare programs beginning on May 1, 2020 and ending on December 31, 2020, while section 102(a) of division N of the CAA, 2021 (Pub. L. 116–260), extended the suspension period to March 31, 2021. An Act to Prevent Across-the-Board Direct Spending Cuts, and for Other Purposes (Pub. L. 117–7), signed into law on April 14, 2021, extends the suspension period to December 31, 2021. Thus, we proposed to amend § 512.255(c)(13) by removing the percentage amount and indicating that sequestration will be applied in accordance with applicable law.

We solicited public comments on our proposal in section XVIII.C.5.b of the CY 2022 OPPS/ASC proposed rule (86 FR 42298).

The following is a summary of the public comments received on this proposal and our responses:

Comment: A couple of commenters all supported removing the specific reference to the sequestration percentage amount and changing text language to indicate that the exact amount will be determined in accordance with the applicable current law.

Response: We thank these commenters for their support.

After considering public comments, we are finalizing our proposal to amend § 512.255(c)(13) by removing the percentage amount and indicating that sequestration will be applied in accordance with applicable law. We are also codifying these policies at § 512.255(c)(13).

c. National Base Rates

We codified at § 512.250(b) the criteria for excluding episodes, as more fully described in 85 FR 61183 through

61184. We finalized that we would exclude episodes in the baseline (finalized in this rule to be formally defined as ''baseline period'') that are not attributed to an RT provider or RT supplier. These episodes are exceedingly rare. There were fewer than 15 episodes out of more than 518,000 episodes in the 2016 to 2018 period where the only RT delivery services in the episode were classified as professional services. There are a few brachytherapy surgery services that are categorized as professional services. We also finalized that episodes would be excluded if either the PC or TC is attributed to an RT provider or RT supplier with a U.S. Territory service location or to a PPS-exempt entity, but that services within an episode provided in a U.S. Territory or provided by a PPS-exempt entity would be included in the episode pricing. We finalized that episodes would be excluded if they include any RT service furnished by a CAH. Finally, we finalized that we would exclude all Maryland and Vermont claims before episodes are constructed and attributed to an RT provider or RT supplier, and we would similarly exclude inpatient and ASC claims from episode construction and attribution. We finalized a policy that excluded claims before episodes were constructed in certain cases, while in other cases, we excluded entire episodes after construction if they included claims that were to be excluded.

To simplify episode construction, attribution, and pricing, we proposed to exclude all Maryland, Vermont, and U.S. Territory claims and all CAH, inpatient, ASC, and PPS-exempt claims in the same manner: before episodes are constructed and attributed to an RT provider or RT supplier. Furthermore, to mirror the participant exclusion policy proposed in section XVIII.C.3. of the CY 2022 OPPS/ASC proposed rule, we proposed to exclude all claims of an HOPD participating in PARHM (during the time period of their participation in PARHM) before episodes are constructed and attributed to an RT provider or RT supplier. We also clarified that we will exclude episodes from the RO Model's pricing methodology that are attributed to an RT provider or RT supplier that is located in a ZIP Code not assigned to a CBSA, not assigned an included cancer type, or that do not have more than $0 in total allowed amount for professional or technical services from Model pricing. We proposed to amend § 512.250(b) accordingly.We solicited public comments on our proposal in section XVIII.C.5.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42298).

The following is a summary of the public comments received on this proposal and our response:

Comment: We received no comments on the proposal to exclude all Maryland, Vermont, and U.S. Territory claims and all CAH, inpatient, ASC, and PPS-exempt claims in the same manner: before episodes are constructed and attributed to an RT provider or RT supplier. We received comments concerning the inclusion of HOPDs identified as eligible to participate in PARHM, which we summarized and responded to in section XVII.C.3.a of this final rule with comment period, but we received no comments specifically related to PARHM considerations in episode construction.

Response: After considering public comments, we are finalizing our proposal to exclude all Maryland, Vermont, and U.S. Territory claims and all CAH, inpatient, ASC, and PPS-exempt claims before episodes are constructed and attributed to an RT provider or RT supplier. We are also finalizing the proposal to exclude all claims of an HOPD participating in PARHM (during the time period of their participation in PARHM) before episodes are constructed and attributed to an RT provider or RT supplier.

We proposed to define the baseline period as the 3-year period within which episodes must initiate in order to be used in the calculation of the national base rates, participant-specific professional and technical historical experience adjustments, and participant-specific professional and technical case mix adjustments for PY1. We proposed that the baseline period would be January 1, 2017 through December 31, 2019, unless the RO Model is prohibited by law from starting in CY 2022, in which case the baseline period will would be adjusted according to the new model performance period (that is, if the model performance period starts any time in CY 2023, then the baseline period would be CY 2018 through CY 2020).

Comment: A couple commenters expressed concern about how we will handle episode data from CYs 2020 and 2021 in the RO Model given the COVID–19 PHE. One commenter noted that because we proposed that the historical experience adjustment be based on 2017–2019 data which would stay constant throughout the duration of the model performance period, the additional cost associated with delivering more expensive treatment for advanced disease due to the COVID–19 PHE would not be captured in that component of the pricing methodology. One commenter supported this 2017–2019 baseline period, specifically because it does not include 2020. The commenter argued that the pandemic depressed healthcare utilization including essential treatment for conditions such as cancer in ways that are not representative of best practices outside of a pandemic.

Response: We thank these commenters for stating their concerns. Please reference the RO Model's EUC policy in section XVII.C.10. of this final rule with comment period for discussion about the pricing methodology and how specific episode data may be handled should an EUC policy be invoked. We are finalizing our policy that the baseline period will be defined as the three calendar year period that begins on January 1 no fewer than five years but no more than six years prior to the start of the model performance period during which episodes must initiate in order to be used in the calculation of the national base rates, each RO participant's historical experience adjustment for the PC or TC or both for the model performance period, and the RO participant's case mix adjustment for the PC or TC or both for PY1. We are finalizing that the baseline period is January 1, 2017 through December 31, 2019, unless the RO Model is prohibited by law from starting in CY 2022. Our finalized national base rates for the model performance period are based on the criteria set forth for cancer type inclusion and are summarized in Table 75 of this final rule with comment period.

BILLING CODE 4120–01–P

TABLE 75: National Base Rates

RO Model-Specific Codes	Professional or Technical	Included Cancer Type	National Base Rate
M1072	Professional	Anal Cancer	$3,104.11
M1073	Technical	Anal Cancer	$16,800.83
M1074	Professional	Bladder Cancer	$2,787.24
M1075	Technical	Bladder Cancer	$13,556.06

BILLING CODE 4120–01–C

d. Trend Factors

We codified our policy at § 512.255(c)(1) to apply a trend factor (an adjustment applied to the national base rates that updates those rates to reflect current trends in the OPPS and PFS rates for RT services) to each of the national base rates. In the Specialty Care Models final rule at 85 FR 61186, we stated that for each PY, we will calculate separate trend factors for the PC and TC of each cancer type using data from HOPDs and freestanding radiation therapy centers not participating in the RO Model. Each of the separate trend factors will be updated and applied to the national base rates prior to the start of each PY (for which they would apply) so as to account for trends in payment rates and volume for RT services outside of the RO Model under OPPS and PFS. We clarified in the CY 2022 OPPS/ASC proposed rule at 86 FR 42299 through 42300, that the number of separate trend factors will vary depending on the number of cancer types included in the RO Model.

Given the multiple delays in the model performance period and our proposal to update the baseline period, we proposed that the numerator of the trend factor would be the product of (a) the average number of times each

HCPCS code (relevant to the component and the cancer type for which the trend factor will be applied) was furnished 3 years prior to the CY used to determine the FFS payment rates and (b) the component's FFS payment rate (as paid under OPPS or PFS) for the CY of the upcoming PY. We proposed that the denominator of the trend factor would be the product of (a) the average number of times each HCPCS code (relevant to the component and the cancer type for which the trend factor will be applied) was furnished in the most recent year of the baseline period and (b) the corresponding FFS payment rate for the most recent year of the baseline period. We also clarified that the trended national base rates will be made available on the RO Model website prior to the start of the applicable PY, along with this final rule.

We solicited public comments on our proposals in section XVIII.C.5.d. of the CY 2022 OPPS/ASC proposed rule (86 FR 42300).

The following is a summary of the public comments received on the proposal to base the denominator of the trend factor on the third year of the proposed baseline period, and the numerator of the trend factor on FFS payment rates for the same CY as the upcoming PY combined with utilization from the third year of the baseline period for PY1, the first CY after the baseline period for PY2, the second CY after the baseline period for PY3, and so on, and our response:

Comment: Many commenters disagreed with the proposed modification of the trend factor, because it did not include guardrails to prevent significant shifts in payment rates under the RO Model's trend factors, since the trend factor methodology incorporates the MPFS and OPPS rates as part of an annual update for the PC and TC of each disease site. These commenters argued that without the guardrails, the proposed trend factor methodology limits rate stability if MPFS and OPPS experience significant payment shifts from year-to-year. Many of these commenters recommended a guardrail of +/-2 percent to help establish rate stability. One commenter argued that it was inappropriate to apply, in part, the rate of growth in physician payments to payments for RT services furnished in HOPDs, as CMS intends to do under the RO Model. This commenter argued that when Congress passed MACRA, it did not intend to apply the annual PFS update factor of 0 percent to payments made under OPPS for the years 2020 through 2025. This commenter recommended that CMS calculate one trend factor for the technical component of RT services furnished in the freestanding radiation therapy center setting using the change in PFS payments and one for the technical component of RT services furnished in an HOPD setting using the change in OPPS payments.

Another commenter argued it will likely take several years before new technology or treatments are reflected in sufficient volume to impact and be reflected in the FFS rates, and, as a result, CMS should establish an add-on payment to account for new technologies.

Many commenters stated that not having access to trend factor values coupled with not having access to participant-specific case mix and historical experience adjustment values until two months prior to the start of the model performance period prevented them from having the critical data they needed to assess the financial implications of the RO Model.

Response: We thank these commenters for their comments. We note that modifications in this section involve the removal of references to specific years, and, instead, add references to specific periods of time relative to the baseline period or upcoming PY. For example, instead of stating a specific year like ''2019,'' we now state ''3 years prior to the CY used to determine the FFS payment rates.'' This allows the text to remain current even if there is a change in baseline period or model performance period.

As we stated in the Specialty Care Models final rule (85 FR 61188), we believe the best way to calculate the trend factors such that spending under the RO Model does not diverge too far from spending under FFS Medicare that non-participants will receive for the underlying bundle of included RT services had they been in the RO Model, is to base the trend factors on service volumes from episodes attributed to both HOPDs and freestanding radiation therapy centers, and on updated PFS and OPPS rates. Calculating unique trend factors for the PC and TC for each cancer type and separately for those furnished in the HOPD setting from those furnished in the freestanding radiation therapy center setting works against the RO Model's goal of site neutrality. As we stated in the Specialty Care Models final rule (85 FR 61188), the trend factors will only generate significant swings if there are large swings in payment rates for RT services that are frequently used during episodes. CMS believes that setting up guardrails risks paying significantly more under the Model than to non-participants. Moreover, to the extent that new technologies and new equipment are billed under new HCPCS codes, we would go through rulemaking to add those new codes to the list of included RT services as we stated at 85 FR 61165.

Since the numerator of the trend factor is based, in part, on each component's (PC or TC) FFS payment rate (as paid under OPPS or PFS) for the CY of the upcoming PY, it is not possible to post trended national base rates prior to when those FFS payment rates are finalized in November prior to the upcoming PY. Please note that we will monitor the adequacy of payments over time, including the trend factor, and consider re-baselining in a later PY if our analysis indicates it is appropriate. Although it may be inferred from the description of the trend factor calculation, we would also like to clearly state that the accounting of ''the average number of times each HCPCS code (relevant to the component and the cancer type for which the trend factor will be applied) was furnished'' as described in the numerator and denominator, is by episode.

We are finalizing our policies as proposed, that is, we will base the denominator of the trend factor on the third year of the baseline period and the numerator of the trend factor on FFS payment rates for the same CY as the upcoming PY combined with utilization from the third year of the baseline period for PY1, the first CY after the baseline period for PY2, the second CY after the baseline period for PY3, and so on.

e. Applying the Adjustments

We finalized our policy at 85 FR 61194 that the combined adjustment, that is the adjustment that results when the corresponding participant-specific historical experience and case mix adjustments, and blend are combined, will be multiplied by the corresponding trended national base rate from Step 2 for each included cancer type. We will repeat this calculation for the corresponding case mix adjustment, historical experience adjustment, and blend for the TC, yielding a total of 32 RO participant-specific episode payments for Dual participants and a total of 16 RO participant-specific episode payments for Professional participants and Technical participants. In the CY 2022 OPPS/ASC proposed rule, we clarified that the total number of RO participant-specific episode payments for Dual participants and the total number of RO participant-specific episode payments for Professional participants and Technical participants will vary depending on the number of

included cancer types. For example, with the removal of liver cancer there are 15 included cancer types that yields a total of 30 RO participant-specific episode payment amounts for Dual participants and a total of 15 RO participant-specific episode payment amounts for Professional participants and Technical participants.

We did not solicit public comments on this clarification.

f. HOPD or Freestanding Radiation Therapy Center With Fewer Than Sixty Episodes During the Baseline Period

We codified at § 512.255(c)(7)(iv) a stop-loss limit of 20 percent for the RO participants that have fewer than 60 episodes from 2016 through 2018 and were furnishing included RT services in the CBSAs selected for participation at the time of the effective date of Specialty Care Models final rule (85 FR 61114). Under this stop-loss limit, CMS uses no-pay claims to determine what these RO participants would have been paid under FFS as compared to the payments they received under the RO Model and CMS pays these RO participants retrospectively for losses in excess of 20 percent of what they would have been paid under FFS. Payments under the stop-loss policy are determined at the time of reconciliation. We proposed to modify this stop-loss limit policy such that it applies to RO participants that have fewer than 60 episodes during the baseline period, as we proposed to define at § 512.205, and that were furnishing included RT services before the start of the model performance period in the CBSAs selected for participation and amend § 512.255(c)(7)(iv) accordingly.

We solicited public comments on our proposal in section XVIII.C.5.f. of the CY 2022 OPPS/ASC proposed rule (86 FR 42301).

The following is a summary of the public comments received on this proposal and our response:

Comment: Some commenters disagreed with the stop-loss policy. A few commenters stated that the stop-loss policy should apply to all RO participants, not just to RO participants that have fewer than 60 episodes during the proposed baseline period. Another commenter requested clarification as to why the stop-loss policy is limited in this way, because the number of episodes an RO participant furnishes is unrelated to case complexity, which the commenter believed is the reason for stop-loss policies in general. They cited the modeling of one entity's 2019 bone metastases episodes, which they believe demonstrates that under the Model, this entity would see a 66 percent rate reduction for that cancer type. Another commenter argued that limiting the stop-loss policy to entities with fewer than 60 episodes during the baseline period ignores the larger impact of financial loss that would be experienced by higher-volume entities serving large, vulnerable Medicare populations.

One commenter recommended that the stop-loss policy be applied to entities with gradually fewer episodes after PY1. A couple of commenters recommended a 20 percent stop-loss policy for rate variance per tumor site.

Response: We thank these commenters for their comments. We proposed to modify the stop-loss policy in only one respect, expanding one criterium of eligibility in that RO participants had to be furnishing included RT services ''before the start of the model performance period in the CBSAs selected for participation,'' instead of ''furnishing included RT services in the CBSAs selected for participation at the time of the effective date of the Specialty Care Models final rule'' as stated in that rule at 85 FR 61114. We received no comments on this specific proposal.

We refer to the Specialty Care Models final rule (85 FR 61177 through 61178) where we summarize and respond to comments on the stop-loss policy similar to those we received here. We would like to point out that those RO participants that have fewer than 60 episodes in the baseline period would not receive an historical experience adjustment. The heavy weight of the RO participants' historical experience in their participant-specific RO payment amount would prevent most if not all of RO participants from qualifying for the stop-loss policy if an historical experience adjustment were applied, particularly in the early PYs of the Model.

We are finalizing the policy as proposed such that those RO participants that had begun furnishing included RT services any time before the start of the model performance period in the CBSAs selected for participation are eligible for such a stop-loss limit and amend § 512.255(c)(7)(iv) accordingly.

g. Apply Adjustments for HOPD or Freestanding Radiation Therapy Center With a Merger, Acquisition, or Other New Business Relationship, With a CCN or TIN Change

We codified at § 512.210(a) those entities that must participate in the RO Model, and as more fully described at 85 FR 61195, an entity must participate in the RO Model if it has a new TIN or CCN that results from a merger, acquisition, or other new clinical or business relationship that occurs prior to October 3, 2025, begins to furnish RT services within a CBSA selected for participation, and meets the RO Model's eligibility requirements. We finalized a requirement for advance notification regarding a new merger, acquisition, or other new clinical or business relationships so that the appropriate adjustments would be made to the new or existing RO participant's participant-specific professional episode payment and participant-specific technical episode payment amounts. We finalized that RO participants must also provide a notification regarding a new clinical relationship that may or may not constitute a change in control, and if there were sufficient historical data from the entities merged, absorbed, or otherwise changed as a result of this new clinical or business relationship, then this data would be used to determine adjustments for the new or existing TIN or CCN. We also note that RO participants are required to report a change in control under § 512.180(c).

We proposed to add § 512.255(c)(14) to establish that we would calculate in accordance with § 512.255(c)(3) the RO participant's case mix adjustments based on all episodes and RO episodes, as applicable, attributed to the RO participant's legacy TIN(s) or legacy CCN(s) during the 3-year period that determines the case mix adjustment for each PY and all episodes and RO episodes, as applicable, attributed to the RO participant's current TIN or CCN during the 3-year period that determines the case mix adjustment for each PY. We also proposed that we would calculate the RO participant's historical experience adjustments in accordance with § 512.255(c)(4) based on all episodes attributed to the RO participant's legacy TIN(s) or legacy CCN(s) during the baseline period and all episodes attributed to the RO participant's current TIN or CCN during the baseline period. We proposed to eliminate the requirement that RO participants provide a notification regarding all new clinical or business relationships that may or may not constitute a change in control. We proposed to add § 512.210(e) requiring an RO participant to furnish to CMS written notice of a change in TIN or CCN in a form and manner specified by CMS at least 90 days before the effective date of any change in TIN or CCN that is used to bill Medicare.

We solicited public comments on our proposal in section XVIII.C.5.g. of the CY 2022 OPPS/ASC proposed rule (86 FR 42301).

The following is a summary of the public comments received on this proposal and our responses:

Comment: One commenter supported the policy to consider the legacy CCN(s) or TIN(s) for the purposes of risk adjustment, as this process is both straightforward and fair to the RO participant.

Response: We thank this commenter for their support.

We continue to believe that some new or altered clinical or business relationships may still pose risks of gaming in the RO Model, regardless of whether a change in control results. However, we believe that requiring RO participants to report changes to TINs or CCNs will capture the types of changes that pose these risks. This would also avoid any ambiguity as to what types of changes RO participants would need to report. After consideration of the comment we received, we are finalizing our policies as proposed with one technical change. We are adding subparagraphs to § 512.255(c)(14).

h. Discount Factor

We codified at both §§ 512.205 and 512.255(c)(8) that the discount factor for the PC would be 3.75 percent and the discount factor for the TC would be 4.75 percent. We proposed at 86 FR 42301 to lower the discount factor for the PC to 3.5 percent and the discount factor for the TC to 4.5 percent. Given our other proposed modifications to the RO Model, including removing brachytherapy and liver cancer, modifying the baseline period, and the current size of the RO Model (approximately 30 percent of eligible episodes), in the CY 2022 OPPS/ASC proposed rule at 86 FR 42301 we described that these modifications would enable us to lower these discounts without increasing the size of the RO Model due to a reduction in pricing variability and expecting to be able to detect a savings of 3.2 percent or greater at a significance level of 0.05 and with a power of 0.8. The definition of discount factor codified at § 512.205 also included the proposed percentages. To simplify the regulation text, we proposed to include the discount percentages at § 512.205 and remove the percentages from § 512.255(c)(8).

We solicited public comments on our proposal in section XVIII.C.5.h. of the CY 2022 OPPS/ASC proposed rule (86 FR 42301).

The following is a summary of the public comments received on this proposal and our response:

Comment: No commenters agreed with the proposed discounts, and many commenters proposed that discounts be set to 3 percent or less. Some commenters stated that they believe the RO pricing methodology fails to recognize that radiation oncology services rely heavily on the use of advanced technology and equipment that requires a significant financial investment. One of those commenters estimated that 85 percent of costs are equipment and technology related, and that beyond upfront capital investment in equipment, hospitals incur significant on-going costs related to software upgrades and equipment calibration. Furthermore, this commenter argued that the high-upfront investment costs and the proprietary nature of the equipment pose a barrier to switching vendors. Given this, the commenter stated that there are limited opportunities for RT providers and RT suppliers that are already adhering to evidence-based treatment guidelines to generate additional savings through internal cost reduction efforts.

One commenter noted that the proposed discounts, along with other aspects of the RO Model's pricing methodology, do not recognize the ongoing support of skilled staff necessary to operate a clinic. Many commenters specifically referenced the proposed discounts in combination with continued declines in MPFS payment rates as the source of their concern. They believe the combination will result in payment cuts that will put many RO participants in financial jeopardy.

One commenter stated the impact of the discount factor will be particularly acute for clinics in communities that serve patients who are more likely to be covered by Medicare or Medicaid programs, rather than privately funded employer-based health plans. According to the commenter, due to this payer mix, this group of physicians typically has more limited financial resources than their peers in other areas, making it difficult to invest in the resources necessary to participate in value-based payment programs. This commenter argued that as a result of this, the RO Model will exacerbate health disparities.

One commenter recommended that if CMS implements the RO Model during the COVID–19 PHE, that CMS gradually phase in the discount factor to allow time for RO participants to implement the systems necessary to succeed under the RO Model, retain the resources necessary to respond quickly to the ever-evolving PHE, and reinvest in a capital-intensive service line to ensure that access to care is maintained. One commenter stated its belief that in the event of a resurgence of the COVID–19 PHE or another nationwide emergency that leads to large disruptions in medical care, CMS should eliminate all downside risk for all participants as was done across models during the COVID–19 PHE in 2020.

Many commenters, recommending a discount factor of 3 percent or less, argued that this would be more in line with other payment models and ensure that radiation oncology providers have sufficient capital to remain operational and invest in the necessary resources (human and equipment) to increase efficiency and enhance beneficiary care. A few commenters recommended a discount of less than 3 percent to align with the discounts CMS applied to Oncology Care Model participants in a two-sided risk arrangement. A few commenters called attention to the discounts in both the Bundled Payment for Care Improvement-Advanced and Comprehensive Care for Joint Replacement (CJR) models. One commenter noted that the discounts in both models are no more than 3 percent, and that in CJR, hospitals that exhibit superior quality outcomes will have their discount factor reduced to as low as to 1.5 percent. Another commenter recommended CMS set lower discount rates for high performers, citing the CJR model as an example where CMS allows participants to earn back a percentage of the discount applied to the episodes based on quality performance. This commenter noted the recent finalized changes to the CJR model, which essentially eliminate the discount applied under the CJR model for the highest performing hospitals. One commenter recommended that CMS eliminate the discount factors altogether.

Response: We thank these commenters for expressing their concerns and for their suggestions. We designed the RO Model to test whether prospective episode payments in lieu of traditional FFS payments for RT services will reduce Medicare expenditures while preserving or enhancing quality. CJR finalized the elimination of the discount for high performers in PY6–8 so as to increase the accuracy of target prices compared to actual performance period spending. We would like to note that the RO Model's discount factors do not inform the accuracy of its episode pricing in the way that discounts do for CJR's pricing. We have made every effort to be responsive to stakeholder requests to lower the discount from what was finalized. In order to be able to detect an impact of the Model, we cannot further reduce the discounts beyond 3.5 percent and 4.5 percent for the PC and TC, respectively, without changing

other aspects of the Model, such as increasing the size of the Model. There has been no interest from stakeholders in increasing the number of CBSAs selected for participation in the Model.

As for the concern that the RO Model will exacerbate health disparities, we have no data or evidence to suggest that this will be the case. We believe that the RO Model presents a number of opportunities to minimize health disparities that currently exist. First, under the RO Model, RO participants will also have the opportunity to work collaboratively on performance improvement. The RO Model will offer shared communication platforms and educational webinars on specific topics of interest. These opportunities will enable RO participants to learn from their peer network and share best practices. CMS will also provide quarterly feedback reports to RO participants so they can better understand their individual patterns of care delivery, compare their data to other similar RO participants in the RO Model, and identify opportunities for quality improvement. In addition, RO participants can submit a DRA, requesting beneficiary line-level claims data, episode-level data, and participant-level data from CMS to help improve their patient care and care coordination.

At the beneficiary-level, we believe the RO Model has the potential to minimize health disparities in care. The potential for fewer treatments under the episode-based payment approach may lead to reduced side effects from treatment, reduced travel time required for treatment, less time spent in a doctor's office or waiting room, and more free time to engage in other activities that can help improve their overall quality of life. Furthermore, RO participants will be required to document an RO beneficiary's performance status to help inform the treatment plan and assess the effects of treatment on that individual and their quality of life. Every RO participant will be required to send a treatment summary to each RO beneficiary's referring physician to facilitate communication and coordination of care. Prior to the start of treatment, RO participants are also required to discuss with RO beneficiaries whether the goal of treatment is curative or palliative and the associated costs including cost-sharing responsibilities to facilitate shared decision-making. As we stated in the Specialty Care Models final rule (85 FR 61171), we plan to carefully monitor the RO Model for unintended consequences as finalized in sections III.C.14 (85 FR 61252) and III.C.16 (85 FR 61257). If our monitoring reveals that the Model reduces patient access to care, we would consider making changes to the Model via future rulemaking. Moreover, our evaluation will consider longer-term impacts on health outcomes associated with the Model.

We are finalizing as proposed the discount factor for the PC at 3.5 percent and the discount factor for the TC at 4.5 percent. We received no comments specifically on the proposed definition of discount factor, and therefore, we are finalizing as proposed to codify this definition at § 512.205, removing the percentages from § 512.255(c)(8). If the RO Model's scope were to increase at some point in the future via rulemaking, we could explore lowering the discount.

i. Withholds

We codified at § 512.255(c)(10) that we would apply a 2 percent quality withhold from each professional episode payment after applying the trend factor, geographic adjustment, case mix and historical experience adjustments, and discount factor to the national base rate. In the CY 2021 OPPS/ASC final rule (85 FR 85866), we delayed RO Model quality measures requirements to what would have been PY2 (January 1, 2022 through December 31, 2022) under the model performance period described in that final rule with comment and thus delayed the application of the quality withhold to that PY2. In the CY 2022 OPPS/ASC proposed rule, we proposed that RO participants submit quality measure data starting in PY1 (when the model performance period begins) as described in section XVIII.C.6. of the CY 2022 OPPS/ASC proposed rule, and that beginning in PY1, a 2 percent quality withhold for the PC would be applied to the applicable trended national base rates after the case mix and historical experience adjustments.

We solicited public comments on our proposal in section XVIII.C.5.i. of the CY 2022 OPPS/ASC proposed rule (86 FR 42301).

The following is a summary of the public comments received on this proposal and our response:

Comment: Some commenters disagreed with this proposal. A few commenters expressed concern, because they believe RO participants will not be able to earn back the full amount withheld, no matter how good the performance. One commenter recommended that the 2 percent quality withhold should not occur until PY2, as was originally proposed. Another commenter recommended that CMS allow RO participants the opportunity to earn back above their quality withhold based on quality performance just as CMS allows participants in the Direct Contracting model to qualify for a bonus above the participant's quality withhold from a High Performers Pool.

Response: We thank these commenters for expressing their concerns and for their suggestions. We believe that the upfront quality withhold will provide the incentive for RO participants to provide high-quality care. Further, we believe that the predetermined withholds help support the Model goal of providing RO participants with prospective, predictable payments. The quality withhold allows the Model to link quality to payment, which is a key requirement of QPP. Please note that Professional participants and Dual participants could earn up to the full amount of the quality withhold (2 percent of the professional episode payment amounts) for a given PY based on their performance on the AQS. Since we are collecting quality measures in PY1, it is necessary to have a quality withhold in PY1. Please note that we did not propose to change the amount of the quality withhold.

After consideration of the public comments, we are finalizing as proposed that RO participants submit quality measure data starting in PY1 (when the model performance period begins) as described in section XVIII.C.6. of the CY 2022 OPPS/ASC proposed rule, and that beginning in PY1, a 2 percent quality withhold for the PC will be applied to the applicable trended national base rates after the case mix and historical experience adjustments. We are codifying this policy at § 512.255(c)(10).

j. Adjustment for Geography

We described in the Specialty Care Models final rule (85 FR 61198) that the geographic adjustment whereby the RO Model-specific relative value unit (RVU) values would be derived from the national base rates which are based on 2016 to 2018 episodes that had the majority of radiation treatment services furnished at an HOPD and that were attributed to an HOPD. We finalized that we would use only 2018 episodes to calculate the implied RVU shares. We proposed in the CY 2022 OPPS/ASC proposed rule to modify this provision to align with the proposed model performance period so that the final year of the baseline period would be used to calculate the implied RVU shares. For example, for a baseline period of 2017–2019, 2019 would be used to calculate the implied RVU shares.

We solicited public comments on our proposal to use the final year of the baseline period to calculate the implied RVU shares in the CY 2022 OPPS/ASC proposed rule (86 FR 42302).

We received no comments and therefore, we are finalizing our proposal without modification to use the final year of the baseline period to calculate the implied RVU shares.

k. Example of Participant-Specific Professional Episode Payment and Participant-Specific Technical Episode Payment for an Episode Involving Lung Cancer in PY1

In section XVIII.C.5.k of the CY 2022 OPPS/ASC proposed rule (86 FR 42304), we noted that we are analyzing whether the COVID–19 PHE resulted in a decrease in Medicare FFS claims submissions for RT services during 2020 relative to historical levels. For this reason, under the extreme and uncontrollable policy proposed in section XVIII.C.10. of the CY 2022 OPPS/ASC proposed rule, pending 12-months of claims run-out for RT services furnished in 2020, we described that we would consider the removal of 2020 data from the calculation of any applicable baseline period or trend factor. We also noted that we are not considering the exclusion of 2020 from the case mix adjustment at this time, because the case mix episodes are weighted equally (unlike the baseline period, where more recent episodes are given more weight than earlier episodes), and the case mix adjustment does not rely on the volume of RT services furnished.

We solicited public comments on our EUC policy as it concerns pricing methodology and the use of certain episode data (86 FR 42311 through 42312). We have summarized and responded to comments in that section.

6. Quality-Form, Manner, and Timing for Quality Reporting

In the Specialty Care Models final rule (85 FR 61220 through 61223), we finalized that the RO Model quality measure reporting will be based on a CY. We also stated in that final rule at 85 FR 61222, that in selecting measures for the RO Model, we sought to include a set of meaningful, parsimonious measures, reflective of the CMS Meaningful Measures framework that balances the need for data about participant performance without creating undue burden on participants. One set of measures used by all RO participants will provide insight for CMS and the radiation oncology field as a whole into how care quality compares across multiple markets. Selective or limited reporting of measures would hinder the ability of CMS to measure or analyze the impact of the Model on quality. In the CY 2021 OPPS/ASC final rule, we delayed RO Model quality measures requirements to PY2 (January 1, 2022 through December 31, 2022). We proposed in in section XVIII.C.6. of the CY 2022 OPPS/ASC proposed rule that Professional participants and Dual participants submit quality measure data starting in PY1 during the proposed model performance period (86 FR 42306 through 42307). Under this proposal, if the proposed model performance period starts mid-year, the CY collection period would remain the same as if the model performance period began on January 1. For example, if the model performance period starts in July, RO participants would collect quality measure data for that CY starting in January, allowing RO participants to use their MIPS data submission to meet the RO Model requirements.

We solicited public comments on our proposal in section XVIII.C.6 of the CY 2022 OPPS/ASC proposed rule (86 FR 42306 through 42307).

The following is a summary of the public comments received on this proposal and our response:

Comment: We received many comments from RO participants stating that they will not be ready to start gathering quality measure data on January 1, 2022, in order to report for PY1. Commenters stated that the requirements were extensive and additional time would be required to develop new processes and procedures.

Response: We thank commenters for their comments. The RO Model was finalized to start January 1, 2021, in the Specialty Care Model final rule (85 FR 61135 through 61137) and RO participants were notified at that time of their inclusion in the RO Model when that final rule was published in September 2020. RO participants have had over a year to prepare for their participation in the RO Model. When the CY 2022 OPPS/ASC proposed rule was published, CMS released the Quality Measure and Clinical Data Elements Guide on the RO Model website, along with the associated CDE templates for each of the five cancer types. We have provided education and outreach support to encourage the efficient collection and submission of this data, including a webinar related to Model requirements in September 2021 to help RO participants prepare for the various requirements. We have additional webinars planned specifically on the QPP, and quality measures and CDEs. Therefore, we believe that RO participants have had adequate time to prepare.

We direct readers to section XVII.C.10 of this final rule with comment period, which discusses our proposal and decision to finalize an EUC policy that would allow CMS flexibility in responding to national, regional, or local circumstances that adversely impact RO participants' ability to deliver care in accordance with the RO Model's requirements, including the COVID–19 PHE. The EUC policy will give CMS the ability to delay some of these quality measure and CDE reporting requirements, as needed.

Comment: Many commenters recommended changes to the quality measure process. Many commenters asked for a voluntary phase-in period to collect quality measure data, which they believe would allow RO participants to become operational within the RO Model and provide better data. We received many comments asking CMS to delay the implementation of data collection for 2 years, while one commenter requested an 18-month delay.

Response: We proposed that RO participants' first submission for the set of quality measures for PY1 (beginning on January 1, 2022) in section XVIII.C.8.b. of the CY 2022 OPPS/ASC proposed rule, would occur in March 2023, based on the timeline finalized in the Specialty Care Models final rule at 85 FR 61211 (footnote 44). We believe beginning the model performance period on January 1, 2022 will allow RO participants to review and to develop best practices to facilitate their data collection and to work with EHR vendors to seek additional EHR support as necessary. We have also done outreach to vendors since the Specialty Care Models final rule published in 2020 to help prepare them for the start of the RO Model.

Comment: A couple of commenters urged CMS to provide additional details on quality measure and CDE collection and submission processes to give RO participants additional time to prepare their systems and comply with these requirements. One commented asked for additional tools and supportive resources up front to aid in implementation. The same commenter asked for an expansion of collection types and reporting mechanisms for the quality measures in order to align with quality reporting programs in other models.

Response: When the CY 2022 OPPS/ASC proposed rule was published, CMS released the Quality Measure and Clinical Data Elements Guide on the RO Model website, along with the

associated CDE templates for each of the five cancer types [569]. This guide may be updated in the future to include additional details on implementation. We have provided education and outreach support to encourage the efficient collection and submission of this data, including a webinar related to Model requirements in September 2021 to help RO participants prepare for the various requirements, and we have additional webinars planned specifically on the QPP program and quality measures and CDEs.

Comment: A few commenters opposed the implementation of quality measures in the RO Model, stating that the measures would not yield information reflective of quality in a radiation oncology practice and would do little to encourage actual improvement in the quality of patient care.

Response: We disagree with commenters' assertions regarding the impact of quality measurement in the RO Model. As we discussed in the Specialty Care Models final rule (85 FR 61214), we believe that the measures we are adopting are appropriate for inclusion in the RO Model. We selected all measures based on clinical appropriateness for RT services spanning a 90-day episode period. We believe that radiation oncologists have an important role to play in ensuring that their patients have a plan to address pain, that they communicate treatment with other providers and suppliers to ensure the RO beneficiaries are receiving coordinated care, and that they have been screened for depression and have an advance care plan. By encouraging radiation oncologists to provide guidance and care coordination as well as engage with patients throughout their treatments, we believe these measures will improve both patients' outcomes and their experience of care. We believe both depression screening and advance care planning help RO beneficiaries ensure they are engaged and pursuing the best course of treatment for them. We believe that including appropriate quality measures in the RO Model—as in other Innovation Center Alternative Payment Models (APMs)—is critical to ensuring that quality of care is preserved or enhanced within an episode payment model testing whether CMS expenditures are reduced. Furthermore, if we did not finalize quality measures for the RO Model, it would not satisfy the criteria to be an Advanced APM or a MIPS APM.

Comment: One commenter asked that CMS retain two of the finalized quality measures but consider revising the full list to focus on the work of radiation oncologists with Medicare patients. The same commenter asked that we revise the specifications for all quality measures in the RO Model to only include Medicare patients in the denominator.

Response: As stated in the Specialty Care Models final rule (85 FR 61220) we believe collecting data for all patients who meet the denominator specifications for each measure from a Professional participant or Dual participant, and not just Medicare beneficiaries, is appropriate because it is consistent with the applicable measure specifications, and any segmentation to solely the Medicare populations would be inconsistent with the measure and add substantial reporting burden to RO participants. We continue to believe that reporting on all-payer data is important to improve and drive the quality of care furnished to all patients, including Medicare beneficiaries.

Comment: Many commenters expressed concern that EHR vendors will use the new requirements to generate additional fees for their products, thereby placing RO participants, especially those that are small and rural, at greater financial risk.

Response: We understand the commenters' concern about the cost of these requirements, but we note that three of the four proposed quality measures are already included in the MIPS program, so we expect that some of these measures may already be familiar to EHR vendors. We believe that the quality measures and CDEs can be collected manually if desired, which would not require payment of additional fees to EHR vendors.

After consideration of the comments received, we are finalizing as proposed that Professional participants and Dual participants submit quality measure data starting in PY1 of the model performance period.

We also proposed that for PY1, Professional participants and Dual participants would be required to submit data for three pay-for-performance measures: (1) Plan of Care for Pain; (2) Screening for Depression and Follow-Up Plan; and (3) Advance Care Plan. Professional participants and Dual participants would be required to submit data on a fourth measure, Treatment Summary Communication—Radiation Oncology, as a pay-for-reporting measure. All quality measure data will be reported using the RO Model secure data portal in the manner consistent with that submission portal and the measures' specifications. We intend to use data submitted by Professional participants and Dual participants for the Treatment Summary Communication—Radiation Oncology measure in PY 1 and PY2 to propose a benchmark to re-specify it as a pay-for-performance measure, for PY3.

We proposed that we may update the specifications for the Treatment Summary Communication—Radiation Oncology measure, should new specifications from the measure's steward meet the RO Model's needs. Any non-substantive updates to the specifications for this measure would be communicated in a form and manner specified by CMS. Any substantive changes to measure specifications would be addressed through notice and comment rulemaking.

We solicited public comments on our proposal in section XVIII.C.6. of the CY 2022 OPPS/ASC proposed rule (86 FR 42307).

The following is a summary of the public comments received on this proposal and our response:

Comment: One commenter agreed with the proposal.

Response: We thank the commenter.

Comment: We received some comments disagreeing with the proposal because the Treatment Summary Communication—Radiation Oncology measure is not NQF-endorsed, is not an outcome measure, is burdensome, and is not used in other CMS programs.

Response: We believe that updated specifications for the Treatment Summary Communication—Radiation Oncology measure may allow for easier implementation of the quality measure and reduced burden. While NQF endorsement and status as an outcome measure are important criteria to consider in the selection of quality measures, we continue to believe that the information captured by this measure is relevant to the RO Model and critical to patients' care continuity and coordination.

After consideration of the comments received, we are finalizing as proposed that we may update the specifications for the Treatment Summary Communication—Radiation Oncology measure, should new specifications from the measure's steward meet the RO Model's needs. Any non-substantive updates to the specifications for this measure will be communicated in a form and manner specified by CMS. Any substantive changes to measure specifications will be addressed through notice and comment rulemaking.

[569] These documents are currently located at *https://innovation.cms.gov/innovation-models/radiation-oncology-model*. If newer versions are posted, these documents will be moved to *https://innovation.cms.gov/innovation-models/radiation-oncology-archived-materials*.

We finalized that we would have a CMS-approved contractor administer the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Cancer Care Survey for Radiation Therapy, beginning in April 2021 (85 FR 61220). In the CY 2021 OPPS/ASC final rule, we revised this policy so that a CMS-approved contractor would administer the CAHPS® Cancer Care Survey for Radiation Therapy beginning in October 2021. Given the change in model performance period due to the delay under section 133 of the CAA 2021, we proposed in section XVIII.C.6 of the CY 2022 OPPS/ASC proposed rule (86 FR 42307) that we would amend existing policy such that the CMS-approved contractor will begin administering the CAHPS® Cancer Care Survey for Radiation Therapy on behalf of the RO participants and CMS as soon as there are completed RO episodes, no earlier than the fourth month of the model performance period.

We solicited public comments on our proposal in section XVIII.C.6 of the CY 2022 OPPS/ASC proposed rule (86 FR 42307).

The following is a summary of the public comments received on this proposal and our response:

Comment: One commenter supported our proposal.

Response: We thank the commenter.

Comment: Some commenters requested additional clarification on future pay-for-performance use of the CAHPS® Cancer Care Survey for Radiation Therapy, requested clarification of sampling of the CAHPS® Cancer Care Survey for Radiation Therapy, suggested use of a web-based data collection mode, requested clarification on overlap with non-RO Model uses of CAHPS® surveys, or requested modifications to account for low patient survey response rates.

Response: We appreciate these comments; however, they are not related to our proposal. Please refer to our policies related to the CAHPS® Cancer Care Survey for Radiation Therapy in the Specialty Care Models final rule (85 61219–61220). We may consider other comments on the CAHPS® Cancer Care Survey for Radiation Therapy in future notice and comment rulemaking.

After consideration of the comments received, we are finalizing without modification our proposal that the CMS-approved contractor will begin administering the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Cancer Care Survey for Radiation Therapy as soon as there are completed RO episodes, no earlier than the fourth month of the model performance period.

In the Specialty Care Models final rule at 85 FR 61223 we discussed that in selecting CDEs for the RO Model, we sought to balance the need for data about participant performance without creating undue burden on participants. In that same final rule (85 FR 61223 through 61226), we finalized under the RO Model's clinical data collection policy that Professional participants and Dual participants must collect certain clinical information not available in claims or quality measures, with data collection starting in PY1. In the CY 2021 OPPS/ASC final rule (85 FR 86262), we revised this policy so that the collection period for CDEs would begin on January 1, 2022. We proposed in section XVIII.C.6 of the CY 2022 OPPS/ASC proposed rule (86 FR 42307) that Professional participants and Dual participants submit CDEs starting in PY1.

We solicited public comments on our proposal in section XVIII.C.6 of the CY 2022 OPPS/ASC proposed rule (86 FR 42307).

The following is a summary of the public comments received on this proposal and our response:

Comment: We received a few comments asking for changes to the reporting timeline for the CDEs. A few commenters asked that the reporting period for the CDEs align with the quality measures so there is one reporting period every year in March. Many commenters expressed concern that the CDEs would need to be manually reported, which would take time and resources. One commenter asked that the CDE reporting requirement under the RO Model be delayed for two years to allow time for RO participants to develop work flows and work with EHR vendors. Many commenters asked that we select CDEs that can be extracted from EHRs and linear accelerators.

Response: While we appreciate that commenters may prefer streamlined reporting periods, we believe that it is important to capture the CDEs twice per year to allow for appropriate monitoring of the RO Model and support early work on the development of outcomes-based quality measures. In contrast, we do not believe that twice per year quality measure data reporting is necessary as it is not used in the development of new outcomes-based quality measures. CMS has shared the CDEs and templates with vendors to facilitate the work needed to extract the CDEs from their EHR systems.

Comment: We received a few comments asking that we reduce the CDE reporting threshold lower than 95 percent.

Response: We believe that the 95 percent threshold is important to ensure the quality and usability of the CDEs received by CMS. By maintaining the 95 percent threshold, CMS will maximize its ability to support monitoring and evaluation of the Model and begin developing new outcome-based quality measures. A reduction in this threshold may jeopardize the ability to draw conclusions from data received from RO participants, thus defeating the purpose of the CDEs.

Comment: We received a comment stating that CDEs should not be captured unless they will be used to risk adjust quality performance or to set payment rates.

Response: As we described in the Specialty Care Models final rule at 85 FR 61223, these data may be used to inform future refinements to the RO Model.

After consideration of comments received, we are finalizing as proposed that Professional participants and Dual participants submit CDE data starting in PY1 of the model performance period.

7. RO Model as an Advanced Alternative Payment Model (Advanced APM) and a Merit Based Incentive Payment System APM (MIPS APM)

At the time of the publication of the Specialty Care Models final rule, the model performance period began on January 1, 2021 and ended December 31, 2025 (42 CFR 512.205). We finalized in the Specialty Care Models final rule the policy that we expected the RO Model to meet the criteria to be an Advanced APM and a MIPS APM under the Quality Payment Program beginning in PY1 of the RO Model.

In the CY 2021 OPPS/ASC final rule (85 FR 86262), we finalized our proposal to amend this policy to reflect that we anticipated that the RO Model will meet the criteria to be both an Advanced APM and a MIPS APM under the Quality Payment Program starting in PY2 which would begin on January 1, 2022. Despite the delay required by the CAA, 2021, we expect the RO Model to meet the criteria to be an Advanced APM and a MIPS APM beginning in PY1, beginning January 1, 2022. Final CMS determinations of Advanced APM status and a list of MIPS APMs for the 2022 performance period will be announced via the Quality Payment Program website at *https://qpp.cms.gov/*. We anticipate that the RO Model will meet the Advanced APM criteria, reflected in our regulation at § 414.1415 in PY1 and all subsequent PYs.

As stated in the CY 2022 OPPS/ASC proposed rule, the first criterion to be an Advanced APM is set forth at

§ 414.1415(a), CEHRT use. For the RO Model, this criterion is satisfied by the requirements of § 512.220(b), that RO participants must use CEHRT; that the RO participant must annually certify its use of CEHRT during the model performance period; and that the RO participant will be required to certify its use of CEHRT within 30 days of the start of each PY (86 FR 42307).

As stated in the CY 2022 OPPS/ASC proposed rule, the second criterion to be an Advanced APM is at § 414.1415(b), Payment based on quality measures. This criterion is satisfied because payment under the RO Model is based on MIPS-comparable quality measures, as specified in regulation at § 414.1415(b). Specifically, the RO participant will have their payment amount adjusted by the 2 percent quality withhold with the chance of earning back some or all of that amount based on their AQS, as codified at § 512.255(c)(10). For further discussion of these requirements, please see the Specialty Care Models final rule at 85 FR 61211 through 61231.

As stated in the CY 2022 OPPS/ASC proposed rule, the third criterion to be an Advanced APM is set forth at § 414.1415(c), Financial Risk. This criterion is satisfied by the application of the discount factor to RO Model payments, codified at § 512.255(c)(8); the application of the quality withhold to the RO Model payments, codified at § 512.255(c)(10); and the fact that RO participants are responsible for 100 percent of all expenditures in excess of the expected amount of expenditures beyond those covered by the participant-specific professional episode payment or the participant-specific technical episode payment as codified at § 512.265, with the exception of those RO participants that qualify for the stop-loss policy as codified at § 512.285(f). The finalized changes to the stop-loss policy described in section XVII.C.5.f. and the discount amounts described in section XVII.C.5.h. of this final rule with comment period do not affect the satisfaction of the Financial Risk criterion.

As finalized in the CY 2021 OPPS/ASC final rule at 85 FR 61237, and reiterated in the CY 2022 OPPS/ASC proposed rule, for the subset of RO participants that are limited to the total amount of losses they may incur because they are eligible for the stop-loss policy, that limit is set to 20 percent of expected expenditures for which the RO participants are responsible for under the RO Model. Therefore, even when the RO Model stop-loss policy is applicable, the RO Model still meets the Financial Risk criterion to be an Advanced APM, which is 3 percent of the expected expenditures for which an APM Entity is responsible under the APM, at § 414.1415(c)(3)(i)(B).

As stated in the CY 2022 OPPS/ASC proposed rule, the MIPS APM criteria at § 414.1367(b) specify that APM entities in a MIPS APM must participate in the APM under an agreement with CMS or through a law or regulation, and the APM must base payment on quality measures and cost/utilization. Professional participants and Dual participants are required to report quality measures, as codified at § 512.275(c), and the RO Model meets the quality measure and cost/utilization requirement through the application of the quality withhold, codified at § 512.255(c)(10), and the use of the Aggregate Quality Score (AQS) and its application to the quality withhold, as finalized at 85 FR 61226 through 61231. Pursuant to §§ 414.1317 and 414.1367, MIPS eligible clinicians who are identified on a participation list of an APM Entity participating in a MIPS APM during the performance period have unique reporting options under MIPS.

We clarified in the CY 2022 OPPS/ASC proposed rule (86 FR 42308) that Professional participants and Dual participants who meet the RO Model requirements codified at § 512.220, including use of CEHRT, and who are eligible clinicians on a Participation List as those terms are defined at § 414.1305, would fall into a category called ''Track One'' of the RO Model. We noted that RO Model participants in Track One would be considered to be participating in the Advanced APM track of the RO Model, and we would make Qualifying APM Participant (QP) determinations for the eligible clinicians on the RO Model Participation List for Track One as provided in § 414.1425. In the CY 2022 OPPS/ASC proposed rule, we stated that we anticipated that Track One of the RO Model would also meet the criteria to be a MIPS APM under the definition at § 414.1305 starting January 1, 2022 (86 FR 42307). If eligible clinicians who are Track One RO Participants do not meet the thresholds to become QPs, they can report to MIPS using reporting options applicable to MIPS APM participants as specified at § 414.1367.

We also proposed in the CY 2022 OPPS/ASC proposed rule that, at the start of a PY, if Professional participants or Dual participants failed to meet any of the RO Model requirements codified at § 512.220, which includes use of CEHRT, they would be moved into a separate category called ''Track Two'' of the RO Model for that PY (86 FR 42308). We proposed to define ''Track Two'' to mean an APM for Dual participants and Professional participants who do not meet the RO Model requirements set forth at § 512.220 and for all Technical participants. RO participants that fall into Track Two would not be participating in an Advanced APM or MIPS APM for the RO Model. As such, we would not make QP determinations for the eligible clinicians on the RO Model Participation List for Track Two. We proposed to codify definitions for ''Track One'' and ''Track Two'' at § 512.205. If an RO participant meets the CEHRT use requirements pursuant to § 414.1415(a)(1)(i) by the last QP determination snapshot date specified at § 414.1325, they would be moved to Track One of the RO Model and would be considered at that point to be participating in an Advanced APM, provided the RO participant meets all other RO Model requirements set forth at § 512.220.

In the CY 2022 OPPS/ASC proposed rule, we stated that we recognized that any failure, however minor, to comply with the RO Model requirements set forth at § 512.220(a)(2) would have an impact on whether an RO Model participant is in Track One versus Track Two. Section 512.220(a)(2) contains a number of requirements, including requirements to discuss goals of care and RO Model cost-sharing responsibilities with each RO beneficiary; adhere to nationally recognized, evidence-based clinical treatment guidelines when appropriate; assess each RO beneficiary's tumor, note, and metastasis cancer stage; and send a treatment summary to each RO beneficiary's referring physician within 3 months of the end of the treatment. Under our proposal, any failure to comply with the requirements of § 512.220(a)(2) would have resulted in Track Two status for the RO participant and would be subject to remedial action under § 512.160. However, we recognized that an RO participant's noncompliance with the terms of § 512.220(a)(2) might not be discovered until after CMS has treated the RO participant as if they were in Track One, including potentially making QP determinations for an RO participant's eligible clinicians and making APM Incentive Payments (or, in years beginning with CY 2026, applying a differentially higher update under the Physician Fee Schedule) (86 FR 42308). In that event, the payments we would make based on the QP status of the RO participant's eligible clinicians pursuant to its Track One status would constitute overpayments. We are concerned that,

in the case of minor noncompliance with the requirements of § 512.220(a)(2), such overpayment liability may be too harsh. We considered removing the requirement that RO Model participants must meet all of the requirements codified in § 512.220(a)(2) to remain in Track One, but feel that these requirements are important to quality improvement in radiation oncology. We noted in the CY 2022 OPPS/ASC proposed rule that we were considering whether the final rule should modify some of the requirements in § 512.220(a)(2). For example, instead of requiring certain actions for ''each RO beneficiary,'' we were considering whether to require those actions for a majority of RO beneficiaries or substantially all RO beneficiaries. In addition, we noted that we were considering whether to modify certain requirements to permit payment of some or all of the payments made based on the QP status the RO participant's eligible clinicians pursuant to its Track One participation, depending on the severity of noncompliance and other factors (86 FR 42308).

We solicited public comments on these proposals, including whether the RO Model can meaningfully improve the quality of care if any of the requirements specified in § 512.220(a)(2) are modified, which requirements would be appropriate for modification, the impact of recoupment, and if there are more effective ways to encourage quality improvement and Track One participation in section XVIII.C.7 of the CY 2022 OPPS/ASC proposed rule (86 FR 42308).

The following is a summary of the public comments received on this proposal and our response:

Comment: A few commenters agreed with our proposal as a whole. Many commenters asked that CMS remove the Track One and Track Two policy as it makes it more difficult for RO participants to achieve QP status or was otherwise unfair to some RO participants.

Response: We appreciate the commenters' concerns. We would like to note that the definitions of Track One and Track Two were only added as a clarification for RO participants. Removing Track One and Track Two would not, in fact, make it easier for an RO participant to meet QP status as it might disqualify the entire RO Model from being an Advanced APM and a MIPS APM.

Further, in order to better align the RO Model with the QPP, and in response to these comments, we are creating three categories for RO participants, ''Track One'', ''Track Two'', and ''Track Three'' codified at § 512.205. Structurally, Track One as proposed will now be divided into two tracks and Track Two as proposed will become Track Three. Track One will be for RO participants who comply with all RO requirements, including CEHRT, and we anticipate that Track One will be both an Advanced APM and MIPS APM. Track Two will be for those RO participants who comply with all RO requirements except for CEHRT, and we anticipate that Track Two will be a MIPS APM, but would not meet the CEHRT use criterion to be an Advanced APM. Track Three will be for all other RO participants, and we anticipate that Track Three will not be an Advanced APM or MIPS APM. We believe that identifying these three tracks is responsive to some of the concerns raised by these commenters. This change would create an incentive for RO participants that are not able to implement CEHRT to be compliant with other aspects of the RO Model in order to participate in a MIPS APM. This also avoids misalignment of RO Model tracks with the MIPS APM criteria, which do not require CEHRT.

After considering public comments, we are finalizing with modification the definitions of Track One, and Track Two, and adding a definition for Track Three. We are finalizing the definition of Track One to mean a track for Professional participants and Dual participants that meet all RO Model requirements set forth at § 512.220, including use of CEHRT. Consistent with this definition, we anticipate that RO Model participants in Track One will be considered to be participating in an Advanced APM and MIPS APM under the RO Model, and we will make Qualifying APM Participant (QP) determinations for the eligible clinicians on the RO Model Participation List for Track One as provided in § 414.1425. We anticipated that Track One of the RO Model would also meet the criteria to be a MIPS APM under the definition at § 414.1305 starting January 1, 2022. If eligible clinicians who are Track One RO Participants do not meet the thresholds to become QPs, can report to MIPS using reporting options applicable to MIPS APM participants as specified at § 414.1367.

We are finalizing the definition of Track Two to mean a track for Professional participants and Dual participants that meet all RO Model requirements set forth at § 512.220, except for use of CEHRT. That is, a Dual participant or Professional participant who does not use CEHRT but meets all other RO Model requirements set forth at § 512.220 would be in Track Two. We anticipate that RO participants in Track Two will be considered to be participating in a MIPS APM under the RO Model.

We are finalizing the definition of Track Three to mean a track for Professional participants and Dual participants who do not meet one or more of the RO Model requirements set forth at § 512.220(a); and for all Technical participants. For example, a Professional participant or Dual participant that does not adhere to nationally recognized, evidence-based clinical treatment guidelines when appropriate would be in Track Three. We anticipate that RO participants that fall into Track Three will be considered to be participating in an APM, but not in an Advanced APM or MIPS APM, under the RO Model. As such, we will not make QP determinations for the eligible clinicians on the RO Model Participation List for Tracks Two and Three. And eligible clinicians on the RO Model Participation List for Track Three will not have the unique MIPS reporting options available to participants in a MIPS APM (though they will receive MIPS Improvement Activity scoring credit for participation in an APM). We are codifying these definitions at § 512.205.

We would also like to note that we are not modifying any requirements to permit payment of some or all of the payments made based on the QP status of the RO participant's eligible clinicians pursuant to its Track One participation, depending on the severity of noncompliance and other factors.

a. Technical Participants and the Quality Payment Program

In the CY 2022 OPPS/ASC proposed rule, we proposed that Technical participants that are freestanding radiation therapy centers (as identified by a TIN) that only provide the technical component (TC), are not required to report quality measures under the RO Model, and fall into Track Two of the RO Model. We proposed that Technical participants would not be considered to be participating in Advanced APMs or MIPS APMs under the RO Model. However, Technical participants that are freestanding radiation therapy centers would be able to attest to their participation in an APM for purposes of MIPS, and may be eligible to receive Improvement Activity credit as specified at § 414.1317(b)(3).

In the CY 2022 OPPS/ASC proposed rule, we also proposed that if the Technical participants that are freestanding radiation therapy centers (as identified by a TIN) begin providing the PC at any point during the model

performance period, then they must notify CMS within 30 days, in a form and manner specified by CMS. We proposed that they would also be required under the RO Model to report quality measures by the next reporting period, which would be March following a PY for quality measures and July of a PY or January following a PY for the CDEs, as finalized at 85 FR 61211 through 61231. If they meet the requirements to be a Track One RO participant at one of the QP determination dates specified in § 414.1425(b), they would be considered to be participating in an Advanced APM and a MIPS APM. Once a Technical participant that is a freestanding radiation therapy center begins providing the professional component, the freestanding radiation therapy center becomes a Dual participant as defined in § 512.205. We noted that we would monitor these RO participants for compliance with the requirement to report quality measures if they begin providing the professional component. We proposed to codify this policy at § 512.275(d).

We solicited public comments on our proposal in section XVIII.C.7.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42308 through 42309). The following is a summary of the public comments received on this proposal and our response:

Comment: CMS received many comments asking that Technical participants be eligible for QP determination. Some commenters noted that the APM Incentive Payment is not only an incentive to participate in the Model, but these commenters believe that it is also designed to support practice transformation essential for meaningful APM participation. According to the commenters, the RO Model participation requirements establish new, unreimbursed practice expenses that would normally be paid from technical fee revenue. Unless the APM Incentive Payment is applied to both the professional and technical charges, the commenter stated that those RO participants will be at a distinct disadvantage and unable to achieve true practice transformation.

Response: We appreciate the commenters' concerns regarding Technical participant eligibility for QP determination. We understand that the APM Incentive Payment can support practice transformation, but we do not agree with the commenter that purpose of the APM Incentive Payment is to support practice transformation for meaningful APM participation. Please refer to § 414.1450 for more information on the APM Incentive Payment. We disagree with the commenters that Technical participants should be eligible for QP determinations under the RO Model. We continue to believe that eligibility for QP determination should be limited to Professional participants and Dual participants. This model is intended to be site neutral, meaning that Technical participants that are freestanding radiation therapy centers paid under the PFS and Technical participants that are HOPDs paid under the OPPS should be treated equally. The majority of Technical participants are HOPDs and are not subject to QPP and there are only a few freestanding radiation therapy centers that furnish only the TC. We would also note that Technical participants are not required to report quality measures or clinical data, or to have CEHRT, under the RO Model.

After considering public comments, we are finalizing as proposed our proposals related to Technical participants that are freestanding radiation therapy centers. We would like to add one non-substantive change to the text of the CY 2022 OPPS/ASC proposed rule. We proposed that Technical participants would not be considered to be participating in Advanced APMs or MIPS APMs under the RO Model. We would like to clarify this text to state that we proposed that Technical participants will not be participating in Track One or Track Two of the RO Model, and are therefore would not be participants in an Advanced or MIPS APM under the RO Model.

We have also removed the regulation at § 512.217(c)(3)(iii) that Technical participants that are freestanding radiation therapy centers would be able to attest to their participation in an APM for purposes of MIPS, and may be eligible to receive Improvement Activity credit as specified at § 414.1317(b)(3), as this language was unnecessary. All participants in APMs are evaluated for Improvement Activity credits under MIPS (§ 414.1355).

We are codifying these policies related to Technical participants that are freestanding radiation therapy centers at § 512.275(d). We are also revising for clarification the notice requirement language at § 512.275(d)(1) to remove the duplicative use of the term ''certify.''

b. Individual Practitioner List

In the Specialty Care Models final rule, we finalized our proposal to codify the requirements concerning the review and certification of the individual practitioner list at § 512.217. In the CY 2021 OPPS/ASC final rule (85 FR 86262), we amended this regulation so that the individual practitioner list was not to be used for QP determinations or for determining participants in a MIPS APM for purposes of MIPS reporting and scoring rules in PY1, and the individual practitioner list was to only be used for the QPP in PY1 to assign an automatic 50 percent score for the Improvement Activity performance category in MIPS for RO participants. This amendment stated that starting in PY2 (January 1, 2022), the individual practitioner list was to be used to identify the relevant eligible clinicians for the purpose of making QP determinations and for certain aspects of MIPS under the Quality Payment Program. The CAA, 2021 prohibits implementation of the RO Model prior to January 1, 2022. We clarified in section XVIII.C.7.b of the CY 2022 OPP/ASC proposed rule that all requirements concerning the review and certification of the individual practitioner list finalized and codified at § 512.217 will remain in effect starting on the first day of the model performance period (86 FR 42309).

In the Specialty Care Models final rule, we codified at § 512.217(a) that upon the start of each PY, CMS creates and provides to each Dual participant and Professional participant an individual practitioner list which identifies by NPI each individual practitioner associated with the RO participant.

We proposed in section XVIII.C.7.b of the CY 2022 ASC/OPPS proposed rule to modify this policy to include that Technical participants that are freestanding radiation therapy centers would also be provided an individual practitioner list (86 FR 42309). We also proposed to add to the regulation at § 512.217(b) that in the case of a Dual participant, Professional participant, or Technical participant that is a freestanding radiation therapy center, which begins participation in the RO Model after the start of a given PY, but at least 30 days prior to the last QP determination snapshot date specified at § 414.1325, of that PY, CMS would create and provide the new Dual participant, Professional participant, or Technical participant that is a freestanding radiation therapy center with an individual practitioner list. Any new Dual participant, Professional participant, or Technical participant that is a freestanding radiation therapy center that begins participation in the RO Model after the start of the PY must review and certify their individual practitioner list by the last QP determination snapshot date specified at § 414.1325.

In the CY 2022 ASC/OPPS proposed rule we proposed to change this policy to be inclusive of new RT providers and RT suppliers that would be required to participate in the RO Model after the start of a PY; we believe this proposal would give all RO participants, including those that begin participation in the RO Model after the start of a PY, more time to review and certify their individual practitioner lists.

We solicited public comments on reviewing and certifying individual practitioner lists. The following is a summary of the public comments received on this proposal and our response:

Comment: We received one comment in support of the proposal to review and certify individual practitioner lists.

Response: We thank this commenter for their support.

We are finalizing as proposed to codify this policy to review and certify individual practitioner lists at our regulation at § 512.217(b).

In the Specialty Care Models final rule, we codified at § 512.217(b) and (c)(1) that the RO participant must review and certify the individual practitioner list within 30 days of receipt of the individual practitioner list. We also codified at § 512.217(d)(1)(i) and (d)(2)(i) that the RO participant must notify CMS within 30 days when there are any additions or removals of eligible clinicians to the individual practitioner list.

In section XVIII.C.7.b of the CY 2022 ASC/OPPS proposed rule, we proposed to modify these policies so that RO participants will have the ability to review their individual practitioner list and add or drop the necessary NPIs from the list up until the last QP determination snapshot date specified at § 414.1325. We proposed to change this policy to give RO participants more time to review and certify their individual practitioner lists by requiring this by the last QP determination snapshot date specified at § 414.1325, instead of within 30 days of receipt of the individual practitioner list (86 FR 42309).

We invited public comments on this proposal to modify the timeframe for which individual practitioner lists shall be certified in the proposed rule.

We received no comments on this proposal (86 FR 42309) and therefore we are finalizing as proposed to codify this policy at our regulation at § 512.217(c)(1) and at § 512.217(d)(1)(i) and (d)(2)(i), and we are finalizing our policy at § 512.217(b) with a non-substantive modification for clarity. We are revising § 512.217(b) for clarity to remove the duplicate use of the term ''certify'' regarding an RO participant's requirement to certify the individual practitioner list.

In the Specialty Care Models final rule, we codified at § 512.217(c)(3) that if Dual participant or Professional participant does not verify and certify the individual practitioner list by the deadline specified by CMS, RO participants on the unverified list are not recognized as participants on a participation list of either a MIPS APM or Advanced APM.

In section XVIII.C.7.b. of the CY 2022 ASC/OPPS proposed rule, we proposed to add at § 512.217(c)(3)(iii) that if individual practitioners who participate in the RO Model with Technical participants that are freestanding radiation therapy centers are not included on a verified list, they would not be eligible to receive Improvement Activity credit under MIPS.

We solicited public comments on this proposal to add § 512.217(c)(3)(iii) in section XVIII.C.7.b of the CY 2022 OPPS/ASC OPPS proposed rule (86 FR 42309).

We received no comments on this proposal and therefore we are finalizing as proposed to codify this policy at our regulation at § 512.217(c)(3)(iii).

c. RO Model Requirements

In the Specialty Care Models final rule, we codified at § 512.220(b) that RO participants must use CEHRT, that the RO participant must annually certify its use of CEHRT during the model performance period, and that the RO participant will be required to certify its use of CEHRT within 30 days of the start of each PY. In CY 2021 OPPS/ASC final rule (85 FR 86262), we amended the CEHRT requirement beginning in PY2, on January 1, 2022, and to be required for PY2 through PY5. However, section 133 of the CAA 2021 prohibits implementation of the RO Model prior to January 1, 2022.

In section XVIII.C.7.c. of the CY 2022 OPPS/ASC OPPS proposed rule, we proposed that the CEHRT requirement would begin in PY1 of the model performance period and that RO participants must certify their use of CEHRT at the start of PY1 and each subsequent PY, as codified at § 512.220(b)(1) and (2). We also proposed to codify at § 512.220(b)(3) that if an RO participant begins participation in the RO Model at any time during an ongoing PY, they would have to certify their use of CEHRT by the last QP determination snapshot date specified at § 414.1325.

In the Specialty Care Models final rule, we codified at § 512.220(a)(1) that RO participants must satisfy the requirements set forth at § 512.220 to qualify for the APM Incentive Payment. In section XVIII.C.7.c. of the CY 2022 OPPS/ASC OPPS proposed rule, we proposed to amend § 512.220(a)(1) to state that RO participants must satisfy the requirements set forth at § 512.220 to be included in Track One of the RO Model. If RO participants do not meet those requirements in a PY, the RO participant would be in Track Two for the applicable PY.

We invited public comments on these proposals related to compliance with the CEHRT requirements and the other requirements as conditions to be included in Track One of the RO Model. The following is a summary of the public comments received on this proposal and our response:

Comment: Many commenters disagreed with the proposal, stating that there is added expense and time required to implement CEHRT. Some commenters recommended that we implement rural or low-volume exemptions to the CEHRT requirement.

Response: We appreciate the commenters' concerns. While we understand the expense and time required to implement CEHRT, we believe that CEHRT is an important element of high-quality care delivery and provides the foundation for improved communication and review of clinical data. We believe that the low-volume opt-out included in the RO Model eliminates the need for an additional low-volume or rural exemption to the CEHRT requirement, and we believe that use of CEHRT is still important in rural areas.

As discussed in section XVII.C.7.a of this final rule with comment period, we are finalizing with modification our proposal to categorize RO participants into three tracks. We believe that the finalized ''Track Two'' RO participant category allows RO participants who do not wish to certify their use of CEHRT to be eligible for MIPS APM reporting and scoring pathways. We believe that this modified policy may lessen the burden of the CEHRT requirement by allowing participants who do not wish or are not able to meet the CEHRT requirement to be eligible for MIPS APM scoring pathways.

Comment: We received many comments noting that the requirements at § 512.220 are burdensome and should be modified or removed because EHR vendors may require additional time to develop fields necessary to capture adherence to the requirements.

Response: We appreciate that the requirements at § 512.220 may require additional effort by RO participants. However, we disagree with the

commenters and do not believe that the requirements will add significant administrative burden as CMS will not require RO participants to report to CMS on these actions with the exception of attesting to the use of CEHRT, the accuracy of their IPL, and participation in a PSO. Rather, compliance with these requirements will be confirmed during virtual and in-person site visits, as described in the Specialty Care Models final rule and codified at §§ 512.130 and 512.150 where CMS may ask for evidence that these requirements are being met. CMS has taken meaningful action to prepare RO participants for the requirements listed at § 512.220. For example, CMS has hosted a webinar on RO Model requirements. Further, as stated in section XII.C.1 of this final rule, we believe that we have provided sufficient time, since the publication of the Specialty Care Models final rule in September 2020, for RO participants and their EHR vendors to implement the software that RO participants may need to adhere to the RO Model requirements. We also note that although an RO participant may document these requirements using their EHR system if they wish, no changes to EHR systems are required for tracking compliance with RO Model requirements. We would also note that how an RO participant tracks their compliance is at their discretion, as long as the RO participant can substantiate their compliance with documentation during a CMS site visit or audit. We are finalizing as proposed to maintain the requirements at § 512.220.

After considering public comments, we are finalizing with modification that RO participants must satisfy the requirements set forth at § 512.220 to be included in Track One of the RO Model. RO participants that meet all of these RO Model requirements in a PY, except for use of CEHRT, will be in Track Two for the applicable PY. RO participants that do not meet one or more of the RO Model requirements in paragraph (a) of this section will be in Track Three for the applicable PY. This policy is codified at § 512.220(a)(1). We are also finalizing as proposed to that the CEHRT requirement would begin in PY1 of the proposed model performance period and that RO participants must certify their use of CEHRT at the start of PY1 and each subsequent PY. This policy is codified at § 512.220(b)(1) and (2). Finally, we are finalizing as proposed that RO if an RO participant begins participation in the RO Model at any time during an ongoing PY, they must certify their use of CEHRT by the last QP determination snapshot date specified at § 414.1325. This policy is codified at § 512.220(c).

8. Reconciliation Process

a. Initial Reconciliation

Reconciliation is the process to calculate reconciliation payments or repayment amounts for incomplete episodes and duplicate RT services. We stated in the Specialty Care Models final rule at 85 FR 61243 that we would conduct the initial reconciliation for PY1 as early as August 2022, and the PY2 initial reconciliation as early as August 2023, and so forth. Given our proposed changes in section XVIII.C.1. of the CY 2022 OPPS/ASC proposed rule to the model performance period (86 FR 42290) which we made in response to the delay under section 133 of the CAA 2021, and our decision to finalize that proposal in section XVII.C.1. of this final rule with comment period, we expect to conduct the initial reconciliation each August for the preceding PY. For example, for PY1, we would conduct the initial reconciliation as early as August of PY2.

In the CY 2021 OPPS/ASC final rule with comment period, we finalized our proposal to amend our regulations at § 512.285(d) such that the quality reconciliation payment amount would not be applicable for PY1, because there would not be a quality withhold in PY1. Proposing to change the model performance period and the application of a quality withhold to begin in PY1 as described in section XVIII.C.5.i. of the CY 2022 OPPS/ASC proposed rule required proposing an amendment to our regulations at § 512.285(d) such that the quality reconciliation payment amount will apply to all PYs.

We solicited public comments on our proposal in section XVIII.C.8.a. of the CY 2022 OPPS/ASC proposed rule (86 FR 42310).

The following is a summary of the public comments received on this proposal and our response:

Comment: Some commenters disagreed with the proposal for the quality withhold to begin in PY1as described and summarized in section XVIII.C.5.i. of this final rule with comment period.

Response: Because we are finalizing our proposals at section XVII.C.6. of this final rule with comment period that quality measures and CDEs will be reported in PY1, we cannot delay the application of the quality withhold in PY1, making the quality reconciliation payment amount applicable to all PYs. The quality withhold allows the RO Model to include quality measure results as a factor when determining payment to RO participants, which is one of the Advanced APM criteria as codified in 42 CFR 414.1415(b)(1).

We are finalizing as proposed that beginning in PY1, a 2 percent quality withhold for the PC will be applied to the applicable trended national base rates after the case mix and historical experience adjustments, and we will codify this policy at § 512.255(c)(10). We are finalizing as proposed that the application of a quality withhold will begin in PY1. Finally, we are amending our regulations at § 512.285(d) such that the quality reconciliation payment amount will apply to all PYs.

b. True-Up Reconciliation

The true-up reconciliation is the process used to calculate additional reconciliation payments or repayment amounts for incomplete episodes and duplicate RT services that are identified after the initial reconciliation and after a 12-month claims run-out for all RO episodes initiated in the applicable PY. We stated in the Specialty Care Models final rule that we would conduct the PY1 true-up reconciliation as early as August 2023, and the PY2 true-up reconciliation as early as August 2024, and so forth (85 FR 61244). We note that this section only involves the removal of the reference to specific years, and, instead, references the specific period of time of ''August of the CY following an initial reconciliation for a PY.'' This allows the text to remain current even if there is a change in baseline period or model performance period. We expect to conduct the true-up reconciliation as early as August of the CY following an initial reconciliation for a PY. For example, for PY1, we would conduct the true-up reconciliation as early as August of PY3.

c. Reconciliation Amount Calculation

We codified at § 512.285(c)(3) that a subset of incomplete episodes in which: (1) The TC is not initiated within 28 days following the PC; (2) the RO beneficiary ceases to have traditional FFS Medicare prior to the date upon which a TC is initiated, even if that date is within 28 days following the PC; or (3) the RO beneficiary switches RT provider or RT supplier before all RT services in the RO episode have been furnished, the RO participant would be owed only what it would have received under FFS for the RT services furnished to that RO beneficiary. CMS will reconcile the episode payment for the PC and TC that was paid to the RO participant with what the FFS payments would have been for those RT services using no-pay claims. Furthermore, we finalized in the case that traditional

Medicare ceases to be the primary payer for an RO beneficiary after the TC of the RO episode has been initiated but before all included RT services in the RO episode have been furnished, each RO participant would be paid only the first installment of the episode payment. The RO participant would not be paid the EOE PC or TC for these RO episodes.

We proposed in section XVIII.C.8.c. of the CY 2022 OPPS/ASC proposed rule to modify this policy such that for all incomplete episodes as defined at § 512.205, including when the RO beneficiary ceases to have traditional FFS Medicare before all included RT services in the RO episode have been furnished, CMS would reconcile the episode payment for the PC and TC that was paid to the RO participant(s) with what the FFS payments would have been for those RT services using no-pay claims. After further reviewing data for incomplete episodes, including incomplete episodes where an RO beneficiary ceases to have traditional FFS Medicare before the end of an episode, we determined that the data did not support paying RO participants only the first installment of an episode for this type of incomplete episode. Upon further review of this data and stakeholder comments on this policy, we proposed in section XVIII.C.8.c. of the CY 2022 OPPS/ASC proposed rule to amend § 512.285(c)(3) and (4) accordingly.

In light of the proposal to modify payment for incomplete episodes, we also proposed conforming changes to § 512.255(c)(12)(iv) regarding beneficiary coinsurance for incomplete episodes. Specifically, we proposed to modify § 512.255(c)(12)(iv) to specify that the coinsurance for all incomplete episodes is 20 percent of the FFS amount applicable to the RT services that were furnished.

We codified at § 512.205 a definition for ''stop-loss reconciliation amount'' to mean the amount owed to RO participants that have fewer than 60 episodes during 2016 through 2018 and were furnishing included RT services in the CBSAs selected for participation at the time of the effective date of the Specialty Care Models final rule for the loss incurred under the RO Model as described in § 512.285(f). We proposed to modify the definition for ''stop-loss reconciliation amount'' to mean the amount owed to RO participants that have fewer than 60 episodes during the baseline period and were furnishing included RT services before the start of the model performance period in the CBSAs selected for participation for the loss incurred under the RO Model as described in § 512.285(f), in order to make this definition consistent with the proposed model performance period.

We solicited public comments on our proposals in section XVIII.C.8.c. of the CY 2022 OPPS/ASC proposed rule (86 FR 42310). The following is a summary of the public comments received on these proposals and our response:

We solicited public comments on our proposal to modify § 512.255(c)(12)(iv) such that for all incomplete episodes as defined at § 512.205, including when the RO beneficiary ceases to have traditional FFS Medicare before all included RT services in the RO episode have been furnished, CMS would reconcile the episode payment for the PC and TC that was paid to the RO participant(s) with what the FFS payments would have been for those RT services using no-pay claims. We received no comments on this proposal.

We solicited public comments on our proposal to specify that the coinsurance for all incomplete episodes is 20 percent of the FFS amount applicable to the RT services that were furnished and to make conforming changes to § 512.255(c)(12)(iv) regarding beneficiary coinsurance for incomplete episodes.

Comment: We received one comment requesting additional information on how RO participants should reconcile beneficiary coinsurance for incomplete episodes in a way that is least burdensome to RO participants and their RO beneficiaries.

Response: We finalized in the Specialty Care Models final rule our proposal to codify at § 512.255(c)(12) a policy that: (1) Permits RO participants to collect beneficiary coinsurance payments for services furnished under the RO Model in multiple installments via a payment plan, (2) prohibits RO participants from using the availability of payment plans as a marketing tool to influence beneficiary choice of health care provider; and (3) provides that an RO participant offering such a payment plan may inform the beneficiary of the availability of the payment plan prior to or during the initial treatment planning session and as necessary thereafter. We believe that this policy places a low burden on RO participants and their RO beneficiaries. We also noted in the Specialty Care Models final rule (85 FR 61199) that RO participants that set up coinsurance payment plans may be able to charge and adjust coinsurance more timely and accurately for incomplete episodes, but in some circumstances the true amount owed by the beneficiary may not be determined until the reconciliation process has occurred.

We are finalizing as proposed to reconcile the episode payment for the PC and TC that was paid to the RO participant(s) with what the FFS payments would have been for those included RT services using no-pay claims and codifying this policy at our regulation at § 512.255(c)(12)(iv).

We solicited comments in section XVIII.C.2. of the CY 2022 OPPS/ASC proposed rule on the definition for ''stop-loss reconciliation amount'' to mean the amount owed to RO participants that have fewer than 60 episodes during the baseline period and were furnishing included RT services before the start of the model performance period in the CBSAs selected for participation for the loss incurred under the RO Model as described in § 512.285(f).

Comment: Some commenters disagreed with the proposed stop-loss policy as described and summarized in section XVIII.C.5.f of this final rule with comment period.

Response: We responded to these comments in section XVII.C.5.f of this final rule with comment period. As noted in that section, we are finalizing our proposal to modify the stop-loss policy such that those RO participants that had begun furnishing included RT services any time before the start of the model performance period in the CBSAs selected for participation are eligible for such a stop-loss limit. Accordingly, as noted in that section, we are finalizing § 512.255(c)(7)(iv) and § 512.205 as proposed. We are also finalizing our proposal to revise the introductory text for § 512.285(f) with one modification, the removal of the word ''any time'' for consistency with § 512.255(c)(7)(iv).

9. Potential Overlap With Other Models Tested Under Section 1115A of the Act and CMS Programs

In the Specialty Care Models final rule (85 FR 61258), we stated that we did not envision that the prospective episode payments made under the RO Model would need to be adjusted to reflect payments made under any of the existing models being tested under section 1115A of the Act or the Medicare Shared Savings Program (Shared Savings Program) under section 1899 of the Act. We also stated that if, in the future, we determined that such adjustments are necessary, we would propose overlap policies for the RO Model through notice and comment rulemaking. However, we did not codify this policy in the regulations for the RO Model at that time. The RO Model is not a total cost of care model, and includes only RT services in the episode payment. The RO Model's payments are narrow in scope because they are limited to RT services furnished during

a distinct period of time. Because the RO Model makes prospective payments for only RT services provided during an episode, a practice participating in the RO Model would receive the same prospective episode payment for RT services regardless of its participation in other CMS models or programs.

Thus, as we noted in in section XVIII.C.9. of the CY 2022 OPPS/ASC proposed rule (86 FR 42310), we continue to see no need to adjust the prospective episode payments made under the RO Model to reflect payments made under the Shared Savings Program or under any other models tested under section 1115A of the Act. We proposed to codify this policy on overlaps at § 512.292. The financial methodology and accounting policies under the applicable model tested under section 1115A of the Act or under the Shared Savings Program will continue to govern the way in which RO Model payments are factored into reconciliation calculations for that initiative. We believe that other initiatives that use a total cost of care approach could consider taking the necessary steps to update their financial methodologies to adjust for the RO Model payments, but we note that the RO Model payments may only be a small portion of the population's overall payments.

We solicited public comments on our proposal to codify our overlap policy in section XVIII.C.9 of the CY 2022 OPPS/ASC proposed rule (86 FR 42310).

We received no comments on this proposal and therefore we are finalizing the proposed new regulation at § 512.292 without modification.

10. Extreme and Uncontrollable Circumstances Policy

The nation, its communities, and its health care providers, on certain occasions, are forced to confront extreme and uncontrollable circumstances (EUC) outside of their control that impact their ability to operate in the ordinary course of business for short-term or sometimes even extended periods. For example, the U.S. has been responding to an the ongoing COVID–19 PHE, which has impacted the U.S. health care system, presenting challenges for stakeholders across the health care delivery system and supply chain. Other extraordinary events that have a disruptive impact may also occur in the future. These events may include other public health emergencies, large-scale natural disasters (such as, but not limited to, hurricanes, tornadoes, and wildfires), or other types of disasters. Such events may strain health care resources, and CMS understands that RT providers and RT suppliers may have limited capacity to continue normal operations and fulfill RO Model participation requirements under such circumstances. Therefore, we proposed to adopt an EUC policy for the RO Model which would allow CMS to revise the model performance period; grant certain exceptions to RO Model requirements to ensure the delivery of safe and efficient health care; and revise the RO Model's pricing methodology.

a. Extreme and Uncontrollable Circumstance Affects the Nation, Region, or a Locale

We proposed in section XVIII.C.10. of the CY 2022 OPPS/ASC proposed rule (86 FR 42311) to define an EUC as a circumstance that is beyond the control of one or more RO participants, adversely impacts such RO participants' ability to deliver care in accordance with the RO Model's requirements, and affects an entire region or locale. We proposed that if CMS determines that there has been an EUC for a geographic region, CMS may: (1) Amend the model performance period; (2) eliminate or delay certain reporting requirements for RO participants; and (3) amend the RO Model's pricing methodology. Application of the modifications would be based on the severity and types challenges that the circumstance imposes on RO participants. In every circumstance, CMS would seek to minimize impact on the RO participants not affected by the EUC, while supporting those that are affected.

In a national, regional, or local event, we proposed to apply the EUC policy only if the magnitude of the event calls for the use of special authority to help providers respond to the emergency and continue providing care. We would not use a bright-line test to assess all types of public health emergencies, disasters, or other extraordinary circumstances; application of the policy would be tailored to the specific circumstance, and to the affected geographic areas. To help identify RO participants that are experiencing an extreme and uncontrollable circumstance, CMS would consider the following factors:

- Whether the RO participants are furnishing services within a geographic area considered to be within an ''emergency area'' during an ''emergency period'' as defined in section 1135(g) of the Social Security Act.
- Whether the geographic area within a county, parish, U.S. territory, or tribal government designated under the Stafford Act served as a condition precedent for the Secretary's exercise of the 1135 waiver authority, or the National Emergencies Act.
- Whether a state of emergency has been declared in the relevant geographic area.

In the event that one or more of these conditions are present, CMS would announce that the EUC policy applies to one or more RO participants within an affected geographic area. CMS would communicate this decision via the RO Model website and written correspondence to RO participants.

We solicited public comments on our proposal in section XVIII.C.10 of the CY 2022 OPPS/ASC proposed rule (86 FR 42311). The following is a summary of the public comments received on this proposal and our response:

Comment: We received many comments on the proposed policy. All commenters expressed support for adopting an EUC policy to the RO Model.

Response: We thank commenters for their support.

Comment: Many commenters asked for clarity on how CMS will determine a geographic region or geographic area when determining an EUC. One commenter asked that CMS maintain ample flexibility in defining ''geographic region or geographic area'' and ''state of emergency.'' Many commenters encouraged CMS to maintain ample flexibility regarding how the Agency will define a ''geographic region or geographic area'' and ''state of emergency'' declaration under this proposal in order to address participant-level COVID–19 infection trends, hospitalizations and staffing shortages irrespective of the status of a state or geographic region, as a whole.

Response: We are clarifying that the affected geographic region(s) or geographic area(s) is/are generally identified by state, county, or ZIP Code within the emergency declaration. CMS will identify affected RO participants by ZIP Code just as we did for participation in the Model. ''State of emergency'' is equivalent to the situation described in the emergency declaration including the emergency area and emergency period. If RO participants are concerned that CMS may be unaware of a situation that they believe should qualify for modification under the EUC policy, RO participants could contact the RO Model Help Desk at *radiationtherapy@cms.hhs.gov* with the RO Participant's RO Model ID, a description of the emergency, the affected areas, and the duration of the emergency period included in the declaration. If an emergency exists only in specific geographic areas, the EUC policy would allow CMS to invoke the provisions

related to reporting requirements and other RO Model requirements, and adjust the quality withhold portion of the pricing methodology, for only the affected geographic areas, as described below and finalized at § 512.249.

After consideration of comments received, we are finalizing as proposed our definition that EUC stands for ''extreme and uncontrollable circumstance'' and means a circumstance that is beyond the control of one or more RO participants, adversely impacts such RO participants' ability to deliver care in accordance with the RO Model's requirements, and affects an entire region or locale. We are also finalizing as proposed to codify this definition at § 512.205.

b. Model Performance Period

In instances where an EUC is nation-wide and impacts RO participants' ability to implement the requirements of the RO Model at the start of the model performance period, we proposed that CMS may delay the start date of the model performance period by up to one CY. RO participants would be notified of any changes to the model performance period on the RO Model website no later than 30 days prior to the original start date. In the case where a delay to the model performance period is required because of an EUC, various other aspects of the RO Model may be impacted, including its status as an Advanced APM and the years that would be included in the baseline period. The implications of a model performance period delay on other aspects of the RO Model would also be included in the RO Model website notification no later than 30 days prior to the original start date. In the case of a regional EUC, we did not propose to modify the model performance period, but proposed instead to either delay or exempt RO Model requirements, as discussed in section XVIII.C.10.c. of the CY 2022 OPPS/ASC proposed rule for the RO participants in the impacted region.

We solicited public comments on our proposal in section XVIII.C.10. of the CY 2022 OPPS/ASC proposed rule (86 FR 42311). The following is a summary of the public comments received on this proposal and our response:

Comment: A few commenters asked whether, if we were still in a PHE on January 1, 2022, CMS would use this authority to change any RO Model requirements. Many commenters stated their belief that the current PHE warrants a delay in the start of the model performance period. Many cited the continued rise in Delta variant cases causing delays in cancer surgeries, staffing shortages, and decreased RT services in their comments. One commenter stated their assumption that by including this provision of the EUC policy that CMS would be delaying the start of the model performance period.

Response: We appreciate commenters' feedback on the impact of the COVID–19 PHE on them, and we will consider this feedback in any decisions related to potential EUC flexibilities. We note that there has been another 90-day extension of the current PHE declaration such that the current PHE will overlap with the start of the model performance period, unless the Secretary terminates the PHE before the latest 90-day extension expires CMS will continue to monitor the impacts of COVID–19 on radiation oncology to determine whether the EUC policy may need to be invoked, and if so, which flexibilities to invoke. If and when CMS invokes any of the flexibilities due to an EUC, related to the COVID–19 PHE or otherwise, we will communicate this decision via the RO Model website and written correspondence to RO participants.

Comment: One commenter encouraged CMS to identify in the final rule regions that it intends to declare as EUC regions for the 2022 calendar year, and to develop and conduct monthly reviews of a ''EUC map'' and add new EUC regions should the COVID–19 PHE continue to surge into 2022.

Response: We thank the commenter for the feedback We will take this comment into consideration in the future.

After consideration of the comments received, we are finalizing our proposal that, in instances where an EUC is nation-wide and impacts RO participants' ability to implement the requirements of the RO Model at the start of the model performance period, CMS may delay the start date of the model performance period by up to one CY.

c. Reporting Requirements

Quality Measures and Clinical Data Elements: If an EUC impacts RO participants' ability to comply with the RO Model's quality measure or CDE reporting requirements, we proposed that CMS may delay or exempt the affected RO participants from the reporting requirements, make the requirements optional, extend the time for RO participants to report data to CMS, as applicable, or both. CMS would modify or grant exceptions to the RO Model's reporting requirements if, for example, affected RO participants could not submit their quality and clinical data reporting due to electricity or internet outages caused by an EUC.

Other Model Requirements: Because RO participants must focus on direct care, we proposed that CMS may waive compliance with or adjust the requirement that RO participants actively engage with an AHRQ-listed patient safety organization (PSO) and provide Peer Review (audit and feedback) on treatment plans.

We solicited public comments on our proposal in section XVIII.C.10. of the CY 2022 OPPS/ASC proposed rule (86 FR 42311). The following is a summary of the public comments received on this proposal and our response:

Comment: One commenter encouraged CMS to deploy the EUC policy options related to quality measure and clinical data reporting whenever a given state or region faces a relevant emergency that impacts their patients and staff.

Response: The EUC regulations allow CMS to determine the impact of the EUC on RO participants' ability to comply with the RO Model's quality measure or CDE reporting requirements. CMS may delay or exempt the affected RO participants from the reporting requirements, make the requirements optional, extend the time for RO participants to report data to CMS, as applicable, or both. CMS may modify or grant exceptions to the RO Model's reporting requirements if, for example, affected RO participants could not submit their quality and clinical data reporting due to electricity or internet outages caused by an EUC. If RO participants are concerned that CMS may be unaware of a situation that they believe should qualify for modification under the EUC policy, RO participants could contact the RO Model Help Desk at *radiationtherapy@cms.hhs.gov* with the RO Participant's RO Model ID, a description of the emergency, the affected areas, and the duration of the emergency period included in the declaration.

After consideration of comments we received, we are finalizing as proposed that CMS may delay or exempt the affected RO participants from quality measure and CDE reporting requirements, make the requirements optional, extend the time for RO participants to report data to CMS, as applicable, or both.

We are also finalizing as proposed that CMS may waive compliance with or adjust the requirement that RO participants actively engage with an AHRQ-listed patient safety organization (PSO) and provide Peer Review (audit and feedback) on treatment plans.

d. Pricing Methodology

Adjusting the Quality Withhold: If CMS were to remove (not merely extend) quality and clinical data submission requirements for affected RO participants due to a national, regional, or local event, we proposed that CMS could choose to repay the quality withhold during the next reconciliation, and award all possible points in the subsequent AQS calculation for affected RO participants, which would potentially increase episode payments during this time.

Trend Factor Adjustments: In situations where RO participants nation-wide experience significant, aggregate-level disruptions to their service utilization, in that the trend factor (specific to a cancer type and component) for the upcoming PY has increased or decreased by more than 10 percent compared to the corresponding trend factor of the previous CY when FFS payment rates are held constant with the previous CY, we proposed that CMS may modify the trend factor calculation for the PC and/or TC of an included cancer type.

For example, for PY2, a change in the trend factor calculation for the PC and/or TC of an included cancer type could be warranted if [(2020 volume * 2022 rates)/(2019 volume * 2019 rates)] is more than 10 percent change from [(2019 volume *2022 rates)/(2019 volume * 2019 rates)]. The 10 percent change threshold aligns with the 10 percent criterion for removing an included cancer type, whereby if CMS discovers a ≥10 percent (≥10%) error in established national base rates, the cancer type will be removed from the RO Model. If CMS were to implement this modification, CMS would ensure that the trend factor calculation is most consistent with the average utilization from the previous CY. We proposed to codify the EUC policies at § 512.294.

We solicited public comments on our proposal in section XVIII.C.10. of the CY 2022 OPPS/ASC proposed rule (86 FR 42311). The following is a summary of the public comments received on this proposal and our response:

Comment: Many commenters agreed with the proposal to revise the volume component associated with the trend factor during an EUC to address fluctuations in utilization due to national disruptions in care, such as those caused by COVID–19. Some commenters did not agree with the application of a 10 percent threshold. Instead, these commenters argued that CMS should simply not use the affected year's data and apply the most recent unaffected year's data to the volume component when calculating the trend factor. One commenter noted that during the COVID–19 PHE, treatments have been interrupted or truncated prior to the treatment's completion due to COVID–19 infection. Furthermore, according to the commenter, local quarantine requirements with unknown impacts on patient care could underestimate the true cost of care and true patient volume. Many commenters supported removal of 2020 data from the calculation of any applicable baseline period or trend factor. Some commenters noted that they have experienced a reduction in beneficiaries and a reduction in income in 2020. One commenter noted that businesses on average lost 8 percent of their revenue. A few commenters stated that they are still seeing the impacts of the COVID–19 PHE on their businesses in 2021.

Response: We continue to analyze whether the COVID–19 PHE has significantly changed the utilization and cost patterns within episodes of RT services. We will utilize Medicare claims data to validate concerns about costs and volumes raised by commenters. If this data show that modifications to this policy will be needed due to the ongoing COVID–19 PHE, we will address those modification through future rulemaking.

We believe that so long as there is sufficient evidence, removal of a year's worth of episode data from the trend factor calculation may be warranted. In this case, we believe sufficient evidence constitutes the trend factor (specific to a cancer type and component) for the upcoming PY has increased or decreased by more than 10 percent compared to the corresponding trend factor of the previous CY when FFS payment rates are held constant with the previous CY. An increase or decrease at a lower threshold, such as 5 percent, for example, may remove data that is appropriately reflecting changes in treatment patterns and payment rates that have occurred under OPPS and PFS. We believe that removal of data without sufficient evidence will introduce bias into the Model's pricing methodology.

After consideration of the comments received, we are finalizing as proposed that in situations where RO participants nation-wide experience significant, aggregate-level disruptions to their service utilization, in that the trend factor (specific to a cancer type and component) for the upcoming PY has increased or decreased by more than 10 percent compared to the corresponding trend factor of the previous CY when FFS payment rates are held constant with the previous CY, CMS may modify the trend factor calculation for the PC and/or TC of an included cancer type.

Upon recognition of an omitted phrase in the proposed rule (86 FR 42311), we are finalizing with modification that if CMS were to remove (not merely extend the submission window) quality and clinical data submission requirements for affected RO participants due to a national, regional, or local event, we could choose to repay the quality withhold during the next reconciliation, and award all possible points in the subsequent AQS calculation for affected RO participants, or not apply the quality withhold to RO Model payments during the EUC, which would potentially increase episode payments during this time.

We are finalizing the proposed new regulation at § 512.294 with modification to address the aforementioned omitted phrase and for precision. We are also modifying cross-references at § 512.294(a) for accuracy and precision.

XVIII. Updates to Requirements for Hospitals To Make Public a List of Their Standard Charges

A. Introduction and Overview

1. Statutory Basis and Background

Section 1001 of the Patient Protection and Affordable Care Act (Pub. L. 111–148), as amended by section 10101 of the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152), amended Title XXVII of the Public Health Service Act (the PHS Act), in part, by adding a new section 2718(e). Section 2718 of the PHS Act, entitled ''Bringing Down the Cost of Health Care Coverage,'' requires each hospital operating within the United States (U.S.) for each year to establish (and update) and make public a list of the hospital's standard charges for items and services provided by the hospital, including for diagnosis-related groups established under section 1886(d)(4) of the Social Security Act (the Act). Section 2718(b)(3) of the PHS Act requires the Secretary of the Department of Health and Human Services (Secretary) to promulgate regulations to enforce the provisions of section 2718 of the PHS Act, and, in so doing, the Secretary may provide for appropriate penalties.

As published in the **Federal Register**, in the final rule entitled ''CY 2020 Hospital Outpatient PPS Policy Changes and Payment Rates and Ambulatory Surgical Center Payment System Policy Changes and Payment Rates. Price Transparency Requirements for Hospitals to Make Standard Charges

Public'' (84 FR 65524, November 27, 2019[570], herein referred to as the CY 2020 Hospital Price Transparency final rule, we implemented these sections by adopting requirements for hospitals to make public their standard charges in two ways: (1) As a comprehensive machine-readable file; and (2) in a consumer-friendly format. We codified these requirements at new 45 CFR part 180.

In the CY 2020 Hospital Price Transparency final rule, we indicated that we believe our policies requiring public release of hospital standard charge information are a necessary and important first step in ensuring transparency in health care prices for consumers, although we also recognized that the release of hospital standard charge information would not be sufficient by itself to achieve the ultimate goals for price transparency. The final regulations were designed to begin to address some of the barriers that limit price transparency with a goal of increasing competition among healthcare providers to bring down costs. In particular, the regulations sought to address the barriers related to lack of hospital standard charge data by requiring some uniformity in the release of hospital standard charge information. We also noted that more work would need to be done to ensure consumers have access to the information they need to make healthcare decisions, and therefore encouraged hospitals and other health care providers to go further in addressing barriers to price transparency.

We received many comments expressing support for or objecting to the policies established and finalized in the CY 2020 Hospital Price Transparency final rule. Issues ranged from CMS's authority to enforce the regulations and assess CMPs, the requirement disclosure of standard charges in a machine-readable format, establishment of payer-specific negotiated charges as a type of standard charge, the burden imposed by the regulation, and other issues unrelated to the policies proposed in the CY 2022 OPPS/ASC proposed rule. We addressed comments on these issues in the CY 2020 Hospital Price Transparency final rule (84 FR 65588) and did not propose in the CY 2022 OPPS/ASC proposed rule to change any of the policies previously established. Accordingly, we consider these comments out of scope.

[570] *https://www.govinfo.gov/content/pkg/FR-2019-11-27/pdf/2019-24931.pdf.*

2. Summary of Final Policies

We are finalizing the following policies in this final rule with comment period: (1) Increasing the dollar amount of penalties for noncompliance through the use of a scaling factor based on hospital bed count; (2) deeming state forensic hospitals that meet certain requirements to be in compliance with the requirements of 45 CFR part 180, and (3) requiring that the machine-readable file be accessible to automated searches and direct downloads. As indicated in the CY 2022 OPPS/ASC proposed rule, we believe these modifications to the hospital price transparency regulations (at 45 CFR part 180) are responsive to stakeholders and are necessary to ensure compliance with the hospital price transparency disclosure requirements. We are also clarifying the expected output of hospital online price estimator tools, where there may be issues with respect to a hospital that chooses to use an online price estimator tool in lieu of posting its standard charges for the required shoppable services in a consumer-friendly format. Finally, we appreciate the thoughtful comments submitted in response to our request for input on a variety of issues that we may consider in future rulemaking to improve standardization of the data disclosed by hospitals.

Comment: While many hospital and hospital associations expressed general support for helping patients know their costs of care, particularly their out-of-pocket costs, such commenters expressed strong concerns that patients will be confused over all the 'tools' available for price transparency, in light of the forthcoming implementation of the No Surprises Act and Transparency in Coverage regulations. These commenters urged CMS to: Ensure alignment across federal transparency initiatives and policies; convene a multi-stakeholder group prior to implementation to ensure alignment across initiatives; and seek input from the public on the information that would be useful for consumers.

Response: We appreciate the commitment expressed by hospitals and hospital associations to improve patient access to and knowledge of their potential out-of-pocket costs and look forward to continued engagement as additional federal price transparency initiatives are implemented. In particular, we appreciate the comments requesting alignment across such initiatives, including those that occur through implementation of the Transparency in Coverage regulations (the TiC Final Rules) and title I (the No Surprises Act) and title II (Transparency) of Division BB of the Consolidated Appropriations Act, 2021 (the CAA).

As the federal government undertakes to implement these new laws and regulations over the next several years, we will continue to monitor and align the Hospital Price Transparency regulations, as necessary. In particular, we note that in the recently published Requirements Related to Surprise Billing; Part II,[571] HHS is seeking comment on how the Hospital Price Transparency requirements for hospitals to display standard charges in a consumer-friendly manner (45 CFR 180.60), and, specifically, the voluntary use of online price estimator tools (45 CFR 180.60(a)(2)), may be leveraged to provide a good faith estimate under the CAA. HHS is also seeking comments on whether there are other opportunities to use the Hospital Price Transparency machine-readable file requirements (45 CFR 180.50) to inform good faith estimates with expected charges, whether or not the comprehensive machine-readable files can assist uninsured (or self-pay) individuals in determining if the good faith estimate charges are reasonable and/or accurate, and what limitations exist in using the comprehensive machine-readable files for purposes of meeting the requirements for provision of the good faith estimates to uninsured (or self-pay) individuals. We encourage the public's continued participation in providing feedback necessary to ensure alignment by responding to the request for comment.

Comment: Many commenters generally welcomed the proposed updates to the Hospital Price Transparency policies and urged CMS to ''make the guidelines for hospitals even stronger.'' Other commenters, hospitals in particular, objected to any modifications for any reason at this time, citing burden imposed by the ongoing COVID–19 PHE.

Response: We appreciate both the general support for the proposals as well as the concerns raised by some commenters. We believe that the proposed modifications are both limited in scope and necessary to ensure compliance with the Hospital Price Transparency final rule and we are therefore finalizing the policies as proposed. Overall, we have also determined that the policies finalized in this rule will result in a burden reduction for hospitals (see Economic

Analysis at XXIV.C.7 of this final rule with comment period).

B. Increasing the Civil Monetary Penalty (CMP) Amounts Using a Scaling Factor

Section 2718(b)(3) of the PHS Act requires the Secretary to promulgate regulations to enforce the provisions of section 2718 of the PHS Act, and, in so doing, the Secretary may provide for appropriate penalties. In the CY 2020 Hospital Price Transparency final rule (84 FR 65581 through 65590), we established monitoring and enforcement policies at new 45 CFR part 180, subpart C. Specifically, we finalized a process for monitoring hospital compliance with section 2718(e) of the PHS Act, by evaluating complaints made by individuals or entities to the Centers for Medicare & Medicaid Services' (CMS), reviewing individuals' or entities' analysis of noncompliance, and auditing hospitals' websites. Should CMS conclude that a hospital is noncompliant with one or more of the requirements to make public standard charges, CMS may take any of the following actions, which generally, but not necessarily, will occur in the following order:

- Provide a written warning notice to the hospital of the specific violation(s).
- Request a corrective action plan from the hospital if its noncompliance constitutes a material violation of one or more requirements.
- Impose a CMP not in excess of $300 per day, on the hospital and publicize the penalty on a CMS website if the hospital fails to respond to CMS' request to submit a corrective action plan or comply with the requirements of a corrective action plan.

As described in the CY 2020 Hospital Price Transparency final rule (84 FR 65588 and 65589), we noted that commenters tended to be divided between those in favor of lower and higher CMP amounts, which indicated to us that the proposed (and subsequently finalized) $300 per day amount struck an appropriate balance between commenter concerns. We also noted that this $300 maximum daily dollar CMP amount is lower than CMPs imposed under certain other authorities administered by HHS agencies, where an entity's noncompliance poses immediate jeopardy, results in actual harm, or both, and stated our belief that the relatively lower amount for a CMP associated with a hospital's noncompliance with requirements to make public standard charges was reasonable since such noncompliance is less serious than noncompliance that poses or results in harm to the public.

As discussed in the CY 2020 Hospital Price Transparency final rule (84 FR 65589), we considered commenters' concerns that some hospitals may prefer to forgo meeting the requirements of 45 CFR part 180 (for example, to not expend resources on reporting or to protect pricing information they consider sensitive), and, instead, face compliance actions including a $300 maximum daily CMP amount. Although we declined at the time to increase the amount of the CMP based on this concern alone, we indicated that as we gained experience with implementing the policy we intended to monitor for such occurrences, and may revisit the need to adjust the amount of the CMP in future rulemaking.

We also considered the feasibility of implementing a sliding scale CMP approach across institutions that meet the definition of hospital according to § 180.20 (84 FR 65588 and 65589). However, at the time, we believed it would be challenging to find a reliable source of data that provides for a scalable factor across all institutions that meet the definition of hospital. Therefore, we declined the commenters' suggestions to scale the CMP amount based on such factors as hospital bed size, location or patient volume. However, we indicated that we would continue to consider this issue and might revisit use of a CMP scaling methodology in future rulemaking.

In the CY 2022 OPPS/ASC proposed rule, based on our initial months of experience with enforcing the hospital price transparency requirements in 45 CFR part 180, we expressed our concern by what appears to be a trend towards a high rate of hospital noncompliance identified by CMS through sampling and reviews to date, and the reported initial high rate of hospital noncompliance with 45 CFR part 180 reflected in early studies cited in the proposed rule. One approach we considered to address this trend was to amend the regulations to impose potentially higher CMPs for noncompliance with the hospital price transparency requirements, and to scale the CMP to ensure the penalty amount would be more relevant to the characteristics of the noncompliant hospital. We indicated that we believe that CMPs are an important component in holding hospitals accountable for their noncompliance with hospital price transparency requirements, and would signal the Secretary's continued support for public access to pricing information and enforcement.

Therefore, we considered two general approaches for increasing the CMP amount: (1) A flat increase in the amount that would be applied uniformly across all hospitals, for example, increasing the maximum CMP amount from $300 per day per hospital to $1000 per day per hospital, or (2) a minimum penalty amount and apply a scaling factor (such as bed count or hospital revenue) to increase the penalty in a manner uniquely tailored to the noncompliant hospital. After considering these two general approaches, we proposed to use a scaling factor to establish the CMP amount for a noncompliant hospital.

Several factors informed our proposal to use a scaling factor to determine the CMP amount for noncompliance with hospital price transparency requirements. First, we indicated that this would allow us to penalize a hospital on a sliding scale in a manner that generally correlates to the hospital's characteristics, such as using the hospital's number of beds as a proxy for the size of the patient population it serves. Second, in prior rulemaking, commenters suggested using a scaling factor as an alternative to a uniform CMP amount so as to not overly penalize smaller hospitals, while also providing a sufficient incentive for hospitals to comply. Third, other Federal programs use scaling factors in determining a CMP amount, in particular by taking into consideration the size of the entity subject to the penalty, or calculating the penalty based on the number of enrollees affected.[572] Fourth, since finalization of the CY 2020 Hospital Price Transparency final rule, we have had the opportunity to evaluate and determine a reliable source of data that could be used to establish a CMP amount across most institutions that meet the definition of 'hospital' as defined at § 180.20.

[572] See for example: 42 CFR 3.408(e), specifying factors considered in determining the amount of a civil money penalty include the financial condition of the respondent, including the size of the respondent (among other factors).

45 CFR 160.408(d), specifying factors considered in determining the amount of a civil money penalty include the financial condition of the covered entity or business associate, consideration of which may include but is not limited to the size of the covered entity or business associate (among other factors).

CMS, Civil Money Penalty Calculation Methodology, Revised, June 21, 2019. Available at: *https://www.cms.gov/Medicare/Compliance-and-Audits/Part-C-and-Part-D-Compliance-and-Audits/Downloads/2019CMPMethodology06212019.pdf* (Pursuant to 42 CFR 422.760(b)(1) and (2), 423.760(b)(1) and (2), 417.500(c), and 460.46, CMS determines if the penalty for a deficiency should be calculated on a per enrollee or per determination basis.).

42 CFR 1003.510 and 45 CFR 102.3, specifying penalty amounts that vary based on number of beds of the hospital; imposing higher penalties for a hospital that has 100 beds or more compared to a hospital that has less than 100 beds.

We also considered the potential specific scaling factor or factors that could be used, and an appropriate data source. We considered two options for a scaling factor: Hospital bed count and hospital revenue. We proposed to use the noncompliant hospital's number of beds, as specified in hospital cost report data submitted to CMS, as the scaling factor to establish CMP amounts. We noted that for purposes of this discussion, we consider ''number of beds'' to be synonymous with ''bed count,'' and that we would use the terms interchangeably.

We indicated we believed the hospital cost report data would be an appropriate data source for a scaling factor for the CMP amount because it is routinely submitted by Medicare-enrolled hospitals, is certified by a hospital official, and is reviewed by a Medicare Administrative Contractor (MAC) to determine acceptability. As explained on the *CMS.gov* website, Cost Reports web page, Medicare-certified institutional providers are required to submit an annual cost report to a MAC. The cost report contains provider information such as facility characteristics and financial statement data. CMS maintains the cost report data in the Healthcare Provider Cost Reporting Information System (HCRIS). HCRIS includes subsystems for the Hospital Cost Report (CMS–2552–96 and CMS–2552–10), among others.[573] Cost Report form CMS–2552–10 and related instructions are effective for hospitals and hospital health care complexes with cost reporting periods beginning on or after May 1, 2010.[574]

For cost reporting purposes, Medicare requires submission of annual reports covering a 12-month period of operations based upon the provider's accounting year. There are also circumstances under which a provider may file a short period cost report for part of a year.[575] Further, there are several exceptions to full cost reporting, including: If a provider does not furnish any covered services to Medicare beneficiaries during a cost reporting period (42 CFR 413.24(g)); or if the provider has had low utilization of covered services by Medicare beneficiaries (as determined by the MAC) and has received correspondingly low interim payments for the cost reporting period (42 CFR 413.24(h)). If the provider fails to submit the cost report, the MAC imposes a penalty by suspending claims payments until the hospital submits the cost report.[576]

The chief financial officer or administrator of the provider certifies the content of the submitted cost report are true, correct, complete and prepared from the books and records of the provider in accordance with applicable instructions.[577] The MAC reviews the cost report within 30 days of receipt of the provider's cost report to determine acceptability. If the cost report is considered unacceptable, the MAC returns the cost report with a letter explaining the reasons for the rejection. When a cost report is rejected, it is deemed an unacceptable submission and treated as if a report had never been filed.[578] Further, the MAC enters certain data on the hospital cost report into HCRIS, including the cost report status as either: As submitted; Settled without audit; Settled with audit; Reopened; or Amended.[579]

As explained in the CY 2022 OPPS/ASC proposed rule, one of the facility characteristics contained in the cost report is ''number of beds,'' which is the number of beds available for use by patients at the end of the cost reporting period. Specifically, ''[a] bed means an adult bed, pediatric bed, portion of inpatient labor/delivery/postpartum (LDP) room (also referred to as birthing room) bed when used for services other than labor and delivery, or newborn ICU bed (excluding newborn bassinets) maintained in a patient care area for lodging patients in acute, long term, or domiciliary areas of the hospital. Beds in post-anesthesia, post-operative recovery rooms, outpatient areas, emergency rooms, ancillary departments (however, see exception for labor and delivery department), nurses' and other staff residences, and other such areas which are regularly maintained and utilized for only a portion of the stay of patients (primarily for special procedures or not for inpatient lodging) are not termed a bed for these purposes.'' [580]

For Medicare-enrolled hospitals, we proposed to determine the CMP amount using the number of beds for the noncompliant hospital, as specified on the most recently available, finalized cost report data. We anticipate this would be the number of beds for the hospital as indicated in HCRIS as either Settled without audit, Settled with audit, Reopened, or Amended.

We proposed the following approach to scaling the CMP amount based on the hospital's number of beds, and as summarized in Table 76 of this final rule with comment period:

- For a noncompliant hospital with a number of beds equal to or less than 30, the maximum daily dollar CMP amount would be $300, even if the hospital is in violation of multiple discrete requirements of 45 CFR part 180.
- For a noncompliant hospital with a number of beds between 31 and 550, the maximum daily dollar CMP amount would be the number of beds times $10, even if the hospital is in violation of multiple discrete requirements of 45 CFR part 180.
- For a noncompliant hospital with a number of beds greater than 550, the maximum daily dollar CMP amount would be $5,500, even if the hospital is in violation of multiple discrete requirements of 45 CFR part 180.

Therefore, for hospitals with 30 or fewer beds, the CMP amount under the proposed approach would be unchanged compared to the existing policy under § 180.90(c)(2). The proposed use of bed count as a scaling factor would increase the penalty, in some cases significantly, for larger hospitals. The following examples illustrate the proposed approach. A small noncompliant hospital with a bed count of fewer than 30 would be subject to the current CMP amount of $300/day

or $109,500/year (that is, 365 days or a full CY of noncompliance). A noncompliant hospital with a bed count of 200 would be assessed a penalty of $2,000/day ($10 * 200/day) or $730,000/year. A noncompliant hospital with a bed count of 550 beds or more would be assessed a maximum penalty of $5,500/day ($10*550/day) or $2,007,500/year.

TABLE 76: Application of CMP Daily Amounts for Hospital Noncompliance for CMPs Assessed in CY 2022 and Subsequent Years.

Number of Beds	Penalty Applied Per Day	Total Penalty Amount for full Calendar Year of Noncompliance
30 or less	$300 per hospital	$109,500 per hospital
31 up to 550	$310 - $5,500 per hospital (number of beds times $10)	$113,150 - $2,007,500 per hospital
>550	$5,500 per hospital	$2,007,500 per hospital

Note: In subsequent years, amounts adjusted according to 45 CFR 180.90(c)(3).

We reviewed CMP amounts for other HHS programs that require reporting information and we believe our proposed maximum daily dollar penalty amount on a sliding scale between $300 and $5,500 per day per hospital is commensurate with the level of severity of the potential violation, taking into consideration that nondisclosure of standard charges does not rise to the level of harm to the public as other violations (such as safety and quality issues) for which HHS imposes CMPs and, therefore, should remain at a relatively lower level. For instance, the proposed maximum amount of $5,500/day, totaling $2,007,500/year would generally align with amounts used by other HHS initiatives that impose CMPs, such as HIPAA-related CMPs that, pursuant to statute, cap penalties at $1.5 million annually.[581]

We proposed that if the number of beds for the hospital cannot be determined according to the most recently available, finalized Medicare cost report data in HCRIS, CMS would use documentation provided by the hospital to determine the number of beds for purposes of calculating the CMP. This approach would be needed to determine the number of beds for a hospital that is not Medicare-enrolled and therefore does not submit to CMS a hospital cost report. Further, we believe there could be circumstances under which there may be an apparent discrepancy, or obvious error, in the most recently available, finalized cost report data for a hospital within HCRIS, and additional documentation from the hospital would be needed to accurately determine the CMP amount.

In the event that CMS requires additional documentation to determine the CMP amount, we proposed to require that the hospital provide CMS with documentation of its number of beds, in a form and manner and by the deadline prescribed by CMS in a written notice provided to the hospital. Should a hospital fail to provide CMS with this documentation, in the prescribed form and manner and by the specified deadline, we proposed that we would impose a CMP on the hospital at the highest, maximum daily dollar amount within the proposed sliding scale. For example, under the proposed approach, if CMS cannot determine a noncompliant hospital's number of beds using hospital cost report data in HCRIS, and if the noncompliant hospital fails to provide CMS with documentation of its number of beds, in the form and manner and by the deadline specified by CMS, we would impose a CMP calculated based on a number of beds greater than 550, and therefore we would impose the maximum penalty of $5,500/day ($10 * 550/day) or $2,007,500/year.

Additionally, we proposed that the approach for scaling the CMP amount based on the hospital's number of beds would apply to days the hospital is out of compliance with hospital price transparency requirements beginning with the effective date of the final rule, assuming the rule is finalized as proposed, and which we anticipate would be January 1, 2022. Further, according to § 180.90(c)(3), the amount of the CMP will be adjusted annually using the multiplier determined by OMB for annually adjusting CMP amounts under 45 CFR part 102. As described in the CY 2020 Hospital Price Transparency final rule (84 FR 65586), this multiplier is based on the Consumer Price Index for All Urban Consumers (CPI–U), not seasonally adjusted. Given that the requirements in 45 CFR part 180, as established by the CY 2020 Hospital Price Transparency final rule, were effective January 1, 2021, and because of the proposed effective date of January 1, 2022, for the modifications to the CMP amounts in the CY 2022 OPPS/ASC proposed rule, we would apply the cost-of-living adjustment multiplier determined by OMB, in calculating CMP amounts for hospital noncompliance with the requirements in 45 CFR part 180, beginning in CY 2023 and subsequent years.

To assist the public in considering the proposals to determine the CMP amount based on the most recently available, finalized number of beds for a hospital indicated in HCRIS, we noted that CMS makes public hospital cost report data in several resources. Data files by fiscal year are accessible through the Cost Reports by Fiscal Year web page, available at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Downloadable-Public-Use-Files/Cost-Reports/Cost-Reports-by-Fiscal-Year*. Specifically, we referred readers to data files by fiscal year (through FY 2020, at the time of the CY 2022 OPPS/ASC proposed rule) for facility type ''HOSPITAL–2010.'' Further, a subset of hospital cost report data for 2014 through 2017 is also made public through the Hospital Cost Report Public Use File web page, available at *https://*

[581] *See* section 1176(a)(3) of the Social Security Act; 45 CFR 160.404.

www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/Medicare-Provider-Cost-Report/HospitalCostPUF (providing access to data as either an Interactive Dataset or a Downloadable Excel file).

We sought comment on the proposal to use a sliding scale approach, based on the hospital's number of beds, to determine the CMP amount. In particular, we sought comment on specifying a minimum penalty amount of $300, consistent with the existing CMP amount, for hospitals with 30 beds or fewer, and whether 30 beds is an appropriate number to delineate for this part of the scale. We sought comment on the proposal to impose a CMP of $10/bed/day on hospitals with 31 beds up to 550 beds, including whether we should specify a higher amount to ensure hospitals' compliance with the requirements to make public standard charges. We sought comment on establishing a maximum daily penalty amount of $5,500 for hospitals with more than 550 beds. We also sought comment on our proposal to use hospital cost report data, as specified in HCRIS, to determine bed count, or if we should consider using other validated data sources or files. In particular, we expressed interest in commenters' input on whether there are any available data sources that would encompass relevant scaling data for all hospitals that are subject to the regulations at 45 CFR part 180, including hospitals that are not Medicare-enrolled.

As an alternative approach, we considered using hospital revenue as a scaling factor, instead of or in addition to hospital bed count, as it could more directly take into account the financial burden that a CMP might impose on a noncompliant hospital. For example, we considered using hospital cost report data to determine the noncompliant hospital's annual ''net patient revenues,'' [582] and to calculate a CMP amount as 0.1 percent of hospital revenue, prorated based on the number of days the hospital is out of compliance. That is, we would multiply the revenue amount by 0.001, and then divide the resulting product by 365 to determine the daily CMP amount. Under this alternative approach to scaling the CMP amount based on hospital revenue the minimum penalty applied would remain $300 per day up to a maximum penalty of approximately $5,480 per day, which would continue to generally align with CMPs for issues unrelated to harm to the public. We indicated that if we were we to adopt an approach for using hospital revenue to scale the CMP amount, we would need to address with greater specificity additional factors, including the amount of precision used in the calculations, such as whole dollar amounts, or two decimal place precision. Further, we expressed concern that an approach that uses hospital revenue as a scaling factor for determining the CMP amount may not be as effective as a scaling factor based on bed count in targeting penalties to the size of the hospital, and we noted evidence that suggests that noncompliance is fairly high among larger hospitals.[583] Additionally, we explained that by failing to post the standard charge data, hospitals are directly hindering consumers' decision-making ability, and our belief that the larger the hospital size (as determined by bed count), the more potential patients are impacted, and, thus, our belief that hospital bed count can serve as a more reliable proxy for the number of potential patients that the hospital serves than using net patient revenues. Conversely, application of a penalty based on net patient revenues would increase the penalty for better resourced hospitals compared to those that might have fewer resources. Such an approach may be more effective at deterring noncompliance among better resourced hospitals which may choose not to comply with the hospital price transparency requirements when the financial benefit of noncompliance outweighs a relatively low CMP amount.

In addition to bed size and hospital revenue, we also considered whether and how we could use additional scaling factors for assessing CMPs such as:

- Other financial metrics for scaling the CMP amount, such as using gross revenue, inpatient, or outpatient revenue to establish a penalty amount.
- The nature, scope, severity, and duration of the noncompliance. For example, taking into account the nature and number of deficiencies found upon review, in addition to applying penalties based on the number of days out of compliance.
- The hospital's reason for noncompliance. For example, applying a greater penalty for intentional noncompliance, such as if a hospital states its willful noncompliance on its website or in response to a compliance action from CMS, or application of a lesser penalty that takes into account extreme and uncontrollable circumstances.

We explained in the CY 2022 OPPS/ASC proposed rule that while using multiple scaling factors might have advantages, such as being able to tailor the amount of the CMP to account for unique hospital circumstances and the potential to assess a greater CMP for egregious noncompliance, we did not propose it because we believed we would need additional time and input to ensure that such scaling factors could be applied in a consistent manner across all hospitals that are subject to these regulations. However, we believe such refinements could improve our application of CMPs to promote hospital compliance and therefore sought comment on the following:

- What additional factors would be feasible for scaling a CMP amount?
- What data sources for the criteria could be used to ensure consistency in application of the criteria across all hospitals subject to these regulations? For example, if hospital revenue was used to scale penalties, what data source to determine revenue should be used? For example, are gross income, net income, net patient revenues, or some other metric appropriate for determining burden imposed by a CMP?
- How should nature, scope, and severity of noncompliance be determined and applied for purposes of assessing CMPs?
- How should a hospital's reason for noncompliance be determined? What factors should be considered when evaluating reason for noncompliance? Are there bases for imposing lower CMPs, such as resource limitations or extreme or unusual circumstances? If yes, how could resource limitations or circumstances contributing to noncompliance be demonstrated and should that be treated differently than documented statements of intent to not comply with the requirements?
- If multiple factors are used to scale the CMP amount, should there be a priority applied to specific factors? Should some factors be weighted more when determining the CMP amount? If yes, which one(s)?

We proposed to revise the regulations at 45 CFR 180.90(c)(2) to specify an amended approach for determining the daily dollar amount for a CMP CMS may impose upon a hospital for noncompliance with the requirements in 45 CFR part 180. As conforming changes, we proposed to specify in the regulations at § 180.90(c)(2)(i), the existing approach to determining the CMP amount, as not to exceed $300 per

[582] The Provider Reimbursement Manual—Part 2, Chapter 40. Refer to section 4040.4, Worksheet G–3—Statement of Revenues and Expenses, describing calculation of Net Patient Revenues (subtract Less: Allowance and Discounts on Patient's Accounts from Total Patient Revenue).

[583] Henderson M & Mouslim MC. Low Compliance From Big Hospitals On CMS's Hospital Price Transparency Rule. *Health Affairs*. March 16, 2021. Available at: *https://www.healthaffairs.org/do/10.1377/hblog20210311.899634/full/*.

day, with introductory text specifying the provision is applicable for CY 2021. We proposed to specify in the regulations at § 180.90(c)(2)(ii), provisions for determining the CMP amount for each day a hospital is determined by CMS to be out of compliance beginning January 1, 2022. The CMP amount would be based on the hospitals' number of beds: (A) A maximum daily dollar CMP amount of $300 for hospitals with a number of beds equal to or less than 30; (B) a maximum daily dollar CMP amount calculated as number of beds times $10 for hospitals with a number of beds between 31 and 550; and (C) a maximum daily dollar CMP amount of $5,500 for hospitals with a number of beds greater than 550. We also proposed to specify within § 180.90(c)(2)(ii)(D)(*1*) that CMS would determine the number of beds for a Medicare-enrolled hospital using the most recently available, finalized Medicare hospital cost report. We also proposed to specify within § 180.90(c)(2)(ii)(D)(*2*) the process by which CMS would determine the hospital's number of beds if such information could not be determined using Medicare hospital cost report data. We specify the conditions for CMS' receipt of documentation from the hospital to determine its number of beds, and specify that if the hospital does not provide CMS with such documentation (in the prescribed form and manner, and by the specified deadline), CMS would impose a CMP on the hospital at the highest, maximum daily dollar amount ($5,500 per day). We welcomed comments on these proposals, and the alternatives we considered.

Comment: Many commenters expressed strong support for the proposal to increase civil monetary penalties for noncompliance. Such commenters explained their belief that increased penalties are necessary to ensure hospital compliance so consumers can have access to standard charge information. Many commenters urged CMS to not delay the proposed increase in penalties past the proposed effective date of January 1, 2022, indicating their belief that any delay in enforcement will cause harm to patients, and that compliance is particularly necessary for patients during the COVID–19 PHE.

By contrast, many commenters strongly opposed any proposed methods that would increase penalties for noncompliance. Some commenters indicated their belief that the proposed increase in penalties is misplaced and ''heavy-handed'', given that hospitals may have valid reasons for noncompliance, for example, due to the ongoing COVID–19 PHE or confusion over what is required by the Hospital Price Transparency regulations. Several commenters indicated their belief that it is too early for CMS to conclude there is widespread noncompliance or to determine what effect CMS enforcement has had on improving compliance; at least one commenter asserted that the industry receipt of warning notices from CMS has served to improve compliance and should therefore be viewed as sufficient. Another commenter indicated their belief that the proposal to increase penalties is premature because the regulations and audit process are new to both hospitals and CMS.

These commenters suggested that CMS should, rather than proposing increases to penalties, do the following: Improve the specificity of the requirements; seek to provide technical assistance and guidance; clarify and provide sufficient detail about the enforcement process; clarify how compliance is defined, assessed, and evaluated; publicize results of audits to allow others to learn from the findings; seek to better understand and take into account the reasons for noncompliance; provide ''clearly defined measures that can be obtained and reported across the board by all providers''; and work with hospitals and other stakeholders in an iterative way to improve compliance.

Other commenters made recommendations for delaying enforcement and for delaying the implementation of the new penalties, if finalized. Specifically, commenters recommended enforcement delays: Indefinitely; until enforcement of the No Surprises Act and Transparency in Coverage commences or until the No Surprises Act and Transparency in Coverage policies are aligned with the Hospital Price Transparency rule; or, if proposed increases are finalized, until one full calendar year after the end of the PHE.

Response: We appreciate commenters' support for increasing the civil monetary penalty amounts and for application of a January 1, 2022 effective date as proposed. As indicated in the CY 2022 OPPS/ASC proposed rule, based on CMS' internal analysis of noncompliance, we determined it was necessary to propose an increase in the penalty amount to ensure hospital compliance with the Hospital Price Transparency regulations. Additionally, the CY 2020 Hospital Price Transparency final rule was published in November 2019 and the effective date for compliance was delayed, in response to comments, until January 1, 2021, providing hospitals additional time to prepare for compliance. We believe this delay provided hospitals with sufficient time to collect and display the standard charge information required under this rule. Further, after the Departments finalized the TiC Final Rules (which were finalized a year after the Hospital Price Transparency final rule), Congress enacted title I (the No Surprises Act) and title II (Transparency) of Division BB of the CAA, which impose important new transparency requirements on plans and issuers. As indicated in FAQs About Affordable Care Act And Consolidated Appropriations Act, 2021 Implementation Part 49,[584] the Departments recognize the number of CAA provisions plans and issuers are required to implement by January 1, 2022 and the considerable time and effort required to make the machine-readable files available in the form and manner required in the TiC Final Rules at the same time. Therefore, the Departments are deferring enforcement of some of the TiC Final Rules' requirements. In particular, the Departments are deferring enforcement of the machine-readable file requirements which are more extensive and overlapping with the CAA requirements than the Hospital Price Transparency machine-readable file requirement. We believe that the circumstances surrounding the delay of the TiC Final Rules are not analogous to, and therefore do not warrant, a further delay in the case of the Hospital Price Transparency requirements or its enforcement. As a result, we are finalizing the increased penalties as proposed and decline to delay our enforcement activities or the effective date of the increase in civil monetary penalties for the reasons raised by commenters.

We appreciate the suggestions related to additional actions CMS may take to improve compliance and will consider them for future rulemaking. Commenters seeking clarity related to CMS' assessment can review the regulations at 45 CFR 180.40, 180.50, and 180.60. Commenters seeking clarity related to the enforcement process can review the enforcement process outlined in the regulations at 45 CFR 180 Subpart C—Monitoring and Penalties for Noncompliance. Additional detail for both can be found in the preamble of the Hospital Price Transparency final rule (84 FR 65524). In response to comments related to the need for additional guidance and adequately preparing hospitals, we note

[584] *https://www.cms.gov/CCIIO/Resources/Fact-Sheets-and-FAQs/Downloads/FAQs-Part-49.pdf.*

that CMS has engaged in a number of education and outreach activities related to the Hospital Price Transparency regulations, including several Open Door Forums. We continue to encourage hospitals to review the guidance found our dedicated hospital price transparency website (*https://www.cms.gov/hospital-price-transparency*).

We continue to welcome and encourage hospitals and other stakeholders to submit specific questions and concerns to us directly at *PriceTransparencyHospitalCharges@cms.hhs.gov.*

Comment: Regarding the proposed use of bed count to scale civil monetary penalties, many commenters including consumers, consumer advocates, and clinician associations expressed support for increasing CMPs, while several supported specifically the use of bed count as a scaling factor, indicating their belief that such an approach would serve as an effective enforcement measure and ensure consistency and fairness across noncompliant hospitals. One commenter stated their view that the use of bed count would be more meaningful than using a percent of net patient revenue. Two commenters supported use of bed count but recommended that CMS using a ''tiering'' approach rather than a sliding scale approach. Several commenters opposed the proposal to cap the bed count at 550, indicating their belief that the cap should be higher (such as 1000) or uncapped.

One commenter questioned the appropriateness of using bed count as a method of determining a penalty amount because 'most shoppable services . . . have little or no relation to the number of beds in a hospital.' One commenter opposed the 30 bed count minimum, stating that the minimum should be lowered to 25 for consistency with CAH designation.

Many other commenters offered suggestions for alternative approaches or factors that should be used to assess penalties or scale the penalty amount, rather than use of bed count, including: Assessing penalties based on unique hospital characteristics (such as geographic location, rural or critical access designation, nonprofit status, or availability of financial resources) or on a case-by-case basis; phasing in penalties over time; penalties that are based on the scope, nature, or severity of noncompliance, similar to other federal initiatives; refining penalty formulas to ensure ''fairness'' across hospitals; assessment of penalties that take into consideration whether the hospital is demonstrating a good faith effort to comply, has taken actions to address deficiencies, or has communicated with CMS regarding identified issues; penalties that take into account the reason for hospital noncompliance, including any extreme and unusual circumstances, such as the impact of the COVID–19 PHE; and penalties that take into account other hospital price transparency efforts and investments and the burden imposed by the Hospital Price Transparency regulations.

Additionally, many commenters suggested that CMS prioritize certain requirements over others and apply or scale penalties only in cases where hospitals are noncompliant with ''priority'' or ''major'' requirements, and not for ''minor'' infractions or deficiencies. Commenters recommended the following requirements be viewed as priorities: Making public a consumer-friendly display; making public a machine-readable file; making public all five types of standard charges; presence of payer-specific negotiated charges in the machine-readable file; display of all payers and plans with which the hospital contracts; and whether the machine-readable file and consumer display are ''generally complete.''

By contrast, several commenters disagreed with alternative methods for scaling penalties based on factors such as scope, nature, or severity of deficiencies because, as one commenter noted, variability in providers would not permit CMS to scale such penalties equitably. A few recommended CMS consider additional types of penalties such as putting Medicare enrollment status or Medicare reimbursement at risk for noncompliance, or withholding ''federal infrastructure research'' until hospitals become compliant.

Response: We agree with commenters that application of a scaling approach using bed count would be an effective way to ensure compliance, consistency and fairness in application of penalties across noncompliant hospitals. Additionally, as explained in the proposed rule, we believe that use of bed count would allow us to penalize a hospital on a sliding scale in a manner that generally correlates to the hospital's characteristics, and is an appropriate proxy for hospital size and the relative impact a hospital's noncompliance may have on the population, although we acknowledge that this proxy would not necessarily take into account the total number of patients (including outpatients) served by the hospital. However, not all hospitals offer outpatient services, so we believe that use of bed count is an appropriate and consistent factor that could be used across all hospitals subject to the regulation. Moreover, we believe using bed count as a scaling factor takes into consideration the size of the hospital which can help avoid overly penalizing smaller hospitals, such as CAHs.

We appreciate the comments related to the many other factors that could be taken into account to determine the amount of a penalty for noncompliance, including use of alternative penalties. As we explained in the CY 2022 OPPS/ASC proposed rule, use of other or multiple scaling factors might have advantages, such as being able to tailor the amount of the CMP to account for unique hospital circumstances and the potential to assess a greater CMP for egregious noncompliance, however, we continue to decline to include additional factors at this time because we do not believe we have a method to ensure such factors could be applied in a consistent manner across all hospitals that are subject to these regulations. However, we will continue to consider the use of alternative factors and, should we find it necessary to refine the determination of the penalty amount, we will revisit this issue in future rulemaking.

We appreciate the other suggestions made by commenters, including the use of a ''tiering'' approach, but we continue to believe that the scaled approach avoids the cliff effect. We further believe that setting a minimum of 30 beds and maximum of 550 beds is appropriate because the calculated CMP for a hospital with 30 beds or fewer is consistent with the current CMP amount of $300 per day or $109,500 per year (84 FR 65589). Given our experience with compliance, we do not think it is appropriate to lower the CMP amount, and the CMP for a hospital with the 550 or more beds would be approximately $2 million which we believe will provide sufficient incentive for large hospitals to comply with the requirements. However, we will continue to monitor and assess the impact of the minimum and maximum number of beds and may revisit in future rulemaking.

Comment: Several commenters expressed various concerns related to the proposed method for determining the number of hospital beds, and whether the use of Cost Report bed count would be accurate or sufficient for purposes of assessing penalties for noncompliance with 45 CFR 180. A few commenters objected to the use of the Cost Report to identify bed size because the date of submission of the cost report varies and may not reflect an 'official count.' A few commenters requested clarification about what field in the cost

report file would be used to determine bed count. Another commenter suggested that the ''OPPS Hospital Impact File'' would be more user-friendly and requested alignment of the two files such that the bed count used from the Cost Report would be reflected in the OPPS Hospital Impact File, if not already reflected in the ''Number of Beds'' column.

Commenters requested that CMS publish a list of bed sizes annually that would be solely used for CMP assessment for noncompliance with 45 CFR part 180, and provide a mechanism for hospitals to submit corrections within 30 days of the publication of such a list. One commenter suggested using the ''number of licensed beds'' for those that are not Medicare-enrolled and asserted that such an approach would be more equitable and would enable CMS to utilize each state's facilities division information on licensed beds.

Response: We appreciate the comments related to the proposed method for determining hospital bed count via use of the most recently available, finalized hospital cost report. As explained in the proposed rule, we believe the hospital cost report data would be an appropriate data source for a scaling factor for the CMP amount because it is routinely submitted by Medicare-enrolled hospitals, is certified by a hospital official, and is reviewed by a Medicare Administrative Contractor (MAC) to determine acceptability. We therefore believe that use of the hospital cost report is both accurate, official, and sufficient for purposes of assessing penalties for noncompliance with 45 CFR 180 for most hospitals.

As we stated in the CY 2022 OPPS/ASC proposed rule, the field in the hospital cost report we proposed to use to determine bed count is designated as ''number of beds,'' which is the number of beds available for use by patients at the end of the cost reporting period. Specifically, ''[a] bed means an adult bed, pediatric bed, portion of inpatient labor/delivery/postpartum (LDP) room (also referred to as birthing room) bed when used for services other than labor and delivery, or newborn ICU bed (excluding newborn bassinets) maintained in a patient care area for lodging patients in acute, long term, or domiciliary areas of the hospital. Beds in post-anesthesia, post-operative recovery rooms, outpatient areas, emergency rooms, ancillary departments (however, see exception for labor and delivery department), nurses' and other staff residences, and other such areas which are regularly maintained and utilized for only a portion of the stay of patients (primarily for special procedures or not for inpatient lodging) are not termed a bed for these purposes.'' [585] Moreover, because the hospital cost report is readily available to the public, we do not believe it would be necessary to publish a separate list for purposes of assessing penalties for noncompliance with 45 CFR part 180.

We appreciate the suggestion to use and/or modify the ''OPPS Hospital Impact File'' to determine or reflect the number of hospital beds used to assess a penalty amount, however, the OPPS Hospital Impact File [586] gathers and presents bed count data from multiple years of HCRIS data primarily for the purpose of analyzing the impact of the OPPS payment system on hospitals that are paid under that system. While it may draw from the same data set we proposed to use for purposes of determining hospital bed count, we believe using the primary source for such information will be more accurate, complete, and timely than relying on similar data from a secondary analysis. For example, unlike the OPPS Hospital Impact File, the HCRIS primary data set includes the status of the reported information (for example, Settled without audit, Settled with audit, Reopened, or Amended) which we proposed to use to determine the CMP amount using the number of beds for the noncompliant hospital, as specified on the most recently available, finalized cost report data. Additionally, the HCRIS primary data set includes cost reports from all Medicare-enrolled hospitals, unlike the OPPS Hospital Impact File which contains data from only those hospitals paid under the OPPS payment system. We therefore believe that using the primary source (HCRIS) is more accurate, complete, and timely.

Finally, regarding the proposal to use documentation provided by non-Medicare enrolled hospitals for determining the number of beds to be used to assess the CMP amount, we agree with the commenters that each state's facilities division documentation of number of licensed beds could be appropriate for this purpose. As such, if such information is necessary and requested for purposes of assessing a CMP, we would accept documentation of number of licensed beds from a state's facilities division that is provided by non-Medicare enrolled hospitals in the form and manner and by the specified deadline. However, should a hospital fail to provide CMS with this documentation, in the prescribed form and manner and by the specified deadline, we would impose a CMP on the hospital at the highest, maximum daily dollar amount.

Comment: Regarding the proposed $10/bed/day penalty amount, not to exceed $5,500/day, many commenters urged CMS to consider even greater penalty amounts including: increasing the penalty amount to $70/bed/day, $100/bed/day, $300/bed/day or even $1000/bed/day; or increasing the penalty amount to achieve a total penalty of $5 million per year. Such commenters indicated their belief that the proposed increase would remain insufficient to drive hospital compliance and asserted that lack of pricing data amounts to a patient harm issue due to the threat of financial ruin from medical debt. Commenters requested that CMS continue to monitor compliance carefully and signal an intent to increase penalties again in the future should hospital noncompliance persist.

By contrast, others suggested that the penalty should be lower than proposed because they disagreed that noncompliance should be viewed as a patient safety issue, or that it rises to the level of a Health Insurance Portability and Accountability Act of 1996 (HIPAA)-related violation. A few commenters, including rural and critical access hospital advocates, requested that CMS retain the current maximum penalty amount of $300/day instead of proposing $300/day as a minimum penalty amount.

Response: Given the comments, we believe our proposed maximum daily dollar penalty amount on a sliding scale between $300 and $5,500 per day per hospital strikes a good balance and is commensurate with the level of severity of the potential violation. However, we will continue to monitor and assess the impact of this penalty and may revisit in future rulemaking.

Final Policy: We are finalizing, as proposed, a revision to the regulations at 45 CFR 180.90(c)(2) to specify an amended approach for determining the daily dollar amount for a CMP CMS may impose upon a hospital for noncompliance with the requirements in 45 CFR part 180. As conforming changes, we are finalizing, as proposed, to specify in the regulations at § 180.90(c)(2)(i), the existing approach to determining the CMP amount, as not to exceed $300 per day, with

[585] The Provider Reimbursement Manual—Part 2, Chapter 40. Refer to Worksheet S–3—HOSPITAL AND HOSPITAL HEALTH CARE COMPLEX STATISTICAL DATA AND HOSPITAL WAGE INDEX INFORMATION, section 4005.1, Part 1—Hospital and Hospital Health Care Complex Statistical Data, Column 2.

[586] *https://www.cms.gov/medicaremedicare-fee-service-paymenthospitaloutpatientppshospital-outpatient-regulations-and-notices/cms-1717-cn.*

introductory text specifying the provision is applicable for CY 2021. We are also finalizing, as proposed, with a technical modification to § 180.90(c)(2)(ii)(B) for clarity, that we will specify in the regulations at § 180.90(c)(2)(ii), provisions for determining the CMP amount for each day a hospital is determined by CMS to be out of compliance beginning January 1, 2022. The CMP amount would be based on the hospital's number of beds: (A) a maximum daily dollar CMP amount of $300 for hospitals with a number of beds equal to or less than 30; (B) a maximum daily dollar CMP amount calculated as number of beds times $10 for hospitals with at least 31 beds up to and including 550 beds; and (C) a maximum daily dollar CMP amount of $5,500 for hospitals with a number of beds greater than 550. We also finalize, as proposed, to specify in § 180.90(c)(2)(ii)(D)(*1*) that CMS will determine the number of beds for a Medicare-enrolled hospital using the most recently available, finalized Medicare hospital cost report. We also finalize, as proposed, to specify in § 180.90(c)(2)(ii)(D)(*2*) the process by which CMS will determine the hospital's number of beds if such information cannot be determined using Medicare hospital cost report data. Specifically, we will specify the conditions for CMS' receipt of documentation from the hospital to determine its number of beds, and specify that if the hospital does not provide CMS with such documentation (in the prescribed form and manner, and by the specified deadline), CMS will impose a CMP on the hospital at the highest, maximum daily dollar amount ($5,500 per day).

C. Deeming of Certain State Forensic Hospitals as Having Met Requirements

Section 180.30(b) of our regulations states that the hospital price transparency requirements at 45 CFR part 180 are not applicable to federally-owned or operated hospitals, including hospitals operated by an Indian Health Program as defined in section 4(12) of the Indian Health Care Improvement Act, and federally owned hospital facilities such as facilities operated by the U.S. Department of Veterans Affairs and Military Treatment Facilities (MTFs) operated by the U.S. Department of Defense. As we explained in the CY 2020 Hospital Price Transparency final rule, we concluded that these exceptions were appropriate because, with the exception of some emergency services, these facilities do not provide services to the general public and their established payment rates for services are not subject to negotiation. Instead, each of these facility types is authorized to provide services to specific populations that meet specific eligibility criteria (84 FR 65532). In addition, federally-owned or operated hospitals such as Indian Health Service and Tribal facilities[587] impose no cost-sharing, or, in the case of VA hospitals[588] and Department of Defense MTFs,[589] little cost-sharing. With respect to such facilities where there is cost-sharing, the charges are publicized through the **Federal Register**, Federal websites, or direct communication, and are therefore known to the populations served by such facilities in advance of receiving health care services. Only emergency services, which would not be shoppable services under our definition because they cannot be scheduled in advance, are available to otherwise non-eligible individuals at federally-owned or operated facilities. Because these hospitals do not treat the general public and their rates are not subject to negotiation, we concluded that it was appropriate to establish different requirements that apply to these hospitals.

In the CY 2022 OPPS/ASC proposed rule, we indicated that we had become aware that some state psychiatric facilities, specifically, state forensic hospitals, may be similarly situated to the types of facilities to which the exception in § 180.30(b) applies and should therefore also be deemed to be in compliance with 45 CFR part 180. Some state forensic facilities are public psychiatric hospitals that exclusively treat patients who are in the custody of penal authorities and who are not responsible for payment for the cost of their care in such facilities which are wholly funded through state general funds.[590] We stated we believed it is reasonable to consider deeming such hospitals as having met the requirements of 45 CFR part 180 for similar reasons that we articulated in the CY 2020 Hospital Price Transparency final rule for deeming federally owned or operated facilities as having met these requirements. Specifically, such state forensic hospitals have specialized patient populations, are not open to the general public, and the rates for such hospital services are not negotiated. Therefore, we proposed to adopt this exception by modifying the introductory language in § 180.30(b) and adding new § 180.30(b)(3) to include state forensic hospitals. For purposes of application of this exception, we proposed to add a definition to § 180.20 to define a ''state forensic hospital'' as a public psychiatric hospital that provides treatment for individuals who are in the custody of penal authorities.[591] Such forensic patients typically include: (1) Offenders incompetent to stand trial, (2) offenders with mental health disorders, (3) mentally ill prisoners transferred from prison, (4) offenders found not guilty by reason of insanity, or (5) post incarcerated civilly committed individuals.[592] In order to be deemed as having met requirements, the state forensic hospital must provide treatment exclusively for individuals who are in the custody of penal authorities (for example, a state psychiatric hospital with a forensic wing would not meet criteria necessary to be deemed to be in compliance). We estimated there are approximately 111 such institutions that could meet the definition of hospital at § 180.20.[593] We proposed to add this exception to § 180.30(b). We welcomed comments on this proposal.

Comment: All commenters that submitted comments on this proposal to deem state forensic hospitals as having met requirements expressed general support. We did not receive any comments opposing the proposal.

Response: We appreciate the support for the proposal to deem state forensic hospitals as having met requirements and are finalizing as proposed.

Comment: One commenter requested that CMS publish a list of all hospitals subject to this deeming requirement.

Response: Many states, which license such institutions as hospitals, maintain this information on publicly available websites, therefore we decline to

maintain a separate public list of state forensic hospitals deemed compliant with the hospital price transparency regulations.

Final Policy: We are finalizing, as proposed, the policy to deem state forensic hospitals as having met the requirements of 45 CFR part 180. Specifically, we are finalizing this policy by modifying the introductory language in § 180.30(b) and adding new § 180.30(b)(3) to include state forensic hospitals. For purposes of application of this exception, we are adding a definition to § 180.20 to define a ''state forensic hospital'' as a public psychiatric hospital that provides treatment for individuals who are in the custody of penal authorities.[594] In order to be deemed as having met requirements, the state forensic hospital must provide treatment exclusively for individuals who are in the custody of penal authorities (for example, a state psychiatric hospital with a forensic wing would not meet criteria necessary to be deemed to be in compliance).

D. Improving Access to the Machine-Readable File

Section 2718(e) of the PHS Act requires hospitals to ''make public (in accordance with guidelines developed by the Secretary) a list of the hospital's standard charges for items and services.''

As explained in the CY 2022 OPPS/ASC proposed rule, 45 CFR 180.50 requires a hospital to make public its standard charges in a single machine-readable file. Section 180.50(d)(1) of our regulations gives a hospital discretion to choose a website for purposes of making its standard charge information available to the public in the machine-readable file. Section 180.50(d)(2) through (5) set forth our accessibility requirements for this information, including that the standard charge information must be displayed prominently and clearly identify the hospital location with which it is associated; easily accessible, without barriers, including but not limited to being free of charge, without having to establish a user account or password, and without having to submit personal identifying information (PII); and contained in a digital file, within which the standard charge information is digitally searchable.

As discussed in the CY 2020 Hospital Price Transparency final rule, we believe there is a direct connection between transparency in hospital standard charge information and having more affordable healthcare and lower healthcare coverage costs (84 FR 65526). For purposes of displaying all standard charges for all items and services in a comprehensive machine-readable file, we proposed and finalized requirements for the file format, the content of the data in the file, and how to ensure the public could easily access and find the file. We acknowledged that the machine-readable file would contain a large amount of data; however, we indicated that we believe that a single data file would be highly useable by the public because all the data would be in one place. By ensuring accessibility to all hospital standard charge data for all items and services, we stated these data would be available for use by the public in price transparency tools, to be integrated into EHRs for purposes of clinical decision-making and referrals, or to be used by researchers and policy officials to help bring more value to healthcare.

As explained in the CY 2022 OPPS/ASC proposed rule, in our experience, many publicly available web pages that are selected by hospitals to host the machine-readable file (or a link to the machine-readable file) are discoverable using simple internet searches (using key words such as the hospital name plus 'standard charges,' 'price,' or 'machine-readable file') or, for example, by navigating to the hospital's home page and clicking and searching through pages related to patient billing and financing. We noted that because of the flexibility we allowed to hospitals to choose the internet location, we recognized and expected that there would be some variability in how hospitals choose to publicly display their machine-readable file and how quickly the file can be found by the public. However, we indicated our belief that this flexibility is afforded under the regulation so long as the hospital ensures that the machine-readable file is accessible ''without barriers,'' including that the file and its contents would be digitally searchable (84 FR 65561 through 65562).

In the CY 2022 OPPS/ASC proposed rule, we expressed our concern that, in some cases, it appears that hospitals have made standard charge data available online but embedded it in websites without any ability for users to easily or directly download a ''single machine-readable file.'' In other cases, hospitals have posted a link to a single machine-readable file but have, either intentionally or unintentionally, placed barriers that make it more challenging for the public find and access the file and its contents. We cited examples of such activities and practices including:

- Employing common methods that hinder the findability [595] of a web page that contains a link to the machine-readable file, such as through the use anti-automation tools such as form submission, or other technological devices that place a ''locked door'' in front of the content thereby making it difficult or impossible for search engines to identify the data. There have also been reports of hospitals using ''blocking codes'' such as use of NOINDEX and ''rel canonical'' tagging or disallow statements or removing the URL from the search index through the use of the webmaster tools URL removal service. These techniques prevent commonly used web search engines from caching web pages on which the link to machine-readable files reside.[596] These examples of tools and codes present barriers because they limit the public's ability to easily search for and find the web page that hosts a link to the machine-readable file.
- Employing common methods that prevent direct access to the file and its contents. For example, some hospitals implement anti-automation tools such as requiring users to pass tests proving they are human users prior to accessing the file, for example, the implementation of CAPTCHA and reCAPTCHA in web applications. CAPTCHA stands for ''Completely Automated Public Turing test to Tell Computers and Humans Apart.'' Common CAPTCHA and reCAPTCHA mechanisms may include distorted text inside images, where the user has to type the text or nine or sixteen square images, where the user has to identify the images that contain certain objects, such as vehicles, trees, or street signs. In other instances, some hospitals require the user to take additional actions upon clicking the link to the machine-readable file, prior to download. For example, pop-up windows that require the user to agree all terms and conditions in a legal disclaimer prior to permitting the machine-readable file and its contents to be downloaded. Such pop-up windows do not permit direct access to the file and its contents, and present a barrier.
- Developing file constructs and web forms that obscure access to the data in

[596] McGinty T, et al. Hospitals Hide Pricing Data from Search Results. *The Wall Street Journal.* March 22, 2021. Available at: *https://www.wsj.com/articles/hospitals-hide-pricing-data-from-search-results-11616405402.*

a single machine-readable file through the use of Application Programming Interfaces (APIs). For example, we have found APIs that use calls for data that will not return a complete data file, that do not provide supporting documentation on the use of the API to retrieve the file, and that do not allow a single query to return all data in a single machine-readable file. These APIs control access to the data in a way that prevents or conceals access to the entire data file. As such, these types of APIs present barriers to direct access to a 'single machine-readable file' and are therefore not permissible forms of APIs for use by a hospital.

Given this additional experience, we proposed to amend the regulations by adding paragraph (d)(3)(iv) to § 180.50 to specify that the hospital must ensure that the standard charge information is easily accessible, without barriers, including, but not limited to, ensuring the information is accessible to automated searches and direct file downloads through a link posted on a publicly available website. We indicated our belief that this additional requirement would ensure greater accessibility to the machine-readable file and its contents and would prohibit practices we have encountered in our compliance reviews, such as lack of a link for downloading a single machine-readable file, using ''blocking codes'' or CAPTCHA, and requiring the user to agreement to terms and conditions or submit other information prior to access.

We sought comment on whether stakeholders have identified additional barriers that we should prohibit. We noted that the list of examples of barriers we have encountered in our reviews of hospital websites is not intended to be exhaustive, and that should we identify additional barriers that prevent automated searches or direct download of the machine-readable file, we may prohibit them via, as appropriate, guidance or future rulemaking.

Finally, we sought comment on whether there are specific criteria we should consider when evaluating whether a hospital has displayed the machine-readable file in a ''prominent manner.'' We explained our belief that files that are posted in a prominent manner can reduce public burden for searching and finding the files, and can ensure the public can easily find the machine-readable file and the information contained within it. When files are posted prominently, we noted, we would be able to more easily monitor and assess hospital compliance with the CY 2020 Hospital Price Transparency final rule. For example, we indicated we were considering establishing a more standardized approach for how hospitals would be required to make public the machine-readable file, in order to relieve the burden on the public and ensure files are found easily. One such method could be to require hospitals to post their machine-readable files using a CMS-specified URL, in addition to the CMS-specified naming convention. Another approach could be to require a standardized location for hospitals to post a link to the file from the hospital's homepage, thus limiting the public's search for such files to the homepage of the hospital and relieving burden on the public to spend time searching for the file. We sought comment on these methods for ensuring that the machine-readable files posted are prominently displayed and easily accessible.

Comment: Many commenters expressed general support for removal of any and all barriers to access. Commenters strongly supported the current accessibility requirements (specifically, that the information be accessible free of charge, without having to establish a user account or password, and without having to submit personal identifying information) and urged CMS to finalize the additional proposed requirement that the machine-readable file be accessible ''to automated searches and direct file downloads through a link posted on a publicly available website.'' Commenters stated that the proposed rule's examples of activities that present barriers to access are accurate and expressed their belief that such a policy is ''necessary, important, and worthwhile'' to improve public access to machine-readable files. Commenters noted that by employing such strategies, hospitals are engaging in additional and unnecessary work, and suggested that the self-imposed additional burden reflects an active intent on the part of a hospital to obfuscate the data and new regulations. Additionally, some commenters expressed appreciation for the specific examples cited by CMS in the proposed rule and urged CMS to continue to provide this type of guidance to help hospitals comply with the new rules.

By contrast, many commenters requested that CMS not impose any additional requirements on hospitals at this time. Instead, commenters recommended that CMS: Identify practices that support access and allow hospitals flexibility to tailor different strategies to their own organizational goals; improve education and outreach; and not impose requirements that would increase hospital administrative costs to comply and 'redevelop' their price transparency solutions.

Several commenters objected to the proposal because ensuring the machine-readable file is accessible to direct downloads from a link posted on a web page would prohibit the use of certain activities and methods such as the use of pop-up disclaimers and agreements as a prerequisite to accessing the machine-readable file. Commenters asserted that pop-up disclaimers are necessary because the information in the machine-readable files could be confusing or even misleading to consumers if presented without context or explanation, and that pop-up disclaimers ''are the only protection hospitals have to avoid negative consequences of misinterpreting information.'' Additionally, commenters argued that CMS itself encouraged use of disclaimers, citing the Hospital Price Transparency final rule in which CMS encouraged hospitals to include ''appropriate disclaimers in their price estimator tools'' (84 FR 65579). Commenters indicated their belief that hospitals can properly require that a consumer acknowledge the hospital's disclaimers through pop-ups without compromising the accessibility of the machine-readable file.

A few commenters objected to the requirement to ensure direct download of the machine-readable file because it would prevent using methods such as CAPTCHA which, commenters asserted, is necessary for hospitals to safeguard the overall web-based hosting environment. Commenters explained that due to the size of some of the files, repeated automated attempts by external sources could place stress on the bandwidth of hospital networks and could present as a ''denial of service'' attack. Denial of service attacks, in turn, could result in the shutdown of the website and interrupt patient access to the website. Commenters recognized there are mitigation strategies available to hospitals, but that some such strategies may represent an additional cost to the facility to implement. Additionally, commenters pointed out that the federal government uses CAPTCHA on some websites for certain purposes, such as the submission of public comment to proposed rules on the **Federal Register** site.

One commenter objected to requiring direct access to the machine-readable file through a link posted on the web page because such a requirement would prohibit the ability to use other methods for displaying standard charge information, such as the use of APIs. Commenters asserted that use of APIs should be permitted because machine-

readable file information that is searchable through an API is beneficial to the end-user. This commenter asserted that finalizing the proposal would increase burden because hospitals using APIs in lieu of providing the public with access to a single machine-readable file may require some hospitals to redevelop their price transparency solutions.

Response: We appreciate and agree with commenters that additional criteria are necessary at this time to ensure public access to the information in the machine-readable file. We believe that prohibiting practices that prevent automated access and direct downloads permits greater flexibility than prescribing the way a hospital must support access. Although we recognize, as articulated by commenters, that there may be legitimate reasons why a hospital may have chosen to display its data the way it currently does, we nonetheless believe the employment of such practices articulated in the proposed rule present barriers to access to the information in the machine-readable file and are thus finalizing the policy as proposed. Any such practice that prevents accessibility of the machine-readable file via automated searches and direct file downloads would be prohibited under this final rule.

We continue to believe that pop-ups (including pop-up disclaimers) present a barrier to both automated and manual access to the machine-readable file by preventing direct download of the file via a link on the hospital's web page. We do not believe, as suggested by some commenters, that such pop-up disclaimers are the only protection afforded to hospitals to avoid negative consequences of misinterpreting the information contained in the machine-readable file. Even so, we note that this prohibition would not prevent a hospital from providing any additional information or relevant disclaimers in the machine-readable file itself or on the web page containing the link to the machine-readable file. However, under the new requirements, such disclaimers or explanatory information may not be used as a barrier to direct downloads of the file from a link on the hospital's web page. Additionally, we do not believe that the policy to require direct downloads is inconsistent with our encouragement of the use of disclaimers in price estimator tools because such tools are designed specifically for manual use by an individual, in contrast to a display of data that is intended to be widely accessible, including accessible by machines. Moreover, we have not received complaints that pop-ups (including pop-up disclaimers) are creating a barrier to access to price estimator tools. However, we will monitor this issue and, to the extent that CAPTCHA or pop-ups (including pop-up disclaimers) present a barrier to access to price estimator tools, we may address it in future rulemaking.

We agree with commenters who indicated that prohibiting use of CAPTCHA (and other similar barriers to directly downloading the machine-readable file) will increase the usability of the machine-readable file for the public, including for researchers and others who seek to update their data sources as part of an automated process. We acknowledge that some commenters may have concerns related to bandwidth considerations and server security. We note, however, that access to machine-readable files from websites is not unusual, nor are direct downloads. Moreover, accounting for bandwidth considerations and preventing attempted denial of service attacks is within the scope of routine server administration. Server administrators therefore have mitigation strategies to address both issues. For example, in our compliance reviews, we have noticed that some hospitals have employed alternative hosting or caching of the machine-readable file. We note that the regulations related to location and accessibility of the machine-readable file require hospitals to ''select a publicly available website for purposes of making public the standard charge information'' (45 CFR 180.50(d)). Thus, hospitals have flexibility to determine the most appropriate public website for posting that permits the public access to the machine-readable file in accordance with the requirements of the final rule. We believe that hospitals can carefully consider how to display the link to the machine-readable file such that all requirements for posting may be met.

We disagree with commenters that suggest that we should not finalize the policy as proposed because some federal websites, such as the **Federal Register**, use CAPTCHA for submission of comments. Use of CAPTCHA for purposes of comment submission to the **Federal Register** is a fundamentally different process than the process for downloading a static file. In the comment response process, the CAPTCHA helps to prevent automated data submission, thereby protecting the value of the comments received by the federal government by ensuring the content submitted is user-created. When downloading a static file, no user-created content is submitted to a web server and therefore there is no data to protect. A more appropriate comparison than the comment submission process to the **Federal Register** would be public access to information that can be downloaded from *Data.gov* which allows the public to directly download data files; Data.gov does not have CAPTCHA requirements or other impediments for accessing direct data downloads.

In the CY 2020 OPPS/ASC proposed rule (84 FR 39582 through 39583), we specifically sought comment on adopting a requirement that hospitals use an open standards-based API through which they would disclose their standard charges and associated data elements. Ultimately, we finalized a policy for hospitals to make public their standard charges by posting a single machine-readable file online as a good initial step, while indicating that as hospital disclosure of standard charges matures, we intended to revisit the issue. Thus, while hospitals are not prohibited under the final rule from making public standard charges via API technology, or using such technology for a consumer-friendly display of standard charges, hospitals must still make public their standard charges in a single machine-readable file. Under this finalized accessibility policy, such single machine-readable files must additionally be accessible to automated searches and direct file downloads through a link on the hospital website.

Comment: Some commenters noted that the most pressing barrier to access is the lack of hospital compliance with the Hospital Price Transparency regulations. Others outlined various technical challenges in identifying and searching for the location of the file related to website domain names, hospitals that don't maintain websites, and search results that include links to third party aggregators of the files. Several commenters requested more guidance related to what is acceptable to meet the current 'prominently displayed' requirement. Others provided detailed suggestions for improving future requirements related to file 'findability,' including: Consideration for developing a centralized location for hospitals to either make public the machine-readable file or to submit a link to the machine-readable file's location; requiring use of certain searchable words or terms on the web page that contains the link to the machine-readable file; requiring hospitals to place a link to the file (or its web page) on the hospital's homepage; requiring the file to be on a web page that is no more than two clicks from the hospital's homepage; requiring hospitals to locate the file on a dedicated price

transparency web page on the hospital's own website. Several commenters supported the establishment of a CMS-specified URL, although one commenter noted that this would not be necessary if CMS chose instead to establish and enforce a specific location for the link to the machine-readable file.

By contrast, other commenters supported the current flexible approach and objected to more specificity in file location requirements, other than ensuring the file is 'not blocked from public view.' One commenter noted that hospitals have frequently chosen to post the link to the machine-readable file on the hospital billing web page.

Response: We appreciate the feedback and acknowledge that hospitals may be experiencing technical challenges as they implement the hospital price transparency requirements. As noted above, we will continue to educate hospitals about the requirements, including the requirement to use the CMS-specified naming convention. Regarding the request for additional guidance related to how a hospital should ensure that the machine-readable file is displayed 'prominently,' we refer hospitals to the detailed discussion in the CY 2020 Hospital Price Transparency final rule (84 FR 65561) (84 FR 65561). In response to commenters requesting additional guidance for how to ensure their machine-readable files are 'prominently displayed', we recommend hospitals do the following:

- Review and use, as applicable, the HHS Web Standards and Usability Guidelines (available at: *https://webstandards.hhs.gov/*), which are research-based and are intended to provide best practices over a broad range of web design and digital communications issues.
- Post a link to machine-readable file on a website where the value and purpose of the web page and its content is clearly communicated, for example, a dedicated price transparency web page or a web page devoted to patient billing or financing healthcare services.
- While ''breadcrumbs'' (for example, secondary navigation aids) can be useful for navigating a website, they should not be relied upon in order for consumers to find the link to the machine-readable file. Instead, facilitate user navigation by including searchable terms on the web page such as ''price transparency,'' ''standard charges,'' or ''machine-readable file.''
- Ensure that the link to the machine-readable file is visually distinguished on the web page, and that its purpose is to open the single machine-readable file for a clearly indicated hospital location.

Additionally, we appreciate the detailed comments related to challenges in locating files, and will continue to consider these suggestions for future rulemaking.

Final Policy: We are finalizing, as proposed, an amendment to the regulations by adding paragraph (d)(3)(iv) to § 180.50 to specify that the hospital must ensure that the standard charge information is easily accessible, without barriers, including, but not limited to, ensuring the information is accessible to automated searches and direct file downloads through a link posted on a publicly available website. We believe that this additional requirement will serve to ensure greater accessibility to the machine-readable file and its contents and would prohibit practices we have encountered in our compliance reviews, such as lack of a link for downloading a single machine-readable file, using ''blocking codes'' or CAPTCHA, and requiring the user to agreement to terms and conditions or submit other information prior to access.

E. Clarification and Requests for Comment

1. Clarification of the Price Estimator Tool Option

In the CY 2022 OPPS/ASC Proposed Rule, we indicated that we had previously finalized a requirement that hospitals make public certain standard charges for 300 ''shoppable'' services in a consumer-friendly manner. We very briefly summarized the rationale and policy finalized in the CY 2020 Hospital Price Transparency final rule at § 180.60(a)(2) that a hospital may voluntarily offer an internet-based price estimator tool and thereby be deemed to have met our requirements to make public its standard charges for selected shoppable services in a consumer-friendly manner, so long as such a price estimator tool:

- Provides estimates for as many of the 70 CMS-specified shoppable services that are provided by the hospital, and as many additional hospital-selected shoppable services as is necessary for a combined total of at least 300 shoppable services.
- Allows healthcare consumers to, at the time they use the tool, obtain an estimate of the amount they will be obligated to pay the hospital for the shoppable service.
- Is prominently displayed on the hospital's website and be accessible without charge and without having to register or establish a user account or password.

In the CY 2022 OPPS/ASC proposed rule, we clarified that to satisfy our requirement at § 180.60(a)(2)(ii), a price estimator tool ''[a]llows healthcare consumers to, at the time they use the tool, obtain an estimate of the amount they will be obligated to pay the hospital for the shoppable service''. Moreover, such a price estimator tool must be ''tailored to individuals' circumstances (whether an individual is paying out of pocket or using insurance) and provide real-time individualized out of pocket estimates that combines hospital standard charge information with the individual's benefit information directly from the insurer, or provide the self-pay amount.'' (84 FR 65578) [597] We went on to note our concern that our reviews of hospital compliance have identified that some hospital price estimator tools do not tailor a single estimated amount based on the individual's circumstance, but, instead, provide estimated average amounts or ranges for the price of a shoppable service that appear to be generated based on a broad population of patients, including outliers. Others do not appear to combine hospital standard charges with the individual's benefit information directly from the insurer to create the estimate, but instead, appear to use information from prior reimbursements or require the user to input benefit information. Still others appear tailored to the individual, but indicate that the price is not what the hospital anticipates that the individual would be obligated to pay, even in the absence of unusual or unforeseeable circumstances. We stated in the proposed rule that such price estimator tools would therefore fail to satisfy our requirements at § 180.60(a)(2).

We noted that under the CY 2020 Hospital Price Transparency final rule, hospitals are not required to offer online price estimator tools. However, we emphasized that when a hospital chooses to offer an online price estimator tool as an alternative to presenting its standard charge information in a consumer-friendly format, we believe it is important for the hospital to select and offer a price estimator tool that provides a single dollar amount that is tailored to the individual seeking the estimate, taking

[597] There were several typographical errors in the clarification published in the proposed rule. The sentence should read as follows: Moreover, such price estimator tools must be tailored to individuals' circumstances (whether an individual is paying out-of-pocket or using insurance) and provide ''real-time individualized out-of-pocket estimates'' that ''[combines] hospital standard charge information with the individual's benefit information directly from the insurer'', or provide the self-pay amount. (84 FR 65578)

the individual's circumstances into consideration when developing the estimate. Moreover, we stated that the estimate must reflect the amount the hospital anticipates will be paid by the individual for the shoppable service, absent unusual or unforeseeable circumstances. We also emphasized that nothing in the Hospital Price Transparency regulations would preclude a hospital from providing additional information that may be helpful to the consumer, such as a range of prices paid by a defined population of consumers for the item or service in the past, or informing the inquirer what circumstances could change the personalized estimate.

Finally, we indicated that we were considering whether we should add requirements for the use of an online price estimator tool as an alternative to making public the standard charges for shoppable services in a consumer-friendly format. We sought stakeholder input for future consideration related to the price estimator tool policies, including identifying best practices, common features, and solutions to overcoming common technical barriers, and specifically, sought input on:

- What best practices should online price estimator tools be expected to incorporate?
- Are there common data elements that should be included in the online price estimator tool to improve functionality and consumer-friendliness?
- What technical barriers exist to providing patients with accurate real-time out-of-pocket estimates using an online price estimator tool? How could such technical barriers be addressed?

Comment: Many commenters supported the policy finalized in the Hospital Price Transparency final rule to permit use of price estimator tools that ''[a]llows healthcare consumers to, at the time they use the tool, obtain an estimate of the amount they will be obligated to pay the hospital for the shoppable service,'' in lieu of making public standard charges in a consumer-friendly manner at 45 CFR 180.60. A few commenters urged CMS to go further and permit such tools to satisfy the requirements for all hospital price transparency rules, including the machine-readable file requirements at 45 CFR 180.50. By contrast, many commenters expressed concerns with permitting hospital use of price estimator tools for any purpose, including meeting the consumer-friendly display requirements at 45 CFR 180.60, because they believe that hospitals are using such tools to continue to obfuscate and avoid making public their standard charges, as required by the law and in accordance with the Hospital Price Transparency final rule. Such commenters explained that consumers want knowledge of 'real' prices, including standard charges, and not just their final out-of-pocket obligations. Commenters asserted that full disclosure of the inputs to determine the out-of-pocket costs are necessary for consumers to validate the final bill. A few commenters therefore urged CMS to rescind the flexibility afforded in the rule that allows hospitals to voluntarily offer price estimator tools that offer only out-of-pocket estimates instead of making public their standard charges for shoppable services in a consumer-friendly manner.

Many commenters, including several providers and provider organizations, expressed strong support and agreement with the clarification that price estimator tools must take into consideration the individual's insurance information when providing an out-of-pocket estimate. Commenters stated that such tools are routinely in use in hospital systems around the country and provide meaningful and accurate estimates to consumers of their out-of-pocket obligations. Others noted that since finalization of the Hospital Price Transparency final rule, the adoption of such real-time tools has increased, along with vendor support for price estimator tools that take individuals' payer information into account. One commenter noted that regular communication channels between both payers and their estimation tool vendor had proven to be a valuable best practice to address estimation accuracy issues.

A few commenters strongly disagreed with the clarification. One commenter objected to requiring that, in order to qualify for an exception to 45 CFR 180.60(b) through (e), a price estimator tool must use a 'standard-charges-based' methodology to provide an estimate of a patient's expected cost sharing obligation. This commenter stated that such a requirement would unduly limit a hospital's flexibility without benefitting consumers. Two commenters pointed out that a statement attributed as a quote from the Hospital Price Transparency final rule (specifically the quote attributed to 84 FR 65578) could not be found and therefore invalidates the clarification. One of the commenters noted that the sections of the quote are contained in separate sections of the Hospital Price Transparency final rule but that the combined quote does not exist. Both commenters suggested that the clarification is contradictory because the Hospital Price Transparency final rule indicates that hospitals should advise user to ''consult, as applicable, with his or her health insurer to confirm individual payment responsibilities and remaining deductible balances.''

Several commenters disagreed that the examples we provided in the proposed rule of price estimator tools would be considered noncompliant, including the following that would be considered out of compliance:

- Tools that provide estimated amounts or ranges, instead of a single dollar out-of-pocket amount. Commenters asserted that ranges are useful to consumers.
- Tools that use prior claims to estimate the potential total standard charges. A commenter asserted that past claims, properly used, can provide a more accurate basis for establishing a reasonable estimate than the use of standard charges. Another indicated that it is impractical to load the information from all payers and all plans and therefore some amount of averaging is necessary.
- Tools that do not combine hospital standard charges with benefit information directly from the insurer, requiring the user to input their own benefit information. Some commenters indicated that some tools request benefit information to be submitted by the consumer, explaining not all payer information is available electronically or updated frequently enough. One commenter noted that, in order to provide more meaningful and accurate estimates, some hospitals have developed an option for patients to manually input or override certain information, such as their progress toward meeting a deductible. Some commenters noted that each electronic transaction with the payer may result in a transaction fee borne by the hospital. Another indicated that electronic requests do not consistently return necessary information from the payer.
- Tools that indicate the price is not what the hospital anticipates the individual would be obligated to pay, even in the absence of unusual or unforeseeable circumstances. One commenter requested that CMS clarify that 'unusual and unforeseen circumstances' are not the only reasons that a final cost could deviate from an estimate because some patient needs are unknowable but not unforeseen; for example, having to order lab tests may not be unusual or unforeseen, but it may not be known in advance which exact labs will be needed. Others requested that CMS enforce the requirement that the price estimator tool reflect the amount that the individual would be ''obligated'' to pay as a binding and

guaranteed estimate and not permit any disclaimers to the contrary. A few commenters expressed understanding that some hospital costs are challenging to predict with certainty but asserted that in such cases, rather than a disclaimer, it would be useful to be offered a reasonable 'bundled' price for a procedure, along with prices for potential 'a la carte' items and services that could be included in the final bill.

A few commenters requested that CMS delay finalizing any additional criteria for the use of hospital price estimator tools. Commenters noted that both the Transparency in Coverage rule as well as the No Surprises Act have requirements for payers to establish price comparison tools.[598] Additionally, the No Surprises Act includes requirements for providers to communicate ''good faith estimates'' to uninsured (including self-pay) patients as well as communication of estimated charges to payers so that payers can, in turn, provide a ''good faith estimate'' to people using insurance. Commenters suggest that the estimates provided by hospital price estimator tools could be related to the ''good faith estimates'' that hospitals will be required to provide under the No Surprises Act. As such, commenters requested that CMS consider and ensure alignment of requirements across these initiatives.

Response: We appreciate commenter support for our Hospital Price Transparency final rule policies related to voluntary use of price estimator tools to satisfy the consumer-friendly display requirements at 45 CFR 180.60. We do not believe the clarification we provided in the proposed rule presents a change to the existing price estimator tool requirements that we previously finalized. However, we appreciate comments related to changes that we may consider in future rulemaking (such as expanding the policy to permit such tools to satisfy other requirements or rescinding the policy to permit hospitals to meet requirements for a consumer-friendly display via use of price estimator tools).

We appreciate commenter support for the clarification of the requirement that voluntary price estimator tools take into account patient insurance information when presenting out-of-pocket estimates. We agree that such tools are routinely used in hospital systems and can be used to provide meaningful and accurate estimates to consumers about their out-of-pocket obligations. We also noted in the Hospital Price Transparency final rule ''that price estimator tools pick up where our rule ends and take the additional steps that would otherwise be required by the consumer to determine their individualized out-of-pocket *by combining hospital standard charge information with the individual's benefit information directly from the insurer* [italics added for emphasis].'' (84 FR 65578).

Thus, the estimate from a price estimator tool, voluntarily used by the hospital in lieu of making public a consumer-friendly list of standard charges, must be tailored to individuals' circumstances and represent a real-time individualized out-of-pocket estimate of the amount they would have to pay the hospital that takes into account any applicable benefit information.

However, although we would expect a personalized out-of-pocket estimate to use hospital standard charges and to take insurer information directly into account, we did not specify the method by which a price estimator tool would do so. As suggested by commenters, we recognize that a population-based analysis of prior reimbursements for hospital services (particularly for complex procedures that have many possible combinations of items and services and corresponding payer-specific negotiated charges, or for procedures that have payer-specific negotiated charges for a service package based on complex contracting arrangements) could help inform the inputs (for example, items and services and total expected payer-specific negotiated charges) that are likely to be encountered by the individual. Additionally, we agree with commenters that there may be existing challenges for electronically accessing some payer information that is necessary to determine an accurate out-of-pocket cost estimate for all individuals seeking to use insurance, and that such challenges may require an individual to input data that comes directly from the payer. Further, we recognize that there may be an opportunity in the future to align requirements for a consumer-friendly display of standard charges with the requirements of the Transparency in Coverage regulations and the implementation of the No Surprises Act.

Accordingly, if a hospital chooses to offer a price estimator tool in lieu of displaying standard charges in a consumer-friendly manner, the hospital must ensure (among the other requirements at 45 CFR 180.60(a)(2)) that the tool allows healthcare consumers to, at the time they use the tool, obtain an estimate of the amount that the hospital anticipates the individual would be obligated to pay. This means that the estimated amount is personalized and represented as a single out-of-pocket dollar amount that takes into account the individual's insurance status. However, the Hospital Price Transparency final rule is not prescriptive regarding the method by which a hospital's price estimator tool estimates the individual's single out-of-pocket dollar amount. Specifically, we note that nothing in the rule prevents a hospital from developing an accurate and reliable cost estimate using prior claims information or from providing additional information that may be useful to the end-user, such as the range of out-of-pocket costs for the population to which the individual belongs. However, the estimate of ''the amount'' the individual would be obligated to pay must be displayed as a single dollar out-of-pocket amount within the tool. Similarly, the Hospital Price Transparency final rule is not prescriptive regarding the method by which the tool accesses the individual's insurance information ''directly from the insurer.'' We therefore agree with commenters that the tool could require the consumer to manually submit such information in order to generate the estimated out-of-pocket amount.

Finally, the Hospital Price Transparency final rule requires price estimator tools to allow consumers to obtain an estimate of the amount ''they will be obligated to pay'' the hospital for the shoppable service and we encouraged hospitals to take note of best practices for developing accurate and reliable cost estimates and seek to ensure the price estimator tools they offer are maximally consumer-friendly. Additionally, as noted by commenters, we encouraged, but did not require, that hospitals ''provide appropriate disclaimers in their price estimator tools, including acknowledging the limitation of the estimation and advising the user to consult, as applicable, with his or her health insurer to confirm individual payment responsibilities and remaining deductible balances.'' As such, we believe such disclaimers should serve to educate the public regarding the estimate and should not be used to avoid making every attempt to ensure the estimate is accurate. We agree that the 'absence of unusual or unforeseeable circumstances' are not the only reasons why a price estimate may change and we encourage hospitals to use the disclaimer as an opportunity to identify, explain, and document any limitations of the analysis, including but not

[598] *https://www.dol.gov/sites/dolgov/files/EBSA/about-ebsa/our-activities/resource-center/faqs/aca-part-49.pdf*

limited to any assumptions and exclusions that were made when developing the estimate.

2. Responses To Request for Comment

In the CY 2022 OPPS/ASC proposed rule (86 FR 42312 through 42321), we sought comment on a number of issues including: (1) Input for future consideration related to the price estimator tool policies, including identifying best practices, common features, and solutions to overcoming common technical barriers; (2) whether we should require specific plain language standards, and, if so, what those plain language standards should be; (3) potential ways that we could highlight exemplar hospital price transparency practices; and (4) recommendations for improving standardization of the machine-readable file. We received approximately 396 timely comments on this RFI. We appreciate the detailed input provided by commenters on these topics.

XIX. Additional Hospital Inpatient Quality Reporting (IQR) Program Policies

A. Safe Use of Opioids—Concurrent Prescribing eCQM (NQF #3316e) and eCQM Reporting Requirements in the Hospital IQR Program—Request for Information

1. Hospital IQR Program Background

We refer readers to the following final rules for detailed discussions of the history of the Hospital IQR Program, including statutory history, and for the measures we have previously adopted for the Hospital IQR Program measure set:

- The FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861);
- The FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181);
- The FY 2012 IPPS/LTCH PPS final rule (76 FR 51605 through 61653);
- The FY 2013 IPPS/LTCH PPS final rule (77 FR 53503 through 53555);
- The FY 2014 IPPS/LTCH PPS final rule (78 FR 50775 through 50837);
- The FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249);
- The FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692);
- The FY 2017 IPPS/LTCH PPS final rule (81 FR 57148 through 57150);
- The FY 2018 IPPS/LTCH PPS final rule (82 FR 38326 through 38328, 38348);
- The FY 2019 IPPS/LTCH PPS final rule (83 FR 41538 through 41609);
- The FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42509);
- The FY 2021 IPPS/LTCH PPS final rule (85 FR 58926 through 58959); and
- The FY 2022 IPPS/LTCH PPS final rule (86 FR 45360 through 45426);

We note this is not an exhaustive list of all prior rulemaking for the Hospital IQR Program. We also refer readers to 42 CFR 412.140 for Hospital IQR Program regulations.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42321), we sought input through a request for information (RFI) regarding the Safe Use of Opioids—Concurrent Prescribing electronic clinical quality measure (eCQM) (NQF #3316e) (hereinafter referred to as the ''Safe Use of Opioids eCQM'') as well as our previously finalized policy of requiring hospitals to report on the Safe Use of Opioids eCQM beginning with the CY 2022 reporting period/FY 2024 payment determination (84 FR 42503 through 42505). We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42459) where we adopted the Safe Use of Opioids eCQM into the Hospital IQR Program beginning with the CY 2021 reporting period/FY 2023 payment determination. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42503 through 42505) in which we finalized our policy requiring hospitals to report on the Safe Use of Opioids eCQM beginning in the CY 2022 reporting period. We also refer readers to the FY 2021 IPPS/LTCH PPS final rule in which we finalized reporting of the Safe Use of Opioids eCQM as one of the four required eCQMs beginning with the CY 2022 reporting period/FY 2024 payment determination (85 FR 58933 through 58939). Specifically, for the CY 2022 reporting period/FY 2024 payment determination, hospitals will be required to report three self-selected calendar quarters of data for each required eCQM: (a) Three self-selected eCQMs; and (b) the Safe Use of Opioids eCQM. For the CY 2023 reporting period/FY 2025 payment determination and subsequent years hospitals will be required to report four calendar quarters of data for each required eCQM: (a) Three self-selected eCQMs; and (b) the Safe Use of Opioids eCQM. The Safe Use of Opioids eCQM is scheduled to be submitted to the National Quality Forum (NQF) in 2022 for re-endorsement consideration as part of the measure maintenance process. The purpose of the RFI was to gather public input for potential measure updates as we prepare for NQF re-endorsement of the endorsed Safe Use of Opioids—Concurrent Prescribing eCQM and to potentially inform any future rulemaking regarding this measure. We provide more detail on both the Safe Use of Opioids eCQM and the eCQM reporting requirements below.

2. Safe Use of Opioids—Concurrent Prescribing eCQM (NQF #3316e)

a. Overview

The Safe Use of Opioids eCQM seeks to reduce preventable mortality and the costs of adverse events associated with opioid use by encouraging providers to identify patients who have concurrent prescriptions for opioids, or opioids and benzodiazepines, and discouraging providers from prescribing these drugs concurrently, unless medically necessary or appropriate. This measure is intended to support a patient-centric approach to help identify and monitor patients at risk, and ultimately reduce the risk of harm to patients across the continuum of care. Specifically, the measure encourages providers to identify patients on medication combinations that could lead to adverse drug events at discharge and motivates providers to consider whether reevaluation of the current medication regimen is warranted. This measure ultimately seeks to help combat the opioid crisis, which has been declared a public health emergency and is recognized as a priority focus area for measurement by CMS and HHS. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42459) where we adopted the Safe Use of Opioids eCQM into the Hospital IQR Program beginning with the CY 2021 reporting period/FY 2023 payment determination.

The Safe Use of Opioids eCQM assesses the proportion of inpatient hospitalizations for patients 18 years of age and older prescribed, or continued on, two or more opioids or an opioid and benzodiazepine concurrently at discharge. The numerator is comprised of patients whose discharge medications include two or more active opioids or an active opioid and benzodiazepine resulting in concurrent therapy at discharge from the hospital-based encounter (84 FR 42452). The denominator consists of patients who have inpatient hospitalizations (inpatient stay less than or equal to 120 days) that end during the measurement period, where the patient is 18 years of age and older at the start of the encounter, and is prescribed a new or continuing opioid or benzodiazepine at discharge (84 FR 42452). Patients who have cancer or are receiving palliative care would be excluded from the denominator (84 FR 42452).

A lower percentage for the measure indicates fewer concurrent prescriptions written. We emphasize that the Safe Use of Opioids eCQM is not expected to have a measure rate of zero (84 FR 42456). Clinician judgment, clinical

appropriateness, or both may indicate that concurrent prescribing of two unique opioids, or an opioid and a benzodiazepine is medically necessary. For example, patients who are on medication for opioid use disorder (OUD) would be included in the measure denominator if they continue that active prescription at discharge and would be counted in the numerator if they receive another prescription for an opioid or benzodiazepine (84 FR 42452). We also refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42459) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58932 through 58939) for more details on the Safe Use of Opioids eCQM.

b. Prior Stakeholder Feedback

We noted in the CY 2022 OPPS/ASC proposed rule (86 FR 42322) that we monitor and evaluate quality measures after they are adopted and implemented into the Hospital IQR Program measure set. We also engage with stakeholders through education and outreach opportunities, which include webinars and help desk questions submitted through the Office of the National Coordinator for Health Information Technology (ONC) Project Tracking System (JIRA) eCQM issue tracker for eCQM implementation and maintenance (84 FR 42454).

Since adopting the Safe Use of Opioids eCQM in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42459), stakeholders had expressed concern about potential unintended consequences associated with requiring reporting on the measure. Specifically, these stakeholders had noted their concern that requiring reporting on the Safe Use of Opioids eCQM could disincentivize clinicians from appropriately concurrently prescribing buprenorphine for the treatment of OUD. They believed that if hospitals are required to report on this measure, clinicians might alter their prescribing practices, making it more difficult for patients to access appropriate treatment for OUD, and ultimately leading to patient harm in a vulnerable population.

We noted that during measure development, clinicians from the expert panel convened by the measure developer on behalf of CMS considered single-condition exclusions such as OUD. After reviewing test results, they recommended continuing to include patients for whom concurrent prescribing is medically necessary, because they stated that those populations: (1) Have the highest risk of receiving concurrent prescriptions; (2) can experience a lag in adverse events; and (3) can experience adverse drug events if an overlap with benzodiazepines occurs (84 FR 42450 through 42451). As we previously noted in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42456), the Safe Use of Opioids eCQM is not expected to have a measure rate of zero; however, this is an important topic and a particular focus area of our monitoring efforts as the eCQM data start to be submitted and on which we sought comment, as further discussed below.

c. National Quality Forum Re-Endorsement

The Safe Use of Opioids eCQM is scheduled to be submitted to the NQF in 2022 for re-endorsement. In support of that effort, we noted that our measure development contractor plans to conduct additional testing, which will include substance use disorder treatment and sickle cell disease. Testing will include discussions with the technical expert panel to identify any potential updates to test as well as testing the rate of concurrent morphine/buprenorphine prescribing alongside opioids and benzodiazepines. Testing work will also include recruiting test sites, receiving test site data, reassessing validity, reliability, performance scores, exclusions, and performance gaps. This testing could be used to inform possible future measure updates or exclusions.

3. Current eCQM Reporting and Submission Requirements for the Hospital IQR Program

Beginning with the CY 2021 reporting period/FY 2023 payment determination, the Safe Use of Opioids eCQM was added as part of the eCQM measure set as one of the eCQMs that eligible hospitals can choose from to meet the eCQM reporting requirements for the Hospital IQR and Medicare Promoting Interoperability Programs (84 FR 42449 through 42459 and 84 FR 42598 through 42599, respectively). Beginning with the CY 2022 reporting period/FY 2024 payment determination, hospitals are required to report data for each required eCQM: (a) Three self-selected eCQMs from the set of available eCQMs for CY 2022, and (b) the Safe Use of Opioids eCQM (85 FR 58933 through 58939). We refer readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58932 through 58939) and the FY 2020 IPPS/LTCH PPS final rule (84 FR 42501 through 42506) for more detailed discussions of the current eCQM reporting and submission requirements for the Hospital IQR Program.

4. Solicitation of Comments

In the RFI, we sought public input on the following:

- *Potential future measure updates of the Safe Use of Opioids eCQM.* We sought additional information or considerations to inform future measure updates to the Safe Use of Opioids eCQM.
- *Required Reporting and Submission Requirement for the Safe Use of Opioids eCQM.* Currently, hospitals are required to report: (a) Three self-selected eCQMs from the set of available eCQMs, and (b) the Safe Use of Opioid eCQM for the CY 2022 reporting period/FY 2024 and subsequent years. As we consider future reporting on the Safe Use of Opioids eCQM, we sought comments on the appropriateness of maintaining this previously finalized policy or allowing hospitals to self-select the Safe Use of Opioids eCQM from our finalized set of eCQMs.

We received comments on these topics.

Comment: Several commenters suggested that CMS should not mandate reporting of the Safe Use of Opioids eCQM, and instead retain the measure as an option to self-select to fulfill the eCQM requirement. Several commenters also requested that CMS delay mandatory reporting until NQF re-endorsement or until the concern about unintended consequences has been addressed.

Response: We thank the commenters for their inputs and interest in this measure. We believe that these comments are very valuable to both the continued development of the Safe Use of Opioids eCQM and also the Hospital IQR Program's reporting policies. We will continue to take these comments into account as we develop future regulatory proposals or other guidance for the Safe Use of Opioids eCQM.

Comment: Several commenters recommended refinements to the measure specifications for the Safe Use of Opioids eCQM. Several commenters urged us to consider incorporating more exclusions, such as for single-condition exclusions (opioid use disorder), appropriate concurrent prescribing, HIV, ESRD, opioid prescriptions from outside facilities, or long encounters (such as those 120 days or longer). Some commenters suggested revising the measure to report on the prevalence of addiction specialists and formal addiction medicine programs. Some commenters requested that the measure be revised to allow for appropriate concurrent prescribing and prevent unintended consequences. One commenter requested that the measure

specifications be clarified so that one prescription for differing dosage of a medication would not be interpreted as two prescriptions for purposes of the Safe Use of Opioids eCQM. One commenter requested that CMS focus on co-prescriptions of opioids and specific benzodiazepines because concurrent prescription of these medications carry a higher risk of accidental overdose and mortality.

Response: We thank the commenters for their suggestions and interest in refinements to this measure. We believe that these comments are very valuable in the continuing development of the Safe Use of Opioids eCQM and will inform the NQF re-endorsement process. We will continue to take these comments into account as we develop future regulatory proposals or other guidance for the Safe Use of Opioids eCQM.

Comment: One commenter encouraged CMS to retain the required reporting of the Safe Use of Opioids eCQM, but also suggested that CMS identify and require reporting of other eCQMs to remove hospital choice.

Response: We thank the commenter for their suggestions and will consider them for future rulemaking.

Comment: One commenter suggested that we share information from the years in which the Safe Use of Opioids eCQM was voluntarily submitted via hospital selection.

Response: We thank the commenters for their input and interest in this measure. We will take this suggestion into consideration.

XX. Additional Medicare Promoting Interoperability Program Policies

A. Safe Use of Opioids—Concurrent Prescribing eCQM (NQF #3316e) and eCQM Reporting Requirements in the Medicare Promoting Interoperability Program—Request for Information

1. Medicare Promoting Interoperability Program Background

We refer readers to the following final rules for detailed discussions regarding the history of the Medicare Promoting Interoperability Program (previously known as part of the Medicare and Medicaid Electronic Health Record Incentive Programs):

- The Electronic Health Record Incentive Program Stage 1 final rule (75 FR 44314);
- The Electronic Health Record Incentive Program Stage 2 final rule (77 FR 53968);
- The Electronic Health Record Incentive Program Stage 3 final rule (80 FR 62762);
- The FY 2017 IPPS/LTCH PPS final rule (81 FR 25245 through 25247);
- The FY 2018 IPPS/LTCH PPS final rule (82 FR 38487 through 38493);
- The FY 2019 IPPS/LTCH PPS final rule (83 FR 41634 through 41677);
- The FY 2020 IPPS/LTCH PPS final rule (84 FR 42591 through 42602);
- The FY 2021 IPPS/LTCH PPS final rule (85 FR 58966 through 58977); and
- The FY 2022 IPPS/LTCH PPS final rule (86 FR 45460 through 45498).

We note this is not an exhaustive list of all prior rulemaking for the Medicare Promoting Interoperability Program. We also refer readers to 42 CFR part 495 for the Medicare Promoting Interoperability Program regulations.

In the CY 2022 OPPS/ASC proposed rule (86 FR 42323 through 42324), we sought input in a request for information (RFI), in alignment with the Hospital Inpatient Quality Reporting Program, regarding the Safe Use of Opioids—Concurrent Prescribing electronic clinical quality measure (eCQM) (NQF #3316e) (hereinafter referred to as the ''Safe Use of Opioids eCQM''), as well as our previously finalized policy of requiring hospitals to report on the Safe Use of Opioids eCQM beginning with the CY 2022 reporting period (84 FR 42598 through 42600 and 85 FR 58970 through 58975). We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42598 through 42599) where we adopted the Safe Use of Opioids eCQM under the Medicare Promoting Interoperability Program beginning with the CY 2021 EHR reporting period, as we continued to align with the Hospital IQR Program. We also refer readers to the FY 2020 and FY 2021 IPPS/LTCH PPS final rules (84 FR 42597 through 42600 and 85 FR 58970 through 58975, respectively) where we finalized our policy requiring hospitals to report on the Safe Use of Opioids eCQM beginning with CY 2022 reporting period. The Safe Use of Opioids eCQM is scheduled to be submitted to the National Quality Forum (NQF) in 2022 for re-endorsement consideration as part of the measure maintenance process. The purpose of this RFI was to gather public input for potential measure updates as we prepare for NQF re-endorsement of the endorsed Safe Use of Opioids—Concurrent Prescribing eCQM and to potentially inform any future rulemaking regarding this measure. We provide more detail on both the Safe Use of Opioids eCQM and the eCQM reporting requirements in section [XX.A.3] of the CY 2022 OPPS/ASC proposed rule (section [XIX.A.3] of this final rule).

2. Safe Use of Opioids—Concurrent Prescribing eCQM (NQF #3316e)

a. Overview

The Safe Use of Opioids eCQM seeks to reduce preventable mortality, and the costs of adverse events associated with opioid use by encouraging providers to identify patients who have concurrent prescriptions for two or more opioids, or a combination of opioids and benzodiazepines, and discouraging providers from prescribing these drugs concurrently, unless medically necessary or appropriate. This measure is intended to support a patient-centric approach to help identify and monitor patients at risk, and ultimately reduce the risk of harm to patients across the continuum of care. Specifically, the measure encourages providers to identify patients receiving combinations of medications that could lead to adverse drug reactions at discharge, and motivates providers to consider whether a re-evaluation of the patient's current medication regimen is warranted. This measure ultimately seeks to help combat the opioid crisis, which has been declared a public health emergency and is recognized as a priority focus area for measurement by CMS and HHS.

The Safe Use of Opioids eCQM assesses the proportion of inpatient hospitalizations for patients 18 years of age and older who are prescribed, or continued on, two or more opioids or an opioid and benzodiazepine concurrently at discharge. The numerator is comprised of patients whose discharge medications include two or more active opioids, or an active opioid and benzodiazepine, resulting in concurrent therapy at discharge from the hospital-based encounter. The denominator consists of patients who have inpatient hospitalizations (inpatient stay less than or equal to 120 days) that end during the measurement period, where the patient is 18 years of age and older at the start of the encounter, and is prescribed a new or continuing opioid or benzodiazepine at discharge. Patients who have cancer or who are receiving palliative care would be excluded from the denominator (84 FR 42452).

A lower percentage for the measure indicates fewer concurrent prescriptions written. We emphasize that the Safe Use of Opioids eCQM is not expected to have a measure rate of zero (84 FR 42456). Clinician judgment, clinical appropriateness, or both, may indicate that concurrent prescribing of two unique opioids, or an opioid and a benzodiazepine is deemed medically necessary. Patients who are receiving medication for an opioid use disorder (OUD) would be included in the

measure denominator if they continue with their active prescription upon discharge, and would be counted in the numerator if they receive an additional prescription for an opioid or benzodiazepine (84 FR 42452). We also refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42598 through 42599) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58932 through 58939) for more details on the Safe Use of Opioids eCQM.

b. Prior Stakeholder Feedback

We noted in the proposed rule (86 FR 42323 through 42324) that we monitor and evaluate quality measures after they are adopted and implemented under the Medicare Promoting Interoperability Program measure set. In collaboration with the Hospital IQR Program, we engage with stakeholders through education and outreach opportunities, which include webinars and help desk questions submitted through the Office of the National Coordinator for Health Information Technology (ONC) Project Tracking System (JIRA) eCQM issue tracker for eCQM implementation and maintenance (84 FR 42454).

Since adopting the Safe Use of Opioids eCQM in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42598 through 42599), stakeholders have expressed concern about the potential for unintended consequences associated with requiring reporting on this measure. Specifically, stakeholders had noted that in requiring reporting on the Safe Use of Opioids eCQM, this could disincentivize clinicians from appropriately prescribing buprenorphine for the treatment of OUD. They believe that if hospitals are required to report on this measure, clinicians might alter their prescribing practices, making it more difficult for patients to access appropriate treatment for OUD, and ultimately, leading to potential patient harm in a vulnerable population.

We noted that during measure development, clinicians from the expert panel convened by the measure developer on behalf of CMS considered single-condition exclusions, such as OUD. After reviewing test results, they recommended continuing to include patients for whom concurrent prescribing is medically necessary, because they stated that those populations: (1) Have the highest risk of receiving concurrent prescriptions; (2) can experience a lag in adverse events; and (3) can experience adverse drug events if an overlap with benzodiazepines occurs (84 FR 42450 through 42451). As was explained by the Hospital IQR Program in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42456), the Safe Use of Opioids eCQM is not expected to have a measure rate of zero, however, this remains an important topic and a particular focus area of our monitoring efforts. For further discussion, we refer readers to section XX.A.4 of the CY 2022 OPPS/ASC proposed rule (section XIX.A.4 of this final rule with comment period).

c. National Quality Forum Re-Endorsement

The Safe Use of Opioids eCQM is scheduled to be submitted to the NQF in 2022 for re-endorsement. In support of that effort, we noted that our measure development contractor plans to conduct additional testing, which will include substance use disorder treatment and sickle cell disease. Testing will include discussions with the technical expert panel to inform potential updates to test, as well as testing the rate of concurrent morphine/buprenorphine prescribing alongside opioids and benzodiazepines. Testing work will also include recruiting test sites, receiving test site data, reassessing validity, reliability, performance scores, exclusions, and performance gaps. This testing could be used to inform possible future measure updates or exclusions.

3. Current eCQM Reporting and Submission Requirements for the Medicare Promoting Interoperability Program

The Medicare Promoting Interoperability Program previously finalized policy for the CY 2022 reporting period requiring that eligible hospitals and CAHs report on three self-selected calendar quarters of data for each required eCQM: (a) Three self-selected eCQMs from the set of available eCQMs for CY 2022, and (b) the Safe Use of Opioids eCQM, for a total of four eCQMs (85 FR 58970 through 58975). We finalized the requirement that hospitals report on the Safe Use of Opioids eCQM in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42598 through 42600), such that the Medicare Promoting Interoperability Program maintained alignment with proposals finalized under the Hospital IQR Program.

Beginning with the CY 2021 reporting period, the Safe Use of Opioids eCQM was added to the eCQM measure set as one of the eCQMs that eligible hospitals and CAHs can choose from to meet the eCQM reporting requirements for the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program (84 FR 42449 through 42459 and 84 FR 42598 through 42599, respectively). We refer readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58970 through 58975) and the FY 2020 IPPS/LTCH PPS final rule (84 FR 42598 through 42600) for more detailed discussions of the current eCQM reporting and submission requirements for the Medicare Promoting Interoperability Program.

4. Solicitation of Comments

In the RFI, in alignment with a similar RFI pertaining to the Hospital IQR Program, we sought public comment on the following:

- *Potential future measure updates of the Safe Use of Opioids eCQM.* We sought additional information or considerations to inform future measure updates of the Safe Use of Opioids eCQM;
- *Required Reporting and Submission Requirement for the Safe Use of Opioids eCQM.* Currently eligible hospitals and CAHs are required to report (a) Three self-selected eCQMs from the set of available eCQMs, and (b) the Safe Use of Opioid eCQM for the CY 2022 reporting period and subsequent years. As we consider future reporting on the Safe Use of Opioids eCQM, we sought comment on the appropriateness of maintaining this previously finalized policy, or, allowing hospitals to self-select the Safe Use of Opioids eCQM from a finalized set of eCQMs (which includes the Safe Use of Opioids eCQM) for the CY 2022 EHR reporting period and subsequent years.

We received comments on these topics, and that feedback is summarized below.

Comment: Several commenters suggested that CMS not mandate the reporting of the Safe Use of Opioids eCQM, and instead retain the measure as optional, to fulfill the eCQM requirement. Several commenters also requested that CMS delay mandatory reporting until after NQF re-endorsement, or until the concern about unintended consequences has been addressed.

Response: We thank the commenters for their input and suggestions. We believe that these comments are valuable to both the continued development of the Safe Use of Opioids eCQM, and also the Medicare Promoting Interoperability Program's reporting policies. Alongside the Hospital IQR Program, we may take these comments under consideration as we develop future policy, or other guidance for the Safe Use of Opioids eCQM.

Comment: One commenter encouraged CMS to retain the required reporting of the Safe Use of Opioids eCQM, but also suggested that CMS

identify and require reporting of other eCQMs to remove, per hospital choice.

Response: We thank the commenter for their suggestions and may consider this for future rulemaking.

XXI. Files Available to the Public via the Internet

The Addenda to the OPPS/ASC proposed rules and the final rules with comment period are published and available via the internet on the CMS website. In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59154), for CY 2019, we changed the format of the OPPS Addenda A, B, and C, by adding a column titled ''Copayment Capped at the Inpatient Deductible of $1,364.00'' where we flag, through use of an asterisk, those items and services with a copayment that is equal to or greater than the inpatient hospital deductible amount for any given year (the copayment amount for a procedure performed in a year cannot exceed the amount of the inpatient hospital deductible established under section 1813(b) of the Act for that year). For CY 2022, we proposed to retain these columns, updated to reflect the amount of the 2022 inpatient deductible. In the CY 2021 OPPS/ASC final rule with comment period (85 FR 86266), we updated the format of the OPPS Addenda A, B, and C by adding a new column titled ''Drug Pass-Through Expiration during Calendar Year'' where we flagged through the use of an asterisk, each drug for which pass-through payment was expiring during the calendar year on a date other than December 31. For CY 2022, we did not receive any public comments and are, therefore, finalizing our proposal to retain these columns that are updated to reflect the drug codes for which pass-through payment is expiring in CY 2022.

To view the Addenda to the CY 2022 OPPS/ASC final rule with comment period pertaining to final CY 2022 payments under the OPPS, we refer readers to the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/Hospital-Outpatient-Regulations-and-Notices.html*; select ''CMS–1753–FC'' from the list of regulations. All OPPS Addenda to the CY 2022 OPPS/ASC final rule with comment period are contained in the zipped folder titled ''2022 NFRM OPPS Addenda'' in the related links section at the bottom of the page. To view the Addenda to the CY 2022 OPPS/ASC final rule with comment period pertaining to CY 2022 payments under the ASC payment system, we refer readers to the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ASCPayment/ASC-Regulations-and-Notices.html*; select ''CMS–1753–FC'' from the list of regulations. The ASC Addenda to the CY 2022 OPPS/ASC final rule with comment period are contained in a zipped folder titled ''Addendum AA, BB, DD1, DD2, and EE.'' in the related links section at the bottom of the page.

XXII. Collection of Information Requirements

A. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act of 1995 (PRA), we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of title 44 of the U.S. Code, as added by section 2 of the Paperwork Reduction Act of 1995, requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

We solicited public comment on each of these issues for the following sections of this final rule with comment period that contain information collection requirements (ICRs):

B. ICRs for the Hospital OQR Program

1. Background

The Hospital Outpatient Quality Reporting (OQR) Program is generally aligned with the CMS quality reporting program for hospital inpatient services known as the Hospital Inpatient Quality Reporting (IQR) Program. We refer readers to the CY 2011 through CY 2021 OPPS/ASC final rules (75 FR 72111 through 72114; 76 FR 74549 through 74554; 77 FR 68527 through 68532; 78 FR 75170 through 75172; 79 FR 67012 through 67015; 80 FR 70580 through 70582; 81 FR 79862 through 79863; 82 FR 59476 through 59479; 83 FR 59155 through 59156; 84 FR 61468 through 61469; and 85 FR 86266 through 86267, respectively) for detailed discussions of the previously finalized Hospital OQR Program ICRs. The ICRs associated with the Hospital OQR Program are currently approved under OMB control number 0938–1109, which expires on March 31, 2023. We continue to estimate a total of 3,300 hospitals will submit required measure data for the Hospital OQR Program, unless otherwise noted. While the exact number of hospitals required to submit data annually may vary, we use this estimate to be consistent with previous rules and for ease of calculation across reporting periods.

In the CY 2018 OPPS/ASC final rule (82 FR 52617), we finalized a proposal to utilize the median hourly wage rate for Medical Records and Health Information Technicians, in accordance with the Bureau of Labor Statistics (BLS), to calculate our burden estimates for the Hospital OQR Program. The BLS describes Medical Records and Health Information Technicians as those responsible for organizing and managing health information data; therefore, we believe it is reasonable to assume that these individuals will be tasked with abstracting clinical data for submission to the Hospital OQR Program. The latest data from the BLS' May 2020 Occupational Employment and Wages data reflects a median hourly wage of $21.20 per hour for a Medical Records and Health Information Technician professional.[599] We have finalized a policy to calculate the cost of overhead, including fringe benefits, at 100 percent of the mean hourly wage (82 FR 52617). This is necessarily a rough adjustment, both because fringe benefits and overhead costs can vary significantly from employer-to-employer and because methods of estimating these costs vary widely from study-to-study. Nonetheless, we believe that doubling the hourly wage rate ($21.20 × 2 = $42.40) to estimate the total cost is a reasonably accurate estimation method and allows for a conservative estimate of hourly costs.

2. Summary

In section XV.B.4. of this final rule with comment period, we are finalizing our proposals to: (1) Adopt the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) measure (OP–38), beginning with the CY 2022 reporting period; (2) adopt the Breast Cancer Screening Recall Rates measure (OP–39), beginning with the CY 2022 reporting period; (3) adopt the ST-Segment Elevation Myocardial Infarction (STEMI) eCQM (OP–40), beginning as a voluntary measure with

[599] *https://www.bls.gov/oes/current/oes292098.htm* (Accessed April 13, 2021). The hourly rate of $42.40 includes an adjustment of 100 percent of the median hourly wage to account for the cost of overhead, including fringe benefits.

the CY 2023 reporting period, and then as a mandatory measure beginning with the CY 2024 reporting period; (4) require the Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey measures (OP–37 a-e), with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2024 reporting period/CY 2026 payment determination; (5) remove the Fibrinolytic Therapy Received Within 30 Minutes measure (OP–2), effective with the CY 2023 reporting period; (6) remove the Median Time to Transfer to Another Facility for Acute Coronary Intervention measure (OP–3), effective with the CY 2023 reporting period; (7) remove the option for hospitals to send medical records to the CMS Data Abstraction Center (CDAC) via paper and removable media and require electronic submission for validation; (8) reduce the number of days hospitals have to submit medical records to the CDAC from 45 days to 30 days for validation; (9) enhance the targeting criteria used for hospital selection for validation by adopting criteria currently used in inpatient data validation by adding the following criteria: (a) Having a lower bound confidence interval score of 75 percent or less; and (b) having not been selected in the previous 3 years; (10) expand our Extraordinary Circumstances Exception (ECE) policy to apply to electronic clinical quality measures (eCQMs), to further align with the Hospital IQR Program; (11) require use of technology updated consistent with 2015 Edition Cures Update criteria beginning with the CY 2023 reporting period/CY 2025 payment determination; and (12) provide a review and corrections period for eCQM data submitted to the Hospital OQR Program. We are also finalizing our proposal with modification to require the Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure (OP–31) beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the CY 2023 reporting period/CY 2025 payment determination.

3. Estimated Burden of Hospital OQR Program Requirements for the CY 2024 Payment Determination and Subsequent Years

a. Information Collection Burden Estimate for the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) Measure (OP–38)

In section XV.B.4 of this final rule with comment period, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (OP–38), beginning with the CY 2022 reporting period/CY 2024 payment determination. Hospitals will submit data through the Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN). The NHSN is a secure, internet-based surveillance system maintained and provided free by the CDC. Currently, the CDC does not estimate burden for COVID–19 vaccination reporting under the CDC PRA (OMB control number 0920–1317, which expires on January 31, 2024) because the agency has been granted a waiver under section 321 of the National Childhood Vaccine Injury Act (NCVIA).[600] As such, the finalized adoption of this measure will not impose any additional information collection under the Paperwork Reduction Act for hospitals for the duration of the public health emergency (PHE), but will impose information collection burden for any reporting of this measure taking place after conclusion of the PHE. Although the burden associated with the COVID–19 Vaccination Coverage Among HCP measure (OP–38) is not accounted for under the CDC PRA 0920–1317 or 0920–0666 (which expires on December 31, 2023) due to the NCVIA waiver, the cost and burden information is included in the Regulatory Impact Analysis section. We will work with CDC to ensure that this burden is accounted for in an updated PRA under OMB control number 0920–1317.

b. Information Collection Burden Estimate for the Breast Cancer Screening Recall Rates Measure (OP–39)

In section XV.B.4.b of this final rule with comment period, we are finalizing our proposal to adopt the Breast Cancer Screening Recall Rates measure (OP–39), beginning with the CY 2023 payment determination using a data collection period of July 1, 2020, to June 30, 2021; for subsequent years, we will use data collection periods from July 1 through June 30 for the 3 years prior to the applicable payment calendar year (for example, for the CY 2024 payment determination, we will use data from July 1, 2021, through June 30, 2022). Because the measure is calculated using claims data that are already submitted to the Medicare program for payment purposes, we do not anticipate that adopting this measure will result in any increase in information collection burden.

c. Information Collection Burden Estimate for the ST-Segment Elevation Myocardial Infarction (STEMI) Measure (OP–40)

In section XV.B.4.c. of this final rule with comment period, we are finalizing our proposal to adopt the STEMI eCQM (OP–40), with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2024 reporting period/CY 2026 payment determination. For the CY 2023 voluntary reporting period, hospitals will be able to voluntarily report the measure for one or more quarters during the year. For subsequent years, we are finalizing our proposal to gradually increase the number of quarters of data hospitals will be required to report on the measure starting with one self-selected quarter for the CY 2024 reporting period/CY 2026 payment determination, two self-selected quarters for the CY 2025 reporting period/CY 2027 payment determination, three self-selected quarters for the CY 2026 reporting period/CY 2028 payment determination, and four quarters for the CY 2027 reporting period/CY 2029 payment determination and for subsequent years.

For the voluntary reporting period in CY 2023, we estimate 20 percent of hospitals will voluntarily report at least one quarter of data for the measure with 100 percent of hospitals reporting the measure as required in subsequent years. Based on experience with reporting of eCQMs on the Hospital IQR program, we are aligning our estimate of the time required for a Medical Records and Health Information Technician professional to submit the data required for the measure to be 10 minutes per quarter for each hospital. For the CY 2023 voluntary reporting period, we estimate an annual burden for all participating hospitals of 110 hours (3,300 hospitals × 20 percent × .1667 hours × 1 quarter) at a cost of $4,664 (110 hours × $42.40). For the CY 2024 reporting period/CY 2026 payment determination, we estimate the annual burden for all participating hospitals to be 550 hours (3,300 hospitals × .1667 hours × 1 quarters) at a cost of $23,320 (550 hours × $42.40). For the CY 2025 reporting period/CY 2027 payment determination, we estimate the annual burden for all participating hospitals to be 1,100 hours (3,300 hospitals × .1667 hours × 2 quarters) at a cost of $46,640 (1,100 hours × $42.40). For the CY 2026 reporting period/CY 2028 payment determination, we estimate the annual

[600] Section 321 of the National Childhood Vaccine Injury Act (NCVIA) provides the PRA waiver for activities that come under the NCVIA, including those in the NCVIA at section 2102 of the Public Health Service Act (42 U.S.C. 300aa-2). Section 321 is not codified in the U.S. Code, but can be found in a note at 42 U.S.C. 300aa-1.

burden for all participating hospitals to be 1,650 hours (3,300 hospitals × .1667 hours × 3 quarters) at a cost of $69,960 (1,650 hours × $42.40). For the CY 2027 reporting period/CY 2029 payment determination and subsequent years, we estimate the annual burden for all participating hospitals to be 2,200 hours (3,300 hospitals × .1667 hours × 4 quarters) at a cost of $93,280 (2,200 hours × $42.40).

The information collection requirement and the associated burden will be submitted as part of a revision of the information collection request currently approved under OMB control number 0938–1109, which expires on March 31, 2023.

d. Information Collection Burden Estimate for OP–31: Cataracts—Improvement in Patient's Visual Function Within 90 Days Following Cataract Surgery Measure

As discussed in section XV.B.5.b. of this final rule with comment period, we are finalizing our proposal with modification to require the Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure (OP–31), beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the proposed CY 2023 reporting period/CY 2025 payment determination. We previously finalized voluntary reporting of this measure in the CY 2015 OPPS/ASC final rule (79 FR 66947 through 66948) and estimated that 20 percent of hospitals would elect to report it annually (79 FR 67014). We continue to estimate it will require hospitals 10 minutes once annually to report this measure using a CMS web-based tool. As a result of this policy, we estimate a total annual burden estimate for all participating hospitals of 550 hours (3,300 hospitals × 0.1667 hours) at a cost of $23,320 (550 hours × $42.40). In addition to reporting the measure, we also require hospitals to perform chart abstraction and estimate that each hospital would spend 25 minutes (0.417 hours) per case to perform this activity. The currently approved burden estimate assumes 384 cases requiring chart abstraction per measure. We are updating this assumption to 242 cases per measure based on data from the CY 2019 reporting period. Updating this assumption results in an annual burden of 101 hours (0.417 hours × 242 cases) at a cost of $4,282 (101 hours × $42.40/hour) per hospital and a total annual burden of 333,300 hours (3,300 hospitals × 101 hours) at a cost of $14,131,920 (333,300 hours × $42.40/hour) for all participating hospitals. In aggregate, we estimate a total annual burden of 333,850 hours (550 hours + 333,300 hours) at a cost of $14,155,240 ($23,320 + $14,131,920) for all hospitals. This is an increase of 267,080 hours and $11,324,192 per year from the currently approved estimate due to the additional 80 percent of hospitals that will be required to report this measure.

The information collection requirement and the associated burden will be submitted as part of a revision of the information collection request currently approved under OMB control number 0938–1109, which expires on March 31, 2023.

e. Information Collection Burden Estimate for the Requirement of OP–37a–e: Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey Measures and Add Administration Methods

The information collection requirements associated with the five OAS CAHPS survey-based measures (OP–37a, OP–37b, OP–37c, OP–37d, and OP–37e) are currently approved under OMB control number 0938–1240 which expires December 31, 2021. In section XV.B.5.a. of this final rule with comment period, we are finalizing our proposal to require data collection for five OAS CAHPS survey-based measures with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2024 reporting period/CY 2026 payment determination and subsequent years: (1) OAS CAHPS—About Facilities and Staff (OP–37a); (2) OAS CAHPS—Communication About Procedure (OP–37b); (3) OAS CAHPS—Preparation for Discharge and Recovery (OP–37c); (4) OAS CAHPS—Overall Rating of Facility (OP–37d); and (5) OAS CAHPS—Recommendation of Facility (OP–37e). Finalizing this proposal will neither require additional questions to be added to the survey nor any other changes which will affect the time required for respondents to complete the survey. Therefore, we are not making any changes to the currently approved burden estimate of 8 minutes per respondent.

In addition, in section XV.D.4.b of this final rule with comment period, we are finalizing our proposal to incorporate two additional administration methods for the OAS CAHPS Survey: (1) Mixed mode web with mail follow-up of non-respondents, and (2) mixed mode web with telephone follow-up of non-respondents. This will allow a total of five methods of survey administration for reporting beginning with voluntary reporting for the CY 2023 reporting period/CY 2025 payment determination and mandatory reporting for the CY 2025 reporting period/CY 2027 payment determination. We currently assume that completion of the OAS CAHPS survey requires approximately 8 minutes per respondent using one of the three current administration methods (mail-only, telephone-only, and mixed-mode (mail with telephone follow-up of non-respondents)). The two additional administration methods will be utilized to increase the response rate of patients to achieve the same required number of 300 patients surveyed per practice; therefore, we are not changing the number of respondents. We also believe that the two administration methods will require approximately the same time to conduct; therefore, we are not changing the currently approved estimate.

f. Information Collection Burden Change for the Removal of Measures OP–2: The Fibrinolytic Therapy Received Within 30 Minutes and OP–3: Median Time To Transfer to Another Facility for Acute Coronary Intervention

In section XV.B.3.c. of this final rule with comment period, we are finalizing our proposal to remove the Fibrinolytic Therapy Received Within 30 Minutes (OP–2) and Median Time to Transfer to Another Facility for Acute Coronary Intervention (OP–3) measures effective with the CY 2023 reporting period. The currently approved burden estimate under OMB control number 0938–1109 (which expires on March 31, 2023) for all participating hospitals is 151,800 hours at a cost of $6,436,320 (151,800 hours × $42.40) for each measure per year. We estimate a total burden decrease of 303,600 hours (151,800 hours × 2 measures) at a cost of $12,872,640 (303,600 hours × $42.40). The information collection under OMB Control number 0938–1109 will be revised and submitted to OMB for approval.

g. Information Collection Burden Estimate for the Removal of the Option for Hospitals to Send Medical Records to the Validation Contractor via Paper and Removable Media and Require Electronic Submission

In section XV. D.9.b. of this final rule with comment period, we are finalizing our proposal to remove the option for hospitals to send medical records to the validation contractor via paper and removable media and are requiring electronic submission. As noted in the CY 2015 OPPS/ASC final rule (79 FR 67015), we have been reimbursing hospitals directly for expenses

associated with submission of medical records for data validation. Specifically, we reimbursed hospitals at 12 cents per photocopied page; for hospitals providing medical records digitally via a rewritable disc, such as encrypted Compact Disc—Read Only Memory, Digital Video Discs, or flash drives, we reimbursed hospitals at a rate of 40 cents per disc, along with $3.00 per record; and for hospitals providing medical records as electronic files submitted via secure file transmission, we reimburse hospitals at $3.00 per record. Because we directly reimburse, we do not anticipate any net change in information collection burden associated with our finalized proposal to require electronic file submissions of medical records via secure file transmission for hospitals selected for chart-abstracted measures validation. Hospitals will continue to be reimbursed at $3.00 per record for electronic files submitted via secure file transmission.

h. Information Collection Burden Estimate for the Reduction in the Number of Days Hospitals Have To Submit Medical Records to the CDAC From 45 Days to 30 Days

In section XV.D.9.b. of this final rule with comment period, we are finalizing our proposal to reduce the number of days hospitals would have to submit medical records to the CDAC from 45 days to 30 days. We expect that this will not yield a change in burden as it does not affect the amount of data required for hospitals to submit. We discuss administrative burdens regarding this change in section XXV.C.4.b. of this final rule with comment period. The existing information collection requirement and the associated burden are currently approved under OMB control number 0938–1109, which expires on March 31, 2023.

i. Information Collection Burden Estimate for the Addition of Targeting Criteria Used for Hospital Selection by Adopting Criteria Currently Used in Inpatient Data Validation

In section XV.D.9.d.(2). of this final rule with comment period, we are finalizing our proposal to add to the targeting criteria used for hospital selection for validation by adopting criteria currently used in inpatient data validation by adding the following criteria: (a) Having a lower bound confidence interval score of 75 percent or less; and (b) having not been selected in the previous 3 years. We expect that this will not yield a change in burden as it does not affect the total number of hospitals selected for data validation nor the data submission requirements for the hospitals selected. The existing information collection requirement and the associated burden are currently approved under OMB control number 0938–1109, which expires on March 31, 2023.

j. Information Collection Burden Estimate for Expanding our Existing ECE Policy To Apply to Electronic Clinical Quality Measures (eCQMs).

In section XV.D.10.b. of this final rule with comment period, we are finalizing our proposal to expand our existing ECE policy to apply to eCQMs, to further align with the Hospital IQR Program. The burden associated with submission of the ECE request form is included under OMB control number 0938–1022 which expires on December 31, 2022. As noted in 0938–1022, the total estimated burden for all hospitals participating in the CMS Quality Reporting Programs for completing forms including the ECE request form is 1,100 hours. In CY 2017, 166 ECE requests were submitted by hospitals for an exception from reporting requirements in the Hospital IQR Program. Based on the estimate of 15 minutes per record to submit the ECE request form, the total burden calculation for the submission of 166 ECE requests was 2,490 minutes (or 41.5 hours) across 3,300 hospitals. We are unable to forecast the number of additional ECE requests which may be submitted as a result of this change; however, we continue to estimate that each submission will continue to require approximately 15 minutes to complete. Using this estimate of 15 minutes per submission, our estimate of 1,100 hours would be adequate to account for a maximum of 4,400 submissions (1,100 hours ÷ 0.25 hours/submission), or 4,234 more than what was received in CY 2017. Therefore, we believe the estimate of 1,100 hours across all hospitals is conservative enough to account for any increase in burden that may be associated with this finalized change in ECE policy.

k. Information Collection Burden Estimate for the Required Use of 2015 Edition Cures Update Certified Technology

In section XV.D.6.c.(1). of this final rule with comment period, we are finalizing our proposal that hospitals use certified technology updated consistent with the 2015 Edition Cures Update beginning with the CY 2023 reporting period/CY 2025 payment determination and subsequent years, which includes both the voluntary period and required submissions of eCQMs. We do not expect that this would affect our information collection burden estimates currently approved under OMB control number 0938–1109 (which expires on March 31, 2023) because this policy does not require hospitals to submit additional data to CMS. With respect to any costs unrelated to data submission, we refer readers to section XXV.C.4.b. of this final rule with comment period.

l. Information Collection Burden Estimate for the Review and Corrections Period for eCQM Data Submitted to the Hospital OQR Program

In section XV.D.8 of this final rule with comment period, we are finalizing our proposal that hospitals would have a review and corrections period for eCQM data submitted to the Hospital OQR Program. Early testing and the use of pre-submission testing tools to reduce errors and inaccurate data submissions in eCQM reporting is encouraged but not required; therefore, we are unable to estimate the number of hospitals that may elect to submit test data files. We account for the burden of submission of production data files in section XXIII.B.3.C. of this final rule with comment period. Similar to our previously finalized burden assumptions regarding a review and corrections period for chart-abstracted measures (79 FR 66964 and 67014) and web-based measures (85 FR 86184 and 86267), this finalized period does not require hospitals to submit additional data and therefore we do not believe it will increase burden for these hospitals.

4. Summary of Information Collection Burden Estimates for the Hospital OQR Program

In summary, under OMB control number 0938–1109 which expires on March 31, 2023, we estimate that the updated assumptions and policies promulgated in this final rule with comment period will result in a decrease of 73,344 hours annually for 3,300 OPPS hospitals across a 5-year period from the CY 2022 reporting period/CY 2024 payment determination through the CY 2027 reporting period/CY 2029 payment determination. The total cost decrease related to this information collection is approximately −$3,109,786 (−73,344 hours × $42.40/hour) (which also reflects use of an updated hourly wage rate as previously discussed). Tables 77, 78, 79, 80, and 81 summarize the total burden changes for each respective CY payment determination compared to our currently approved information collection burden estimates (the table for the CY 2029 payment determination

reflects the cumulative burden changes). We note that for the STEMI eCQM (OP–40), the tables do not reflect the maximum burden for the CY 2025 payment determination, because we estimate only 20 percent of hospitals will voluntarily report the measure during the CY 2023 reporting period. While it is possible that more than 20 percent of hospitals may voluntarilyreport the measure during the CY 2023 reporting period, this percentage is consistent with our experience implementing eCQM measures with voluntary reporting periods under the Hospital IQR Program. We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–1109.[601]

BILLING CODE 4120–01–C

C. ICRs for the ASCQR Program

1. Background

We refer readers to the CY 2012 OPPS/ASC final rule (76 FR 74554), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53672), and the CY 2013, CY 2014, CY 2015, CY 2016, CY 2017, CY 2018, CY 2019, CY 2020, and CY 2021 OPPS/ASC final rules (77 FR 68532 through 68533; 78 FR 75172 through 75174; 79 FR 67015 through 67016; 80 FR 70582 through 70584; 81 FR 79863 through 79865; 82 FR 59479 through 59481; 83 FR 59156 through 59157; 84 FR 61469; and 85 FR 86267, respectively) for detailed discussions of the Ambulatory Surgical Center Quality Reporting (ASCQR) Program ICRs we have previously finalized. The ICRs associated with the ASCQR Program for the CY 2014 through CY 2023 payment determinations are currently approved under OMB control number 0938–1270, which expires on December 31, 2022.

In the CY 2018 OPPS/ASC final rule (82 FR 52619 through 52620), we finalized a proposal to utilize the median hourly wage rate for Medical Records and Health Information Technicians, in accordance with the BLS, to calculate our burden estimates for the ASCQR Program. The BLS describes Medical Records and Health Information Technicians as those responsible for organizing and managing health information data; therefore, we believe it is reasonable to assume that these individuals will be tasked with abstracting clinical data for submission to the ASCQR Program. The latest data from the BLS' May 2020 Occupational Employment and Wages data reflects a median hourly wage of $21.20 per hour for a Medical Records and Health Information Technician professional.[602] We have finalized a policy to calculate the cost of overhead, including fringe benefits, at 100 percent of the mean hourly wage (82 FR 52619 through 52620). This by necessity is a rough adjustment, both because fringe benefits and overhead costs can vary significantly from employer-to-employer and because methods of estimating these costs vary widely from study-to-study. Nonetheless, we believe that doubling the hourly wage rate ($21.20 × 2 = $42.40) to estimate the total cost is a reasonably accurate estimation method and allows for a conservative estimate of hourly costs.

Based on an analysis of the CY 2020 payment determination data, we found that of the 6,651 ASCs that met eligibility requirements for the ASCQR Program, 3,494 were required to participate in the Program and did so. In addition, 689 ASCs that were not required to participate, did so, for a total of 4,183 participating facilities. As noted in section XXV.C.5.a. of the Regulatory Impact Analysis, for the CY 2021 payment determination, all 6,811 ASCs that met eligibility requirements for the ASCQR Program received the annual payment update due to data submission requirements being excepted under the ASCQR Program's ECE policy in consideration of the COVID–19 PHE; 3,957 of these ASCs would have been required to participate without the PHE exception. Therefore, we estimate that 3,957 plus 689, or 4,646, ASCs will submit data for the ASCQR Program for the CY 2022 payment determination unless otherwise noted.

2. Summary

In section XVI. B.3.a. and XVI. B.4. of this final rule with comment period, we are finalizing our proposals to: (1) Adopt the COVID–19 Vaccination Coverage Among HCP measure, beginning with the CY 2022 reporting period/CY 2024 payment determination (ASC–20); (2) require four patient safety outcome measures beginning with the CY 2023 reporting period/CY 2025 payment determination: (a) Patient Burn (ASC–1); (b) Patient Fall (ASC–2); (c) Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant (ASC–3); and (d) All-Cause Hospital Transfer/Admission (ASC–4); and (3) add two additional data collection survey modes of OAS CAHPS measures collection to the existing three modes of collection and provide survey administration requirements. We are finalizing with modification our proposals to: (1) Require the Cataracts: Improvement in Patient's Visual

[602] *https://www.bls.gov/oes/current/oes292098.htm* (Accessed April 13, 2021). The hourly rate of $42.40 includes an adjustment of 100 percent of the median hourly wage to account for the cost of overhead, including fringe benefits.

Function within 90 days Following Cataract Surgery (ASC–11) measure beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the CY 2023 reporting period/CY 2025 payment determination; and (2) require the Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey measures (ASC–15 a–e) with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2025 reporting period/CY 2027 payment determination instead of the CY 2024 reporting period/CY 2026 payment determination.

3. Estimated Burden of ASCQR Program Proposals for the CY 2024 Payment Determination and Subsequent Years

a. Information Collection Burden Estimate for the COVID–19 Vaccination Coverage Among Health Care Personnel (HCP) Measure (ASC–20)

In section XVI.B.3.a. of this final rule with comment period, we are finalizing our proposal to adopt the COVID–19 Vaccination Coverage Among HCP measure (ASC–20), beginning with the CY 2022 reporting period/CY 2024 payment determination. ASCs will submit data through the NHSN, a secure, internet-based surveillance system maintained and provided free by the CDC. Currently the CDC does not estimate burden for COVID–19 vaccination reporting under the CDC PRA (OMB control number 0920–1317, which expires on January 31, 2024) because the agency has been granted a waiver under section 321 of the NCVIA.[603] As such, the burden associated with the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) has not been accounted for under the CDC PRA 0920–1317 or 0920–0666 (which expires on December 31, 2023) due to the NCVIA waiver, however the cost and burden information is included in the Regulatory Impact Analysis section. We will work with CDC to ensure that the burden is accounted for in an updated PRA under OMB control number 0920–1317.

[603] Section 321 of the National Childhood Vaccine Injury Act (NCVIA) provides the PRA waiver for activities that come under the NCVIA, including those in the NCVIA at section 2102 of the Public Health Service Act (42 U.S.C. 300aa-2). Section 321 is not codified in the U.S. Code, but can be found in a note at 42 U.S.C. 300aa–1.

b. Information Collection Burden Estimate for the Requirement of Four Patient Safety Outcome Measures: Patient Burn (ASC–1); Patient Fall (ASC–2); Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant (ASC–3); and All-Cause Hospital Transfer/Admission (ASC–4)

In section XVI.B.4.a of this final rule with comment period, we are finalizing our proposal to resume and require four patient safety outcome measures beginning with the CY 2023 reporting period/CY 2025 payment determination: (1) Patient Burn (ASC–1); (2) Patient Fall (ASC–2); (3) Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant (ASC–3); and (4) All-Cause Hospital Transfer/Admission (ASC–4). Measure data for these measures will be submitted via the CMS Hospital Quality Reporting (HQR) system secure portal (also known as the CMS QualityNet Secure Portal). Consistent with prior years (78 FR 75171 through 75172), we estimate that each participating facility will spend 10 minutes per measure per year to collect and submit the data via a CMS web-based tool (OMB control number 0938—1270, which expires on December 31, 2022). As a result of finalizing this requirement, we estimate a resulting total annual burden estimate for all ASCs of 3,098 hours (0.1667 hours/measure × 4 measures × 4,646 ASCs) at a cost of $131,355 (3,098 hours × $42.40). The information collection under OMB Control number 0938—1270 will be revised and submitted to OMB for approval.

c. Information Collection Burden Estimate for the ASC–11, Cataracts: Improvement in Patient's Visual Function Within 90 Days Following Cataract Surgery Measure

As discussed in section XVI.B.4.b. of this final rule with comment period, we are finalizing with modification our proposal to require the Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery (ASC–11) measure beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the CY 2023 reporting period/CY 2025 payment determination. We previously finalized voluntary reporting of this measure in the CY 2015 OPPS/ASC final rule (79 FR 66985) and estimated that 20 percent of ASCs would elect to report it annually (79 FR 67016). We continue to estimate it will require ASCs 10 minutes once annually to report this measure. As a result of this policy, we estimate a total annual burden estimate for all ASCs to report the measure of 774 hours (4,646 ASCs × 0.1667 hours) at a cost of $32,818 (774 hours × $42.40). In addition to reporting the measure, we also require ASCs to perform chart abstraction for a minimum required yearly sample size of 63 cases. We estimate that each ASC would spend 15 minutes per case to perform this activity. As a result of this policy, we estimate an annual burden of 16 hours (0.25 hours × 63 measures) at a cost of $678 (16 hours × $42.40) per ASC and a total annual burden of 74,336 hours (4,646 ASCs × 16 hours) at a cost of $3,151,846 (74,336 hours × $42.40). In aggregate, we estimate a total annual burden of 75,110 hours (774 + 74,336) at a cost of $3,184,664 (75,110 hours × $42.40) for all ASCs. Considering the increase in the number of ASCs submitting data, there is an increase of 60,088 hours (75,110 hours × 80 percent) and $2,547,731 ($3,184,664 × 80 percent) per year from the currently approved estimate (OMB control number 0938–1270, which expires on December 31, 2022) due to the additional 80 percent of ASCs that would be reporting this measure. The information collection under OMB Control number 0938–1270 will be revised and submitted to OMB for approval.

d. Information Collection Burden Estimate for the Requirement of ASC–15 a–e: The Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey Measures and Incorporation of Additional Administration Methods

The information collection requirements associated with the five OAS CAHPS Survey-based measures (proposed ASC–15a, ASC–15b, ASC–15c, ASC–15d, and ASC–15e) are currently approved under OMB control number 0938–1240 which expires December 31, 2021.In section XVI.B.4.c. of this final rule with comment period, we are finalizing our proposal with modification to require five OAS CAHPS Survey-based measures with voluntary reporting beginning with the CY 2023 reporting period/CY 2025 payment determination and mandatory reporting beginning with CY 2025 reporting period/CY 2027 payment determination and subsequent years: (1) ASC–15a: OAS CAHPS—About Facilities and Staff; (2) ASC–15b: OAS CAHPS—Communication About Procedure; (3) ASC–15c: OAS CAHPS—Preparation for Discharge and Recovery; (4) ASC–15d: OAS CAHPS—Overall Rating of Facility; and (5) ASC–15e: OAS CAHPS—Recommendation of Facility. Finalizing this change will

neither require additional questions to be added to the survey nor any other changes which will affect the time required for respondents to complete the survey. Therefore, we are not making any changes to the currently approved burden estimate of 8 minutes per respondent.

In addition, in section XVI.D.1.d.(2). of this final rule with comment period, we finalized our proposal to incorporate two additional administration methods for the OAS CAHPS Survey: (1) Mixed mode web with mail follow-up of non-respondents, and (2) mixed mode web with telephone follow-up of non-respondents. The addition of these two survey administration methods will provide a total of five methods of survey administration for reporting beginning with voluntary reporting for the CY 2023 reporting period/CY 2025 payment determination and mandatory reporting for the CY 2025 reporting period/CY 2027 payment determination. We currently assume that completion of the OAS CAHPS survey requires approximately 8 minutes per respondent using one of the three current administration methods (mail-only, telephone-only, and mixed-mode (mail with telephone follow-up of nonrespondents)). We believe that the two administration methods will require approximately the same time to conduct, therefore, we are not changing the currently approved estimate. In addition, the two administration methods will be utilized to increase the response rate of patients to achieve the same required number of 200 patients surveyed per practice, therefore we are not changing the number of respondents.

e. Summary of Information Collection Burden Estimates for the ASCQR Program

In summary, under OMB control number 0938–1270 which expires on December 31, 2022, we estimate that the policies promulgated in this final rule with comment period will result in an increase of 67,085 hours annually for 4,646 ASCs across a 4-year period from the CY 2023 reporting period/CY 2025 payment determination through the CY 2026 reporting period/CY 2028 payment determination. The total cost increase related to this information collection is approximately $2,844,404 (67,085 hours × $42.40). Tables 82 and 83 summarize the total burden changes for each respective CY payment determination compared to our currently approved information collection burden estimates. We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–1270.[604]

BILLING CODE 4120–01–C

All comments on the CY 2022 OPPS/ASC proposed rule were received on or by September 17, 2021.

XXIII. Response to Comments

Because of the large number of public comments we normally receive on **Federal Register** documents, we are not able to acknowledge or respond to them individually. We considered all comments we received by the date and time specified in the **DATES** section of this preamble and responded to the comments in the preamble of this final rule with comment period.

XXIV. Economic Analyses

A. Statement of Need

This final rule with comment period is necessary to make updates to the Medicare hospital OPPS rates. It is necessary to make changes to the payment policies and rates for outpatient services furnished by hospitals and CMHCs in CY 2022. We are required under section 1833(t)(3)(C)(ii) of the Act to update annually the OPPS conversion factor used to determine the payment rates for APCs. We also are required under section 1833(t)(9)(A) of the Act to review, not less often than annually, and revise the groups, the relative payment weights, and the wage and other adjustments described in section 1833(t)(2) of the Act. We must review the clinical integrity of payment groups and relative payment weights at least annually. We are revising the APC relative payment weights using claims data for services furnished on and after January 1, 2019, through and including December 31, 2019, and processed through June 30, 2020, and prior cost report information, consistent with our final policy of using data prior to the start of the PHE.

This final rule with comment period also is necessary to make updates to the ASC payment rates for CY 2022, enabling CMS to make changes to payment policies and payment rates for covered surgical procedures and covered ancillary services that are performed in ASCs in CY 2022. Because ASC payment rates are based on the OPPS relative payment weights for most of the procedures performed in ASCs, the ASC payment rates are updated annually to reflect annual changes to the OPPS relative payment weights. In addition, we are required under section 1833(i)(1) of the Act to review and update the list of surgical procedures that can be performed in an ASC, not less frequently than every 2 years.

In the CY 2019 OPPS/ASC final rule with comment period (83 FR 59075 through 59079), we finalized a policy to update the ASC payment system rates using the hospital market basket update instead of the CPI–U for CY 2019 through 2023. We believe that this policy will help stabilize the differential between OPPS payments and ASC payments, given that the CPI–U has been generally lower than the hospital market basket, and encourage the migration of services to lower cost settings as clinically appropriate.

B. Overall Impact of Provisions of This Final Rule With Comment Period

We have examined the impacts of this final rule with comment period, as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995, Pub. L. 104–4), Executive Order 13132 on Federalism (August 4,

1999), and the Congressional Review Act (5 U.S.C. 804(2)). This section of this final rule with comment period contains the impact and other economic analyses for the provisions we are finalizing for CY 2022.

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This final rule with comment period has been designated as an economically significant rule under section 3(f)(1) of Executive Order 12866 and hence also a major rule under Subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996 (also known as the Congressional Review Act).'' Accordingly, this final rule with comment period has been reviewed by the Office of Management and Budget. We have prepared a regulatory impact analysis that, to the best of our ability, presents the costs and benefits of the provisions of this final rule with comment period. We solicited public comments on the regulatory impact analysis in the CY 2022 OPPS/ASC proposed rule, and we address any public comments we received in this CY 2022 OPPS/ASC final rule with comment period, as appropriate.

We estimate that the total increase in Federal Government expenditures under the OPPS for CY 2022, compared to CY 2021, due only to the changes to the OPPS in this final rule with comment period, would be approximately $1.27 billion. Taking into account our estimated changes in enrollment, utilization, and case-mix for CY 2022, we estimate that the OPPS expenditures, including beneficiary cost-sharing, for CY 2022 would be approximately $82.1 billion, which is approximately $5.9 billion higher than estimated OPPS expenditures in CY 2021. Because the provisions of the OPPS are part of a final rule that is economically significant, as measured by the threshold of an additional $100 million in expenditures in 1 year, we have prepared this regulatory impact analysis that, to the best of our ability, presents its costs and benefits. Table 84 of this final rule with comment period displays the distributional impact of the CY 2022 changes in OPPS payment to various groups of hospitals and for CMHCs.

We note that under our final CY 2022 policy, drugs and biologicals that are acquired under the 340B Program are paid at ASP minus 22.5 percent, WAC minus 22.5 percent, or 69.46 percent of AWP, as applicable.

Our final policy for the CY 2022 OPPS pauses the elimination of the IPO list and adds services removed in 2021 back to the IPO list, with several codes remaining off the IPO list for CY 2022. We note that CY 2019 OPPS claims are being used in the CY 2022 OPPS ratesetting process and because the initial policy to remove codes from the IPO list was originally established in CY 2021, the effects of such policy would not be observed in our data or in the impact table. Based on our initial review of the CY 2021 claims data, we observe that most of the changes resulting from that policy have been more code-specific in nature and have had a limited broader impact. As more CY 2021 claims become available, we will continue to review that data. For a more detailed discussion of the IPO list changes, please see section IX. of this final rule with comment period.

We also note that there are changes to the ASC CPL for the CY 2022 ASC payment system. Based on initial review of the available CY 2021 claims data for ASCs, we observe that there is limited aggregate impact for codes initially added to the ASC CPL list in the CY 2021 ASC payment. In addition, we note that because CY 2019 claims data are being used in developing the impact analysis and the initial changes to the list were implemented in CY 2021, the effect of changes related to those services would not appear in this impact analysis. For a more detailed discussion of changes to the ASC CPL, please see section XIII of this final rule with comment period.

We estimate that the final update to the conversion factor and other budget neutrality adjustments would increase total OPPS payments by 2.1 percent in CY 2022. The changes to the APC relative payment weights, the changes to the wage indexes, the continuation of a payment adjustment for rural SCHs, including EACHs, the continuation of payment policy for separately payable drugs acquired under the 340B program, and the payment adjustment for cancer hospitals would not increase OPPS payments because these changes to the OPPS are budget neutral. However, these updates would change the distribution of payments within the budget neutral system. We estimate that the total change in payments between CY 2021 and CY 2022, considering all budget-neutral payment adjustments, changes in estimated total outlier payments, pass-through payments and the adjustment to provide separate payment for a device category, drugs, and biologicals with pass-through status expiring between December 31, 2021, and September 30, 2022, and the application of the frontier State wage adjustment, in addition to the application of the OPD fee schedule increase factor after all adjustments required by sections 1833(t)(3)(F), 1833(t)(3)(G), and 1833(t)(17) of the Act, would increase total estimated OPPS payments by 1.6 percent.

We estimate the total increase (from changes to the ASC provisions in this final rule with comment period as well as from enrollment, utilization, and case-mix changes) in Medicare expenditures (not including beneficiary cost-sharing) under the ASC payment system for CY 2022 compared to CY 2021, to be approximately $40 million. Because the provisions for the ASC payment system are part of a final rule that is economically significant, as measured by the $100 million threshold, we have prepared a regulatory impact analysis of the changes to the ASC payment system that, to the best of our ability, presents the costs and benefits of this portion of this final rule with comment period. Tables 85 and 86 of this final rule with comment period display the redistributive impact of the CY 2022 changes regarding ASC payments, grouped by specialty area and then grouped by procedures with the greatest ASC expenditures, respectively.

C. Detailed Economic Analyses

1. Estimated Effects of OPPS Changes in This Final Rule With Comment Period

a. Limitations of Our Analysis

The distributional impacts presented here are the projected effects of the CY 2022 policy changes on various hospital groups. We post on the CMS website our hospital-specific estimated payments for CY 2022 with the other supporting documentation for this final rule with comment period. To view the hospital-specific estimates, we refer readers to the CMS website at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/HospitalOutpatientPPS/index.html.* At the website, select ''regulations and notices'' from the left side of the page and then select ''CMS–1753–FC'' from the list of regulations and notices. The hospital-specific file layout and the hospital-specific file are listed with the other supporting documentation for this final rule with comment period. We show hospital-specific data only for hospitals whose claims were used for

modeling the impacts shown in Table 84. We do not show hospital-specific impacts for hospitals whose claims we were unable to use. We refer readers to section II.A. of this final rule with comment period for a discussion of the hospitals whose claims we do not use for ratesetting or impact purposes.

We estimate the effects of the individual policy changes by estimating payments per service, while holding all other payment policies constant. We use the best data available, but do not attempt to predict behavioral responses to our policy changes in order to isolate the effects associated with specific policies or updates, but any policy that changes payment could have a behavioral response. In addition, we have not made adjustments for future changes in variables, such as service volume, service-mix, or number of encounters.

b. Estimated Effects of the Payment Policy for Drugs and Biologicals Obtained Under the 340B Program

In section V.B. of this final rule with comment period with comment period, we discuss our policy of adjusting the payment amount for nonpass-through, separately payable drugs acquired by certain 340B participating hospitals through the 340B Program. Rural SCHs, children's hospitals, and PPS-exempt cancer hospitals continue to be excepted from this payment policy in CY 2022. Specifically, in this final rule with comment period for CY 2022, for hospitals paid under the OPPS (other than those that are excepted for CY 2022), we are paying for separately payable drugs and biologicals that are obtained with a 340B discount, excluding those on pass-through payment status and vaccines, at ASP minus 22.5 percent. Because we are continuing current Medicare payment policy for CY 2022, there is no change to the budget neutrality adjustment as a result of the 340B drug payment policy.

c. Estimated Effects of OPPS Changes on Hospitals

Table 84 shows the estimated impact of this final rule with comment period on hospitals. Historically, the first line of the impact table, which estimates the change in payments to all facilities, has always included cancer and children's hospitals, which are held harmless to their pre-BBA amount. We also include CMHCs in the first line that includes all providers. We include a second line for all hospitals, excluding permanently held harmless hospitals and CMHCs.

We present separate impacts for CMHCs in Table 84, and we discuss them separately below, because CMHCs are paid only for partial hospitalization services under the OPPS and are a different provider type from hospitals. In CY 2022, we are continuing to pay CMHCs for partial hospitalization services under APC 5853 (Partial Hospitalization for CMHCs) and to pay hospitals for partial hospitalization services under APC 5863 (Partial Hospitalization for Hospital-Based PHPs).

The estimated increase in the total payments made under the OPPS is determined largely by the increase to the conversion factor under the statutory methodology. The distributional impacts presented do not include assumptions about changes in volume and service-mix. The conversion factor is updated annually by the OPD fee schedule increase factor, as discussed in detail in section II.B. of this final rule with comment period.

Section 1833(t)(3)(C)(iv) of the Act provides that the OPD fee schedule increase factor is equal to the market basket percentage increase applicable under section 1886(b)(3)(B)(iii) of the Act, which we refer to as the IPPS market basket percentage increase. The IPPS market basket percentage increase applicable to the OPD fee schedule for CY 2022 is 2.7 percent. Section 1833(t)(3)(F)(i) of the Act reduces that 2.7 percent by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act, which is 0.7 percentage point for CY 2022 (which is also the productivity adjustment for FY 2022 in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45214)), resulting in the CY 2022 OPD fee schedule increase factor of 2.0 percent. We are using the OPD fee schedule increase factor of 2.0 percent in the calculation of the CY 2022 OPPS conversion factor. Section 10324 of the Affordable Care Act, as amended by HCERA, further authorized additional expenditures outside budget neutrality for hospitals in certain frontier States that have a wage index less than 1.0000. The amounts attributable to this frontier State wage index adjustment are incorporated in the estimates in Table 84 of this final rule with comment period.

To illustrate the impact of the CY 2022 changes, our analysis begins with a baseline simulation model that uses the CY 2021 relative payment weights, the FY 2021 final IPPS wage indexes that include reclassifications, and the final CY 2021 conversion factor. Table 84 shows the estimated redistribution of the increase or decrease in payments for CY 2022 over CY 2021 payments to hospitals and CMHCs as a result of the following factors: The impact of the APC reconfiguration and recalibration changes between CY 2021 and CY 2022 (Column 2); the wage indexes and the provider adjustments (Column 3); the combined impact of all of the changes described in the preceding columns plus the 2.0 percent OPD fee schedule increase factor update to the conversion factor (Column 4); the estimated impact taking into account all payments for CY 2022 relative to all payments for CY 2021, including the impact of changes in estimated outlier payments, and changes to the pass-through payment estimate and adjustment to provide separate payment for a device category, drugs, and biologicals with pass-through status expiring between December 31, 2021, and September 30, 2022 (Column 5).

We did not model an explicit budget neutrality adjustment for the rural adjustment for SCHs because we are maintaining the current adjustment percentage for CY 2022. Because the updates to the conversion factor (including the update of the OPD fee schedule increase factor), the estimated cost of the rural adjustment, and the estimated cost of projected pass-through payment for CY 2022 are applied uniformly across services, observed redistributions of payments in the impact table for hospitals largely depend on the mix of services furnished by a hospital (for example, how the APCs for the hospital's most frequently furnished services will change), and the impact of the wage index changes on the hospital. However, total payments made under this system and the extent to which this final rule with comment period will redistribute money during implementation also will depend on changes in volume, practice patterns, and the mix of services billed between CY 2021 and CY 2022 by various groups of hospitals, which CMS cannot forecast.

Overall, we estimate that the rates for CY 2022 will increase Medicare OPPS payments by an estimated 1.6 percent. Removing payments to cancer and children's hospitals because their payments are held harmless to the pre-OPPS ratio between payment and cost and removing payments to CMHCs results in an estimated 1.6 percent increase in Medicare payments to all other hospitals. These estimated payments will not significantly impact other providers.

Column 1: Total Number of Hospitals

The first line in Column 1 in Table 84 shows the total number of facilities (3,659), including designated cancer and children's hospitals and CMHCs, for which we were able to use CY 2019 hospital outpatient and CMHC claims

data to model CY 2021 and CY 2022 payments, by classes of hospitals, for CMHCs and for dedicated cancer hospitals. We excluded all hospitals and CMHCs for which we could not plausibly estimate CY 2021 or CY 2022 payment and entities that are not paid under the OPPS. The latter entities include CAHs, all-inclusive hospitals, and hospitals located in Guam, the U.S. Virgin Islands, Northern Mariana Islands, American Samoa, and the State of Maryland. This process is discussed in greater detail in section II.A. of this final rule with comment period. At this time, we are unable to calculate a DSH variable for hospitals that are not also paid under the IPPS because DSH payments are only made to hospitals paid under the IPPS. Hospitals for which we do not have a DSH variable are grouped separately and generally include freestanding psychiatric hospitals, rehabilitation hospitals, and long-term care hospitals. We show the total number of OPPS hospitals (3,552), excluding the hold-harmless cancer and children's hospitals and CMHCs, on the second line of the table. We excluded cancer and children's hospitals because section 1833(t)(7)(D) of the Act permanently holds harmless cancer hospitals and children's hospitals to their ''pre-BBA amount'' as specified under the terms of the statute, and therefore, we removed them from our impact analyses. We show the isolated impact on the 39 CMHCs at the bottom of the impact table (Table 84) and discuss that impact separately below.

Column 2: APC Recalibration—All Changes

Column 2 shows the estimated effect of APC recalibration. Column 2 also reflects any changes in multiple procedure discount patterns or conditional packaging that occur as a result of the changes in the relative magnitude of payment weights. As a result of APC recalibration, we estimate that urban hospitals will experience no change, with the impact ranging from a decrease of 0.1 percent to an increase of 0.1, depending on the number of beds. Rural hospitals will experience no change overall. Major teaching hospitals will experience an estimated decrease of 0.1 percent.

Column 3: Wage Indexes and the Effect of the Provider Adjustments

Column 3 demonstrates the combined budget neutral impact of the APC recalibration; the updates for the wage indexes with the FY 2022 IPPS post-reclassification wage indexes; the rural adjustment; the frontier adjustment, and the cancer hospital payment adjustment. We modeled the independent effect of the budget neutrality adjustments and the OPD fee schedule increase factor by using the relative payment weights and wage indexes for each year, and using a CY 2021 conversion factor that included the OPD fee schedule increase and a budget neutrality adjustment for differences in wage indexes.

Column 3 reflects the independent effects of the updated wage indexes, including the application of budget neutrality for the rural floor policy on a nationwide basis, as well as the CY 2022 changes in wage index policy discussed in section II.C. this final rule with comment period. We did not model a budget neutrality adjustment for the rural adjustment for SCHs because we are continuing the rural payment adjustment of 7.1 percent to rural SCHs for CY 2022, as described in section II.E. of this final rule with comment period. We also did not model a budget neutrality adjustment for the cancer hospital payment adjustment because the payment-to-cost ratio target for the cancer hospital payment adjustment in CY 2022 is 0.89, the same as the ratio that was reported for the CY 2021 OPPS/ASC final rule with comment period (85 FR 85914). We note that, in accordance with section 16002 of the 21st Century Cures Act, we are applying a budget neutrality factor calculated as if the cancer hospital adjustment target payment-to-cost ratio was 0.90, not the 0.89 target payment-to-cost ratio we are applying in section II.F. of this final rule with comment period.

We modeled the independent effect of updating the wage indexes by varying only the wage indexes, holding APC relative payment weights, service-mix, and the rural adjustment constant and using the CY 2022 scaled weights and a CY 2021 conversion factor that included a budget neutrality adjustment for the effect of the changes to the wage indexes between CY 2021 and CY 2022.

Column 4: All Budget Neutrality Changes Combined With the Market Basket Update

Column 4 demonstrates the combined impact of all of the changes previously described and the update to the conversion factor of 2.0 percent. Overall, these changes will increase payments to urban hospitals by 2.1 percent and to rural hospitals by 2.3 percent. Both sole community hospitals and other rural hospitals receive an estimated increase of 2.3 percent.

Column 5: All Changes for CY 2022

Column 5 depicts the full impact of the final CY 2022 policies on each hospital group by including the effect of all changes for CY 2022 and comparing them to all estimated payments in CY 2021. Column 5 shows the combined budget neutral effects of Columns 2 and 3; the OPD fee schedule increase; the impact of estimated OPPS outlier payments, as discussed in section II.G. of this final rule with comment period; the change in the Hospital OQR Program payment reduction for the small number of hospitals in our impact model that failed to meet the reporting requirements (discussed in section XIV. of this final rule with comment period); and the difference in total OPPS payments dedicated to transitional pass-through payments and the proposed adjustment to provide separate payment for the device category, drugs, and biologicals with pass-through status expiring between December 31, 2021, and September 30, 2022.

Of those hospitals that failed to meet the Hospital OQR Program reporting requirements for the full CY 2021 update (and assumed, for modeling purposes, to be the same number for CY 2022), we included 17 hospitals in our model because they had both CY 2019 claims data and recent cost report data. We estimate that the cumulative effect of all changes for CY 2022 will increase payments to all facilities by 1.6 percent for CY 2022. We modeled the independent effect of all changes in Column 5 using the final relative payment weights for CY 2021 and the final relative payment weights for CY 2022. We used the final conversion factor for CY 2021 of $82.797 and the final CY 2022 conversion factor of $84.177 discussed in section II.B. of this final rule with comment period.

Column 5 contains simulated outlier payments for each year. We used the 2-year charge inflation factor used in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59039) of 13.2 percent (1.13218) to increase individual costs on the CY 2019 claims, and we used the overall CCR in the April 2020 Outpatient Provider-Specific File (OPSF) with a 1-year CCR adjustment factor of 0.974495 (85 FR 59040) to estimate outlier payments for CY 2021. Using the CY 2019 claims and a 13.2 percent charge inflation factor, we currently estimate that outlier payments for CY 2021, using a multiple threshold of 1.75 and a fixed-dollar threshold of $5,300, will be approximately 1.07 percent of total payments. The estimated current outlier payments of 1.07 percent are incorporated in the comparison in Column 5. We used the same set of claims and a charge inflation factor of 20.4 percent (1.20469) and the CCRs in the April 2020 OPSF, with an adjustment of 0.974495 multiplied by

0.974495 (86 FR 25718), to reflect relative changes in cost and charge inflation between CY 2019 and CY 2022, to model the final CY 2022 outliers at 1.0 percent of estimated total payments using a multiple threshold of 1.75 and a fixed-dollar threshold of $6,175. The charge inflation and CCR inflation factors are discussed in detail in the FY 2021 IPPS/LTCH PPS final rule (84 FR 45542).

Overall, we estimate that facilities will experience an increase of 1.6 percent under this final rule with comment period in CY 2022 relative to total spending in CY 2021. This projected increase (shown in Column 5) of Table 84 reflects the 2.0 percent OPD fee schedule increase factor, minus 0.32 percent for the change in the pass-through payment estimate between CY 2021 and CY 2022 and the adjustment to provide separate payment for the device category, drugs, and biologicals with pass-through status expiring between December 31, 2021, and September 30, 2022, minus the difference in estimated outlier payments between CY 2021 (1.07 percent) and CY 2022 (1.0 percent). We estimate that the combined effect of all proposed changes for CY 2022 will increase payments to urban hospitals by 1.6 percent. Overall, we estimate that rural hospitals will experience a 1.6 percent increase as a result of the combined effects of all the proposed changes for CY 2022.

Among hospitals, by teaching status, we estimate that the impacts resulting from the combined effects of all changes will include an increase of 1.4 percent for major teaching hospitals and an increase of 1.7 percent for nonteaching hospitals. Minor teaching hospitals will experience an estimated increase of 1.6 percent.

In our analysis, we also have categorized hospitals by type of ownership. Based on this analysis, we estimate that voluntary hospitals will experience an increase of 1.6 percent, proprietary hospitals will experience an increase of 1.7 percent, and governmental hospitals will experience an increase of 1.7 percent.

CMHCs		39	0.4	-1	1.4	1.1

Column (1) shows total hospitals and/or CMHCs.

Column (2) includes all CY 2022 OPPS policies and compares those to the CY 2021 OPPS.

Column (3) shows the budget neutral impact of updating the wage index by applying the final FY 2022 hospital inpatient wage index. The rural SCH adjustment continues our current policy of 7.1 percent so the budget neutrality factor is 1. The budget neutrality adjustment for the cancer hospital adjustment is 1.0000 because the CY 2022 target payment-to-cost ratio is the same as the CY 2021 PCR target (0.89)

Column (4) shows the impact of all budget neutrality adjustments and the addition of the 2.0 percent OPD fee schedule update factor (2.7 percent reduced by 0.7 percentage points for the productivity adjustment).

Column (5) shows the additional adjustments to the conversion factor resulting from a change in the pass-through estimate, adjustment to provide separate payment for the device category, drugs, and biologicals with pass-through status
expiring between December 31, 2021 and September 30, 2022, and adding estimated outlier payments. Note that previous years included the frontier adjustment in this column, but we have added the frontier adjustment to Column 3 in this table.

These 3,659 providers include children and cancer hospitals, which are held harmless to pre-BBA amounts, and CMHCs.

BILLING CODE 4120–01–C

d. Estimated Effects of OPPS Changes on CMHCs

The last line of Table 84 demonstrates the isolated impact on CMHCs, which furnish only partial hospitalization services under the OPPS. In CY 2021, CMHCs are paid under APC 5853 (Partial Hospitalization (3 or more services) for CMHCs). We modeled the impact of this APC policy assuming CMHCs will continue to provide the same number of days of PHP care as seen in the CY 2019 claims used for rate setting in the final rule. We excluded days with 1 or 2 services because our policy only pays a per diem rate for partial hospitalization when 3 or more qualifying services are provided to the beneficiary. We estimate that CMHCs will experience an overall 1.1 percent increase in payments from CY 2021 (shown in Column 5). We note that this includes the trimming methodology as well as the proposed CY 2022 geometric mean costs used for developing the PHP payment rates described in section VIII.B. of this final rule with comment period.

Column 3 shows the estimated impact of adopting the final FY 2022 wage index values will result in a decrease of 1.0 percent to CMHCs. Column 4 shows that combining the OPD fee schedule increase factor, along with final changes in APC policy for CY 2022 and the final FY 2022 wage index updates, will result in an estimated increase of 1.4 percent. Column 5 shows that adding the changes in outlier and pass-through payments will result in a total 1.1 percent increase in payment for CMHCs. This reflects all final changes for CMHCs for CY 2022.

e. Estimated Effect of OPPS Changes on Beneficiaries

For services for which the beneficiary pays a copayment of 20 percent of the payment rate, the beneficiary's payment would increase for services for which the OPPS payments will rise and will decrease for services for which the OPPS payments will fall. For further discussion of the calculation of the national unadjusted copayments and minimum unadjusted copayments, we refer readers to section II.I. of this final rule with comment period. In all cases, section 1833(t)(8)(C)(i) of the Act limits beneficiary liability for copayment for a procedure performed in a year to the hospital inpatient deductible for the applicable year.

We estimate that the aggregate beneficiary coinsurance percentage would be 18.2 percent for all services paid under the OPPS in CY 2022. The estimated aggregate beneficiary coinsurance reflects general system adjustments, including the final CY 2022 comprehensive APC payment policy discussed in section II.A.2.b. of this final rule. We note that the individual payments, and therefore copayments, associated with services may differ based on the setting in which they are furnished. However, at the aggregate system level, because site of service changes related to the IPO list and ASC CPL for certain procedures are more service specific and because the overall impact has been limited in nature, we do not currently observe significant impact on beneficiary coinsurance as a result of those policies.

f. Estimated Effects of OPPS Changes on Other Providers

The relative payment weights and payment amounts established under the OPPS affect the payments made to ASCs, as discussed in section XIII of the final rule. No types of providers or suppliers other than hospitals, CMHCs, and ASCs will be affected by the changes in the final rule.

g. Estimated Effects of OPPS Changes on the Medicare and Medicaid Programs

The effect on the Medicare program is expected to be an increase of $1.27 billion in program payments for OPPS services furnished in CY 2022. The effect on the Medicaid program is expected to be limited to copayments that Medicaid may make on behalf of Medicaid recipients who are also Medicare beneficiaries. We estimate that the changes in the final rule would increase these Medicaid beneficiary payments by approximately $80 million in CY 2022. Currently, there are approximately 10 million dual-eligible beneficiaries, which represent approximately thirty percent of Medicare Part B fee-for-service beneficiaries. The impact on Medicaid was determined by taking 30 percent of the beneficiary cost-sharing impact. The national average split of Medicaid payments is 57 percent Federal payments and 43 percent state payments. Therefore, for the estimated $80 million Medicaid increase, approximately $45 million will be from the Federal Government and $35 million would be from state governments.

h. Alternative OPPS Policies Considered

Alternatives to the OPPS changes we proposed and the reasons for our selected alternatives are discussed throughout the final rule.

- Alternatives Considered for the Claims Data used in OPPS and ASC Ratesetting due to the PHE.

We refer readers to section X.E. of the CY 2022 OPPS/ASC proposed rule with comment period for a discussion of our proposed policy of generally using claims, cost report, and other data prior to the PHE. We note that in that section we discuss the alternative proposal we considered regarding applying the standard ratesetting process, in particular the selection of data used, which would include claims and cost report data including the timeframe of the PHE. We note that there are potential issues related to that data, including the effect of the PHE on the OPPS relative payment weights and the service mix applied in the budget neutrality process; and, therefore, our primary proposal was to use CY 2019 claims and cost report data generally in CY 2022 OPPS ratesetting. In this final rule, as discussed in section X.E., we are finalizing a policy of using the CY 2019 claims data in CY 2022 OPPS ratesetting, while allowing for certain exceptions in which we would use CY 2020 claims in consideration of factors such as APC placement.

We note that these policy considerations also have ASC implications since the relative weights for certain surgical procedures

performed in the ASC setting are developed based on the OPPS relative weights and claims data.

2. Estimated Effects of CY 2022 ASC Payment System Changes

Most ASC payment rates are calculated by multiplying the ASC conversion factor by the ASC relative payment weight. As discussed fully in section XIII. of this final rule with comment period, we are setting the CY 2022 ASC relative payment weights by scaling the final CY 2022 OPPS relative payment weights by the final ASC scalar of 0.8552. The estimated effects of the final updated relative payment weights on payment rates are varied and are reflected in the estimated payments displayed in Tables 85 and 86.

Beginning in CY 2011, section 3401 of the Affordable Care Act requires that the annual update to the ASC payment system (which, in CY 2019, we adopted a policy to be the hospital market basket for CY 2019 through CY 2023) after application of any quality reporting reduction be reduced by a productivity adjustment. Section 1886(b)(3)(B)(xi)(II) of the Act defines the productivity adjustment to be equal to the 10-year moving average of changes in annual economy-wide private nonfarm business multifactor productivity (MFP) (as projected by the Secretary for the 10-year period, ending with the applicable fiscal year, year, cost reporting period, or other annual period). For ASCs that fail to meet their quality reporting requirements, the CY 2022 payment determinations will be based on the application of a 2.0 percentage point reduction to the annual update factor, which will be the hospital market basket for CY 2022. We calculated the CY 2022 ASC conversion factor by adjusting the CY 2021 ASC conversion factor by 0.9997 to account for changes in the pre-floor and pre-reclassified hospital wage indexes between CY 2021 and CY 2022 and by applying the CY 2022 productivity-adjusted hospital market basket update factor of 2.0 percent (which is equal to the projected hospital market basket update of 2.7 percent reduced by a productivity adjustment of 0.7 percentage point). The CY 2022 ASC conversion factor is $49.916 for ASCs that successfully meet the quality reporting requirements.

a. Limitations of Our Analysis

Presented here are the projected effects of the final changes for CY 2022 on Medicare payment to ASCs. A key limitation of our analysis is our inability to predict changes in ASC service-mix between CY 2019 and CY 2022 with precision. We believe the net effect on Medicare expenditures resulting from the final CY 2022 changes will be small in the aggregate for all ASCs. However, such changes may have differential effects across surgical specialty groups, as ASCs continue to adjust to the payment rates based on the policies of the revised ASC payment system. We are unable to accurately project such changes at a disaggregated level. Clearly, individual ASCs will experience changes in payment that differ from the aggregated estimated impacts presented below.

b. Estimated Effects of ASC Payment System Policies on ASCs

Some ASCs are multispecialty facilities that perform a wide range of surgical procedures from excision of lesions to hernia repair to cataract extraction; others focus on a single specialty and perform only a limited range of surgical procedures, such as eye, digestive system, or orthopedic procedures. The combined effect on an individual ASC of the final update to the CY 2022 payments will depend on a number of factors, including, but not limited to, the mix of services the ASC provides, the volume of specific services provided by the ASC, the percentage of its patients who are Medicare beneficiaries, and the extent to which an ASC provides different services in the coming year. The following discussion includes tables that display estimates of the impact of the final CY 2022 updates to the ASC payment system on Medicare payments to ASCs, assuming the same mix of services, as reflected in our CY 2019 claims data. Table 85 depicts the estimated aggregate percent change in payment by surgical specialty or ancillary items and services group by comparing estimated CY 2021 payments to estimated CY 2022 payments, and Table 86 shows a comparison of estimated CY 2021 payments to estimated CY 2022 payments for procedures that we estimate will receive the most Medicare payment in CY 2021.

In Table 85, we have aggregated the surgical HCPCS codes by specialty group, grouped all HCPCS codes for covered ancillary items and services into a single group, and then estimated the effect on aggregated payment for surgical specialty and ancillary items and services groups. The groups are sorted for display in descending order by estimated Medicare program payment to ASCs. The following is an explanation of the information presented in Table 85.

- Column 1—Surgical Specialty or Ancillary Items and Services Group indicates the surgical specialty into which ASC procedures are grouped and the ancillary items and services group which includes all HCPCS codes for covered ancillary items and services. To group surgical procedures by surgical specialty, we used the CPT code range definitions and Level II HCPCS codes and Category III CPT codes, as appropriate, to account for all surgical procedures to which the Medicare program payments are attributed.
- Column 2—Estimated CY 2021 ASC Payments were calculated using CY 2019 ASC utilization data (the most recent full year of ASC utilization) and CY 2021 ASC payment rates. The surgical specialty and ancillary items and services groups are displayed in descending order based on estimated CY 2021 ASC payments.
- Column 3—Estimated CY 2022 Percent Change is the aggregate percentage increase or decrease in Medicare program payment to ASCs for each surgical specialty or ancillary items and services group that is attributable to final updates to ASC payment rates for CY 2022 compared to CY 2021.

As shown in Table 85, for the six specialty groups that account for the most ASC utilization and spending, we estimate that the proposed update to ASC payment rates for CY 2022 will result in a 1-percent decrease in aggregate payment amounts for eye and ocular adnexa procedures, a 2-percent increase in aggregate payment amounts for nervous system procedures, 2-percent increase in aggregate payment amounts for digestive system procedures, a 3-percent increase in aggregate payment amounts for musculoskeletal system procedures, a 6-percent increase in aggregate payment amounts for cardiovascular system procedures, and a 3-percent increase in aggregate payment amounts for genitourinary system procedures. We note that these changes can be a result of different factors, including updated data, payment weight changes, and proposed changes in policy. In general, spending in each of these categories of services is increasing due to the 2.0 percent proposed payment rate update. After the payment rate update is accounted for, aggregate payment increases or decreases for a category of services can be higher or lower than a 2.0 percent increase, depending on if payment weights in the OPPS APCs that correspond to the applicable services increased or decreased or if the most recent data show an increase or a decrease in the volume of services performed in an ASC for a category. For example, we estimate a 6-percent increase in proposed aggregate cardiovascular procedure payments.

The increase in payment rates for cardiovascular procedures as a result of increased device-intensive designations is further increased by the final 2.0 percent ASC rate update for these procedures. Conversely, we estimate a 1-percent decrease in proposed aggregate eye and ocular adnexa procedures related to certain high-volume procedures no longer being assigned device-intensive status as well as estimates in utilization for certain new cataract removal and device insertion procedures. For estimated changes for selected procedures, we refer readers to Table 85 provided later in this section.

TABLE 85: ESTIMATED IMPACT OF THE CY 2022 UPDATE TO THE ASC PAYMENT SYSTEM ON AGGREGATE CY 2022 MEDICARE PROGRAM PAYMENTS BY SURGICAL SPECIALTY OR ANCILLARY ITEMS AND SERVICES GROUP

Surgical Specialty Group (1)	Estimated CY 2021 ASC Payments (in Millions) (2)	Estimated CY 2022 Percent Change (3)
Total	$5,682	2
Eye	$1,918	-1
Nervous System	$1,211	2
Gastrointestinal	$948	2
Musculoskeletal	$727	3
Cardiovascular	$280	6
Genitourinary	$213	3

Table 85 shows the estimated impact of the updates to the revised ASC payment system on aggregate ASC payments for selected surgical procedures during CY 2022. The table displays 30 of the procedures receiving the greatest estimated CY 2021 aggregate Medicare payments to ASCs. The HCPCS codes are sorted in descending order by estimated CY 2021 program payment.

- Column 1—CPT/HCPCS code.
- Column 2—Short Descriptor of the HCPCS code.
- Column 3—Estimated CY 2021 ASC Payments were calculated using CY 2019 ASC utilization (the most recent full year of ASC utilization) and the CY 2021 ASC payment rates. The estimated CY 2021 payments are expressed in millions of dollars.
- Column 4—Estimated CY 2022 Percent Change reflects the percent differences between the estimated ASC payment for CY 2021 and the estimated payment for CY 2022 based on the final update.

BILLING CODE 4120–01–P

TABLE 86 : ESTIMATED IMPACT OF THE FINAL CY 2022 UPDATE TO THE ASC PAYMENT SYSTEM ON AGGREGATE PAYMENTS FOR SELECTED PROCEDURES

CPT/HCPCS Code (1)	Short Descriptor (2)	Estimated CY 2021 ASC Payment (in millions) (3)	Estimated CY 2022 Percent Change (4)

64561	Implant neuroelectrodes	$28	2
G0260	Inj for sacroiliac jt anesth	$27	3

c. Estimated Effects of Proposed ASC Payment System Policies on Beneficiaries

We estimate that the CY 2022 update to the ASC payment system will be generally positive (that is, result in lower cost-sharing) for beneficiaries with respect to the new procedures designated as office-based for CY 2022. First, other than certain preventive services where coinsurance and the Part B deductible is waived to comply with sections 1833(a)(1) and (b) of the Act, the ASC coinsurance rate for all procedures is 20 percent. This contrasts with procedures performed in HOPDs under the OPPS, where the beneficiary is responsible for copayments that range from 20 percent to 40 percent of the procedure payment (other than for certain preventive services), although the majority of HOPD procedures have a 20-percent copayment. Second, in almost all cases, the ASC payment rates under the ASC payment system are lower than payment rates for the same procedures under the OPPS. Therefore, the beneficiary coinsurance amount under the ASC payment system will almost always be less than the OPPS copayment amount for the same services. (The only exceptions will be if the ASC coinsurance amount exceeds the hospital inpatient deductible since the statute requires that OPPS copayment amounts not exceed the hospital inpatient deductible. Therefore, in limited circumstances, the ASC coinsurance amount may exceed the hospital inpatient deductible and, therefore, the OPPS copayment amount for similar services.) Beneficiary coinsurance for services migrating from physicians' offices to ASCs may decrease or increase under the ASC payment system, depending on the particular service and the relative payment amounts under the MPFS compared to the ASC. While the ASC payment system bases most of its payment rates on hospital cost data used to set OPPS relative payment weights, services that are performed a majority of the time in a physician office are generally paid the lesser of the ASC amount according to the standard ASC ratesetting methodology or at the

nonfacility practice expense based amount payable under the PFS. For those additional procedures that we designate as office-based in CY 2022, the beneficiary coinsurance amount under the ASC payment system generally will be no greater than the beneficiary coinsurance under the PFS because the coinsurance under both payment systems generally is 20 percent (except for certain preventive services where the coinsurance is waived under both payment systems).

3. Accounting Statements and Tables

As required by OMB Circular A–4 (available on the Office of Management and Budget website at: *https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/assets/OMB/circulars/a004/a-4.html*), we have prepared accounting statements to illustrate the impacts of the OPPS and ASC changes in this final rule with comment period. The first accounting statement, Table 87, illustrates the classification of expenditures for the CY 2022 estimated hospital OPPS incurred benefit impacts associated with the final CY 2022 OPD fee schedule increase. The second accounting statement, Table 88, illustrates the classification of expenditures associated with the 2.0 percent CY 2022 update to the ASC payment system, based on the provisions of the final rule with comment period and the baseline spending estimates for ASCs. Both tables classify most estimated impacts as transfers.

TABLE 87: ACCOUNTING STATEMENT: CY 2022 Estimated Hospital OPPS Transfers from CY 2021 to CY 2022 Associated with the CY 2022 Hospital Outpatient OPD Fee Schedule Increase

Category	Transfers
Annualized Monetized Transfers	$1,270 million
From Whom to Whom	Federal Government to outpatient hospitals and other providers who receive payment under the hospital OPPS

TABLE 88: ACCOUNTING STATEMENT: Classification of Estimated Transfers from CY 2021 to CY 2022 as a Result of the CY 2022 Update to the ASC Payment System

Category	Transfers
Annualized Monetized Transfers	$80 million
From Whom to Whom	Federal Government to Medicare Providers and Suppliers
Total	$80 million

TABLE 89: Estimated Costs in CY 2022

CATEGORY	Costs
Burden	$4.54 million*
Regulatory Familiarization	$17.057 million**

*The annual estimate includes the impact of OQR and ASCQR program, vaccination coverage data collection across hospitals and ASCs, burden estimate for RO model, and burden reduction for State forensic hospitals.
** Regulatory familiarization costs occur upfront only.

TABLE 90 : Accounting Statement Estimated Impacts for the Radiation Oncology Model

Category	Estimates	Units		
		Year Dollar	Discount Rate	Period Covered
Transfers				
Annualized Monetized ($million/year)	-$27 million	2020	7%	2022 – 2026
	-$29 million	2020	3%	2022 – 2026
From Whom to Whom	From the Federal Government to healthcare providers			

BILLING CODE 4120–01–C

4. Effects of Changes in Requirements for the Hospital OQR Program

a. Background

We refer readers to the CY 2018 OPPS/ASC final rule (82 FR 59492 through 59494), for the previously estimated effects of changes to the Hospital Outpatient Quality Reporting (OQR) Program for the CY 2018, CY 2019, and CY 2021 payment determinations. Of the 3,163 hospitals that met eligibility requirements for the CY 2021 payment determination, we determined that 77 hospitals did not meet the requirements to receive the full annual Outpatient Department (OPD) fee schedule increase factor.

b. Impact of CY 2022 OPPS/ASC Finalized Policies

We anticipate that some of the CY 2022 Hospital OQR Program finalized policies will impact the number of facilities that will receive payment reductions. In this final rule, we are finalizing our proposals to: (1) Adopt the COVID–19 Vaccination Coverage Among HCP measure (OP–38), beginning with the CY 2022 reporting period; (2) adopt the Breast Screening Recall Rates measure (OP–39), beginning with the CY 2022 reporting period; (3) adopt the STEMI eCQM (OP–40), beginning as a voluntary measure with the CY 2023 reporting period, and then as a mandatory measure beginning with the CY 2024 reporting period; (4) require the Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey measures (OP–37a–e), with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2024 reporting period/CY 2026 payment determination; (5) remove the Fibrinolytic Therapy Received Within 30 Minutes measure (OP–2), effective with the CY 2023 reporting period; (6) remove the Median Time to Transfer to Another Facility for Acute Coronary Intervention measure (OP–3), effective with the CY 2023 reporting period; (7) remove the option for hospitals to send medical records to the validation contractor via paper and removable media and require electronic submission; (8) reduce the number of days hospitals have to submit medical records to the CDAC from 45 days to 30 days; (9) enhance the targeting criteria used for hospital selection by adopting criteria currently used in inpatient data validation by adding the following criteria: (a) Having a lower bound confidence interval score of 75 percent or less; and (b) having not been selected in the previous 3 years; (10) extend our existing ECE policy to apply to eCQMs, to further align with the Hospital Inpatient Quality Reporting (IQR) Program; and (11) require use of technology updated consistent with 2015 Edition Cures Update criteria beginning with the CY 2023 reporting period. We are also finalizing our proposal with modification to require the Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery measure (OP–31) beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the CY 2023 reporting period/CY 2025 payment determination.

As shown in Table 81 in section XXII.B.4. (Collection of Information) of this final rule with comment period, we estimate a total information collection burden decrease for 3,300 OPPS hospitals of −73,344 hours at a cost of −$3,109,786 annually associated with our proposed policies and updated burden estimates across a 5-year period from the CY 2022 reporting period/CY 2024 payment determination through the CY 2027 reporting period/CY 2029 payment determination, compared to our currently approved information collection burden estimates. We refer readers to section XXII.B. of this final rule (information collection requirements) for a detailed discussion of the calculations estimating the changes to the information collection burden for submitting data to the Hospital OQR Program. As discussed in this section of the final rule, we are finalizing policies that will have additional economic impact. The finalized policies not discussed in this section are believed to have no further economic impact beyond information collection burden.

In section XV.B.4.a. of this final rule with comment period, we are finalizing the adoption of the COVID–19 Vaccination Coverage Among HCP measure (OP–38) beginning with the CY 2022 reporting period/CY 2024 payment determination. Hospitals will submit data through the Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN). The NHSN is a secure, internet-based system maintained by the CDC and provided free. Currently the CDC does not estimate burden for COVID–19 vaccination reporting under the CDC PRA package currently approved under OMB control number 0920–1317 because the agency has been granted a waiver under section 321 of the National Childhood Vaccine Injury Act (NCVIA).[605] Although the burden associated with the COVID–19 Vaccination Coverage Among HCP measure (OP–38) is not accounted for under the CDC PRA 0920–1317 or 0920–0666, the cost and burden information is included here. We estimate that it will take each hospital on average approximately 1 hour per month to report data for the COVID–19 Vaccination Coverage Among HCP measure (OP–38) which may vary between 45 minutes and 1 hour and 15 minutes to enter this data into NHSN. Beginning with the CY 2022 reporting period/FY 2024 payment determination, hospitals will incur an additional annual burden between 9 hours (0.75 hours/month × 12 months) and 15 hours (1.25 hours/month × 12 months) per hospital and between 29,700 hours (9 hours/hospital × 3,300 hospitals) and 49,500 hours (15 hours/hospital × 3,300 hospitals) for all hospitals. Each hospital will incur an estimated cost of between $323.28 (9 hours × $35.92/hr) and $538.80 annually (15 hours × $35.92/hr).[606] The estimated cost across all 3,300 hospitals will be between $1,066,824 ($323.28/hospital × 3,300 hospitals) and $1,778,040 ($538.80/hospital × 3,300 hospitals) annually thereafter. We recognize that many healthcare facilities are also reporting other COVID–19 data to HHS. We believe the benefits of reporting data on the COVID–19 Vaccination Coverage Among HCP measure (OP–38) outweigh the associated costs of reporting. We did not receive any comments on the estimated time to collect data and enter it into the NHSN as well as any additional costs associated with this measure.

In section XV.B.4.c. of this final rule with comment period, we are finalizing the adoption of the STEMI eCQM (OP–40). Similar to the FY 2019 IPPS/LTCH PPS final rule, we believe that costs associated with adoption of eCQMs are multifaceted and include not only the burden associated with reporting but also the costs associated with implementing and maintaining Program requirements, such as maintaining measure specifications in hospitals EHR systems for all of the eCQMs available

[605] Section 321 of the National Childhood Vaccine Injury Act (NCVIA) provides the PRA waiver for activities that come under the NCVIA, including those in the NCVIA at section 2102 of the Public Health Service Act (42 U.S.C. 300aa–2). Section 321 is not codified in the U.S. Code, but can be found in a note at 42 U.S.C. 300aa–1.

[606] *https://www.bls.gov/oes/current/oes436013.htm.* Accessed on April 13, 2021. The adjusted hourly wage rate of $35.92/hr includes an adjustment of 100 percent of the median hourly wage to account for the cost of overhead, including fringe benefits.

for use in the Hospital OQR Program (83 FR 41771).

As described in section XV.D.6. of this final rule with comment period, we are finalizing certification requirements requiring the use of the 2015 Edition Cures Update for eCQMs beginning with the CY 2025 payment determination. We expect this finalization to have no impact on information collection burden for the Hospital OQR Program because this policy does not require hospitals to submit new data to CMS. With respect to any costs unrelated to data submission, although this finalized policy will require some investment in systems updates, the Medicare Promoting Interoperability Program (previously known as the Medicare and Medicaid EHR Incentive Programs) previously finalized a requirement that hospitals use the 2015 Edition Cures Update for eCQMs (85 FR 84818 through 84825). Because all hospitals participating in the Hospital OQR Program are subsection (d) hospitals that also participate in the Medicare Promoting Interoperability Program (previously known as the Medicare and Medicaid EHR Incentive Programs), we do not anticipate any additional costs as a result of the finalization of this policy. This is because the burden and costs involved in updating to the 2015 Edition Cures Update is the same regardless of whether the technology is used for eCQMs. Therefore, we believe that the Medicare Promoting Interoperability Program has already addressed the additional costs unrelated to data submission through their previously finalized requirements.

In section XV.D.9.c. of this final rule with comment period, we are finalizing the proposal to reduce the number of days hospitals have to submit medical records to the CDAC from 45 days to 30 days. In previous years, charts were requested by the CMS CDAC contractor and hospitals were given 45 days from the date of the request to submit the requested records. This may be an additional administrative burden to hospitals selected for validation. However, this deadline is in line with the Hospital IQR Program's validation policy, the large majority of hospitals that have participated in Hospital OQR Program data validation efforts have submitted their records prior to 30 days in the current process, and outpatient records typically contain significantly fewer pages than the inpatient records. Therefore, we believe the impact of finalizing this policy to be minimal.

5. Effects of Requirements for the ASCQR Program

a. Background

In section XVI. of this final rule with comment period, we discuss our finalized policies affecting the Ambulatory Surgical Center Quality Reporting (ASCQR) Program. For the CY 2021 payment determination, all 6,811 ASCs that met eligibility requirements for the ASCQR Program received the annual payment update due to data submission requirements being excepted under the ASCQR Program's Extraordinary Circumstances Exceptions policy in consideration of the COVID–19 public health emergency.[607]

b. Impact of CY 2022 OPPS/ASC Finalized Policies

In section XVI. of this final rule with comment period, we are finalizing our proposals to: (1) Require four patient safety outcome measures beginning with the CY 2023 reporting period/CY 2025 payment determination: (a) Patient Burn (ASC–1); (b) Patient Fall (ASC–2); (c) Wrong Site, Wrong Side, Wrong Patient, Wrong Procedure, Wrong Implant (ASC–3); and (d) All-Cause Hospital Transfer/Admission (ASC–4); (2) add two additional data collection survey modes of OAS CAHPS measures collection to the existing three modes of collection and provide survey administration requirements; and (3) adopt the COVID–19 Vaccination Coverage Among HCP measure (ASC–20), beginning with the CY 2022 reporting period/CY 2024 payment determination. We note that we are finalizing with modification our proposals to: (1) Require the Cataracts: Improvement in Patient's Visual Function within 90 days Following Cataract Surgery (ASC–11) measure beginning with the CY 2025 reporting period/CY 2027 payment determination instead of the CY 2023 reporting period/CY 2025 payment determination; and (2) require the Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems (OAS CAHPS) Survey measures (ASC–15 a–e) with voluntary reporting beginning with the CY 2023 reporting period and mandatory reporting beginning with CY 2025 reporting period/CY 2027 payment determination instead of the CY 2024 reporting period/CY 2026 payment determination.

As shown in Tables 82 and 83 in section XXII.C.3.e. (Collection of Information) of this final rule with comment period, we estimate a total information collection burden increase for 4,646 ACSs of +67,085 hours at a cost of +$2,844,404 annually associated with our proposed policies and updated burden estimates across a 4 year period from the CY 2023 reporting period/CY 2025 payment determination through the CY 2026 reporting period/CY 2028 payment determination, compared to our currently approved information collection burden estimates. We refer readers to section XXIII.C. of the preamble of this final rule with comment period (information collection requirements) for a detailed discussion of the calculations estimating the changes to the information collection burden for submitting data to the ASCQR Program.

In section XVI.B.3.a. of this final rule with comment period, we are finalizing the adoption of the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) beginning with the CY 2022 reporting period/CY 2024 payment determination. The impacts and benefits associated with finalizing this proposal are comparable to those previously discussed for the same measure being finalized in the Hospital OQR Program. Currently the CDC does not estimate burden for COVID–19 vaccination reporting under the CDC PRA package currently approved under OMB control number 0920–1317 because the agency has been granted a waiver under section 321 of the National Childhood Vaccine Injury Act (NCVIA).[608] Although the burden associated with the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) is not accounted for under the CDC PRA 0920–1317 or 0920–0666, the cost and burden information is included here. We estimate that each ASC will spend on average approximately 1 hour per month to collect data for the COVID–19 Vaccination Coverage Among HCP measure (ASC–20) and enter it into NHSN. We have estimated that the associated burden is comprised of administrative hours and wages. We believe an Administrative Assistant will spend between 45 minutes and 1 hour and 15 minutes to enter this data into NHSN. Beginning with the CY 2022 reporting period/FY 2024 payment

[607] Centers for Medicare & Medicaid Services. COVID–19 Quality Reporting Programs Guidance Memo. Available at *https://www.cms.gov/files/document/guidance-memo-exceptions-and-extensions-quality-reporting-and-value-based-purchasing-programs.pdf.*

[608] Section 321 of the National Childhood Vaccine Injury Act (NCVIA) provides the PRA waiver for activities that come under the NCVIA, including those in the NCVIA at section 2102 of the Public Health Service Act (42 U.S.C. 300aa–2). Section 321 is not codified in the U.S. Code, but can be found in a note at 42 U.S.C. 300aa–1.

determination, ASCs will incur an additional annual burden between 9 hours (0.75 hours/month × 12 months) and 15 hours (1.25 hours/month × 12 months) per ASC and between 41,814 hours (9 hours/hospital × 4,646 ASCs) and 69,690 hours (15 hours/hospital × 4,646 ASCs) for all ASCs. Each ASC will incur an estimated cost of between $323.28 (9 hours × $35.92/hour) and $538.80 annually (15 hours × $35.92/hour). The estimated cost across all 4,646 ASCs will be between $1,501,959 ($323.28/ASC × 4,646 ASCs) and $2,503,265 ($538.80/ASC × 4,646 ASCs) annually thereafter. We did not receive comments on the estimated time to collect data and enter it into the NHSN as well as any additional costs associated with this measure.

6. Effects of Requirements for the RO Model

a. Financial Impact

We have examined the impact of this final rule as required by Executive Order 12866 and other laws and Executive Orders, requiring economic analysis of the effects of final rules. We are finalizing a different model performance period than was finalized in the Hospital Outpatient Prospective Payment (OPPS) and Ambulatory Surgical Center (ASC) Payment Systems and Quality Reporting Programs final rule with comment period (85 FR 85866) (hereinafter referred to as ''CY 2021 OPPS/ASC final rule''). We are also finalizing an updated baseline period, lower discounts, the removal of brachytherapy from the included modalities, and the removal of liver cancer from the list of included cancer types finalized under the publication of the Medicare Program; Specialty Care Models to Improve Quality of Care and Reduce Expenditures Final Rule (Specialty Care Models final rule) (85 FR 61114) on September 29, 2020. We have updated our net estimate of the RO Model impact to reflect all of the modifications to the RO Model design in this final rule. Accordingly, we have prepared an RIA that, to the best of our ability, reflects the economic impact of the policies contained in this final rule.

b. Statement of Need for the Radiation Oncology (RO) Model

In the CY 2021 OPPS/ASC proposed rule (86 FR 42350), we noted that the statement of need for the RO Model described in the Specialty Care Models final rule (85 FR 61347) and the CY 2021 OPPS/ASC final rule (85 FR 86296) remains unchanged.

c. Impact of RO Model

Based on the finalized policy of the Specialty Care Models final rule (85 FR 61114), we expected a savings of $230 million for Medicare over a 5-year model performance period. The CY 2021 OPPS/ASC final rule with comment period (85 FR 86296) included a savings estimate of $220 million for Medicare over a 4.5-year model performance period. We now expect that the finalized modifications included in this final rule, which include a change to a revised model performance period that begins January 1, 2022 and ends December 31, 2026, a revised baseline period, the removal of brachytherapy and liver cancer, as well as the lowered discounts, will reduce savings to $150 million for Medicare over the course of the five-year model performance period.

d. Anticipated Effects

(1) Scale of the Radiation Oncology (RO) Model

As we stated in the CY 2022 OPPS/ASC proposed rule (86 FR 42350), revising the model performance period to begin January 1, 2022 will not affect the number of PGPs or HOPDs we expect to furnish RT services in the simulated selected CBSAs. We currently expect the model performance period that begins January 1, 2022, and ends December 31, 2026, will include approximately 282,000 episodes, 250,000 beneficiaries, and $4.6 billion in total episode spending of allowed charges over the model performance period. The revision was primarily the result of updated FFS Part B enrollment projections, slower assumed growth in RT episodes per patient, and minor technical changes to the projection process than was assumed in the Specialty Care Models final rule in September 2020.

(2) Effects of the RO Model on the Medicare Program

(a) Overview

Under the current FFS payment system, RT services are paid on a per service basis to both PGPs (including freestanding radiation therapy centers) and HOPDs through the PFS and the OPPS, respectively. The RO Model is a mandatory model designed to test a prospectively determined episode payment for RT services furnished to Medicare beneficiaries during episodes initiated between January 1, 2022 and December 31, 2026.

(b) Data and Methods

Similar to the analysis performed for the regulatory impact analysis for the Specialty Care Models final rule (85 FR 61347) and the CY 2022 OPPS/ASC proposed rule (86 FR 42350), a stochastic simulation based on the policies in this final rule was created to estimate the financial impacts of the RO Model relative to baseline expenditures.

(c) Medicare Estimate

Table 91 summarizes the estimated impact of the RO Model with a model performance period that begins January 1, 2022, and ends December 31, 2026. We estimate that on net the Medicare program would save $150 million over the 5-year model performance period. Changes in the estimated impacts for this policy relative to those presented in the CY2022 OPPS/ASC proposed rule (86 FR 42350 through 42352) generally reflect updated economic assumptions, no material technical changes were made to our projection methodology. As in the Specialty Care Models final rule (85 FR 61350) and the CY 2021 OPPS/ASC final rule with comment period (85 FR 86297), this is the net Medicare Part B impact that includes both Part B premium and Medicare Advantage United States Per Capita Costs (MA USPCC) rate financing interaction effects. This estimate excludes changes in beneficiary cost sharing liability to the extent it is not a Federal outlay under the policy.

As codified at § 512.280(d), the APM incentive payment will apply only to the professional episode payment amounts and not the technical episode payment amounts. Moreover, due to the 2-year lag in Quality Payment Program performance and payment periods and quality data reporting starting in 2022, APM incentive payments will only be made during 2024. We projected that 80 percent (down from 83 percent as projected in the Specialty Care Models final rule) of physician participants (measured by unique NPI) will receive the APM incentive payment under the Quality Payment Program for 2022.

Complete information regarding the data sources and underlying methodology used to determine amounts for reconciliation were not available at the time of this forecast. Like in the Specialty Care Models final rule, in the case of the incomplete payment withhold, we assumed CMS retains payment only in the event that offsetting payment errors were made elsewhere. Moreover, past CMS experience in the and Hospital Value-Based Purchasing (VBP) and Merit-based Incentive Payment System (MIPS) programs that included value-based reporting requirements has shown a low rate of non-compliance on the part of providers and suppliers. Given the

limited spending being withheld, scoring criteria (that is the use of the Aggregate Quality Score (AQS) and its application to the quality withhold, as finalized at 85 FR 61226 through 61231), and specified timeframes involved, we assume that quality and patient experience withholds, on net, would have a negligible financial impact to CMS.

A key assumption underlying the impact estimate is that the volume and intensity (V&I) of the bundled services per episode remains unchanged between the baseline period and when bundled RO payments are made. If V&I were to decrease by 1.0 percent annually for the bundled services absent the RO Model, then we estimated the RO Model to be approximately budget neutral between January 1, 2022 and December 31, 2026. Similarly, if V&I increases by 1.0 percent annually then net Medicare outlays would be reduced by $280 million for this projection period. Although V&I growth from 2014 through 2019 fell within this 1.0 percent range and did not exhibit a secular trend, actual experience may differ.

Please also note that due to the current public health crisis caused by the COVID–19 virus, the forecasted impacts for the RO Model are subject to an additional level of uncertainty. The duration of the current COVID–19 pandemic, its severity, and future policy measures taken in response are variables that are significant but unknown at this time. This forecast assumes that Medicare FFS billing and treatment patterns for beneficiaries observed during the 2017 to 2019 baseline period have resumed by the start of 2022.To the extent that this assumption does not hold, actual experience may vary significantly. Table 91 summarizes our estimated impacts of this final rule with comment period.

TABLE 91: Estimates of Medicare Program Savings (Millions $) for Radiation Oncology Model (Starting January 1, 2022)

	Year of Model					
	2022	**2023**	**2024**	**2025**	**2026**	**Total***
Net Impact to Medicare Program Spending	-20	-30	-20	-40	-40	-150
Changes to Incurred FFS Spending	-20	-20	-20	-30	-30	-120
Changes to MA Capitation Payments	0	-20	-20	-20	-30	-80
Part B Premium Revenue Offset	0	10	10	10	10	50
Total APM Incentive Payments	0	0	10	0	0	10
Episode Allowed Charges	830	860	900	930	970	4,490
Episode Medicare Payment	650	670	700	730	750	3,500
Total Number of Episodes	53,300	54,900	56,400	58,000	59,600	282,200
Total Number of Beneficiaries	51,900	53,500	54,900	56,500	58,100	250,200

*Negative spending reflects a reduction in Medicare spending, while positive spending reflects an increase.

*Totals may not sum due to rounding and from beneficiaries that have cancer treatment spanning multiple years.

e. Effects on RO Participants

We believe that the finalized changes will not affect the total cost of learning the billing system for the RO Model but will, however, affect the burden estimate for reporting quality measures and clinical data elements.

We believe the burden estimate for quality measure and clinical data element reporting requirements that is provided for Small Businesses in CY 2021 OPPS/ASC final rule with comment period (85 FR 86297) apply to RO participants that are not considered small entities. The burden estimate for collecting and reporting quality measures and clinical data for the RO Model may be equal to or less than that for small businesses, which we estimated to be approximately $1,845 per entity per year based on 2020 wages. Since we estimated approximately 500 Professional participants and Dual participants will be collecting and reporting this data, the total annual burden estimate for collecting and reporting quality measures and clinical data is approximately $922,500 for a total of $4,612,500 over 5 years, and this remains unchanged in this final rule.

Like the Medicare Specialty Models final rule (85 FR 61358), this final rule with comment period affects: (1) Radiation oncology PGPs that furnish RT services in both freestanding radiation therapy centers and HOPDs; (2) PGPs that furnish RT services only in HOPDs; (3) PGPs that are categorized as freestanding radiation therapy centers; and (4) HOPDs. Based on the finalized modifications to the design of the RO Model, we believe that on average, Medicare FFS payments to PGPs (including freestanding radiation therapy centers) will increase by 6.3 percent and Medicare FFS payments to HOPDs will be reduced by 9.9 percent over the life of the Model as shown in Table 92 below. This estimate is made under the assumption of no changes to PFS clinical labor rates as outlined in the CY 2022 PFS proposed rule (CMS–1751–P) occurring. To the extent the PFS were to finalize clinical labor RVU adjustment policies outlined in the recent proposed rule, we would expect PGPs to see an average increase of 10.2 percent and HOPDs a decrease of 11.3 percent over the lifetime of the RO Model.

Under Medicare FFS, PGPs that furnish RT professional services to HOPDS are largely paid through the PFS and freestanding radiation therapy centers are largely paid through the PFS for both RT professional and technical services. In contrast, HOPDs are paid through the OPPS for RT technical services. Unit-cost increases under the PFS are projected to be lower than under the OPPS over time. This means that when the payment rates of the PFS and the OPPS (along with the volume of HCPCS codes of non-participant episodes) are used to determine the trend factors for each cancer type, PGPs (including freestanding radiation therapy centers), on average, are projected to experience incremental gains to payment over time, while HOPDs, on average, are projected to experience incremental losses to payment over time. In other words, the impact for HOPDs and PGPs depends on a combination of the RO Model's discount factor and the RO Model's trend factor, which blends the latest OPPS and PFS payment rates based on their historical claims volume in non-participating RT providers and RT suppliers. Given that PFS rates are not expected to increase between 2019 and 2026 and the OPPS rates are, blending these rates together leads to an average increase in allowed charges expected for PGPs (including freestanding radiation therapy centers) and an average decrease in allowed charges expected for HOPDs (because HOPDs that are RO participants will not get the full OPPS rate increase but rather a trend that blends OPPS with PFS). Table 92 provides additional information about the expected impacts by year:

TABLE 92: Radiation Oncology Model PGP (including freestanding radiation therapy centers) vs HOPD Allowed Charge Impacts 2022 to 2026 as compared to those not participating in the RO Model

% Impact	2022	2023	2024	2025	2026	2022 to 2026
PGP (including freestanding radiation therapy centers)	3.1%	4.5%	6.0%	7.4%	8.9%	6.3%
HOPD	-7.8%	-8.8%	-9.6%	-10.6%	-11.6%	-9.9%

We believe that this impact would be reduced for smaller RO participants, those RO participants that are eligible for the low volume opt-out in some performance years, and that there would be no impact for those RO participants that are eligible for the low volume opt-out for the entire model performance period (see section XVII.C.3.d. of this final rule with comment period).

We solicited comment on the assumptions and analysis presented throughout the regulatory impact section, section XXIV.C.6, of this final rule with comment period.

Comment: Some commenters called attention to the three percent change in the number of physician participants (measured by unique NPI) that will receive the APM incentive payment under the Quality Payment Program for 2022 as CMS now projects 80 percent (down from 83 percent as projected in the Specialty Care Models final rule) of physician participants will receive the APM incentive payment. These commenters note that it will be devastating for those practices unable to attain Advanced APM status as many of them will be left with fewer resources.

Response: Please see Table 92 in this final rule with comment period. It is important to note that the PGP figures in Table 92 encompass entities defined under the RO Model as a Medicare-enrolled PGPs and includes freestanding radiation therapy centers, as both are paid through the MPFS. The HOPD figures in Table 92 encompass entities defined under the RO Model as HOPDs, which are paid through the OPPS. On average, we estimate that PGPs (including freestanding radiation therapy centers) furnishing included RT services under the RO Model will see an increase in payment relative to those same entities outside of the RO Model, whereas HOPDs furnishing included RT services under the RO Model are expected, on average, to see a decrease in payment relative to their counterparts outside of the RO Model.

As seen in Table 92, we project that for PGP participants, the RO Model discounts will be offset in the first year of the model performance period by use of blended PFS and OPPS trend update factors. By 2024 RO participants that are PGPs (including freestanding radiation therapy centers) are expected to see an average increase in payment rates on average of approximately 6.3 percent. Over the lifetime of the RO Model we expect about 95 percent of RO participants that are PGPs (including freestanding radiation therapy centers) to see increases in payment relative to traditional FFS. This is due to the OPPS receiving projected updates of 2.3 percent on average for the 2019–2026 period, the PFS being legislated to receive effectively no conversion factor update on net for these years, and the use of blended updates redistributing a large portion of work RVU revisions finalized in the CY 2021 PFS PPS final rule onto HOPDs. Also, we assume limited dollars under the APM incentive payment, because it is limited to one year.

Comment: Some commenters stated that CMS' regulatory impact analysis significantly underestimates the cost of collecting and reporting quality measures and CDEs, and that CMS does not adequately recognize the time and resources necessary to comply with the reporting requirements. One commenter stated hearing that one hospital system that spanned eight regions within the health system uses an existing radiation oncology EHR system, but only a couple of the regions are using it to document care. Those systems that are using the EHR system to document care need to implement various software product upgrades to support the higher level CEHRT requirements. The commenter reported a cost of an estimated $1.74 million for all eight regions to be compliant with Model requirements, and that this cost does not include the cost associated with staff time or the ramp up time necessary to train and operationalize these new systems. This same commenter reported that a large academic medical center with OCM experience, has reported to them that

the cost of compliance is three- to four-times the anticipated cost of the 2-percent withhold.

Response: We thank these commenters for explaining their concerns. We continue to expect the burden costs per small entity associated with quality measure reporting to be small because three of the four measures for the RO Model are already in use in other CMS programs; and compliance with the Treatment Summary Communication (the measure not currently in use) is a best practice that should already be the standard of care across PGPs and HOPDs. In the Medicare Specialty Models final rule (85 FR 61360), we explain that the use of EHR technology is not included in the regulatory impact analysis as part of the cost of the Model, because an entity's EHR has many uses within the clinical setting and is not solely used for RO Model measures reporting. Please note that we will be monitoring burden on RO participants throughout the model performance period.

Comment: Many commenters stated that CMS estimates do not appropriately account for the proposed conversion factor and relative value units (RVUs) under the CY 2022 Medicare Physician Fee Schedule (MPFS) proposed rule. Many commenters believed CMS has failed to account for the continued decline in MPFS rates that factor into the RO Model payment methodology as part of the trend factor calculation. These commenters stated that under the CY 2022 MPFS proposed rule, CMS is proposing cuts of 8.75 percent across all radiation oncology services, due to the proposed change in Clinical Labor Pricing Inputs and the expiration of the Consolidated Appropriations Act (CCA), which equates to a cut of 3.75 percent to the conversion factor. These commenters stated that the MPFS proposals in the CY 2022 MPFS proposed rule affect the RO Model due to its trend factors, which use the MPFS and the OPPS payment rates to update the national base rate amounts each year. These commenters argued that CMS is understating the impact of the cuts with the comparison to 2020, not 2021. One commenter noted that CMS's impact estimates for PGPs, in particular, is deceiving, given significant reductions in MPFS payments proposed by CMS. Many commenters also noted their belief that the proposed payment reductions under the MPFS, when combined with the Model's withholds and discount factor, will be unsustainable for RT providers and RT suppliers under the Model and likely result in access issues for beneficiaries. They argued that these reductions have the potential to put many practices at financial risk, particularly those with thin operating margins.

One commenter argued that CMS inappropriately included the incentive payments provided to Qualified Participant (QP) status in its budgetary calculations for the RO Model. This commenter cites the Act at section 1833(z)(1)(C), which states: ''Payments under this subsection shall not be taken into account for purposes of determining actual expenditures under an alternative payment model and for purposes of determining or rebasing any benchmarks used under the alternative payment model.'' In Table 78 of the CY 2022 OPPS/ASC proposed rule (86 FR 42351), CMS has included the incentive payments for RO Model QPs in its calculations of net savings attributable to the Model. The commenter stated that the purpose of the QP incentive payments is to help support APM participants as they transition from the traditional fee-for-service system to payment under APMs, and that these incentive payments should not be considered costs attributable to the RO Model.

A couple of commenters stated that CMS estimates do not appropriately account for sequestration. Finally, a commenter urges CMS to release the assumptions upon which their actuaries rest their analysis, as well as the analysis itself, so that stakeholders can understand how they arrived at their calculations.

Response: We direct readers to section XVIII.C.5.h of this final rule with comment period where we address comments specific to the impact of the discount factors on payment and to section XVIII.C.5.d of this final rule with comment period where we address comments concerning the trend factor methodology with its incorporation of MPFS and OPPS rates as part of an annual update for the PC and TC of each disease site. We do, however, acknowledge that the RO estimates could change due to CY 2022 or subsequent MPFS policies, in addition to a variety of other factors. It is important to note that the figures listed in Table 92 should be interpreted as an overall comparison between those participating in the RO Model to those outside of it during the 5-year model performance period, all else equal. This analysis therefore excludes impacts due to other CMS policy changes. The figures listed in Table 92 are averages and should not be interpreted as the reduction or increase in current payment that an individual PGP (including freestanding radiation therapy centers) or an individual HOPD receives.

As for the comment concerning the inclusion of APM incentive payments in the RO Model savings estimates, the APM incentive payment will not be included in accounting of expenditures during the Model's reconciliation for RO participants. Finally, actuarial assumptions used to calculate the financial impacts of the RO Model are included in this section of this final rule with comment period. We have added several clarifying statements throughout this section to facilitate understanding of the RO Model's financial impacts and the actuarial assumptions on which these impacts are based.

7. Effects of Requirements for Hospitals To Make Public a List of Their Standard Charges

In this final rule with comment period, we are modifying 45 CFR 180.30(b) and adding new § 180.30(b)(3) to include that state forensic hospitals will be deemed to have met requirements, similar to our policy to deem Federally owned/operated hospitals as having met requirements. These state forensic hospitals and have closed populations, are not open to the general public, and the cost of care is funded by the state. This proposal will reduce the overall burden we estimated in the Hospital Price Transparency final rule by removing such hospitals from the obligation to make public standard charges in the form and manner prescribed at 45 CFR 180.

In the Hospital Price Transparency final rule, we estimated the total burden for hospitals to review and post their standard charges for the first year to be 150 hours per hospital at $11,898.60 per hospital for a total burden of 900,300 hours (150 hours × 6,002 hospitals) and total cost of $71,415,397 ($11,898.60 × 6,002 hospitals) (84 FR 65595). We estimated the total annual burden for hospitals to review and post their standard charges for subsequent years to be 46 hours per hospital at $3,610.88 per hospital for a total annual burden for subsequent years of 276,092 hours (46 hours × 6,002 hospitals) and total annual cost of $21,672,502 ($3,610.88 × 6,002 hospitals). For purposes of the changes in this rule, we assume that state forensic hospitals have complied with the Hospital Price Transparency final rule requirements in the first year of implementation (CY 2021) and are therefore basing our burden reduction estimate on the cost of implementation for subsequent years alone. In other words, because state forensic hospitals would no longer be required to make the annual updates as required under the

Hospital Price Transparency final rule, the burden reduction applies to CY 2022 and subsequent years.

We estimate that 111[609] hospitals would meet our definition of 'state forensic hospital'. To estimate the associated burden reduction for state forensic hospitals, we used the hourly cost for each labor category by referencing Bureau of Labor Statistics report on Occupational Employment and Wages (May 2020), as indicated in Table 93.[610]

TABLE 93: Occupation Titles and Wage Rates

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefit ($/hr)	Adjusted Hourly Wage ($/hr)
General Operations Manager	11-1021	$60.45	$60.45	$120.90
Business Operations Specialist	13-1000	$37.66	$37.66	$75.32
Network and Computer System Administrator	15-1244	$43.01	$43.01	$86.02

We estimate a reduction in burden of 2 hours for a general operations manager to review and determine updates in compliance requirements, or a savings of $241.80 (2 hours * $120.90) per hospital. We estimate a total burden reduction of 222 hours (2 hours * 111 hospitals) with a total burden reduction $26,839.80 (222 hours * $120.90).

Next, we estimate a reduction in burden of 32 hours for a business operations specialist because they will no longer be required to update necessary processes and procedures and gather and compile required information, a savings of $2,410.24 (32 hours * $75.32) per hospital. We estimate a total burden reduction of 3,552 hours (32 hours * 111 hospitals) with a total burden reduction $267,536.64 (3,552 hours * $75.32).

Finally, we estimate a reduction in burden of 12 hours for network and computer system administrator because they will no longer be required to maintain the required systems to make this data publicly available, a savings of $1,032.24 (12 hours * $86.02) per hospital. We estimate a total burden reduction of 1,332 hours (12 hours * 111 hospitals) with a total burden reduction $114,578.64 (1,332 hours * $86.02).

Therefore, we believe the total annual burden reduction for the proposal in this rule, for subsequent years, to be 46 hours (2 hours + 32 hours + 12 hours) per hospital, with a savings of $3,684.28 ($241.80 + $2,410.24 + $1,032.24) per hospital. We also estimate a total annual burden reduction for subsequent years of 5,106 hours (46 hours * 111 hospitals) and a total cost of $408,955.08 ($3,684.28 * 111 hospitals), as shown in Table 94.

TABLE 94: Costs per Organization and Total Cost Figures

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefit ($/hr)	Adjusted Hourly Wage ($/hr)	Subsequent Year Hours
General Operations Manager	11-1021	$60.45	$60.45	$120.90	2
Business Operations Specialist	13-1000	$37.66	$37.66	$75.32	32
Network and Computer System Administrator	15-1244	$43.01	$43.01	$86.02	12
Total Hours per state forensic hospital					46
Total Reduction per state forensic hospital (Dollars)					($3,684.28)
Total hours for State forensic hospitals (hours)					5,106
Total Burden Reduction for all State forensic hospitals					($408,955.08)

We received a several comments related to the burden and costs of complying with the Hospital Price Transparency final rule. We addressed comments on these issues in the CY 2020 Hospital Price Transparency final rule's Collection of Information Requirements and Regulatory Impact Analysis (84 FR 65591–65602) and did not propose in the CY 2022 OPPS/ASC proposed rule to change any of the policies or cost analysis previously established. Accordingly we consider these comments out of scope.

Comment: Some commenters indicated that any modifications to the hospital price transparency final rule requirements could negate much of the

[609] SAMHSA. National Mental Health Services Survey (N–MHSS): 2019 Data on Mental Health Treatment Facilities. *https://www.samhsa.gov/data/sites/default/files/reports/rpt29388/2019_NMHSS/2019-NMHSS-R.pdf.*

[610] Bureau of Labor Statistics. National Occupational Employment and Wage Estimates, May 2020. Available at *https://www.bls.gov/oes/current/oes_nat.htm.*

work that has been done and would require hospitals to start over to recreate their files in a new format. Commenters stated that additional requirements would create excess administrative burden and would require a minimum of six months to implement, noting the needed time to gather data and execute the necessary IT build for reporting.

Response: In this final rule with comment period, we are finalizing the following policies: (1) Increasing the civil monetary penalty using a scaling factor; (2) deeming state forensic hospitals as having met requirements; and (3) requiring hospitals to ensure that the machine-readable file is accessible to automated searches and direct downloads. In the proposed rule, we determined that neither increasing the penalty amount nor ensuring the machine-readable file is barrier free would result in a cost burden over the amount that was estimated in the impact analysis in the Hospital Price Transparency final rule. We further estimated that the policy to deem state forensic hospitals as having met requirements would reduce hospital burden. None of the policies modify any other requirements in the Hospital Price Transparency final rule (such as changes in formatting requirements or data elements that must be displayed). We therefore disagree with commenters that the modifications made in this final rule will ''negate'' work already done by hospitals to come into compliance or that such policy modifications would cause a hospital to spend 6 months to gather and display information or that such policy modifications would ''require hospitals to start over to recreate their files in a new format.'' Additionally, we have assessed the final policies in this final rule with comment period to result in an overall burden reduction and therefore disagree that the policies we are finalizing in this rule will ''create excess administrative burden.''

Comment: Some commenters recommended that in the spirit of setting hospitals up for success, CMS should provide sufficient notification when making any changes to the reporting requirements and allow hospitals adequate time for feedback related to costs of implementation. A few commenters suggested that CMS collect post-implementation cost estimates and publish them on a public facing website or otherwise take them into account in future impact analyses.

Response: We believe that the rulemaking process provides sufficient notification of proposed changes and allows adequate time for stakeholders to submit substantive comments related to costs of implementation. We appreciate the additional suggestions related to development of future impact analyses, however, we believe that such a requirement (if finalized in future rulemaking) would impose an unnecessary burden on stakeholders and CMS.

D. Regulatory Review Costs

If regulations impose administrative costs on private entities, such as the time needed to read and interpret a rule, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that will review a rule, we assumed that the number of commenters on this final rule with comment period (1,349) will be the number of reviewers of this final rule with comment period. We acknowledge that this assumption may understate or overstate the costs of reviewing proposed rule. It is possible that not all commenters will review the proposed rule in detail, and it is also possible that some reviewers will choose not to comment on the proposed rule. Nonetheless, we believe that the number of commenters on the CY 2022 OPPS/ASC proposed rule is a fair estimate of the number of reviewers of the final rule. We welcome any comments on the approach in estimating the number of entities that will review the final rule. We also recognize that different types of entities are, in many cases, affected by mutually exclusive sections of the proposed rule and the final rule with comment period, and, therefore, for the purposes of our estimate, we assumed that each reviewer reads approximately 50 percent of the rule.

Using the wage information from the 2020 BLS for medical and health service managers (Code 11–9111), we estimated that the cost of reviewing this rule is $114.24 per hour, including overhead and fringe benefits (*https://www.bls.gov/oes/current/oes_nat.htm*). Assuming an average reading speed, we estimate that it will take approximately 8 hours for the staff to review half of final rule. For each facility that reviewed the proposed rule, the estimated cost is $913.92 (8 hours × $114.24). Therefore, we estimated that the total cost of reviewing the final rule is $17,057,493 ($913.92 × 18,664 reviewers on the CY 2022 proposed rule).

E. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities, if a rule has a significant impact on a substantial number of small entities. For purposes of the RFA, many hospitals are considered small businesses either by the Small Business Administration's size standards with total revenues of $41.5 million or less in any single year or by the hospital's not-for-profit status. Most ASCs and most CMHCs are considered small businesses with total revenues of $16.5 million or less in any single year. For details, we refer readers to the Small Business Administration's ''Table of Size Standards'' at *http://www.sba.gov/content/table-small-business-size-standards*. As its measure of significant economic impact on a substantial number of small entities, HHS uses a change in revenue of more than 3 to 5 percent. We do not believe that this threshold will be reached by the requirements in this final rule with comment period. As a result, the Secretary has determined that this final rule with comment period will not have a significant impact on a substantial number of small entities.

In addition, section 1102(b) of the Act requires us to prepare a regulatory impact analysis if a rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of a metropolitan statistical area and has 100 or fewer beds. We estimate that this final rule with comment period would increase payments to small rural hospitals by approximately 2 percent. Therefore, it should not have a significant impact on approximately 583 small rural hospitals. We note that the estimated payment impact for any category of small entity will depend on both the services that they provide as well as the payment policies and/or payment systems that may apply to them. Therefore, the most applicable estimated impact may be based on the specialty, provider type, or payment system.

The analysis above, together with the remainder of this preamble, provides a regulatory flexibility analysis and a regulatory impact analysis. We note that the policies established in this final rule with comment period apply more broadly to OPPS providers and do not specifically focus on small rural hospitals. As a result, the impact on those providers may depend more significantly on their case mix of services provided, since the broader impact on the hospital category is more dependent on the OPD update factor, as indicated in the impact table.

F. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (UMRA) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2021, that threshold level is currently approximately $158 million. This final rule with comment period does not mandate any requirements for state, local, or tribal governments, or for the private sector.

G. Conclusion

The changes we are making in this final rule with comment period will affect all classes of hospitals paid under the OPPS and will affect both CMHCs and ASCs. We estimate that most classes of hospitals paid under the OPPS will experience a modest increase or a minimal decrease in payment for services furnished under the OPPS in CY 2022. Table 84 demonstrates the estimated distributional impact of the OPPS budget neutrality requirements that would result in a 1.6 percent increase in payments for all services paid under the OPPS in CY 2022, after considering all of the changes to APC reconfiguration and recalibration, as well as the OPD fee schedule increase factor, wage index changes, including the frontier state wage index adjustment, estimated payment for outliers, and changes to the pass-through payment estimate. However, some classes of providers that are paid under the OPPS would experience more significant gains or losses in OPPS payments in CY 2022.

The updates we are making to the ASC payment system for CY 2022 would affect each of the approximately 5,600 ASCs currently approved for participation in the Medicare program. The effect on an individual ASC would depend on its mix of patients, the proportion of the ASC's patients who are Medicare beneficiaries, the degree to which the payments for the procedures offered by the ASC are changed under the ASC payment system, and the extent to which the ASC provides a different set of procedures in the coming year. Table 85 demonstrates the estimated distributional impact among ASC surgical specialties of the productivity-adjusted hospital market basket update factor of 2.0 percent for CY 2022.

H. Federalism Analysis

Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct costs on state and local governments, preempts state law, or otherwise has federalism implications. We have examined the OPPS and ASC provisions included in this final rule with comment period in accordance with Executive Order 13132, Federalism, and have determined that they will not have a substantial direct effect on state, local or tribal governments, preempt state law, or otherwise have a federalism implication. As reflected in Table 84 of this final rule with comment period, we estimate that OPPS payments to governmental hospitals (including state and local governmental hospitals) will increase by 1.7 percent under this final rule with comment period. While we do not know the number of ASCs or CMHCs with government ownership, we anticipate that it is small. The analyses we have provided in this section of this final rule with comment period, in conjunction with the remainder of this document, demonstrate that this final rule with comment period is consistent with the regulatory philosophy and principles identified in Executive Order 12866, the RFA, and section 1102(b) of the Act.

This final rule with comment period will affect payments to a substantial number of small rural hospitals and a small number of rural ASCs, as well as other classes of hospitals, CMHCs, and ASCs, and some effects may be significant. However, as noted in section XXIV.E., this final rule should not have a significant effect on small rural hospitals.

Chiquita Brooks-LaSure, Administrator of the Centers for Medicare & Medicaid Services, approved this document on October, 28, 2021.

List of Subjects

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 416

Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 419

Hospitals, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 512

Administrative practice and procedure, Health facilities, Medicare, Reporting and recordkeeping requirements.

45 CFR Part 180

Hospitals, Reporting and recordkeeping requirements.

Centers for Medicare & Medicaid Services

For the reasons set forth in the preamble, the Centers for Medicare & Medicaid Services amends 42 CFR chapter IV as set forth below:

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 1. The authority citation for part 412 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 2. Section 412.3 is amended by revising paragraph (d)(2)(i) to read as follows:

§ 412.3 Admissions.

* * * * *

(d) * * *

(2) * * *

(i) For those services and procedures removed on or after January 1, 2020, the exemption in this paragraph (d)(2) will last for 2 years from the date of such removal.

* * * * *

PART 416—AMBULATORY SURGICAL SERVICES

■ 3. The authority citation for part 416 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 4. Section 416.164 is amended by revising paragraphs (a)(4) and (b)(6) to read as follows:

§ 416.164 Scope of ASC services.

(a) * * *

(4) Drugs and biologicals for which separate payment is not allowed under the hospital outpatient prospective payment system (OPPS), with the exception of non-opioid pain management drugs and biologicals that function as a supply when used in a surgical procedure as determined by CMS under § 416.174;

* * * * *

(b) * * *

(6) Non-opioid pain management drugs and biologicals that function as a supply when used in a surgical procedure as determined by CMS under § 416.174.

* * * * *

■ 5. Section 416.166 is revised to read as follows:

§ 416.166 Covered surgical procedures.

(a) *Covered surgical procedures.* Effective for services furnished on or after January 1, 2022, covered surgical procedures are those procedures that meet the general standards described in paragraph (b) of this section (whether commonly furnished in an ASC or a physician's office) and are not excluded under paragraph (c) of this section.

(b) *General standards.* Subject to the exclusions in paragraph (c) of this section, covered surgical procedures are surgical procedures specified by the Secretary and published in the **Federal Register** and/or via the internet on the CMS website that are separately paid under the OPPS, that would not be expected to pose a significant safety risk to a Medicare beneficiary when performed in an ASC, and for which standard medical practice dictates that the beneficiary would not typically be expected to require active medical monitoring and care at midnight following the procedure.

(c) *General exclusions.* Notwithstanding paragraph (b) of this section, covered surgical procedures do not include those surgical procedures that —

(1) Generally result in extensive blood loss;

(2) Require major or prolonged invasion of body cavities;

(3) Directly involve major blood vessels;

(4) Are generally emergent or life-threatening in nature;

(5) Commonly require systemic thrombolytic therapy;

(6) Are designated as requiring inpatient care under § 419.22(n) of this chapter;

(7) Can only be reported using a CPT unlisted surgical procedure code; or

(8) Are otherwise excluded under § 411.15 of this chapter.

(d) *Additions to the list of ASC covered surgical procedures.* Surgical procedures are added to the list of ASC covered surgical procedures as follows:

(1) *Nominations.* On or after January 1, 2023, an external party may nominate a surgical procedure by March 1 of a calendar year for the list of ASC covered surgical procedures for the following calendar year.

(2) *Inclusion in rulemaking.* If CMS identifies a surgical procedure that meets the requirements at paragraph (a) of this section, including a surgical procedure nominated under paragraph (d)(1) of this section, it will propose to add the surgical procedure to the list of ASC covered surgical procedures in the next available annual rulemaking.

■ 6. Section 416.171 is amended by revising paragraphs (b)(1) and (4) to read as follows:

§ 416.171 Determination of payment rates for ASC services.

* * * * *

(b) * * *

(1) Covered ancillary services specified in § 416.164(b), with the exception of radiology services and certain diagnostic tests as provided in § 416.164(b)(5) and non-opioid pain management drugs and biologicals that function as a supply when used in a surgical procedure as determined by CMS under § 416.174.

* * * * *

(4) Notwithstanding paragraph (b)(2) of this section, procedures assigned to Low Volume APCs where the otherwise applicable payment rate calculated based on the standard methodology for such procedures described in paragraph (b) of this section would exceed the payment rate for the equivalent service set under the payment system established under part 419 of this chapter, for which the payment rate will be set at an amount equal to the amount under that payment system.

* * * * *

■ 7. Section 416.174 is added to reads as follows:

§ 416.174 Payment for non-opioid pain management drugs and biologicals that function as supplies in surgical procedures.

(a) *Eligibility for separate payment for non-opioid pain management drugs and biologicals.* Beginning on or after January 1, 2022, a non-opioid pain management drug or biological that functions as a surgical supply is eligible for separate payment if CMS determines it meets the following requirements:

(1) The drug is approved under a new drug application under section 505(c) of the Federal Food, Drug, and Cosmetic Act (FDCA), under an abbreviated new drug application under section 505(j), or, in the case of a biological product, is licensed under section 351 of the Public Health Service Act. The product has an FDA approved indication for pain management or analgesia.

(2) The per-day cost of the drug or biological must exceed the OPPS drug packaging threshold set annually through notice and comment rulemaking.

(b) [Reserved]

PART 419—PROSPECTIVE PAYMENT SYSTEM FOR HOSPITAL OUTPATIENT DEPARTMENT SERVICES

■ 8. The authority citation for part 419 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395l(t), and 1395hh.

■ 9. Section 419.22 is amended by revising paragraph (n) to read as follows:

§ 419.22 Hospital services excluded from payment under the hospital outpatient prospective payment system.

* * * * *

(n) Services and procedures that the Secretary designates as requiring inpatient care.

* * * * *

■ 10. Section 419.23 is added to read as follows:

§ 419.23 Removal of services and procedures from the Inpatient Only List.

(a) *Inpatient Only List.* CMS maintains a list of services and procedures that the Secretary designates as requiring inpatient care under § 419.22(n) that are not paid under the hospital outpatient prospective payment system. This list is referred to as the Inpatient Only List.

(b) *Removals from the Inpatient Only List.* CMS assesses annually whether a service or procedure on the Inpatient Only List described in paragraph (a) of this section should be removed from the list by determining whether the service or procedure meets at least one of the following criteria:

(1) Most outpatient departments are equipped to provide the service or procedure to the Medicare population.

(2) The simplest service or procedure described by the code may be performed in most outpatient departments.

(3) The service or procedure is related to codes that CMS has already removed from the Inpatient Only List described in paragraph (a) of this section.

(4) CMS determines that the service or procedure is being performed in numerous hospitals on an outpatient basis.

(5) CMS determines that the service or procedure can be appropriately and safely performed in an ambulatory surgical center, and is specified as a covered ambulatory surgical procedure under § 416.166 of this chapter, or CMS has proposed to specify it as a covered ambulatory surgical procedure under § 416.166 of this chapter.

■ 11. Section 419.46 is amended by revising paragraphs (f)(1) and (3) to read as follows:

§ 419.46 Participation, data submission, and validation requirements under the Hospital Outpatient Quality Reporting (OQR) Program.

* * * * *

(f) * * *

(1) Upon written request by CMS or its contractor, a hospital must submit to

CMS supporting medical record documentation that the hospital used for purposes of data submission under the program. The specific sample that a hospital must submit will be identified in the written request. A hospital must submit the supporting medical record documentation to CMS or its contractor within 30 days of the date identified on the written request, in the form and manner specified in the written request.

* * * * *

(3) CMS will select a random sample of 450 hospitals for validation purposes, and will select an additional 50 hospitals for validation purposes based on the following criteria:

(i) The hospital fails the validation requirement that applies to the previous year's payment determination; or

(ii) The hospital has an outlier value for a measure based on the data it submits. An ''outlier value'' is a measure value that is greater than 5 standard deviations from the mean of the measure values for other hospitals, and indicates a poor score; or

(iii) Any hospital that has not been randomly selected for validation in any of the previous 3 years; or

(iv) Any hospital that passed validation in the previous year, but had a two-tailed confidence interval that included 75 percent.

* * * * *

PART 512—RADIATION ONCOLOGY MODEL AND END STAGE RENAL DISEASE TREATMENT CHOICES MODEL

■ 12. The authority citation for part 512 continues to read as follows:

Authority: 42 U.S.C. 1302, 1315a, and 1395hh.

■ 13. Section 512.205 is amended by:
■ a. Adding the definition for ''Baseline period'' in alphabetical order;
■ b. Revising the definition for ''Discount factor'';
■ c. Adding definitions for ''EUC'', ''Legacy CCN'', and ''Legacy TIN'' in alphabetical order;
■ d. Revising the definition for ''Model performance period'';
■ e. Removing the definition of ''Performance year (PY)'';
■ f. Revising the definition for ''PY'' and ''Stop-loss reconciliation amount''; and
■ g. Adding definitions for ''Track One'', ''Track Two'', and ''Track Three'' in alphabetical order.

The additions and revisions read as follows:

§ 512.205 Definitions.

* * * * *

Baseline period means the three calendar year period that begins on January 1 no fewer than five years but no more than six years prior to the start of the model performance period during which episodes must initiate in order to be used in the calculation of the national base rates, each RO participant's historical experience adjustment for the PC or TC or both for the model performance period, and the RO participant's case mix adjustment for the PC or TC or both for PY1. The baseline period is January 1, 2017 through December 31, 2019, unless the RO Model is prohibited by law from starting in calendar year (CY) 2022, in which case the baseline period will be delayed based on the new model performance period (for example, if the model performance period starts any time in CY 2023, then the baseline period would be CY 2018 through CY 2020).

* * * * *

Discount factor means the percentage by which CMS reduces payment of the professional component and technical component.

(1) The reduction of payment occurs after the trend factor, the geographic adjustment, and the RO Model-specific adjustments have been applied, but before beneficiary cost-sharing and standard CMS adjustments, including sequestration, have been applied.

(2) The discount factor does not vary by cancer type.

(3) The discount factor for the professional component is 3.5 percent; the discount factor for the technical component is 4.5 percent.

* * * * *

EUC stands for ''extreme and uncontrollable circumstance'' and means a circumstance that is beyond the control of one or more RO participants, adversely impacts such RO participants' ability to deliver care in accordance with the RO Model's requirements, and affects an entire region or locale.

* * * * *

Legacy CCN means a CMS certification number (CCN) that an RO participant that is a hospital outpatient department (HOPD) or its predecessor(s) previously used to bill Medicare for included RT services but no longer uses to bill Medicare for included RT services.

Legacy TIN means a taxpayer identification number (TIN) that an RO participant that is a PGP, or a freestanding radiation therapy center, or its predecessor(s) previously used to bill Medicare for included RT services but no longer uses to bill Medicare for included RT services.

* * * * *

Model performance period means the five performance years (PYs) during which RO episodes must initiate and terminate. The model performance period begins on January 1, 2022 and ends on December 31, 2026, unless the RO Model is prohibited by law from starting on January 1, 2022, in which case the model performance period begins on the earliest date permitted by law that is January 1, April 1, or July 1.

* * * * *

PY stands for performance year and means each 12-month period beginning on January 1 and ending on December 31 during the model performance period, unless the model performance period begins on a date other than January 1, in which case, the first performance year (PY1) begins on that date and ends on December 31 of the same year.

* * * * *

Stop-loss reconciliation amount means the amount set forth in § 512.285(f) owed by CMS for the loss incurred under the Model to RO participants that have fewer than 60 episodes during the baseline period and were furnishing included RT services before the start of the model performance period in the CBSAs selected for participation.

* * * * *

Track One means a track for Professional participants and Dual participants that meet all RO Model requirements as specified in § 512.220, including use of CEHRT.

Track Two means a track for Professional participants and Dual participants that meet all RO Model requirements as specified in § 512.220, except for use of CEHRT.

Track Three means a track for Professional participants and Dual participants who do not meet one or more of the RO Model requirements set forth at § 512.220(a); and for all Technical participants.

* * * * *

■ 14. Section 512.210 is amended by —
■ a. Revising paragraphs (a) and (b)(5).
■ b. Adding paragraph (b)(6);
■ c. Revising paragraph (c); and
■ d. Adding paragraph (e).

The revisions and additions read as follows:

§ 512.210 RO participants and geographic areas.

(a) *RO participants.* Unless otherwise specified in paragraph (b) or (c) of this section, any Medicare-enrolled PGP, freestanding radiation therapy center, or HOPD that furnishes included RT services in a 5-digit ZIP Code linked to a CBSA selected for participation to an

RO beneficiary for an RO episode that begins and ends during the model performance period must participate in the RO Model.

(b) * * *

(5) Participates in the Pennsylvania Rural Health Model; or

(6) Participates in the Community Transformation Track of the Community Health Access and Rural Transformation (CHART) Model as a participating hospital.

(c) *Low volume opt-out.* A PGP, freestanding radiation therapy center, or HOPD that would otherwise be required to participate in the RO Model may choose to opt-out of the RO Model as follows:

(1) If the PGP, freestanding radiation therapy center, or HOPD furnished fewer than 20 episodes in the calendar year that is two years prior to the start of PY1 across all CBSAs selected for participation, it may opt out of the RO Model for PY1.

(2) If the PGP, freestanding radiation therapy center, or HOPD furnished fewer than 20 episodes in the calendar year that is two years prior to the start of PY2 across all CBSAs selected for participation, it may opt out of the RO Model for PY2.

(3) If the PGP, freestanding radiation therapy center, or HOPD furnished fewer than 20 RO episodes in PY1 across all CBSAs selected for participation, and PY1 begins on January 1, it may choose to opt out of the RO Model for PY3. In the event that PY1 begins on a date other than January 1, the PGP, freestanding radiation therapy center, or HOPD may opt-out of the RO Model for PY3 if the total number of furnished episodes of the calendar year in which PY1 began and RO episodes in PY1 is fewer than 20 across all CBSAs selected for participation.

(4) If the PGP, freestanding radiation therapy center, or HOPD furnished fewer than 20 RO episodes in PY2 across all CBSAs selected for participation, it may opt out of the RO Model for PY4.

(5) If the PGP, freestanding radiation therapy center, or HOPD furnished fewer than 20 RO episodes in PY3 across all CBSAs selected for participation, it may opt out of the RO Model for PY5.

(6) At least 30 days prior to the start of each PY, CMS provides notice to RO participants eligible for the low volume opt-out for the upcoming PY of such eligibility. The RO participant must attest that it intends to opt out of the RO Model prior to the start of the upcoming PY.

(7) An entity is not eligible for the low-volume opt out if its current TIN or CCN, or its legacy TIN or legacy CCN, or both were used to bill Medicare for 20 or more episodes or RO episodes, as applicable, of RT services in the two years prior to the applicable PY across all CBSAs selected for participation.

* * * * *

(e) *Notice of change in TIN or CCN.* An RO participant must furnish written notice to CMS in a form and manner specified by CMS at least 90 days before the effective date of any change in TIN or CCN that is used to bill Medicare.

■ 15. Section 512.217 is amended —

■ a. By revising paragraphs (a), (b), and (c)(1);

■ b. In paragraph (c)(3)(i) by removing the word ''and'' at the end of the paragraph;

■ c. In paragraph (c)(3)(ii) by removing the period at the end of the paragraph and adding ''; and'' in its place; and

■ d. By revising paragraphs (d)(1)(i) and (d)(2)(i).

The revisions and addition read as follows:

§ 512.217 Identification of individual practitioners.

(a) *General.* Upon the start of each PY, CMS creates and provides to each RO participant that is a PGP or a freestanding radiation therapy center an individual practitioner list identifying by NPI each individual practitioner associated with the RO participant. For RO participants that begin participation in the RO Model after the start of a PY, but at least 30 days prior to the last QP determination date as specified at § 414.1325 of this chapter, CMS creates and provides an individual practitioner list to that RO participant.

(b) *Review of individual practitioner list.* Up until the last QP determination date as specified at § 414.1325 of this chapter, the RO participant must review the individual practitioner list, correct any inaccuracies in accordance with paragraph (d) of this section, and certify the list (as corrected, if applicable) in a form and manner specified by CMS and in accordance with paragraph (c) of this section. The RO participant may correct any inaccuracies in its individual practitioner list until the last QP determination date as specified at § 414.1325 of this chapter. Any Dual participant, Professional participant, or Technical participant that is a freestanding radiation therapy center and joins the RO Model after the start of a PY must review and certify its individual practitioner list by the last QP determination date as specified at § 414.1325 of this chapter.

(c) * * *

(1) Up until the last QP determination date as specified at § 414.1325 of this chapter, an individual with the authority to legally bind the RO participant must certify the accuracy, completeness, and truthfulness of the individual practitioner list to the best of his or her knowledge, information, and belief.

* * * * *

(d) * * *

(1) * * *

(i) An RO participant must notify CMS of an addition to its individual practitioner list when an eligible clinician reassigns his or her rights to receive payment from Medicare to the RO participant. The notice must be submitted in the form and manner specified by CMS up until the last QP determination date as specified at § 414.1325 of this chapter.

* * * * *

(2) * * *

(i) An RO participant must notify CMS when an individual on the RO participant's individual practitioner list ceases to be an individual practitioner up until the last QP determination date as specified at § 414.1325 of this chapter. The notice must be submitted in the form and manner specified by CMS.

* * * * *

■ 16. Section 512.220 is amended by revising paragraphs (a)(1) and (b) to read as follows:

§ 512.220 RO participant compliance with RO Model requirements.

(a) * * *

(1) An RO participant must satisfy the requirements of this section to be included in Track One under the RO Model in a particular PY. An RO participant that meets all of these RO Model requirements in a particular PY, excluding use of CEHRT, will be in Track Two for such PY. An RO participant that does not meet one or more of the RO Model requirements in paragraph (a) of this section in a particular PY will be in Track Three for such PY.

* * * * *

(b) *CEHRT.* (1) RO participants must use CEHRT, and ensure that their individual practitioners use CEHRT, in a manner sufficient to meet the applicable requirements of the Advanced APM criteria as specified at § 414.1415(a)(1)(i) of this chapter.

(2) Within 30 days of the start of PY1 and each subsequent PY, the RO participant must certify its use of CEHRT throughout such PY in a manner sufficient to meet the requirements set

forth in § 414.1415(a)(1)(i) of this chapter.

(3) An RO participant that joins the RO Model at any time during an ongoing PY must certify their use of CEHRT by the last QP determination date as specified at § 414.1325 of this chapter.

■ 17. Section 512.230 is amended by revising paragraphs (a) and (b) to read as follows:

§ 512.230 Criteria for determining cancer types.

(a) *Included cancer types.* CMS includes in the RO Model cancer types that satisfy the following criteria:

(1) The cancer type is commonly treated with radiation per nationally recognized, evidence-based clinical treatment guidelines;

(2) The cancer type has one or more associated current ICD–10 codes that have demonstrated pricing stability; and

(3) The Secretary has not determined that the cancer type is not suitable for inclusion in the RO Model.

(b) *Removing cancer types.* CMS removes cancer types in the RO Model if it determines:

(1) That there is a ≥10 percent error in established national base rates; or

(2) The cancer type does not meet the criteria set forth in paragraph (a) of this section.

* * * * *

■ 18. Section 512.240 is revised to read as follows:

§ 512.240 Included modalities.

The modalities included in the RO Model are 3-dimensional conformal RT (3DCRT), intensity-modulated RT (IMRT), stereotactic radiosurgery (SRS), stereotactic body RT (SBRT), proton beam therapy (PBT), and image-guided radiation therapy (IGRT).

■ 19. Section 512.245 is amended by revising paragraph (a) to read as follows:

§ 512.245 Included RO episodes.

(a) *General.* Any RO episode that begins on or after the first day of the model performance period and ends on or before the last day of the model performance period is included in the model performance period.

* * * * *

■ 20. Section 512.250 is amended by revising (b)(1) and (2) to read as follows:

§ 512.250 Determination of national base rates.

* * * * *

(b) * * *

(1) CMS excludes from episode pricing and RO episode pricing any claim containing an RT service furnished:

(i) In Maryland, Vermont, or any of the U.S. Territories;

(ii) In the inpatient setting;

(iii) By an entity classified as an ASC, CAH, or PPS-exempt cancer hospital; or

(iv) By an HOPD participating in the Pennsylvania Rural Health Model at the time the RT service was furnished.

(2) CMS excludes the following episodes from the determination of the national base rates:

(i) Episodes that are not linked to a CBSA selected for participation in the RO Model;

(ii) Episodes that are not attributed to an RT provider or RT supplier;

(iii) Episodes that are not assigned an included cancer type; or

(iv) Episodes for which the total allowed amount for RT services listed on claims used to calculate an episode's payment amount is not greater than $0.

* * * * *

■ 21. Section 512.255 is amended by—

■ a. Revising paragraphs (c)(7), (8), and (10), (c)(12)(iv), and (c)(13); and

■ b. Adding paragraph (c)(14).

The revisions and addition read as follows:

§ 512.255 Determination of participant-specific professional episode payment and participant-specific technical episode payment amounts.

* * * * *

(c) * * *

(7) *Adjustments for RO participants with fewer than 60 episodes during the baseline period.* (i) RO participants that have fewer than 60 episodes in the baseline period do not receive a historical experience adjustment during the model performance period.

(ii) RO participants that have fewer than 60 episodes in the baseline period do not receive a case mix adjustment for PY1.

(iii) RO participants that have fewer than 60 episodes in the baseline period that continue to have fewer than 60 episodes in the rolling 3-year period used to determine the case mix adjustment for each PY and that have never received a case mix adjustment do not receive a case mix adjustment for that PY.

(iv) RO participants that have fewer than 60 episodes in the baseline period and were furnishing included RT services in the CBSAs selected for participation before the start of the model performance period are eligible to receive a stop-loss reconciliation amount, if applicable, as described in § 512.285(f).

(8) *Discount factor.* CMS reduces each episode payment by the discount factor after applying the trend factor, geographic adjustment, and case mix and historical experience adjustments to the national base rate.

* * * * *

(10) *Quality withhold.* In accordance with § 414.1415(b)(1) of this chapter, CMS withholds 2 percent from each professional episode payment after applying the trend factor, geographic adjustment, case mix and historical experience adjustments, and discount factor to the national base rate. RO participants may earn back this withhold, in part or in full, based on their AQS.

* * * * *

(12) * * *

(iv) In the case of incomplete episodes, the beneficiary coinsurance payment equals 20 percent of the FFS amounts that would have been paid in the absence of the RO Model for the services furnished by the RO participant that initiated the PC and the RO participant that initiated the TC (if applicable).

* * * * *

(13) *Sequestration.* In accordance with applicable law, CMS deducts a percentage from each episode payment after applying the trend factor, geographic adjustment, case mix and historical experience adjustments, discount, withholds, and coinsurance to the national base rate.

(14) *Modifications to the participant-specific adjustments for changes in TINs or CCNs.* (i) CMS calculates the RO participant's case mix adjustments in accordance with paragraph (c)(3) of this section based on all episodes and RO episodes, as applicable, attributed to the RO participant's legacy TIN(s) or legacy CCN(s), and current TIN or CCN, during the 3-year period that determines the case mix adjustment for each PY.

(ii) CMS calculates the RO participant's historical experience adjustments in accordance with paragraph (c)(4) of this section based on all episodes attributed to the RO participant's legacy TIN(s) or legacy CCN(s), and current TIN or CCN, during the baseline period.

■ 22. Section 512.275 is amended by adding paragraph (d) to read as follows:

§ 512.275 Quality measures, clinical data, and reporting.

* * * * *

(d) *Technical participants and reporting of quality measures and clinical data elements.* Technical participants that are freestanding radiation therapy centers and also begin furnishing the professional component during the model performance period must:

(1) Notify CMS no later than 30 days after the technical participant begins

furnishing the professional component, in a form and manner specified by CMS; and

(2) Report quality measures and clinical data elements by the next submission period, as described in paragraph (c) of this section.

§ 512.280 [Amended]

■ 23. Section 512.280 is amended by removing and reserving paragraph (f)(4) to read as follows:

§ 512.280 RO Model Medicare Program Waivers

* * * * *

(f) * * *

(4) [Reserved]

* * * * *

■ 24. Section 512.285 is amended by revising paragraphs (c)(3), (c)(4)(i) and (ii), (d), and (f) introductory text to read as follows:

§ 512.285 Reconciliation process.

* * * * *

(c) * * *

(3) *Total incomplete episode amount.* For incomplete episodes initiated in the PY, CMS determines the total incomplete episode amount by calculating the difference between the following amounts:

(i) The sum of all FFS amounts that would have been paid to the RO participant in the absence of the RO Model for any included RT services furnished during such incomplete episodes, as determined by no-pay claims. CMS owes this sum to the RO participant for such incomplete episodes.

(ii) The sum of the participant-specific episode payment amounts paid to the RO participant for such incomplete episodes initiated in the PY.

(4) * * *

(i) If the sum described in paragraph (c)(3)(i) of this section is more than the sum described in paragraph (c)(3)(ii) of this section, the difference is subtracted from the total duplicate RT services amount described in paragraph (c)(2) of this section and the resulting amount is the total incorrect episode payment amount.

(ii) If the sum described in paragraph (c)(3)(i) of this section is less than the sum described in paragraph (c)(3)(ii) of this section, the difference is added to the total duplicate RT services amount described in paragraph (c)(2) of this section and the resulting amount is the total incorrect episode payment amount.

* * * * *

(d) *Quality reconciliation payment amount.* For Professional participants and Dual participants, CMS determines the quality reconciliation payment amount for each PY by multiplying the participant's AQS (as a percentage) by the total quality withhold amount for all RO episodes initiated during the PY.

* * * * *

(f) *Stop-loss reconciliation amount.* CMS determines the stop-loss reconciliation amount for RO participants that have fewer than 60 episodes during the baseline period and were furnishing included RT services before the start of the model performance period in the CBSAs selected for participation by—

* * * * *

■ 25. Section 512.292 is added to read as follows:

§ 512.292 Overlap with other models tested under Section 1115A and CMS programs.

Participant-specific professional episode payments and Participant-specific technical episode payments made under the RO Model are not adjusted to reflect payments made under models being tested under 1115A of the Act or the Medicare Shared Savings Program under section 1899 of the Act.

■ 26. Section 512.294 is added to read as follows:

§ 512.294 Extreme and uncontrollable circumstances.

(a) *General.* If CMS determines that there is an EUC pursuant to paragraph (b) of this section, CMS may grant RO participants exceptions to the RO Model requirements under paragraph (c) of this section and revise the RO Model's pricing methodology under paragraphs (e) and (f) of this section.

(b) *Determination factors.* CMS determines whether there is an EUC based on the following factors:

(1) Whether the RO participants are furnishing services within a geographic area considered to be within an ''emergency area'' during an ''emergency period'' as defined in section 1135(g) of the Social Security Act;

(2) Whether the geographic area within a county, parish, U.S. territory, or tribal government designated under the Stafford Act served as a condition precedent for the Secretary's exercise of the 1135 waiver authority, or the National Emergencies Act; or

(3) Whether a state of emergency has been declared in the geographic area.

(c) *Modified requirements.* CMS may grant RO Participants exceptions to the following RO Model requirements:

(1) *Reporting requirements.* CMS may delay or exempt RO participants from one or more of the RO Model's quality measure or clinical data element reporting requirements if an EUC impacts the RO participants' ability to comply with quality measure or clinical data element reporting requirements.

(2) *Other requirements.* CMS may issue a notice on the RO Model website that may waive compliance with or modify the following RO Model requirements:

(i) The requirement set forth at § 512.220(a)(2)(vii) that RO participants provide Peer Review (audit and feedback on treatment plans).

(ii) The requirement set forth at § 512.220(a)(3) that RO participants actively engage with an AHRQ-listed patient safety organization (PSO).

(d) *Model performance period.* If CMS determines that the EUC affects the United States and if CMS determines that the EUC would impact RO participants' ability to implement the requirements of the RO Model prior to the start of the model performance period, CMS may amend the model performance period.

(e) *Trend factor.* If CMS determines that the EUC affects the entire United States, and if CMS determines that as a result of the EUC, the trend factor (specific to the PC, TC, or both for an included cancer type) for the upcoming PY has increased or decreased by more than 10 percent compared to the corresponding trend factor of the previous CY when FFS payment rates are held constant with the previous CY, CMS may modify the trend factor calculation for the PC, TC, or both the PC and TC of an included cancer type in a manner that ensures the trend factor is consistent with the average utilization from the previous CY.

(f) *Quality withhold.* In response to a national, regional, or local event, CMS may adjust the quality withhold by choosing to repay the quality withhold during the next reconciliation and award all possible points in the subsequent AQS calculation amount or to not apply the quality withhold to RO Model payments during the EUC if CMS removes the quality measure and clinical data element reporting requirements pursuant to paragraph (c)(1) of this section.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

For the reasons set forth in the preamble, the Department of Health and Human Services amends 45 CFR part 180 as set forth below:

PART 180—HOSPITAL PRICE TRANSPARENCY

■ 27. The authority citation for part 180 continues to read as follows:

Authority: 42 U.S.C. 300gg–18, 42 U.S.C. 1302.

■ 28. Section 180.20 is amended by adding a definition for ''State forensic hospital'' in alphabetical order to read as follows:

§ 180.20 Definitions.

* * * * *

State forensic hospital means a public psychiatric hospital that provides treatment for individuals who are in the custody of penal authorities.

* * * * *

■ 29. Section 180.30 is amended—

■ a. In paragraph (b) introductory text by removing the phrase ''Federally owned or operated hospitals'' and adding in its place the phrase ''Federal and State hospitals''; and

■ b. By adding paragraph (b)(3).

The addition reads as follows:

§ 180.30 Applicability.

* * * * *

(b) * * *

(3) State forensic hospitals that provide treatment exclusively to individuals who are in the custody of penal authorities.

* * * * *

■ 30. Section 180.50 is amended—

■ a. In paragraph (d)(3)(ii) by removing the word ''and'' at the end of the paragraph;

■ b. In paragraph (d)(3)(iii) by removing the period at the end of the paragraph and adding ''; and'' in its place; and

■ c. By adding paragraph (d)(3)(iv).

The addition reads as follows:

§ 180.50 Requirements for making public hospital standard charges for all items and services.

* * * * *

(d) * * *

(3) * * *

(iv) To automated searches and direct file downloads through a link posted on a publicly available website.

* * * * *

■ 31. Section 180.90 is amended by revising paragraph (c)(2) to read as follows:

§ 180.90 Civil monetary penalties.

* * * * *

(c) * * *

(2) CMS determines the daily dollar amount for a civil monetary penalty for which a hospital may be subject as follows:

(i) For each day during Calendar Year 2021 that a hospital is determined by CMS to be out of compliance, the maximum daily dollar amount for a civil monetary penalty to which the hospital may be subject is $300. Even if the hospital is in violation of multiple discrete requirements of this part, the maximum total sum that a single hospital may be assessed per day is $300.

(ii) Beginning January 1, 2022, for each day a hospital is determined by CMS to be out of compliance:

(A) For a hospital with a number of beds equal to or less than 30, the maximum daily dollar civil monetary penalty amount to which it may be subject is $300, even if the hospital is in violation of multiple discrete requirements of this part.

(B) For a hospital with at least 31 and up to and including 550 beds, the maximum daily dollar civil monetary penalty amount to which it may be subject is the number of beds times $10, even if the hospital is in violation of multiple discrete requirements of this part.

(C) For a hospital with a number of beds greater than 550, the maximum daily dollar civil monetary penalty amount to which it may be subject is $5,500, even if the hospital is in violation of multiple discrete requirements of this part.

(D)(*1*) CMS will use the most recently available, finalized Medicare hospital cost report to determine the number of beds for a Medicare-enrolled hospital, for purposes of determining the maximum daily dollar civil monetary penalty amount under paragraph (c)(2) of this section.

(*2*) If the number of beds for the hospital cannot be determined according to paragraph (c)(2)(ii)(D)(*1*) of this section, CMS will request that the hospital provide documentation of its number of beds, in a form and manner and by the deadline prescribed by CMS in a written notice provided to the hospital. Should the hospital fail to provide CMS with this documentation in the prescribed form and manner, and by the specified deadline, CMS will impose on the hospital the maximum daily dollar civil monetary penalty amount according to paragraph (c)(2)(ii)(C) of this section.

* * * * *

Dated: October 29, 2021.

Xavier Becerra,

Secretary, Department of Health and Human Services.

[FR Doc. 2021–24011 Filed 11–2–21; 4:15 pm]

FEDERAL REGISTER

Vol. 86 Tuesday,

No. 218 November 16, 2021

Part III

Department of the Interior

Fish and Wildlife Service

50 CFR Part 17

Endangered and Threatened Wildlife and Plants; Threatened Species Status With Section 4(d) Rule for Atlantic Pigtoe and Designation of Critical Habitat; Final Rule

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 17

[Docket No. FWS–R4–ES–2018–0046; FF09E21000 FXES1111090FEDR 223]

RIN 1018–BD12

Endangered and Threatened Wildlife and Plants; Threatened Species Status With Section 4(d) Rule for Atlantic Pigtoe and Designation of Critical Habitat

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: We, the U.S. Fish and Wildlife Service (Service), list the Atlantic pigtoe, (*Fusconaia masoni*), a freshwater mussel species from Virginia and North Carolina, as a threatened species with a rule issued under section 4(d) of the Endangered Species Act of 1973 (Act), as amended. We also designate critical habitat for the species under the Act. In total, approximately 563 river miles (906 river kilometers) fall within 17 units of critical habitat in Bath, Botetourt, Brunswick, Craig, Dinwiddie, Greensville, Halifax, Lunenburg, Mecklenburg, Nottoway, Pittsylvania, and Sussex Counties, Virginia, and in Durham, Edgecombe, Franklin, Granville, Halifax, Johnston, Montgomery, Nash, Orange, Person, Pitt, Randolph, Rockingham, Vance, Wake, Warren, and Wilson Counties, North Carolina. This rule extends the Act's protections to the species and its designated critical habitat.

DATES: This rule is effective December 16, 2021.

ADDRESSES: This final rule is available on the internet at *http://www.regulations.gov* under Docket No. FWS–R4–ES–2018–0046. Comments and materials we received, as well as supporting documentation we used in preparing this rule, are available for public inspection at *http://www.regulations.gov.*

The coordinates or plot points from which the maps are generated are included in the decision file for this critical habitat designation and are available at *http://www.regulations.gov* at Docket No. FWS–R4–ES–2018–0046 and the shapefiles for the critical habitat designation are available on the Service's Environmental Conservation Online System (ECOS) website at *http://ecos.fws.gov/ecp/species/5164.* Any additional tools or supporting information that we developed for this critical habitat designation will also be available at the Service's website set out above or at *http://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: Pete Benjamin, Field Supervisor, U.S. Fish and Wildlife Service, Raleigh Ecological Services Field Office, 551F Pylon Drive, Raleigh, NC 27606; telephone 919–816–6408. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service at 800–877–8339.

SUPPLEMENTARY INFORMATION:

Executive Summary

Why we need to publish a rule. Under the Act, if we determine that a species is an endangered or threatened species throughout all or a significant portion of its range, we are required to promptly publish a proposal to list the species in the **Federal Register** and make a determination on our proposal within one year. If there is substantial disagreement regarding the sufficiency and accuracy of the available data relevant to the proposed listing, we may extend the final determination for not more than six months. To the maximum extent prudent and determinable, we must designate critical habitat for any species that we determine to be an endangered or threatened species under the Act. When we list a species as a threatened species, we issue such regulations as deemed necessary and advisable to provide for the conservation of such species. In addition, we may by regulation prohibit with respect to any threatened species any act prohibited under section 9(a)(1) of the Act for endangered species. Listing a species as an endangered or threatened species, designation of critical habitat, and protection of threatened species can only be completed by issuing a rule.

What this document does. This rule finalizes the listing of the Atlantic pigtoe (*Fusconaia masoni*) as a threatened species with a rule issued under section 4(d) of the Act (a ''4(d) rule'') and designates critical habitat in 17 units totaling approximately 563 river miles (906 river kilometers (km)) within portions of 12 counties in Virginia and 17 counties in North Carolina.

The basis for our action. Under section 4(a)(1) of the Act, we may determine that a species is an endangered or threatened species based on any of five factors: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence. We have determined that habitat degradation (Factor A), resulting from the cumulative impacts of land use change and associated watershed-level effects on water quality, water quantity, habitat connectivity, and instream habitat suitability, poses the largest risk to the future viability of the Atlantic pigtoe. This stressor primarily consists of habitat changes: The buildup of fine sediments, the loss of flowing water, instream habitat fragmentation, and impairment of water quality, and it is exacerbated by the effects of climate change (Factor E). Further, the existing regulatory mechanisms are not adequate to reduce these threats so that the species would not warrant listing (Factor D).

Section 4(a)(3) of the Act requires the Secretary of the Interior (Secretary) to designate critical habitat concurrent with listing to the maximum extent prudent and determinable. Section 3(5)(A) of the Act defines critical habitat as (i) the specific areas within the geographical area occupied by the species, at the time it is listed, on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protections; and (ii) specific areas outside the geographical area occupied by the species at the time it is listed, upon a determination by the Secretary that such areas are essential for the conservation of the species. Section 4(b)(2) of the Act states that the Secretary must make the designation on the basis of the best scientific data available and after taking into consideration the economic impact, the impact on national security, and any other relevant impacts of specifying any particular area as critical habitat.

Economic analysis. In accordance with section 4(b)(2) of the Act, we prepared an economic analysis of the impacts of designating critical habitat. On October 11, 2018, we published an announcement of, and solicited public comments on, the draft economic analysis (83 FR 51570). The September 22, 2020, revisions to proposed critical habitat (85 FR 59487) did not affect the economic analysis because the impacts on the counties with new proposed units were already factored into the original analysis. We received no comments on the draft economic analysis and adopted the draft economic analysis as final.

Peer review and public comment. Prior to development of our October 11, 2018, proposed rule, we received peer reviews of the Species Status

Assessment (SSA) report from two experts, which informed our assessment that we used for this rulemaking. Information we received from peer review is incorporated into this final rule. We also considered all comments and information we received from the public during two public comment periods.

Previous Federal Actions

Please refer to the proposed listing rule for the Atlantic pigtoe (83 FR 51570) for a detailed description of previous Federal actions concerning this species. We published a proposed listing, 4(d) rule, and critical habitat designation for the Atlantic pigtoe on October 11, 2018 (83 FR 51570); we accepted public comments on the proposed rule for 60 days, ending December 10, 2018. Based on information we received during the public comment period, on September 22, 2020, we proposed a revised 4(d) rule and critical habitat designation for the Atlantic pigtoe (85 FR 59487); we accepted public comments on the proposed revisions as well as the October 11, 2018, proposed rule for 30 days, ending October 22, 2020. Please refer to the October 11, 2018, and September 22, 2020, documents for detailed descriptions of other previous Federal actions concerning this species.

Supporting Documents

An SSA team prepared an SSA report for the Atlantic pigtoe. The SSA team was composed of Service biologists, in consultation with other species experts. The SSA report represents a compilation of the best scientific and commercial data available concerning the status of the Atlantic pigtoe, including the impacts of past, present, and future factors (both negative and beneficial) affecting the species. The SSA report and other materials relating to this rule can be found *at http://www.regulations.gov* under Docket No. FWS–R4–ES–2018–0046.

Summary of Changes From the Proposed Rule

This final rule incorporates several changes to our proposed rule (83 FR 51570; October 11, 2018) based on the comments we received during that proposal's 60-day comment period as well as during the reopened public comment (see 85 FR 59487; September 22, 2020), which are summarized below under Summary of Comments and Recommendations. Minor, nonsubstantive changes and corrections were made throughout this rule in response to comments. Based on these comments, we also incorporated as appropriate new information into our SSA report, including updated survey information. The information we received during both public comment periods did not change our determination that the Atlantic pigtoe is a threatened species.

We received substantive comments on the proposed 4(d) rule and critical habitat designation, and we made changes to both of these as a result. We made changes to the 4(d) rule exceptions to the incidental take prohibitions as follows:

- For incidental take resulting from species restoration efforts by State wildlife agencies, we now include monitoring, which is necessary to determine the success of captive propagation and stocking efforts;
- For channel restoration projects, we remove erroneous mention of second- to third-order streams, and we add language to require surveys for and relocation of Atlantic pigtoe observed prior to commencement of restoration action;
- For bank stabilization projects, we add a requirement that appropriate ''native'' vegetation, including woody and herbaceous species appropriate for the region and habitat, be used for stabilization; and
- For forestry-related actions, we use alternative language provided by NCFS and VDOF (see *(13) Comment* under Summary of Comments and Recommendations, below).

We have also changed the way in which the provisions of the 4(d) rule will appear at 50 CFR 17.45(a). We no longer generally refer to the 50 CFR 17.31 prohibitions and exceptions to those prohibitions, but instead specify the applicable prohibitions in the 4(d) rule. In addition, for clarity and readability, we present separate lists for the general exceptions to the prohibitions and the exceptions from prohibitions for specific types of incidental take. However, these changes are simply formatting changes and do not affect the substance of the 4(d) rule.

For the critical habitat designation, we removed proposed Unit 3 (Middle James River) based on comments received from the VADWR (see *(9) Comment* under Summary of Comments and Recommendations, below). This removal changes the numbering of all following units (Units 4 through 18 become Units 3 through 17); therefore, revisions to the proposed critical habitat designation described in the September 22, 2020, document (85 FR 59487) differ slightly, but only by unit numbering, than as presented in this rule. We added two critical habitat units (Sappony Creek Unit (now Unit 3) and Little Grassy Creek Unit (now Unit 8)) and modified four units (Nottoway River Subbasin (now Unit 4), Dan River (now Unit 6), Upper/Middle Tar River Subbasin (now Unit 9), Sandy/Swift Creek (now Unit 10)) of the critical habitat designation for Atlantic pigtoe, for a total critical habitat designation of 563 river miles (906 river kilometers), an increase of 21 river miles (34 river kilometers) from the October 11, 2018, proposed designation.

We also added information about regulatory mechanisms to Factors Influencing Atlantic Pigtoe Viability (below), including information about state endangered species laws, state and federal stream protections, and state and federal water quality programs.

Summary of Comments and Recommendations

In the October 11, 2018, and September 22, 2020, proposed rules, we requested that all interested parties submit written comments. We also contacted appropriate Federal and State agencies, scientific experts and organizations, and other interested parties and invited them to comment on the proposed rules. Newspaper notices inviting general public comment were published in the USA Today legal notice section on October 25, 2018, and October 1, 2020. Although we invited requests for a public hearing in both proposed rules, we did not receive any requests for a public hearing. All substantive information received during both comment periods has either been incorporated directly into this final determination or is addressed below. For topics we received comments on during both comment periods, we specify whether the comments were received as part of the initial comment period (October 11–December 10, 2018) or the reopened comment period (September 22–October 22, 2020).

Peer Reviewer Comments

In accordance with our peer review policy published on July 1, 1994 (59 FR 34270), and our August 22, 2016, memorandum updating and clarifying the role of peer review of listing actions under the Act, we solicited expert opinion regarding the SSA report from six knowledgeable individuals with scientific expertise that included familiarity with Atlantic pigtoe and its habitat, biological needs, and threats. We received responses from two of those individuals. We reviewed all comments we received from the peer reviewers for substantive issues and new information regarding the information contained in the SSA report. The peer reviewers generally

concurred with our methods and conclusions, and provided additional information, clarifications, and suggestions to improve the SSA report. Peer reviewer comments are addressed in the following summary and were incorporated into the SSA report as appropriate.

(1) Comment: One peer reviewer noted that redundancy calculations provided in the Summary Table of the SSA report were confusing and asked us to clarify changes in redundancy for current condition.

Our Response: Because redundancy relates to the number and distribution of populations, we used the number of occupied watersheds, or HUCs (Hydrologic Unit Codes), to clarify changes in redundancy, as summarized in Table ES–1 of the SSA report. For current condition, there has been a 60 percent reduction in redundancy across the species' historical range (*i.e.,* 31 out of 81 HUCs are now currently occupied; 31/81 = 0.4, which equates to a reduction of 0.6 or 60 percent).

State Agency Comments

We received comments from six State agencies: The North Carolina Wildlife Resources Commission (NCWRC), the Georgia Department of Natural Resources (GADNR), the Virginia Department of Wildlife Resources (VADWR), the South Carolina Department of Natural Resources (SCDNR), the North Carolina Forest Service (NCFS), and the Virginia Department of Forestry (VDOF). Because we received several comments from both NCFS and VDOF and the public regarding forestry considerations, we address most NCFS and VDOF comments in the *Public Comments* section, below.

(2) Comment: The GADNR recommended we use an occupancy model analysis to inform our population factors.

Our Response: Occupancy modeling relies on multiple visits to the same site over time, thus allowing for an estimation of detection. At the time of SSA analysis (2015–2016), the available rangewide data were not conducive for use with occupancy models. We did not receive additional occupancy data during the public comment periods that would allow us to conduct an occupancy model analysis.

(3) Comment: The NCWRC noted that it has not been able to do intensive surveys for Atlantic pigtoe in portions of the Cape Fear River Basin. It suggested that the Optimistic Scenario consider the potential to find additional populations in the Piedmont to reflect that the species exists in areas where surveys have not been updated and habitat conditions have not changed.

Our Response: The narrative portion of the SSA report acknowledges the possibility of finding new locations for the species. However, those findings are not reflected in the Scenario table because the potential future abundances are not known and therefore cannot be incorporated into future condition categorization.

(4) Comment: The NCWRC commented that several areas within the known range of the Atlantic pigtoe have not been surveyed sufficiently since 2005 to conclude that the species is not present.

Our Response: We recognize that detection is imperfect; therefore, we involved NCWRC biologists in the development of the SSA report and sought their input into the decision to use 2005 as the earliest date for ''current.'' This year was selected based on the perceived adequacy of survey effort from 2005–2015 for justifying current species presence/absence conclusions. Ultimately, we relied on data provided by each state's agency biologists to develop the distribution and abundance heat maps contained in Appendix B of the SSA report.

(5) Comment: The NCWRC noted that many of the critical habitat reaches lack definable limits that can be precisely described and recommended that critical habitat units start and end at distinct locations, such as tributary confluences or road crossings.

Our Response: For the purposes of this rule, critical habitat reaches are defined based on Natural Heritage species ''element occurrences.'' An element occurrence is an area of land and/or water in which a species or ecological community is present. Since these comprise the best available scientific information, we used them for unit boundaries rather than relying on a tributary confluence or road crossing. Both coordinates or plot points from which the maps are generated and shapefiles are available (see **ADDRESSES**, above) to help users precisely identify limits on a map.

(6) Comment: The NCWRC recommended the 4(d) rule be clarified to state that provisions of sections 7 and 9(a)(1) of the Act will not apply to those areas where Atlantic pigtoe are stocked by NCWRC or Service biologists into unoccupied habitat. This clarification will allow biologists to stock Atlantic pigtoe in suitable yet currently unoccupied habitat within the species' historical range without these restored populations being subject to the provisions of sections 7 and 9(a)(1) of the Act.

Our Response: We recognize the special and unique relationship with our State natural resource agency partners in contributing to conservation of listed species. Therefore, under the final 4(d) rule, any qualified employee or agent of a State conservation agency, that is a party to a cooperative agreement with the Service in accordance with section 6(c) of the Act, and who is designated by his or her agency for such purposes, will be able to conduct activities designed to conserve Atlantic pigtoe that may result in otherwise prohibited take without additional authorization.

Nothing in this final 4(d) rule changes in any way the consultation requirements under section 7 of the Act. However, interagency cooperation may be further streamlined through planned programmatic consultations for the species between Federal agencies and the Service, where appropriate.

(7) Comment: The NCWRC provided recommendations, with supporting data, to revise the 4(d) rule language by adding (a) monitoring to the species restoration exception for incidental take; (b) language to the channel restoration exception for incidental take that requires surveys for and relocation of Atlantic pigtoe observed prior to commencement of restoration action; and (c) language to the incidental take exception resulting from bank stabilization projects to add a requirement that appropriate ''native'' vegetation, including woody and herbaceous species appropriate for the region and habitat, be used for stabilization.

Our Response: The suggested revisions are important considerations to include in the exceptions outlined and provide for the conservation of the Atlantic pigtoe, therefore we made the suggested revisions to the 4(d) rule.

(8) Comment: The NCWRC provided recommendations, with supporting data, to revise several critical habitat units, truncating two units (*i.e.,* removing 3.8 river miles from Upper/Middle Tar River Subbasin and 8.2 river miles from Sandy/Swift Creek), adding occupied habitat to two units (10 river miles to Upper/Middle Tar River Subbasin and 7 river miles to Dan River), and creating a new unit (Little Grassy Creek). During the reopened comment period, the VADWR suggested the removal of the Middle James River critical habitat unit, noting that the last detection of living Atlantic pigtoe in that reach was in the late 1960s.

Our Response: As announced in our reopening of the rule, we reviewed this new information received from State agencies, in conjunction with all prior

data. In doing so, we noted an accidental omission error during our mapping of critical habitat that resulted in the omission of a 2011 observation of Atlantic pigtoe in Sappony Creek. Based on the new information, we made several revisions to the proposed critical habitat designation. We removed 3.8 river miles and added 10 river miles to Unit 9 (Upper/Middle Tar River Subbasin) for a net change of 6.2 additional river miles. We removed 8.2 river miles from Unit 10 (Sandy/Swift Creek), added 3.5 river miles to Sturgeon Creek and 10.3 river miles to Nottoway River in Unit 4 (Nottoway River Subbasin). Further, we added 7 river miles to Unit 6 (Dan River). We created two new units based on the data received and the accidental omission, including the Sappony Creek Unit (Unit 3; 4 river miles) and the Little Grassy Creek Unit (Unit 8; 3 river miles). Addition of these units did not change the economic analysis, as both units are in counties that were included as part of the original analysis. We removed the originally proposed Unit 3 (Middle James River) because the VADWR data indicated that the Atlantic pigtoe does not currently occupy habitat in that part of the system; therefore, this unit no longer meets the criteria for designation as critical habitat as we determined that designation of unoccupied critical habitat is not essential for the conservation of the species (see Criteria Used to Identify Critical Habitat, below). All of these modifications were included in our reopening of the rule (85 FR 59487).

(9) Comment: The VADWR provided data for a newly recorded occurrence for Atlantic pigtoe, located approximately 500 meters (m) downstream of proposed critical habitat Unit 5. The commenter asked that the new information be recorded, but did not believe extending the proposed critical habitat another 500 to 600 m, in addition to the 8 km currently proposed for designation, would significantly benefit the conservation and recovery of Atlantic pigtoe. They also stated that potential delays in the proposed listing due to another reopening of the comment period on the critical habitat designation would be detrimental to the overall conservation and recovery of the species.

Our Response: The Service acknowledges receipt of the new occurrence record and appreciates the commenter's perspective on moving forward with listing and designation of critical habitat without delay. We concur that adding a small length of stream to an existing critical habitat unit would not be a significant benefit to the species, and would not contribute substantially to the previously identified strategy that we have deemed essential for the conservation of the species. We note that a critical habitat designation does not signal that habitat outside the designated area is unimportant or may not be valuable for recovery of the species. We have updated the SSA report accordingly.

(10) Comment: The SCDNR stated that our initial assumption that Atlantic pigtoe does not currently occur in South Carolina was incorrect. Specifically, the agency indicated that data do not exist to assert that South Carolina populations of Atlantic pigtoe are extirpated from the State. It mentioned the possibility that Atlantic pigtoe persists in areas of the State where it was thought to be historically, but has lacked concentrated survey efforts, especially in the Edisto and Pee Dee basins. The SCDNR indicated that survey efforts that have taken place are not adequate to determine the presence or absence of a rare species.

Our Response: We acknowledge the concerns of the SCDNR that targeted surveys for Atlantic pigtoe are needed in South Carolina watersheds. We updated the SSA report to include a statement that few surveys have been conducted in the Edisto and Pee Dee basins in South Carolina. However, based on current scientific information, the species has not been observed since the 1800s in South Carolina; therefore, we did not include areas in South Carolina as part of the currently occupied range. The Service will work closely with SCDNR and other States' agencies to evaluate priorities for data collection and monitoring related to the recovery of Atlantic pigtoe, including ensuring information is collected in South Carolina to make better determinations of presence/absence in South Carolina watersheds that would be informative for status reviews and recovery metrics.

(11) Comment: The SCDNR agreed with language of the proposed 4(d) rule's silvicultural exception ''to clarify that the BMPs [best management practices] must result in protection of the habitat features that provide for breeding, feeding, sheltering, and dispersal needs of the Atlantic pigtoe.'' However, the SCDNR recommended that we use the streamside management zones applied to Municipal Water Supplies in the Virginia BMP Technical Manual (2011), because they are more appropriate for protecting the species than those recommended for trout. They commented that BMPs that include these wider streamside management zones will minimize the impact of the silviculture activities including impacts from access roads and skid trails on the species by reducing sedimentation and protecting water quality by filtering excess nutrients.

Our Response: The Virginia BMP Streamside Management Zone (SMZ) widths for municipal water supplies, to which the SCDNR refers, are 100, 150, or 200 feet on each side of a waterbody (stream or lake), depending on the percent slope of adjacent lands (VDOF 2011, p. 15). While we acknowledge that the Virginia forestry BMP manual includes guidance for SMZ widths adjacent to municipal water supplies, we conclude that applying those, or the trout SMZs, in the 4(d) rule would introduce confusion among forest landowners and practitioners.

A primary reason for citing SMZs for trout in the preamble of our revised proposal (85 FR 59487; September 22, 2020) was that trout and the Atlantic pigtoe are similarly sensitive to sedimentation and thermal inputs. We acknowledge and agree with the SCDNR's point, supported by the scientific literature, that the sedentary nature of mussels renders them especially vulnerable to habitat degradation, including sedimentation and pollution (*e.g.,* ammonia, as mentioned in the comment letter). However, some resources (including Mayer et al. (2005), cited in SCDNR's letter) indicate that SMZ width alone may not be an effective measure of SMZ function. For example, buffer width significantly explained only 14 percent of a buffer's nitrogen removal effectiveness: ''forested and wetland buffers showed no relationship between buffer width and nitrogen removal effectiveness'' (Mayer et al. 2005, p. 5). While the Mayer study concluded that wider buffers were more consistently effective in nitrogen removal, it also concluded that other factors related to subsurface flow (*e.g.,* soil type, hydrology, biogeochemistry) were crucial. These findings regarding forested SMZ widths agree with those from the NCFS's most recent assessment of forestry BMPs; while the assessment found that wider buffers were generally associated with fewer risks to water quality, a model of the data showed a less than 10 percent probability of risk to water quality at buffer widths of 50 feet regardless of ecoregion (*i.e.,* Mountains, Piedmont, Coastal Plain), and that much narrower SMZ widths in some ecoregions achieved the same low probability of risk (Coats et al. 2017, p. 32), suggesting that there are more effective approaches to water quality protection in silviculture than prescribing a uniform SMZ width for all situations.

Our intent in the 4(d) rule for excepting incidental take resulting from forestry and silviculture activities is to relieve some regulatory burden on operations for which proper implementation of BMPs may offer a net conservation benefit. Therefore, based on the best available science and the comments we received, we have revised the 4(d) rule language to specify outcome-based management goals necessary for conservation of the species and its habitat to provide for the breeding, feeding, survival, and shelter of the Atlantic pigtoe, rather than prescribing a particular management practice with which to achieve necessary species and habitat protection (see II. Final Rule Issued Under Section 4(d) of the Act, below, for more information).

(12) Comment: During the first comment period, the NCFS suggested that it would be beneficial to focus only on BMPs and not include forest practice guidelines (FPGs) or forest certification standards in the 4(d) rule, because the FPGs and certification standards refer to State-approved BMPs as the guideline for management. Subsequently, during the second comment period, two commenters from State forestry agencies (VDOF and NCFS) offered alternative language for the entirety of the silvicultural component of the proposed 4(d) rule. They noted that this alternative language was drafted with the intent of applicability in targeted watersheds of the eastern Piedmont region and upper Coastal Plain region, where most of the Atlantic pigtoe's known current occupancy and proposed critical habitat is located. They also noted that their alterative language may be useful in other future listings of aquatic species. The suggested alternative language for the 4(d) rule exception follows: ''Forestry-related activities, including silvicultural practices, forest management work and fire control tactics, that achieve all of the following: 1. Establish a streamside management zone alongside the margins of each occupied waterway. 2. Restrain visible sedimentation caused by the forestry-related activity from entering the occupied waterway. 3. Maintain groundcover within the streamside management zone of the occupied waterway, and promptly re-establish groundcover if disturbed. 4. Limit installation of new vehicle or equipment crossings of the occupied waterway to only where necessary for the forestry-related activity. Such crossings shall: (a) Have erosion and sedimentation control measures installed to divert surface runoff away and restrain visible sediment from entering the waterway; (b) Allow for movement of aquatic organisms within the waterway; and (c) Have groundcover applied and maintained through completion of the forestry-related activity. 5. Prohibit the use of tracked or wheeled vehicles for reforestation site preparation within the streamside management zone of the occupied waterway. 6. Prohibit locating log decks, skid trails, new roads, and portable mill sites in the streamside management zone of the occupied waterway. 7. Prohibit obstruction and impediment of the flow of water within the occupied waterway, caused by direct deposition of debris or soil by the forestry-related activity. 8. Maintain shade over the occupied waterway similar to that observed prior to the forestry-related activity. 9. Prohibit discharge of any solid waste, petroleum, pesticide, fertilizer, or other chemical into the occupied waterway.''

Our Response: The Service appreciates the constructive communications with State forestry agencies during the public comment periods, their willingness to express the challenges that the proposed 4(d) rule posed for implementation and forestry operation oversight, and their collaborative effort to offer alternative 4(d) rule language that will be more straightforward to implement and communicate to forestry practitioners. Importantly, the language offered by the NCFS and VDOF during the second comment period also conveys the necessity of achieving the water quality outcomes the Service intended for the protection of Atlantic pigtoe and its habitat, while reducing the regulatory burden associated with strict adherence to the 4(d) rule's provisions. We have revised the 4(d) rule language to reflect these suggested changes for the forestry exception (see Summary of Changes from the Proposed Rule, below).

Public Comments

(13) Comment: Several comments we received, both from the public and from three State forestry agencies (VDOF, NCFS, and SC Forestry Commission (SCFC)), indicated the Service did not explain or justify the necessity for two-zoned SMZs, for SMZs wider than those already recommended by State forestry BMPs within the geographic range of the Atlantic pigtoe, or for SMZs related to Virginia and North Carolina trout waters being applied to the majority of waters where the Atlantic pigtoe occurs. Some comments further suggested that references to trout rules or BMPs beyond those already required within the range of the Atlantic pigtoe would be confusing and challenging to implement. Several such comments further questioned any additional conservation benefit that SMZs wider than those currently recommended in State BMPs would provide.

Our Response: In the preamble of our September 22, 2020, proposed rule (85 FR 59487), we addressed comments we received on the October 11, 2018, proposed rule (83 FR 51570), that stated the proposed 4(d) language related to ''highest standard BMPs'' was too vague or confusing. In the September 22, 2020, proposed rule, it was our intent to provide additional discussion and detail for the proposed 4(d) incidental take exception resulting from silviculture. By referring to BMPs related to trout waters, specifically SMZs, we intended to use a frame of reference that would be familiar to forest landowners for species sensitive to sedimentation and thermal effects on stream waters. The proposed regulation text in the September 22, 2020, proposed rule outlined BMPs, but did not include references to trout. However, we understand that the references to trout waters in the preamble of that document has caused considerable confusion for multiple reasons, including: (1) The Atlantic pigtoe mostly occurs in watersheds absent of trout; (2) the preamble did not clearly state how the Atlantic pigtoe is similarly sensitive to sedimentation (a primary factor responsible for the adoption of BMPs specific to trout waters); and (3) multiple other regulations and recommended practices already exist in watersheds where the Atlantic pigtoe occurs (*e.g.,* region-specific State BMPs, riparian buffer rules in some watersheds). We have carefully considered and addressed the concerns of the commenters by revising the final 4(d) rule to specify the outcome-based habitat management goals necessary to provide habitat for the breeding, feeding, survival, and sheltering of the Atlantic pigtoe, rather than prescribing a particular management practice with which to achieve necessary habitat protection (*e.g.,* we removed the two-zoned SMZs of variable width; see II. Final Rule Issued Under Section 4(d) of the Act and Regulation Promulgation, below, for more information).

(14) Comment: We received many comments, from both the public and from State forestry agencies (SCFC and VDOF), noting that State-approved BMPs are sufficient for the protection of the Atlantic pigtoe. These commenters also maintained that mandatory adoption of BMPs is not necessary as BMP implementation rates are already high.

Our Response: When properly implemented, BMPs can offer a substantial improvement to water quality compared to forestry operations where BMPs are not implemented or not properly implemented; therefore, we have included an exception for incidental take resulting from silviculture and forest management in the final 4(d) rule. Intact riparian buffers (*i.e.,* SMZs) have been cited as important contributing factors for protecting mussels against excess sedimentation and nutrient input from a variety of consumptive land uses (O'Driscoll et al. 2014, pp. 87–90; Osterling and Hogberg 2014, p. 219). Streams with forested buffers have been shown to have greater mussel species evenness; less ammonia, nitrogen, and solar radiation input; and less fluctuation of daily temperatures than streams with narrow, grassy riparian zones (Morris and Corkum 1996, pp. 580–584).

The commenters also provided information that indicates forestry BMP implementation across the nation and Southeast region are generally high; we agree, but assert that implementation of effective BMPs in forest management is not universal. A 2018 report by the Southern Group of State Foresters (SGSF) shows that overall BMP implementation rates have increased over the last 20 years, more markedly in some States than in others (*e.g.,* BMP implementation in Virginia was the lowest of all the southeastern States (76 percent) as recently as 2007, but increased to 94 percent by 2016 (SGSF 2018, p. 10)). Virginia's most recent BMP monitoring report indicated that audits of 240 sites in 2018 resulted in findings of significant water quality risk in only four cases, and that none of them had active sedimentation during the audit visit (VDOF 2020, p. 3). However, they also reported that despite overall high BMP implementation rates, three very important categories that often lead to water quality concerns (roads, crossings, and skid trails), sometimes lag behind other categories with regard to implementation percentage (VDOF 2020, p. 3). Data from the SGSF show North Carolina has the lowest overall implementation rate (84 percent) in the Southeast, with other State implementation rates ranging from 89 to 99 percent (SGSF 2018, p. 10). The most recent survey of BMP implementation in North Carolina showed that implementation rates—while averaging 84 percent Statewide—varied among regions within the State, and with respect to the type of BMP being evaluated (Coats 2017, pp. 8–41). The NCFS reported that BMPs were not applied or properly implemented in 4,584 opportunities in their assessments, and that 30 percent of these cases posed a risk to water quality (Coats 2017, p. 8). The NCFS also reported that 74 percent of all identified risks to water quality were associated with the lack of application or improper implementation of BMPs related to stream crossings (average implementation rate = 79 percent; range 72–83 percent), SMZs (average implementation rate = 86 percent; range 72–91 percent), and post-harvest rehabilitation of a site (average implementation rate = 71 percent; range 53–83 percent) (Coats 2017, pp. 8, 9, 18–19, 26–34). Such incidents of improperly or unused BMPs and their associated risks to water quality and habitat, as illustrated by these reports, are important to acknowledge in the context of rare, imperiled species, where any one particular localized event may result in further imperilment of a population or hamper recovery of the species.

Development and refinement of BMPs has resulted in substantial improvements to forestry's impacts on water quality in recent decades and has created a culture of water stewardship in the forest landowner community, making this stakeholder group an important ally in the conservation of imperiled species. The reduced risks to water quality justify our inclusion of a 4(d) incidental take exception resulting from forestry and silviculture for the Atlantic pigtoe, but the remaining presence of sedimentation risk supports the need to specify conditions required for the exception to apply. Forest management activities in the range of the Atlantic pigtoe that are not expected to meet the conditions of the 4(d) rule exception could still occur via consultation with the Service under section 7 or a conservation agreement under section 10 of the Act.

Existing BMPs will be sufficient for the protection of the Atlantic pigtoe if they are widely implemented in watersheds where the species occurs and are implemented appropriately such that forest management operations maintain compliance with State regulatory requirements, and that they achieve management goals related to conserving and maintaining suitable habitat for the Atlantic pigtoe, which closely mirror State forestry regulations on water quality. State-approved BMPs, properly implemented, protect water quality and help conserve aquatic species, including the Atlantic pigtoe. Forest landowners who properly implement those BMPs are helping conserve the species, and this final 4(d) rule is an incentive for all landowners to properly implement those BMPs to avoid any possible take liability. Further, those forest landowners who are third-party-certified to a credible forest management standard are providing audited certainty that BMPs are being implemented across the landscape.

(15) Comment: Some of the comments concerning BMPs also suggested that assessments of water quality using aquatic insects as indicators confirm that BMPs are protective of water quality and habitat for aquatic species.

Our Response: Much of the literature shared by commenters on the effectiveness of BMPs for protecting aquatic species and their habitats relies on aquatic macroinvertebrate assessments, mostly of aquatic insects. While they are a common rapid field assessment method for monitoring or measuring water quality, current scientific information does not support the assertion made by several commenters that presence or recovery of insects is a proxy for suitable habitat recovery after disturbance (*i.e.,* a sedimentation event) for benthic invertebrates like the Atlantic pigtoe, or a proxy for recolonization of mussels after such a disturbance. While reliance on effects to aquatic insect communities is a useful rapid assessment tool for water quality, there is a gap in the best available science about how that resilience relates to comparatively long-lived animals, such as unionid freshwater mussels (*e.g.,* the Atlantic pigtoe). Some research comparing how macroinvertebrate insect assessments relate to other taxa (*e.g.,* amphibians, fishes, zooplankton) indicates that insect assessments do not correspond well in evaluations of watershed land use or anthropogenic effects on water quality and water resources for these species (*e.g.,* Brazner et al. 2007, pp. 625–627; Kovalenko et al. 2019, entire; Herlihy et al. 2020, entire). Further, some studies recommend using assessments from multiple taxa to better evaluate the response of biological integrity in streams to anthropogenic activities (Herlihy et al. 2020, p. 10; Hughes et al. 2000, pp. 437–440). The risks of water quality impacts to many taxa are emphasized in studies, highlighting the utility of aquatic insect assessments for evaluating forestry BMPs, along with the need for research on forestry BMP effectiveness for the protection of taxa other than aquatic insects (Warrington et al. 2017, entire). Freshwater mussels have been recognized for decades as important for biomonitoring of environmental health

because of their sedentary nature, long lifespans, and complex life history (Van Hassel and Farris 2007, entire).

A number of other differences between aquatic insects and unionid mussels makes comparisons of their responses to water quality tenuous and demands careful consideration in applying the results from one to the other. Most aquatic insects (particularly those widely used in assessments) are not rare species; thus, the impact of any single or isolated event is likely to be more easily masked at the population level. Further, the aquatic larval phase of macroinvertebrate insects typically emphasized in assessments is of short duration (*e.g.,* aquatic phases ranging less than 1 to 2 years for many mayflies (Ephemeroptera; Voshell 2002, p. 270); 1 to 2 years for many stoneflies (Plecoptera; Voshell 2002, p. 310); less than 1 to 2 years for most caddisflies (Trichoptera; Voxhell 2002, p. 375)) and acute effects in the recent past (less than 5 years) may not present in assessment data. This is facilitated by the immigration of aquatic insects back into impacted stream reaches by downstream drift or other mechanisms, including the adult winged flight stage, which allows immigration from other nearby waterbodies or from downstream reaches (Waters 1972, entire).

Conversely, Atlantic pigtoe is a rare, sedentary mussel living in stream bed substrates, with different ecological requirements and a decades-long lifespan. Extirpation of Atlantic pigtoe from a stream reach after an impact to the population (*e.g.,* a sedimentation event that suffocates mussels in the stream bed or impairs reproduction in a given year) would have longer lasting consequences, and recolonization can be hampered by many factors, such as: The Atlantic pigtoe's typically small population sizes, low reproductive success, instream barriers to the migration of host fishes, distance between populations that can serve as potential recolonization sources, and long generation time (approximately 10 to 12 years; Service 2021, p. 66). Again, we recognize that widespread implementation of BMPs has unquestionable benefits to water quality and likely Atlantic pigtoe habitat; however, we also recognize that additional quantification of the effects of BMPs on mussels would be valuable, particularly given the differential life history characteristics between macroinvertebrate taxa.

(16) Comment: Some commenters stated that the Service did not provide evidence that the Atlantic pigtoe is a sensitive species, and at least one commenter stated that failure to describe its sensitivity or similarity to trout sensitivity is arbitrary and capricious.

Our Response: In our October 11, 2018, proposed rule (83 FR 51570), we included several details related to the ecological requirements of the Atlantic pigtoe (*e.g.,* high dissolved oxygen, silt-free substrates), referenced the SSA report, and included a summary of risk factors to the species (*e.g.,* primarily habitat degradation, including the buildup of fine sediments, the loss of flowing water, instream habitat fragmentation, and impairment of water quality). In our September 22, 2020, revisions to the proposed rule (85 FR 59487), we provided additional information, including statements on the effects of sedimentation to the Atlantic pigtoe (*e.g.,* Silted stream bottoms suffocate filter feeding animals and decrease the stream's insect population, an important source of food for host fish (VDOF 2011, p. 37). Siltation also makes mussel and host fish reproduction difficult (Service 2021, pp. 29, 41, 47, 57). Transformed juvenile mussels require clean gravel/coarse sand substrates with oxygenated water to successfully become adults (Service 2021, p. 11). Lastly, a silted bottom substrate can result in mortality (Service 2021, pp. 29, 59)). (see 85 FR 59490). The September 22, 2020 revisions to the proposed rule were specific to the 4(d) rule and designation of critical habitat, and it directed readers to the initial listing proposal, the SSA report, and previous Federal actions for additional detailed information about the Atlantic pigtoe. The commenters may not have realized that the September 22, 2020, document discussed a subset, but did not repeat the entirety, of the proposals published in the October 11, 2018, proposed rule; the focus of the September 22, 2020, document was on the substantive revisions proposed. However, the concerns of the commenters have been carefully considered and are addressed in this rule by removing references to trout and providing more detailed information about the Atlantic pigtoe, its habitat requirements, and its sensitivity to threats, particularly sedimentation, using the best available scientific information about this species and relevant information from related species (*i.e.,* freshwater bivalves).

(17) Comment: A few commenters highlighted proposed or final rules for other aquatic species that they say indicate a Service precedent for accepting State-approved forestry BMPs as sufficient for protection of a species in a 4(d) rule's exceptions, and that they think that approach should also apply to the Atlantic pigtoe's 4(d) rule.

Our Response: All 4(d) rules establish species-specific regulations to provide for the conservation of a threatened species and must be considered within the context of that species' needs. Because all species are unique, measures included in some 4(d) rules should not be considered to set a precedent for future 4(d) rules on other species. Although it may be practical to consider the implications of how 4(d) rules are implemented for species with overlapping geographic ranges and habitat needs, we still must ensure that each 4(d) rule establishes the regulations necessary and advisable to provide for the conservation of species listed as threatened. We also note that several of the commenters' examples do not apply to threatened species or are not from a 4(d) rule. For example, commenters referenced language in the preamble of the final rule listing the Black Warrior waterdog (*Necturus alabamensis*) as an endangered species and designating critical habitat (83 FR 257; January 3, 2018) that refers to Alabama's forestry BMPs in the Summary of Factors Affecting the Species discussion. Other comments we received referred to BMP discussions not for species' listing actions but for critical habitat designations (*e.g.,* candy darter (*Etheostoma osburni*), diamond darter (*Crystallaria cincotta*), and big sandy crayfish (*Cambarus callainus*)) that listed BMPs among activities that can ameliorate threats to critical habitat. Comments also referenced the pearl darter (*Percina aurora*), a species listed as threatened in 2017 (82 FR 43885; September 20, 2017) when our regulations at 50 CFR 17.31 applied to threatened species all of the provisions of 50 CFR 17.21 for endangered species unless we promulgated species-specific provisions under section 4(d) of the Act for the threatened species; the pearl darter listing rule (82 FR 43885; September 20, 2017) included silviculture with BMPs among actions unlikely to result in a violation of the Act's section 9, and that rule also discussed poor silviculture under the Summary of Factors Affecting the Species. Finally, some comments referenced the trispot darter (*Etheostoma trisella*), which is a threatened species listing with a species-specific 4(d) rule that includes an exception for silviculture. The final 4(d) rule for the trispot darter (85 FR 61619; September 30, 2020) has an incidental take exception for silviculture practices and forest management activities that includes

requirements for implementing State BMPs for SMZs, stream crossings, and forest roads, among others; removing logging debris from stream channels; and limiting activities to only a portion of the year if they involve spawning habitat. Although the trispot darter 4(d) rule is the most similar among the commenters' examples to this rule for the Atlantic pigtoe (*i.e.,* a threatened species listing rule with a 4(d) rule incidental take exception for silviculture), we are required to tailor the 4(d) rule to the Atlantic pigtoe, based on what is necessary and advisable to provide for the conservation specifically of the Atlantic pigtoe. Furthermore, a mobile darter has a different life history than a sessile freshwater mussel, and likewise has different responses to sedimentation or water quality inputs. The Service considers existing local environmental rules, local environmental conditions, and other factors, *in toto,* and tailors regulations to the management needs of species within that context to ensure prohibitions and exceptions to prohibitions for threatened species outlined in 4(d) rules are specific to the considerations for each particular species.

(18) Comment: Two comments expressed concern that, if the proposal were made final with forest management requirements in the 4(d) rule's exceptions that exceed State-recommended BMPs for the areas in which the Atlantic pigtoe occurs, the 4(d) rule for the Atlantic pigtoe would set a precedent not founded in the best available scientific information.

Our Response: See our response to *(17) Comment,* above. The species-specific nature of 4(d) rules is inherently incompatible with setting precedents because we must consider the needs of the individual species being listed within each rule. The Atlantic pigtoe's 4(d) rule does not prescribe management restrictions; rather, it provides for the conservation of the species by outlining prohibitions (*e.g.,* take) that are compatible with the overall conservation of the species, and sets forth exceptions to those prohibitions for activities that are expected not to impede conservation. The Atlantic pigtoe's 4(d) rule's exceptions to prohibitions provide specific information on the conditions required for being excepted from incidental take resulting from certain activities. The 4(d) rule does not prohibit silvicultural management; activities resulting in incidental take not included in the 4(d) rule's exceptions to prohibitions could still be covered under a conservation agreement under section 10 of the Act or authorized via section 7 of the Act. The 4(d) rule's incidental take exceptions are intended to provide some relief from regulatory burden, while outlining the conditions necessary and advisable for the conservation of the species.

As discussed above (see our response to *(13) Comment,* above), we have revised the 4(d) rule by removing the two-zoned SMZ requirement over concerns related to confusion and challenging implementation of multiple sets of forestry-related rules and guidelines already in place within the geographic range of the Atlantic pigtoe.

(19) Comment: During the first public comment period, two commenters noted that the meaning of ''highest-standard'' BMPs as stated in the proposed 4(d) rule is unclear. They indicate that each forestry BMP stands on its own merits; there are not different classes or degrees or standards of BMPs. Indeed, on some sites, it may be adequate to apply a limited number of BMPs, while on other sites, a more comprehensive set of BMPs may be appropriate. One of the commenters suggested that to avoid confusion, the 4(d) rule should say, ''State-approved best management practices'' or an equivalent phrase.

After revisions to the 4(d) rule, during the second comment period, several commenters requested that we revise the proposed 4(d) rule to ''only reference State-approved BMPs without addition or modification.'' Another commenter (NCFS) suggested an alternative to incorporate by reference a section of the Code of Federal Regulations (CFR) related to compliance with the exemption from permitting to discharge dredged or fill material into waters of the United States (*i.e.,* 33 CFR 323.4(a)(6)(ix): The discharge shall not take, or jeopardize the continued existence of, a threatened or endangered species as defined under the Endangered Species Act, or adversely modify or destroy the critical habitat of such species.) The NCFS asserted that a 4(d) rule for the Atlantic pigtoe should be written to cross-reference these existing Federal regulations and apply concurrent compliance with the requirements of both the Clean Water Act (CWA; 33 U.S.C. 1251 *et seq.*) and Endangered Species Act, through a blanket section 7 consultation.

Our Response: In response to the comments from the first public comment period, we modified the proposed 4(d) rule language to provide specific details for SMZ widths that will be most protective of the habitat for the species (85 FR 59487; September 22, 2020), similar to those ''more substantial'' BMPs considered for streams that are designated ''trout waters'' and already implemented by both Virginia's and North Carolina's State forestry programs. We also modified the 4(d) rule language to use the phrase ''State-approved BMPs'' as suggested by the original commenter.

In response to additional comments we received during the second comment period (specifically those suggesting reference to the U.S. Army Corps of Engineers' regulations at 33 CFR 323.4(a)(6)(ix), which set forth exemptions for CWA permitting requirements for the construction of farm roads, forest roads, or temporary roads for moving mining equipment), we find that these regulations are not designed to conservation species such as Atlantic pigtoe. The CFR reference suggested by the commenter is provides no specific guidance on implementing the exempted activities to avoid take of or jeopardy to endangered or threatened species. The use of State-approved BMPs for forestry to meet the CWA exemption are not species conservation regulatory requirements. Furthermore, State forestry BMP manuals do not represent a law or requirement; they are a set of recommended practices for achieving compliance with water quality regulations, and BMP manuals are subject to change. In fact, the NCFS has recently proposed revisions to the NC BMP manual (Gerow 2020, pers. comm.); this highlights the need to provide specific information for the conservation of a species in the text of the 4(d) rule. It is the responsibility of the Service under the Endangered Species Act to provide guidance on how to avoid take of or jeopardy to endangered and threatened species, and the Act guides the Service to establish a species-specific 4(d) rules for threatened species, including language stating prohibitions and exceptions to prohibitions for the protection of the species.

Finally, nothing in this final 4(d) rule will change in any way the consultation requirements under section 7 of the Act. However, interagency cooperation may be further streamlined through planned programmatic consultations for the species between Federal agencies and the Service, where appropriate.

(20) Comment: Two commenters stated that SMZs are part of a suite of BMPs and that they should not be proposed alone.

Our Response: We proposed the incidental take exception resulting from forestry to include multiple State-approved BMPs, highlighting considerations for SMZs because of their importance to stream habitat, along with considerations for stream

crossings, skid trails, and access roads. However, commenters have demonstrated particular concern and confusion over that portion of the proposed incidental take exception resulting from forestry activities with specifications on SMZs. As noted in our response to *(13) Comment,* above, we have revised the 4(d) rule's incidental take exception to include the suite of BMPs.

(21) Comment: During the first comment period, the NCFS commented that forestry-related, site-disturbing activities must protect riparian areas, indicating that the multiple layers of existing State-enacted riparian zone protections are sufficient to restrain sediment from negatively impacting habitat for the Atlantic pigtoe and other species. They referenced a U.S. Department of Agriculture study demonstrating that the use of BMPs and compliance with the State's standards effectively maintained water quality and sustained the populations of benthic macroinvertebrates, and noted that the results from this study demonstrate that forestry operations will not impact Atlantic pigtoe habitat. They recommended that compliance with State-enacted riparian buffer rules should be deemed as concurrent compliance with the 4(d) rule's prohibitions as well as concurrent protection of critical habitat. In addition, we received several comments indicating that a 4(d) rule that includes overly specific prescriptive measures for protecting water quality and habitat for the Atlantic pigtoe would be confusing to communicate to landowners and challenging to implement.

Our Response: State regulations are susceptible to change (as described in the SSA report, section 4.2); therefore, it is necessary to detail the requirements needed for the Atlantic pigtoe in the Federal listing rule, which includes the 4(d) rule. The reference to the paired watershed study is not specifically relevant to the Atlantic pigtoe, as that study focused on water quality only (not instream or streamside habitat) and impacts to benthic macroinvertebrates that did not include freshwater mussels. Therefore, in our 4(d) rule, we articulate outcome-based habitat management that, if followed, will eliminate sedimentation threats to Atlantic pigtoe habitat and is excepted from incidental take prohibitions.

(22) Comment: One commenter recommended that the Service remove from the descriptions of critical habitat units references to silviculture being a potential source of pollution. The commenter indicated that the forestry sector in general believes that such references may have had some credence a generation or more ago, but the advent of BMPs, their proven effectiveness, and high implementation rates make such references incorrect today.

Our Response: The best available science indicates that proper implementation of forestry BMPs reduces negative effects on water quality compared to historical silvicultural practices and compared to current practices that do not apply or properly implement BMPs. However, although BMPs generally are implemented at high rates, they are not universally applied or always properly implemented, and forest management activities can still contribute to high sediment loads. As noted above, the most recent assessment of BMP implementation by the NCFS reported that the majority of risks to water quality identified during the assessment were associated with forest managers' failure to use or properly apply BMPs related to SMZs, stream crossings, and post-harvest restoration (Coats 2017, pp. 8–34). We also acknowledge that there are multiple sources of sediment and other pollutants. That said, we have removed from the critical habitat descriptions the statements about silvicultural runoff as a source of pollution, and we have replaced them with language about management activities that will benefit habitat for the species, such as riparian buffer restoration, reduced surface and groundwater withdrawals, stormwater retrofits, elimination of direct stormwater discharges, and implementation of the highest levels of wastewater treatment practicable.

(23) Comment: One commenter noted that the Service's proposed critical habitat designation for the Atlantic pigtoe is inadequate to ensure the conservation of the species because the Service has only proposed critical habitat within the species' currently occupied habitat, neglecting the essential protection of unoccupied habitat pursuant to 16 U.S.C. 1532(5)(A)(ii).

Our Response: We did not propose to designate any areas outside the geographical area currently occupied by the species because we did not find any unoccupied areas to be essential for the conservation of the species. We have determined that the designation of critical habitat within eight occupied management units currently categorized as moderately or highly resilient across the physiographic representation of the species' range will conserve the species. Efforts to improve the resiliency of populations in currently occupied streams should increase viability to the point that the protections of the Act are no longer necessary. See Criteria Used to Identify Critical Habitat, below, for more information.

(24) Comment: One commenter noted that the Service's failure to protect as critical habitat the currently unoccupied habitat across Georgia, South Carolina, North Carolina, and Virginia that soon may be subject to anticipated State restocking efforts undermines the Service's charge under the Act to fashion a concerted regulatory scheme to ensure the long-term viability of this species by bolstering its range and resiliency. The commenter called upon the Service to designate suitable, unoccupied critical habitat in each of the 12 river basins in the Atlantic pigtoe's historical range to prevent the further deterioration of their once-and-future habitat.

Our Response: We are working in coordination with State efforts to re-establish extirpated Atlantic pigtoe populations via captive propagation. Designation of critical habitat is not required for these species restoration efforts, and as discussed above (see our responses to *(8) Comment* and *(23) Comment,* above), we have determined that designation of unoccupied critical habitat is not essential for the conservation of the species. In our final 4(d) rule for the Atlantic pigtoe, we are excepting incidental take resulting from captive propagation and reintroduction efforts, as we recognize these efforts further the conservation of the species. Excepting incidental take resulting these activities under the 4(d) rule enables each State to proceed with stocking that is not subject to incidental take. In addition, section 6 of the Act provides that the Service shall cooperate to the maximum extent practicable with the States in carrying out programs authorized by the Act. Therefore, the final 4(d) rule also provides that any qualified employee or agent of a State conservation agency that is a party to a cooperative agreement with the Service in accordance with section 6(c) of the Act, who is designated by his or her agency for such purposes, would be able to conduct activities designed to conserve Atlantic pigtoe that may result in otherwise prohibited take without additional authorization.

I. Final Listing Determination

Background

Please refer to the October 11, 2018, proposed rule (83 FR 51570), the September 22, 2020, document (85 FR 59487), and the SSA report for a full summary of species information. These documents are available at *http://*

www.regulations.gov under Docket No. FWS–R4–ES–2018–0046.

The Atlantic pigtoe is a small freshwater mussel with a sub-rhomboidal shaped shell. Although larger specimens exist, the Atlantic pigtoe rarely exceeds 50 millimeters (mm) (2 inches (in)) in length. The known historical range of the Atlantic pigtoe included 12 populations in Atlantic river basins from Virginia to Georgia. However, surveys conducted from 2005 to 2019 indicate that the currently occupied range of the Atlantic pigtoe consists of seven populations in Virginia and North Carolina. The Atlantic pigtoe is dependent on clean, moderate-flowing water with high dissolved oxygen content in creek and riverine environments. Historically, the most abundant populations existed in creeks and rivers with excellent water quality, and where stream flows were sufficient to maintain clean, silt-free substrates. It is associated with gravel and coarse sand substrates at the downstream edge of riffles (shallow water with rapid currents running over gravel or rocks), and less commonly occurs in cobble, silt, or sand detritus mixtures. Because this species prefers more pristine conditions, it typically occurs in headwaters of rural watersheds.

The Atlantic pigtoe is presumed to be an omnivore. Adults primarily filter feed on a wide variety of microscopic particulate matter suspended in the water column, including phytoplankton, zooplankton, bacteria, detritus, and dissolved organic matter, although juveniles tend to pedal feed in the sediment (Alderman and Alderman 2014, p. 9). Like most freshwater mussels, the Atlantic pigtoe has a unique life cycle that relies on fish hosts for successful reproduction. Following release from the female mussel, sticky packets of floating glochidia (larvae) attach to the gills and scales of host minnows. The larvae stay attached to the host fish until they complete metamorphosis, when they release from the fish and fall to the substrate.

The Atlantic pigtoe has been documented in all major river basins in the Atlantic coastal drainages from the James River Basin in Virginia south to the Altamaha River Basin in Georgia, and from the foothills of the Appalachian Mountains to the Coastal Plain. However, abundance and distribution of the species has declined, with the species currently occupying approximately 40 percent of its historical range. Most of the remaining populations are small and fragmented, only occupying a fraction of reaches that were historically occupied. Recent surveys found Atlantic pigtoes remain in seven populations in Virginia and North Carolina; however, only three populations have multiple documented occurrences within the past 16 years. This decrease in abundance and distribution has resulted in largely isolated contemporary populations. Evidence suggests that the range reduction of the species corresponds to habitat degradation resulting from the cumulative impacts of land use change and associated watershed-level effects on water quality, water quantity, habitat connectivity, and instream habitat suitability.

Regulatory and Analytical Framework

Regulatory Framework

Section 4 of the Act (16 U.S.C. 1533) and its implementing regulations (50 CFR part 424) set forth the procedures for determining whether a species is an ''endangered species'' or a ''threatened species.'' The Act defines an ''endangered species'' as a species that is in danger of extinction throughout all or a significant portion of its range, and a ''threatened species'' as a species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. The Act requires that we determine whether any species is an ''endangered species'' or a ''threatened species'' because of any of the following factors:

(A) The present or threatened destruction, modification, or curtailment of its habitat or range;

(B) Overutilization for commercial, recreational, scientific, or educational purposes;

(C) Disease or predation;

(D) The inadequacy of existing regulatory mechanisms; or

(E) Other natural or manmade factors affecting its continued existence.

These factors represent broad categories of natural or human-caused actions or conditions that could have an effect on a species' continued existence. In evaluating these actions and conditions, we look for those that may have a negative effect on individuals of the species, as well as other actions or conditions that may ameliorate any negative effects or may have positive effects.

We use the term ''threat'' to refer in general to actions or conditions that are known to or are reasonably likely to negatively affect individuals of a species. The term ''threat'' includes actions or conditions that have a direct impact on individuals (direct impacts), as well as those that affect individuals through alteration of their habitat or required resources (stressors). The term ''threat'' may encompass—either together or separately—the source of the action or condition or the action or condition itself.

However, the mere identification of any threat(s) does not necessarily mean that the species meets the statutory definition of an ''endangered species'' or a ''threatened species.'' In determining whether a species meets either definition, we must evaluate all identified threats by considering the expected response by the species, and the effects of the threats—in light of those actions and conditions that will ameliorate the threats—on an individual, population, and species level. We evaluate each threat and its expected effects on the species, then analyze the cumulative effect of all of the threats on the species as a whole. We also consider the cumulative effect of the threats in light of those actions and conditions that will have positive effects on the species, such as any existing regulatory mechanisms or conservation efforts. The Secretary determines whether the species meets the definition of an ''endangered species'' or a ''threatened species'' only after conducting this cumulative analysis and describing the expected effect on the species now and in the foreseeable future.

The Act does not define the term ''foreseeable future,'' which appears in the statutory definition of ''threatened species.'' Our implementing regulations at 50 CFR 424.11(d) set forth a framework for evaluating the foreseeable future on a case-by-case basis. The term ''foreseeable future'' extends only so far into the future as the Service can reasonably determine that both the future threats and the species' responses to those threats are likely. In other words, the foreseeable future is the period of time in which we can make reliable predictions. ''Reliable'' does not mean ''certain''; it means sufficient to provide a reasonable degree of confidence in the prediction. Thus, a prediction is reliable if it is reasonable to depend on it when making decisions.

It is not always possible or necessary to define foreseeable future as a particular number of years. Analysis of the foreseeable future uses the best scientific and commercial data available and should consider the timeframes applicable to the relevant threats and to the species' likely responses to those threats in view of its life-history characteristics. Data that are typically relevant to assessing the species' biological response include species-specific factors such as lifespan, reproductive rates or productivity,

certain behaviors, and other demographic factors.

Our proposed rule described ''foreseeable future'' as the extent to which we can reasonably rely on predictions about the future in making determinations about the future conservation status of the species. The Service since codified its understanding of foreseeable future at 50 CFR 424.11(d) (84 FR 45020; August 27, 2019). In those regulations, we explain the term ''foreseeable future'' extends only so far into the future as the Service can reasonably determine that both the future threats and the species' responses to those threats are likely. The Service will describe the foreseeable future on a case-by-case basis, using the best available data and taking into account considerations such as the species' life-history characteristics, threat-projection timeframes, and environmental variability. The Service need not identify the foreseeable future in terms of a specific period of time.

These regulations did not significantly modify the Service's interpretation of the term ''foreseeable future''; rather they codified a framework that sets forth how the Service will determine what constitutes the foreseeable future based on our long-standing practice. However, the regulations at 50 CFR 424.11(d) do not apply to this final rule because the October 11, 2018, proposed rule for the Atlantic pigtoe (83 FR 51570) published prior to the effective date of the final rule amending 50 CFR 424.11(d) (84 FR 45020; August 27, 2019). Our assessment of the ''foreseeable future'' for the Atlantic pigtoe, as presented in our October 11, 2018, proposed rule and this final rule, has not changed.

Analytical Framework

The SSA report documents the results of our comprehensive biological review of the best scientific and commercial data regarding the status of the species, including an assessment of the potential threats to the species. The SSA report does not represent a decision by the Service on whether the species should be listed as an endangered or threatened species under the Act. However, it does provide the scientific basis that informs our regulatory decisions, which involve the further application of standards within the Act and its implementing regulations and policies. The following is a summary of the key results and conclusions from the SSA report; the full SSA report can be found at *http://www.regulations.gov* under Docket No. FWS–R4–ES–2018–0046.

To assess Atlantic pigtoe viability, we used the three conservation biology principles of resiliency, redundancy, and representation (the ''3 Rs'') (Shaffer and Stein 2000, pp. 306–310). Briefly, resiliency supports the ability of the species to withstand environmental and demographic stochasticity (for example, wet or dry, warm or cold years), redundancy supports the ability of the species to withstand catastrophic events (for example, droughts, large pollution events), and representation supports the ability of the species to adapt over time to long-term changes in the environment (for example, climate changes). In general, the more resilient and redundant a species is and the more representation it has, the more likely it is to sustain populations over time, even under changing environmental conditions. Using these principles, we identified the species' ecological requirements for survival and reproduction at the individual, population, and species levels, and described the beneficial and risk factors influencing the species' viability.

The SSA process can be divided into three sequential stages. During the first stage, we evaluated the individual species' life-history needs. In the next stage, we assessed the historical and current condition of the species' demographics and habitat characteristics, including an explanation of how the species arrived at its current condition. In the final stage, we made predictions about the species' responses to positive and negative environmental and anthropogenic influences. Throughout all of these stages, we used the best available information to characterize viability as the ability of a species to sustain populations in the wild over time. We use this information to inform our regulatory decision.

Summary of Biological Status and Threats

In this discussion, we review the biological condition of the species and its resources, and the threats that influence the species' current and future condition, in order to assess the species' overall viability and the risks to that viability.

To evaluate the current and future viability of the Atlantic pigtoe, we assessed a range of conditions to allow us to consider the species' resiliency, representation, and redundancy. Populations were delineated using the 12 river basins that Atlantic pigtoe mussels historically occupied: The James, Chowan, Roanoke, Tar, Neuse, Cape Fear, Pee Dee, Catawba, Edisto, Savannah, Ogeechee, and Altamaha River basins. Because the river basin level is at a very coarse scale, populations were further delineated using management units (MUs). The MUs were defined as one or more U.S. Geological Survey Hydrological Unit Code (HUC) 10 watersheds that species experts identified as the most appropriate unit for assessing population-level resiliency. To provide context for the current condition of the species using the 3 Rs, we considered the historical range as context for the species' resiliency, redundancy, and representation on the landscape in the past. However, in addressing the current condition of the 3 Rs, only extant populations were analyzed.

To assess resiliency, we qualitatively analyzed data related to three population factors (MU occupancy, recruitment, and abundance) and four habitat elements (water quality, water quantity/flow, instream substrate, and habitat connectivity). Overall population condition rankings and habitat condition rankings were determined by combining these factors and elements.

We described representation for the Atlantic pigtoe in terms of river basin variability (known from 12 historical river basins, currently extant in 7), physiographic variability (Mountains, Piedmont, and Coastal Plain), and historical latitudinal variability (Virginia south to Georgia). We assessed Atlantic pigtoe redundancy by first evaluating occupancy within each of the hydrologic units (*i.e.,* HUC10s) that constitute MUs, and then evaluating occupancy at the MU, and ultimately the population level.

Factors Influencing Atlantic Pigtoe Viability

Aquatic systems face a multitude of natural and anthropogenic factors that may impact the status of species within those systems (Neves et al. 1997, p. 44). Generally, these factors can be categorized as either environmental stressors (*e.g.,* development, agriculture practices, improper forest management) or systematic changes (*e.g.,* climate change, invasive species, dams or other barriers). The largest threats to the future viability of the Atlantic pigtoe consist of habitat degradation from stressors influencing water quality, water quantity, instream habitat, and habitat connectivity. All of these threats are exacerbated by the effects of climate change. A brief summary of these primary stressors is presented below; for a full description of these stressors, refer to chapter 4 of the SSA report (Service 2021, pp. 45–61). We did not find that the species faces significant threats from overutilization for commercial,

recreational, scientific, or education purposes, or from disease or predation.

Environmental Stressors

Development: Development refers to urbanization of the landscape, including (but not limited to) land conversion for urban and commercial use, infrastructure (roads, bridges, utilities), and urban water uses (water supply reservoirs, wastewater treatment, etc.). The effects of urbanization may include alterations to water quality, water quantity, and habitat (both in stream and streamside) (Ren et al. 2003, p. 649; Wilson 2015, p. 424). These alterations adversely affect both Atlantic pigtoe adults, which require clear, flowing water with a temperature less than 35 degrees Celsius (°C) (95 degrees Fahrenheit (°F)) and a dissolved oxygen greater than 3 milligrams per liter (mg/L), and juveniles, which require very specific interstitial chemistry to complete that life stage: Low salinity (similar to 0.9 parts per thousand (ppt)), low ammonia (similar to 0.7 mg/L), low levels of copper and other contaminants, and dissolved oxygen greater than 1.3 mg/L.

Impervious surfaces associated with development negatively affect water quality when pollutants that accumulate on impervious surfaces are washed directly into the streams during storm events. Storm water runoff affects such water quality parameters as temperature, pH, dissolved oxygen, and salinity, which in turn alter the water chemistry and could make habitat unsuitable for the Atlantic pigtoe. Concentrations of contaminants, including nitrogen, phosphorus, chloride, insecticides, polycyclic aromatic hydrocarbons, and personal care products, increase with urban development (Giddings et al. 2009, p. 2; Bringolf et al. 2010, p. 1311).

Urban development can also lead to increased variability in streamflow, typically increasing the amount of water entering a stream after a storm and decreasing the time it takes for the water to travel over the land before entering the stream (Giddings et al. 2009, p. 1). Stream habitat is altered either directly via channelization or clearing of riparian areas, or indirectly via high stream flows that reshape the channel and cause sediment erosion (Giddings et al. 2009, p. 2). Impervious surfaces associated with increased development cause rain water to accumulate and flow rapidly into storm drains, thereby becoming overheated, which can stress or kill mussels when it enters streams. Pollutants like gasoline, oil, and fertilizers are also washed directly into streams and can kill mussels and other aquatic organisms. The large volumes and velocity of water, combined with the extra debris and sediment entering streams following a storm, can stress, displace, or kill Atlantic pigtoes and the host fish species on which they depend. Many of the known host fish of the Atlantic pigtoe can tolerate short periods of turbidity associated with rain events; however, the cyprinid host fish typically do not persist in streams with consistently high sedimentation. Changes in flow may also result in turbidity that can reduce feeding efficiency and eliminate spawning habitat due to lack of clean gravel substrate.

A further risk of urbanization is the accompanying road development that often results in improperly constructed culverts at stream crossings. These culverts act as barriers, either if flow through the culvert varies significantly from the rest of the stream, or if the culvert ends up being perched above the stream bed so that host fish (and, therefore, the Atlantic pigtoe) cannot pass through them. This leads to loss of access to quality habitat, as well as fragmented habitat and a loss of connectivity between populations. This can limit both genetic exchange and recolonization opportunities.

All of the river basins within the range of this species are affected to some extent by development, ranging from 3 percent of the Black River subbasin in the Cape Fear River Basin to 70 percent of the Crabtree Creek subbasin in the Neuse River Basin (based on the 2011 National Land Cover Data). The Neuse River basin in North Carolina contains one-sixth of the entire State's population, indicating heavy development pressure on the watershed. As another example, the Middle James MU (in the James population) contains 159 impaired stream miles (*i.e.,* waters that exceed water quality standards for a particular parameter), 2 major discharges, 32 minor discharges, and over 1,300 road crossings. Similarly, the Muddy Creek MU is currently made up of 12.3 percent impervious surfaces. For complete data on all of the populations, refer to appendix C of the SSA report.

Agricultural Practices: The main impacts to the Atlantic pigtoe from agricultural practices are from nutrient pollution and water pumping for irrigation. Fertilizers and animal manure, which are both rich in nitrogen and phosphorus, are the primary sources of nutrient pollution from agricultural sources when agricultural best management practices are not used. Excess nutrients impact water quality when it rains or when water and soil containing nitrogen and phosphorus wash into nearby waters or leach into the water table and ground waters causing algal blooms. These algal blooms can harm freshwater mussels by suffocating host fish and decreasing available oxygen in the water column.

It is common practice to pump water for irrigation from adjacent streams or rivers into a reservoir pond, or to spray the stream or river water directly onto crops. If the water withdrawal is excessive or done illegally, this may cause impacts to the amount of water available to downstream sensitive areas during low flow months, resulting in dewatering of channels and stranding of mussels, leading to desiccation and death. The Cape Fear River basin has 33 reservoirs, many of them supplying water to some of the most populated areas in North Carolina, including the Triad (Greensboro and High Point), Chapel Hill, Fayetteville, and Wilmington. All told, this basin contains one-fifth of the entire State's population and is the most industrialized basin, as well as home to the most large-scale livestock operations in the State. However, according to the 2011 National Land Cover Data, all of the watersheds within the range of the Atlantic pigtoe are affected by agricultural land uses, most with 20 percent or more of the watershed having been converted to agricultural use.

Incompatible Forest Management: Silvicultural activities, when performed according to strict forest practices guidelines (FPGs) or BMPs, can retain adequate conditions for aquatic ecosystems; however, when FPGs/BMPs are not followed or are implemented poorly, these practices can also contribute to the myriad of stressors facing aquatic systems in the Southeast. Both small- and large-scale clearing of forests have been shown to have a significant impact upon the physical, chemical, and biological characteristics of adjacent small streams (Allan 1995, pp. 324–327; Valente-Neto 2015, p. 116). Clearcutting and harvests in riparian systems can eliminate shade provided by forest canopies, exposing streams to more sunlight and increasing the instream water temperature (Swift and Messer 1971, p. 111; Hewlett and Forston 1982, p. 983; GB Rishel 1982, p. 112; Lynch et al. 1984, p. 161; Allan 1995, p. 325; Keim and Shoenholtz 1999, p. 197; Carroll et al. 2004, p. 275; B.D. Clinton 2011, p. 979; Caldwell et al. 2014, p. 3). The increase in stream temperature and light after deforestation of riparian areas alters the macroinvertebrate and other aquatic species richness and abundance composition in streams (Wenger 1999, p. 35; Caldwell et al. 2014, p. 3). As

stated above, the Atlantic pigtoe is sensitive to changes in temperature, and sustained temperature increases will stress and possibly lead to mortality for this species.

Forestry activities can include the construction of logging roads through the riparian zone, and this can directly degrade nearby stream environments. Roads can cause point-source pollution and sedimentation, as well as sediment traveling downstream into sensitive habitats. These effects lead to stress and mortality for the species, as discussed under *Development,* above, and as reported in studies of forestry-related sedimentation effects on survival of aquatic invertebrates (Osterling et al. 2008, pp. 1368–1369; Reid et al. 2013, pp. 571, 577; O'Driscoll et al. 2014, pp. 87–90; Osterling and Hogberg 2014, pp. 215–217, 219; Osterling 2015, pp. 448–450; Osterling 2019, pp. 444, 446–448). While BMPs are widely adhered to now, they were not historically a common practice, and implementation is still imperfect. The most recent surveys of BMP implementation rates in North Carolina show that they average approximately 83–90 percent in river basins where Atlantic pigtoe occurs (Coats 2017, p. 38), and in Virginia, the most recent average Statewide BMP implementation rate was 91.8 percent (VDOF 2020, p. 2). Accordingly, while incompatible implementation is rare, the failure to implement BMPs or inadequate implementation can have negative effects on sensitive aquatic species. Acute impacts associated with episodic events may be particularly consequential for long-lived, sedentary species like the Atlantic pigtoe. Further, the most recent assessment of forestry BMPs in North Carolina reported that improperly implemented BMPs associated with SMZs and stream crossings were among the most frequently associated with risks to water quality (Coats 2017, p. 9); VDOF similarly identified stream crossings, along with roads and skid trails, among the BMP categories frequently associated with water quality concerns (VDOF 2020, p. 3).

Systemic Changes

Climate Change: Aquatic systems are encountering changes and shifts in seasonal patterns of precipitation and runoff as a result of climate change. While mussels evolved in habitats that experience seasonal fluctuations in discharge, global weather patterns can have an impact on the normal regimes (*e.g.,* El Niño or La Niña). Both excessively high (*i.e.,* floods and storms) and excessively low (*i.e.,* droughts) flows can adversely affect the species.

As to droughts, even naturally occurring low flow events can cause mussels to become stressed, either because they must exert significant energy to move to deeper waters or they may succumb to desiccation. Because late summer and early fall are stressful periods for the species due to low flows, droughts during this time of year can be especially harmful, resulting in increased mortality rates. Atlantic pigtoe habitat must have adequate flow to deliver oxygen, enable passive reproduction, and deliver food to filter-feeding mussels. Further, flow removes contaminants and fine sediments from interstitial spaces, preventing mussel suffocation. Droughts have impacted all river basins within the range of Atlantic pigtoe, from an ''abnormally dry'' ranking for North Carolina and Virginia in 2001 on the Southeast Drought Monitor scale to the highest ranking of ''exceptionally dry'' for the entire range of the species in 2002 and 2007. In 2015, the entire Southeast ranged from ''abnormally dry'' to ''moderate drought'' or ''severe drought.'' These data covered the first week in September, which, as noted above, is a very sensitive time for drought to be affecting the species. The Middle Neuse tributaries of the Neuse River basin had consecutive drought years from 2005 through 2012, indicating sustained stress on the species over a long period of time.

Increases in the frequency and strength of storms events alter stream habitat. Stream habitat is altered either directly via channelization or clearing of riparian areas, or indirectly via high stream flows that reshape the channel and cause sediment erosion. The large volumes and velocity of water, combined with the extra debris and sediment entering streams following a storm, stress, displace, or kill Atlantic pigtoes and the host fish species on which they depend.

Sedentary freshwater mussels have limited ability to seek refuge from droughts and floods, and they are completely dependent on specific water temperatures to complete their physiological requirements. Changes in water temperature lead to stress, increased mortality, and also increase the likelihood of extinction.

Invasive Species: Nonnative species are invading aquatic communities and altering biodiversity by competing with native species for food, light, or breeding and nesting areas in many areas across the range of the Atlantic pigtoe. For example, the Asian clam (*Corbicula fluminea*) alters benthic substrates, competes with native species for limited resources, and causes ammonia spikes in surrounding water when they die off en masse. Native mussel growth is negatively associated with Asian clam abundance, indicating invasive clams may be a pervasive stressor to native species (Haag et al. 2021, pp. 451–454). Juvenile mussels need low levels of ammonia to survive, and freshwater mollusks are more sensitive than previously known to some chemical pollutants, including ammonia (Augspurger et al. 2003, entire and references therein). The Asian clam is ubiquitous across the southeastern United States and is present in watersheds across the range of the Atlantic pigtoe.

The flathead catfish (*Pylodictis olivaris*) is an apex predator that feeds on almost anything, including other fish, crustaceans, and mollusks. Predation by flathead catfish diminishes host fish communities, reducing the amount of fish available as hosts for the mussels to complete their glochidia life stage. Introductions of flathead catfish into rivers in North Carolina and Georgia have led to steep declines in numbers of native fish (Service 2021, p. 59). The flathead catfish has been documented in six of the seven river systems currently inhabited by the Atlantic pigtoe (James, Roanoke, Tar, Neuse, Cape Fear, and Yadkin-Pee Dee).

Hydrilla (*Hydrilla verticillata*), an aquatic plant, alters habitat, decreases flows, and contributes to sediment buildup in streams. Hydrilla occurs in several watersheds where the Atlantic pigtoe occurs, including recent documentation from the upper Neuse system and the Tar River. The dense growth is altering the flow in these systems and causing sediment buildup, which can cause suffocation in filter-feeding mussels. While data are lacking on hydrilla currently having population-level effects on the Atlantic pigtoe, the spread of this invasive plant is expected to increase in the future.

Dams and Barriers: Extinction and extirpation of North American freshwater mussels can be traced to impoundment and inundation of riffle habitats in all major river basins of the central and eastern United States. Upstream of dams, the change from flowing to impounded waters, increased depths, increased buildup of sediments, decreased dissolved oxygen, and the drastic alteration in resident fish populations can threaten the survival of mussels and their overall reproductive success. Downstream of dams, fluctuations in flow regimes, minimal releases and scouring flows, seasonal dissolved oxygen depletion, reduced or increased water temperatures, and changes in fish assemblages can also

threaten the survival and reproduction of many mussel species.

Because Atlantic pigtoes use smaller host fish (*e.g.,* darters and minnows), they are even more susceptible to impacts from habitat fragmentation due to increasing distance between suitable habitat patches and a low likelihood of host fish swimming over that distance. Even improperly constructed culverts at stream crossings can act as significant barriers and have some similar effects as dams on stream systems (see discussion under *Development,* above). These barriers not only fragment habitats along a stream course, they also contribute to genetic isolation of the Atlantic pigtoe. Nearly all of the MUs containing Atlantic pigtoe populations have been impacted by dams, with as few as 2 dams in Mill Creek in the James River basin to 237 dams throughout the Middle Neuse basin (Service 2021, appendix D). The Middle Neuse also contains over 5,000 stream crossings, so connectivity in that basin has been severely affected by barriers. Only the Edisto River basin within the range of the Atlantic pigtoe has not been impacted by dams.

Regulatory Mechanisms

State Endangered Species Laws

Each state within the range of the Atlantic Pigtoe has state-level legislation modeled after the federal Endangered Species Act: In Virginia it is both the Virginia Endangered Species Act and the Endangered Plant and Insect Species Act, in North Carolina it is the North Carolina Endangered Species Act, in South Carolina it is the Nongame and Endangered Species Conservation Act, and in Georgia it is the Endangered Wildlife Act. Animal species that are protected by the state laws are regulated by state wildlife agencies: The Virginia Department of Game and Inland Fisheries, the North Carolina Wildlife Resources Commission, the South Carolina Department of Natural Resources, and the Georgia Department of Natural Resources.

The state endangered species protection laws allow the state wildlife agencies to identify, document, and protect any animal species that is considered rare or in danger of extinction. In most of the states (VA, NC, SC, GA), illegal activities include take, transport, export, processing, selling, offering for sale, or shipping species, and the penalty for doing so is a misdemeanor crime, usually resulting in a fine of no more than $1,000 or imprisonment not to exceed a year (Pellerito 2002, entire). There are no mechanisms for recovery, consultation, or critical habitat designation other than in North Carolina where conservation plans must be developed for all state listed species (Pellerito 2002, Snape and George 2010, p.346). In addition, nothing in the North Carolina Endangered Species Act ''shall be construed to limit the rights of a landholder in the management of his lands for agriculture, forestry, development, or any other lawful purpose'' (NC GS 113–332).

State and Federal Stream Protections (Buffers & Permits)

A buffer is a strip of trees, plants, or grass along a stream or wetland that naturally filters out dirt and pollution from rain water runoff before it enters rivers, streams, wetlands, and marshes (SELC 2014, p.2). Several state laws require setbacks or buffers, and all allow variances/waivers for those restrictions. Virginia's Chesapeake Bay Preservation Act requires 100-foot buffers on all perennial streams in designated ''Resource Protection Areas.'' North Carolina used to have buffer requirements in specific watersheds (*e.g.,* Tar-Pamlico, Neuse, Catawba, Jordan Lake, and Goose Creek), however, the NC Legislature enacted a Regulatory Reform effort, including ''Riparian Buffer Reform'' that allowed for the amendment of the buffer rules to allow/exempt development (see Session Law 2012–200, Section 8 and Session Law 2015–246, Section 13.1, G.S. 143–214.23A (NCDEQ 2016, entire)). North Carolina also has guidance for 200 foot riparian buffer protections for streams draining to listed aquatic species habitats (NCWRC 2002, p.11). In South Carolina, 30–45 ft buffer management zones are required for stormwater management (SCDHEC 2016, entire). In Georgia, all state waters are protected by a 25-foot vegetated buffer, and trout waters have a 50-foot vegetated buffer requirement.

Section 401 of the federal Clean Water Act (CWA) requires that an applicant for a federal license or permit provide a certification that any discharges from the facility will not degrade water quality or violate water-quality standards, including state-established water quality standard requirements. Section 404 of the CWA establishes a program to regulate the discharge of dredged and fill material into waters of the United States. Permits to fill wetlands and fill, culvert, bridge or re-align streams or water features are issued by the U.S. Army Corps of Engineers under Nationwide, Regional General Permits or Individual Permits.

- Nationwide Permits are for ''minor'' impacts to streams and wetlands, and do not require an intense review process. These impacts usually include stream impacts under 150 feet, and wetland fill projects up to 0.50 acres. Mitigation is usually provided for the same type of wetland or stream impacted, and is usually at a 2:1 ratio to offset losses and make the ''no net loss'' closer to reality.
- Regional General Permits are for various specific types of impacts that are common to a particular region; these permits will vary based on location in a certain region/state.
- Individual permits are for the larger, higher impact and more complex projects. These require a complex permit process with multi-agency input and involvement. Impacts in these types of permits are reviewed individually and the compensatory mitigation chosen may vary depending on project and types of impacts.

State and Federal Water Quality Programs

Current State regulations regarding pollutants are designed to be protective of aquatic organisms; however, freshwater mollusks may be more susceptible to some pollutants than the test organisms commonly used in bioassays. Additionally, water quality criteria may not incorporate data available for freshwater mussels (March et al. 2007, pp. 2,066–2,067). A multitude of bioassays conducted on 16 mussel species (summarized by Augspurger et al. 2007, pp. 2025–2028) show that freshwater mollusks are more sensitive than previously known to some chemical pollutants, including chlorine, ammonia, copper, fungicides, and herbicide surfactants. Another study found that nickel and chlorine were toxic to a federally threatened mussel species at levels below the current criteria (Gibson 2015, pp. 90–91). The study also found mussels are sensitive to SDS (sodium dodecyl sulfate), a surfactant commonly used in household detergents, for which water quality criteria do not currently exist. Several studies have demonstrated that the criteria for ammonia developed by EPA in 1999 were not protective of freshwater mussels (Augspurger et al. 2003, p. 2,571; Newton et al. 2003, pp. 2,559–2,560; Mummert et al. 2003, pp. 2,548–2,552). However, in 2013 EPA revised its recommended criteria for ammonia. The new criteria are more stringent and reflect new toxicity data on sensitive freshwater mollusks (78 FR 52192, August 22, 2013; p. 2). All of the states in the range of the Atlantic Pigtoe have not yet adopted the new ammonia criteria. NPDES permits are valid for 5 years, so even after the new criteria are

adopted, it could take several years before facilities must comply with the new limits.

TMDL, or Total Maximum Daily Load, is a regulatory term from the CWA describing a plan for restoring impaired waters that identify the maximum amount of a pollutant that a body of water can receive while still maintaining water quality standards. In North Carolina, despite management actions that started in the mid-1990s, long term monitoring and trend analyses have demonstrated that TMDL goals have not been met: ''Despite the fact that the targeted point and nonpoint pollution sources have been able to meet their nutrient reductions, total nitrogen and total phosphorous concentrations do not show a downward trend and loads have not permanently fallen below 1991 baseline load goals'' (as referenced (p.6) in SRI public comment letter on Yellow Lance Listing to USFWS, 6/5/2017).

Under the CWA, states are required to review their water quality standards and classifications every three years to make any modifications necessary to protect the waters of the state (NCDEQ 2016, entire). During this process, known as the Triennial Review, state water quality staff review current EPA guidelines, scientific data, and public comments and make recommendations for any changes of the water quality standards. In North Carolina, the most recent triennial review started in 2007 and was not completed until 2015 (NCDEQ 2016, entire). The state of North Carolina has not addressed water quality standards for several pollutants of concern for freshwater mussles, particularly ammonia, despite the EPA's 2013 recommended ambient water quality criteria for ammonia (as referenced (p.7) in SRI public comment letter on Yellow Lance Listing to USFWS, 6/5/2017).

In summary, despite existing authorities such as the Clean Water Act, pollutants continue to impair the water quality throughout the current range of the Atlantic Pigtoe. State and Federal regulatory mechanisms have helped reduce the negative effects of point source discharges since the 1970s, yet these regulations are difficult to implement and regulate. While new water quality criteria are being developed that take into account more sensitive aquatic species, most criteria currently do not. It is expected that several years will be needed to implement new water quality criteria throughout the range.

Synergistic Effects

In addition to impacting the species individually, it is likely that several of the above-summarized risk factors are acting synergistically or additively on the species. The combined impact of multiple stressors is likely more harmful than a single stressor acting alone. For example, in the Meherrin River MU, there are four stream reaches with 34 miles of impaired streams. They have low benthic-macroinvertebrate scores, low dissolved oxygen, low pH, and contain *Escherichia coli* (also known as *E. coli*). There are 16 non-major and 2 major discharges within this MU, along with 7 dams, and 676 road crossings. Additionally, droughts were recorded for 4 consecutive years (2007–2010) in this MU. The combination of all of these stressors on the sensitive aquatic species in this habitat has probably impacted Atlantic pigtoe, in that only two individuals have been recorded here since 2005, and therefore are affecting the species more severely in combination than any factor alone.

We note that, by using the SSA framework to guide our analysis of the scientific information documented in the SSA report, we have not only analyzed individual effects on the species, but we have also analyzed their potential cumulative effects. We incorporate the cumulative effects into our SSA analysis when we characterize the current and future condition of the species. To assess the current and future condition of the species, we undertake an iterative analysis that encompasses and incorporates the threats individually and then accumulates and evaluates the effects of all the factors that may be influencing the species, including threats and conservation efforts. Because the SSA framework considers not just the presence of the factors, but to what degree they collectively influence risk to the entire species, our assessment integrates the cumulative effects of the factors and replaces a standalone cumulative effects analysis.

Conservation Actions

The Service and State wildlife agencies are working with numerous partners to provide technical guidance and offering conservation tools to meet both species and habitat needs in aquatic systems in North Carolina. Land trusts are targeting key parcels for acquisition; Federal and State biologists are surveying and monitoring species occurrences; and, recently, there has been a concerted effort to ramp up captive propagation and species population restoration via augmentation, expansion, and reintroduction efforts. In 2014, NCWRC staff and partners began a concerted effort to propagate the Atlantic pigtoe in hopes of augmenting existing populations in the Tar and Neuse River basins. In July 2015, 250 Atlantic pigtoes were stocked into Sandy Creek, a tributary of the Tar River. Annual monitoring to evaluate growth and survival is planned, and additional propagation and stocking efforts will continue in upcoming years (Service 2021, p. 59).

Current Condition of Atlantic Pigtoe

The historical range of the Atlantic pigtoe included 12 populations in Atlantic river basins from Virginia to Georgia. The surveys conducted from 2005 to 2018 indicate that the currently occupied range of the Atlantic pigtoe consists of 13 MUs within 7 populations in Virginia and North Carolina, in the Tar, Neuse, James, Chowan, Roanoke, Cape Fear, and Yadkin-Pee Dee River basins. The species is presumed extirpated from the southern portion of its range, including the Catawba, Edisto, Savannah, Ogeechee, and Altamaha River basins. The Atlantic pigtoe currently (defined as the observation of at least one specimen from 2005 to 2019) occupies 13 of the 81 historically occupied MUs. At the population level, the overall current condition (= resiliency) of the extant populations was estimated to be high for the Tar Population; moderate for the Neuse Population; and low for the James, Chowan, Roanoke, Cape Fear, and Yadkin-Pee Dee populations.

The Atlantic pigtoe currently has reduced adaptive potential due to limited representation (compared with historical representation) in seven river basins and three physiographic regions. The species retains 58 percent of its known river basin variability, but, as discussed above, distribution has been reduced in the James, Chowan, Roanoke, Cape Fear, and Yadkin-Pee Dee populations. In addition, although the species continues to maintain physiographic representation in all three regions it historically occupied, occupancy has decreased in each region. A 67 percent estimated loss has occurred in the Mountain region's watersheds, 48 percent loss in the Piedmont region's watersheds, and 76 percent loss in the Coastal Plain region's watersheds. Latitudinal variability is also reduced and is largely limited to the central portions of its historical range, primarily in the Tar and Neuse basins.

Redundancy was estimated as the number of historically occupied MUs that remain currently occupied. The species has limited redundancy within the James, Chowan, Roanoke, and Cape Fear River populations, and only two

populations (Tar and Neuse) have multiple moderate or highly resilient MUs. Overall, the species has decreased redundancy across its range due to an estimated 60 percent reduction in occupancy compared to historical levels.

Future Scenarios

For the purpose of this assessment, we define viability as the ability of the species to sustain populations in the wild over time. To help address uncertainty associated with the degree and extent of potential future stressors and their impacts on the needs of the species, the 3 Rs were applied using four plausible future scenarios. We devised these scenarios by eliciting expert information on the primary stressors anticipated to affect the species into the future: Habitat loss and degradation due to urbanization and the effects of climate change. The models that were used to forecast both urbanization and climate change projected 50 years in the future. Synergistic interactions are possible between the effects of climate change and the effects of other potential threats, such as development. Increases in temperature and changes in precipitation are likely to affect stream dynamics, which will in turn affect the Atlantic pigtoe. However, it is difficult to project how climate change will affect stream dynamics because there can be both an increase in storm events as well as an increase in low flow, or drought, conditions. Uncertainty about how stream dynamics will respond to climate change, combined with uncertainty about how changes in instream habitat conditions would affect suitability for Atlantic pigtoe, make projecting possible synergistic effects of climate change on the Atlantic pigtoe too speculative. Below, we provide a brief summary of each plausible future scenario (see Table 1); for more detailed information on these models and their projections, please see the SSA report (Service 2021, chapter 3).

Under Scenario 1, the ''Status Quo'', factors that influence current populations of Atlantic pigtoe were assumed to remain constant over the 50 year time horizon. Under this scenario a loss of resiliency, representation, and redundancy is expected. Under this scenario, we predicted that no MUs would remain in high condition, 2 would be in moderate condition, 6 would be in low condition, and 20 MUs would be likely extirpated. Redundancy would be reduced to two MUs in the Tar Population. Representation would also be reduced, primarily with reduced variability in the Mountains and Coastal Plain.

Under scenario 2, the ''Pessimistic'', factors that negatively influence Atlantic pigtoe populations get worse. We predicted substantial losses of resiliency, representation, and redundancy. Redundancy would be reduced to 4 MUs in just two populations, and the resiliency of those populations is expected to be low; 24 MUs were predicted to be extirpated. All measures of representation are predicted to decline under this scenario, leaving remaining Atlantic pigtoe populations underrepresented in river basin and physiographic variability.

Under scenario 3, the ''Optimistic'', factors that influence the habitat conditions where Atlantic pigtoe populations exist were predicted to slightly improve over the 50 year time horizon. We predicted slightly higher levels of resiliency, representation, and redundancy than were estimated under the Status Quo or Pessimistic options. Two MUs would be in high condition, 5 in moderate condition, and 5 would be in low condition, but 16 would remain extirpated. Despite predictions of population persistence in the Chowan and Pee Dee river basins, these populations are expected to retain only low levels of resiliency; thus, levels of representation are also predicted to decline under this scenario.

Finally, under scenario 4, the ''Opportunistic'', landscape-level factors that influence populations of Atlantic pigtoe were predicted to get moderately worse. We predicted reduced levels of resiliency, representation, and redundancy. None of the MUs would be in high condition, 3 would be in moderate condition, 5 would be in low condition, and 20 would be likely extirpated. Redundancy would be reduced by losing 6 MUs compared to current condition. Under the ''Opportunistic'' scenario, representation is predicted to be reduced, with only 6 (50 percent) of the former 12 occupied river basins remaining occupied and with reduced variability in all three physiographic regions. This expected reduction in both the number and distribution of resilient populations is likely to make the species vulnerable to catastrophic disturbance.

BILLING CODE 4333–15–P

BILLING CODE 4333–15–C

Table 1. Current and Future Scenario Summary for Atlantic Pigtoe.

POPULATIONS: Management Units	Future Scenarios of Population Conditions				
	Current	**Status Quo**	**Pessimistic**	**Optimistic**	**Opportunistic**
James: Craig Creek Subbasin	Moderate	Low	Likely Extirpated	Moderate	Moderate
James: Mill Creek	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
James: Rivanna	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
James: Upper James	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
James: Middle James	Very Low	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
James: Appomattox	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Chowan: Nottoway	Moderate	Likely Extirpated	Likely Extirpated	Low	Low
Chowan: Meherrin	Low	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Roanoke: Dan River Subbasin	Low	Likely Extirpated	Likely Extirpated	Moderate	Likely Extirpated
Roanoke: Roanoke	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Tar: Upper/Middle Tar	High	Low	Low	Moderate	Low
Tar: Lower Tar	Low	Low	Likely Extirpated	Low	Likely Extirpated
Tar: Fishing Ck	High	Moderate	Low	High	Moderate
Tar: Sandy-Swift	High	Moderate	Low	High	Moderate
Neuse: Upper Neuse	Moderate	Low	Likely Extirpated	Moderate	Low
Neuse: Middle Neuse	Moderate	Likely Extirpated	Likely Extirpated	Low	Likely Extirpated
Cape Fear: New Hope	Moderate	Low	Likely Extirpated	Low	Likely Extirpated
Cape Fear: Deep River Subbasin	Low	Likely Extirpated	Likely Extirpated	Moderate	Low
Cape Fear: Mainstem	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Cape Fear: Black	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Pee Dee: Muddy	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Pee Dee: Uwharrie/Little	Low	Low	Low	Low	Low
Pee Dee: Goose/Lanes	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Catawba	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Edisto	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Savannah	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Ogeechee	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated
Altamaha	Presumed Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated	Likely Extirpated

Determination of the Atlantic Pigtoe's Status

Section 4 of the Act (16 U.S.C. 1533) and its implementing regulations (50 CFR part 424) set forth the procedures for determining whether a species meets the definition of an ''endangered species'' or a ''threatened species.'' The Act defines an ''endangered species'' as a species that is in danger of extinction throughout all or a significant portion of its range, and a ''threatened species'' as a species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. The Act requires that we determine whether a species meets the definition of endangered species or threatened species because of any of the following factors: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) Overutilization for commercial, recreational, scientific, or educational purposes; (C) Disease or predation; (D) The inadequacy of existing regulatory mechanisms; or (E) Other natural or manmade factors affecting its continued existence.

Atlantic Pigtoe's Status Throughout All of Its Range

We have carefully assessed the best scientific and commercial information available regarding the past, present, and future threats to the Atlantic pigtoe. Currently the Atlantic pigtoe is presumed extirpated from 54 percent (15) of the historically occupied MUs; of the remaining currently extant populations (13 MUs), 57 percent are characterized as moderately or highly resilient, and 43 percent are currently characterized by low resiliency. Many of the streams that remain part of the current species' range are estimated to be in low or very low condition with decreased occupancy of Atlantic pigtoe.

The Atlantic pigtoe faces threats from declines in water quality, loss of stream flow, riparian and instream fragmentation, and deterioration of instream habitats (Factor A). These threats, which are expected to be exacerbated by continued urbanization (Factor A) and effects of climate change (Factor E), will impact the future viability of the Atlantic pigtoe. We did not find that the Atlantic pigtoe was impacted by overutilization (Factor B), or by disease or predation (Factor C). While there are regulatory mechanisms in place that may benefit the Atlantic pigtoe, the existing regulatory mechanisms did not reduce the impact of the stressors to the point that the species is not at risk of extinction (Factor D).

Given current and future decreases in resiliency, populations become more vulnerable to extirpation from stochastic events, in turn, resulting in concurrent losses in representation and redundancy. The range of plausible future scenarios of Atlantic pigtoe habitat conditions and population factors suggest reduced viability into the future.

We considered whether the Atlantic pigtoe is currently in danger of extinction and determined that endangered status is not appropriate. Notwithstanding the number of populations that are no longer extant, several moderately resilient populations remain over portions of the species' historical range. The historical range of the Atlantic pigtoe included streams and rivers in 12 Atlantic Slope drainages from the James River Basin to the Altamaha River Basin, with the documented historical distribution in 28 MUs within those basins. Currently, the Atlantic pigtoe is presumed extirpated from 54 percent (15) of the historically occupied MUs and 5 of the drainages. Of the remaining 13 occupied MUs, 3 (21 percent) are estimated to be highly resilient and 5 (36 percent) moderately resilient, with 5 (43 percent) having low resiliency. Eight moderate to high resiliency MUs provide the ability for the species to withstand stochastic disturbance events. Scaling up from the MU to the population level, 1 of 12 former populations (the Tar population) was estimated to have high resiliency, 1 population (the Neuse population) was estimated to have moderate resiliency, 5 populations (the James, Chowan, Roanoke, Cape Fear, and Yadkin-Pee Dee populations) had low estimated resiliency, and 5 of the former 12 populations are presumed extirpated; this means that 42 percent of the species' historical range has been eliminated. Seventy-one percent of streams that remain part of the current species' range are estimated to be in low condition as defined in the SSA report. The species continues to maintain physiographic representation in all 3 regions it historically occupied, although occupancy has decreased in each region by between 48 and 76 percent. However, while threats are currently acting on the species and many of those threats are expected to continue into the future (see below), we did not find that the species is currently in danger of extinction throughout all of its range. With eight moderately or highly resilient MUs in three physiographic regions, the current condition of the species still provides resiliency, redundancy, and representation such that it is not at risk of extinction now.

However, after evaluating threats to the species and assessing the cumulative effect of the threats under the Act's section 4(a)(1) factors, we predict that the population and habitat factors that we used to determine the resiliency, representation, and redundancy for the Atlantic pigtoe will continue to decline. Fifty years was considered ''foreseeable'' in this case because it included projections from both available models, and Atlantic pigtoes are a long-lived and slow-growing species. We can reliably predict both the future threats and the species' responses to those threats over 50 years as presented in the models of predicted urbanization and climate change.

As discussed above, the range of plausible future scenarios of Atlantic pigtoe habitat conditions and population factors projects reduced viability into the future. Under all future scenarios, resiliency is low in a majority of the remaining populations, and many populations are likely extirpated so that redundancy and representation are predicted to be significantly reduced. This expected reduction in both the number and distribution of sufficiently resilient populations is likely to make the species vulnerable to catastrophic disturbance. Our analysis of the species' future conditions show that habitat modification and destruction (Factor A) and other natural and manmade factors (Factor E) will continue to impact the resiliency, representation, and redundancy for the Atlantic pigtoe so that it is likely to become in danger of extinction throughout all or a significant portion of its range within the foreseeable future.

Atlantic Pigtoe's Status Throughout a Significant Portion of Its Range

Under the Act and our implementing regulations, a species may warrant listing if it is in danger of extinction or likely to become so in the foreseeable future throughout all or a significant portion of its range. The court in *Center for Biological Diversity* v. *Everson,* 2020 WL 437289 (D.D.C. Jan. 28, 2020) (*Center for Biological Diversity*), vacated the aspect of the Final Policy on Interpretation of the Phrase ''Significant Portion of Its Range'' in the Endangered Species Act's Definitions of ''Endangered Species'' and ''Threatened Species'' (79 FR 37578; July 1, 2014) that provided that the Service does not undertake an analysis of significant portions of a species' range if the species warrants listing as threatened throughout all of its range. Therefore,

we proceed to evaluate whether the species is endangered in any significant portion of its range—that is, whether there is any portion of the species' range for which both (1) the portion is significant; and (2) the species is in danger of extinction in that portion. Depending on the case, it might be more efficient for us to address the ''significance'' question or the ''status'' question first. We can choose to address either question first. Regardless of which question we address first, if we reach a negative answer with respect to the first question that we address, we do not need to evaluate the other question for that portion of the species' range.

Following the court's holding in *Center for Biological Diversity,* we now consider whether there are any significant portions of the species' range where the species is in danger of extinction now (*i.e.,* endangered). In undertaking this analysis for the Atlantic pigtoe, we chose to address the status question first—we considered information pertaining to the geographic distribution of both the species and the threats that the species faces to identify any portions of the range where the species is endangered.

Specifically, we considered whether the threats are geographically concentrated in any portion of the species' range at a biologically meaningful scale. We examined the following threats: Declines in water quality, loss of stream flow, riparian and instream fragmentation, and deterioration of instream habitats, including cumulative effects. Overall, we found that threats are likely acting on individuals or MUs, or even basins (populations), similarly across the species' range. These threats are certain to occur, and in those basins with MUs that are predominantly in low condition currently, the populations are facing the same threats as those in moderate or high resiliency condition.

Thus, there are no portions of the species' range where the species has a different status from its rangewide status. Therefore, no portion of the species' range provides a basis for determining that the species is in danger of extinction in a significant portion of its range, and we determine that the species is likely to become in danger of extinction within the foreseeable future throughout all of its range. This is consistent with the courts' holdings in *Desert Survivors* v. *Department of the Interior,* No. 16–cv–01165–JCS, 2018 WL 4053447 (N.D. Cal. Aug. 24, 2018), and *Center for Biological Diversity* v. *Jewell,* 248 F. Supp. 3d, 946, 959 (D. Ariz. 2017).

Determination of Status

Our review of the best available scientific and commercial information indicates that the Atlantic pigtoe meets the Act's definition of a threatened species. Therefore, we are listing the Atlantic pigtoe as a threatened species in accordance with sections 3(20) and 4(a)(1) of the Act.

Available Conservation Measures

Conservation measures provided to species listed as endangered or threatened species under the Act include recognition, recovery actions, requirements for Federal protection, and prohibitions against certain practices. Recognition through listing results in public awareness, and conservation by Federal, State, Tribal, and local agencies, private organizations, and individuals. The Act encourages cooperation with the States and requires that recovery actions be carried out for all listed species. The protection required by Federal agencies and the prohibitions against certain activities are discussed, in part, below.

The primary purpose of the Act is the conservation of endangered and threatened species and the ecosystems upon which they depend. The ultimate goal of such conservation efforts is the recovery of these listed species, so that they no longer need the protective measures of the Act. Section 4(f) of the Act requires the Service to develop and implement recovery plans for the conservation of endangered and threatened species. The recovery planning process involves the identification of actions that are necessary to halt or reverse the species' decline by addressing the threats to its survival and recovery. The goal of this process is to restore listed species to a point where they are secure, self-sustaining, and functioning components of their ecosystems.

Recovery planning includes the development of a recovery outline shortly after a species is listed and preparation of a draft and final recovery plan. The recovery outline guides the immediate implementation of urgent recovery actions and describes the process to be used to develop a recovery plan. Revisions of the plan may be done to address continuing or new threats to the species, as new substantive information becomes available. The recovery plan identifies recovery criteria for review of when a species may be ready for for removal from protected status (''delisting''), and methods for monitoring recovery progress. Recovery plans also establish a framework for agencies to coordinate their recovery efforts and provide estimates of the cost of implementing recovery tasks. Recovery teams (composed of species experts, Federal and State agencies, nongovernmental organizations, and stakeholders) are often established to develop recovery plans. When completed, the recovery outline, draft recovery plan, and the final recovery plan will be available on our website (*http://www.fws.gov/endangered*) or from our Raleigh Ecological Services Field Office (see **FOR FURTHER INFORMATION CONTACT**).

Implementation of recovery actions generally requires the participation of a broad range of partners, including other Federal agencies, States, Tribes, nongovernmental organizations, businesses, and private landowners. Examples of recovery actions include habitat restoration (*e.g.,* restoration of native vegetation), research, captive propagation and reintroduction, and outreach and education. The recovery of many listed species cannot be accomplished solely on Federal lands because their range may occur primarily or solely on non-Federal lands. To achieve recovery of these species requires cooperative conservation efforts on private, State, and Tribal lands.

Following publication of this rule, funding for recovery actions will be available from a variety of sources, including Federal budgets, State programs, and cost share grants for non-Federal landowners, the academic community, and nongovernmental organizations. In addition, pursuant to section 6 of the Act, the States of Virginia, North Carolina, South Carolina, and Georgia will be eligible for Federal funds to implement management actions that promote the protection or recovery of the Atlantic pigtoe. Information on our grant programs that are available to aid species recovery can be found at: *http://www.fws.gov/grants.*

Please let us know if you are interested in participating in recovery efforts for the Atlantic pigtoe. Additionally, we invite you to submit any new information on this species whenever it becomes available and any information you may have for recovery planning purposes (see **FOR FURTHER INFORMATION CONTACT**).

Section 7(a) of the Act requires Federal agencies to evaluate their actions with respect to any species that is listed as an endangered or threatened species and with respect to its critical habitat, if any is designated. Regulations implementing this interagency cooperation provision of the Act are codified at 50 CFR part 402. Section 7(a)(2) of the Act requires Federal

agencies to ensure that activities they authorize, fund, or carry out are not likely to jeopardize the continued existence of any endangered or threatened species or destroy or adversely modify its critical habitat. If a Federal action may affect a listed species or its critical habitat, the responsible Federal agency must enter into consultation with the Service.

Federal agency actions within the species' habitat that may require conference or consultation or both as described in the preceding paragraph may include, but are not limited to, management and any other landscape-altering activities on Federal lands administered by the Service, U.S. Forest Service, and National Park Service; issuance of section 404 Clean Water Act (33 U.S.C. 1251 *et seq.*) permits by the U.S. Army Corps of Engineers; and construction and maintenance of roads or highways by the Federal Highway Administration.

It is our policy, as published in the **Federal Register** on July 1, 1994 (59 FR 34272), to identify to the maximum extent practicable at the time a species is listed, those activities that would or would not constitute a violation of section 9 of the Act. The intent of this policy is to increase public awareness of the effect of a listing on proposed and ongoing activities within the range of the listed species. The discussion below regarding protective regulations under section 4(d) of the Act complies with our policy.

II. Final Rule Issued Under Section 4(d) of the Act

Background

Section 4(d) of the Act contains two sentences. The first sentence states that the Secretary shall issue such regulations as she deems necessary and advisable to provide for the conservation of species listed as threatened. The U.S. Supreme Court has noted that statutory language like ''necessary and advisable'' demonstrates a large degree of deference to the agency (see *Webster* v. *Doe,* 486 U.S. 592 (1988)). Conservation is defined in the Act to mean the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to the Act are no longer necessary. Additionally, the second sentence of section 4(d) of the Act states that the Secretary may by regulation prohibit with respect to any threatened species any act prohibited under section 9(a)(1), in the case of fish or wildlife, or section 9(a)(2), in the case of plants. Thus, the combination of the two sentences of section 4(d) provides the Secretary with wide latitude of discretion to select and promulgate appropriate regulations tailored to the specific conservation needs of the threatened species. The second sentence grants particularly broad discretion to the Service when adopting the prohibitions under section 9.

The courts have recognized the extent of the Secretary's discretion under this standard to develop rules that are appropriate for the conservation of a species. For example, courts have upheld rules developed under section 4(d) as a valid exercise of agency authority where they prohibited take of threatened wildlife, or include a limited taking prohibition (see *Alsea Valley Alliance* v. *Lautenbacher,* 2007 U.S. Dist. Lexis 60203 (D. Or. 2007); *Washington Environmental Council* v. *National Marine Fisheries Service,* 2002 U.S. Dist. Lexis 5432 (W.D. Wash. 2002)). Courts have also upheld 4(d) rules that do not address all of the threats a species faces (see *State of Louisiana* v. *Verity,* 853 F.2d 322 (5th Cir. 1988)). As noted in the legislative history when the Act was initially enacted, ''once an animal is on the threatened list, the Secretary has an almost infinite number of options available to [her] with regard to the permitted activities for those species. [She] may, for example, permit taking, but not importation of such species, or [s]he may choose to forbid both taking and importation but allow the transportation of such species'' (H.R. Rep. No. 412, 93rd Cong., 1st Sess. 1973).

Exercising its authority under section 4(d), the Service has developed a rule that is designed to address the Atlantic pigtoe's specific threats and conservation needs. Although the statute does not require us to make a ''necessary and advisable'' finding with respect to the adoption of specific prohibitions under section 9, we find that this rule as a whole satisfies the requirement in section 4(d) of the Act to issue regulations deemed necessary and advisable to provide for the conservation of the Atlantic pigtoe. As discussed above under Summary of Biological Status and Threats, we have concluded that the Atlantic pigtoe is likely to become in danger of extinction within the foreseeable future primarily due to habitat degradation from stressors influencing water quality, water quantity, instream habitat, and habitat connectivity. The provisions of this 4(d) rule will promote conservation of the Atlantic pigtoe by encouraging management of the landscape in ways that meet both land management considerations and the conservation needs of the Atlantic pigtoe. The provisions of this rule are one of many tools that the Service will use to promote the conservation of the Atlantic pigtoe.

Provisions of the 4(d) Rule

This 4(d) rule will provide for the conservation of the Atlantic pigtoe by prohibiting the following activities, except as otherwise authorized or permitted: Importing or exporting; take; possession and other acts with unlawfully taken specimens; delivering, receiving, transporting, or shipping in interstate or foreign commerce in the course of commercial activity; or selling or offering for sale in interstate or foreign commerce.

Import/export, possession, transportation, sale, and commerce are of concern for many aquatic mollusks, primarily because they are sought after for use as fishing bait and for human consumption. Regulating these activities will help protect the Atlantic pigtoe from exploitation.

Under the Act, ''take'' means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Some of these provisions have been further defined in regulation at 50 CFR 17.3. Take can occur knowingly or otherwise, by direct and indirect impacts, and intentionally or incidentally. Protecting the Atlantic pigtoe from direct forms of take, such as physical injury or killing or unauthorized handling or collecting of the species, whether incidental or intentional, will help preserve and recover the species. Therefore, we prohibit intentional take of Atlantic pigtoe, including, but not limited to, capturing, handling, trapping, collecting, or other activities.

Also, as discussed above under Summary of Biological Status and Threats, habitat degradation from stressors influencing water quality, water quantity, instream habitat, and habitat connectivity are affecting the status of the Atlantic pigtoe. Across the species' range, stream and water quality have been degraded physically by sedimentation, pollution, contaminants, impoundments, channelization, destruction of riparian habitat, and loss of riparian vegetation due to development, agricultural practices, land conversion, incompatible forest management, invasive species, and dams and barriers. Other habitat or hydrological alteration (such as ditching, draining, diverting, dredging, snagging, impounding, channelization, or modification of stream channels or

banks; discharge of fill material into stream channels; or diversion or alteration of surface or ground water flow into or out of a stream) will impact the habitat of the species. Regulating incidental take that may result from these activities will help preserve the species' remaining populations, slow their rate of decline, and decrease synergistic, negative effects from other threats. Therefore, we prohibit incidental take of the Atlantic pigtoe resulting from activities that destroy, alter, or degrade the habitat in the manner described above.

As discussed above, during both of the public comment periods, the Service received numerous comments on its proposal to exempt from these prohibitions incidental take resulting from silvicultural practices and forest management activities (see Summary of Comments and Recommendations, above). Forestry BMPs, when properly implemented, protect water quality and help conserve aquatic species, including the Atlantic pigtoe. Forest landowners who properly implement those BMPs are helping conserve the pigtoe, and this 4(d) rule is an incentive for all landowners to properly implement BMPs to avoid any take implications. Further, those forest landowners who are third-party certified to a credible forest management standard are providing audited certainty that BMP implementation is taking place across the landscape.

To address any uncertainty regarding which silvicultural and forest management BMPs will satisfy the 4(d) rule's exception for incidental take resulting from silvicultural practices and forest management activities, our regulations specify the conditions that must be met. Further, we revised our 4(d) rule language to clarify that to qualify for the exception, the BMPs must result in protection of the habitat features that provide for the breeding, feeding, sheltering, and dispersal needs of the Atlantic pigtoe, which will in turn provide for the conservation of the species. In waterbodies that support listed aquatic species, a wider SMZ is more effective at reducing sedimentation, maintaining lower water temperatures through shading, and introducing food (such as leaves and insects) into the food chain (VDOF 2011, p. 37). Ninety percent of the food in forested streams comes from bordering vegetation (NCWRC 2002, p. 6; Service 2006, p. 6; Stewart et al. 2000, p. 210; Service 2021, p. 11). Atlantic pigtoes require cool, well-oxygenated water, and a clean stream bottom (Service 2021, p. 11). A lack of these features limits the number of pigtoes a stream can support. Aquatic habitat and suitable water temperature can be maintained even during logging operations when streamside vegetation is left intact (VDOF 2011, p. 37). The exception for incidental take associated with these activities seeks to ensure these characteristics are maintained for the conservation of the Atlantic pigtoe.

Therefore, under this 4(d) rule, most prohibitions and provisions of 50 CFR 17.21 for endangered wildlife apply to the Atlantic pigtoe, except that incidental take resulting from the following actions is not prohibited:

(1) Species restoration efforts by State wildlife agencies, including collection of broodstock, tissue collection for genetic analysis, captive propagation, and subsequent stocking into currently occupied and unoccupied areas within the historical range of the species, and follow-up monitoring.

(2) Channel restoration projects that create natural, physically stable, ecologically functioning streams (or stream and wetland systems) that are reconnected with their groundwater aquifers. These projects can be accomplished using a variety of methods, but the desired outcome is a natural channel with low shear stress (force of water moving against the channel); bank heights that enable reconnection to the floodplain; a reconnection of surface and groundwater systems, resulting in perennial flows in the channel; riffles and pools composed of existing soil, rock, and wood instead of large imported materials; low compaction of soils within adjacent riparian areas; and inclusion of riparian wetlands. Streams reconstructed in this way would offer suitable habitats for the Atlantic pigtoe and contain stable channel features, such as pools, glides, runs, and riffles, which could be used by the species for spawning, rearing, growth, feeding, dispersal, and other normal behaviors. Prior to restoration action, surveys to determine presence of Atlantic pigtoe must be performed, and if located, mussels must be relocated prior to project implementation.

(3) Bank stabilization projects that use bioengineering methods to replace pre-existing, bare, eroding stream banks with vegetated, stable stream banks, thereby reducing bank erosion and instream sedimentation and improving habitat conditions for the species. Following these bioengineering methods, stream banks may be stabilized using native species live stakes (live, vegetative cuttings inserted or tamped into the ground in a manner that allows the stake to take root and grow), native species live fascines (live branch cuttings, usually willows, bound together into long, cigar-shaped bundles), or native species brush layering (cuttings or branches of easily rooted tree species layered between successive lifts of soil fill). Native species vegetation includes woody and herbaceous species appropriate for the region and habitat conditions. These methods do not include the sole use of quarried rock (rip-rap) or the use of rock baskets or gabion structures.

(4) Forestry-related activities, including silvicultural practices, forest management work, and fire control tactics, that implement State-approved BMPs. In order for this exception to apply to forestry-related activities, these BMPs must achieve all of the following:

(a) Establish a streamside management zone alongside the margins of each waterway.

(b) Restrain visible sedimentation caused by the forestry-related activity from entering the waterway.

(c) Maintain native groundcover within the streamside management zone of the waterway, and promptly re-establish native groundcover if disturbed.

(d) Limit installation of vehicle or equipment crossings of the waterway to only where necessary for the forestry-related activity. Such crossings must:

(i) Have erosion and sedimentation control measures installed to divert surface runoff away and restrain visible sediment from entering the waterway;

(ii) Allow for movement of aquatic organisms within the waterway; and

(iii) Have native groundcover applied and maintained through completion of the forestry-related activity.

(e) Prohibit the use of tracked or wheeled vehicles for reforestation site preparation within the streamside management zone of the waterway.

(f) Prohibit locating log decks, skid trails, new roads, and portable mill sites in the streamside management zone of the waterway.

(g) Prohibit obstruction and impediment of the flow of water within the waterway that is caused by direct deposition of debris or soil by the forestry-related activity.

(h) Maintain shade over the waterway similar to that observed prior to the forestry-related activity.

(i) Prohibit discharge of any solid waste, petroleum, pesticide, fertilizer, or other chemical into the waterway.

We reiterate that these actions and activities may result in some minimal level of take of the Atlantic pigtoe, but they are unlikely to negatively impact the species' conservation and recovery efforts. To the contrary, we expect they would have a net beneficial effect on the

species. Across the species' range, instream habitats have been degraded physically by sedimentation and by direct channel disturbance. The activities in the 4(d) rule will correct some of these problems, creating more favorable habitat conditions for the species.

We may issue permits to carry out otherwise prohibited activities, including those described above, involving threatened wildlife under certain circumstances. Regulations governing permits are codified at 50 CFR 17.32. With regard to threatened wildlife, a permit may be issued for the following purposes: for scientific purposes, to enhance propagation or survival, for economic hardship, for zoological exhibition, for educational purposes, for incidental taking, or for special purposes consistent with the purposes of the Act. The statute also contains certain exemptions from the prohibitions, which are found in sections 9 and 10 of the Act.

We recognize the special and unique relationship with our State natural resource agency partners in contributing to conservation of listed species. State agencies often possess scientific data and valuable expertise on the status and distribution of endangered, threatened, candidate, and at-risk species of wildlife and plants. State agencies, because of their authorities and their close working relationships with local governments and landowners, are in a unique position to assist the Service in implementing all aspects of the Act. In this regard, section 6 of the Act provides that the Service shall cooperate to the maximum extent practicable with the States in carrying out programs authorized by the Act. Therefore, any qualified employee or agent of a State conservation agency that is a party to a cooperative agreement with the Service in accordance with section 6(c) of the Act, who is designated by his or her agency for such purposes, will be able to conduct activities designed to conserve the Atlantic pigtoe that may result in otherwise prohibited take without additional authorization.

Nothing in this 4(d) rule will change in any way the recovery planning provisions of section 4(f) of the Act, the consultation requirements under section 7 of the Act, or the ability of the Service to enter into partnerships for the management and protection of the Atlantic pigtoe. However, interagency cooperation may be further streamlined through planned programmatic consultations for the species between Federal agencies and the Service.

III. Critical Habitat

Background

Critical habitat is defined in section 3 of the Act as:

(1) The specific areas within the geographical area occupied by the species, at the time it is listed in accordance with the Act, on which are found those physical or biological features

(a) Essential to the conservation of the species, and

(b) Which may require special management considerations or protection; and

(2) Specific areas outside the geographical area occupied by the species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

Our regulations at 50 CFR 424.02 define the geographical area occupied by the species as an area that may generally be delineated around species' occurrences, as determined by the Secretary (*i.e.,* range). Such areas may include those areas used throughout all or part of the species' life cycle, even if not used on a regular basis (*e.g.,* migratory corridors, seasonal habitats, and habitats used periodically, but not solely by vagrant individuals).

Conservation, as defined under section 3 of the Act, means to use and the use of all methods and procedures that are necessary to bring an endangered or threatened species to the point at which the measures provided pursuant to the Act are no longer necessary. Such methods and procedures include, but are not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transplantation, and, in the extraordinary case where population pressures within a given ecosystem cannot be otherwise relieved, may include regulated taking.

Critical habitat receives protection under section 7 of the Act through the requirement that Federal agencies ensure, in consultation with the Service, that any action they authorize, fund, or carry out is not likely to result in the destruction or adverse modification of critical habitat. The designation of critical habitat does not affect land ownership or establish a refuge, wilderness, reserve, preserve, or other conservation area. Such designation does not allow the government or public to access private lands. Such designation does not require implementation of restoration, recovery, or enhancement measures by non-Federal landowners. Where a landowner requests Federal agency funding or authorization for an action that may affect a listed species or critical habitat, the Federal agency would be required to consult with the Service under section 7(a)(2) of the Act. However, even if the Service were to conclude that the proposed activity would result in destruction or adverse modification of the critical habitat, the Federal action agency and the landowner are not required to abandon the proposed activity, or to restore or recover the species; instead, they must implement ''reasonable and prudent alternatives'' to avoid destruction or adverse modification of critical habitat.

Under the first prong of the Act's definition of critical habitat, areas within the geographical area occupied by the species at the time it was listed are included in a critical habitat designation if they contain physical or biological features (1) which are essential to the conservation of the species and (2) which may require special management considerations or protection. For these areas, critical habitat designations identify, to the extent known using the best scientific and commercial data available, those physical or biological features that are essential to the conservation of the species (such as space, food, cover, and protected habitat). In identifying those physical or biological features within an area, we focus on the specific features that support the life-history needs of the species, including but not limited to, water characteristics, soil type, geological features, prey, vegetation, symbiotic species, or other features. A feature may be a single habitat characteristic, or a more complex combination of habitat characteristics. Features may include habitat characteristics that support ephemeral or dynamic habitat conditions. Features may also be expressed in terms relating to principles of conservation biology, such as patch size, distribution distances, and connectivity.

Under the second prong of the Act's definition of critical habitat, we can designate critical habitat in areas outside the geographical area occupied by the species at the time it is listed, upon a determination that such areas are essential for the conservation of the species. We determine whether unoccupied areas are essential for the conservation of the species by considering the life-history, status, and conservation needs of the species. This determination is further informed by any generalized conservation strategy, criteria, or outline that may have been

developed for the species to provide a substantive foundation for identifying which features and specific areas are essential to the conservation of the species and, as a result, the development of the critical habitat designation. For example, an area currently occupied by the species but that was not occupied at the time of listing may be essential to the conservation of the species and may be included in the critical habitat designation.

Section 4 of the Act requires that we designate critical habitat on the basis of the best scientific data available. Further, our Policy on Information Standards Under the Endangered Species Act (published in the **Federal Register** on July 1, 1994 (59 FR 34271)), the Information Quality Act (section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Pub. L. 106–554; H.R. 5658)), and our associated Information Quality Guidelines provide criteria, establish procedures, and provide guidance to ensure that our decisions are based on the best scientific data available. They require our biologists, to the extent consistent with the Act and with the use of the best scientific data available, to use primary and original sources of information as the basis for recommendations to designate critical habitat.

When we are determining which areas should be designated as critical habitat, our primary source of information is generally the information from the SSA report and other information developed during the listing process for the species. Additional information sources may include any generalized conservation strategy, criteria, or outline that may have been developed for the species; the recovery plan for the species; articles in peer-reviewed journals; conservation plans developed by States and counties; scientific status surveys and studies; biological assessments; other unpublished materials; or experts' opinions or personal knowledge.

Habitat is dynamic, and species may move from one area to another over time. We recognize that critical habitat designated at a particular point in time may not include all of the habitat areas that we may later determine are necessary for the recovery of the species. For these reasons, a critical habitat designation does not signal that habitat outside the designated area is unimportant or may not be needed for recovery of the species. Areas that are important to the conservation of the species, both inside and outside the critical habitat designation, will continue to be subject to: (1) Conservation actions implemented under section 7(a)(1) of the Act; (2) regulatory protections afforded by the requirement in section 7(a)(2) of the Act for Federal agencies to ensure their actions are not likely to jeopardize the continued existence of any endangered or threatened species; and (3) the prohibitions found in section 9 of the Act. Federally funded or permitted projects affecting listed species outside their designated critical habitat areas may still result in jeopardy findings in some cases. These protections and conservation tools will continue to contribute to recovery of the species. Similarly, critical habitat designations made on the basis of the best available information at the time of designation will not control the direction and substance of future recovery plans, habitat conservation plans (HCPs), or other species conservation planning efforts if new information available at the time of those planning efforts calls for a different outcome.

On August 27, 2019, we published a final rule in the **Federal Register** (84 FR 45020) to amend our regulations concerning the procedures and criteria used for listing or removing species from the Lists of Endangered and Threatened Wildlife and Plants and designating critical habitat. That rule became effective on September 26, 2019, but, as stated in that rule, the revisions it sets forth apply to classification and critical habitat rules for which a proposed rule was published after September 26, 2019. We published our proposed critical habitat designation for the Atlantic pigtoe on October 11, 2018 (83 FR 51570); therefore, the revisions set forth in the August 27, 2019, final rule do not apply to this final designation of critical habitat for the Atlantic pigtoe and this final rule follows the version of § 424.12 that was in effect prior to September 26, 2019.

Physical or Biological Features Essential to the Conservation of the Species

In accordance with section 3(5)(A)(i) of the Act and regulations at 50 CFR 424.12(b), in determining which areas we will designate as critical habitat from within the geographical area occupied by the species at the time of listing, we consider the physical or biological features that are essential to the conservation of the species and which may require special management considerations or protection. The regulations at 50 CFR 424.02 define ''physical or biological features essential to the conservation of the species'' as the features that occur in specific areas and that are essential to support the life-history needs of the species, including, but not limited to, water characteristics, soil type, geological features, sites, prey, vegetation, symbiotic species, or other features. A feature may be a single habitat characteristic or a more complex combination of habitat characteristics. Features may include habitat characteristics that support ephemeral or dynamic habitat conditions. Features may also be expressed in terms relating to principles of conservation biology, such as patch size, distribution distances, and connectivity. For example, physical features essential to the conservation of the species might include gravel of a particular size required for spawning, alkaline soil for seed germination, protective cover for migration, or susceptibility to flooding or fire that maintains necessary early-successional habitat characteristics. Biological features might include prey species, forage grasses, specific kinds or ages of trees for roosting or nesting, symbiotic fungi, or a particular level of nonnative species consistent with conservation needs of the listed species. The features may also be combinations of habitat characteristics and may encompass the relationship between characteristics or the necessary amount of a characteristic essential to support the life history of the species.

In considering whether features are essential to the conservation of the species, we may consider an appropriate quality, quantity, and spatial and temporal arrangement of habitat characteristics in the context of the life-history needs, condition, and status of the species. These characteristics include, but are not limited to, space for individual and population growth and for normal behavior; food, water, air, light, minerals, or other nutritional or physiological requirements; cover or shelter; sites for breeding, reproduction, or rearing (or development) of offspring; and habitats that are protected from disturbance.

Summary of Essential Physical or Biological Features

We derive the specific physical or biological features essential for the conservation of the Atlantic pigtoe from studies of this species' habitat, ecology, and life history. The primary habitat elements that influence resiliency of the Atlantic pigtoe include water quality, water quantity, substrate, and habitat connectivity. A full description of the needs of individuals, populations, and the species is available from the SSA report (Service 2021, p. 11). We have determined that the following physical

or biological features are essential to the conservation of Atlantic pigtoe:

(1) Suitable substrates and connected instream habitats, characterized by geomorphically stable stream channels and banks (*i.e.,* channels that maintain lateral dimensions, longitudinal profiles, and sinuosity patterns over time without an aggrading or degrading bed elevation) with habitats that support a diversity of freshwater mussel and native fish (such as stable riffle-run-pool habitats that provide flow refuges consisting of silt-free gravel and coarse sand substrates).

(2) Adequate flows, or a hydrologic flow regime (which includes the severity, frequency, duration, and seasonality of discharge over time), necessary to maintain benthic habitats where the species is found and to maintain connectivity of streams with the floodplain, allowing the exchange of nutrients and sediment for maintenance of the mussel's and fish hosts' habitat, food availability, spawning habitat for native fishes, and the ability for newly transformed juveniles to settle and become established in their habitats.

(3) Water and sediment quality (including, but not limited to, conductivity, hardness, turbidity, temperature, pH, ammonia, heavy metals, and chemical constituents) necessary to sustain natural physiological processes for normal behavior, growth, and viability of all life stages.

(4) The presence and abundance of fish hosts necessary for recruitment of the Atlantic pigtoe.

Special Management Considerations or Protection

When designating critical habitat, we assess whether the specific areas within the geographical area occupied by the species at the time of listing contain features which are essential to the conservation of the species and which may require special management considerations or protection. Special management considerations or protection may be required of the Federal action agency to eliminate, or to reduce to negligible levels, the threats affecting the physical and biological features of each unit. The features essential to the conservation of the Atlantic pigtoe may require special management considerations or protections to reduce the following threats: (1) Urbanization of the landscape, including (but not limited to) land conversion for urban and commercial use, infrastructure (roads, bridges, utilities), and urban water uses (water supply reservoirs, wastewater treatment, etc.); (2) nutrient pollution from agricultural activities that impact water quantity and quality; (3) significant alteration of water quality; (4) incompatible forest management or silviculture activities that remove large areas of forested wetlands or riparian systems; (5) culvert and pipe installation that creates barriers to movement; (6) impacts from invasive species; (7) changes and shifts in seasonal precipitation patterns as a result of climate change; and (8) other watershed and floodplain disturbances that release sediments or nutrients into the water.

Management activities that could ameliorate these threats include, but are not limited to: Use of BMPs designed to reduce sedimentation, erosion, and bank side destruction; protection of riparian corridors and maintenance of sufficient canopy cover along banks; moderation of surface and ground water withdrawals to maintain natural flow regimes; increased use of stormwater management and reduction of stormwater flows into the systems; and reduction of other watershed and floodplain disturbances that release sediments, pollutants, or nutrients into the water.

Criteria Used To Identify Critical Habitat

As required by section 4(b)(2) of the Act, we use the best scientific data available to designate critical habitat. In accordance with the Act and our implementing regulations at 50 CFR 424.12(b), we review available information pertaining to the habitat requirements of the species and identify specific areas within the geographical area occupied by the species at the time of listing and any specific areas outside the geographical area occupied by the species to be considered for designation as critical habitat.

The current distribution of the Atlantic pigtoe is much reduced from its historical distribution. We anticipate that recovery will require continued protection of existing populations and habitat, and it will need to ensure that there are adequate numbers of mussels occurring in stable populations and that these populations occur over a wide geographic area. This strategy will help to ensure that catastrophic events, such as the effects of hurricanes (*e.g.,* flooding that causes excessive sedimentation, nutrients, and debris to disrupt stream ecology), cannot simultaneously affect all known populations. Rangewide recovery considerations, such as maintaining existing genetic diversity and striving for representation of all major portions of the species' current range, were considered in formulating this critical habitat designation.

Sources of data for the critical habitat designation include multiple databases maintained by universities and State agencies for Virginia and North Carolina, and numerous survey reports on streams throughout the species' range (see SSA report). We have also reviewed available information that pertains to the habitat requirements of this species. Sources of information on habitat requirements include studies conducted at occupied sites and published in peer-reviewed articles, agency reports, and data collected during monitoring efforts (Service 2021, p. 11).

Areas Occupied at the Time of Listing

We identified stream channels that currently support populations of the Atlantic pigtoe. We defined ''current'' as stream channels with observations of the species from 2005 to the present, as described in the SSA report and supported by the species' life history and habitat stability over time (Service 2021, p. 10). Due to the breadth and intensity of survey effort done for freshwater mussels throughout the known range of the species, species experts found that it is reasonable to assume that streams with no positive surveys since 2005 should not be considered occupied for the purpose of our analysis. However, since each particular area is not surveyed every year, and these cryptic mussels have a 42 percent detection probability, only one negative survey would not be sufficient to determine that the species is not present. Therefore, it is reasonable to assume that if the species had been seen within the past 15 years that it could be considered currently occupied. Specific habitat areas were delineated based on Natural Heritage Element Occurrences (EOs) following NatureServe's occurrence delineation protocol for freshwater mussels (NatureServe 2018). These EOs provide habitat for Atlantic pigtoe subpopulations and are large enough to be self-sustaining over time, despite fluctuations in local conditions. The EOs contain stream reaches with interconnected waters so that host fish containing Atlantic pigtoe glochidia can move between areas, at least during certain flows or seasons.

We consider the following streams to be occupied by the species at the time of listing: Craig Creek, Mill Creek, Sappony Creek, Nottoway River Subbasin, Meherrin River, Dan River, Aarons Creek, Little Grassy Creek, Upper/Middle Tar River Subbasin, Sandy/Swift Creek, Fishing Creek

Subbasin, Lower Tar River, Upper Neuse River Subbasin, Middle Neuse River Subbasin, New Hope Creek, Deep River Subbasin, and Little River Subbasin (see Final Critical Habitat Designation, below). The critical habitat designation does not include all streams known to have been occupied by the species historically; instead, it includes only the currently occupied streams within the historical range that have also retained the physical or biological features that will allow for the maintenance and expansion of existing populations.

Areas Outside the Geographic Area Occupied at the Time of Listing

We are not designating any areas outside the geographical area currently occupied by the species because we did not find any unoccupied areas that were essential for the conservation of the species. The protection of eight moderately or highly resilient MUs across the physiographic representation of the range will sufficiently reduce the risk of extinction. Improving the resiliency of populations in the currently occupied streams will increase viability to the point that the protections of the Act are no longer necessary.

Critical Habitat Maps

When determining critical habitat boundaries, we used Geographic Information System (GIS) hydrology data layers that can differ slightly based on the scale of the map; therefore, users should use published coordinates for upstream and downstream boundaries (see **ADDRESSES**). We also made every effort to avoid including developed areas such as lands covered by buildings, pavement, and other structures because such lands lack physical or biological features necessary for the Atlantic pigtoe. The scale of the maps we prepared under the parameters for publication within the Code of Federal Regulations may not reflect the exclusion of such developed lands. Any such lands inadvertently left inside critical habitat boundaries shown on the maps of this rule have been excluded by text in the rule and are not designated as critical habitat. Therefore, a Federal action involving these lands will not trigger section 7 consultation under the Act with respect to critical habitat and the requirement of no adverse modification unless the specific action will affect the physical or biological features in the adjacent critical habitat.

We are designating as critical habitat areas that we have determined are occupied at the time of listing (*i.e.,* currently occupied) and that contain one or more of the physical or biological features that are essential to support life-history processes of the species. Units are designated based on one or more of the physical or biological features being present to support the Atlantic pigtoe's life-history processes. All units contain all of the identified physical or biological features and support multiple life-history processes.

The critical habitat designation is defined by the map or maps, as modified by any accompanying regulatory text, presented at the end of this document under Regulation Promulgation. We include more detailed information on the boundaries of the critical habitat designation in the discussion of individual units below. We will make the coordinates on which each map is based available to the public on *http://www.regulations.gov* under Docket No. FWS–R4–ES–2018–0046.

Final Critical Habitat Designation

We are designating 17 units as critical habitat for the Atlantic pigtoe. The critical habitat areas described below constitute our best assessment at this time of areas that meet the definition of critical habitat. Those 17 units are: (1) Craig Creek, (2) Mill Creek, (3) Sappony Creek, (4) Nottoway River Subbasin, (5) Meherrin River, (6) Dan River, (7) Aarons Creek, (8) Little Grassy Creek, (9) Upper/Middle Tar River Subbasin, (10) Sandy/Swift Creek, (11) Fishing Creek Subbasin, (12) Lower Tar River, (13) Upper Neuse River Subbasin, (14) Middle Neuse River Subbasin, (15) New Hope Creek, (16) Deep River Subbasin, and (17) Little River. Table 2 below shows the occupied units.

TABLE 2—CRITICAL HABITAT UNITS FOR THE ATLANTIC PIGTOE

Critical habitat unit	Riparian ownership	River miles (kilometers)
1. JR1—Craig Creek	Private; Federal	29 (46.7)
2. JR2—Mill Creek	Private	1 (1.6)
3. CR1—Sappony Creek	Private	4 (6.6)
4. CR2—Nottoway River Subbasin	Private; Federal	64 (103)
5. CR3—Meherrin River	Private	5 (8)
6. RR1—Dan River	Private	14 (22.5)
7. RR2—Aarons Creek	Private	12 (19.3)
8. RR3—Little Grassy Creek	Private	3 (4.8)
9. TR1—Upper/Middle Tar River Subbasin	Private; Easements	91 (146.5)
10. TR2—Sandy/Swift Creek	Private; State; Easements	50 (80.5)
11. TR3—Fishing Creek Subbasin	Private; State; Easements	85 (136.8)
12. TR4—Lower Tar River	Private; State; Easements	30 (48.3)
13. NR1—Upper Neuse River Subbasin	Private; State; Easements	60 (95)
14. NR2—Middle Neuse River Subbasin	Private; State; County; Easements	61 (98.2)
15. CF1—New Hope Creek	Private; Easements	4 (6.4)
16. CF2—Deep River Subbasin	Private	10 (16.1)
17. YR1– Little River	Private; Easements	40 (64.4)
Total		563 (906)

Note: Mileage may not sum due to rounding.

We present brief descriptions of all units, and reasons why they meet the definition of critical habitat for the Atlantic pigtoe, below. All units are considered occupied.

James River Population

Unit 1: JR1—Craig Creek, Craig and Botetourt Counties, Virginia

Unit 1 consists of 29 river mi (46.7 river km) of Craig Creek near VA Route 616 northeast of New Castle downstream to just below VA Route 817 crossing. The land adjacent to Craig Creek is primarily private, although approximately 1 mi (1.6 km) of land along the river is federally owned by George Washington and Jefferson National Forest (GWJ NF), and 2.5 mi (4 km) consists of conservation easements. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required to address excess nutrients, sediment, and pollutants that enter the creek and serve as indicators of other forms of pollution such as bacteria and toxins, reducing water quality for the species. Sources of these types of pollution are wastewater, agricultural runoff, and urban stormwater runoff. Five stream reaches, totaling approximately 21 river miles, are impaired for aquatic life in the lower Craig Creek watershed. Impairment is indicated by low benthic-macroinvertebrate bioassessments, pH issues, high temperature, and fecal coliform. Given the stormwater and nonpoint source pollution identified as contributing to water quality issues in this unit, special management considerations including riparian buffer restoration, reduced surface and groundwater withdrawals, stormwater retrofits, eliminating direct stormwater discharges, and implementing highest levels of wastewater treatment practicable will benefit the species' habitat in this unit.

The GWJ NF surrounds the Craig Creek Subbasin; protections and management of the GWJ NF will likely enable habitat conditions (water quality, water quantity/flow, instream substrate, and connectivity) to remain high into the future. Targeted species restoration in conjunction with current associated-species restoration efforts in Johns, Dicks, and Little Oregon Creeks within the Craig Creek Subbasin will likely improve the Atlantic pigtoe's resiliency in these areas. Maintenance of forested buffer conditions is essential to retaining high-quality instream habitat in this unit.

Unit 2: JR2—Mill Creek, Bath County, Virginia

Unit 2 consists of a 1-mile (1.6-km) segment of Mill Creek at the VA39 (Mountain Valley Road) crossing. The land surrounding the creek is privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within Unit 2 to address excess nutrients, sediment, and pollutants that enter the creek and serve as indicators of other forms of pollution such as bacteria and toxins. Sources of these types of pollution are wastewater, agricultural runoff, and urban stormwater runoff. Given the urban stormwater and nonpoint source pollution identified as contributing to water quality issues in this unit, special management considerations including riparian buffer restoration, reduced surface and groundwater withdrawals, stormwater retrofits, eliminating direct stormwater discharges, increasing open space in the watershed, and implementing highest levels of wastewater treatment practicable will benefit the species' habitat in this unit.

The GWJ NF surrounds most of the Mill Creek watershed; protections and management of the GWJ NF will likely enable habitat conditions to remain high into the future. Targeted species restoration in conjunction with current associated-species restoration efforts in Mill Creek will likely improve the Atlantic pigtoe's resiliency in these areas. Maintenance of forested buffer conditions is essential to retaining high-quality instream habitat in this unit.

Chowan River Population

Unit 3: CR1—Sappony Creek, Dinwiddie County, Virginia

Unit 3 consists of 4 river miles (6.6 river km) of Sappony Creek beginning just upstream of the Seaboard Railroad crossing and ending just downstream of the Shippings Road (SR709) crossing. The riparian areas on either side of the river are privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required to address excess sediment and pollutants that enter the creek and serve as indicators of other forms of pollution such as bacteria and toxins, reducing water quality for the species. Sources of these types of pollution are likely agricultural and silvicultural runoff. Special management focused on agricultural and silviculture BMPs, maintenance of forested buffers, and connection of protected riparian corridors will benefit habitat for the species in this unit.

Unit 4: CR2—Nottoway River Subbasin, Nottoway, Lunenburg, Brunswick, Dinwiddie, Greensville, and Sussex Counties, Virginia

Unit 4 consists of 64 river miles (103 river km) of the Nottoway River, and a portion of Sturgeon Creek, beginning downstream of the Nottoway River's confluence with Dickerson Creek and ending just downstream of Little Mill Road, and includes Sturgeon Creek upstream of Old Stage Road. Land bordering the river is primarily privately owned, although some of the land is part of the Fort Pickett National Guard Installation (see Exemptions, below), containing 14.2 mi (23 km) of conservation parcels. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. In the past decade, the Nottoway River suffered from several seasonal drought events, which not only caused very low dissolved oxygen conditions but also decreased food delivery because of minimal flows. In addition, these conditions led to increased predation rates on potential host fishes that were concentrated into low-flow refugia (*e.g.,* pools). Urban stormwater and nonpoint source pollution have been identified as contributing to water quality issues in this unit; therefore, special management considerations for riparian buffer restoration, reduced surface and groundwater withdrawals, and stormwater retrofits will benefit the habitat in this unit. Additional special management considerations or protection may be required within this unit to address low water levels as a result of water withdrawals and drought.

Unit 5: CR3—Meherrin River, Brunswick County, Virginia

Unit 5 consists of 5 river miles (8 river km) of the Meherrin River, from approximately 1.5 miles below the confluence with Saddletree Creek under VA Highway 46 (Christana Highway) to VA715 (Iron Bridge Road). The land on either side of the river is privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within

this unit to address a variety of threats. Like the Nottoway River, the Meherrin River has been affected by seasonal droughts, resulting in low flow conditions and low dissolved oxygen conditions. The rural nature of the unit will benefit from following agricultural and silvicultural BMPs. Additional special management considerations or protection such as riparian buffer protection, reduced surface and groundwater withdrawals, and water conservation programs may be required within this unit to address low water levels as a result of water withdrawals and drought.

Roanoke River Population

Unit 6: RR1—Dan River, Pittsylvania County, Virginia, and Rockingham County, North Carolina

Unit 6 consists of 14 river miles (22.5 river km) of the Dan River along the border of Virginia and North Carolina from just upstream of NC Highway 700 near Eden, North Carolina, into Pittsylvania County, Virginia, and downstream to the confluence with Williamson Creek in Rockingham County, North Carolina. The land on either side of the river is privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address threats. For example, a Duke Energy Coal Ash spill occurred upstream of this unit in February 2014; subsequent actions related to mitigating the effects of the spill will ultimately benefit the habitat in this unit, potentially allowing species restoration efforts.

Unit 7: RR2—Aarons Creek, Granville County, North Carolina, and Mecklenburg and Halifax Counties, Virginia

Unit 7 consists of 12 river miles (19.3 river km) of Aarons Creek, from NC96 in Granville County, North Carolina, downstream across the North Carolina-Virginia border to just upstream of VA602 (White House Road) along the Mecklenburg County-Halifax County line in Virginia. Land on either side of the river is privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. There are two impaired stream reaches totaling approximately 12 river miles (19.3 river km) in the Aarons Creek watershed. An ''impairment'' designation by the State here is a result of low dissolved oxygen and low benthic-macroinvertebrate assessment scores. Special management focused on maintaining riparian buffers and following BMPs will be important for the habitat in this unit.

Unit 8: RR3—Little Grassy Creek, Granville County, North Carolina

Unit 8 consists of 3 river miles (4.8 river km) of Little Grassy Creek in Granville County, North Carolina, beginning at the Crawford Currin Road crossing and ending at the confluence with Grassy Creek. The riparian areas on either side of the river are privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required to address excess sediment and pollutants that enter the creek and serve as indicators of other forms of pollution such as bacteria and toxins, reducing water quality for the species. Sources of these types of pollution are likely agricultural and silvicultural runoff. Given the nonpoint source pollution identified as contributing to water quality issues in this unit, special management considerations related to riparian buffer protection and restoration and reduced surface and groundwater withdrawals will benefit the species' habitat in this unit.

Tar River Population

Unit 9: TR1—Upper/Middle Tar River Subbasin, Granville, Vance, Franklin, and Nash Counties, North Carolina

This unit consists of 91 river miles (146.5 river km) of the mainstem of the upper and middle Tar River as well as several tributaries (Bear Swamp Creek, Fox Creek, Crooked Creek, Cub Creek, and Shelton Creek), all in North Carolina. The portion of Cub Creek starts near Hobgood Road and continues to the confluence with the Tar River; the Tar River portion starts just upstream of the NC158 bridge and goes downstream to the NC 581 crossing; the Shelton Creek portion starts upstream of NC158 and goes downstream to the confluence with the Tar River; the Bear Swamp Creek portion begins upstream of Dyking Road and goes downstream to the confluence with the Tar River (and includes an unnamed tributary upstream of Beasley Road); the Fox Creek portion begins downstream of NC 561 and goes to the confluence with the Tar River; and the Crooked Creek portion begins upstream of NC98 crossing and goes downstream to confluence with Tar River. Land bordering the river and creeks is mostly privately owned (79 mi (119 km)), with some areas in public ownership or easements (12 mi (17 km)). The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. Excessive amounts of nitrogen and phosphorus run off the land or are discharged into the waters, causing too much growth of microscopic or macroscopic vegetation and leading to extremely low levels of dissolved oxygen. As a result, there are six ''impaired'' stream reaches (as defined on the State's 303d list) totaling approximately 32 river miles in the unit. Expansion or addition of new wastewater discharges are also a threat to habitat in this unit. Special management focused on agricultural BMPs, implementing highest levels of treatment of wastewater practicable, maintenance of forested buffers, and connection of protected riparian corridors will benefit habitat for the species in this unit.

Unit 10: TR2—Sandy/Swift Creek, Warren, Franklin, and Nash Counties, North Carolina

This unit consists of a 50-mile (80.5-km) segment of Sandy/Swift Creek beginning at Southerland Mill Road and continuing downstream to NC301. Land bordering the river and creeks is mostly privately owned (42 mi (80 km)), with some areas covered by protective easements (8 mi (13 km)). The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. Excessive amounts of nitrogen and phosphorus run off the land or are discharged into the waters, causing excessive growth of microscopic or macroscopic vegetation and leading to extremely low levels of dissolved oxygen; there is one ''impaired'' stream reach totaling approximately 5 river miles (8 river km) in this unit. Given the nonpoint source pollution identified as contributing to water quality issues in this unit, special management considerations including riparian buffer protection and restoration, connection of protected riparian corridors, reduced surface and groundwater withdrawals,

and stormwater retrofits will benefit habitat for the species in this unit.

Unit 11: TR3—Fishing Creek Subbasin, Warren, Halifax, Franklin, and Nash Counties, North Carolina

This unit consists of 85 river miles (136.8 river km) in Fishing Creek, Little Fishing Creek, Shocco Creek, and Maple Branch. The Shocco Creek portion begins downstream of the NC58 bridge and continues to the confluence with Fishing Creek; the entirety of Maple Branch is included, down to the confluence with Fishing Creek; Fishing Creek begins at Axtell Ridgeway Road (SR1112) downstream to I–95; and Little Fishing Creek begins upstream of Briston Brown Road (SR1532) downstream to the confluence with Fishing Creek. The land bordering the creeks includes private parcels (56 miles (90 km)), protective easements (14 miles (23 km)), and State game lands (15 miles (24 km)). The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. Excessive amounts of nitrogen and phosphorus run off the land or are discharged into the waters, causing excessive growth of microscopic or macroscopic vegetation and leading to extremely low levels of dissolved oxygen. Given the nonpoint source pollution identified as contributing to water quality issues in this unit, special management considerations including riparian buffer restoration, reduced surface and groundwater withdrawals, and stormwater retrofits will benefit habitat for the species in this unit.

Unit 12: TR4—Lower Tar River, Edgecombe and Pitt Counties, North Carolina

This unit consists of 30 river miles (48.3 river km) of the Lower Tar River, lower Swift Creek, and Fishing Creek in Edgecombe County, North Carolina, from NC97 near Leggett, North Carolina, to the Edgecombe-Pitt County line near NC33. Land along the river is divided between private parcels, protective easements, State game lands, and State park land. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. Excessive amounts of nitrogen and phosphorus run off the land or are discharged into the waters, causing excessive growth of microscopic or macroscopic vegetation and leading to extremely low levels of dissolved oxygen. Special management focused on agricultural BMPs, maintenance of forested buffers, and connection of protected riparian corridors will benefit habitat for the species in this unit.

Neuse River Population

Unit 13: NR1—Upper Neuse River Subbasin, Person, Durham, and Orange Counties, North Carolina

This unit consists of 60 river miles (95 river km) in four reaches including Flat River, Little River, Eno River, and the Upper Eno River. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

The Flat River reach consists of 19 river miles (30.6 river km) in the Flat River Subbasin in Person and Durham Counties, North Carolina, including the South Flat River downstream of Dick Coleman Road, the North Flat River near Parsonage Road, and Deep Creek near Helena-Moriah Road downstream where each river converges into the Flat River downstream of State Forest Road. Land along the Flat River subunit includes mostly private parcels, with some easements (1 mi (1.7 km)) and State forest land (1.4 mi (2.3 km)).

The Little River Subbasin includes 18 river miles (29 river km) of the North Fork and South Fork Little Rivers in Orange and Durham Counties, North Carolina, bordered by mostly private land and 0.2 mi (0.4 km) of conservation easements.

The Upper Eno River reach consists of 4 river miles (6.4 river km) in Orange County, North Carolina, including the West Fork Eno River upstream of Cedar Grove Road to the confluence with McGowan Creek. This subunit is bordered by 3 miles (4.8 km) of private land and 1 mile (1.6 km) of conservation parcels.

The Eno River reach consists of 18 river miles (29 river km) in Orange and Durham Counties, North Carolina, from below Eno Mountain Road to NC15–501. Land bordering the river contains nearly all State park land (17 mi (27.4 km)) and 0.3 mi (0.45 km) of conservation parcels; the remaining land is privately owned.

Special management considerations or protection may be required within this unit to address a variety of threats. Large quantities of nutrients (especially nitrogen) contributed by fertilizers and animal waste washed from lawns, urban developed areas, farm fields, and animal operations are impacting aquatic ecosystems in this unit. More than 300 permitted point-source sites discharge wastewater into streams and rivers in the basin. Development is also impacting areas along the Upper Neuse River. Special management considerations in this unit include using the highest available wastewater treatment technologies, retrofitting stormwater systems, eliminating direct stormwater discharges, increasing open space, maintaining connected riparian corridors, and treating invasive species (like hydrilla).

Unit 14: NR2—Middle Neuse River Subbasin, Wake, Johnston, Wilson Counties, North Carolina

This unit consists of 61 river miles (98.2 river km) in five reaches including Swift Creek, Middle Creek, Upper Little River, Middle Little River, and Contentnea Creek, all in North Carolina. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe and currently supports some breeding, feeding, and sheltering needs for the species.

The Middle Creek reach is 19 river miles (30.6 river km) below Old Stage Road downstream to below Crantock Road, and the Swift Creek reach is 25 river miles (40.2 river km) from Lake Benson downstream to confluence with the Neuse, both in Wake and Johnston Counties. They are primarily bordered by private land with 1.2 mi (1.9 km) of easement parcels.

The Upper Little River reach includes 4 river miles (6.4 river km) of the Upper Little River from the confluence with Perry Creek to Fowler Road in Wake County, North Carolina. The land along this stream reach is primarily county-owned (3.4 mi (5.4 km) with some private parcels.

The Middle Little River reach includes 11 river miles (17.7 river km) from Atkinsons Mill downstream to NC301 in Johnston County, North Carolina. This area is bordered predominantly by private land and 0.2 mi (0.4 km) of conservation parcels.

The Contentnea Creek reach consists of 2 river miles (3.2 river km) below Buckhorn Reservoir to just below Sadie Road near NC581 in Wilson County, North Carolina, bordered entirely by private land.

Special management considerations or protection may be required within this unit to address a variety of threats. Large quantities of nutrients (especially nitrogen) contributed by fertilizers and animal waste washed from lawns, urban developed areas, farm fields, and animal operations are impacting aquatic ecosystems in this unit. More than 300 permitted point-source sites discharge wastewater into streams and rivers in

the basin. Development is also impacting areas along the Middle Neuse River.

There are 49 State-defined ''impaired'' stream reaches totaling approximately 447 river miles (719.4 river km) in this unit. There are many factors that cause an impairment label to be given by the State, including low benthic-macroinvertebrate assessment scores, low pH, poor fish community scores, low dissolved oxygen, polychlorinated biphenyls (PCBs), copper, and zinc. There are 349 non-major and 6 major (Apex Water Reclamation Facility, Central Johnston County Waste Water Treatment Plant, Cary Waste Water Treatment Plant, City of Raleigh Wastewater Treatment Plant, Dempsey Benton Water Treatment Plant, and Terrible Creek Waste Water Treatment Plant) permitted discharges in this MU. Special management related to developed areas, including using the best available wastewater treatment technologies, retrofitting stormwater systems, eliminating direct stormwater discharges, increasing open space in the watershed, and maintaining connected riparian corridors, will be important to maintain habitat in this unit.

Cape Fear Population

Unit 15: CF1—New Hope Creek, Orange County, North Carolina

This unit consists of 4 river miles (6.4 river km) of habitat in the New Hope Creek from NC86 to Mimosa Road. The land bordering the creek includes private parcels and 2.5 mi (4 km) of conservation easements. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Special management considerations or protection may be required within this unit to address a variety of threats. Large quantities of nutrients (especially nitrogen) contributed by fertilizers and animal waste washed from lawns, urban developed areas, farm fields, and animal operations are impacting aquatic ecosystems in this unit. More than 200 permitted point-source sites discharge wastewater into streams and rivers in the basin. Development is also impacting areas along New Hope Creek.

Special management, including using the best available wastewater treatment technologies, retrofitting stormwater systems, eliminating direct stormwater discharges, increasing open space in the watershed, and maintaining connected riparian corridors, may be required to maintain habitat in this unit.

Unit 16: CF2—Deep River Subbasin, Randolph County, North Carolina

The Deep River Subbasin unit consists of 10 river miles (16.1 river km), including the mainstem between Richland and Brush Creeks as well as Richland Creek from Little Beane Store Road to the confluence with the Deep River and Brush Creek from Brush Creek Road to the confluence with the Deep River. Land bordering the area is privately owned. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

The Deep River Subbasin is situated in a mostly rural part of the Cape Fear River Basin, and large-scale agriculture and livestock operations are present. Special management considerations or protection may be required within this unit to ensure the use of agriculture BMPs, especially preventing cattle access to streams, as well as protecting forested riparian buffers to benefit habitat in this unit. The invasive plant hydrilla has recently been identified in the Deep River, and special management will likely be required to eradicate the infestation to improve habitat conditions to meet the breeding, feeding, and sheltering needs of Atlantic pigtoe.

Yadkin-Pee Dee River Population

Unit 17: YR1—Little River, Randolph and Montgomery Counties, North Carolina

This unit consists of 40 river miles (64.4 river km) of Little River from SR1114 downstream to Okeewemee Star Road, including the West Fork Little River from NC134 to the confluence with the Little River. Land along the river is predominantly privately owned, with 0.7 mi (1.15 km) of parcels in conservation easements. The unit contains all of the physical or biological features that are essential to support life-history processes of the Atlantic pigtoe.

Habitat fragmentation from dams and reservoirs is impacting the aquatic ecosystems in this unit. Sedimentation from intensive agriculture is the top pollution problem in the basin. Special management considerations or protection may include the use of agricultural BMPs, especially preventing cattle access to streams, as well as protecting forested riparian buffers to benefit habitat in this unit.

Effects of Critical Habitat Designation

Section 7 Consultation

Section 7(a)(2) of the Act requires Federal agencies, including the Service, to ensure that any action they fund, authorize, or carry out is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of designated critical habitat of such species.

We published a final rule revising the definition of destruction or adverse modification on August 27, 2019 (84 FR 44976). Destruction or adverse modification means a direct or indirect alteration that appreciably diminishes the value of critical habitat as a whole for the conservation of a listed species.

If a Federal action may affect a listed species or its critical habitat, the responsible Federal agency (action agency) must enter into consultation with us. Examples of actions that are subject to the section 7 consultation process are actions on State, Tribal, local, or private lands that require a Federal permit (such as a permit from the U.S. Army Corps of Engineers under section 404 of the Clean Water Act (33 U.S.C. 1251 *et seq.*) or a permit from the Service under section 10 of the Act) or that involve some other Federal action (such as funding from the Federal Highway Administration, Federal Aviation Administration, or the Federal Emergency Management Agency). Federal actions not affecting listed species or critical habitat—and actions on State, Tribal, local, or private lands that are not federally funded, authorized, or carried out by a Federal agency—do not require section 7 consultation.

Compliance with the requirements of section 7(a)(2) is documented through our issuance of:

(1) A concurrence letter for Federal actions that may affect, but are not likely to adversely affect, listed species or critical habitat; or

(2) A biological opinion for Federal actions that may affect, and are likely to adversely affect, listed species or critical habitat.

When we issue a biological opinion concluding that a project is likely to jeopardize the continued existence of a listed species and/or destroy or adversely modify critical habitat, we provide reasonable and prudent alternatives to the project, if any are identifiable, that would avoid the likelihood of jeopardy and/or destruction or adverse modification of critical habitat. We define ''reasonable and prudent alternatives'' (at 50 CFR 402.02) as alternative actions identified during consultation that:

(1) Can be implemented in a manner consistent with the intended purpose of the action,

(2) Can be implemented consistent with the scope of the Federal agency's legal authority and jurisdiction,

(3) Are economically and technologically feasible, and

(4) Would, in the Service Director's opinion, avoid the likelihood of jeopardizing the continued existence of the listed species and/or avoid the likelihood of destroying or adversely modifying critical habitat.

Reasonable and prudent alternatives can vary from slight project modifications to extensive redesign or relocation of the project. Costs associated with implementing a reasonable and prudent alternative are similarly variable.

Regulations at 50 CFR 402.16 set forth requirements for Federal agencies to reinitiate formal consultation on previously reviewed actions. These requirements apply when the Federal agency has retained discretionary involvement or control over the action (or the agency's discretionary involvement or control is authorized by law) and, subsequent to the previous consultation: (1) If the amount or extent of taking specified in the incidental take statement is exceeded; (2) if new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (3) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (4) if a new species is listed or critical habitat designated that may be affected by the identified action.

In such situations, Federal agencies sometimes may need to request reinitiation of consultation with us, but the regulations also specify some exceptions to the requirement to reinitiate consultation on specific land management plans after subsequently listing a new species or designating new critical habitat. See the regulations for a description of those exceptions.

Application of the ''Adverse Modification'' Standard

The key factor related to the adverse modification determination is whether implementation of the proposed Federal action directly or indirectly alters the designated critical habitat in a way that appreciably diminishes the value of the critical habitat as a whole for the conservation of the listed species. As discussed above, the role of critical habitat is to support physical or biological features essential to the conservation of a listed species and provide for the conservation of the species.

Section 4(b)(8) of the Act requires us to briefly evaluate and describe, in any proposed or final regulation that designates critical habitat, activities involving a Federal action that may violate section 7(a)(2) of the Act by destroying or adversely modifying such habitat, or that may be affected by such designation.

Activities that the Service may, during a consultation under section 7(a)(2) of the Act, consider likely to destroy or adversely modify critical habitat include, but are not limited to:

(1) Actions that would alter the minimum flow or the existing flow regime. Such activities could include, but are not limited to, impoundment, channelization, water diversion, water withdrawal, and hydropower generation. These activities could eliminate or reduce the habitat necessary for the growth and reproduction of the Atlantic pigtoe by decreasing or altering flows to levels that would adversely affect its ability to complete its life cycle.

(2) Actions that would significantly alter water chemistry or temperature. Such activities could include, but are not limited to, release of chemicals (including pharmaceuticals, metals, and salts), biological pollutants, or heated effluents into the surface water or connected groundwater at a point source or by dispersed release (non-point source). These activities could alter water conditions to levels that are beyond the tolerances of the Atlantic pigtoe and result in direct or cumulative adverse effects to individuals and their life cycles.

(3) Actions that would significantly increase sediment deposition within the stream channel. Such activities could include, but are not limited to, excessive sedimentation from livestock grazing, road construction, channel alteration, incompatible forestry activities, off-road vehicle use, and other watershed and floodplain disturbances. These activities could eliminate or reduce the habitat necessary for the growth and reproduction of the Atlantic pigtoe by increasing the sediment deposition to levels that would adversely affect its ability to complete its life cycle.

(4) Actions that would significantly increase the filamentous algal community within the stream channel. Such activities could include, but are not limited to, release of nutrients into the surface water or connected groundwater at a point source or by dispersed release (non-point source). These activities can result in excessive filamentous algae filling streams and reducing habitat for the Atlantic pigtoe, degrading water quality during algal decay, and decreasing oxygen levels at night from algal respiration to levels below the tolerances of the mussel.

(5) Actions that would significantly alter channel morphology or geometry. Such activities could include, but are not limited to, channelization, impoundment, road and bridge construction, mining, dredging, and destruction of riparian vegetation. These activities may lead to changes in water flows and levels that would degrade or eliminate the Atlantic pigtoe and/or its habitats. These actions can also lead to increased sedimentation and degradation in water quality to levels that are beyond the tolerances of the Atlantic pigtoe.

(6) Actions that result in the introduction, spread, or augmentation of nonnative aquatic species in occupied stream segments, or in stream segments that are hydrologically connected to occupied stream segments, even if those segments are occasionally intermittent, or introduction of other species that compete with or prey on the Atlantic pigtoe. Possible actions could include, but are not limited to, stocking of nonnative fishes or other related actions. These activities can introduce parasites or disease to mollusks; result in direct predation; or affect the growth, reproduction, and survival of Atlantic pigtoes.

Finally, we note that for any of the six categories of actions outlined above, we and the relevant Federal agency may find that the agency's anticipated actions affecting critical habitat may be appropriate to consider programmatically in section 7 consultation. Programmatic consultations can be an efficient method for streamlining the consultation process by addressing an agency's multiple similar, frequently occurring, or routine actions expected to be implemented in a given geographic area. Programmatic section 7 consultation can also be conducted for an agency's proposed program, plan, policy, or regulation that provides a framework for future proposed actions. We are committed to responding to any agency's request for a programmatic consultation, when appropriate and subject to the approval of the Service Director, as a means to streamline the regulatory process and avoid time-consuming and inefficient multiple individual consultations.

Exemptions

Application of Section 4(a)(3) of the Act

The Sikes Act Improvement Act of 1997 (Sikes Act) (16 U.S.C. 670a) required each military installation that includes land and water suitable for the conservation and management of natural resources to complete an integrated natural resources management plan (INRMP) by November 17, 2001. An INRMP integrates implementation of the military mission of the installation with stewardship of the natural resources found on the base. Each INRMP includes:

(1) An assessment of the ecological needs on the installation, including the need to provide for the conservation of listed species;

(2) A statement of goals and priorities;

(3) A detailed description of management actions to be implemented to provide for these ecological needs; and

(4) A monitoring and adaptive management plan.

Among other things, each INRMP must, to the extent appropriate and applicable, provide for fish and wildlife management; fish and wildlife habitat enhancement or modification; wetland protection, enhancement, and restoration where necessary to support fish and wildlife; and enforcement of applicable natural resource laws.

The National Defense Authorization Act for Fiscal Year 2004 (Pub. L. 108–136) amended the Act to limit areas eligible for designation as critical habitat. Specifically, section 4(a)(3)(B)(i) of the Act (16 U.S.C. 1533(a)(3)(B)(i)) provides that the Secretary shall not designate as critical habitat any lands or other geographical areas owned or controlled by the Department of Defense, or designated for its use, that are subject to an INRMP prepared under 16 U.S.C. 670a, if the Secretary determines in writing that such plan provides a benefit to the species for which critical habitat is proposed for designation.

We consult with the military on the development and implementation of INRMPs for installations with listed species. We analyze INRMPs developed by military installations located within the range of critical habitat designations to determine if they meet the criteria for exemption from critical habitat under section 4(a)(3) of the Act.

Approved INRMPs

We have identified one area within the critical habitat designation that consists of Department of Defense lands with a completed, Service-approved INRMP. The Army National Guard—Maneuver Training Center Fort Pickett (Fort Pickett) is located in southeastern Virginia on 41,000 acres in three counties: Nottoway, Brunswick, and Dinwiddie. Fort Pickett is federally owned land that is managed by the Virginia Army National Guard and is subject to all federal laws and regulations. The Fort Pickett INRMP covers fiscal years 2017–2021, and serves as the principal management plan governing all natural resource activities on the installation. Among the goals and objectives listed in the INRMP is habitat management for rare, threatened, and endangered species, and the Atlantic pigtoe is included in this plan. Management actions that benefit the Atlantic pigtoe include maintenance and improvement of habitat, monitoring mussel populations, and improving water quality. Additional elements of the management actions included in the INRMP that will benefit Atlantic pigtoe and its habitat are forest management, stream and wetland protection zones, and public outreach and education.

Fourteen river miles (22.5 km) of Unit 4 (CR2—Nottoway River Subbasin) are located within the area covered by this INRMP. Based on the above considerations, and in accordance with section 4(a)(3)(B)(i) of the Act, we have determined that the identified streams are subject to the Fort Pickett INRMP and that conservation efforts identified in the INRMP will provide a benefit to the Atlantic pigtoe. Therefore, streams within this installation are exempt from critical habitat designation under section 4(a)(3) of the Act. We are not including approximately 14 river miles (22.5 river km) of habitat in this critical habitat designation because of this exemption.

Consideration of Impacts Under Section 4(b)(2) of the Act

Section 4(b)(2) of the Act states that the Secretary shall designate and make revisions to critical habitat on the basis of the best available scientific data after taking into consideration the economic impact, national security impact, and any other relevant impact of specifying any particular area as critical habitat. The Secretary may exclude an area from critical habitat if we determine that the benefits of such exclusion outweigh the benefits of specifying such area as part of the critical habitat, unless we determine, based on the best scientific data available, that the failure to designate such area as critical habitat will result in the extinction of the species. In making the determination to exclude a particular area, the statute on its face, as well as the legislative history, are clear that the Secretary has broad discretion regarding which factor(s) to use and how much weight to give to any factor. On December 18, 2020, we published a final rule in the **Federal Register** (85 FR 82376) revising portions of our regulations pertaining to exclusions of critical habitat. These final regulations became effective on January 19, 2021, and apply to critical habitat rules for which a proposed rule was published after January 19, 2021. Consequently, these new regulations do not apply to this final rule.

Under section 4(b)(2) of the Act, we may exclude an area from designated critical habitat based on economic impacts, impacts on national security, or any other relevant impacts. In considering whether to exclude a particular area from the designation, we identify the benefits of including the area in the designation, identify the benefits of excluding the area from the designation, and evaluate whether the benefits of exclusion outweigh the benefits of inclusion. If the analysis indicates that the benefits of exclusion outweigh the benefits of inclusion, the Secretary may exercise discretion to exclude the area only if such exclusion would not result in the extinction of the species. We describe below the process that we undertook for taking into consideration each category of impacts and our analyses of the relevant impacts.

Consideration of Economic Impacts

Section 4(b)(2) of the Act and its implementing regulations require that we consider the economic impact that may result from a designation of critical habitat. In order to consider economic impacts, we prepared an incremental effects memorandum (IEM) and screening analysis which, together with our narrative and interpretation of effects we consider our draft economic analysis (DEA) of the proposed critical habitat designation and related factors (IEc, 2018, entire). The analysis, dated April 13, 2018, was made available for public review from October 11, 2018, through December 10, 2018 (83 FR 51570). We then accepted public comments on the analysis for an additional 30 days, from September 22, 2020, through October 22, 2020, when we published a revised proposed critical habitat designation (85 FR 59487). The DEA addressed probable economic impacts of critical habitat designation for the Atlantic pigtoe. Following the close of the comment periods, we reviewed and evaluated all information submitted during the comment periods that may pertain to our consideration of the probable incremental economic

impacts of this critical habitat designation. Additional information relevant to the probable incremental economic impacts of critical habitat designation for the Atlantic pigtoe is summarized below and available in the screening analysis for the Atlantic pigtoe (IEc, 2018, entire), available at *http://www.regulations.gov.*

Executive Orders (E.O.s) 12866 and 13563 direct Federal agencies to assess the costs and benefits of available regulatory alternatives in quantitative (to the extent feasible) and qualitative terms. Consistent with the E.O. regulatory analysis requirements, our effects analysis under the Act may take into consideration impacts to both directly and indirectly affected entities, where practicable and reasonable. If sufficient data are available, we assess to the extent practicable the probable impacts to both directly and indirectly affected entities. As part of our screening analysis, we considered the types of economic activities that are likely to occur within the areas likely affected by the critical habitat designation. In our March 19, 2018, IEM describing probable incremental economic impacts that may result from the proposed designation, we first identified probable incremental economic impacts associated with each of the following categories of activities: (1) Federal lands management (National Park Service, U.S. Forest Service, Department of Defense); (2) agriculture; (3) forest management/silviculture/timber; (4) development; (5) recreation; (6) restoration activities; and (7) transportation. We considered each industry or category individually. Additionally, we considered whether the activities have any Federal involvement. Critical habitat designation generally will not affect activities that do not have any Federal involvement; under the Act, designation of critical habitat only affects activities conducted, funded, permitted, or authorized by Federal agencies. This rule lists the Atlantic pigtoe as a threatened species, and, on the effective date of this rule (see **DATES**, above), in areas where the Atlantic pigtoe is present, under section 7 of the Act, Federal agencies will be required to consult with the Service on activities they fund, permit, or implement that may affect the species.

In our IEM, we attempted to clarify the distinction between the effects that will result from the species being listed and those attributable to the critical habitat designation (*i.e.,* difference between the jeopardy and adverse modification standards) for the Atlantic pigtoe. Because critical habitat is being designated concurrently with the listing, it has been our experience that it is more difficult to discern which conservation efforts are attributable to the species being listed and those which will result solely from the designation of critical habitat. However, the following specific circumstances in this case help to inform our evaluation: (1) The essential physical or biological features identified for critical habitat are the same features essential for the life requisites of the species, and (2) any actions that would result in sufficient harm or harassment to constitute jeopardy to the Atlantic pigtoe would also likely adversely affect the essential physical or biological features of critical habitat. The IEM outlines our rationale concerning this limited distinction between baseline conservation efforts and incremental impacts of the designation of critical habitat for this species. This evaluation of the incremental effects has been used as the basis to evaluate the probable incremental economic impacts of this designation of critical habitat.

The critical habitat designation for the Atlantic pigtoe totals approximately 563 river miles (906 river km), all of which are currently occupied by the species. In these areas, any actions that may affect the species or its habitat will likely also affect critical habitat, and it is unlikely that any additional conservation efforts will be required to address the adverse modification standard over and above those recommended as necessary to avoid jeopardizing the continued existence of the species. Therefore, the only additional costs that are expected in all of the critical habitat designations are administrative costs, due to the fact that this additional analysis will require time and resources by both the Federal action agency and the Service. However, it is believed that, in most circumstances, these costs would not reach the threshold of ''significant'' under E.O. 12866. We anticipate a maximum of 109 section 7 consultations annually at a total incremental cost of less than $230,000 per year. The addition of two units did not affect the economic analysis because the analysis was done at county level, and the new units were included in the initial calculations.

Exclusions

Exclusions Based on Economic Impacts

As discussed above, the Service considered the economic impacts of this critical habitat designation, and the Secretary is not exercising her discretion to exclude any areas from this designation of critical habitat for the Atlantic pigtoe based on economic impacts. A copy of the IEM and screening analysis with supporting documents may be obtained by contacting the Raleigh Ecological Services Field Office (see **FOR FURTHER INFORMATION CONTACT**) or by downloading from the internet at *http://www.regulations.gov.*

Exclusions Based on National Security Impacts or Homeland Security Impacts

Section 4(a)(3)(B)(i) of the Act (see Exemptions, above) may not cover all Department of Defense lands or areas that pose potential national-security concerns (*e.g.,* a DoD installation that is in the process of revising its INRMP for a newly listed species or a species previously not covered). If a particular area is not covered under section 4(a)(3)(B)(i), national-security or homeland-security concerns are not a factor in the process of determining what areas meet the definition of ''critical habitat.'' Nevertheless, when designating critical habitat under section 4(b)(2), the Service must consider impacts on national security, including homeland security, on lands or areas not covered by section 4(a)(3)(B)(i). Accordingly, we will always consider for exclusion from the designation areas for which Department of Defense, Department of Homeland Security, or another Federal agency has requested exclusion based on an assertion of national-security or homeland-security concerns. We have determined that, other than the land exempted under section 4(a)(3)(B)(i) of the Act based upon the existence of an approved INRMP (see Exemptions, above), the lands within the designation of critical habitat for the Atlantic pigtoe are not owned or managed by the Department of Defense or Department of Homeland Security. Furthermore, we did not receive any requests for exclusion from any federal agency responsible for homeland or national security. Therefore, we anticipate no impact on national security, and the Secretary is not exercising her discretion to exclude any areas from the final designation based on impacts on national security.

Exclusions Based on Other Relevant Impacts

Under section 4(b)(2) of the Act, we consider any other relevant impacts, in addition to economic impacts and impacts on national security. Other relevant impacts may include, but are not limited to, impacts to Tribes, States, local governments, public health and safety, community interests, the environment (such as increased risk of

wildfire or pest and invasive species management), Federal lands, and conservation plans, agreements, or partnerships. To identify other relevant impacts that may affect the exclusion analysis, we consider a number of factors, including whether there are permitted conservation plans covering the species in the area such as HCPs, safe harbor agreements, or candidate conservation agreements with assurances, or whether there are non-permitted conservation agreements and partnerships that may be impaired by designation of, or exclusion from, critical habitat. In addition, we look at whether Tribal conservation plans and partnerships, Tribal resources, or government-to-government relationships of the United States with Tribal entities may be affected by the designation. We also consider any State, local, public-health, community-interest, environmental, or social impacts that might occur because of the designation.

In preparing this designation, we have determined that there are currently no HCPs or other management plans for the Atlantic pigtoe, and the designation does not include any Tribal lands or trust resources. We anticipate no impact on Tribal lands, partnerships, or HCPs from this critical habitat designation. Accordingly, the Secretary is not exercising her discretion to exclude any areas from the final designation based on other relevant impacts.

Required Determinations

Regulatory Planning and Review (Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. OIRA has determined that this rule is not significant.

Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this rule in a manner consistent with these requirements.

Regulatory Flexibility Act (5 U.S.C. 601 et seq.)

Under the Regulatory Flexibility Act (RFA; 5 U.S.C. 601 *et seq.*), as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA; 5 U.S.C. 801 *et seq.*), whenever an agency is required to publish a notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effects of the rule on small entities (*i.e.,* small businesses, small organizations, and small government jurisdictions). However, no regulatory flexibility analysis is required if the head of the agency certifies the rule will not have a significant economic impact on a substantial number of small entities. The SBREFA amended the RFA to require Federal agencies to provide a certification statement of the factual basis for certifying that the rule will not have a significant economic impact on a substantial number of small entities.

According to the Small Business Administration, small entities include small organizations such as independent nonprofit organizations; small governmental jurisdictions, including school boards and city and town governments that serve fewer than 50,000 residents; and small businesses (13 CFR 121.201). Small businesses include manufacturing and mining concerns with fewer than 500 employees, wholesale trade entities with fewer than 100 employees, retail and service businesses with less than $5 million in annual sales, general and heavy construction businesses with less than $27.5 million in annual business, special trade contractors doing less than $11.5 million in annual business, and agricultural businesses with annual sales less than $750,000. To determine whether potential economic impacts to these small entities are significant, we considered the types of activities that might trigger regulatory impacts under this designation as well as types of project modifications that may result. In general, the term ''significant economic impact'' is meant to apply to a typical small business firm's business operations.

Under the RFA, as amended, and as understood in the light of recent court decisions, Federal agencies are required to evaluate the potential incremental impacts of rulemaking on those entities directly regulated by the rulemaking itself; in other words, the RFA does not require agencies to evaluate the potential impacts to indirectly regulated entities. The regulatory mechanism through which critical habitat protections are realized is section 7 of the Act, which requires Federal agencies, in consultation with the Service, to ensure that any action authorized, funded, or carried out by the agency is not likely to destroy or adversely modify critical habitat. Therefore, under section 7, only Federal action agencies are directly subject to the specific regulatory requirement (avoiding destruction and adverse modification) imposed by critical habitat designation. Consequently, it is our position that only Federal action agencies will be directly regulated by this critical habitat designation. The RFA does not require evaluation of the potential impacts to entities not directly regulated. Moreover, Federal agencies are not small entities. Therefore, because no small entities will be directly regulated by this rulemaking, the Service certifies that this critical habitat designation will not have a significant economic impact on a substantial number of small entities.

In summary, we have considered whether the designation will result in a significant economic impact on a substantial number of small entities. For the above reasons and based on currently available information, we certify that this critical habitat designation will not have a significant economic impact on a substantial number of small business entities. Therefore, a regulatory flexibility analysis is not required.

Energy Supply, Distribution, or Use—Executive Order 13211

Executive Order 13211 (Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use) requires agencies to prepare Statements of Energy Effects when undertaking certain actions. In our economic analysis, we did not find that the designation of this critical habitat will significantly affect energy supplies, distribution, or use. Therefore, this action is not a significant energy action, and no Statement of Energy Effects is required.

Unfunded Mandates Reform Act (2 U.S.C. 1501 et seq.)

In accordance with the Unfunded Mandates Reform Act (2 U.S.C. 1501 *et seq.*), we make the following findings:

(1) This final rule will not produce a Federal mandate. In general, a Federal mandate is a provision in legislation, statute, or regulation that would impose an enforceable duty upon State, local, or Tribal governments, or the private sector, and includes both ''Federal

intergovernmental mandates'' and ''Federal private sector mandates.'' These terms are defined in 2 U.S.C. 658(5)–(7). ''Federal intergovernmental mandate'' includes a regulation that ''would impose an enforceable duty upon State, local, or Tribal governments'' with two exceptions. It excludes ''a condition of Federal assistance.'' It also excludes ''a duty arising from participation in a voluntary Federal program,'' unless the regulation ''relates to a then-existing Federal program under which $500,000,000 or more is provided annually to State, local, and Tribal governments under entitlement authority,'' if the provision would ''increase the stringency of conditions of assistance'' or ''place caps upon, or otherwise decrease, the Federal Government's responsibility to provide funding,'' and the State, local, or Tribal governments ''lack authority'' to adjust accordingly. At the time of enactment, these entitlement programs were: Medicaid; Aid to Families with Dependent Children work programs; Child Nutrition; Food Stamps; Social Services Block Grants; Vocational Rehabilitation State Grants; Foster Care, Adoption Assistance, and Independent Living; Family Support Welfare Services; and Child Support Enforcement. ''Federal private sector mandate'' includes a regulation that ''would impose an enforceable duty upon the private sector, except (i) a condition of Federal assistance or (ii) a duty arising from participation in a voluntary Federal program.''

The designation of critical habitat does not impose a legally binding duty on non-Federal Government entities or private parties. Under the Act, the only regulatory effect is that Federal agencies must ensure that their actions do not destroy or adversely modify critical habitat under section 7. While non-Federal entities that receive Federal funding, assistance, or permits, or that otherwise require approval or authorization from a Federal agency for an action, may be indirectly impacted by the designation of critical habitat, the legally binding duty to avoid destruction or adverse modification of critical habitat rests squarely on the Federal agency. Furthermore, to the extent that non-Federal entities are indirectly impacted because they receive Federal assistance or participate in a voluntary Federal aid program, the Unfunded Mandates Reform Act would not apply, nor would critical habitat shift the costs of the large entitlement programs listed above onto State governments.

(2) We do not believe that this final rule will significantly or uniquely affect small governments because the government-owned lands being designated as critical habitat are owned by the States of Virginia and North Carolina. These government entities do not fit the definition of ''small governmental jurisdiction.'' Therefore, a Small Government Agency Plan is not required.

Takings—Executive Order 12630

In accordance with E.O. 12630 (Government Actions and Interference with Constitutionally Protected Private Property Rights), we have analyzed the potential takings implications of designating critical habitat for Atlantic pigtoe in a takings implications assessment. The Act does not authorize the Service to regulate private actions on private lands or confiscate private property as a result of critical habitat designation. Designation of critical habitat does not affect land ownership, or establish any closures, or restrictions on use of or access to the designated areas. Furthermore, the designation of critical habitat does not affect landowner actions that do not require Federal funding or permits, nor does it preclude development of habitat conservation programs or issuance of incidental take permits to permit actions that do require Federal funding or permits to go forward. However, Federal agencies are prohibited from carrying out, funding, or authorizing actions that would destroy or adversely modify critical habitat. A takings implications assessment has been completed and concludes that this designation of critical habitat for Atlantic pigtoe does not pose significant takings implications for lands within or affected by the designation.

Federalism—Executive Order 13132

In accordance with E.O. 13132 (Federalism), this final rule does not have significant Federalism effects. A federalism summary impact statement is not required. In keeping with Department of the Interior and Department of Commerce policy, we requested information from, and coordinated development of this critical habitat designation with, appropriate State resource agencies in Virginia and North Carolina. From a federalism perspective, the designation of critical habitat directly affects only the responsibilities of Federal agencies. The Act imposes no other duties with respect to critical habitat, either for States and local governments, or for anyone else. As a result, the final rule does not have substantial direct effects either on the States, or on the relationship between the national government and the States, or on the distribution of powers and responsibilities among the various levels of government. The designation may have some benefit to these governments because the areas that contain the features essential to the conservation of the species are more clearly defined, and the physical or biological features of the habitat necessary to the conservation of the species are specifically identified. This information does not alter where and what federally sponsored activities may occur. However, it may assist these local governments in long-range planning because these local governments no longer have to wait for case-by-case section 7 consultations to occur.

Where State and local governments require approval or authorization from a Federal agency for actions that may affect critical habitat, consultation under section 7(a)(2) will be required. While non-Federal entities that receive Federal funding, assistance, or permits, or that otherwise require approval or authorization from a Federal agency for an action, may be indirectly impacted by the designation of critical habitat, the legally binding duty to avoid destruction or adverse modification of critical habitat rests squarely on the Federal agency.

Civil Justice Reform—Executive Order 12988

In accordance with Executive Order 12988 (Civil Justice Reform), the Office of the Solicitor has determined that the rule does not unduly burden the judicial system and that it meets the requirements of sections 3(a) and 3(b)(2) of the Order. We are designating critical habitat in accordance with the provisions of the Act. To assist the public in understanding the habitat needs of the species, this final rule identifies the physical or biological features essential to the conservation of the species. The areas of designated critical habitat are presented on maps, and the rule provides several options for the interested public to obtain more detailed location information, if desired.

Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.)

This rule does not contain information collection requirements, and a submission to the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*) is not required. We may not conduct or sponsor and you are not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act (42 U.S.C. 4321 et seq.)

We have determined that environmental assessments and environmental impact statements, as defined under the authority of the National Environmental Policy Act (NEPA), need not be prepared in connection with adopted pursuant to section 4(a) of the Act. We published a notice outlining our reasons for this determination in the **Federal Register** on October 25, 1983 (48 FR 49244). This position was upheld by the U.S. Court of Appeals for the Ninth Circuit (*Douglas County* v. *Babbitt,* 48 F.3d 1495 (9th Cir. 1995), cert. denied 516 U.S. 1042 (1996)).

Government-to-Government Relationship With Tribes

In accordance with the President's memorandum of April 29, 1994 (Government-to-Government Relations with Native American Tribal Governments; 59 FR 22951), Executive Order 13175 (Consultation and Coordination with Indian Tribal Governments), and the Department of the Interior's manual at 512 DM 2, we readily acknowledge our responsibility to communicate meaningfully with recognized Federal Tribes on a government-to-government basis. In accordance with Secretarial Order 3206 of June 5, 1997 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act), we readily acknowledge our responsibilities to work directly with Tribes in developing programs for healthy ecosystems, to acknowledge that Tribal lands are not subject to the same controls as Federal public lands, to remain sensitive to Indian culture, and to make information available to Tribes. We have identified no Tribal interests that will be affected by this rule.

List of Subjects in 50 CFR Part 17

Endangered and threatened species, Exports, Imports, Reporting and recordkeeping requirements, Transportation.

Regulation Promulgation

Accordingly, we amend part 17, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as set forth below:

PART 17—ENDANGERED AND THREATENED WILDLIFE AND PLANTS

■ 1. The authority citation for part 17 continues to read as follows:

Authority: 16 U.S.C. 1361–1407; 1531–1544; and 4201–4245, unless otherwise noted.

■ 2. Amend § 17.11(h) by adding an entry for ''Pigtoe, Atlantic'' to the List of Endangered and Threatened Wildlife in alphabetical order under CLAMS to read as follows:

§ 17.11 Endangered and threatened wildlife.

* * * * *

(h) * * *

Common name	Scientific name	Where listed	Status	Listing citations and applicable rules
*	*	*	*	*
CLAMS				
*	*	*	*	*
Pigtoe, Atlantic	*Fusconaia masoni*	Wherever found	T	86 FR [insert **Federal Register** page where the document begins], November 16, 2021; 50 CFR 17.45(a); [4d] 50 CFR 17.95(f).[CH]
*	*	*	*	*

■ 3. Revise § 17.45 to read as follows:

§ 17.45 Special rules—snails and clams.

(a) Atlantic pigtoe (*Fusconaia masoni*)—(1) *Prohibitions.* The following prohibitions that apply to endangered wildlife also apply to the Atlantic pigtoe. Except as provided under paragraphs (a)(2) and (3) of this section and §§ 17.4 and 17.5, it is unlawful for any person subject to the jurisdiction of the United States to commit, to attempt to commit, to solicit another to commit, or cause to be committed, any of the following acts in regard to this species:

(i) Import or export, as set forth at § 17.21(b) for endangered wildlife.

(ii) Take, as set forth at § 17.21(c)(1) for endangered wildlife.

(iii) Possession and other acts with unlawfully taken specimens, as set forth at § 17.21(d)(1) for endangered wildlife.

(iv) Interstate or foreign commerce in the course of commercial activity, as set forth at § 17.21(e) for endangered wildlife.

(v) Sale or offer for sale, as set forth at § 17.21(f) for endangered wildlife.

(2) *General exceptions from prohibitions.* In regard to this species, you may:

(i) Conduct activities as authorized by a permit under § 17.32.

(ii) Take, as set forth at § 17.21(c)(2) through (c)(4) for endangered wildlife.

(iii) Take, as set forth at § 17.31(b).

(iv) Possess and engage in other acts with unlawfully taken Atlantic pigtoe, as set forth at § 17.21(d)(2) through (4) for endangered wildlife.

(3) *Exceptions from prohibitions for specific types of incidental take.* The following entities and activities that cause take that is incidental to an otherwise lawful activity are not in violation of the prohibitions:

(i) Species restoration efforts by State wildlife agencies, including collection of broodstock, tissue collection for genetic analysis, captive propagation, and subsequent stocking into currently occupied and unoccupied areas within the historical range of the species, and follow-up monitoring.

(ii) Channel restoration projects that create natural, physically stable, ecologically functioning streams (or stream and wetland systems) that are reconnected with their groundwater aquifers. These projects can be accomplished using a variety of methods, but the desired outcome is a natural channel with low shear stress (force of water moving against the channel); bank heights that enable reconnection to the floodplain; a reconnection of surface and

groundwater systems, resulting in perennial flows in the channel; riffles and pools comprised of existing soil, rock, and wood instead of large imported materials; low compaction of soils within adjacent riparian areas; and inclusion of riparian wetlands. Streams reconstructed in this way would offer suitable habitats for the Atlantic pigtoe and contain stable channel features, such as pools, glides, runs, and riffles, which could be used by the species and its host fish for spawning, rearing, growth, feeding, migration, and other normal behaviors. Prior to restoration action, surveys to determine presence of Atlantic pigtoe must be performed, and if located, mussels must be relocated prior to project implementation.

(iii) Bank stabilization projects that use bioengineering methods to replace pre-existing, bare, eroding stream banks with vegetated, stable stream banks, thereby reducing bank erosion and instream sedimentation and improving habitat conditions for the species. Following these bioengineering methods, stream banks may be stabilized using native species live stakes (live, vegetative cuttings inserted or tamped into the ground in a manner that allows the stake to take root and grow), native species live fascines (live branch cuttings, usually willows, bound together into long, cigar-shaped bundles), or native species brush layering (cuttings or branches of easily rooted tree species layered between successive lifts of soil fill). Native vegetation includes woody species appropriate for the region and habitat conditions. These methods do not include the sole use of quarried rock (rip-rap) or the use of rock baskets or gabion structures.

(iv) Forestry-related activities, including silvicultural practices, forest management work, and fire control tactics, that implement State-approved best management practices. In order for this exception to apply to forestry-related activities, these best management practices must achieve all of the following:

(A) Establish a streamside management zone alongside the margins of each waterway.

(B) Restrain visible sedimentation caused by the forestry-related activity from entering the waterway.

(C) Maintain native groundcover within the streamside management zone of the waterway, and promptly re-establish native groundcover if disturbed.

(D) Limit installation of vehicle or equipment crossings of the waterway to only where necessary for the forestry-related activity. Such crossings shall:

(*1*) Have erosion and sedimentation control measures installed to divert surface runoff away and restrain visible sediment from entering the waterway;

(*2*) Allow for movement of aquatic organisms within the waterway; and

(*3*) Have native groundcover applied and maintained through completion of the forestry-related activity.

(E) Prohibit the use of tracked or wheeled vehicles for reforestation site preparation within the streamside management zone of the waterway.

(F) Prohibit locating log decks, skid trails, new roads, and portable mill sites in the streamside management zone of the waterway.

(G) Prohibit obstruction and impediment of the flow of water within the waterway that is caused by direct deposition of debris or soil by the forestry-related activity.

(H) Maintain shade over the waterway similar to that observed prior to the forestry-related activity.

(I) Prohibit discharge of any solid waste, petroleum, pesticide, fertilizer, or other chemical into the waterway.

(b) [Reserved]

■ 4. Amend § 17.95(f) immediately following the entry for ''Rabbitsfoot (*Quadrilla cylindrica cylindrica*)'' by adding an entry for ''Atlantic Pigtoe (*Fusconaia masoni*)'' to read as follows:

§ 17.95 Critical habitat—fish and wildlife.

* * * * *

(f) *Clams and Snails.*

* * * * *

Atlantic Pigtoe (Fusconaia masoni)

(1) Critical habitat units are depicted for Bath, Botetourt, Brunswick, Craig, Dinwiddie, Greensville, Halifax, Lunenburg, Mecklenburg, Nottoway, Pittsylvania, and Sussex Counties in Virginia, and Durham, Edgecombe, Franklin, Granville, Halifax, Johnston, Montgomery, Nash, Orange, Person, Pitt, Randolph, Rockingham, Vance, Wake, Warren, and Wilson Counties in North Carolina, on the maps in this entry.

(2) Within these areas, the physical or biological features essential to the conservation of Atlantic pigtoe consist of the following components:

(i) Suitable substrates and connected instream habitats, characterized by geomorphically stable stream channels and banks (*i.e.,* channels that maintain lateral dimensions, longitudinal profiles, and sinuosity patterns over time without an aggrading or degrading bed elevation) with habitats that support a diversity of freshwater mussel and native fish (such as stable riffle-run-pool habitats that provide flow refuges consisting of silt-free gravel and coarse sand substrates).

(ii) Adequate flows, or a hydrologic flow regime (which includes the severity, frequency, duration, and seasonality of discharge over time), necessary to maintain benthic habitats where the species is found and to maintain connectivity of streams with the floodplain, allowing the exchange of nutrients and sediment for maintenance of the mussel's and fish hosts' habitat, food availability, spawning habitat for native fishes, and the ability for newly transformed juveniles to settle and become established in their habitats.

(iii) Water and sediment quality (including, but not limited to, conductivity, hardness, turbidity, temperature, pH, ammonia, heavy metals, and chemical constituents) necessary to sustain natural physiological processes for normal behavior, growth, and viability of all life stages.

(iv) The presence and abundance of fish hosts necessary for recruitment of the Atlantic pigtoe.

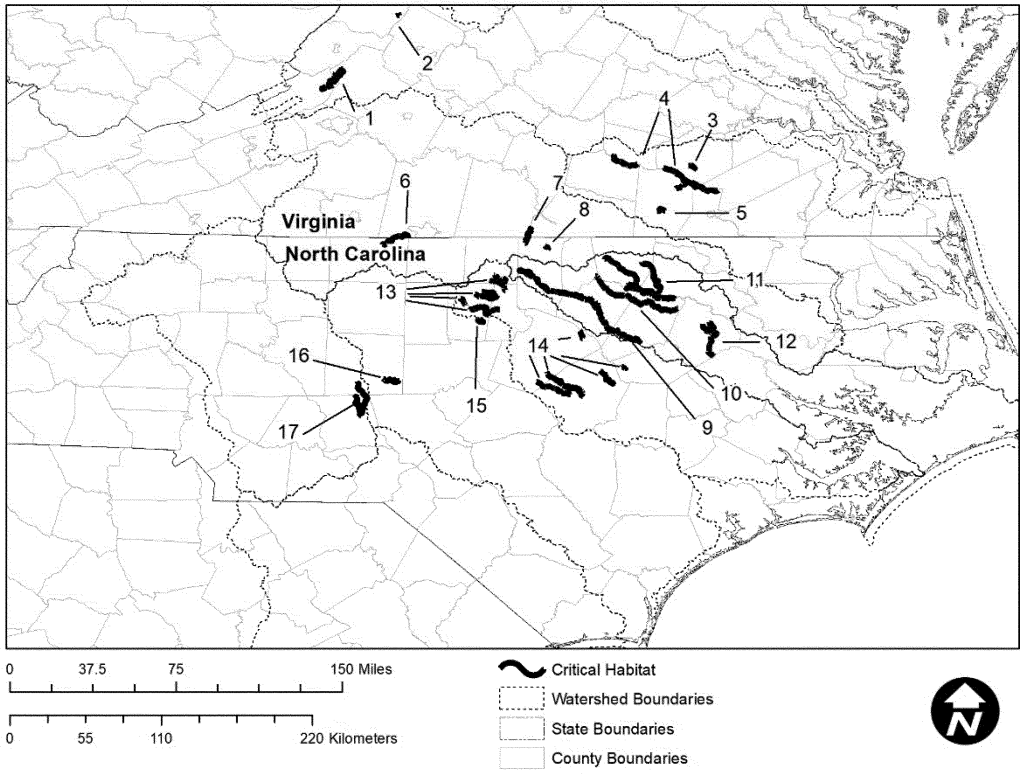
(3) Critical habitat does not include manmade structures (such as buildings, aqueducts, runways, roads, and other paved areas) and the land on which they are located existing within the legal boundaries on December 16, 2021.

(4) Data layers defining map units were created by overlaying Natural Heritage Element Occurrence data and U.S. Geological Survey (USGS) hydrologic data for stream reaches. The hydrologic data used in the critical habitat maps were extracted from the USGS 1:1M scale nationwide hydrologic layer (*https://nationalmap.gov/small_scale/mld/1nethyd.html)* with a projection of EPSG:4269–North American Datum of 1983 (NAD83) Geographic. The North Carolina and Virginia Natural Heritage program species presence data and the Virginia Department of Wildlife Resources species data were used to select specific stream segments for inclusion in the critical habitat layer. The maps in this entry, as modified by any accompanying regulatory text, establish the boundaries of the critical habitat designation. The coordinates or plot points on which each map is based are available to the public at *http://www.regulations.gov* under Docket No. FWS–R4–ES–2018–0046 and at the field office responsible for this designation. You may obtain field office location information by contacting one of the Service regional offices, the addresses of which are listed at 50 CFR 2.2.

(5) Note: Index map follows:

BILLING CODE 4333–15–P

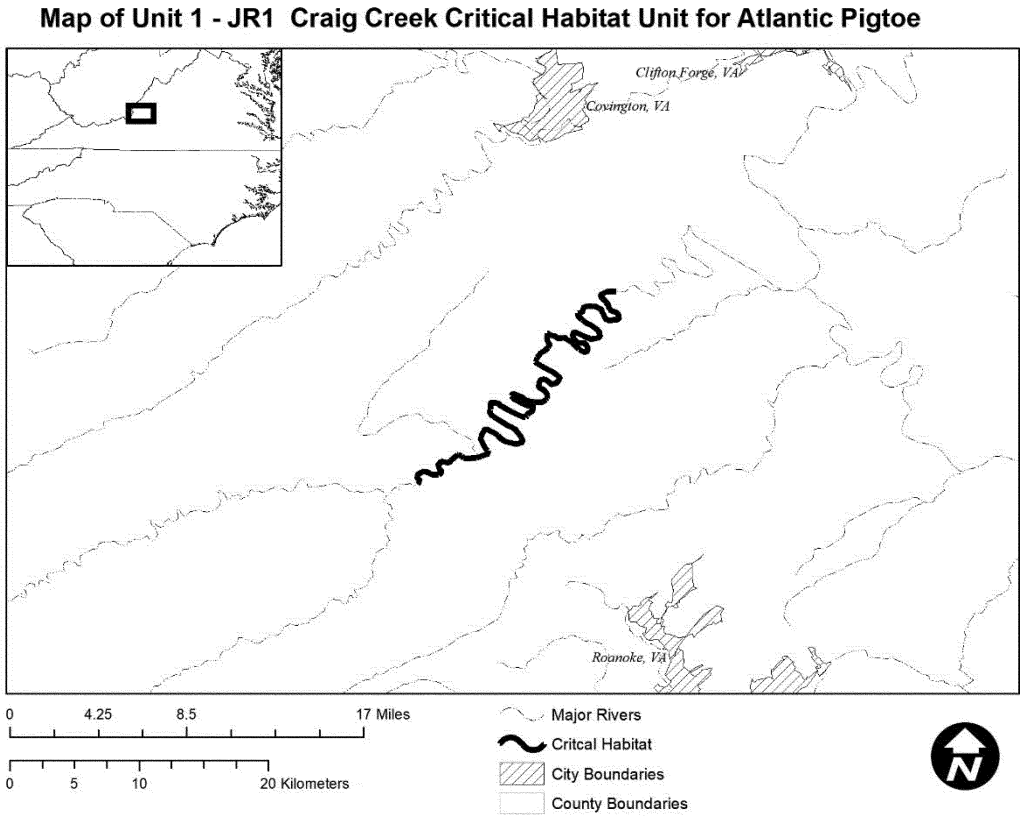
Index Map of Critical Habitat Units for Atlantic Pigtoe



(6) Unit 1: JR1—Craig Creek, Craig and Botetourt Counties, Virginia.

(i) This unit consists of 29 river miles (46.7 river kilometers (km)) of Craig Creek near VA Route 616 northeast of New Castle downstream to just below VA Route 817 crossing.

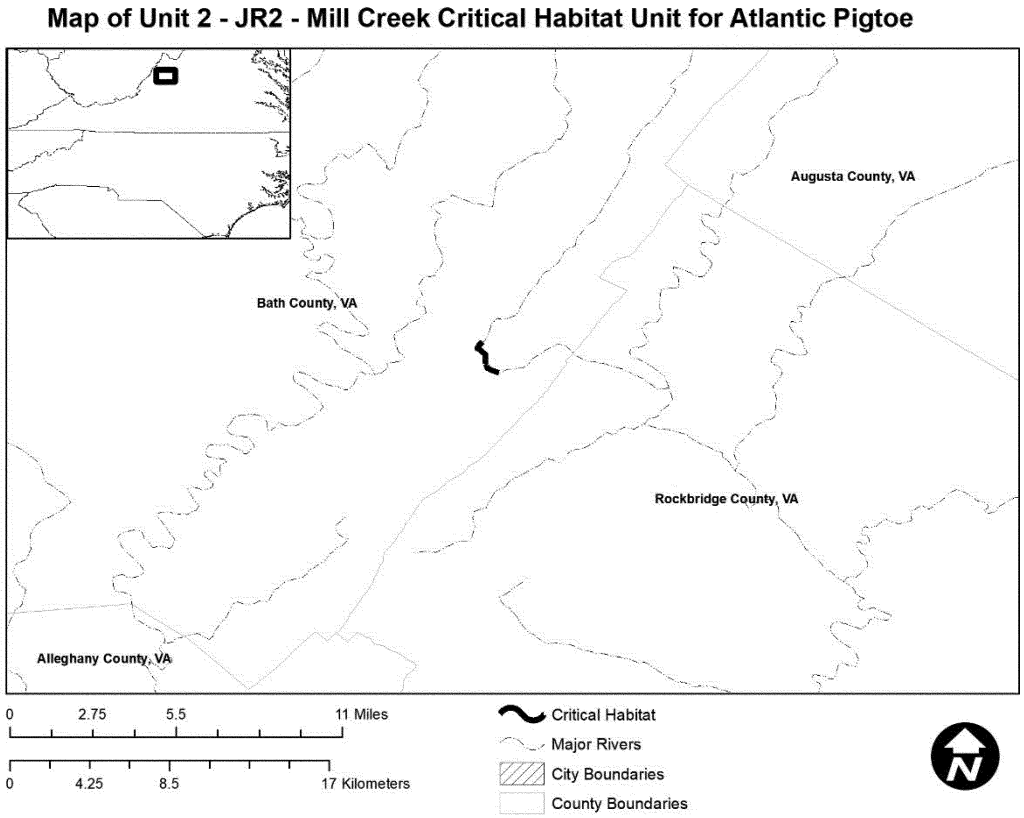
(ii) Map of Unit 1 (Craig Creek) follows:



(7) Unit 2: JR2—Mill Creek, Bath County, Virginia.

(i) This unit consists of a 1-mile (1.6-km) segment of Mill Creek at the VA39 (Mountain Valley Road) crossing.

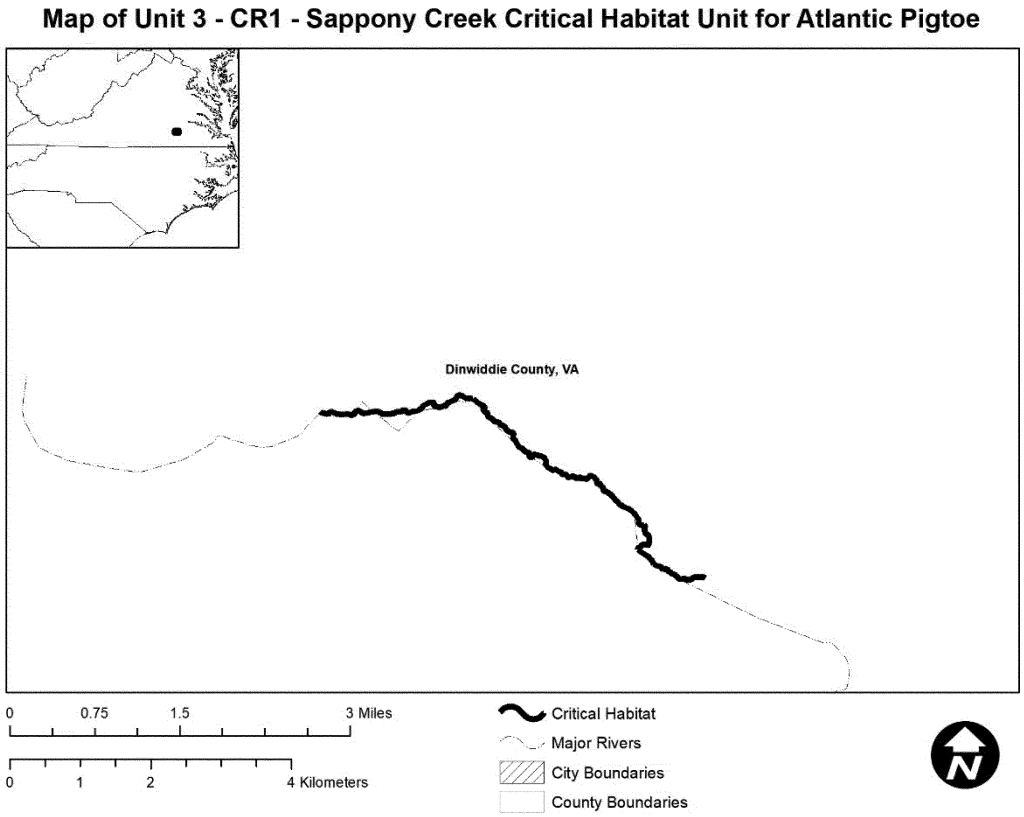
(ii) Map of Unit 2 (Mill Creek) follows:



(8) Unit 3: CR1—Sappony Creek, Dinwiddie County, Virginia.

(i) This unit consists of 4 river miles (6.6 river km) of Sappony Creek beginning just upstream of the Seaboard Railroad crossing and ending just downstream of the Shippings Road (SR709) crossing.

(ii) Map of Unit 3 (Sappony Creek) follows:

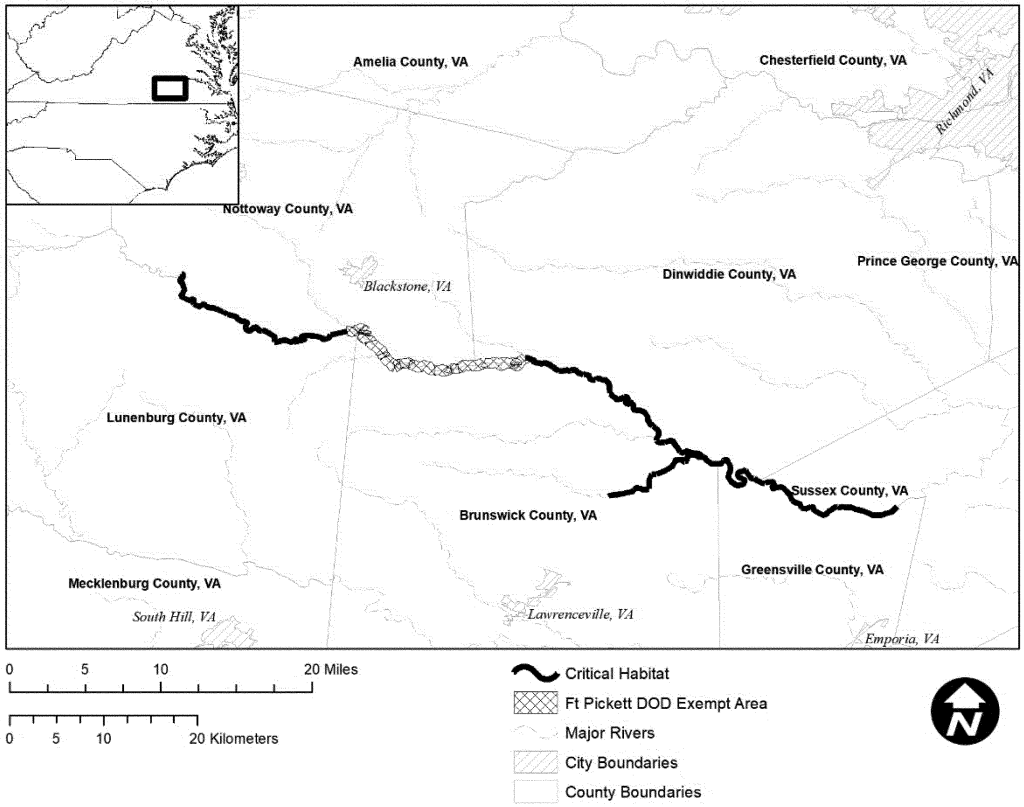


(9) Unit 4: CR2—Nottoway River Subbasin, Nottoway, Lunenburg, Brunswick, Dinwiddie, Greensville, and Sussex Counties, Virginia.

(i) This unit consists of 64 river miles (103 river km) of the Nottoway River, and a portion of Sturgeon Creek, beginning downstream of the Nottoway River's confluence with Dickerson Creek and ending just downstream of Little Mill Road, and includes Sturgeon Creek upstream of Old Stage Road. Land bordering the river is primarily privately owned, although some of the land along the river is part of the Fort Pickett National Guard Installation.

(ii) Map of Unit 4 (Nottoway River Subbasin) follows:

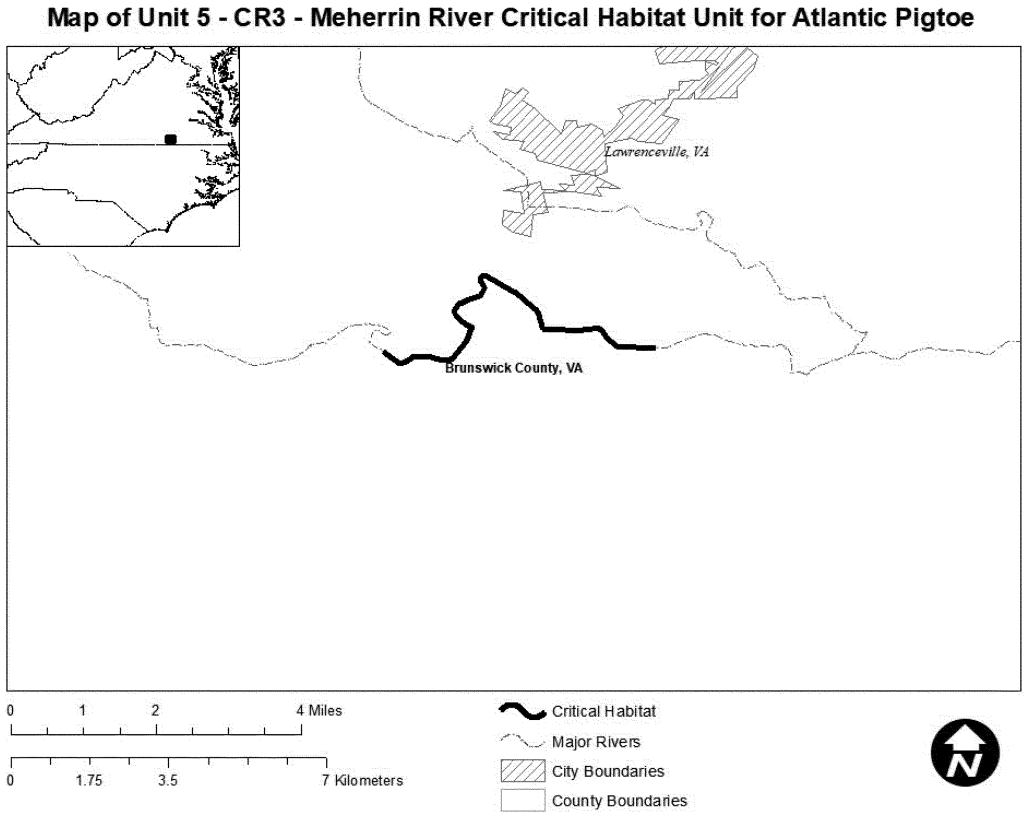
Map of Unit 4 - CR2 - Nottaway River Subbasin Critical Habitat Unit for Atlantic Pigtoe



(10) Unit 5: CR3—Meherrin River, Brunswick County, Virginia.

(i) This unit consists of 5 river miles (8 river km) of the Meherrin River from approximately 1.5 miles below the confluence with Saddletree Creek under VA Highway 46 (Christana Highway) to VA715 (Iron Bridge Road).

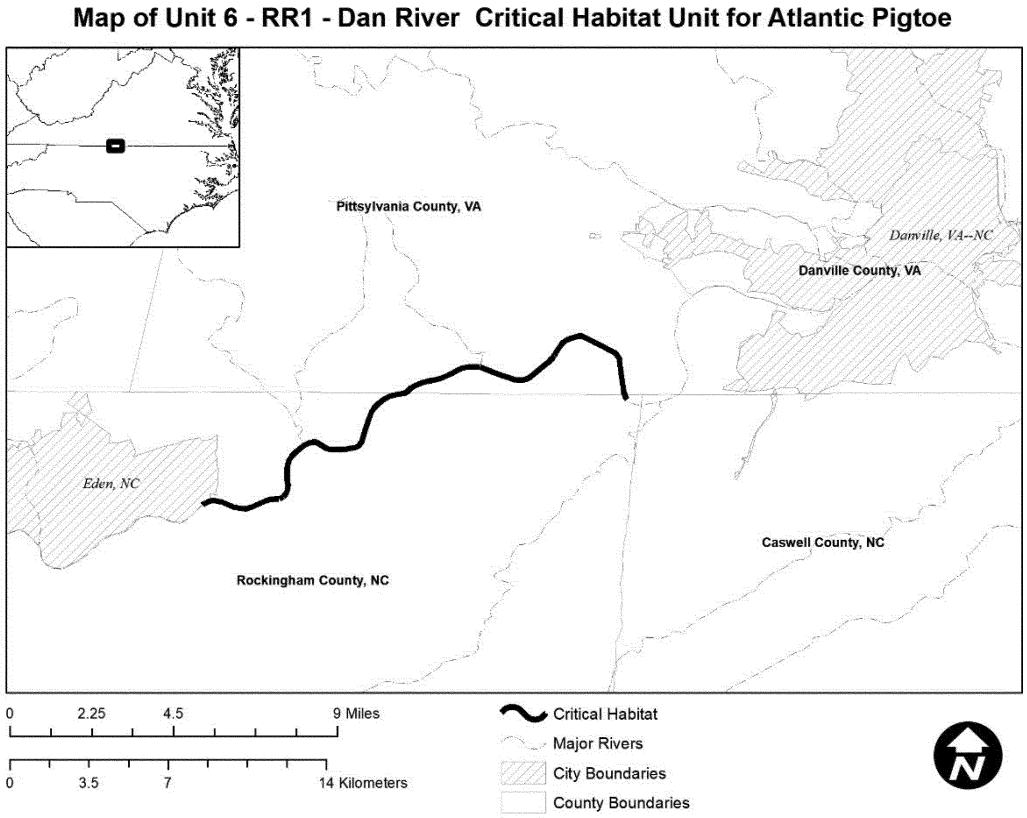
(ii) Map of Unit 5 (Meherrin River) follows:



(11) Unit 6: RR1—Dan River, Pittsylvania County, Virginia, and Rockingham County, North Carolina.

(i) This unit consists of 14 river miles (22.5 river km) of the Dan River along the border of Virginia and North Carolina from just upstream of NC Highway 700 near Eden, North Carolina, into Pittsylvania County, Virginia, and downstream to the confluence with Williamson Creek in Rockingham County, North Carolina.

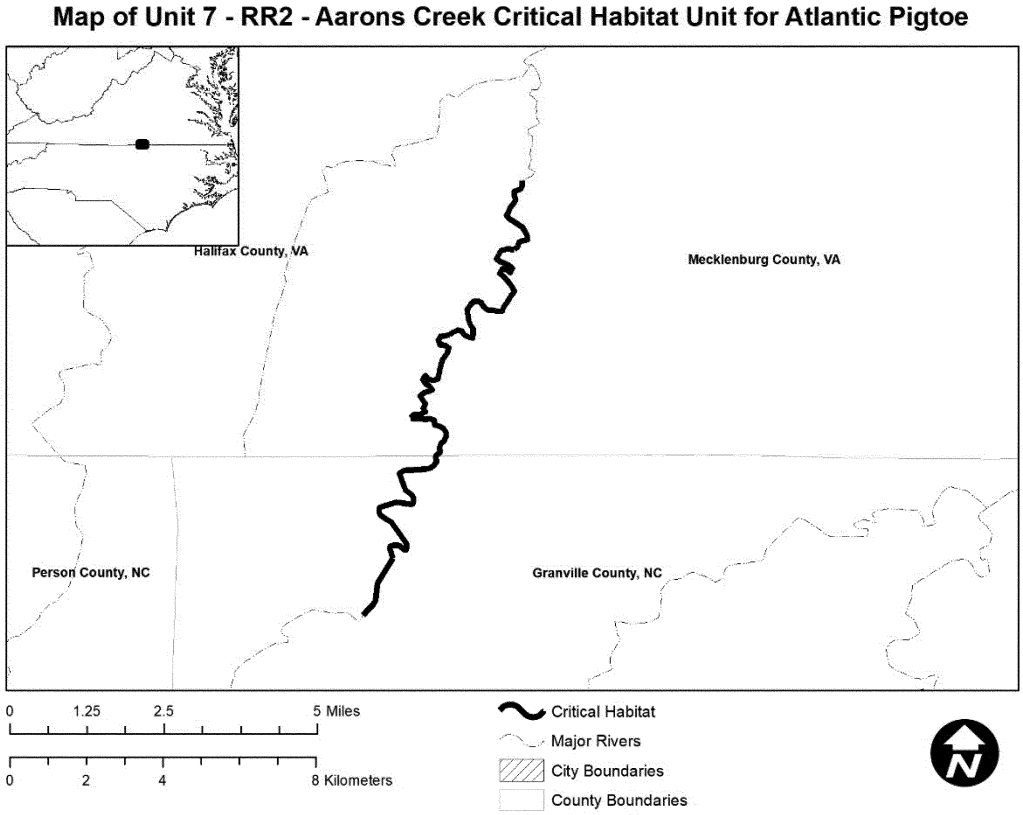
(ii) Map of Unit 6 (Dan River) follows:



(12) Unit 7: RR2—Aarons Creek, Granville County, North Carolina, and Mecklenburg and Halifax Counties, Virginia.

(i) This unit consists of 12 river miles (19.3 river km) of Aarons Creek, from NC96 in Granville County, North Carolina, downstream across the North Carolina-Virginia border to just upstream of VA602 (White House Road) along the Mecklenburg County-Halifax County line in Virginia.

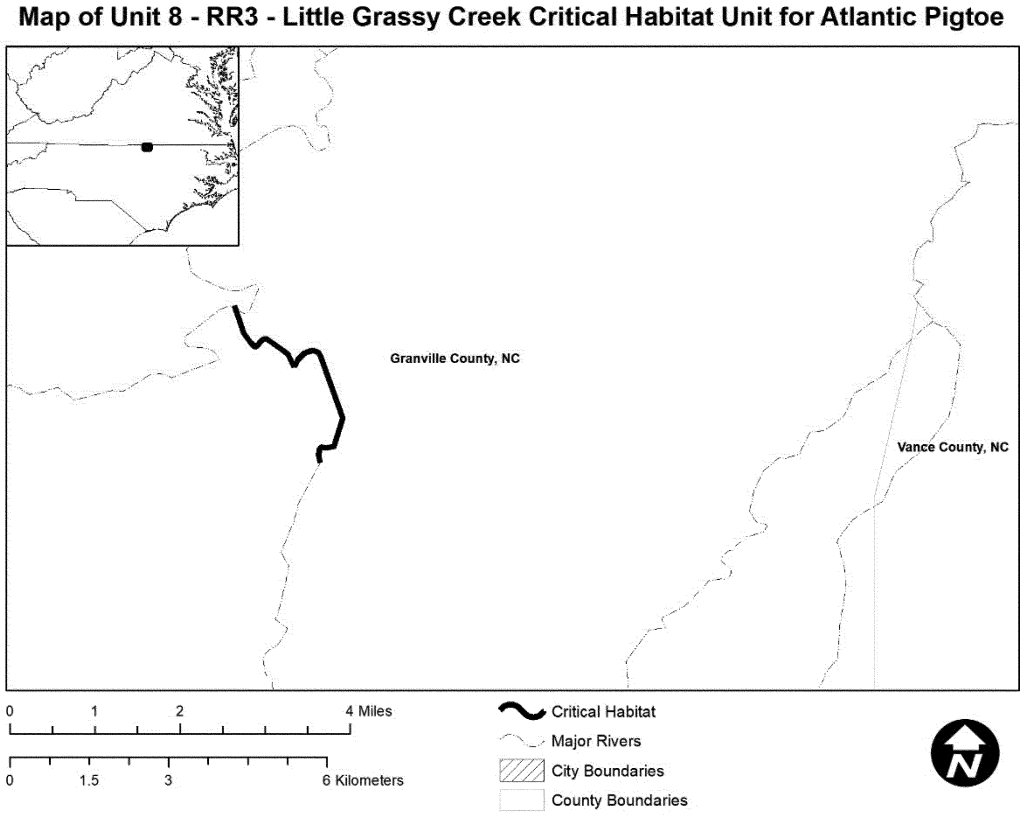
(ii) Map of Unit 7 (Aarons Creek) follows:



(13) Unit 8: RR3—Little Grassy Creek, Granville County, North Carolina.

(i) This unit consists of 3 river miles (4.8 river km) of Little Grassy Creek in Granville County, North Carolina, beginning at the Crawford Currin Road crossing and ending at the confluence with Grassy Creek.

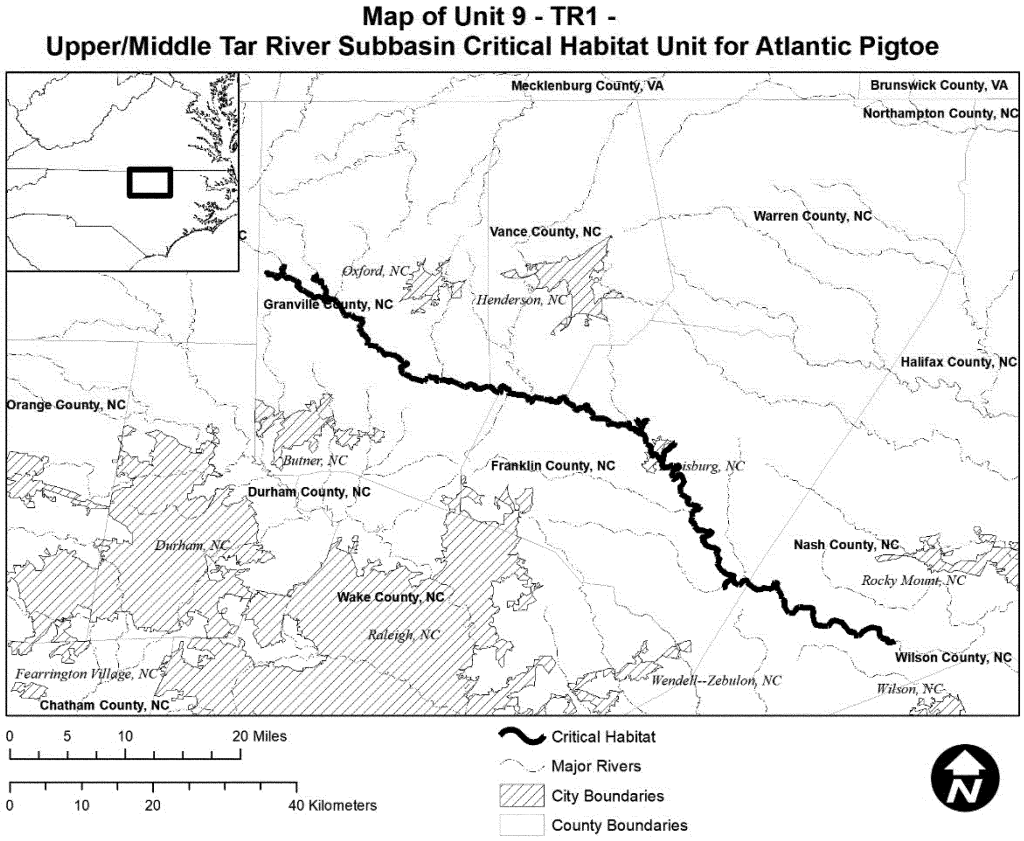
(ii) Map of Unit 8 (Little Grassy Creek) follows:



(14) Unit 9: TR1—Upper/Middle Tar River Subbasin, Granville, Vance, Franklin, and Nash Counties, North Carolina.

(i) This unit consists of 91 river miles (146.5 river km) of the mainstem of the upper and middle Tar River as well as several tributaries (Bear Swamp Creek, Fox Creek, Crooked Creek, Cub Creek, and Shelton Creek), all in North Carolina. The portion of Cub Creek starts near Hobgood Road and continues to the confluence with the Tar River; the Tar River portion starts just upstream of the NC158 bridge and goes downstream to the NC581 crossing; the Shelton Creek portion starts upstream of NC158 and goes downstream to the confluence with the Tar River; the Bear Swamp Creek portion begins upstream of Dyking Road and goes downstream to the confluence with the Tar River (and includes an unnamed tributary upstream of Beasley Road); the Fox Creek portion begins downstream of NC561 and goes to the confluence with the Tar River; and the Crooked Creek portion begins upstream of NC98 crossing and goes downstream to confluence with Tar River.

(ii) Map of Unit 9 (Upper/Middle Tar River Subbasin) follows:

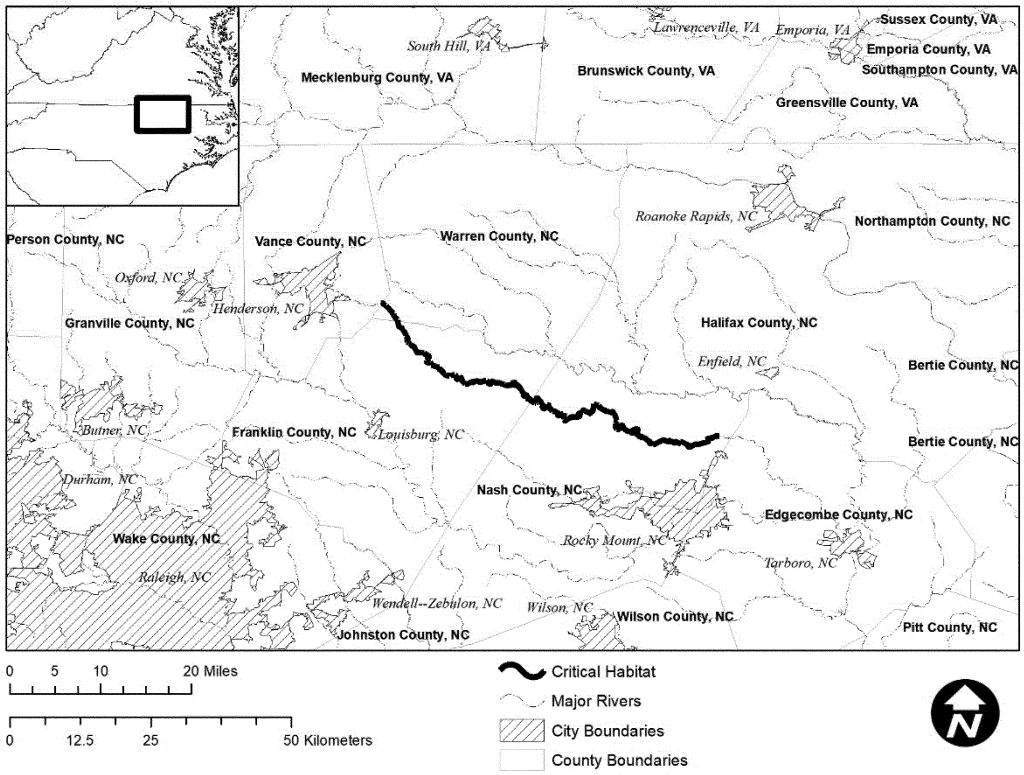


(15) Unit 10: TR2—Sandy/Swift Creek, Warren, Franklin, and Nash Counties, North Carolina.

(i) This unit consists of a 50-mile (80.5-km) segment of Sandy/Swift Creek beginning at Southerland Mill Road and continuing downstream to NC301.

(ii) Map of Unit 10 (Sandy/Swift Creek) follows:

Map of Unit 10 - TR2 - Sandy/Swift Creek Critical Habitat Unit for Atlantic Pigtoe

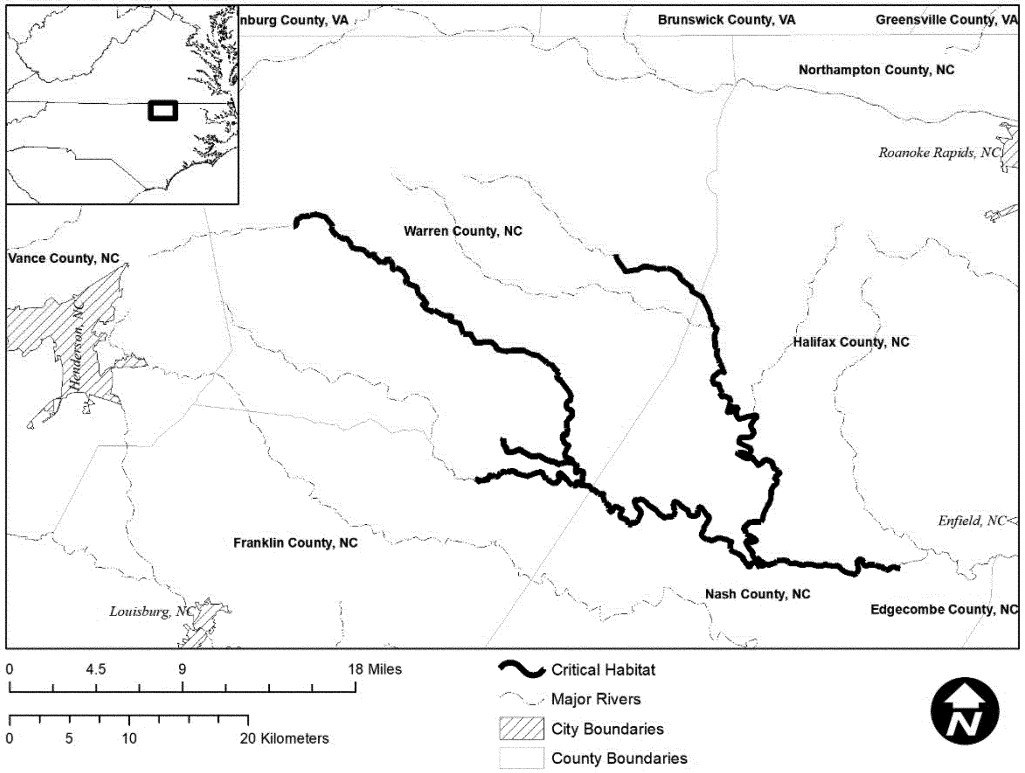


(16) Unit 11: TR3—Fishing Creek Subbasin, Warren, Halifax, Franklin, and Nash Counties, North Carolina.

(i) This unit consists of 85 river miles (136.8 river km) in Fishing Creek, Little Fishing Creek, Shocco Creek, and Maple Branch. The Shocco Creek portion begins downstream of the NC58 bridge and continues to the confluence with Fishing Creek; the entirety of Maple Branch is included, down to the confluence with Fishing Creek; Fishing Creek begins at Axtell Ridgeway Road (SR1112) and goes downstream to I–95; and Little Fishing Creek begins upstream of Briston Brown Road (SR1532) and goes downstream to the confluence with Fishing Creek.

(ii) Map of Unit 11 (Fishing Creek Subbasin) follows:

Map of Unit 11 - TR3 - Fishing Creek Subbasin Critical Habitat Unit for Atlantic Pigtoe

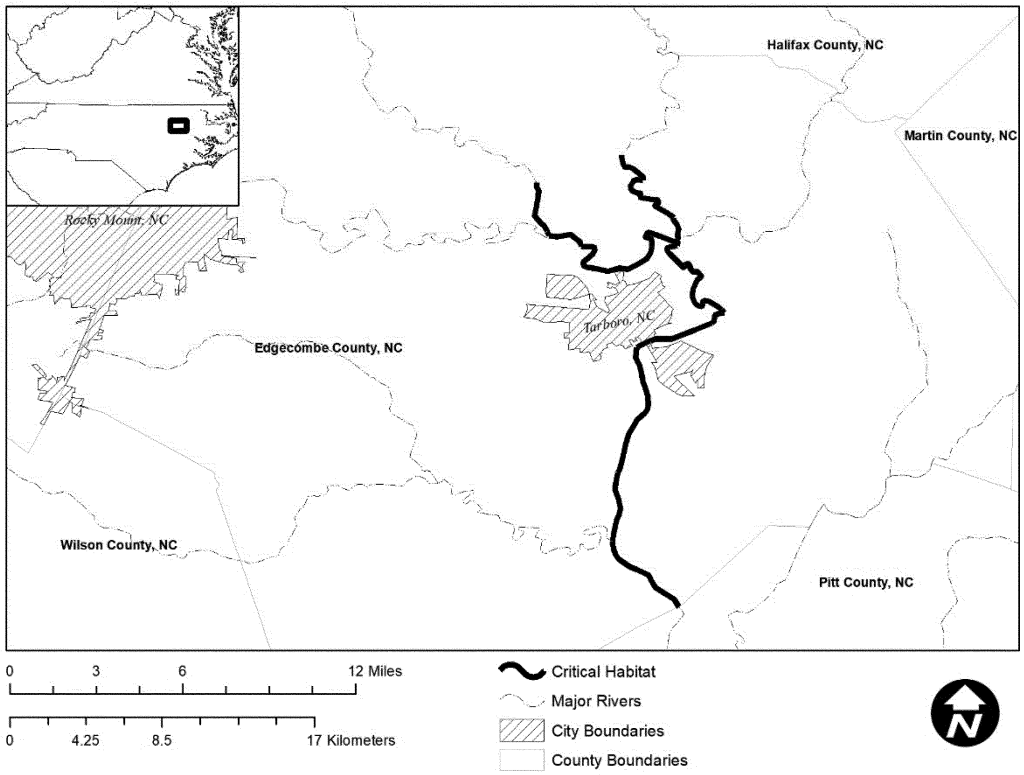


(17) Unit 12: TR4—Lower Tar River, Edgecombe and Pitt Counties, North Carolina.

(i) This unit consists of 30 river miles (48.3 river km) of the Lower Tar River, lower Swift Creek, and Fishing Creek in Edgecombe County, North Carolina, from NC97 near Leggett, North Carolina, to the Edgecombe County-Pitt County line near NC33.

(ii) Map of Unit 12 (Lower Tar River) follows:

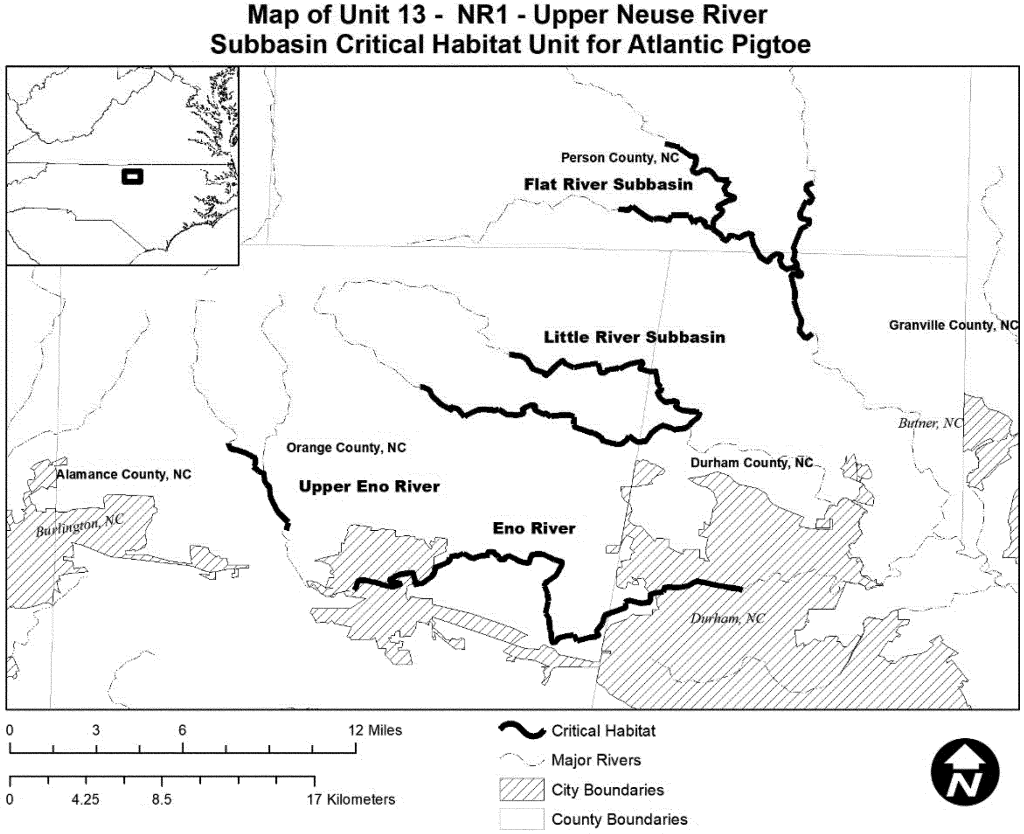
Map of Unit 12 - TR4 - Lower Tar River Critical Habitat Unit for Atlantic Pigtoe



(18) Unit 13: NR1—Upper Neuse River Subbasin, Person, Durham, and Orange Counties, North Carolina.

(i) This unit consists of 60 river miles (95 river km) in four reaches including Flat River, Little River, Eno River, and the Upper Eno River. The Flat River reach consists of 19 river miles (30.6 river km) in the Flat River Subbasin in Person and Durham Counties, North Carolina, including the South Flat River downstream of Dick Coleman Road, the North Flat River near Parsonage Road, and Deep Creek near Helena-Moriah Road downstream where each river converges into the Flat River downstream of State Forest Road. The Little River Subbasin includes 18 river miles (29 river km) of the North Fork and South Fork Little Rivers in Orange and Durham Counties, North Carolina. The Upper Eno River reach consists of 4 river miles (6.4 river km) in Orange County, North Carolina, including the West Fork Eno River upstream of Cedar Grove Road to the confluence with McGowan Creek. The Eno River reach consists of 18 river miles (29 river km) in Orange and Durham Counties, North Carolina, from below Eno Mountain Road to NC15–501.

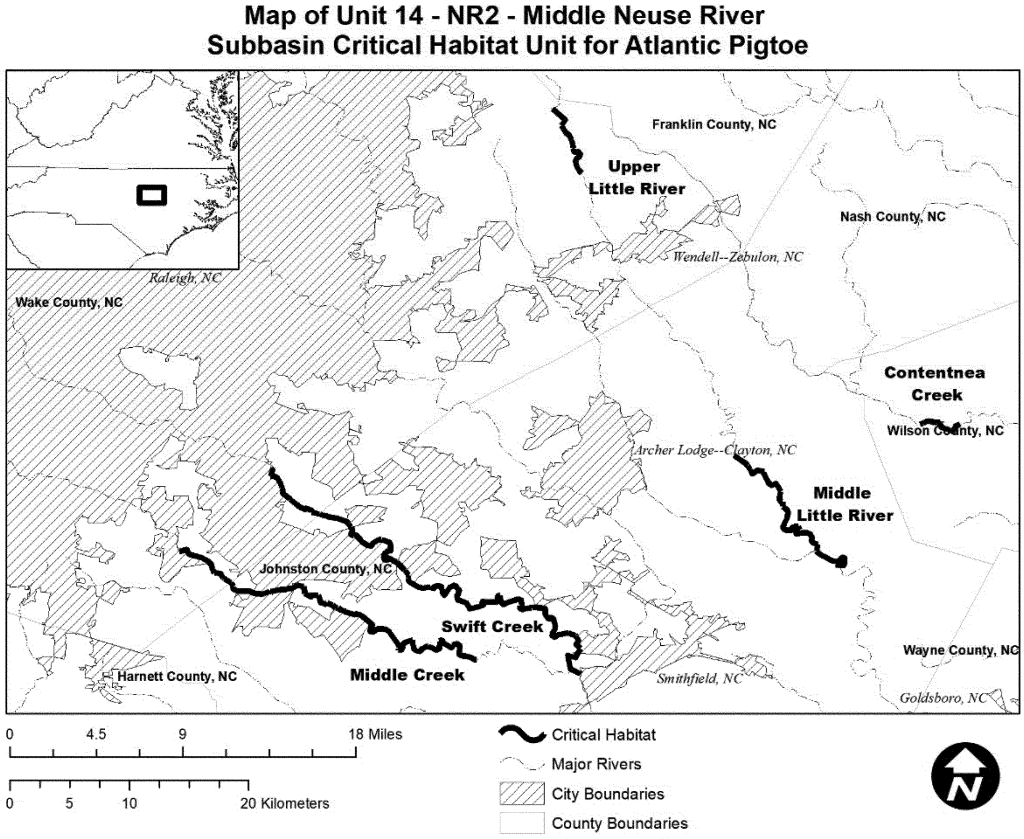
(ii) Map of Unit 13 (Upper Neuse River Subbasin) follows:



(19) Unit 14: NR2—Middle Neuse River Subbasin, Wake, Johnston, and Wilson Counties, North Carolina.

(i) This unit consists of 61 river miles (98.2 river km) in five reaches including Swift Creek, Middle Creek, Upper Little River, Middle Little River, and Contentnea Creek, all in North Carolina. The Middle Creek reach is 19 river miles (30.6 river km) below Old Stage Road downstream to below Crantock Road, and the Swift Creek reach is 25 river miles (40.2 river km) from Lake Benson downstream to its confluence with the Neuse, both in Wake and Johnston Counties. The Upper Little River reach includes 4 river miles (6.4 river km) of the Upper Little River from the confluence with Perry Creek to Fowler Road in Wake County, North Carolina. The Middle Little River reach includes 11 river miles (17.7 river km) from Atkinsons Mill downstream to NC301 in Johnston County, North Carolina. The Contentnea Creek reach consists of 2 river miles (3.2 river km) below Buckhorn Reservoir to just below Sadie Road near NC581 in Wilson County, North Carolina.

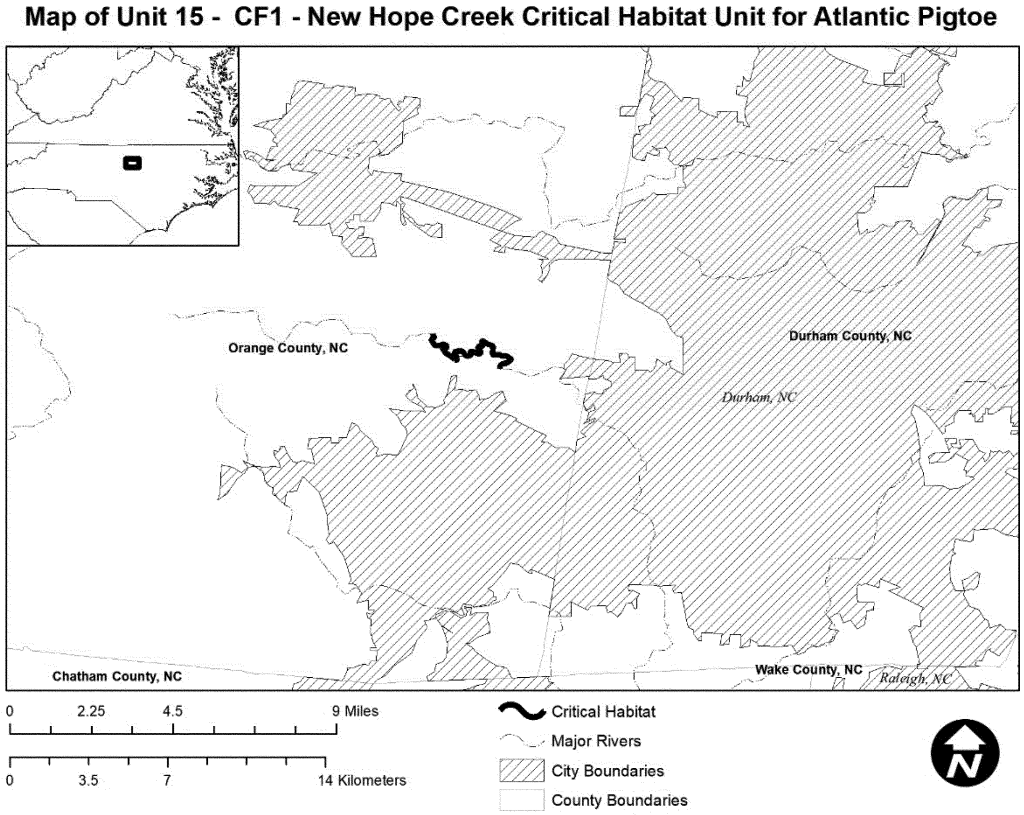
(ii) Map of Unit 14 (Middle Neuse River Subbasin) follows:



(20) Unit 15: CF1—New Hope Creek, Orange County, North Carolina.

(i) This unit consists of 4 river miles (6.4 river km) of habitat in the New Hope Creek from NC86 to Mimosa Road.

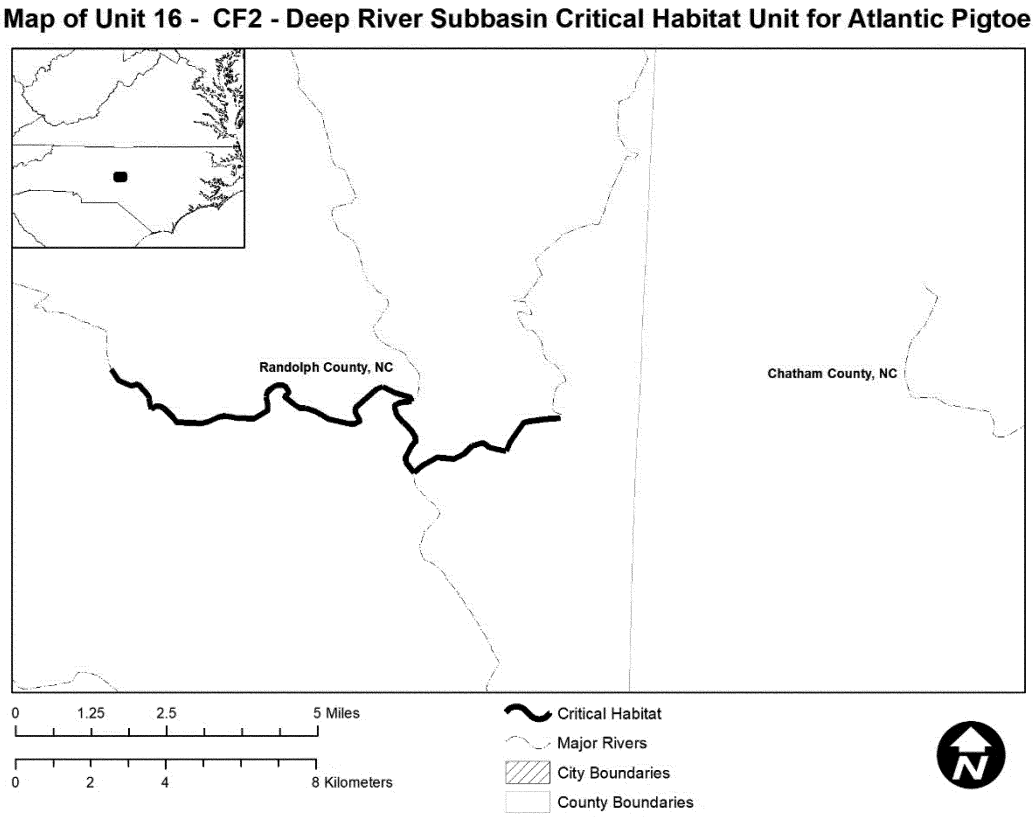
(ii) Map of Unit 15 (New Hope Creek) follows:



(21) Unit 16: CF2—Deep River Subbasin, Randolph County, North Carolina.

(i) The Deep River Subbasin unit consists of 10 river miles (16.1 river km), including the mainstem between Richland and Brush Creeks as well as Richland Creek from Little Beane Store Road to the confluence with the Deep River and Brush Creek from Brush Creek Road to the confluence with the Deep River.

(ii) Map of Unit 16 (Deep River Subbasin) follows:



(22) Unit 17: YR1—Little River, Randolph and Montgomery Counties, North Carolina.

(i) This unit consists of 40 river miles (64.4 river km) of Little River from SR1114 downstream to Okeewemee Star Road, including the West Fork Little River from NC134 to the confluence with the Little River.

(ii) Map of Unit 17 (Little River) follows:

ELECTRONIC RESEARCH

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: **www.govinfo.gov.**

Federal Register information and research tools, including Public Inspection List and electronic text are located at: **www.federalregister.gov.**

E-mail

FEDREGTOC (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to **https://public.govdelivery.com/accounts/USGPOOFR/subscriber/new**, enter your email address, then follow the instructions to join, leave, or manage your subscription.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to **http://listserv.gsa.gov/archives/publaws-l.html and select** *Join or leave the list (or change settings);* then follow the instructions.

FEDREGTOC and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: **fedreg.info@nara.gov**

The Federal Register staff cannot interpret specific documents or regulations.
