Congress drafted the FD&C Act with broad reach, consistent with the remedial purpose of the legislation, and then exempted specific actors and activities as appropriate, but never exempted laboratories. In 1938, Congress included the term ''diagnosis'' in the FD&C Act specifically to empower FDA to address articles producing false diagnostic results, without any carveout for laboratories. FD&C Act (June 25, 1938), Public Law 75–717, 52 Stat. 1040 (defining ''drug'' and ''device'' with reference to an intended use in ''diagnosis,'' among other things). In 1976, Congress reiterated that diagnostic articles should be regulated by FDA, now under the new, more robust device framework, and again made no distinction in the device definition between entities manufacturing those articles. See, *e.g.,* H.R. Rep. 94–853 at 11 (February 29, 1976). As described in response to comment 53, the authorizing committees discussed concerns about diagnostic systems at length—and particularly the potential harms of faulty test results—but never mentioned that entities such as laboratories should fall outside the reach of the FD&C Act, even though laboratories were manufacturing tests at the time and FDA had recently announced, by regulation, that IVDs were devices regardless of their manufacturer. And in the over 30 years since FDA first stated its authority over LDTs specifically, Congress has not acted to limit the Agency's jurisdiction. Instead, in 2014, Congress passed legislation expressly recognizing that ''a clinical diagnostic laboratory test . . . offered and furnished only by a single laboratory'' can be ''cleared or approved by the Food and Drug Administration,'' 42 U.S.C. 1395m–1(d)(5) & (d)(5)(B), and thus is within the definition of a device. Therefore, examining the text in context, the definition provides ''clear congressional authorization'' for this rulemaking.

E. Other Legal Comments

(Comment 93) Two comments raised First Amendment concerns. One comment asserted that LDTs are different from other devices in that the design and execution of LDTs, as well as the communication of test results, involve speech. In particular, the comment pointed to two CLIA regulations, 42 CFR 493.1445 and 493.1457, which provide that laboratory directors and clinical consultants must ''[e]nsure that consultation is available to the laboratory's clients on matters relating to the quality of the test results reported and their interpretation concerning specific patient conditions.'' The comment asserted that these communications will be restricted if FDA has not authorized them through premarket review. The comment then argued that the premarket review requirement for LDTs cannot survive First Amendment analysis. Although the comment conceded that there is a government interest in ensuring that test results do not include misleading information, the comment asserted that premarket review of LDTs would be too burdensome because such review would restrict laboratory directors and clinical consultants from sharing information about the meaning of test results. That outcome, the comment continued, would undermine the goal of providing healthcare practitioners with information relevant to treatment.

The other comment focused on the right of physicians to receive information as part of their professional speech. The comment suggested that professional speech is subject to special protections under *National Inst. of Family and Life Advocates* v. *Becerra,* 138 S. Ct. 2361 (2018) (NIFLA) and this special protection extends to physicians' right to receive information. Similar to the first comment, this comment asserted that an LDT is different from many other medical devices in that it is ''an informational service'' incorporating expert professional judgments. While the comment admitted that the FD&C Act properly places the burden on product sponsors to produce evidence that their products are safe and effective before they can be used, the comment asserted that ''the Constitution flips the burden of proof'' when regulating flows of medical information, so that FDA would bear the burden of establishing that an LDT is unsafe in order to regulate the LDT.

(Response 93) We disagree with these comments, both in terms of the premises and the analyses. As an initial matter, it is important to clarify the limited impact that the application of the device authorities to LDTs will have on professional communications. As the phaseout of the general enforcement discretion approach is implemented, laboratories that manufacture IVDs offered as LDTs will be generally expected to comply with several pre- and post-market submission and reporting requirements applicable to devices for humans. As most relevant to this discussion, the premarket review requirements are intended to ensure that a device has a reasonable assurance of safety and effectiveness (or other assurances as required under the FD&C Act) for its intended uses prior to being offered for use. For IVDs, appropriate assurances of safety and effectiveness mean, among other things, that a test is not providing false results, which can stem from an analytical error or from a lack of clinical validity where a measured result is incorrectly associated with a particular clinical state. Accordingly, premarket review involves a scientific evaluation of the functioning of the device for accuracy and reliability. Where premarket requirements apply, a test may not be offered for use if those requirements have not been satisfied. But FDA does not generally consider professional advice regarding a patient's results as evidence of a new intended use, and nothing in this rule is intended to change this practice or otherwise limit the speech clinical professionals may employ in describing and interpreting the outputs of the devices that are lawful to employ. As discussed in more detail below, courts have upheld these premarket review requirements against First Amendment challenges.

Both comments suggested that LDTs are different from other devices because they convey individuals' health information—that is, test results. The comments asserted that this information constitutes speech. But LDTs are not unique in conveying individuals' health information. So too do many non-laboratory IVDs have informational outputs, as well as numerous other types of diagnostic devices, such as radiological imaging devices (such as mammography, x-ray, CT, ultrasound machines), electrocardiograms, blood pressure cuffs, pulse oximeters, cardiac monitors including fetal heart rate monitors, and thermometers. These devices all communicate information—in the form of words, numbers, images, and/or sounds. Yet FDA's statutory authority to regulate diagnostic devices is well established. *See* 21 U.S.C. 321(h)

by the Eleventh Circuit. *United States* v. *Franck's Lab, Inc.,* 2012 U.S. App. LEXIS 27100 (11th Cir. 2012).

(defining ''device'' in part as an article ''intended for use in the diagnosis of disease or other conditions''). And the constitutionality of Congress's grant of authority to regulate these devices, and to prohibit their sale or use where applicable premarket requirements are not satisfied, has not been questioned. There is nothing about LDTs, as compared with these other devices (or with non-LDT IVDs that produce diagnostic results), that suggests they uniquely implicate the First Amendment. They do not.

We are not aware of any instance in which a litigant has raised a First Amendment challenge to the application of the premarket review provisions of the FD&C Act for diagnostic devices based on the informational nature of their outputs. Any such challenge should fail on legal grounds. Even where LDTs or other diagnostic devices convey information about the health of patients, they do not convey ideas, creative expression, or editorial judgments—that is, they do not convey speech that implicates the First Amendment. Rather, they simply convey scientifically-generated test results purely as a function of the device. In this regard, they cannot be distinguished from a vast array of products whose regulation does not implicate the First Amendment: radar detectors, gas gauges, expiration lights for water filters, and so forth. Even though the very point of these products is to convey information, the Government may seek to ensure that they do so accurately and reliably—and may bar the sale of those that are not accurate and reliable—without triggering First Amendment scrutiny. Indeed, requirements of prior certification before commercial use of weighing and measuring devices—devices whose purpose is to convey information in ways analogous to diagnostic tests—are ubiquitous. *See, e.g.,* Nat'l Inst. of Standards & Technology, *Weights and Measures Program Requirements: A Handbook for the Weights and Measures Administrator* 13–14 (2017) (''Before measuring instruments may be installed in stores or at business locations, most states require that the many types of measuring instruments have type evaluation certificates reporting that the models comply with the requirements of NIST Handbook 44,'' which provides ''the technical and performance requirements for commercial measuring instruments used in the United States''). But we are unaware of a single court that has even applied First Amendment scrutiny to these requirements. The application of the FD&C Act's medical device regulation to LDTs is the same in all relevant respects.[71]

The comments also erred in their assessment of how the rule would affect professional speech. More specifically, the first comment was incorrect in suggesting that premarket review will preclude the laboratory directors and clinical consultants from consulting on the quality of the test results and their interpretation concerning specific patient conditions pursuant to the CLIA regulations. Premarket review for LDTs is intended to help assure that LDTs generate accurate and reliable test results. As noted, FDA does not generally consider professional advice regarding a patient's results as evidence of a new intended use, and nothing in this rule is intended to change this practice.[72] FDA recognizes that laboratory directors and clinical consultants help with interpretation and consulting to the healthcare provider, and they can and do give recommendations that are not limited to the content of FDA-required labeling. This clinical consultation is unaffected by FDA's oversight of LDTs. Indeed, the CLIA provisions are not specific to LDTs and have coexisted with FDA regulation of other IVDs for some time. The commenter therefore was incorrect in construing the premarket review and related requirements discussed in this preamble as restricting laboratory directors and clinical consultants from sharing truthful and nonmisleading information about the meaning of a test result.

In addition, with respect to speech by laboratories more generally, contrary to the first comment's suggestion, FDA does not take the position that communications by medical product manufacturers are strictly limited to the content of FDA-required labeling. For example, FDA has issued final guidance regarding medical product manufacturers sharing data and information about the authorized uses of their products that are not contained in their products' FDA-required labeling; the final guidance provides recommendations on how to share the information in a truthful and non-misleading way (see Ref. 62). FDA has also issued draft guidance with recommendations on how medical product manufacturers can share truthful and non-misleading information about unapproved uses of medical products (see, *e.g.,* Refs. 158 and 159).

Essentially, then, the only content restriction is the requirement of premarket review itself—that laboratories cannot offer test results without first subjecting its device to premarket review to help assure that the device produces accurate and reliable results. A First Amendment challenge to the rule is therefore fundamentally a challenge to the FD&C Act's existing premarket requirements themselves, which prohibit the conduct of marketing devices absent satisfaction of those requirements. Even to the extent that the premarket requirements relate to speech in the form of labeling and marketing, they have long been upheld.

Courts have upheld these premarket review requirements in the context of First Amendment challenges on a variety of grounds. The premarket review requirements do not burden free expression because they are directed to conduct and not to speech. *United States* v. *Facteau,* 89 F.4th 1, 29 (1st Cir. 2023), *petition for cert. filed,* ____ U.S.L.W. ____ (U.S. March 13, 2024) (No. 23–1016). A device is adulterated or misbranded ''if, among other things, it is intended for a use [subject to premarket review] that has not been approved or cleared by FDA.'' January 2017 Memorandum at 40; *see generally* id. at 40–47 (Ref. 17). In this case, the relevant conduct includes making LDTs available for use and sale without premarket review when such review is required, which constitutes adulterating or misbranding the device while it is held for sale in violation of section 301(k) of the FD&C Act. ''[I]t has never been deemed an abridgment of freedom of speech'' to regulate conduct that involves language where the ''effect on speech would be only incidental to its primary effect on conduct.'' *Expressions Hair Design* v. *Schneiderman,* 581 U.S. 37, 47 (2017) (cleaned up). Accordingly, regulation of the conduct of making a device available without premarket review has only ''incidental effects'' on speech and ''do[es] not implicate the First Amendment.'' Facteau, 89 F.4th 1 at 29 *petition for cert. filed,* ____ U.S.L.W. ____ (U.S. March 13, 2024) (No. 23–1016) (cleaned up). *See also Flytenow, Inc.* v. *FAA,* 808 F.3d 882, 894 (D.C. Cir. 2015) (any ''incidental burden'' that regulatory requirements impose on speech ''does not violate the

[71] *See also Winter* v. *G.P. Putnam's Sons,* 938 F.2d 1033, 1035–36 (9th Cir. 1991) (citing numerous courts that have applied products liability law, without First Amendment scrutiny, to aeronautical charts that contain erroneous information, noting that: ''Aeronautical charts are highly technical tools. They are graphic depictions of technical, mechanical data. . . . The chart itself is like a physical 'product.'. . . . [not] pure thought and expression.'').

[72] In contrast, if a laboratory offers a test on its website for an unauthorized use, FDA would likely consider that offer to be evidence of a new intended use.

First Amendment'' where the requirements ''further an important government interest unrelated to the suppression of free expression,'' such as promoting safety). As explained above, premarket review helps assure medical products are safe and effective—which is a substantial government interest unrelated to the suppression of free expression.

And it is ''constitutionally permissible'' to rely on speech to ''infer intent,'' including where that intent establishes that the product is within a category that is subject to and violative of FDA premarket review requirements. *Whitaker* v. *Thompson,* 353 F.3d 947, 953 (D.C. Cir. 2004). For example, charcoal products intended for emergency treatment of poisoning by ingestion are drugs regulated by FDA, but charcoal sold as fuel is not within FDA's jurisdiction. The product's intended use, which may be determined from the product's labeling, establishes whether the product is within FDA's jurisdiction (see Ref. 17). The First Circuit recently observed that ''courts to consider the issue have uniformly concluded that using speech merely as evidence of a misbranding offense under the [FD&C Act] does not raise First Amendment concerns.'' *United States* v. *Facteau,* 89 F.4th 1 at 25, *petition for cert. filed,* ____ U.S.L.W. ____ (U.S. March 13, 2024) (No. 23–1016). *See, e.g.,* Nicopure Labs, 944 F.3d 267 at 282 (''FDA's reliance on a seller's claims about a product as evidence of that product's intended use, in order that the FDA may correctly classify the product and restrict it if misclassified, does not burden the seller's speech''); *United States* v. *LeBeau,* 2016 U.S. Dist. LEXIS 13612, *27 (E.D. Wisc. February 3, 2016) (''A product's labeling can be used to infer the seller's intended use and whether the product is an unapproved drug under the FDCA.''), aff'd, 2016 U.S. App. LEXIS 12375 (7th Cir. 2016); *United States* v. *Cole,* 84 F. Supp. 3d 1159, 1166 (D. Or. 2015); *United States* v. *Livdahl,* 459 F. Supp. 2d 1255 (S.D. Fla. 2005); *United States* v. *Lane Labs-USA, Inc.,* 324 F. Supp. 2d 547 (D.N.J. 2004); *U.S.* v. *Undetermined Quantities of Articles of Drug,* 145 F. Supp. 2d 692 at 703 (D. Md. 2001). *See also Flytenow, Inc.* v. *FAA,* 808 F.3d at 894 (the ''evidentiary use of speech'' is ''well settled'').[73]

Nor does FDA's determination to exercise enforcement discretion with respect to premarket review in certain specific contexts (see discussion in section V.B) restrict or burden speech. As the First Circuit recently explained in rejecting a First Amendment challenge to an FDA final guidance describing an enforcement discretion policy, the enforcement policy does not ''burden[ ] what [medical product] manufacturers may say,'' but instead ''expands, rather than contracts, the domain of speech that the government shields from being used as evidence'' of intended use. Facteau, 89 F.4th at 28, *petition for cert. filed,* ____ U.S.L.W. ____ (U.S. March 13, 2024) (No. 23–1016). The court held that ''a policy that limits the consideration of [certain] speech as evidence of intended use does not raise First Amendment concerns.'' Id. at 25. The D.C. Circuit similarly held, regarding an earlier iteration of the enforcement policy, that a policy that provides a ''safe harbor'' from the use of certain speech as evidence of intended use did not establish ''independent authority to regulate manufacturer speech'' and therefore was not subject to First Amendment scrutiny. *Washington Legal Found.* v. *Henney,* 202 F.3d 331, 336 (D.C. Cir. 2000).

Moreover, to be protected under the First Amendment, commercial speech must ''concern lawful activity.'' *Central Hudson Gas & Elec. Corp.* v. *Pub. Serv. Comm'n,* 447 U.S. 557, 566 (1980). Where Congress requires FDA premarket review of a product, making the LDTs available for use or sale without such review ''renders the sale-as-labeled unlawful.'' *Nicopure Labs.* v. *FDA,* 944 F.3d 267, 284 (D.C. Cir. 2019). The speech proposing an illegal sale of such a product is ''related to illegal activity'' and therefore is ''not subject to constitutional protection.'' Id.; *accord United States* v. *LeBeau,* 654 Fed. App'x 826, 831 (7th Cir. 2016) (''Because [defendant]'s statements promoted the unlawful sale of an unapproved drug, they were not entitled to protection.''); *United States* v. *Caputo,* 517 F.3d 935, 940–41 (7th Cir. 2008) (the unapproved device ''could not lawfully be sold at all'' and therefore ''[t]here was no lawful activity for speech to promote''); *United States* v. *Cole,* 84 F. Supp. 3d 1159, 1166–67 (D. Or. 2015) (''[d]efendants' speech concerns an illegal activity—the introduction into interstate commerce of unapproved new drugs[,] . . . the First Amendment is not violated.'').

And commercial speech is protected under the First Amendment only to the extent that it is ''not . . . misleading.'' *Central Hudson,* 447 U.S. 557 at 566. The labeling and advertising for unapproved medical products may be considered misleading where the labeling or advertising ''claim [the product] to be safe and effective without any scientific support.'' *United States* v. *Undetermined Quantities of Articles of Drug,* 145 F. Supp. 2d 692, 703. In such instances, the labeling and advertising is ''entitled to no First Amendment protections.'' Id.

Even if the premarket review and related requirements for devices were subject to First Amendment scrutiny, they would easily pass muster under *Central Hudson* and even more exacting levels of scrutiny. Under the *Central Hudson* framework, if the speech is truthful, not inherently or actually misleading, and relates to lawful activity, the government may impose restrictions that advance a ''substantial'' government interest and are no ''more extensive than is necessary to serve that interest.'' *Central Hudson,* 447 U.S. 557 at 566. As FDA has explained elsewhere, premarket review and related requirements for medical products advance several substantial government interests including motivating the development of robust scientific data on safety and efficacy; maintaining the premarket review process for safety and efficacy to prevent harm, protect against fraud, misrepresentation, and bias, and to prevent the diversion of healthcare resources toward ineffective treatments; and ensuring required labeling is accurate and informative. *See* January 2017 Memorandum at 3; *see also* id. at 4–11 (Ref. 17); Nicopure Labs, 944 F.3d 267 at 285 (premarket and labeling requirements ''directly advance[ ] the government's interest in accuracy and public health''). These interests apply to LDTs: as explained above, premarket review and related requirements help assure the safety and effectiveness of IVDs offered as LDTs.

These premarket review and related requirements are appropriately tailored to achieve these goals. To the extent that premarket review requirements relate to speech at all, they implicate speech only by firms responsible for the product's development and/or distribution—the parties best able to conduct the research and gather information necessary for premarket review and otherwise take steps necessary to assure that the

[73] Although the Second Circuit stated in *United States* v. *Caronia,* 703 F.3d 149, 169 (2d Cir. 2012) that ''the government cannot prosecute pharmaceutical manufacturers and their representatives under the [FD&C Act] for speech promoting the lawful, off-label use of an FDA-approved drug,'' the Second Circuit later confirmed that ''*Caronia* left open the government's ability to prove misbranding on a theory that promotional speech provides evidence that a drug is intended for a use that is not included on the drug's FDA approved label.'' *United States ex rel. Polansky* v. *Pfizer, Inc.,* 822 F.3d 613 n.2 (2d Cir. 2016). The First Circuit likewise found that *Caronia* provides ''no basis to depart from the rule . . . that the evidentiary use of speech does not violate the First Amendment.'' *Facteau,* 89 F.4th at 24, *petition for cert. filed,* ____ U.S.L.W. ____ (U.S. March 13, 2024) (No. 23–1016).

medical product is safe and effective (see Ref. 17 at 24–25). In this way, these requirements are similar to other Federal regulatory programs that are directed to particular regulated industry and the products those companies produce. Moreover, these requirements do not operate to ban speech but rather to establish a process for evaluating medical products that fosters truthful, non-misleading, and appropriately substantiated speech. *See* Nicopure Labs, 944 F.3d 267 at 289 (products subject to premarket review are ''not excluded from the marketplace of information, only evaluated first to prevent them from misleading consumers''); Ref. 160 (''Commercial speech serves an 'informational function' and can be regulated to ensure that the public has access to accurate information. The FDA serves exactly this end. The agency aims not to censor company speech, but to foster the development of accurate and reliable information, and channel that information into settings where it can be rigorously evaluated.'').

The Agency has also considered a variety of alternative approaches and has determined that they would not optimally advance the government interests described above. One alternative would be to continue to exercise enforcement discretion in perpetuity regarding premarket review requirements for IVDs offered as LDTs and instead rely on postmarket remedies, such as enforcement actions for LDTs shown to be unsafe. However, FDA has carefully tailored this final rule to balance competing interests important to the protection of the public health and determined to exercise enforcement discretion with respect to premarket review in certain specific contexts (see discussion in section V.B); FDA has determined that, in other contexts, exclusive reliance on post-market remedies would not be in the best interest of public health because it does not provide a reasonable assurance of safety and effectiveness prior to the introduction of an IVD to the market.

One comment suggested, as an alternative approach to premarket review, that LDT regulation should ''replicate CLIA's reliance on private ordering solutions (*e.g.,* private accreditation) and rely on postmarketing assessment (rather than premarket review) of LDT safety and effectiveness.'' Another alternative would be to enforce premarket review requirements only for the highest risk LDTs. Yet another alternative would be for FDA to continue to exercise enforcement discretion for IVDs offered as LDTs but have unauthorized LDTs disclose that they are not FDA-reviewed. All of these potential alternatives, like FDA's continuing to exercise enforcement discretion in perpetuity, would fall short in achieving FDA's public health objectives: by forgoing most or all premarket review except in the limited circumstances covered by the enforcement discretion policies described in section V.B of this preamble (or other enforcement discretion policies that FDA may adopt), these approaches would not sufficiently address the safety and effectiveness concerns that have led to the issuance of this rule.

More specifically, the steps suggested by the comment—replicating CLIA's reliance on private ordering solutions and relying on postmarketing assessments—would be inadequate substitutes for premarket review. Among other things, CLIA inspections are conducted biennially, so that, if a laboratory has not developed a safe and effective test, it could be giving false or invalid results to healthcare providers or patients for up to 2 years before the laboratory's CLIA inspection. Also, CLIA inspectors typically pick a sample of tests for detailed review. Therefore, an LDT from a laboratory test manufacturer that has added multiple new tests since its last inspection may not have any review of the underlying documentation for that test. For additional discussion of why CLIA does not provide sufficient assurances of safety and effectiveness for IVDs offered as LDTs, see our responses to comments in section VI.C.2 of this preamble.

Now we turn to the remaining arguments made in the comments. As noted, one comment suggested that the rule would impermissibly interfere with physicians' right to receive information as part of their professional speech. As discussed above, however, this comment failed to acknowledge that premarket review relates to a scientific evaluation of the accuracy and reliability of the test results, which is the function of the device; FDA does not intend to consider professional advice regarding a patient's results as evidence of a new intended use. In addition, framing the issue from the perspective of the healthcare practitioner receiving information, as opposed to the perspective of the speaker, does not change the First Amendment analysis. For example, the origin of the commercial speech doctrine was based largely on the interests of consumers in receiving information. *See Virginia State Bd. of Pharmacy* v. *Virginia Citizens Consumer Council,* 425 U.S. 748, 757 (1976). Accordingly, focusing on the interests of the listener, as opposed to the interests of the speaker, does not render the *Central Hudson* analysis inapplicable in evaluating the constitutionality of premarket review.

It also makes no difference whether the recipient of the information is a healthcare practitioner or a patient. Congress enacted the FD&C Act to cover medical products directed to both healthcare practitioners and patients. For example, FDA regulates the labeling of medical products to help assure that they are used safely and effectively, whether the labeling is directed to healthcare practitioners or patients. And the government interest in providing a reasonable assurance of safety and effectiveness of devices applies no matter who is the audience for the information.

Contrary to one comment's suggestion, the Supreme Court's opinion in *NIFLA* is inapposite. On the topic of professional speech, that decision merely held that ''neither California nor the Ninth Circuit has identified a persuasive reason for treating professional speech as a unique category that is exempt from ordinary First Amendment principles'' but the Court did not ''foreclose the possibility that some such reason exists.'' *NIFLA,* 138 S. Ct. 2361 at 2375. In any event, our analysis does not rely on treating professional speech as a unique category that is exempt from ordinary First Amendment principles.

We also disagree with the comments' assertions that strict scrutiny should apply because the speech regarding test results is not itself commercial. As discussed above, these devices produce scientifically-generated informational outputs as their function; they do not convey the type of speech that might justify heightened scrutiny. Moreover, courts do not apply the concept of commercial speech so narrowly: information disclosed ''in connection with a proposed commercial transaction'' constitutes commercial speech, even where the relevant speech itself does not propose a commercial transaction. *See N.Y. State Rest. Ass'n* v. *N.Y. City Bd. of Health,* 556 F.3d 114, 131 (2d Cir. 2009) (a requirement to post calorie content information on menus ''is clearly commercial speech''). More specifically, courts have held that FDA's premarket review requirements are subject to review under the commercial speech doctrine rather than strict scrutiny, even where the manufacturer's speech involves matters of science. *See Discount Tobacco* v. *United States,* 674 F.3d 509, 532–33 (6th Cir. 2012) (*Central Hudson* was the appropriate test for premarket review of tobacco harm reduction claims where the claims

were ''consumer-directed'' and ''regarding a manufacturer's specific products''); *Washington Legal Foundation* v. *Friedman,* 13 F. Supp. 2d 51, 62–65 (D.D.C. 1998) (finding manufacturers' dissemination of scientific information about their products to health practitioners to be commercial speech), vacated in part on other grounds, 202 F.3d 331 (D.C. Cir. 2000). Nevertheless, even if this rule were subject to First Amendment scrutiny (which, as explained above, it is not) and even if strict scrutiny were then applied, that test would be satisfied here because the government has a compelling interest in protecting the public health, and premarket review is narrowly tailored to achieve that result, for the reasons explained above.

Finally, we are not aware of any authority to support the flipped-burden-of-proof theory regarding premarket review. Congress established the premarket review requirements under the FD&C Act, which places the burden on the manufacturer to establish the safety and effectiveness of medical products. To the extent a stakeholder challenges those requirements under the First Amendment, it is the government's burden to establish that the requirements are constitutionally permissible. That is, the government bears the burden on the *Central Hudson* analysis or other applicable First Amendment doctrine of making the required showing, *e.g.,* that the premarket review requirement directly advances a substantial government interest. But there is no First Amendment principle that would result in a court or an agency rewriting the premarket review provisions of the FD&C Act to require FDA to prove that an individual LDT is unsafe.

In sum, FDA's premarket review and related requirements for medical devices do not violate the First Amendment, and the action FDA is taking today to clarify their application to LDTs does not raise any constitutional concerns.

(Comment 94) One comment suggested that the rule might raise concerns under Equal Protection principles on the ground that the rule unduly favors large entities over smaller ones without a rational basis for the distinction. The comment similarly suggested the rule may have antitrust implications by disproportionately affecting smaller laboratories to the benefit of larger entities because the costs of entry or operation will be too high for the small laboratories to compete.

(Response 94) The rule does not raise either Equal Protection or antitrust concerns. Under Equal Protection jurisprudence, the government has ''considerable leeway'' to issue rules that ''may appear to affect similarly situated people differently.'' *Clements* v. *Fashing,* 457 U.S. 957, 962–963 (1982). The case law refers to such an effect as a ''classification.'' Where the classification involves a suspect class, such as race or nationality, or infringes on a fundamental right, the law will be subject to heightened scrutiny. *Massachusetts Bd. of Retirement* v. *Murgia,* 427 U.S. 307, 312 (1976). In the absence of those circumstances, a law containing a classification is ''accorded a strong presumption of validity,'' *Heller* v. *Doe,* 509 U.S. 312, 319 (1993), and will be upheld if it ''bears some fair relationship to a legitimate public purpose.'' *Plyler* v. *Doe,* 457 U.S. 202, 216 (1982).

We disagree with the comment's suggestion that this rule involves a classification. Neither the underlying provisions of the FD&C Act, nor the gradual phaseout of FDA's general enforcement discretion approach, treats smaller entities differently from larger ones. Thus, Equal Protection principles have no application here.

But even assuming that the rule involved a classification in the form of a different effect on smaller entities, the rule would be subject to rational basis review. The comment did not claim that this rule involves any suspect classification or fundamental right. Although the comment stated that certain diseases are more prevalent in certain ''ethnic groups,'' and the rule must be implemented in a non-discriminatory manner to the extent it may affect IVDs offered as LDTs that are intended for those diseases, the comment does not explain how these facts would support a suspect classification theory. Even if the rule were to have a disproportionate impact, a disproportionate impact, by itself, does not trigger strict scrutiny under Equal Protection principles. *Washington* v. *Davis,* 426 U.S. 229, 242 (1976).

Accordingly, even if the rule involved a classification (which it does not), the rule would be subject to rational basis review, which the rule would easily satisfy. FDA rationally concluded that the phaseout policy will help to ensure the safety and effectiveness of IVDs offered as LDTs and more accurate diagnoses, which will lead to better care and advance public health overall. The rule therefore is rationally related to a legitimate purpose.

FDA also disagrees that the rule raises antitrust concerns. Antitrust law is directed toward preserving free and unfettered competition by curtailing anti-competitive conduct by private entities, such as precluding private arrangements among companies that unreasonably restrain competition. *See, e.g., Northern Pac. Ry. Co.* v. *United States,* 356 U.S. 1, 4–5 (1958). Antitrust law does not concern and does not curtail the Federal government's oversight in the interest of protecting and promoting the public health.

(Comment 95) One comment asserted that the LDT rule would constitute a ''taking'' under the Fifth Amendment to the U.S. Constitution because it would disadvantage smaller, more specialized laboratories to the benefit of larger laboratories and AMCs. The comment contended that this would be a regulatory taking in that it would significantly diminish the value of property without a valid public purpose.

(Response 95) We disagree that the rule would constitute a taking. The Fifth Amendment to the U.S. Constitution prohibits the Government from taking private property for public use without just compensation. The Supreme Court has held that the Government effects a ''per se'' taking when it physically appropriates property, which is the ''clearest sort of taking.'' *Cedar Point Nursery* v. *Hassid,* 141 S. Ct. 2063, 2071 (2021). The Court has also recognized that there may be a regulatory taking where regulations that ''restrict an owner's ability to use his own property'' go ''too far.'' Id. at 2071–72. In such cases, a taking may be found based ''on a complex of factors, including: (1) the economic impact of the regulation on the claimant; (2) the extent to which the regulation has interfered with distinct investment-backed expectations; and (3) the character of the governmental action.'' *Murr* v. *Wisconsin,* 582 U.S. 383, 393 (2017) (cleaned up) (referred to as the ''Penn Central factors'' after *Penn Central Transp. Co.* v. *New York City,* 438 U.S. 104, 124 (1978)). The force of any one of these three Penn Central factors may be ''so overwhelming . . . that it disposes of the taking question.'' *Ruckelshaus* v. *Monsanto Co.,* 467 U.S. 986, 1005.

As the phaseout of the general enforcement discretion approach is implemented, laboratories that manufacture IVDs offered as LDTs generally will be expected to comply with several pre- and post-market submission and reporting requirements applicable to devices for humans, including premarket notification/PMA requirements (as applicable), registration and listing, labeling requirements, reporting requirements regarding adverse events and corrections and removals, QS

requirements, and certain IDE regulations. To our knowledge, the FD&C Act's premarket review and related requirements have never been held to effectuate a taking of property. It has long been established that the government may regulate products in the interests of public health and safety and such regulation ''cannot, in any just sense, be deemed a taking.'' *Mugler* v. *Kansas,* 123 U.S. 623, 668 (1887). The takings doctrine is based on the concept that, when the government seizes property for the public benefit, such as land for a road or a dam, the public should compensate the owner. But that is a different scenario from where the government limits the use of property to protect public health and safety. *See* id. at 669. As the Supreme Court has elaborated, ''[l]ong ago it was recognized that all property in this country is held under the implied obligation that the owner's use of it shall not be injurious to the community, and the Takings Clause did not transform that principle to one that requires compensation whenever the State asserts its power to enforce it.'' *Keystone Bituminous Coal Ass'n* v. *DeBenedictis,* 480 U.S. 470, 491–92 (1987) (cleaned up). As a result, restrictions on ''uses of personal property'' that are ''directed at the protection of public health and safety'' are ''the type of regulation in which the private interest has traditionally been most confined and governments are given the greatest leeway to act without the need to compensate those affected by their actions.'' *Rose Acre Farms, Inc.* v. *United States,* 559 F.3d 1260, 1281 (Fed. Cir. 2009).

The phaseout of the general enforcement discretion approach for LDTs is intended to protect public health and safety and to prevent injuries to the community. FDA is taking this action to help ensure the safety and effectiveness of IVDs offered as LDTs and to achieve more accurate diagnoses, which will lead to better care and advance the public health overall. Accordingly, the character of the government's action here—to advance the public health—weighs heavily, if not conclusively, against finding that the phaseout effects a taking.

The other Penn Central factors also weigh in favor of finding no taking here. With regard to economic impact, the comment asserted that the value of the property of small laboratory manufacturers will be diminished. However, many changes in government laws, regulations, and policies have economic consequences, and the Supreme Court has long recognized that ''[g]overnment hardly could go on if to some extent values incident to property could not be diminished without paying for every such change in the general law.'' *Pennsylvania Coal Co.* v. *Mahon,* 260 U.S. 393, 413 (1922). The Supreme Court has explained that ''mere diminution in the value of property, however serious, is insufficient to demonstrate a taking.'' *Concrete Pipe & Prods.* v. *Constr. Laborers Pension Trust,* 508 U.S. 602, 645 (1993). Similarly, a ''loss of profit'' does not establish a taking. *74 Pinehurst LLC* v. *New York,* 59 F.4th 557, 566 (2d Cir. 2023). And courts have rejected regulatory takings claims even where the government's action ''impose considerable costs on private actors in the regulated industry.'' *Mobile Relay Assocs.* v. *FCC,* 457 F.3d 1, 12 (D.C. Cir. 2006). Instead, in evaluating the economic impact of a regulation, courts have explained that the ''touchstone'' is ''proportionality'': ''the size of a liability only weighs in favor of finding a taking insofar as it is out of proportion to the legitimate obligations society may impose on individual entities.'' *B&G Constr. Co.* v. *Dir., OWCP,* 662 F.3d 233, 260 (3d Cir. 2011) (cleaned up).

In enacting the FD&C Act, Congress determined that manufacturers of medical products should bear the costs of ensuring that their products are appropriately safe and effective, and these costs are proportional to the resulting benefits of FDA oversight to the public health. Furthermore, as discussed elsewhere in this preamble, FDA has taken several steps to address the economic impact of the final phaseout policy—for example, by including certain enforcement discretion policies in the final phaseout policy (see section V.B of this preamble). Accordingly, the phaseout policy does not place disproportionate costs on laboratory manufacturers.

With respect to the last Penn Central factor, a ''reasonable investment-backed expectation must be more than a unilateral expectation or an abstract need.'' *Ruckelshaus* v. *Monsanto Co.,* 467 U.S. 986 at 1005 (cleaned up). Courts have held that those who do business in highly regulated fields are on notice that changes are possible. *Connolly* v. *Pension Ben. Guar. Corp.,* 475 U.S. 211, 226–27 (1986) (''Those who do business in the regulated field cannot object if the legislative scheme is buttressed by subsequent amendments to achieve the legislative end'') (cleaned up).

Laboratory manufacturers have been on notice for some time that their tests could be subject to increased oversight. As a legal matter, FDA has long taken the position that LDTs are devices subject to regulation under the FD&C Act, over which it was exercising enforcement discretion. Moreover, laboratory manufacturers have been on notice that their tests could be subject to increased oversight at various times—*e.g.,* after issuance of the preamble to the ASR rule nearly 30 years ago, stating that ''FDA believes that clinical laboratories that develop [in-house] tests are acting as manufacturers of medical devices and are subject to FDA jurisdiction under the act'' (62 FR at 62249), and after two draft guidance documents were issued by FDA on October 3, 2014, entitled ''Framework for Regulatory Oversight of Laboratory Developed Tests (LDTs)'' (79 FR 59776) and ''FDA Notification and Medical Device Reporting for Laboratory Developed Tests (LDTs)'' (79 FR 59779) (Refs. 38 and 112). Accordingly, laboratory manufacturers did not have reasonable investment-backed expectations that they would not ever be subject to FDA oversight.

Accordingly, application of the Penn Central factors confirms that FDA's phaseout of the general enforcement discretion approach for LDTs will not effect a taking.

(Comment 96) Various comments requested, or stated that FDA should have granted,[74] an extension of the 60-day comment period. Most of these comments requested a 60-day or longer extension. The comments argued for an extension given the following: (1) the complex and multifaceted nature of the proposed rule, which required review by experts in various fields; (2) the significant implications that the final rule will have on stakeholders; (3) the numerous legal issues raised by the rule; (4) differences in FDA's proposal compared to its previous proposals (*e.g.,* with respect to tests currently on the market and the timeline for premarket review expectations); (5) a longer comment period would be in line with Agency precedent (*e.g.,* the comment period for the 2014 draft LDT guidance documents was 120 days, and other FDA rulemakings ''with more modest impact'' had longer than 60-day comment periods); (6) the length of time that FDA has been working on the proposed rule (at least 7 months, according to one comment); and/or (7)

[74] FDA received 14 requests for extensions soon after publication of the NPRM. For those requests, FDA responded directly to the requesters (and submitted a sample of such a response to the docket, see *e.g.* Ref. 161) and posted an update to its website stating that ''[a]fter considering the [request/requests] and other factors, including the extensive background of public comment on this topic and the public health benefits of proceeding expeditiously, the FDA has determined to proceed with the standard 60-day comment period'' (Ref. 113).

the comment period spanned the Thanksgiving holiday season. Various comments described what they would do with additional time, which included surveying small businesses and investors to better understand the implications of the costs of the rule; estimating added costs to the U.S. healthcare system from the loss of competition resulting from the rule; and assessing the harm to patients resulting from small entities exiting the market and/or reducing operations. Several comments stated that FDA's denial of requests for extensions raised concerns about the thoroughness of stakeholder engagement and noted that the denials were based on FDA's ''manufactured sense of urgency.''

(Response 96) After reviewing the public comments and the requests for additional time for comment, FDA does not believe that extending or reopening the comment period is necessary for the public to receive a meaningful opportunity to comment on the NPRM. Consequently, and in light of the public health benefits of proceeding expeditiously, FDA is again declining to extend the comment period.

Under the APA, agencies are required to provide interested persons an opportunity to participate in the rulemaking through submission of comments. 5 U.S.C. 553(c). Although the APA does not delineate a minimum number of days that a comment period must run, courts have said that the length of a comment period must provide a meaningful opportunity to comment. See *Rural Cellular Ass'n* v. *FCC,* 588 F.3d 1095, 1101 (D.C. Cir. 2009). And while some courts have found comment periods of less than 30 days to be appropriate, various courts have observed that 30 days is generally the shortest time period for interested persons to meaningfully review a proposed rule and provide informed comment. *See, e.g., Nat'l Lifeline Ass'n* v. *FCC,* 921 F.3d 1102, 1117 (D.C. Cir. 2019). FDA's own regulations require that the Agency generally provide 60 days for comment on proposed regulations, see 21 CFR 10.40(b)(2), and E.O. 12866 generally recommends a comment period of at least 60 days for most rulemaking, see E.O. 12866, sec. 6(a), 58 FR 51735, October 4, 1993.

The Supreme Court has stated that the APA ''sets forth the full extent of judicial authority to review executive agency action for procedural correctness.'' *FCC* v. *Fox Television Stations, Inc.,* 556 U.S. 502, 513 (2009). Moreover, the Court has emphasized that beyond the APA's minimum requirements, courts lack authority ''to impose upon [an] agency its own notion of which procedures are 'best' or most likely to further some vague, undefined public good.'' *Vermont Yankee Nuclear Power Corp.* v. *NRDC,* 435 U.S. 519, 549 (1973). Under this rubric, many courts have refused to find an APA violation where an agency provides a 60-day (or even shorter) comment period and otherwise provides a meaningful opportunity to comment. *See Little Sisters of the Poor Saints Peter & Paul Home* v. *Pennsylvania,* 140 S. Ct. 2367, 2386 (2020) (''The Departments complied with each of these statutory procedures. They 'request[ed] and encourag[ed] public comments on all matters addressed' in the rules. . . . They also gave interested parties 60 days to submit comments.'') (internal citations omitted); see also *Chamber of Com. of United States* v. *United States Sec. & Exch. Comm'n,* 85 F.4th 760, 779–80 (5th Cir. 2023) (''We cannot conclude that the initial [45-day] comment period was so short as to deprive petitioners of a meaningful opportunity to comment on the proposed rulemaking. Petitioners may have hoped for more time, but it is not for us to decide whether an agency has chosen a maximally net beneficial comment period.'').

FDA has determined that the 60-day comment period for the NPRM allowed sufficient time for a meaningful opportunity to comment. There was ample time for the submission of more than 6,500 comments. A variety of entities submitted comments, including medical device associations, industry, medical and healthcare professional associations, other advocacy organizations, government agencies, and individuals, and they offered a broad array of perspectives on FDA's proposal. In addition, FDA has determined that an extension would not be appropriate in light of the public health benefits of proceeding expeditiously in finalizing this rulemaking.

We note that many of the complex policy and legal issues have been discussed by FDA and stakeholders for over a decade.[75] In addition, after publication of the NPRM, FDA worked to ensure that stakeholders fully understood the proposal, including by hosting a webinar (see Ref. 162). The webinar addressed, among other things, the various differences in FDA's proposal compared to its previous proposals.

We are not persuaded by the other arguments made in the comments. For example, we do not believe it would be appropriate to extend the comment period for this NPRM to align it with the comment period of other FDA proposed rules or the 2014 LDT draft guidance documents. The appropriate length for a comment period is not a one-size-fits-all analysis but rather depends on many relevant factors, which were all considered in choosing a 60-day comment period for this NPRM and considering extension requests. In addition, we disagree that the length of time that FDA spent developing, drafting, and publishing the NPRM suggests that a meaningful opportunity to comment was not provided to interested persons or that an extension is appropriate based on that timing. Finally, as noted above, one comment argued for an extension because the comment period was over Thanksgiving, and also because various small laboratories would be preparing during the 60-day comment period for a January conference. Although the 60-day comment period covered Thanksgiving, it ended on December 4, 2023, and a 30- or 60-day extension would have extended the comment period through the December/January holiday season. Moreover, although certain small laboratories impacted by this rulemaking may have participated in a January conference, we do not believe that an extension to accommodate such a commitment would have been appropriate in light of the public health benefits of proceeding expeditiously in finalizing this rulemaking.

[75] As discussed in the NPRM (88 FR 68006 at 68016) and elsewhere in this preamble, the Agency held a 2-day public meeting and opened a docket for public comment in 2010 regarding FDA's plans to develop a broad approach to the oversight of LDTs (75 FR 34463, June 17, 2010). Input received through those proceedings informed two draft guidance documents issued by FDA on October 3, 2014, entitled ''Framework for Regulatory Oversight of Laboratory Developed Tests (LDTs)'' (79 FR 59776) and ''FDA Notification and Medical Device Reporting for Laboratory Developed Tests (LDTs)'' (79 FR 59779). FDA solicited public feedback on the draft guidance documents and held a public workshop on January 8 and 9, 2015 (79 FR 69860, November 24, 2014). From October 2014 through 2016, FDA analyzed more than 300 sets of comments on the draft guidance documents, as well as discussion from the public workshop, and engaged extensively with stakeholders in meetings and conferences. A number of interested parties provided feedback, including laboratories, healthcare providers, patients, conventional IVD manufacturers, government agencies, and members of Congress. The feedback ranged generally from strong opposition to strong support for FDA's proposed increased oversight of LDTs and addressed a wide range of topics, including FDA's authority to regulate LDTs, the risks posed by LDTs without increased FDA enforcement, the effect of a new enforcement approach on test access and innovation, the potential interplay between FDA regulation and CLIA, and the implications of increased FDA oversight for competition in the IVD market. FDA also has received and responded to multiple citizen petitions raising some of the same policy and legal issues raised in this rulemaking. *See* Refs. 114–115.

(Comment 97) One comment stated that a 180-day extension of the comment period was appropriate (and preferred a 9 to 12-month extension), noting that such a request aligns with the **Federal Register**'s Guide to the Rulemaking Process.

(Response 97) For the reasons set forth in response to comment 96, after reviewing the public comments and the requests for additional time for comment, FDA does not believe that extending the comment period is necessary for the public to receive a meaningful opportunity to comment on the NPRM. Consequently, and in light of the public health benefits of proceeding expeditiously, FDA is again declining to extend the comment period.

Notably, in its Guide to the Rulemaking Process, the **Federal Register** acknowledges that comment periods on proposed rules typically range from 30 to 60 days: ''[i]n general, agencies will specify a comment period ranging from 30 to 60 days in the 'Dates' section of the **Federal Register** document, but the time period can vary'' (Ref. 163). Although the **Federal Register** states that for complex rulings, agencies may provide for longer periods, such as 180 days or more, see id., the **Federal Register** is clear that this is not a requirement.

(Comment 98) Several comments emphasized that a 60-day comment period was insufficient specifically for practitioners, who are directly impacted by the rule. These comments noted that practitioners are busy taking care of patients, some were uncertain regarding the details of the proposed rule, and many were not aware of the proposed rule when it issued.

(Response 98) For the reasons discussed in response to comment 96, FDA disagrees that the 60-day comment period was insufficient. Moreover, we note that to help ensure stakeholders understood the proposal, FDA held a webinar on October 31, 2023, providing information on and answering questions about the NPRM (see Ref. 162). In addition, although certain individual practitioners may not have been aware of the proposal after it was issued, FDA received numerous lengthy and substantive comments from practitioners, trade groups, and other organizations representing practitioners, and those comments have helped to shape the final phaseout policy.

(Comment 99) One comment urged FDA to hold a public meeting (not less than 60 days before the comment deadline) to educate laboratories on the specifics of the ''regulatory requirements FDA plans to impose,'' among other things.

(Response 99) To help stakeholders understand and comment on the NPRM, FDA held a webinar on October 31, 2023, to provide stakeholders with information on and answer questions about the NPRM (see Ref. 162). The presentation, printable slides, and transcript from the Webinar have been available on FDA's website since that date (see Ref. 72).

(Comment 100) One comment stated that the initial categorization of the proposed rule as not ''Section 3(f)(1) significant'' was inconsistent with E.O. 12866 and the Office of Information and Regulatory Affairs' (OIRA's) April 6, 2023 memorandum regarding implementation of that E.O. because the proposed rule impacts the three listed categories of significant regulatory actions and exceeds the threshold for economic significance. The comment noted that although the proposed rule was later re-assigned a categorization of ''Section 3(f)(1) significant,'' the original categorization demonstrates ''a lack of consideration of all relevant factors by the FDA'' and ''portrays a lack of partnership in helping to identify and establish a regulatory framework that could work for the industry being regulated.''

(Response 100) The proposed rule was originally categorized as ''Other significant'' in the Spring 2023 Unified Agenda—*i.e.,* as significant under a provision of E.O. 12866 other than section 3(f)(1)—and then categorized as ''Section 3(f)(1) significant'' in all subsequent Unified Agendas. For the Spring 2023 Unified Agenda, the exact proposal was still under development and it was not clear whether the proposed rule would be ''Section 3(f)(1) significant.'' As such, FDA categorized it as ''Other significant.'' As discussed in section VIII, OIRA has determined that the final rule is a significant regulatory action under E.O. 12866 section 3(f)(1). In any event, the comment does not explain, and it is otherwise unclear to FDA, how this initial categorization demonstrates a lack of consideration by FDA of ''relevant factors'' or a ''lack of partnership'' with industry to establish an appropriate policy.

(Comment 101) One comment stated that FDA failed to conduct the required federalism analysis under E.O. 13132 and the Agency erroneously stated in the NPRM that ''this proposed rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government.'' [76] The comment stated that because the proposed rule has such effects, and would preempt state law under section 521 of the FD&C Act (21 U.S.C. 360k), FDA must comply with all of the requirements of sections 6(c) [77] and 8(a) [78] of E.O. 13132. Another comment stated that the conclusions in the proposed rule regarding federalism ''do not reflect the impact on practice of medicine'' given that the proposed rule conflicts with certain state medical practice acts as well as NYS CLEP that currently permits the review, approval, and use of LDTs.

(Response 101) Although E.O. 13132 contains principles that apply broadly to ''policies that have federalism implications,'' which means ''regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government,'' a federalism summary impact statement is required for a ''regulation'' that has federalism implications and that meets certain additional criteria. Because the requirement for a federalism summary impact statement applies specifically to ''regulation'' and not to policy, the requirement for a federalism summary impact statement applies to the proposed amendment to § 809.3 and not to the proposed phaseout policy. And because the proposed amendment to § 809.3 would not establish any new requirements, it would not have any federalism implications under E.O. 13132 (see section XI).

Even if the requirement for a federalism summary impact statement were to apply to the phaseout policy, the policy does not have federalism implications because it is not establishing any new requirements. Rather, the phaseout policy is about increasing oversight of existing requirements under the FD&C Act and

[76] Another comment agreed with this comment to the extent FDA was asserting authority to regulate States and State-owned entities (*see* comment 106).

[77] Section 6(a) of E.O. 13132 states that ''[t]o the extent practicable and permitted by law, no agency shall promulgate any regulation that has federalism implications and that preempts State law, unless the agency, prior to the formal promulgation of the regulation'' meets certain prescribed requirements.

[78] Section 8(a) of E.O. 13132 states that ''[i]n transmitting any draft final regulation that has federalism implications to the Office of Management and Budget pursuant to Executive Order 12866 of September 30, 1993, each agency shall include a certification from the official designated to ensure compliance with this order stating that the requirements of this order have been met in a meaningful and timely manner.''

FDA regulations. All laboratory manufacturers, including State-owned laboratories, have been legally subject to these requirements even though the Agency generally has not enforced them. As such, the enforcement policy is not changing their legal obligations.

Moreover, we note that E.O. 12866, section 11 makes clear that the order ''is intended only to improve the internal management of the executive branch, and is not intended to create any right or benefit, substantive or procedural, enforceable at law by a party against the United States, its agencies, its officers, or any person.''

For additional discussion regarding NYS CLEP, see sections V.B.2 and VI.F.5 of this preamble.

(Comment 102) Several comments stated that FDA has violated the MDA General Rule because the proposed rule is unduly burdensome and lacks flexibility.

(Response 102) The ''general rule'' provision for records and reports in the MDA states that: ''Every person who is a manufacturer, importer, or distributor of a device intended for human use shall establish and maintain such records, make such reports, and provide such information, as the Secretary may by regulation reasonably require to assure that such device is not adulterated or misbranded and to otherwise assure its safety and effectiveness,'' and that ''Regulations prescribed under the preceding sentence—(1) shall not impose requirements unduly burdensome to a device manufacturer, importer, or distributor taking into account his cost of complying with such requirements and the need for the protection of the public health and the implementation of this Act. . . .'' Section 2 of the MDA, Public Law 94–295 (1976), codified at section 519 of the FD&C Act. Section 519 has since been amended and this provision now appears at section 519(a) and (a)(4).

As an initial matter, the ''general rule'' provision referenced in the comment is not applicable to this rulemaking. FDA is not prescribing new regulations under section 519 of the FD&C Act regarding records and reports, but rather is amending § 809.3 and phasing out the general enforcement discretion approach for IVDs offered as LDTs.

In any event, FDA disagrees with the assertion that the proposed rule is overly burdensome and lacks flexibility such as might violate this provision. For additional discussion of FDA's adherence to least burdensome principles, see the response to comment 12.

(Comment 103) Several comments stated that FDA violated the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) (UMRA) because it did not assess all regulatory options and select the least burdensome avenue in its proposal. Some of these comments asserted that the proposal shows no evidence of consideration of viable alternatives.

(Response 103) Under the UMRA, before issuing any rule for which a written statement is required under section 202 of the UMRA, agencies must ''identify and consider a reasonable number of regulatory alternatives and from those alternatives select the least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule.'' *See* 2 U.S.C. 1535. Under section 202 of the UMRA, unless otherwise prohibited by law, a written statement containing certain prescribed information must be prepared before an agency issues any general notice of proposed rulemaking that ''is likely to result in promulgation of any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any 1 year.''

As an initial matter, the UMRA requirement referenced in the comment is not applicable to this rulemaking. This rulemaking is not likely to result in a final rule that includes any Federal mandate, as that term is defined in the UMRA (see 2 U.S.C. 658(6)), and so a written statement is not required under section 202 and the requirements at 2 U.S.C. 1535 do not apply.

Even if the requirements applied, however, FDA disagrees with the assertion that it did not assess all regulatory options and select the least burdensome avenue in its proposal such as might violate the UMRA. FDA identified and considered a reasonable number of regulatory alternatives and selected the most cost-effective or least burdensome alternative that achieves the objective of this rule, as required by the UMRA. Specifically, FDA considered five different regulatory alternatives, comparing the total costs, benefits, and transfers with one option that would be more stringent and three options that would be less stringent than the proposal. *See* section II.J of the PRIA (Ref. 60). FDA also sought comments on various additional policies and has considered those comments and made changes to the proposal based on some of the comments submitted.

(Comment 104) One comment stated that the NPRM fails to comply with a new provision of the APA, codified at 5 U.S.C. 553(b)(4), which requires that an NPRM include a website with a 100-word or less, plain language summary of the NPRM that is posted on *regulations.gov*.[79] The comment asserted that this failure undermines the ability of stakeholders—particularly smaller laboratories and their employees—to understand FDA's proposal and participate meaningfully in the public comment process. As such, the comment stated that FDA must publish a concise summary of its proposal, reissue the NPRM with the mandatory internet address included, and restart this proceeding with a new public comment period.

(Response 104) We disagree. FDA substantially complied with this new APA requirement by including an 89-word, plain-language summary of the NPRM on its website (see Ref. 115), which is included as Ref. 56 of the NPRM, posted on *regulations.gov*.[80] [81] That suffices, but even if it did not, any insufficiency would not have undermined the ability of stakeholders to understand FDA's proposal and participate meaningfully in the public comment process. During the comment period, a summary of the NPRM was included on FDA's LDT web page (see Ref. 134), a summary of the NPRM was included at the beginning of the NPRM, FDA's press release for the NPRM provided high-level information regarding the content of the NPRM (see Ref. 164), and FDA held a webinar after issuance of the NPRM to provide stakeholders with information on and

[79] On July 23, 2023, the ''Providing Accountability Through Transparency Act of 2023,'' Public Law 118–9, amended section 553(b) of the APA, adding the requirement that an NPRM include ''the internet address of a summary of not more than 100 words in length of the proposed rule, in plain language, that shall be posted on the internet website under section 206(d) of the E-Government Act of 2002 (44 U.S.C. 3501 note) (commonly known as *regulations.gov*).'' Section 553(b)(4) of the APA.

[80] Under the ''Increased FDA Oversight to Help Ensure Safety and Effectiveness of LDTs'' heading, which was posted the same day of publication of the NPRM, FDA included the following summary of the NPRM: ''On September 29, 2023, the FDA announced a proposed rule aimed at helping to ensure the safety and effectiveness of these tests. The proposed rule seeks to amend the FDA's regulations to make explicit that IVDs are devices under the Federal Food, Drug, and Cosmetic Act, including when the manufacturer of the IVD is a laboratory. Along with this amendment, the FDA is proposing a policy under which the FDA intends to provide greater oversight of LDTs through a phaseout of its general enforcement discretion approach for most LDTs.'' (Ref. 113).

[81] On March 11, 2024, a summary was added to the ''Docket Details'' of the LDT NPRM. See *https://www.regulations.gov*.

answer questions about the NPRM (see Ref. 162). In light of all of this, we disagree that stakeholders, particularly smaller laboratories and their employees, were deprived of a meaningful public comment process. In fact, the sheer number of comments submitted on the NPRM, including by small laboratories and their employees, contradicts such an assertion. Nor did any commenter identify any way in which the comments they submitted would have differed in any way had FDA published a 100-word summary on *https://www.regulations.gov.* For these reasons, FDA declines to reissue the comment period.

(Comment 105) Several comments stated that State-owned and academic institutions should not fall under the jurisdiction of FDA. One of these comments stated that FDA's regulation of State governmental entities is constrained by the text of the FD&C Act, which the comment stated does not treat states as ''persons'' subject to various significant medical device provisions of the FD&C Act (*e.g.,* registration requirements under section 510(c), premarket notification requirements under section 510(k), premarket approval requirements under section 515(c), and adverse event reporting requirements in part 803). The comment stated that these provisions regulate ''persons,'' not sovereign states, and that the Supreme Court's ''longstanding presumption'' against treating U.S. states as ''persons'' can be ''disregarded only upon some affirmative showing of statutory intent to the contrary.'' [82] The comment stated that the FD&C Act provides no affirmative showing of congressional intent for FDA to regulate laboratories owned by State agencies and State universities.

(Response 105) FDA disagrees. The comment does not include several key points that, when taken together, indicate that a state is properly understood as a ''person'' under the FD&C Act.

The comment relies on the Supreme Court's decision in *Vt. Agency for Nat. Res.* v. *U.S. ex rel. Stevens* to support the assertion that the term ''person'' does not encompass States. After its decision in Stevens, however, the Court made clear that ''qualification of a sovereign as a 'person' . . . depends not upon a bare analysis of the word 'person,' but on the legislative environment in which the word appears.'' *Inyo County* v. *Paiute-Shoshone Indians of the Bishop Cmty. of the Bishop Colony,* 538 U.S. 701, 711 (2003) (citations and internal quotations omitted); see also *Pfizer, Inc.* v. *Gov't of India,* 434 U.S. 308, 313 (1978) (''In light of the law's expansive remedial purpose, the Court has not taken a technical or semantic approach in determining who is a 'person' entitled to sue for treble damages. Instead, it has said that '[t]he purpose, the subject matter, the context, the legislative history, and the executive interpretation of the statute are aids to construction which may indicate' the proper scope of the law.'') (quoting *United States* v. *Cooper Corp.,* 312 U.S. 600, 605 (1941)).

There are two key features of the ''legislative environment'' of the FD&C Act that, taken together, make clear that the statute's reference to ''person'' encompasses States—a position long reflected in FDA's regulations. *See* § 814.3(h) (issued in 1986) (defining ''[p]erson'' to include, among other things, ''any . . . scientific or academic establishment, Government agency, or organizational unit thereof, or any other legal entity''). First, the definition of ''person'' in the FD&C Act uses the term ''includes.'' 21 U.S.C. 321(e) (''[t]he term 'person' includes individual, partnership, corporation, and association''). It is a longstanding rule of statutory construction that, ''[i]n definitive provisions of statutes and other writings, 'include' is frequently, if not generally, used as a word of extension or enlargement rather than as one of limitation or enumeration.'' *Am. Sur. Co. of New York* v. *Marotta,* 287 U.S. 513, 517 (1933). Accordingly, in choosing to define ''person'' in the FD&C Act as ''includ[ing]'' individuals, partnerships, corporations, and associations, Congress indicated the term could be construed broadly to include entities in addition to the enumerated ones. This is particularly clear in light of the other definitions in section 201 of the FD&C Act, most of which use the term ''means'' (*i.e.,* ''The term X means. . . .''). If Congress had intended a limited meaning, it would have used the much more restrictive sentence structure that appears in all of the surrounding definitions and said: ''The term person *means* individuals, partnerships, corporations, and associations'' (emphasis added). Indeed, in *Vermont Agency of Natural Resources,* the Supreme Court acknowledged that very distinction in Stevens—definitions of person that used the term ''means,'' as in the example in that case, point to a different result from those that use the term ''includes.'' 529 U.S. 765, 786 n.17 (2000) (citing *California* v. *United States,* 320 U.S. 577, 585–86 (1944)).[83]

Second—and crucially—Congress demonstrated its understanding that the FD&C Act's reference to ''person'' includes government entities when it enacted provisions involving the payment of fees in connection with the submission of certain premarket review submissions to FDA. The FD&C Act requires that ''[e]ach person'' who submits several different types of premarket review submissions shall be subject to a fee. *See* 21 U.S.C. 379h(a)(1)(A), 379j(a)(2)(A), 379j–42(a)(1)(A), 379j–52(a)(1)(A). The FD&C Act then exempts ''State and Federal'' government entities from the payment of fees for submissions relating to products that will not be distributed commercially. *See* 21 U.S.C. 379g(1), 379j(a)(2)(B), 379j–41(1)(b)(ii), 379j–51(4)(b)(iv). These exemptions would be superfluous if the term ''person'' already excluded governmental entities. In addition, under the terms of the statute, governmental entities are subject to fees for submissions related to products to be distributed commercially. *See, e.g.,* 21 U.S.C. 379j(a)(2)(B)(iii). These provisions, too, demonstrate that Congress intended their devices to be subject to premarket review under the FD&C Act.

(Comment 106) One comment cited a June 2020 memorandum from Robert Charrow (then-HHS General Counsel) to Stephen Hahn, MD (then-Commissioner of Food and Drugs) that said that the FDA likely had limited to no authority to regulate states and state-owned entities. The comment noted that FDA omitted any discussion of this potential, significant legal limitation in the proposed rule and regulatory impact analysis and did not comment on whether the current HHS General Counsel or FDA accepted or rejected the prior legal analysis. The comment noted that this limitation would have a profound impact on State-owned AMCs and other State-owned laboratory entities and stated that the issue should be subject to more significant administrative or judicial consideration prior to advancing any proposed rule.

(Response 106) FDA referenced the memorandum from the HHS Office of the General Counsel in the proposed rule, noting that it informed HHS' August 2020 posting of a statement on its website entitled ''Rescission of Guidances and Other Informal Issuances.'' 88 FR 68006 at 68016. FDA

[82] *See Vermont Agency of Natural Resources* v. *US ex rel Stevens,* 529 U.S. 765, 766 (2000).

[83] Similarly, in *Return Mail, Inc.* v. *USPS,* the Court invoked the presumption that a person does not include governmental entities where the statute did not define ''person.'' 139 S. Ct. 1853, 1861 (2019).

stated that in November 2021, based on new advice from the HHS Office of the General Counsel, HHS leadership determined that the August 2020 statement no longer represented the Department's policy or legal views. Id. As stated in the response to comment 105, FDA does not agree that it has limited to no authority to regulate States and State-owned entities, and we do not agree that additional consideration of this issue is necessary or appropriate prior to advancing this rulemaking.

(Comment 107) One comment stated that FDA has significant conflicts of interest associated with the rulemaking because the final rule will significantly increase the Agency's acquisition of fees and likely also its Federal appropriations, as increased oversight will require additional funding. The comment noted that FDA's relationships with manufacturers are also a conflict of interest as the final rule will primarily benefit test manufacturers from who FDA currently receives significant user fees. Finally, the comment noted that a rule that increases test manufacturers' market share in laboratory testing and which may result in increased submissions to the FDA from such manufacturers provides additional financial incentives to FDA.

(Response 107) We disagree. FDA frequently issues rules, like this final rule, that have significant implications on the number of applications and submissions (many of which have associated user fees) that it receives. The fact that a rule may result in increased submissions/applications (with associated user fees) does not mean that there are conflicts of interest at issue.

To the extent the comment is suggesting that the motivation behind the rulemaking is some type of financial gain, we also disagree. As FDA has noted in the NPRM and elsewhere in this preamble, we are issuing this rule to help ensure the safety and effectiveness of IVDs offered as LDTs and to achieve more accurate diagnoses, which will lead to better care and advance public health overall (88 FR 68006 at 68012). Although the final rule is expected to increase the number of applications and submissions FDA receives, the collection of those fees is not the driver behind this rulemaking. Finally, FDA does not control the amount of funds appropriated by Congress, so it is unclear how this rulemaking could be argued to be motivated by FDA's desire for an increase in appropriated funds.

(Comment 108) One comment stated that FDA provides no legal basis or justification for excluding certain tests from its definition of an LDT (*i.e.,* an IVD that is intended for clinical use and that is designed, manufactured, and used within a single laboratory that is certified under CLIA and meets the regulatory requirements under CLIA to perform high complexity testing). The comment also stated that FDA excludes certain tests from its definition that are specifically recognized under CLIA regulations. Another comment expressed concern about the definition, and specifically the lack of clarity regarding the meaning of ''clinical use'' and the process for assessing ''intent'' when applied to genomics.

(Response 108) As noted in the NPRM and in this preamble, FDA has generally considered an LDT to be an IVD that is intended for clinical use and that is designed, manufactured, and used within a single laboratory that is certified under CLIA and meets the regulatory requirements under CLIA to perform high complexity testing (88 FR 68006 at 68009). Although FDA's general enforcement discretion approach has been focused on LDTs, FDA's phaseout policy has a broader scope. Specifically, FDA is applying the phaseout policy to IVDs that are manufactured and offered as LDTs by laboratories that are certified under CLIA and that meet the regulatory requirements under CLIA to perform high complexity testing, and used within such laboratories, even if those IVDs do not fall within FDA's traditional understanding of an LDT because they are not designed, manufactured, and used within a single laboratory. Whether a test falls within FDA's traditional understanding of an LDT therefore is inapposite for purposes of the phaseout policy. Moreover, for the enforcement discretion policies included in this rule that apply to certain types of ''LDTs,'' FDA has included its rationale for those policies and their scopes in section V.B.

(Comment 109) One comment stated that the final rule should explicitly state the legal authority supporting the regulation and should highlight the urgency of ''addressing LDT regulation given that it currently falls within a regulatory gap.''

(Response 109) FDA has included a discussion of the legal authority for the rule (see sections I.C and IV of this preamble) as well as a discussion of the need for the rule (section III.B of this preamble).

(Comment 110) One comment stated that this rule cannot become a binding regulation until it is subjected to the centralized regulatory review process, which consists of a benefit-cost analysis and Office of Management and Budget (OMB) review.

(Response 110) To the extent the comment is implying that this rulemaking did not include centralized regulatory review, it is incorrect. FDA has gone through that process. As part of that process, it has prepared preliminary and final regulatory impact analyses under EOs 12866, 13563, and 14094, as well as the Regulatory Flexibility Act and the Unfunded Mandates Reform Act. OIRA has reviewed those analyses and this rule.

Although this rule has been issued in accordance with the centralized regulatory review process described in E.O. 12866 and its amendments, FDA disagrees with the assertion that a rule would not be ''binding'' were it not subjected to all aspects of centralized regulatory review as specified by E.O. 12866. Legal requirements for rulemaking are set forth in the APA and related statutes, organic statutes such as the FD&C Act, and applicable regulations. Additionally, Section 10 of E.O. 12866 provides: ''This Executive order is intended only to improve the internal management of the Federal Government and does not create any right or benefit, substantive or procedural, enforceable at law . . . . '' *See also Alliance for Natural Health U.S.* v. *Sebelius,* 775 F. Supp. 2d 114, 135 n.10 (D.D.C. 2011) (citing Section 10 in rejecting challenge to FDA regulation for alleged violation of E.O. 12866); E.O. 13563 section 7(f) (noting that the E.O. does not create any right or benefit enforceable at law or in equity); E.O. 14094 section 4(c) (same). E.O. 12866 thus does not establish legally enforceable requirements for rulemaking.

(Comment 111) One comment argued that, to phase out the general enforcement discretion approach for IVDs offered as LDTs, FDA would have to provide data ''to cross a predetermined threshold for action,'' and the data should be presented ''along with the minutes of meetings around it.''

(Response 111) There is no requirement—in the APA, FD&C Act, or otherwise—establishing a ''predetermined threshold'' for changing an enforcement discretion approach. As FDA explained in section III.B of this preamble as well as the NPRM, the LDT landscape has evolved significantly since the enactment of the MDA (88 FR 68006 at 68009), and several factors justify this rule, including, but not limited to, the increased complexity of IVDs offered as LDTs and their growing share of the testing market. The documents supporting FDA's findings, including sources such as peer-reviewed literature and FDA memoranda, were

published in the docket for this rulemaking.

(Comment 112) One comment expressed concern with FDA characterizing the proposed rule, if finalized, as not establishing any requirements. The comment stated that ''applying a panoply of regulations to an entirely new class that had not hitherto been regulated is, from the perspective of laboratories, imposing entirely new requirements.''

(Response 112) To the extent the commenter is suggesting that FDA is required to go through notice-and-comment rulemaking to phase out the general enforcement discretion approach for applicable requirements, we disagree. The phaseout policy does not impose any binding requirements on the Agency or LDT manufacturers, but rather describes how FDA intends to phase out the general enforcement discretion approach for existing requirements under the FD&C Act that apply to LDTs as devices. The phaseout policy described in the NPRM, and this preamble, is a general statement of policy and therefore, it is exempt from the rulemaking procedures of the APA. 5 U.S.C. 553(b)(3)(A). Moreover, the phaseout policy is an enforcement policy, and the FD&C Act's enforcement provisions commit broad discretion to FDA to decide how and when they should be exercised. *See Heckler* v. *Chaney,* 470 U.S. 821, 835 (1985). In any event, such an argument is misplaced given that FDA is in fact engaging in notice-and-comment rulemaking here.

To the extent the comment is instead suggesting that FDA's characterization means that the Agency is underestimating the costs of the phaseout, we also disagree. The economic analyses in the proposed and final rules do not assume zero costs to laboratories because FDA is not changing any legal requirements. Rather, these analyses account for all of the costs associated with changes in FDA's enforcement approach.

(Comment 113) One comment stated that two sources—an overview of Federal law related to IVDs and clinical laboratories appearing in Clinical Chemistry, and a white paper written on behalf of ACLA—provide a good alternative to FDA's position.

(Response 113) It is not clear if this comment was saying that these sources provide an alternative policy FDA should consider, or if the comment was saying that these papers undermine FDA's legal position. In any event, to the extent those sources make significant arguments that have been advanced by other comments submitted to the docket for this rulemaking, those arguments have been addressed. In particular, the express purpose of the referenced journal article is ''to provide a legislative and regulatory history of IVDs to foster a foundational basis for future LDT discussions,'' and FDA addresses comments it received regarding the history of its statements on LDTs elsewhere in this preamble. The argument that LDTs are not devices and are therefore outside FDA's jurisdiction, which is advanced in the white paper written on behalf of ACLA, has likewise been addressed elsewhere in this preamble.

F. Phaseout Policy

1. General Comments on the Phaseout Policy

(Comment 114) Some comments stated that FDA's approach to phasing out the general enforcement discretion approach for LDTs is too broad and does not appropriately account for differences in the types of IVDs offered as LDTs. Some comments stated that FDA should utilize a risk-based approach in its oversight of IVDs offered as LDTs.

(Response 114) FDA does not agree with these comments. FDA has crafted a tailored phaseout policy intended to better protect the public health by helping to assure the safety and effectiveness of IVDs offered as LDTs, while also accounting for other important public health considerations such as patient access and reliance. Notably, the phaseout policy includes several new, targeted enforcement discretion policies, based in part on comments submitted on the NPRM regarding whether and how FDA should phase out the general enforcement discretion approach for more than a dozen specific types of tests (see section VI.L). FDA's reasons for adopting these policies are discussed further in section V.B. For other categories of IVDs, for the reasons discussed throughout this preamble, including responses to comments in sections L and F, FDA is not adopting enforcement discretion policies.

(Comment 115) Some comments suggested that FDA's phaseout of the general enforcement discretion approach should only apply to ''commercial'' manufacturers and for-profit laboratories, and that FDA should establish a separate framework for oversight of LDTs that are offered in laboratories that work closely with treating physicians and are directly integrated into patient care. One comment suggested that FDA continue its enforcement discretion approach for tests that are designed and overseen by physicians and laboratories for the care of their patients in consultation with their clinical providers.

(Response 115) FDA disagrees that the Agency should phase out the general enforcement discretion approach only for conventional manufacturers and for-profit laboratories. The need for greater FDA oversight to better assure the safety and effectiveness of IVDs offered as LDTs applies to IVDs offered as LDTs by non-profit laboratories as well as other types of laboratories.

Regarding the comments about LDTs manufactured by laboratories that work closely with treating physicians or that are directly integrated into patient care, we note that FDA is adopting an enforcement discretion policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. As discussed in section V.B.3, FDA has determined that an enforcement discretion policy for premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for such LDTs is appropriate given the likelihood that laboratories would stop manufacturing unmet need LDTs under the proposed phaseout policy (given the limited market for such LDTs and perceived costs of compliance with premarket review and QS requirements), the risk mitigations present in these circumstances, and the lack of available FDA-authorized IVDs to meet the patient's need.

(Comment 116) Several comments suggested alternatives to the phaseout policy, including combining a quality framework like ISO 9001 with a risk-based self-regulation model; utilizing a targeted program focusing on areas of concern by providing tools to qualify both LDTs and other IVDs for specific indications; updating the CLIA regulations or otherwise tightening the regulation of laboratories and standardizing best practices; ''leveraging'' existing quality assurance programs and programmatic guardrails for lower risk tests; ''exempting'' tests that have been reviewed and approved by NYS CLEP and providing for other ''categorical exemptions''; exercising enforcement discretion for LDTs developed and offered locally in small volumes; creating a framework for LDT manufacturers to make their validation studies public (which FDA could then utilize for risk-based enforcement); incorporating principles from the proposed VALID Act; establishing national accuracy laboratories or partnering with existing organizations to

serve as independent entities dedicated to evaluating and verifying the performance of diagnostic tests; or establishing regional market zones for LDTs (by state or locality) to facilitate conversations between laboratories and clinicians.

(Response 116) Many of the suggestions provided in these comments are outside of FDA's authority to implement. For example, FDA does not have the statutory authority to implement specific provisions of the VALID Act bill (*e.g.,* technology certification), as the bill was never enacted. Similarly, regarding the comments about CLIA, FDA is not the agency in charge of administering that statute. Other suggestions may fall outside of FDA's authority and also lack sufficient clarity, such as suggestions that FDA establish national accuracy laboratories or regional market zones for LDTs. With respect to making validation studies public, adopting a risk-based self-regulation model, or utilizing a targeted program focusing on areas of concern by providing tools to qualify LDTs and other IVDs for specific indications, FDA disagrees that these measures reduce the public health need for additional FDA oversight of IVDs offered as LDTs. These measures would not include critical aspects of FDA's oversight (such as requirements for premarket review, QS, registration and listing or centralized adverse event reporting), would not provide for oversight by independent experts, and would not address the risks associated with IVDs for indications that do not fall within specific ''areas of concern.''

Likewise, with respect to standardizing best practices or ''leveraging'' existing quality assurance programs and programmatic guardrails for lower risk tests, FDA disagrees that such mechanisms mitigate the need to phase out the general enforcement discretion approach for LDTs, as explained in sections VI.C.1 and VI.C.3. FDA also disagrees that an enforcement discretion policy for LDTs that are developed and offered locally in small volumes would be appropriate, as FDA has concerns that there would not be sufficient risk mitigations in such circumstances.

With respect to the comment about LDTs that have been reviewed and approved by NYS CLEP, we agree that an enforcement discretion policy for LDTs approved by NYS CLEP is appropriate, as explained in section V.B.2.

(Comment 117) FDA received a comment from DoD stating that FDA should continue the general enforcement discretion approach for LDTs used within DoD. Specifically, DoD explained that its ''use of LDTs is based on unique, military-relevant scenarios not encountered within the civilian or commercial sectors, therefore, there is no commercial market or incentive for private development of such tests. For example, DoD, on behalf of the United States, is a party to international agreements that require deployed service members to test negative for certain infectious diseases prior to deployment . . . In addition, with DoD personnel and US citizens deployed worldwide, to sometimes austere environments, isolated cases of rare infectious diseases require LDT testing without the benefit of a declared emergency and access to the FDA EUA pathway.'' DoD further explained that ''Department of Defense Instruction (DoDI) 6640.02, establishes the Center for Clinical Laboratory Medicine (CCLM),'' and that ''DoD would work with FDA to establish standards within the DoD unique internal program to achieve stated objectives that provide for clinical validity of LDTs.''

(Response 117) For the reasons discussed further in section V.B.1, FDA intends to exercise enforcement discretion and generally not enforce applicable requirements for LDTs manufactured and performed within DoD.

(Comment 118) FDA received several comments stating that FDA should continue the general enforcement discretion approach for LDTs manufactured and performed within VHA. Two comments suggested that FDA should not continue the general enforcement discretion approach for LDTs manufactured and performed within VHA because VHA's program is not in alignment with FDA regulation (though one of these comments supported ''leveraging'' outside programs ''in principle''). One comment asked whether continuation of the general enforcement discretion approach for LDTs manufactured and performed within VHA would extend beyond the administrative boundaries for which VHA's program is currently limited.

(Response 118) FDA agrees with those comments that stated that FDA should have an enforcement discretion policy for LDTs manufactured and performed within VHA. For the reasons discussed in more detail in section V.B.1, FDA intends to exercise enforcement discretion and generally not enforce applicable requirements for LDTs manufactured and performed within VHA. With respect to concerns that VHA's program is not currently in alignment with FDA regulation, FDA notes that VHA is taking steps in consultation with FDA to track all LDTs in its system and to ensure both the analytical and clinical validity of its LDTs, the quality manufacturing of its LDTs, and the central reporting of adverse events. As noted in section V.B.1, this enforcement discretion policy applies only to LDTs used for patients that are being tested and treated within the VHA program.

(Comment 119) One comment requested that FDA provide more clarity ''for LDTs where the testing laboratory does [not] manufacture any parts of the tests.''

(Response 119) As discussed in the responses to comments in section VI.D.2, a test system is a device regardless of who manufactures it or its components, and is subject to applicable requirements in the FD&C Act and implementing regulations.

2. Continued Enforcement Discretion for Currently Marketed IVDs Offered as LDTs

(Comment 120) We received many comments urging FDA to maintain the general enforcement discretion approach with respect to applicable requirements (or a subset thereof) for currently marketed IVDs offered as LDTs. Many of these comments stated that continuing the general enforcement discretion approach for such IVDs is critical to prevent patients from losing access to certain valuable tests. Several of these comments also suggested that ''the for-profit sector'' would not step in to fill the gaps left by market withdrawal of IVDs for which there are ''small markets.'' Other comments stated that it is important to continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs to sustain successful patient outcomes. Some of these comments asserted that certain IVDs offered as LDTs have become the standard of care, and some stated that losing access to certain currently marketed IVDs offered as LDTs could require the use of inferior tests. Other comments argued that currently marketed IVDs offered as LDTs that are already integrated into clinical practice pose a minimal safety risk, as many have been used effectively for years without causing harm, and/or already satisfy accreditation criteria from recognized accreditation bodies. A few comments noted that some currently marketed IVDs offered as LDTs address unmet needs for which authorized tests do not exist, or for which authorized tests do not reflect the latest advances in science, suggesting that FDA ought to continue the general enforcement

discretion approach to currently marketed IVDs offered as LDTs to avoid disrupting access to these IVDs.

Some comments asserted that not continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would negatively impact specific populations, such as children, individuals with rare diseases, individuals requiring transplantation, and oncology patients. Comments stated that certain IVDs offered as LDTs for use in children are the gold standard, and that essential, time-sensitive testing conducted by pediatric laboratories is performed most effectively if done rapidly in house.

Comments also stated that laboratories have substantial reliance interests in currently marketed IVDs offered as LDTs, having made business decisions against the backdrop of FDA's decades-long general enforcement discretion approach. These comments asserted that discontinuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would not recognize these reliance interests. Other comments stated that patients have reliance interests in IVDs offered as LDTs that would be ''suddenly rendered uneconomical,'' and that these reliance interests would not be recognized if FDA did not continue the general enforcement discretion approach for these IVDs.

In addition, many comments stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs to reduce the demands on FDA resources. Some comments described concerns based on experiences with EUA requests during the COVID–19 pandemic. Other comments highlighted the estimated number of premarket submissions in FDA's PRIA. The comments generally argued that continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would help to ensure that FDA has sufficient resources to conduct timely reviews of other submissions and would avoid bottlenecks such as those that have been observed in other jurisdictions. Many comments also stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs to reduce the burden on laboratories. These comments generally emphasized the many submissions that laboratories might reasonably need to prepare within the applicable timeframe and stated that user fee payments would be too high. One comment added that although it is ''critical'' that FDA not enforce against IVDs offered as LDTs for lacking premarket authorization while a submission for that IVD is reviewed, such an approach does not mitigate the need to continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs, as it does not address the burden of preparing and reviewing submissions. Several comments argued that continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would help to reduce the need for laboratories to divert resources from innovation to support the compliance of currently marketed IVDs.

Other comments supported continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs because, according to these comments, validation studies may otherwise need to be repeated that would be impossible or unethical to repeat; financial costs to patients and legal costs to providers would otherwise increase; and because FDA previously expressed support for continuing the general enforcement discretion approach with respect to certain requirements for currently marketed LDTs (see Ref. 57).

(Response 120) As discussed in section V.B.3, FDA generally intends to exercise enforcement discretion with respect to premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3 The scope of and basis for this policy are set forth in section V.B.3.

Although FDA is adopting this policy, it does not necessarily agree with all of the statements made in comments supporting an enforcement discretion policy for currently marketed IVDs offered LDTs. For example, we do not agree that currently marketed IVDs offered as LDTs that are already integrated into clinical practice pose a minimal safety risk, or that meeting accreditation criteria from recognized accreditation bodies eliminates the need for FDA oversight for the reasons discussed in response to comments under section VI.C.3. Rather, FDA is including this enforcement discretion policy in consideration of other factors, as discussed in section V.B.3.

(Comment 121) In contrast, FDA received several comments that did not support continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs, or favored significantly limiting the number of IVDs that would fall under the continued enforcement discretion approach. Comments expressed concern that continuing the general enforcement discretion approach would be inappropriate given the evidence of ''low-performing'' IVDs offered as LDTs currently on the market. Other comments expressed concern that continuing the general enforcement discretion approach for these IVDs may cause certain IVDs to appear to be FDA-authorized even when they have not been authorized, and that laboratories might extensively modify their IVDs and avoid compliance with applicable requirements for these modified IVDs. One comment opposed continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs ''particularly for commercial testing''; other comments asserted that continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would inappropriately focus on where or by whom an IVD was developed, rather than the risk of the IVD, and stated that it would be more ''effective'' to narrowly tailor any continued enforcement discretion approach to LDTs that are not associated with safety or effectiveness concerns.

Finally, a few comments did not completely oppose or support an enforcement discretion policy for currently marketed IVDs offered as LDTs. For example, some comments stated that continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs would not be sufficient to address other problems with the phaseout policy, including laboratories' inability to make ''necessary'' updates to their IVDs or respond to changing public health needs. Other comments suggested that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs only if FDA does not establish other more specific policies.

(Response 121) FDA has also carefully considered the comments recommending against the inclusion of a policy for currently marketed IVDs offered as LDTs. FDA agrees that there is evidence in the record demonstrating that there are problematic IVDs offered as LDTs that are currently marketed. However, FDA remains concerned about the potential harms from loss of access to beneficial IVDs offered as LDTs on which patients are currently relying. Therefore, FDA has determined that it best serves the public health to adopt a more targeted expectation of compliance for currently marketed IVDs offered as LDTs. As noted in section V.B.3, FDA

anticipates that adverse event reporting, information contained in labeling, and other sources of information (including public reports and any relevant information from the healthcare community) will help the Agency identify problematic currently marketed IVDs offered as LDTs for which enforcement or other action is warranted. FDA intends to take such action as appropriate. In this way, FDA's policy is consistent with one comment's recommendation to ''narrowly tailor'' the approach, taking into account ''safety or effectiveness concerns'' with currently marketed IVDs offered as LDTs.

One comment argued against an enforcement discretion policy for currently marketed IVDs offered as LDTs because such a policy may cause these IVDs to appear to be FDA-authorized even when they have not been authorized. FDA disagrees. Devices marketed under an enforcement discretion policy are not lawfully on the market, and should not be understood to share the same legal status as lawfully marketed devices. Statements in labeling that an unauthorized IVD is authorized by FDA, or suggestions along those lines, would misbrand the IVD under section 502(a) of the FD&C Act. We believe that enforcing this and other labeling requirements would help to address the concern raised in the comment.

Another comment stated that a policy for currently marketed IVDs offered as LDTs could be problematic because laboratories might extensively modify their IVDs and avoid compliance with applicable requirements for these modified IVDs. As described in section V.B.3, the enforcement discretion policy for currently marketed IVDs offered as LDTs is limited to instances in which the IVD is unmodified, or the IVD is modified only in certain limited ways. If an IVD is modified in more significant ways, FDA intends to phase out the general enforcement discretion approach with respect to all requirements for that IVD. We believe this policy addresses the concern raised in the comment.

FDA also acknowledges that under this policy, its compliance expectations for currently marketed IVDs will differ depending on whether the IVD is offered by a laboratory or a conventional manufacturer. However, in light of the reliance interests engendered by FDA's longstanding enforcement discretion approach for LDTs, as described in the comments, we have determined that this differential treatment is warranted. Over time, FDA anticipates that IVDs will evolve and eventually come into compliance with FDA requirements, such that IVDs manufactured by laboratories will generally fall under the same enforcement approach as other IVDs. In the FRIA, we estimate that 50 percent of currently marketed IVDs offered as LDTs will be submitted to FDA for premarket review (*e.g.,* due to significant modifications as described in section V.B.3) over the course of 20 years.

To the extent that some comments indicated that this policy is appropriate to address unmet needs, FDA notes that discussion regarding tests for unmet needs can be found in section VI.L.5 of this preamble. Also, discussion regarding potential impacts on specific patient populations can be found in section VI.K.

(Comment 122) Some comments stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs only with respect to premarket review requirements. Other comments stated that the enforcement discretion policy for currently marketed IVDs offered as LDTs should be for premarket review requirements and all QS requirements, though one comment recommended that the policy apply for premarket review requirements and QS requirements related only to design controls. Most comments that supported continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs were focused on premarket review and QS requirements, and not all requirements. However, a few comments suggested that the general enforcement discretion approach continue for all applicable requirements. Several comments stated that MDR requirements and registration and listing requirements should be enforced, as these requirements would provide important information about the testing landscape. One comment suggested that while registration and listing requirements should still be enforced, currently marketed IVDs offered as LDTs from hospital and health system laboratories should not be ''subject to overly burdensome requirements'' for registration and listing; for example, FDA should limit the amount of listing information expected for those IVDs. Another comment expressed concern that enforcing registration requirements for laboratories manufacturing currently marketed IVDs offered as LDTs could ''be prohibitive'' for some laboratories. One comment stated that laboratories that have a system for reporting errors, and that are integrated into a health system, generally should not be expected to comply with adverse event reporting requirements (it is not clear if this comment was intended to be specific to currently marketed IVDs offered as LDTs, but the organization of the comment suggests that it was).

(Response 122) FDA agrees that it should phase out the general enforcement discretion approach for all applicable requirements other than premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. This policy reflects a careful balancing of relevant considerations, as discussed in section V.B.3 and in response to comment 120.

We note that the costs of compliance with premarket review and QS requirements are a significant portion of the overall anticipated costs to laboratories of complying with applicable FDA requirements (see section II.F.5 of the FRIA (Ref. 10)). Of the total estimated discounted costs to industry of $1.17 billion, the average estimated costs of compliance with stages 1 and 2 are approximately $9,522 per test ($74,783 per laboratory) and the average estimated costs of compliance with premarket review and QS requirements are approximately $3.02 million per test ($1.26 million per laboratory). As a result, FDA has concluded that focusing the policy on these requirements should address the concerns about widespread market exit. As noted above, FDA expects compliance with requirements under part 820, subpart M (Records), including compliance with QS requirements regarding complaint files. This will facilitate compliance with MDR requirements, because complaints will then be reviewed to determine whether they are MDR reportable. FDA intends to review complaint files during an inspection to assess compliance with relevant QS and MDR requirements.

FDA intends to phase out the general enforcement discretion approach for requirements other than premarket review and most QS requirements in order to gather information about, and take appropriate action with respect to, currently marketed IVDs offered as LDTs. FDA has determined that the public-health value of compliance with these requirements outweighs any concerns raised in the comments. In particular, based on the information in the FRIA, we do not believe compliance with these other requirements will cause laboratories to stop offering IVDs on which patients currently rely. In addition, FDA disagrees that

laboratories that have a system for reporting errors and are integrated into a health system should not be expected to submit MDRs to FDA for currently marketed IVDs offered as LDTs (or for other IVDs). Centralized reporting of adverse events enables FDA to track trends across devices of the same type, identify when issues arise, and work with stakeholders to address those issues. For example, as discussed in section III.B, FDA was able to identify a biotin interference issue through analysis of MDRs indicating inaccurate test results. Biotin is commonly used in immunoassays as part of the test technology. Therefore, when high dose biotin supplements (advertised for hair and nail growth) became more popular, FDA began seeing inaccurate test results associated with these immunoassays. FDA's investigation revealed that this biotin interference affected dozens of tests across multiple manufacturers. This led to a multiyear interactive effort to have manufacturers address the issue through assay re-design. Notably, it is likely many RUO immunoassay kits still use biotin that would be affected in the same manner by these supplements, and it is likely that those manufacturers have not addressed this issue. These RUO kits currently may be offered as LDTs by laboratories. Enforcement of adverse event reporting and registration and listing requirements for these currently marketed IVDs offered as LDTs will help FDA identify where this problem may still be occurring, and where other problems are occurring, so that these problems can be addressed.

For additional discussion of FDA's phaseout of the general enforcement discretion approach with respect to registration and listing requirements and adverse event reporting requirements, see sections VI.F.7 and VI.F.8 of this preamble.

(Comment 123) Some comments recommended that FDA continue the general enforcement discretion approach with respect to certain requirements for currently marketed IVDs offered as LDTs that were first marketed prior to publication of the *proposed rule* whereas other comments recommended such an approach should be for currently marketed IVDs offered as LDTs that were first marketed prior to publication of the *final rule,* or prior to the effective date of the final rule. One comment suggested that FDA continue the general enforcement discretion approach with respect to certain requirements for IVDs offered as LDTs that are marketed within the next 4 years. Another comment suggested that FDA continue the general enforcement discretion approach with respect to certain requirements for IVDs offered as LDTs that have been marketed for at least 3 years prior to March 31, 2024, and that are supported by post-market data that provide evidence of device performance and safety.

(Response 123) As discussed in section V.B.3, FDA has keyed the policy for currently marketed IVDs offered as LDTs to the date of this final rule, rather than the proposed rule. FDA chose this date because patients and the healthcare community may have begun relying on these IVDs during the period between publication of the proposed and final rule. Patients and the healthcare community also may have begun relying on IVDs offered as LDTs that were marketed before March 31, 2024 (and that are currently marketed), even if such IVDs were marketed for fewer than 3 years prior to that date. By contrast, for IVDs offered as LDTs that are introduced after the date of issuance of the final rule (*e.g.,* within the next 4 years), the decisions of laboratories, patients, and the healthcare community would be made taking into account the expectation of compliance and not presuming the same reliance. Furthermore, given the timing of the phaseout policy and the enforcement discretion policy for currently marketed IVDs offered as LDTs, FDA anticipates that laboratories should be able to comply with premarket review and QS requirements by the time of stages 3–5 for IVDs offered as LDTs that are marketed after the publication date for this final rule.

(Comment 124) Some comments stated that if FDA were to continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs, the approach should apply to such IVDs even if the IVDs are modified. One comment argued that modifications are essential to the evolution of patient care. However, most comments suggested that a general enforcement discretion approach for currently marketed IVDs offered as LDTs should not apply to such IVDs after certain types of modifications are made. These comments generally proposed that an enforcement discretion approach should not apply to currently marketed IVDs offered as LDTs after any changes to intended use, indications for use, and/or performance. One comment proposed that a general enforcement discretion approach for currently marketed IVDs offered as LDTs apply to those IVDs if modified in ways that do not significantly change the indications for use, except for some changes to specimen type; that do not significantly change performance claims or significantly and adversely change performance; or that do not adversely change the safety for individuals who come in contact with the IVD. Another comment proposed that a general enforcement discretion approach for currently marketed IVDs offered as LDTs apply to those IVDs if modified in ways that do not alter methodology, intended use, or performance, arguing that this would allow laboratories to continue innovating and address emerging scientific understanding and patient needs. One comment suggested that a laboratory manufacturing a currently marketed IVD offered as an LDT should not be expected to submit a premarket submission for modifications that are properly validated by the laboratory, stating that the utility of currently marketed IVDs offered as LDTs will diminish over time if overly restrictive constraints are placed on modifications.

Some comments emphasized that FDA should provide clear guidance regarding what IVDs offered as LDTs would fall within an enforcement discretion policy for currently marketed IVDs offered as LDTs, including regarding the types of modifications that would be included within that policy.

(Response 124) FDA agrees that the policy should apply to currently marketed IVDs offered as LDTs when they are modified in certain limited ways.

As discussed in response to comment 261, FDA's regulations require premarket review when an authorized device is modified in a way that affects safety and effectiveness (for a device approved under a PMA, with certain exceptions) or in a way that could significantly affect safety and effectiveness (for a device subject to 510(k)). Following a similar approach in this context, and as discussed in more detail in section V.B.3, FDA generally intends to exercise enforcement discretion with respect to premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified in relatively minor ways. This policy is intended to preserve access to beneficial IVDs on which patients and the healthcare community currently rely, including versions of that IVD with minor changes. However, once the IVD is changed in certain, more significant ways that could affect its basic safety and effectiveness profile, the policy no longer applies. Thus, FDA generally expects compliance with premarket review and QS requirements for currently marketed IVDs offered as

LDTs when a laboratory's modifications (individually or in aggregate) change the indications for use of the IVD, alter the operating principle of the IVD (*e.g.,* changes in critical reaction components), include significantly different technology (*e.g.,* addition of artificial intelligence/machine learning to the test algorithm, a change from targeted sequencing to whole genome sequencing, a change from immunoassay to mass spectrometry, or a change from manual to automated procedures), or adversely change the performance or safety specifications of the IVD. These modifications are generally consistent with the types of modifications that comments suggested should not fall within an enforcement discretion policy for currently marketed IVDs offered as LDTs. Although some comments suggested that the policy should encompass all modifications to currently marketed IVDs offered as LDTs, FDA does not agree that this type of broad policy would appropriately serve the public health purpose of this rulemaking.

(Comment 125) FDA received several comments that proposed specific circumstances under which FDA might continue the general enforcement discretion approach with respect to certain requirements for currently marketed IVDs offered as LDTs. Some comments stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs that are ''standard of care'' or otherwise well established in the literature; that are widely adopted and incorporated into professional society treatment guidelines; that are developed and offered locally; that are ''already in known published medical classifications''; that have ''proven performance serving a vital part of healthcare''; for which there are long-term safety and effectiveness records, or evidence of analytical and clinical validity and clinical utility; and/or that are not high risk. One comment stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs that, among other types of IVDs, have been modified from FDA-authorized devices with respect to certain parameters (in some cases supported by further studies), or that have been developed by a government or reference laboratory in good standing under CLIA. Another comment stated that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs that have ''demonstrated concordance with FDA-approved companion diagnostics.'' Yet another comment suggested FDA continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs that are used ''without issues'' within public health laboratories.

(Response 125) As discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs as long as they are not modified following issuance of this final rule, or are modified but only as described in section V.B.3. FDA is adopting this policy based on careful consideration of the comments and the economic projections in the proposed rule, and after weighing competing interests at issue here, as described in section V.B.3.

FDA does not believe that the alternative policies suggested by stakeholders in the comments summarized above would strike the appropriate balance between these competing interests. For example, policies only for some currently marketed IVDs offered as LDTs would not adequately address concerns that patients and providers may have reasonably made choices based on an assumption of continued access to certain IVDs that may not be offered as a result of the phaseout policy, and specifically if FDA were to expect compliance with premarket review and most QS requirements. These include policies that are limited only to currently marketed IVDs offered as LDTs that are offered by certain types of laboratories; that have been modified from FDA-authorized devices with respect to certain parameters; or that have ''demonstrated concordance'' with certain FDA-authorized IVDs. For discussion of FDA's determination not to phase out the general enforcement discretion approach only for IVDs that are high-risk, see section VI.L.4.

In addition, many of the policies suggested in comments would be difficult to administer or would not set clear expectations for stakeholders. For example, a policy for currently marketed IVDs offered as LDTs that are ''standard of care,'' or otherwise well established in the literature, may not be clear for stakeholders. There may be different opinions regarding what IVDs offered as LDTs are standard of care or well established in the literature, and defining those terms in a manner that could be consistently and predictably applied may not be feasible. Similar concerns apply to policies for currently marketed IVDs offered as LDTs that are ''widely adopted'' and incorporated into professional society treatment guidelines; that are developed and offered locally; that are ''already in known published medical classifications''; that have ''proven performance serving a vital part of healthcare''; or for which there are ''long-term'' safety and effectiveness records or evidence.

(Comment 126) One comment suggested that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs upon request.

(Response 126) FDA believes that continuing the general enforcement discretion approach for currently marketed IVDs offered as LDTs only upon request would not set clear expectations for stakeholders and would be administratively difficult to implement.

(Comment 127) Some comments suggested that FDA should continue the general enforcement discretion approach only for specific types of currently marketed IVDs offered as LDTs (depending on the impact to different patient populations), or for currently marketed IVDs offered as LDTs that are intended for unmet needs or for rare diseases or indications or where there is a strong public health need for the IVD, linked to ensuring access to accurate and reliable IVDs and facilitating a smooth transition for FDA oversight. Other comments suggested that FDA should continue the general enforcement discretion approach for currently marketed IVDs offered as LDTs that have been approved by other regulatory bodies, Federal agencies, or certain other programs or entities, in some cases only when the IVD has been offered for a minimum period of time without any reported adverse consequences, or when there is no credible information establishing a lack of validity, false or misleading claims, or a probability that the IVD will cause serious adverse health consequences.

(Response 127) Regarding the comments about a policy for LDTs for unmet needs, we note that FDA is adopting a policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. Moreover, regarding the comment about a policy for currently marketed IVDs offered as LDTs that have been approved by other regulatory bodies, FDA is adopting an enforcement policy for LDTs that are approved by NYS CLEP. In addition,

FDA is adopting an enforcement policy for LDTs offered within DOD's and VHA's oversight programs. For further discussion of these aspects of the phaseout policy, see sections V.B.2 and V.B.3.

Further, similar to our response to comment 125, FDA is concerned that a policy for IVDs offered as LDTs for a certain period of time without issues or that meet a strong public health need would be difficult to administer and would not set clear expectations for stakeholders as there may be different opinions regarding what IVDs offered as LDTs meet these, or any similar, descriptions.

(Comment 128) One comment suggested that IVDs falling within the policy for currently marketed IVDs offered as LDTs be labeled with a statement disclosing they have not been authorized by FDA.

(Response 128) The Agency does not believe such a policy would be appropriate at this time. FDA expects that most IVDs offered as LDTs subject to premarket review requirements will lack required FDA authorization for several years following issuance of this final rule. Under the phaseout policy described in section V.C, the phaseout of enforcement discretion with respect to premarket review requirements will begin 3.5 years (for high-risk IVDs offered as LDTs) to 4 years (for other IVDs offered as LDTs subject to premarket review) from the date of issuance of this rule. After a complete premarket submission for an IVD offered as an LDT has been submitted within these timeframes, FDA generally does not intend to enforce against the IVD for lacking FDA authorization during the pendency of FDA review. Thus, in the context of the phaseout policy, including such a statement in the labeling for currently marketed IVDs offered as LDTs could create confusion by suggesting a distinction that does not exist between those IVDs that are in the process of coming into compliance with premarket review requirements and those that are not. If our experience with implementation of the phaseout policy indicates that a different approach to inclusion of such a statement is warranted as more IVDs offered as LDTs come into compliance with premarket review requirements, FDA would consider making appropriate policy changes in accordance with good guidance practices (§ 10.115).

To the extent anyone may seek information regarding whether a particular test has been authorized by FDA, such information can be found in FDA databases. For example, tests that have been approved, cleared, or had a De Novo request granted by FDA appear in the PMA, 510(k), and De Novo databases, respectively (Refs. 165,166, and 224). We expect that most tests, including those offered without premarket review (*e.g.,* because they are exempt from premarket notification or fall within an enforcement discretion policy), will be listed in the Registration & Listing database in Stage 2 of the phaseout policy. Where a test has been approved, cleared, or had a De Novo request granted, this database will also indicate the applicable premarket submission number.

(Comment 129) Several comments stated that if FDA continues the general enforcement discretion approach for currently marketed IVDs offered as LDTs, ''FDA should retain the authority to require additional regulatory evaluation where there is a need to do so.''

(Response 129) We agree that regardless of the policy for currently marketed IVDs offered as LDTs or any other enforcement discretion policy included in the phaseout policy, FDA retains the authority to enforce any applicable requirements and pursue enforcement action at any time against violative IVDs. Moreover, we note that as discussed above, suggestions that an unauthorized IVD is authorized by FDA would misbrand the IVD under section 502(a) of the FD&C Act.

(Comment 130) One comment stated that if FDA continues the general enforcement discretion approach with respect to premarket review requirements for currently marketed IVDs offered as LDTs, FDA should allow submission of predetermined change control plans (PCCPs) for currently marketed IVDs offered as LDTs without additional submissions, to allow for ''controlled, pre-approved test modifications.''

(Response 130) Under section 515C of the FD&C Act, FDA may approve or clear a PCCP that is submitted in a PMA, supplemental PMA, or 510(k) notification. A PMA supplement or new 510(k) is not required for a modification to a device that would otherwise be required if the change is consistent with a PCCP previously approved or cleared by FDA. As set forth in section 515C, a PCCP can only be approved under section 515 of the FD&C Act or cleared under section 510(k) of the FD&C Act. For additional discussion of PCCPs, see our response to comments in section VI.M. FDA notes, however, that the policy for currently marketed IVDs offered as LDTs does encompass modifications to such IVDs when the modification involves a minor change, as discussed in section V.B.3.

(Comment 131) One comment stated that if FDA continues the general enforcement discretion approach with respect to premarket review for currently marketed IVDs offered as LDTs, those IVDs should be able to serve as predicate devices if laboratories subsequently modify the IVDs and submit 510(k)s for those modified IVDs.

(Response 131) Under section 513(i) of the FD&C Act and part 807, subpart E of FDA's regulations, a predicate device (for purposes of FDA clearance of a 510(k) submission) is a ''legally marketed'' device. FDA's regulations establish that ''[a] legally marketed device to which a new device may be compared for a determination regarding substantial equivalence is a device that was legally marketed prior to May 28, 1976, or a device which has been reclassified from class III to class II or I (the predicate), or a device which has been found to be substantially equivalent through the 510(k) premarket notification process'' (§ 807.92(a)(3)). An IVD that does not satisfy this definition, including a currently marketed IVD offered as an LDT that requires but does not have premarket authorization, would not be eligible to serve as a predicate device.

3. Small Laboratories

(Comment 132) FDA received comments stating that FDA should structure the phaseout of the general enforcement discretion approach for LDTs differently for small laboratories, as such laboratories will be more heavily affected by the phaseout. Some comments stated that small laboratories often develop and validate innovative assays or modify existing tests to serve specific populations, which can be costly. One comment stated that compliance with FDA requirements is a large and costly undertaking which only the largest corporations would be able to do, and that providing a longer phaseout period for LDTs offered by laboratories with annual receipts below $150,000 would still not be sufficient for small laboratories to come into compliance. Another comment recommended FDA have a ten-year phaseout for IVDs offered as LDTs by small laboratories and define small laboratory using the definition proffered by the Small Business Administration.

(Response 132) FDA recognizes that some small laboratories may be disproportionately impacted by the phaseout of the general enforcement discretion approach for LDTs from a financial perspective, as discussed in section III of the FRIA (Ref. 10). However, the final phaseout policy includes several enforcement discretion

policies that we anticipate will reduce costs for laboratories compared to what was estimated in the PRIA, including for small laboratories (see section V.B). As shown in table 48 of the FRIA, annualized costs per entity under the final phaseout policy (taking into account the enforcement discretion policies described in section V.B of this preamble) are estimated to be about 6 percent of receipts for small laboratories (for further discussion see section III.B of the FRIA).

In light of the anticipated costs to small laboratories associated with the final phaseout policy, and the additional considerations discussed in comment 133, FDA does not believe it is appropriate to adopt an enforcement discretion policy for small laboratories' IVDs offered as LDTs or to extend the phaseout policy to 10 years for such laboratories.

We understand that small laboratories may manufacture innovative LDTs or modify existing IVDs to serve specific populations. For small laboratories that are integrated within a healthcare system, certain of their LDTs may fall within the unmet need policy, discussed further in section V.B.3. Small laboratories that are not integrated within a healthcare system would fall outside that policy including because there are not the same risk mitigations present in such situations (see further discussion in section V.B.3).

(Comment 133) Some comments expressed opposition to FDA having a different enforcement approach for small laboratories and advocated for uniform treatment of all laboratories. Several comments stated that the size of the laboratory should not determine how certain tests are treated, noting that this type of approach would not be acceptable if applied to non-laboratory manufacturers and would be inconsistent with a risk-based approach. Some comments also stated that the harm to patients from faulty tests does not change based on the size of the laboratory and remarked that a longer phaseout period may allow for continued patient harm due to problematic IVDs offered as LDTs. One comment stated that small laboratories with fewer LDTs may actually be better able to comply with FDA requirements than larger laboratories and AMCs with hundreds of LDTs and suggested that any extension of the implementation period be based on the number of LDTs that a laboratory performs rather than annual receipts. Another comment noted that some small laboratories are associated with large hospital systems, which may prevent them from qualifying for any exemption or special considerations afforded to small laboratories.

(Response 133) FDA agrees that the phaseout of the enforcement discretion approach for LDTs should not be determined by laboratory size, as a different enforcement approach for small laboratories would not be in the best interest of the public health where we are unaware of any evidence supporting that IVDs manufactured by small laboratories are any less likely to be problematic than IVDs manufactured by large laboratories. We note that this approach is generally consistent with FDA's device regulations and policies, which generally do not distinguish small businesses from other regulated entities (though small businesses are eligible for a waiver or reduction of certain MDUFA user fees as a matter of statute). FDA also anticipates that features of the final phaseout policy will address many of the concerns of small laboratories as discussed in response to comment 132 above. FDA's phaseout policy is described in detail in section V.

4. Academic Medical Centers

(Comment 134) We received many comments responding to the questions posed in the NPRM (88 FR 68006 at 68023–24) about whether FDA should continue the general enforcement discretion approach with respect to any requirements for tests manufactured by AMC laboratories. We received a wide variety of comments spanning all sides of the issue: comments in favor of continuing an enforcement discretion approach for tests manufactured by AMC laboratories, comments recommending that FDA also continue an enforcement discretion approach for tests manufactured by other similarly situated laboratories, comments that suggested limitations to an enforcement discretion approach for tests manufactured by AMC laboratories, and comments against the continuation of an enforcement discretion approach for tests manufactured by AMC laboratories. We also received various suggestions on possible ways to define an AMC.

(Response 134) As stated in section V.B, FDA is adopting several enforcement discretion policies that may apply to certain IVDs manufactured by AMC laboratories. First, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs as long as they are not modified following issuance of this rule, or are modified but only in certain limited ways as described in section V.B.3. This includes IVDs currently offered as LDTs by AMC laboratories. Second, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP, as described in section V.B.2. We anticipate that some LDTs manufactured by AMC laboratories may fall within this policy. Third, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. We anticipate many LDTs made in AMC laboratories will fall within this policy.

For the reasons set forth in section V.B and discussed in the response to comment 135, FDA does not think it is appropriate to have an enforcement discretion policy for: all LDTs manufactured by AMC laboratories; all requirements for LDTs manufactured by AMCs laboratories; or LDTs manufactured by AMC laboratories but not LDTs manufactured by other laboratories integrated within a healthcare system (as such, and because we are not adopting an enforcement policy for AMC laboratories, we have not included a definition of AMCs in the phaseout policy).

(Comment 135) Comments suggested that FDA should continue its general enforcement discretion approach with respect to tests manufactured by AMC laboratories for various reasons. Some argued that a continued enforcement discretion approach for AMCs is necessary because increased FDA oversight of their LDTs would negatively impact the public health, access, medical training, and innovation. Comments also claimed that AMC laboratories cannot afford the cost of compliance with FDA requirements as they perform tests on hospitalized patients, with no additional revenue stream or resources to cover the cost of compliance with FDA requirements. Other comments claimed that continuing an enforcement discretion approach is necessary because AMC laboratories already operate with tight budgets, are short staffed, and struggle to find qualified talent. Similar comments indicated that due to budgets, AMC laboratories may be prevented from performing FDA-authorized alternative tests where such tests require specialized capital equipment,

additional training, and inventory management, whereas a continued enforcement discretion approach for LDTs made by AMC laboratories would account for consolidation of testing platforms for efficiency. Comments hypothesized that increased FDA oversight would cause AMC laboratories to limit their testing offerings, detrimentally impacting the most vulnerable populations, raising costs to patients, and hurting access. Many comments stated that AMC laboratories manufacture and provide tests for unmet needs to provide care for the most complex adult and pediatric patients. This includes tests for rare diseases, which are low volume or do not have a ''commercial'' alternative. For example, a comment indicated that there are less than 20 laboratories that perform advanced immunologic testing, and all such laboratories are AMC laboratories. Comments expressed concern that patients might not otherwise have access to these and other tests. Other comments focused on the role of AMCs in training medical students, research, and innovation. Some pointed out that AMC laboratories create and develop test methods that ''commercial'' laboratories later adopt and use for their tests, and that AMC laboratories are nimble and able to explore and employ creative applications of new technology to enhance clinical testing. These comments expressed concern that increased FDA oversight would inhibit training and research to the detriment of the public health.

Comments also stated that the integration of AMC laboratories into patient care at the AMC provides a direct feedback loop between providers and patients that helps to mitigate the risks of the tests by providing context about the patient, their condition, and the particular purpose a test serves in this patient's care, and thereby allowing for conversation about the interpretation of results between the physician, patient, and test manufacturer. The commenters posit that these factors allow test manufacturers to troubleshoot as needed.

(Response 135) As described in response to comment 134, FDA is adopting several enforcement discretion policies that may apply to certain IVDs manufactured by AMC laboratories, including an enforcement discretion policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. As discussed in section V.B.3, in the circumstances described in the unmet needs policy, FDA has greater confidence that ordering physicians will communicate any questions about LDTs or concerns regarding the safety and effectiveness of the LDT (*e.g.,* when the patient's symptoms point to another diagnosis; when subsequent test results contradict the original test result) to a laboratory given the built-in communication mechanisms present. Moreover, FDA generally has greater confidence that laboratories will communicate any limitations of the LDT or other relevant information to the ordering physician given these mechanisms. We think this is particularly likely to happen in the context of LDTs for unmet needs, which are likely to be a focus of attention and communication between laboratorians and providers given the uncommon nature of the issues presented.

FDA anticipates that this and other enforcement discretion policies (described in response to comment 134) that may apply to IVDs manufactured by AMC laboratories will help to avoid the access concerns discussed in the comments. Specifically, FDA anticipates that these policies will reduce the compliance costs associated with the phaseout policy for many laboratories, including AMC laboratories, thereby addressing many of the financial concerns referenced in the comments. As described in the FRIA, the costs of compliance with premarket review and QS requirements are a significant portion of the overall anticipated costs to laboratories of complying with applicable FDA requirements (see section II.F.5 of the FRIA (Ref. 10)). Of the total estimated discounted costs to industry of $1.17 billion, the average estimated costs of compliance with stages 1 and 2 are approximately $9,522 per test ($74,783 per laboratory) and the average estimated costs of compliance with premarket review and QS requirements are approximately $3.02 million per test ($1.26 million per laboratory). Therefore, these policies may help to avoid AMC laboratories from no longer offering currently marketed IVDs or from manufacturing LDTs for unmet needs in the future due to the perceived costs of compliance with premarket review and QS requirements, as discussed further in section V.B.3. We also anticipate these policies will help to address the other concerns raised in comments, such as regarding AMC laboratories' role in training medical students to understand tests.

As discussed in the response to comment 142, we believe that for unmet need LDTs, the risk mitigations present in laboratories integrated within healthcare systems will help to address some of the concerns raised regarding problematic IVDs offered as LDTs discussed in the NPRM and this preamble. Notably, this policy is limited to exercising enforcement discretion for premarket review and most QS requirements (not all FDA requirements) and LDTs for unmet needs (not LDTs for which there are available FDA-authorized alternatives).

FDA believes it is important that an enforcement discretion policy for laboratories integrated within a healthcare system be limited to premarket review and QS requirements. Compliance with other applicable requirements will help provide assurances regarding safety and effectiveness and help FDA monitor for potentially poor performing LDTs that should be addressed. Moreover, we understand that compliance with premarket review and QS requirements are what is likely to lead laboratories integrated within a healthcare system to stop manufacturing LDTs for unmet needs in the future due to perceived compliance costs.

(Comment 136) Other comments pointed out features they assert mitigate the risk of tests manufactured by AMC laboratories. Comments noted that such laboratories are already regulated under/by CLIA, CAP, and other state and local accreditation bodies and that most hospital systems have mechanisms for reporting and tracking of events that have the potential for negative patient impact in order to comply with accreditation requirements. Some pointed to the not-for-profit nature of AMCs and the fact that AMCs are working to educate providers and enhance patient care—not generate profit or ''commercialize'' the tests they manufacture. Some claimed AMC laboratories have a demonstrated track record for developing safe and effective tests. Comments stated that AMCs were not subject to the lawsuits involving misleading information which FDA cited in the NPRM. Another posited that tests developed by AMCs do not have the problems observed in ''commercial'' tests.

(Response 136) FDA does not agree with comments that assert that an enforcement discretion policy is appropriate for all requirements for all LDTs manufactured and performed by AMC laboratories. FDA does not agree with the assertion that there are no problems with IVDs offered as LDTs by AMC laboratories nor does FDA agree that CLIA and other accreditations and the not-for-profit nature of AMCs are sufficient mitigations to justify such a policy. As described in the NPRM and

memorandums to file prepared by FDA that were included in the docket for this rulemaking, we are aware of problems with certain IVDs offered as LDTs manufactured and performed by AMC laboratories (see Refs. 16 and 18).

FDA does not believe it would be appropriate to have an enforcement discretion policy for all LDTs manufactured by AMC laboratories because such laboratories must comply with CLIA, as some comments asserted. In our response to comments in section VI.C, we explain that CLIA requirements and accreditation activities serve a complementary and distinct purpose from FDA oversight, and are therefore insufficient on their own to justify FDA continuing its general enforcement discretion approach for IVDs offered as LDTs.

Although healthcare systems may already have mechanisms addressing the reporting and tracking of adverse events, that does not negate the need for FDA oversight, including of MDR requirements. FDA uses adverse event information to monitor safety signals and identify trends, so that we can inform healthcare providers about issues the Agency has identified and work with manufacturers to correct problems with their devices. Reports to FDA about corrections and removals are also important in assuring that healthcare providers, patients, and caregivers are aware of problems and how to address them.

Finally, we note that even if an AMC is a not-for-profit entity, as raised in the comments, whether or not a test is sold for profit does not determine the quality of the test itself, which is the focus of FDA's attention.

(Comment 137) In response to FDA's question whether to continue its general enforcement discretion approach for tests made by AMC laboratories, many comments made various suggestions to FDA about continuing its general enforcement discretion for LDTs made by other types of health systems that are responsible for patients' complete clinical course of care. Some comments asserted that FDA should continue its general enforcement discretion approach for LDTs: (1) made by laboratories within hospitals that provide immediate patient care or any community healthcare delivery system, (2) manufactured by laboratories in accredited hospitals and healthcare systems where the laboratory directors meet prerequisite education and experience requirements, or (3) manufactured by CLIA-certified laboratories that are integrated as part of a healthcare organization providing direct medical care. These comments claimed that a continued enforcement discretion approach for these LDTs would be appropriate, either because an AMC is too hard to define, or because some of the aspects of AMCs described in the NPRM, *i.e.,* integration into patient care, and CLIA certification and meeting requirements to perform high-complexity testing, also apply to clinical laboratories in other health systems.

(Response 137) For the reasons discussed further in section V.B.3, FDA is adopting an enforcement discretion policy for LDTs manufactured and performed by laboratories integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA is not adopting an enforcement policy specific to AMC laboratories based on FDA's understanding that AMCs are not the only healthcare systems in which integrated laboratories make LDTs to meet the needs of patients being cared for in the same healthcare system.

FDA believes that the risk mitigations present when the patient tested is receiving care within the same healthcare system as the laboratory offering the unmet need LDT, along with the other risk mitigations discussed in section V.B.3, help to address some of the concerns raised regarding problematic IVDs offered as LDTs discussed in the NPRM and this preamble. Specifically, in such situations, FDA generally has greater confidence that ordering physicians will communicate any questions about LDTs or concerns regarding the safety and effectiveness of the LDT (*e.g.,* when the patient's symptoms point to another diagnosis; when subsequent test results contradict the original test result) to a laboratory given the built-in communication mechanisms present. Moreover, FDA generally has greater confidence that laboratories will communicate any limitations of the LDT or other relevant information to the ordering physician given these mechanisms. We think this is particularly likely to happen in the context of LDTs for unmet needs, which are likely to be a focus of attention and communication between laboratorians and providers given the uncommon nature of the issues presented. For further discussion on these risk mitigations, please refer to section V.B.3. While we recognize that these features do not mitigate all risk and there may still be some uncertainty about the performance of tests subject to this policy, we believe that these features support enforcement discretion for premarket review and quality system requirements in the specific context of LDTs for unmet needs.

Thus, and as described further in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. This policy may include, but is not limited to, AMC laboratories' LDTs. We believe this policy generally encompasses the scenarios described in the comments summarized above (*e.g.,* where LDTs are made by laboratories within hospitals or that are part of a healthcare organization providing direct medical care), albeit it applies only to LDTs that are intended to meet an unmet need of patients receiving care within the same healthcare system as the laboratory. As described in section V.B.3, an enforcement discretion policy whereby FDA generally would not enforce premarket review and most QS requirements for *any* LDTs manufactured by laboratories integrated within healthcare systems would appear to be overly broad, including because it would encompass LDTs for which there are FDA-authorized alternatives that we know have appropriate assurances of safety and effectiveness.

(Comment 138) Some comments suggested that FDA should continue a general enforcement discretion approach only with respect to premarket review, but phase in other requirements, such as reporting of adverse events, for LDTs manufactured by AMC laboratories.

(Response 138) FDA is adopting an enforcement discretion policy for premarket review and most QS requirements for certain unmet need LDTs manufactured and performed by laboratories integrated within a healthcare system where the patient is receiving care. Among other things, this enforcement discretion policy is intended to avoid laboratories that manufacture unmet need LDTs from no longer manufacturing such LDTs as a result of the phaseout policy and perceived costs with premarket review and QS requirements. FDA is concerned that including premarket review requirements only in the policy would not sufficiently address this concern. As noted in section V.B.3, FDA expects compliance with all other applicable requirements as described in the phaseout policy.

For the reasons discussed in section V.B.3, FDA is not adopting an enforcement discretion policy for all LDTs manufactured and performed by

AMC laboratories (or other laboratories integrated within healthcare systems).

(Comment 139) Another comment suggested that FDA continue the general enforcement discretion approach for all regulatory requirements, but only for low-risk tests offered by AMC laboratories.

(Response 139) FDA disagrees that it would be appropriate to adopt an enforcement discretion policy for all FDA requirements for low-risk tests offered by AMC laboratories. As an initial matter, FDA does not believe that AMC laboratories would stop offering low-risk tests as a result of the phaseout policy (including because most low-risk tests are exempt from premarket notification, meaning premarket submissions are not required). Moreover, for the reasons discussed throughout this preamble, compliance with other applicable requirements, such as registration and listing and adverse event reporting, among others, will provide critical assurances regarding these tests and allow FDA to monitor and take action in the event a problematic IVD is offered.

(Comment 140) A comment urged FDA to recognize that some hospitals and integrated patient facilities, including AMCs, may need to use devices ''off label,'' and asked how certain provisions, like the custom device exemption and IDE expanded access, apply to laboratories.

(Response 140) FDA recognizes that, under the FD&C Act, healthcare practitioners may prescribe or administer a legally marketed device to a patient for any condition or disease within a legitimate healthcare practitioner-patient relationship (see section 1006 of the FD&C Act (21 U.S.C. 396)). As discussed further in section VI.D.6, however, section 1006 of the FD&C Act does not reach the manufacturing of a device, including by a laboratory.

Regarding the custom device exemption and IDE expanded access, FDA has issued a final guidance document on the custom device exemption (Ref. 168) and has provided information on its website about expanded access for medical devices (Ref. 169) as resources to device manufacturers, including laboratory manufacturers, among others.

(Comment 141) Some comments claimed that AMCs engage in the practice of medicine when they modify or use FDA-authorized tests off-label and so AMCs are not subject to FDA laws and requirements when they engage in these activities. Another comment stated that there are exclusions in the FD&C Act that apply to AMCs. Specifically, the comment quoted the following provision from the FD&C Act: ''practitioners licensed by law to prescribe or administer drugs or devices and who manufacture, prepare, propagate, compound or process drugs or devices solely for use in the course of their professional practice,'' and cited the following provisions in the FD&C Act: 21 U.S.C. 360(g)(2), 360i(c)(2),[84] and 374(a)(2)(B).

(Response 141) We do not agree that the ''practice of medicine'' provision in the FD&C Act is so broad as to encompass all of the activities raised in the comments (see response to comment 74 for a further discussion of this provision). Section 1006 of the FD&C Act expressly states what conduct within the practice of medicine falls outside of FDA's statutory authority. *See* 21 U.S.C. 396 (''Nothing in this [Act] shall be construed to limit or interfere with the authority of a health care practitioner to prescribe or administer any legally marketed device to a patient for any condition or disease within a legitimate health care practitioner-patient relationship,'' with several explicit limitations). Notably, the provision limits FDA's oversight of certain practitioners' ''prescrib[ing] or administer[ing]'' of a ''legally marketed device,'' but it does not reach the manufacturing of a device. Thus, to the extent that an AMC or AMC laboratory is manufacturing a device, including by modifying another entity's device, its actions do not fall within the ''practice of medicine'' provision.

Regarding the comment asserting that various referenced exemptions in the FD&C Act generally apply to AMCs or AMC laboratories, we note that these exemptions apply when a ''practitioner[ ]'': (1) is ''licensed by law to prescribe or administer'' a device, such as an IVD, (2) ''manufacture[s]'' that device, and (3) does so ''solely for use in the course of their [or his] professional practice.'' As discussed in response to comment 77, these exemptions are only relevant when a particular individual meets all three criteria and, by their plain terms, do not apply to an institution or an entity. Thus, to the extent the commenter is asserting that all AMCs or all AMC laboratories generally fall within these exemptions, we disagree.

(Comment 142) Several comments suggested that AMCs should be subject to the same enforcement approach as all other IVD manufacturers because it is important that patients be able to depend on tests regardless of who develops them. One comment stated that applying the same oversight approach would help to ''standardize the development and validation of LDTs.'' Another comment thought that FDA should not continue an enforcement discretion approach for LDTs manufactured and used in an AMC laboratory because it falsely gives the impression that LDTs manufactured by AMCs are superior to LDTs manufactured by non-AMCs. Another comment highlighted that FDA's memorandum to file entitled ''Summary of 2020 Assessment of the First 125 EUA Requests from Laboratories for Molecular Diagnostic Tests for SARS–CoV–2'' concluded that the deficiencies found in design, validation, and performance of COVID–19 tests were similar across all types of laboratories, including AMCs (see Ref. 18). Other comments suggested that any continuation of enforcement discretion should be test-based, with comments highlighting that FDA should focus on continuing its enforcement discretion approach for tests developed to meet needs of those impacted by pediatric and rare diseases, regardless of where the test is manufactured.

(Response 142) FDA agrees that patients should be able to depend on IVDs regardless of who manufactures them, which is why FDA is phasing out the general enforcement discretion approach for LDTs. This phaseout policy includes several enforcement discretion policies for certain requirements for specific categories of IVDs manufactured by a laboratory. This phaseout policy is intended to better protect the public health by helping to assure the safety and effectiveness of IVDs offered as LDTs, while also accounting for other important public health considerations such as patient access and reliance.

Regarding the enforcement discretion policies FDA is adopting, as discussed further in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. We understand that AMCs generally integrate their laboratories within their

[84] Although this comment cited 21 U.S.C. 360(i)(c)(2), we believe the commenter may have intended to reference 21 U.S.C. 360(i)(c)(1), which refers to ''any practitioner who is licensed by law to prescribe or administer devices intended for use in humans and who manufactures or imports devices solely for use in the course of his professional practice.''

respective healthcare systems, and so this policy generally applies to their LDTs for unmet needs, as well as the unmet need LDTs manufactured and performed by other laboratories integrated within a healthcare system.

As discussed further in section V.B.3, FDA understands that laboratories integrated within a healthcare system may no longer manufacture and perform many critical LDTs for unmet needs due to a lack of financial incentive and the perceived costs of premarket review and QS requirements for such tests if expected to comply with such requirements. FDA is aware, however, of problems with certain IVDs offered as LDTs manufactured and performed by AMC laboratories (see response to comment 32). Certain evidence of problematic IVDs offered as LDTs described in the NPRM addressed tests from AMCs, including the memorandum described above entitled ''Summary of 2020 Assessment of the First 125 EUA Requests from Laboratories for Molecular Diagnostic Tests for SARS-CoV–2'' (Ref. 18). In addition, another FDA memorandum and several of the studies referenced in the NPRM referenced IVDs manufactured by AMC laboratories (see Refs. 20 and 92). We believe the risk mitigations present in laboratories integrated within healthcare systems, and various other risk mitigations, as described in section V.B.3, help to address some of the concerns raised regarding problematic IVDs offered as LDTs discussed in the NPRM and this preamble.

As discussed further in section V.B.3, while we recognize that these features do not mitigate all risk and there may still be some uncertainty about the performance of tests subject to this policy, we believe that these features support enforcement discretion for premarket review and quality system requirements in the specific context of LDTs for unmet needs. FDA considers an LDT to be for an unmet need where there is no available FDA-authorized IVD that meets the patient's needs. This may be because: (1) there is no FDA-authorized IVD for the disease or condition (for example, because it is for a rare disease or condition); (2) there is an FDA-authorized IVD for the disease or condition but it is not indicated for use on the patient, or a unique attribute needs to be added to the LDT to meet the patient's needs; or (3) there is an FDA-authorized IVD but it is not available to the patient.

We also acknowledge statements in the comments that applying the same oversight approach would help to standardize the development and validation of LDTs. In light of unique validation issues for many IVDs for unmet needs, FDA intends to consider whether issuing additional guidance regarding validation of tests, including those for rare diseases that takes into consideration the challenges in obtaining a robust number of samples for validation, would be helpful, as discussed in section V.B.3. In the event FDA were to issue any such guidance, FDA would do so in accordance with good guidance practices (see § 10.115). FDA anticipates that such guidance could result in more consistently robust validation practices across laboratories that develop tests for unmet needs and reduce the potential for introduction of poorly performing LDTs.

Finally, we do not think it is appropriate to adopt an enforcement discretion policy for all LDTs developed to meet the needs of those impacted by pediatric and rare diseases, regardless of where the LDT is manufactured and performed. As discussed further in section V.B.3, such a policy would appear to be overly broad, as there are not the same risk mitigations present for all such LDTs that would help address and avoid the use of problematic LDTs.

(Comment 143) A number of comments expressed concern that if FDA were to continue its general enforcement discretion approach for AMCs, it would distort the market and negatively impact underserved and rural regions. Comments indicated that AMCs are generally concentrated in urban areas and that many patients in rural areas are not able to access AMCs due to lack of proximity or insurance coverage. Another comment stated that community health centers provide more cancer treatment than AMCs. The comments expressed fear that continuing an enforcement discretion approach for AMCs will exacerbate the disparities in care between urban and rural regions and would be detrimental to the ability of community centers to provide tests for cancer patients. Similarly, another comment stated that non-AMCs will have trouble attracting talent if FDA continues to exercise enforcement discretion for AMCs.

(Response 143) As discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system.

FDA believes that this policy will help to address the concerns raised in the comments for patients in underserved and rural regions and should mitigate concerns about attracting talented laboratorians. The policy applies to all laboratories integrated within a healthcare system, not only AMCs. FDA anticipates that this policy will help to avoid laboratories integrated within healthcare systems, wherever such healthcare systems are located, from no longer manufacturing LDTs to meet the unmet needs of patients receiving care within the same healthcare system due to the costs of compliance with premarket review and QS requirements.

(Comment 144) Several comments suggested that FDA not extend its general enforcement discretion approach to AMCs if AMCs were to ''commercialize'' the tests they develop at a significant volume.

(Response 144) FDA believes that an enforcement discretion policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system should be limited only to those LDTs for which there is an unmet need, and should not apply when there is an FDA-authorized test available that meets the needs of the patient. There may be an unmet need because—(1) there is no FDA-authorized IVD for the disease/condition (for example, because it is for a rare disease/condition); (2) there is an FDA-authorized IVD for the disease/condition but it is not indicated for use on the patient, or a unique attribute needs to be added to the test to meet the patient's needs; or (3) there is an FDA-authorized IVD but it is not available to the patient. Moreover, as described in section V.B.3, this enforcement discretion policy is limited to LDTs for patients who are receiving care within the same healthcare system as the laboratory offering the test.

(Comment 145) Multiple comments indicated that it will be difficult to develop a consistently implementable definition of AMCs. Many other comments stated that AMC laboratories serve patients beyond a single physical location and that such a ''requirement'' would be too narrow. These comments indicated that it is rare for specimen collection, testing in a clinical laboratory, and treatment of the patient to all take place in the same building. Comments also pointed out that real estate availability and patient needs may force AMCs to take advantage of multiple physical spaces. Other comments indicated that while AMCs may span multiple physical locations, they may all be connected by one

electronic management record system. Some comments suggested FDA consider an enforcement discretion policy for AMCs that have closely affiliated health systems or where the laboratories work directly or in coordination or collaboration with the academic institution. Other comments questioned what it meant to have a medical residency training or fellowship program involving test development, and whether this applied to pathology. Others wanted clarity on the meaning of ''direct patient care.''

We also received many comments providing various possible definitions of an AMC. Common across many comments was that AMCs are high-complexity CLIA-accredited laboratories and that the leadership or a portion of the laboratory leadership have an academic appointment at an Accreditation Council for Graduate Medical Education (ACGME)-accredited school with a training program in pathology or laboratory medicine. Some comments suggested an AMC laboratory should provide testing for patients in their AMCs. Another comment suggested an AMC laboratory should accept at least 50 percent of its samples from patients being tested within the institution-affiliated healthcare system. Another comment suggested that FDA should not limit an enforcement discretion policy to tests where samples come from within the AMC because AMCs are often referral centers. A comment suggested that an AMC be defined as a nonprofit 501(c)(3) with a Liaison Committee on Medical Education-accredited medical school, teaching hospital, residency training program, and a mission to educate medical professionals. Other comments suggested an AMC use a single EMR where testing is performed within the system and reported into the system EMR. Another comment suggested an AMC is a unit where the physician ordering the specimen is either employed by the healthcare system or has active clinical privileges at a hospital owned by the healthcare system.

(Response 145) Based on these and other comments submitted to the docket for this rulemaking and for the reasons described in section V.B.3, FDA will not have a separate enforcement discretion policy for AMC laboratories. Instead, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. As such, FDA is not defining an AMC in this preamble and many of the concerns raised in the comments summarized above have been addressed or are no longer relevant (*e.g.,* concerns regarding limiting the policy to manufacturers at a single physical location; questions regarding what it means to have a medical residency training or fellowship program involving test development; questions regarding the meaning of ''direct patient care'').

5. New York State Department of Health Clinical Laboratory Evaluation Program (NYS CLEP)

(Comment 146) FDA received several comments in support of ''leveraging'' LDT approval under established programs, specifically NYS CLEP, in lieu of ending FDA's general enforcement discretion approach for LDTs with respect to premarket review requirements, in order to prevent duplicative efforts and reduce burden for both FDA and laboratories. Some comments expressed general support for relying on established programs such as NYS CLEP, but noted that these programs would need to be aligned with FDA's regulatory review standards. Some comments noted that NYS CLEP provides a robust system of oversight and furthers the same goals as FDA's 510(k) process, but they suggested that adverse event data collection and registration and listing should be conducted at the Federal level. Other comments recommended using NYS CLEP as a model when structuring FDA's enforcement of requirements for IVDs offered as LDTs. Some comments supported the idea of continuing the general enforcement discretion approach for all FDA requirements for tests that have already been approved by NYS CLEP. One comment noted that relying on existing programs and continuing enforcement discretion for these tests would reduce concerns about bottlenecks in FDA's review capacity and constraints on innovation and alleviate concerns about increased costs.

NYS provided a comment indicating support for continued enforcement discretion with respect to premarket review requirements for LDTs they have reviewed and approved. They explained that their ''technical review is designed to determine whether the test is analytically and clinically valid. The laboratory must submit all applicable standard operating procedures, validation data demonstrating accuracy and reliability of the test results, documentation that the results are associated with a clinical or public health need, examples of reports, and other material necessary to evaluate the tes t. . . . CLEP's LDT oversight process is designed to address the risk for each LDT and considers all parts of the test, including test method, intended use, specimen type, and claims, as well as the laboratory performing the test. Each LDT application is reviewed by subject matter experts with post-graduate experience and training in the field and reviews are not conducted during onsite survey. An LDT approval is specific to the laboratory. . . . Tests that cannot meet CLEP requirements are denied. Approval may be revoked or modified if an approved test is found subsequently to be no longer analytically and/or clinically valid.'' However, NYS supported the collection of adverse event information and registration and listing information at a national level.

(Response 146) As discussed in section V.B.2, FDA intends to exercise enforcement discretion with respect to premarket review requirements for LDTs approved by NYS CLEP. FDA notes that this is an enforcement discretion policy and not a substitute for FDA premarket review. FDA believes that the term ''leveraging'' in the NPRM (88 FR 68006 at 68024) might have caused confusion. FDA recognizes that NYS CLEP's regulatory framework is not the same as FDA's (*e.g.,* NYS CLEP has a different risk classification and premarket review program). However, as explained in section V.B.2, FDA believes that NYS CLEP has a program that provides for certain mitigations that help reduce the risk of harm from inaccurate and unreliable LDTs. Specifically, NYS CLEP has a program under which high risk and moderate risk LDTs generally are evaluated for analytical and clinical validity. Based on the available information, FDA believes that generally NYS CLEP's review of analytical and clinical validity of LDTs helps to mitigate the risk of harm from inaccurate and unreliable LDTs and that, rather than enforcing premarket review requirements by FDA, it would be more efficient and effective to use our resources for other oversight activities regarding IVDs offered as LDTs. See section V.B.2. for further information. We have accounted for this enforcement discretion policy in the FRIA. Specifically, as discussed in appendix A of the FRIA (Ref. 10), we estimate that 12.1 percent of IVDs offered as LDTs would not experience new costs associated with submission preparation and review as a result of FDA's enforcement discretion policy with respect to LDTs approved by NYS CLEP.

However, as discussed in section V.B.2, FDA intends to phase out its general enforcement discretion approach with respect to other regulatory requirements, such as registration and listing and MDR requirements, for these LDTs. Enforcement of other requirements will help to protect and promote the public health, *e.g.,* by providing FDA and the public with important information about these tests. See section V.B.2 for further information.

(Comment 147) Some comments stated that an external program such as NYS CLEP should not ''replace FDA regulation,'' but noted that such programs could be used to streamline FDA review or provide additional ''flexibility'' to tests certified under such regimes. Some comments expressed concern that such external programs would be unable to handle the volume of requests from laboratories, and others noted that if FDA were to ''leverage'' such external programs and continue its general enforcement discretion approach, this may lead to an overly broad approach with FDA accepting foreign standards like the EU CE Certificate.

(Response 147) FDA's policy with regard to LDTs approved by NYS CLEP does not ''replace FDA regulation.'' As described in section V.B.2, FDA intends to exercise enforcement discretion with respect to premarket review requirements, but not other FDA requirements such as MDR reporting, for LDTs approved by NYS CLEP. See section V.B.2. for further information. Additionally, as noted above, this is an enforcement discretion policy and not a substitute for FDA premarket review. As described in section V.B.2, FDA intends to exercise enforcement discretion and generally not enforce the premarket review requirements for LDTs approved by NYS CLEP because NYS CLEP has a program under which high risk and moderate risk LDTs generally are evaluated for analytical and clinical validity. Based on the available information, FDA believes that generally NYS CLEP's review of analytical and clinical validity of LDTs helps to mitigate the risk of harm from inaccurate and unreliable LDTs and that, rather than enforcing premarket review requirements by FDA, it would be more efficient and effective to use our resources for other oversight activities regarding IVDs offered as LDTs. Further, as stated in section V.B.2, FDA retains its discretion to pursue enforcement action at any time against violative IVDs when appropriate.

This enforcement discretion policy for LDTs approved by NYS CLEP does not apply to tests with foreign approvals if those tests are not approved by NYS CLEP. With respect to concerns regarding potentially overwhelming NYS CLEP, the likelihood of this result is unclear. However, FDA anticipates collaborative communication with NYS CLEP. Should experience with this policy indicate that changes are warranted, FDA would consider appropriate policy changes through guidance in accordance with good guidance practices (see § 10.115).

(Comment 148) A few comments stated that FDA should not ''leverage'' outside programs and continue applying the general enforcement discretion approach for tests under those programs. They stated that these programs as they exist today do not have the same scope and standards as FDA's device regulations. Further, they stated that ''allowing'' external programs with different standards to ''stand in for FDA regulation'' would not further the goal of implementing a single risk-based regulatory framework.

(Response 148) As discussed in the response to comment 146, FDA believes that the term ''leveraging'' in the NPRM (88 FR 68006 at 68023) might have caused confusion. FDA recognizes that NYS CLEP's regulatory framework is not the same as FDA's (*e.g.,* NYS CLEP has a different risk classification and premarket review program). However, as discussed in section V.B.2, FDA intends to exercise enforcement discretion with respect to premarket review requirements for LDTs approved by NYS CLEP because FDA believes that NYS CLEP has a program that provides for certain mitigations that help reduce the risk of harm from inaccurate and unreliable LDTs. See section V.B.2 for further information. FDA notes that this is an enforcement discretion policy and not a substitute for FDA premarket review or a ''stand in for FDA regulation.'' Further, as described in section V.B.2, FDA generally intends to exercise enforcement discretion with respect to premarket review requirements, but not other FDA requirements such as MDR reporting, for LDTs approved by NYS CLEP. See section V.B.2 for further information.

(Comment 149) One comment asked whether an enforcement discretion policy for NYS CLEP-approved LDTs would include those used on people across all states, or whether the policy would be limited to NYS CLEP-approved tests used only in New York State.

(Response 149) FDA generally intends to exercise enforcement discretion with respect to premarket review requirements for LDTs approved by NYS CLEP. As explained in section V.B.2, these are LDTs with NYS CLEP approval, conditional approval, or within an approved exemption from full technical documentation granted by NYS CLEP. The enforcement discretion policy with respect to LDTs approved by NYS CLEP applies regardless of whether that LDT is performed on specimens from NYS or elsewhere, as the risk mitigations upon which the policy is based apply regardless of where the specimens are coming from. This enforcement discretion policy only applies to the version of the LDT approved by NYS CLEP. If the laboratory is offering and using a different version of the LDT that is not approved by NYS CLEP, this enforcement discretion policy would not apply.

(Comment 150) FDA received comments suggesting that NYS CLEP should be granted ''deemed'' status and tests subject to NYS CLEP should be exempt from the phaseout of FDA's general enforcement discretion approach for LDTs.

(Response 150) As described in section V.B.2, FDA generally intends to exercise enforcement discretion with respect to premarket review requirements for LDTs approved by NYS CLEP. FDA's policy with respect to LDTs approved by NYS CLEP is an enforcement discretion policy and not a substitute for FDA premarket review. Further, FDA intends to phase out its general enforcement discretion approach with respect to other regulatory requirements, such as registration and listing and MDR requirements, for these LDTs. Enforcement of other requirements will help to protect and promote the public health, *e.g.,* by providing FDA and the public with important information about these tests. For additional discussion of FDA's policy with respect to LDTs approved by NYS CLEP, see section V.B.2.

6. Timing and Structure of the Phaseout Policy

(Comment 151) FDA's proposed phaseout policy described a gradual phaseout of the general enforcement discretion approach for LDTs that would occur in stages over a total period of 4 years. FDA received several comments stating that this timeline is too short and should be extended. These comments generally proposed that FDA modify the phaseout period to last a total of 7–10 years, though at least one comment proposed a significantly longer phaseout period of 15 years. One

comment suggested that each stage of the phaseout period should be extended by an additional year. These comments generally characterized the length of the phaseout period as unreasonable or not workable, and emphasized laboratories' lack of experience and infrastructure for complying with FDA requirements; the number of tests that laboratories will have to address and associated resource demands; FDA's resource limitations; the time required for laboratories to become familiar with applicable requirements; and general uncertainty regarding how laboratories will navigate the phaseout process. One comment noted that in a survey of 39 laboratories, only 1 laboratory stated that it would likely be able to implement all applicable requirements within the 4-year timeframe (this survey is described in Ref. 170). In describing this survey finding, the comment characterized the proposed phaseout timeline as ''unrealistic since the requirements for FDA approval cannot be conducted in a timely fashion due to the large number of LDTs and insufficient resources,'' and further stated that ''[FDA's] review process is also lengthy once data is submitted.'' Some comments suggested that the length of the phaseout period be extended for certain types of tests, such as diagnostic flow cytometry leukemia and lymphoma immunophenotyping tests, due to the challenges associated with preparing premarket submissions for such tests.

In addition, one comment noted that the average time to bring a medical device to market has been estimated to range from 2–7 years, and several comments noted that FDA had proposed a longer phaseout period of 9 years in 2014. One comment noted that the VALID Act had proposed a transition period of up to 10 years. Another comment stated that the reliance interests of laboratories would be harmed if the length of the phaseout period were not extended, given the challenges that laboratories would face from competing demands for limited resources.

FDA also received comments stating that the overall length of the phaseout period should be reduced. One comment stated that if laboratories have been doing ''the right thing,'' they should not require 4 years to comply with applicable requirements, and patients should not have to wait 4 years to be able to rely on accurate tests. Another comment suggested that FDA consider the Agency's expectations for a startup conventional IVD manufacturer and apply the same expectations to laboratory manufacturers, stating that a conventional manufacturer could not take 4 years to come into compliance. One comment stated that FDA should shorten the phaseout period for premarket approval requirements for tests that pose a higher risk of harm from 4 years to 1–2 years.

FDA also received a comment that agreed with FDA's phaseout timeline. This comment stated that the timeline would give laboratories adequate time to come into compliance with applicable requirements while allowing FDA to gather information on the LDT market and prioritize review of high-risk tests.

(Response 151) After considering the public comments and the impact of new enforcement discretion policies included in the final phaseout policy, FDA has determined that it should retain a 4-year, gradual phaseout of the Agency's general enforcement discretion approach for LDTs.

As described in section II.F of the FRIA (Ref. 10), FDA has estimated the time and resources that will be required for laboratories to comply during each stage of the phaseout policy. We estimate total costs to be approximately $101 million for stage 1 in year 1 for 1,275 affected laboratories, $113 million for stages 1 and 2 in year 2 for 1,275 affected laboratories, $386 million for stages 1 through 4 in year 3 for 858 affected laboratories, and $1.65 billion for stages 1 through 5 for 849 affected laboratories with 7,554 premarket submissions in subsequent years (year 4 to year 20).

Based on these estimates, and in consideration of the factors discussed for each stage of the phaseout policy in section V.C, FDA has determined that the time allotted for each stage of the phaseout will give laboratories adequate time to comply with the requirements that are the focus of that stage. For example, FDA has determined that a 1-year time period is adequate to phase out the general enforcement discretion approach for LDTs with respect to MDR requirements and correction and removal reporting requirements under stage 1 of the phaseout policy, given that laboratories should already have some processes in place for detecting problems with their IVDs to comply with CLIA regulations, and in stage 1 laboratories will be reporting adverse events and malfunctions to FDA in accordance with part 803. Additional discussion of the timeframe associated with stage 1 and the timeframes associated with other stages of the phaseout policy is provided in response to comments 154–159. Additional discussion of FDA's phaseout of the general enforcement discretion approach with respect to particular requirements under each stage of the phaseout policy is provided in sections VI.F.7–13 of this preamble.

In addition, changes have been made to the phaseout policy that directly address the concerns raised in comments that laboratories' reliance interests will be harmed if the phaseout period is not extended, and that laboratories will not be able to come into compliance during the time periods set forth in the phaseout policy (*e.g.,* due to the lack of experience with FDA oversight, the cost of compliance, etc.). FDA recognizes that some laboratories may lack familiarity, experience, or existing infrastructure for complying with FDA requirements. However, we note that, as discussed elsewhere in this preamble, there are numerous existing final guidance documents and educational resources made available by FDA to help companies comply with requirements applicable to devices. FDA also intends to issue guidance documents or make other resources available to provide further clarity to stakeholders regarding implementation of certain aspects of the phaseout policy following issuance of this rule. FDA also recognizes that the time and resource demands associated with each stage of the phaseout policy may be significant for laboratories, and a laboratory's efforts to come into compliance with the requirements associated with different stages of the phaseout policy may need to take place concurrently. However, as described in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs. As discussed further in section V.B.3, this policy takes into account that laboratories may have made financial investments and other decisions based on a past assumption about the presence of the general enforcement discretion approach.

In addition, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs that are approved by NYS CLEP. As a result of these policies, the time and resources associated with stages 3, 4, and 5 of the phaseout policy are estimated to be significantly reduced as

compared to the estimates in the PRIA (see sections II.F.3, 4, and 5 of the FRIA (Ref. 10)). With fewer competing demands, laboratories may be better able to comply with the requirements that are the focus of stages 1 and 2 of the phaseout policy.

While the Agency appreciates the information provided in a comment regarding a survey in which only 1 out of 39 laboratories stated that the laboratory would likely be able to implement all applicable requirements within the proposed 4-year phaseout period, this survey did not take into account the enforcement discretion policies described in the preceding paragraph. The comment that described this survey emphasized the perceived burden of compliance with FDA's premarket review requirements, yet under many of the enforcement discretion policies included in the final phaseout policy, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements. FDA also notes that this survey was conducted with a small sample size and reflects the subjective views of entities that would be subject to increased FDA oversight under the phaseout policy.

Regarding the comments on extending the phaseout policy in light of demands on FDA resources, we note that the enforcement discretion policies included in the final phaseout policy will significantly reduce these demands. The annualized costs to FDA over 20 years are approximately $408 million less than the estimates in the PRIA (in the FRIA, the primary estimate for FDA review costs over 20 years at a 7 percent discount rate are $121 million, as compared to $530 million in the PRIA). These policies, and in particular the policy for currently marketed IVDs offered as LDTs, also address concerns that FDA should modify the length of the phaseout period for certain types of tests to account for perceived challenges associated with preparing premarket submissions for such tests.

FDA does not believe it would be in the best interest of public health to adopt a longer phaseout period or to extend the time allotted for any of the stages in the phaseout policy. Based on information currently available to the Agency regarding the risks associated with IVDs offered as LDTs (as discussed in the NPRM and sections III.B and VI.C of this preamble), an extension of the phaseout policy to a period longer than 4 years would be inconsistent with FDA's mission to protect the public health. FDA encourages manufacturers to begin working towards compliance with applicable requirements as early as possible, and to engage with FDA through a Pre-Submission or other available mechanism.

FDA recognizes that the Agency proposed a different timeline for phasing out its general enforcement discretion approach for LDTs in 2014, which, if finalized, would have involved a longer overall phaseout period. However, as noted in section III.B and described in the NPRM, FDA's concerns regarding the risks associated with IVDs offered as LDTs have grown in recent years, and more recent evidence from a variety of sources underscores the pressing need to better assure the safety and effectiveness of IVDs offered as LDTs (88 FR 68006 at 68009). Diagnostic testing is increasingly important; for example, as time goes on, more novel treatments will require use of a specialized test to identify patients likely to benefit from those treatments.[85] Furthermore, IVDs offered as LDTs are a growing sector of the diagnostic testing market (Ref. 4). FDA anticipates that IVDs will continue to become more complex and play a greater role in modern healthcare (Ref. 3). The U.S. LDT market size is anticipated to grow 6 percent from 2023 to 2030 due to varying factors including increased use in personalized medicine and rising prevalence of chronic diseases. (Id.) FDA is therefore taking steps to oversee the safety and effectiveness of IVDs regardless of where they are manufactured, so that both now and in the future, patients can have confidence about the tests used in their care.

Moreover, the longer timeline proposed in 2014 included a phaseout of enforcement discretion for LDTs already on the market, whereas the phaseout policy described in this preamble phases out enforcement discretion with respect to premarket review for IVDs offered as LDTs entering the market after publication of the final rule.

We disagree with comments that the time to bring a device to market or any timing provisions in the proposed VALID Act should dictate the timeline of the phaseout policy. For example, we note that even if the average time to bring a medical device to market ranges from 2–7 years, as one comment asserted, this does not mean that 7 years is needed to prepare and submit a premarket submission to FDA, even if new data must be collected to support the submission. FDA is aware of estimates that refer to the time required to bring a new device all the way from concept to market as 3–7 years (Ref. 171). Not only does this cover development time prior to FDA review, but it is also based on all devices including permanent implants, which generally take longer to develop and evaluate than IVDs.

FDA also does not agree that the length of the phaseout period should be reduced to less than 4 years. A reduced timeline would mean phasing out the general enforcement discretion approach with respect to premarket review requirements before the start of a new user fee cycle, which would not provide industry with a prior opportunity to participate in user fee negotiations with the knowledge that laboratory manufacturers will be expected to comply with premarket review requirements for new IVDs offered as LDTs. A shorter overall phaseout timeline would also place greater concurrent demands on laboratory resources. For the same reasons, FDA does not believe that the phaseout period for premarket review requirements for high-risk IVDs offered as LDTs should be shortened from 4 years to 1–2 years. FDA notes that the phaseout policy already prioritizes phasing out the general enforcement discretion approach for high-risk IVDs offered as LDTs by phasing out enforcement discretion with respect to premarket review requirements for high-risk tests prior to doing so for moderate-risk and low-risk tests.

Finally, some comments suggested that the length of the phaseout period be extended for certain types of tests, such as diagnostic flow cytometry leukemia and lymphoma immunophenotyping tests, due to the challenges associated with preparing premarket submissions for such tests. We believe the timelines for premarket review are reasonable and appropriate, as discussed further in section V.C and the responses to comments in section VI.F.13. Moreover, providing different timelines for the phasing out of the enforcement discretion approach for different types of IVDs would be overly complicated for laboratories to follow and for FDA to implement.

(Comment 152) FDA received comments stating that the timing of certain stages of the phaseout policy should be measured from when FDA issues final guidance documents or other educational materials regarding implementation of the phaseout policy, rather than from publication of the phaseout policy itself.

(Response 152) FDA disagrees with these comments. Although FDA intends to issue guidance documents or make

[85] *See, e.g.,* Ref. 23 (''Demand is increasing in the CDx market, due to the paradigm shift to precision medicine.'').

other resources available to provide further clarity to stakeholders regarding implementation of certain aspects of the phaseout policy, and intends to issue any such guidance documents or provide other resources expeditiously, there are numerous existing final guidance documents and educational resources on FDA's website to help companies comply with FDA requirements applicable to devices. Moreover, this preamble includes extensive information about the phaseout policy and FDA's expectations, as well as references to final guidance documents and resources available to laboratories.

(Comment 153) One comment stated that it was unclear whether FDA intended the stages of the phaseout policy to run concurrently or consecutively. The comment requested that FDA clarify this point.

(Response 153) The timing for each stage of the phaseout policy is based on the date that FDA publishes this final rule and not when the previous stage ends. For example, stage 3 will begin after 3 years, measured from the date of publication of this final rule and not relative to the timing of any other stages. However, because each stage will begin after a different length of time has passed from the date of publication of this final rule, the stages will commence in sequence. For example, as described in section V.C, stage 1 will commence 1 year after publication of this final rule. Upon the start of stage 1, FDA will generally expect compliance with applicable MDR requirements, correction and removal reporting requirements, and QS requirements under § 820.198 (complaint files). Stage 2 will commence 2 years after publication of this final rule. Upon the start of stage 2, FDA will generally expect compliance with applicable requirements discussed under stage 2, in addition to continued compliance with MDR requirements, correction and removal reporting requirements, and QS requirements under § 820.198 (complaint files) for which the general enforcement discretion approach was phased out at the beginning of stage 1.

(Comment 154) One comment stated that ending the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements 1 year after publication of the phaseout policy is appropriate, as this timeline will enable FDA to quickly identify LDTs potentially associated with safety or performance issues. This comment further stated that laboratories that are in compliance with CLIA requirements should already have systems in place for detecting problems with their tests. Another comment stated that FDA should end the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements 6 months after publication of the phaseout policy. According to this comment, 6 months is more than adequate to establish procedures for identifying events that need to be reported and for implementing a reporting mechanism (*e.g.,* through the FDA eSubmitter software). In addition, this comment recommended that all subsequent stages of the phaseout policy commence 6 months sooner than proposed by FDA, as a result of the shorter timeline for phasing out the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements under stage 1.

(Response 154) FDA agrees with the comment that stated that phasing out the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements 1 year after publication of the phaseout policy is appropriate, for the reasons discussed in section V.C. FDA also agrees that most laboratories should be able to establish and implement procedures for complying with MDR requirements and correction and removal reporting requirements within 6 months; however, we also believe it is appropriate to provide a little more time to help to ensure compliance with the requirements.[86] In recognition that phasing out the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements too quickly may lead to less effective reporting, FDA has determined to phase out the general enforcement discretion approach with respect to these requirements 1 year after publication of this final rule. As such, FDA also disagrees that all subsequent stages of the phaseout policy should commence 6 months sooner than proposed by FDA in the proposed phaseout policy.

(Comment 155) FDA received one comment which expressed concern that FDA had not proposed to phase out the general enforcement discretion approach with respect to the requirements addressed in stage 2 of the phaseout policy in a manner that would distinguish between IVDs of different risk levels. The comment stated that a decision not to pursue such an approach, which FDA had previously considered, would be arbitrary and not justified.

(Response 155) FDA does not agree that the phaseout of the general enforcement discretion approach with respect to the requirements addressed in stage 2 of the phaseout policy should be conducted in a manner that distinguishes between IVDs of different risk levels, or that the Agency's decision not to structure the phaseout policy in the manner suggested by the comment is arbitrary and unjustified. The requirements for which FDA will expect compliance in stage 2 of the phaseout policy, including registration and listing requirements under 21 U.S.C. 360, part 607, and part 807 (excluding subpart E), labeling requirements under 21 U.S.C. 352 and parts 801 and 809, subpart B, and investigational use requirements under 21 U.S.C. 360j(g) and part 812, are general controls under section 513(h)(1) of the FD&C Act, and are thus generally applicable to all devices. FDA has determined that it would best serve the public health to phase out the general enforcement discretion approach with respect to these requirements 2 years after publication of this final rule, irrespective of the risk classification of the device.

In the NPRM, FDA acknowledged that this proposal was different from FDA's prior statements in the 2017 Discussion Paper (88 FR 68006 at 68025), wherein FDA discussed a scenario in which the timing of FDA's expectations for compliance with certain requirements might depend on the type of premarket review applicable to the device (Ref. 57). FDA anticipates that 2 years is adequate time for laboratories to come into compliance with the requirements addressed in stage 2, and structuring the phaseout policy in this manner is easier for laboratories to comprehend and follow, easier for FDA to implement, and more responsive to the pressing need for additional FDA oversight of IVDs offered as LDTs.

(Comment 156) One comment requested clarification as to whether FDA intends to phase out the general enforcement discretion approach with respect to QS provisions regarding complaint files under § 820.198 during stage 1 of the phaseout policy (when FDA generally intends to phase out the general enforcement discretion approach with respect to MDR requirements), rather than during stage 3 of the phaseout policy, given that FDA's regulations regarding MDR requirements state that ''[i]f you are a manufacturer, you may maintain MDR

[86] Some comments submitted on the draft guidance documents that FDA issued in 2014, in which FDA proposed a 6-month timeframe for laboratory compliance with MDR requirements, suggested that a longer period would be appropriate.

event files as part of your complaint file, under part 820 of this chapter, if you prominently identify these records as MDR reportable events. We will not consider your submitted MDR report to comply with this part unless you evaluate an event in accordance with the quality system requirements described in part 820 of this chapter'' (§ 803.18(e)).

(Response 156) FDA has modified the phaseout policy to clarify that while FDA generally intends to phase out the general enforcement discretion approach with respect to QS requirements in stage 3 of the phaseout policy (as described in section V.C), FDA intends to phase out the general enforcement discretion approach with respect to the QS requirements under § 820.198 (complaint files) in stage 1 of the phaseout policy, given the connection between the complaint investigation and complaint file requirements and the MDR reporting regulations.

(Comment 157) FDA received one comment which stated that it could take up to a year for a sizable healthcare system to prepare a list of LDTs, before the healthcare system could list those LDTs with FDA.

(Response 157) FDA appreciates that it may take time for laboratories to identify and prepare a list of their IVDs offered as LDTs before being able to comply with device listing requirements under the FD&C Act and FDA's regulations. Under FDA's phaseout policy, FDA is phasing out the general enforcement discretion approach with respect to registration and listing requirements 2 years after publication of this final rule, which will provide sufficient time for laboratories to come into compliance even if a year is needed for some laboratories to prepare a comprehensive list of their IVDs offered as LDTs.

(Comment 158) One comment stated that 3 years could be sufficient to develop a quality management system that complies with QS requirements, but that developing a quality management system that is both QS-compliant and CLIA-compliant will be complex and require uncommon knowledge and expertise. This comment also stated that to develop a quality management system that meets FDA's expectations, laboratories will require guidance from FDA with detailed descriptions of the differences that exist between QS requirements and CLIA regulations. The comment urged FDA to phase out the general enforcement discretion approach with respect to QS requirements 4 years after publication of the phaseout policy or 1 year after FDA issues a guidance document regarding the differences that exist between the QS requirements and CLIA regulations, whichever comes later. The comment also stated that this approach should provide FDA sufficient time to amend the QSR to harmonize with international standards.

(Response 158) FDA does not agree that the Agency should phase out the general enforcement discretion approach with respect to QS requirements 4 years after publication of the phaseout policy, or 1 year after issuance of a guidance document describing differences that exist between QS requirements and CLIA regulations, rather than 3 years after publication of the phaseout policy as proposed by FDA. While FDA recognizes that laboratories will be complying with applicable CLIA requirements as well as applicable QS requirements, laboratories already comply with CLIA requirements.

Moreover, as discussed in section V.C, compliance with CLIA requirements provides certain quality assurances that may be relevant to laboratories' manufacturing practices, and laboratories may be able to apply concepts set forth under CLIA requirements to manufacturing activities regulated by FDA. As such, and as further discussed in section V.C.3, FDA intends to phase out the general enforcement discretion approach with respect to only a subset of QS requirements rather than all applicable requirements for LDTs. This subset of QS requirements is listed in section V.C.3.

FDA also notes that it has already finalized amendments to the QSR (effective in February 2026), and the amended QS requirements, which align more closely with international consensus standards for devices, will be in effect prior to the beginning of stage 3 (see 89 FR 7496). FDA anticipates providing to all its stakeholders, including laboratories, timely guidance on compliance with the regulatory requirements in that rule. In addition, several educational resources regarding the QS requirements currently applicable under part 820 are currently available on FDA's website (see Ref. 72).

(Comment 159) One comment stated that FDA should phase out the general enforcement discretion approach with respect to premarket review requirements after 4 years for PMAs and after 9 years for 510(k)s and De Novo submissions. Another comment stated that FDA should phase out the general enforcement discretion approach with respect to premarket review requirements after 5 years for PMAs, after 7 years for De Novo requests, and after 9 years for 510(k)s. In addition, one comment stated that if FDA does not continue the general enforcement discretion approach with respect to premarket review and QS requirements for ''existing LDTs,'' FDA should, in the alternative, consider ''exempting or more gradually phasing in premarket review and QSR requirements for LDTs that meet certain criteria,'' such as those ''certified by [NYS CLEP].'' Another comment stated that FDA should extend the phaseout by 5 years for premarket review and QS requirements for LDTs introduced or modified after the effective date of the rule that have approval from NYS CLEP, receive coverage from the MolDx Program, or are performed in a CLIA-certified clinical laboratory accredited by CAP, unless there is credible information establishing that the LDT is marketed with insufficient evidence of analytical or clinical validity, that the LDT is marketed with false or misleading analytical or clinical claims, or that it is probable that the LDT will cause serious adverse health consequences.

(Response 159) After considering the public comments and the impact of other policies included in the phaseout policy, for the reasons discussed in section V.C, FDA has determined that it should phase out the general enforcement discretion approach: (1) with respect to QS requirements (other than requirements under § 820.198 (complaint files)), 3 years after publication of this final rule; (2) with respect to premarket review requirements for high-risk IVDs, 3½ years after publication of this final rule; and (3) with respect to premarket review requirements for moderate-risk and low-risk IVDs (that require premarket submissions), 4 years after publication of this final rule. For further discussion of these stages and the QS and premarket review requirements, see sections V.C.3–5, VI.F.12, and VI.F.13.

FDA disagrees that the phaseout policy should be modified as suggested by these comments. As discussed in response to comment 151, FDA has determined that extending the timelines for stages of the phaseout policy is not necessary to provide an adequate opportunity for laboratories to comply with applicable requirements or to effectively implement the phaseout policy, and is not in the best interest of the public health. This is true even in the case of IVDs offered as LDTs covered by the MolDx Program or performed in a CAP-accredited CLIA-certified laboratory. As discussed in response to comments in section VI.C.3, neither the MolDx Program nor CAP accreditation

provides a substitute for FDA oversight or mitigates the need for FDA oversight. With respect to LDTs approved by NYS CLEP, as described in section V.B.2, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP. As further discussed in section V.B.2, compliance with the QS requirements that FDA intends to enforce for these LDTs will help provide for quality manufacturing of these LDTs. FDA understands that NYS CLEP's clinical laboratory standards (which exceed CLIA requirements in certain respects) and its premarket review requirements collectively could generally satisfy these QS requirements except as to certain aspects of design control documentation, and FDA therefore does not anticipate significant additional burden with respect to compliance with these QS requirements for laboratories offering LDTs approved by NYS CLEP.

We further note that the absence of ''credible information'' establishing a lack of evidence of analytical or clinical validity, false or misleading claims, or a probability that the IVD offered as an LDT will cause serious adverse health consequences does not justify delaying the phaseout of FDA's general enforcement discretion approach with respect to QS and premarket review requirements. Even in the absence of such ''credible information,'' risks may exist that will be mitigated by compliance with applicable QS and premarket review requirements.

In addition, as described above, one comment submitted to the docket suggested that FDA exempt or more gradually phase in premarket review and QS requirements for certain LDTs as an alternative option in the event that FDA determined not to continue the general enforcement discretion approach with respect to premarket review and QS requirements for existing tests. As described in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified in certain limited ways.

(Comment 160) FDA received several comments which stated that the Agency should end the general enforcement discretion approach with respect to MDR requirements and/or registration and listing requirements prior to deciding whether and when to phase out the general enforcement discretion approach with respect to other applicable requirements. These comments generally asserted that FDA lacks certain information necessary to inform the feasibility of the phaseout policy. For example, one comment stated that FDA is missing information regarding how many clinical laboratories currently offer LDTs, how many LDTs are on the market, how frequently LDTs are modified, the nature of those modifications, and the intended use(s) of those LDTs. In addition to these comments, a comment suggested that FDA's 4-year phaseout policy should apply only to high-risk IVDs offered as LDTs, after which FDA should determine how best to proceed with respect to other IVDs offered as LDTs.

(Response 160) FDA does not agree that the Agency should phase out the general enforcement discretion approach only with respect to MDR requirements and/or registration and listing requirements prior to determining how to proceed with respect to other applicable requirements. Although FDA is prioritizing the phaseout of the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements (followed by registration and listing requirements) to obtain additional information about potentially harmful IVDs offered as LDTs as soon as feasible (see discussion in section V.C), FDA already possesses enough information to determine that there is no longer a sound basis to generally treat LDTs differently from other IVDs and that the general enforcement discretion approach for LDTs does not best serve the public health. As discussed in response to comment 151, recent evidence from a variety of sources underscores the pressing need to better assure the safety and effectiveness of LDTs. Adopting a phaseout policy that only addresses MDR and registration and listing requirements at this time would inevitably delay the phaseout of the general enforcement discretion approach for other requirements beyond a 4 year period, and thus would be inconsistent with FDA's mission to protect the public health.

In addition, the FRIA (Ref. 10) provides estimates of much of the information that the comments characterized as ''missing,'' such as how many laboratories currently offer IVDs as LDTs and how many IVDs offered as LDTs are on the market. Although we acknowledge that these are estimates, and we do not have exact numbers, we do not believe that should delay the phaseout of the general enforcement discretion approach, which we have determined is not in the best interest of public health. FDA also does not agree that certain information, such as the intended use(s) of all IVDs offered as LDTs, is necessary for FDA to determine whether and when to phase out the general enforcement discretion approach with respect to certain requirements.

FDA likewise does not agree that the Agency should phase out the general enforcement discretion approach for high-risk IVDs offered as LDTs prior to determining how to proceed with respect to other IVDs offered as LDTs. As FDA explained in the NPRM and in this preamble, the Agency is aware of information showing that there is a high variability in the performance of IVDs offered as LDTs even in circumstances where the test technology is relatively simple and well-understood, and where the tests are low risk (88 FR 68006 at 68010–11).

(Comment 161) Some comments suggested that FDA consider stratifying the phaseout policy by annual test volume, due to the potential impact of high-volume LDTs on larger patient populations.

(Response 161) FDA does not agree that FDA's general enforcement discretion approach for LDTs should be phased out on a different timeline, in a different sequence, or otherwise in a different manner based on annual test volume. The importance of having assurances regarding the safety and effectiveness of IVDs offered as LDTs does not depend on whether IVDs are offered in low or high volume. Moreover, we think stratifying the phaseout in this way would be overly complicated for laboratories to comprehend and follow, and for FDA to implement.

(Comment 162) Some comments stated that FDA did not provide sufficient clarity or specificity regarding how it intends to implement the phaseout policy, resulting in uncertainty among laboratories which may have a ''chilling effect.'' Another comment stated that the phaseout policy is too complicated for laboratories to follow.

(Response 162) We believe the information included in the phaseout policy, including the timeline for the various stages in the phaseout policy and information regarding enforcement discretion policies described in this preamble, provides clear expectations for laboratories that offer IVDs as LDTs. FDA appreciates that additional guidance regarding implementation of the phaseout policy may facilitate

efforts by laboratories to comply with applicable requirements. As discussed more fully in response to comment 291, FDA anticipates issuing a small entity compliance guidance, issuing guidance documents, and/or making additional resources available on specific topics over the course of the phaseout period.

(Comment 163) A comment sought clarification regarding how the phaseout policy will apply to LDTs that are developed during the phaseout period, for example, LDTs that are developed between issuance of the rule and the start of stage 1 of the phaseout policy, or that are developed between successive stages of the phaseout policy.

(Response 163) Laboratories that first introduce IVDs offered as LDTs after the publication of the final rule and during the phaseout period will be expected to comply with requirements consistent with the dates identified for each stage of the phaseout policy. For example, an IVD offered as an LDT introduced 2½ years after publication of this final rule, which would be after the start of stage 2 of the phaseout policy but before the start of stage 3, would be expected to comply with requirements for which FDA has already phased out the general enforcement discretion approach under stages 1 and 2. FDA would expect compliance with QS requirements upon the start of stage 3 (other than requirements under § 820.198 (complaint files), for which FDA would have already phased out the general enforcement discretion approach under stage 1), and so on for stages 4 and 5 as applicable. Laboratories should also be aware of the enforcement discretion policies included in the phaseout policy, including those set forth in section V.B.

7. MDR Requirements

(Comment 164) Many comments supported FDA's proposal to end its general enforcement discretion approach with respect to the MDR requirements within 1 year from publication of the final rule. A comment suggested that this approach was reasonable regardless of the risk or volume of the LDTs the laboratory distributed. However, another comment suggested that FDA would need to provide additional guidance on the types of events it is interested in to avoid being flooded with reports about events that are of the type that are within CLIA's purview. This comment stated that the vast majority of laboratory adverse events are due to human error (*e.g.,* manual mispipetting or a lost specimen) and not due to a design flaw with an LDT. Along these lines, another comment requested that FDA provide definitions of certain terms in the context of laboratories, such as: FDA reportable adverse event, causal for MDR requirements, malfunction, and recall. Another suggested that such definitions align with reporting for ''conventional'' IVDs. Yet another comment suggested that FDA continue the general enforcement discretion approach for the MDR requirements until FDA provides education on this topic.

(Response 164) FDA agrees with the comments supporting FDA's proposed phaseout of enforcement discretion regarding MDR reporting for IVDs offered as LDTs. As stated in section V.C, FDA is phasing out the general enforcement discretion approach with respect to the MDR requirements within one year from publication of the final rule for IVDs offered as LDTs. FDA acknowledges that some laboratories may not be familiar with FDA's MDR requirements in part 803. However, FDA disagrees that this justifies waiting to phase out the general enforcement discretion approach with respect to those requirements. Laboratories should already have some processes in place for detecting problems with their IVDs to comply with CLIA regulations. In addition, FDA already has a number of resources to assist manufacturers in complying with MDR requirements, including guidance, information on FDA's website, and webinars. These include, for example, FDA's final guidance document entitled ''Medical Device Reporting for Manufacturers'' (Ref. 172), and information on ''How to Report Medical Device Problems'' on the Agency's website (Ref. 173). Laboratories can better understand their responsibilities under part 803 by consulting these resources. FDA also intends to develop additional educational resources on MDR reporting to assist laboratories transitioning to compliance with these requirements.

With respect to the comment requesting that FDA provide definitions of certain terms in the context of laboratories, we note that the following terms are already defined in part 803 for purposes of MDR reporting requirements: ''MDR reportable event'' (§ 803.3(o)(2)), ''caused or contributed'' (§ 803.3(c)), and ''malfunction'' (§ 803.3(k)). These definitions apply to MDR reporting requirements regardless of whether the manufacturer of a device is a laboratory and regardless of whether the device at issue is an IVD or another kind of device. Although the term ''recall'' is not used in FDA's MDR regulations, we note that FDA regulations define the term ''recall'' at 21 CFR 7.3(g) (voluntary recalls) and 21 CFR 810.2(k) (mandatory device recalls). FDA has multiple resources for industry regarding recalls available on its website (see, *e.g.,* Ref. 174).

Further, we note that MDR reportable events can include events caused by user error and are not limited to events resulting from a flaw in device design. For example, under the regulations, a device manufacturer must submit a report to FDA when it becomes aware of information that reasonably suggests that the manufacturer's device may have caused or contributed to a death or serious injury (§ 803.50(a)(1)). Section 803.3(c) defines ''caused or contributed,'' to specifically include death or serious injury events occurring as a result of labeling or user error, among other things. However, if the manufacturer determines that an event is solely the result of user error with no other performance issue, and there has been no device-related death or serious injury, the manufacturer is not required to submit an MDR report. It would therefore generally be unlikely that a laboratorian losing a specimen (as referenced in the comment) would be considered a reportable event.

Importantly, CLIA does not require laboratories to report suspected device-associated adverse events to any Federal oversight authority. Therefore, we disagree with the comment suggesting that the phaseout of enforcement discretion for MDR requirements will result in a flood of MDRs for events ''of the type within CLIA's purview.''

(Comment 165) Several comments argued that MDR requirements should not apply to laboratories. Some of these comments indicated that the framework is not appropriate for laboratories, while others asserted that CLIA already covers the MDR activities. In particular, a comment stated that CLIA requires laboratories to identify, document, and perform corrective measures for any laboratory errors, including patient harm and that this documentation is reviewed by a CLIA inspector, its accrediting bodies, or exempt States. Further, the comment stated that CMS-approved accrediting organizations are required to notify CMS within 10 days of any deficiency identified in an accredited or CLIA-exempt laboratory if the deficiency poses an immediate jeopardy to the patient or a hazard to the general public. Another comment suggested that FDA should not ''subject'' laboratories that have a system for reporting errors, and which are integrated within a health system, to the MDR requirements. Another comment opined that compliance with the MDR requirements was not

warranted because events were rare and for most laboratories never occur.

(Response 165) FDA disagrees with the suggestion that laboratory compliance with the MDR requirements is not warranted. MDR reporting is an important postmarket surveillance tool that FDA uses to monitor device performance, detect potential device-related safety issues, and contribute to benefit-risk assessments of medical devices. FDA also disagrees that CLIA ''covers'' activities equivalent to complying with MDR reporting requirements. As explained in our responses to comments in section VI.C.2, the CLIA requirements are geared towards identifying issues and problems with the laboratory operations, not with an LDT itself. Further, unlike FDA's MDR regulations, CLIA regulations do not require centralized reporting of suspected, device-associated adverse events to inform tracking and trending by a Federal oversight authority. FDA's MDR regulations require that a manufacturer report to FDA within specified timeframes when the manufacturer receives or otherwise becomes aware of information reasonably suggesting that a device it markets may have caused or contributed to a death or serious injury, or has malfunctioned and the device or a similar device that the manufacturer markets would be likely to cause or contribute to a death or serious injury, if the malfunction were to recur (§§ 803.50(a) and 803.53). It is important that FDA receive this information to enable it to identify trends and detect safety signals. For example, FDA received MDRs regarding incorrect test results due to ''carryover'' in automated test systems. ''Carryover'' is when a falsely high result is obtained due to residual analyte from a high concentration sample that was tested immediately prior. Upon review of trends across MDRs and further investigation, FDA found that ''carryover'' caused inaccurate results across multiple automated test systems. Based on this finding, FDA worked to ensure that manufacturers of affected automated test systems addressed this issue. This included FDA classification of recalls for affected tests and manufacturer notification to users. As another example, FDA received MDRs indicating that ambient temperature in laboratories was affecting test results for common tests. Upon review of trends across MDRs and further investigation, we found that temperature interference caused inaccurate results across different tests that used different instruments from different manufacturers in different laboratories. Based on this finding, manufacturers redesigned affected tests to address this issue and submitted the changes for FDA review.

For similar reasons, FDA disagrees that there generally should be continued enforcement discretion for MDR requirements for laboratories that have a system for reporting errors, and which are integrated within a health system. Being integrated within a health system does not ensure centralized reporting of suspected, device-associated adverse events to inform tracking and trending by a Federal oversight authority in accordance with the manufacturer reporting requirements in part 803. Continuing to exercise enforcement discretion for the MDR requirements for all the entities identified in the comment would undermine FDA's ability to identify trends or issues with the performance of IVDs offered as LDTs.

Moreover, FDA disagrees with the comment indicating that adverse events associated with LDTs are rare. In the absence of the type of reporting required by the MDR regulations, FDA has no assurance that adverse events associated with IVDs offered as LDTs are ''rare.'' Laboratories may not be tracking or reporting these adverse events currently, but that does not mean that they do not occur. However, if MDR reportable events are truly rare for certain laboratories, that should minimize additional burden of complying with the MDR requirements.

8. Registration and Listing Requirements

(Comment 166) FDA received many comments supporting the need for and rationale behind the proposal to phase out the enforcement discretion approach for registration and listing requirements. One comment emphasized the need to create an active and accurate account of LDTs offered. Some comments voiced the need for FDA to identify and address poorly performing tests and the importance of transparency in terms of LDTs currently in use and any related adverse events.

(Response 166) FDA agrees that registration and listing information will provide FDA with a better understanding of the exact universe of IVDs offered as LDTs and facilitate oversight. FDA is phasing out the general enforcement discretion approach with respect to registration and listing requirements under 21 U.S.C. 360 and part 807 (excluding subpart E) 2 years after publication of this final rule. Under this timeline, FDA will be able to utilize registration and listing information to obtain an understanding of the universe of IVDs offered as LDTs to facilitate premarket review of those IVDs.

FDA also agrees with comments supporting FDA addressing poorly performing IVDs offered as LDTs and noting the importance of transparency in terms of any IVD adverse events. Beginning 1 year after the publication date of this final rule, FDA no longer intends to have the general enforcement discretion approach for MDR requirements, among other requirements. Enforcement of MDR requirements will enable FDA to systematically monitor significant adverse events to identify problematic IVDs offered as LDTs, such as those with poor performance or other safety issues.

(Comment 167) One comment suggested that FDA accelerate the phaseout timeline for registration and listing requirements, emphasizing the importance of this information in implementing the rest of the phaseout policy. Some comments agreed with the need to enforce registration and listing requirements but requested that FDA enforce only the elements that are currently required for IVDs and other devices, as it is ''not appropriate to require more elements for LDTs than are currently required for IVDs and medical devices.''

(Response 167) As described in section V.C, FDA has determined that it will best serve the public health to phase out the general enforcement discretion approach with respect to registration and listing requirements 2 years after publication of this final rule. We believe laboratories will have sufficient time to come into compliance with these requirements, and that any less time may not be sufficient. Moreover, FDA is first prioritizing the phaseout of the enforcement discretion approach for MDR requirements (and related complaint file requirements) and correction and removal requirements to obtain information about potentially harmful IVDs offered as LDTs as soon as possible (stage 1).

We note that the registration and listing requirements applicable to IVDs offered as LDTs are the same as those applicable to other IVDs and other devices; FDA is not establishing any new registration and listing requirements as part of this rulemaking.

(Comment 168) Several comments supported the enforcement of registration and listing requirements but urged FDA to phase out the general enforcement discretion approach for registration and listing requirements before phasing out the general enforcement discretion approach for

other requirements. In particular, some comments suggested phasing out the general enforcement discretion approach with respect to registration and listing requirements before MDR requirements.

(Response 168) Under the final phaseout policy, FDA intends to phase out the general enforcement discretion approach for registration and listing requirements in stage 2, after first phasing out the general enforcement discretion approach for MDR requirements and correction and removal reporting requirements (as well as requirements regarding complaint files, given the connection between the complaint investigation and complaint file requirements and the MDR reporting regulations) in stage 1. FDA does not agree that the phaseout policy should address registration and listing requirements before the requirements described in stage 1. FDA has structured the phaseout policy to facilitate obtaining information about potentially harmful IVDs offered as LDTs as soon as feasible. As detailed in this preamble, FDA is concerned that some LDTs on the market may be posing risks to patients. Phasing out the general enforcement discretion approach for MDR requirements and correction and removal reporting requirements (stage 1) will help FDA to systematically monitor significant adverse events and identify problematic IVDs offered as LDTs. In addition, under this phaseout structure, laboratory manufacturers will have sufficient time to comply with registration and listing requirements (stage 2).

FDA therefore intends to phase out the general enforcement discretion approach with respect to MDR requirements and correction and removal reporting requirements before registration and listing requirements. We note that, as stated in section V.C, FDA generally does not intend to enforce requirements to include certain information (*e.g.,* registration numbers, premarket submission numbers) in reports or other submissions to the Agency until the information is addressed in a later stage of the phaseout policy.

(Comment 169) FDA received comments requesting guidance on the information required for registration and listing. One comment suggested that FDA consider creating temporary product codes in order to advance the registration and listing process while product codes are developed.

(Response 169) FDA has instructions and educational resources relating to registration and listing requirements available on FDA's website (Ref. 175). For more information on product codes, see FDA's final guidance on ''Medical Device Classification Product Codes.'' FDA intends to consider creating product codes to be used during the registration and listing process where no product code exists for a given test type. FDA also intends to consider providing additional or more targeted resources on registration and listing requirements over the course of the phaseout period, as appropriate.

(Comment 170) One comment encouraged FDA to establish a clear and publicly available mechanism that would allow patients and providers to ''ascertain the test's level of review.''

(Response 170) As detailed in section V.C, FDA intends to phase out the general enforcement discretion approach with respect to registration and listing requirements 2 years after publication of this final rule. The registration and listing database generally will provide patients and healthcare providers with information about specific IVDs as required by FDA regulation (*see, e.g.,* § 807.26(g)), including information regarding an IVD's ''level of review.'' In particular, we note that the device listing database includes information indicating the type of premarket submission (if any) for the listed device. We recognize that this information may not be included for currently marketed IVDs offered as LDTs, as well as for IVDs offered as LDTs after the publication of the final rule prior to stages 4 and 5.

(Comment 171) FDA received comments regarding the potentially prohibitive costs of registration and listing for some laboratories. One comment recommended FDA enforce ''limited'' registration and listing requirements for existing tests and allow laboratories to provide an ''electronic, internet-based test menu'' housed on the laboratory's website in lieu of individual test listings. Another comment noted that some laboratories maintain publicly available test catalogs online that include such information on tests' intended use, test method, and specimen requirements, and urged FDA to continue to exercise enforcement discretion if laboratories submit links to these test catalogs instead of providing all the information required for listing.

(Response 171) FDA disagrees with these comments. As described in section II.F.2.a of the FRIA, FDA estimates the cost of compliance with registration and listing requirements (this does not include registration fees) to range between $0.20 million and $0.82 million in initial costs and between $0.08 million and $0.34 million in recurring costs for between 590 and 2,362 affected laboratories (as well as between $0.02 million and $0.07 million in initial costs for between 47 and 189 new affected laboratories each year). This amounts to less than $500 per laboratory for compliance with initial registration and listing requirements and slightly over $100 per laboratory for compliance with annual requirements. In addition, under current user fee rates, laboratories must pay an annual establishment registration fee of $7,653. FDA believes it is unlikely for these costs of registration and listing to be prohibitively expensive for laboratories.

FDA also disagrees with the suggestions provided in these comments. FDA has determined that collecting registration and listing information for all laboratories and IVDs offered as LDTs in a uniform and systematic manner will provide the Agency with a holistic and comprehensive view of the universe of IVDs offered as LDTs and better enable FDA to help assure the safety and effectiveness of LDTs. FDA does not believe ''limited'' registration and listing information or the submission of electronic internet-based test menus/catalogs would allow the Agency to have such a comprehensive view.

(Comment 172) One comment stated that laboratories with multiple locations operating under a common quality management system should be allowed to register as a single entity with multiple sites.

(Response 172) With the phaseout of the general enforcement discretion approach, manufacturers of IVDs offered as LDTs generally will be expected to comply with registration and listing requirements under 21 U.S.C. 360, part 607, and part 807 (excluding subpart E) in the same way as other medical device manufacturers. FDA's regulations define establishment in the registration context as ''a place of business under one management at one general physical location at which a device is manufactured, assembled, or otherwise processed.'' 21 CFR 807.3(c); see also 21 CFR 607.3(c) (defining ''establishment'' in the context of registration requirements for licensed devices as ''a place of business under one management at one general physical location''). To the extent a laboratory has multiple sites in different physical locations, each of these sites would be registered separately. This information is important to inform FDA's oversight, including with respect to conducting inspections. If a laboratory with multiple sites were to register as a single entity that would impede such oversight and FDA's ability to conduct

inspections in a timely and efficient manner.

(Comment 173) One comment suggested that FDA should reduce the burden of registration and listing for clinical laboratories by continuing an enforcement discretion approach for low-risk tests with regard to registration and listing requirements if the laboratory ''documents'' all low-risk LDTs it performs as required by CAP accreditation.

(Response 173) As discussed in section VI.L.4, FDA does not think it is appropriate to continue an enforcement discretion approach for low-risk LDTs, including with respect to registration and listing requirements. Moreover, specifically regarding registration and listing requirements, comprehensive registration and listing is critical to inform FDA's understanding of the universe of IVDs offered as LDTs and to help FDA identify, monitor, and address any issues with IVDs offered as LDTs. In addition, as discussed in response to comment 171, FDA does not anticipate the costs of registration and listing to be prohibitively expensive for laboratories. We also note that under the phaseout policy, FDA expects compliance with registration and listing 2 years after publication of the final rule (stage 2), which we anticipate will be sufficient time to come into compliance with the registration and listing requirements.

9. Corrections and Removals Reporting Requirements

(Comment 174) A comment stated that it did not agree with FDA's proposal to end the general enforcement discretion approach with respect to the correction and removal reporting requirements because it perceives CLIA as adequately covering these requirements. Another comment suggested that FDA continue the general enforcement discretion approach for correction and removal reporting requirements if laboratories have documented corrective action and removal processes.

(Response 174) FDA disagrees with these comments. As described in sections V.C, VI.C.2, and VI.D.8, CLIA requirements are complementary and distinct from FDA requirements. They do not provide adequate oversight of IVDs offered as LDTs to render FDA oversight unnecessary. Under the FD&C Act, certain entities are required to report device malfunctions, adverse events, and corrections and/or removals of a device. Moreover, FDA has authority to take steps when a device presents a risk to the public health, including utilizing its mandatory recall authority. There are not the same requirements and authorities under CLIA.

Enforcement of correction and removal reporting requirements along with the MDR requirements will enable FDA to systematically monitor adverse events, identify problematic IVDs offered as LDTs, and monitor corrections and removals of IVDs offered as LDTs. Moreover, as FDA stated in response to comment 165, MDR is one of the postmarket surveillance tools that FDA uses to monitor device performance, detect potential device-related safety issues, and contribute to benefit-risk assessments of medical devices. Under § 806.10, manufacturers and importers are required to submit a written report to FDA of any correction or removal of a device initiated by such manufacturer or importer if the correction or removal was initiated: (1) to reduce a risk to health posed by the device or (2) to remedy a violation of the FD&C Act caused by the device which may present a risk to health (subject to the limitation and exemption described in § 806.10(a)(2)), within 10 working days of initiating such action. This information is critical to FDA's ability to assure that patients, healthcare providers, and other stakeholders have information about safety or other issues with a device, and to monitor the effectiveness of corrective actions.

Laboratories having ''documented processes'' relating to corrections and removals does not provide the same types of critical assurances. If laboratories do have existing internal processes, however, that should ease the burden of complying with FDA's correction and removal reporting requirements.

10. Investigational Device Exemption Requirements

(Comment 175) Several comments suggested clarification around when investigational use requirements apply to IVDs offered as LDTs. One comment requested that FDA address how the phaseout would impact laboratories that validate reagents for use in a clinical trial where the reagent has been labeled by its manufacturer as being RUO, or validate kits that have been manufactured by a third party but which are validated by the laboratory for a specific purpose for use in a clinical trial, *e.g.,* for clinical trial stratification, inclusion/exclusion determinations, or safety assessments of enrolled subjects. This comment further stated that FDA should be cognizant of the time that is required to get a test ready for use in a clinical trial. Another comment sought clarification regarding potential impacts of the phaseout on clinical research organizations (CROs). This comment observed that it would be redundant for both CROs and their clients to make submissions to FDA for the same IVDs, and further stated that if ''CRO LDTs'' are ''restricted'' by the phaseout, there could be significant delays with respect to drug and IVD development. The comment recommended that FDA consider granting all accredited CRO laboratories ''an exemption'' from applicable requirements. Multiple comments requested clarification regarding clinical trial assays that have no direct impact on patient care, such as for pharmacokinetic analyses for dosing studies. Others cited the importance of IVDs offered as LDTs in drug trials and suggested continued enforcement discretion to support therapeutic product development.

(Response 175) The IDE requirements under section 520(g) of the FD&C Act and part 812 apply to clinical investigations of devices. However, certain categories of clinical investigations of devices are exempt from most IDE requirements under § 812.2(c), and certain other categories of device investigations are deemed to have an approved IDE application under § 812.2(b) if the conditions therein are met. Sponsors and investigators of investigational devices have obligations under the IDE regulations (and related regulations such as parts 50 and 56 (21 CFR parts 50 and 56), regarding protection of human subjects and institutional review boards, respectively). Thus, if a laboratory is a sponsor or investigator of an investigational IVD (including a reagent or instrument), that laboratory is responsible for ensuring compliance with all applicable requirements under the FD&C Act and FDA's regulations. Investigational IVDs may include an IVD that was previously labeled RUO by a third-party manufacturer, an IVD that was previously labeled by a third party manufacturer for a use different from the use in the clinical investigation, or an IVD manufactured by a third party but modified by the laboratory for purposes of the clinical investigation. Additional information regarding RUO-labeled products is available in FDA's final guidance document entitled ''Distribution of In Vitro Diagnostic Products Labeled for Research Use Only or Investigational Use Only'' (Ref. 176).

Under the phaseout policy described in section V.C, FDA expects compliance with applicable IDE requirements and other applicable requirements, such as parts 50 and 56, for investigations that involve investigational IVDs offered as

LDTs 2 years after publication of this final rule. FDA has several resources available to help sponsors comply with IDE requirements in the context of clinical investigations of IVDs, including a final guidance document entitled ''In Vitro Diagnostic (IVD) Device Studies—Frequently Asked Questions,'' which has been available to stakeholders since June 2010 (see Ref. 177).

We recognize that some sponsors of clinical investigations of investigational IVDs may choose to engage with a CRO, including a CRO laboratory, to perform certain duties, including certain obligations under the IDE regulations. It is up to the sponsor and CRO to decide which duties and obligations the CRO will undertake. The obligations that apply under the IDE regulations must be met regardless of which party performs them. If an IDE application is required, either the sponsor or the sponsor's CRO may submit the application, *i.e.,* it is not necessary for both parties to submit an IDE application for the same clinical investigation of the investigational IVD. We note that to the extent a CRO submits an IDE application to FDA, this application would be distinct from the premarket submission (such as a 510(k), De Novo, or PMA) that the CRO's client may subsequently submit to FDA if the client intends to offer the IVD.

With respect to use of IVDs offered as LDTs in clinical investigations of drugs, FDA has issued a draft guidance document entitled ''Investigational IVDs Used in Clinical Investigations of Therapeutic Products'' (this guidance has not been finalized at this time but it includes information that may be helpful, such as a discussion of certain IDE requirements) and a final guidance document entitled ''Investigational In Vitro Diagnostics in Oncology Trials: Streamlined Submission Process for Study Risk Determination Guidance for Industry,'' which provide additional information regarding investigational use requirements in such settings (see Refs. 178 and 179). As FDA has explained, sponsors should already be aware that all investigational IVDs used in therapeutic product trials are subject to IDE requirements, and may require the submission of an IDE application separate from an investigational new drug application (IND) to the extent an IDE application is required under part 812 of FDA's regulations (Ref. 178). When an IDE application is not required, a therapeutic product trial that uses an investigational IVD must still comply with other IDE requirements as applicable under part 812. An IDE and an IND may be held by the same entity or may be held by different entities (for example, a CRO and its client); however, IDE and IND applications may cross-reference each other through a letter of authorization, or in cases where either an IND or an IDE application is not required, information may be provided through the use of a master file (MAF). As explained in section V.C, FDA generally expects compliance with the device investigational use requirements 2 years after publication of the final rule. Given this time period to prepare, FDA does not anticipate that compliance with IDE requirements will meaningfully delay drug or IVD development activities. Further, FDA notes that investigations of diagnostic devices are exempt from most IDE requirements, provided that certain labeling requirements are met and the testing: is noninvasive, does not require an invasive sampling procedure that presents significant risk, does not by design or intention introduce energy into a subject, and is not used as a diagnostic procedure without confirmation of the diagnosis by another, medically established diagnostic product or procedure (§ 812.2(c)(3)). Additionally, investigations of diagnostic devices that are not significant risk are deemed to have an approved IDE (without submission of an IDE application) if the conditions in § 812.2(b) are met.

Finally, in response to comments that inquired regarding the applicability of IDE requirements to certain types of assays, FDA would generally need additional information regarding the specific assay and the investigation in which the assay is intended to be used. FDA encourages stakeholders to consult the materials that have been made available by the Agency regarding IDE requirements, including the final guidance documents referenced above. Laboratories may also contact FDA with product-specific questions, as discussed elsewhere in this preamble.

11. Labeling Requirements

(Comment 176) FDA received several comments inquiring about labeling requirements for LDTs and requesting clear guidance on the required information and where such information needs to be located. One comment asked whether labeling for LDTs should be written with the performing laboratory as the audience or the ordering physician, noting that this distinction ''is critical as it directly impacts the communication of clinical information, essential for accurate patient diagnosis and treatment.'' Another comment stated that FDA should not consider the ''test menu, educational and interpretive information, and scientific publications included on the laboratory website'' as labeling and must not treat this information in the same way as product advertisement. Another comment stated that information listed as part of test menus ''cannot be subject to rigid labeling requirements and should not be considered 'promotional.''''

(Response 176) FDA appreciates the comments requesting clarification regarding the labeling requirements for LDTs. FDA's regulations in § 809.10 set forth specific labeling requirements for IVDs, including specific information that must be included. FDA anticipates that this information might be encompassed in more than one document, such as the test protocol, test report template, and test menu.

FDA intends to provide more targeted guidance and/or additional resources regarding the applicable labeling requirements prior to stage 2 of the phaseout period.

(Comment 177) One comment expressed concern that FDA labeling requirements would be duplicative because similar information is provided in the test ordering form or as part of the electronic order entry process. The comment also expressed concern that FDA labeling requirements would be impractical because there is limited space on the label after compliance with CLIA and other requirements, and that data elements of electronic health records would need to be added and then standardized and harmonized. This comment recommended FDA continue the general enforcement discretion approach for labeling requirements if the ''LDTs' information'' is documented and made available to FDA upon request.

(Response 177) FDA disagrees with this suggestion. FDA is phasing out the general enforcement discretion approach with respect to labeling requirements under 21 U.S.C. 352 and parts 801 and 809, subpart B. FDA believes that generally enforcing the labeling requirements for IVDs offered as LDTs will provide for consistent and comprehensive information that will benefit healthcare providers and patients and help FDA to better protect and promote the public health. As noted in response to comment 176, FDA anticipates that the information required under § 809.10 might be encompassed in more than one document, such as the test protocol, test report template, and test menu. In addition, in the case of insufficient space with respect to the label, to the extent there is an immediate container onto which a label could be affixed, we note that § 809.10(a)(10) provides that some of the

required information may appear on the outer container labeling. These and other labeling requirements are additionally discussed in FDA's final guidance document entitled ''Labeling: Regulatory Requirements for Medical Devices'' (Ref. 180).

As noted in response to comment 176, FDA intends to provide more targeted guidance and/or additional resources regarding labeling requirements prior to stage 2 of the phaseout period.

(Comment 178) FDA received one comment stating that significant problems for laboratories could be expected when ''adhering to guidance for manufacturers regarding labeling practices.'' The comment also stated that LDTs cannot reasonably be expected to adhere to the label requirements under § 809.10 as there is no physical container onto which a label could be affixed. Similarly, the comment noted that creation of a package insert would not be practical in a laboratory setting.

(Response 178) It is unclear what ''guidance'' the comment is referring to as the comment did not identify any specific guidance. To the extent the comment is referring to the labeling requirements in § 809.10, as noted in response to comment 176, FDA anticipates that the information required under § 809.10 might be encompassed in more than one document, such as the test protocol, test report template, and test menu.

FDA's IVD labeling requirements in § 809.10(b) specify the information that must be included in labeling and provides a package insert as an example of labeling. However, the regulations do not require that the labeling be a package insert.

FDA recognizes that guidance and/or additional resources on the labeling requirements for LDTs would be helpful for laboratory manufacturers. Therefore, FDA intends to provide more targeted guidance and/or additional resources on labeling requirements, including label requirements, prior to phase 2 of the phaseout period.

(Comment 179) One comment requested that FDA clarify expectations regarding compliance with UDI requirements for IVDs offered as LDTs.

(Response 179) FDA recognizes that the labeling requirements under part 801 of FDA's regulations, for which FDA intends to phase out the general enforcement discretion approach under stage 2 of the phaseout policy (see section V.C), include UDI requirements. FDA intends to provide more targeted guidance and/or additional resources regarding UDI requirements prior to stage 2 of the phaseout period.

12. Quality System Requirements

(Comment 180) A number of comments agreed with FDA that laboratories should have quality systems to help ensure that there are less errors with IVDs offered as LDTs. These comments went on, however, to express concerns with FDA's proposal to exercise enforcement discretion with respect to certain QS requirements in part 820 for those IVDs for which all design and manufacturing activities occur within a single CLIA-certified laboratory that meets the regulatory requirements to perform high complexity testing and for which distribution of the IVD does not occur outside that single laboratory. In particular, comments thought that having two different systems could result in confusion about what is ''required.''

(Response 180) FDA agrees that quality systems are important to assuring that a manufacturer consistently manufactures IVDs that have appropriate assurance of safety and effectiveness, and FDA generally expects laboratories to comply with the QS requirements at the 3-year mark under stage 3 of the phaseout policy (other than requirements under § 820.198 (complaint files), for which FDA will phase out the general enforcement discretion approach under stage 1 of the phaseout policy). As stated in section V.C, FDA is also finalizing the QS policy for LDTs as proposed. For LDTs, FDA will expect compliance at the 3-year mark with some, but not all, of the QS requirements.

FDA recognizes that this policy creates a more nuanced approach in terms of expectations for QS compliance, but we believe this nuance is justified because it may be important for some laboratories while still serving FDA's public-health goals. FDA has set forth the reasoning for this policy, which is based on certain quality assurances provided through compliance with CLIA requirements, in section V.C. This policy is consistent with the Agency's least burdensome approach for devices. FDA also welcomes compliance with the full QSR, including to avoid confusion. As with any enforcement discretion policy, this policy is subject to change as circumstances warrant.

(Comment 181) Many comments sought additional clarity about the QS requirements. These comments explained that laboratories do not have experience with FDA's QS requirements and may need substantial assistance in understanding the requirements and whether they can ''leverage'' their existing quality system to meet FDA's requirements. Another comment questioned the requirements that would be included in FDA's final rule amending part 820 and whether FDA would require certification to the relevant ISO standard (*i.e.,* ISO 13485). A similar comment asked whether FDA would make guidance available to clinical laboratories on this topic and whether such guidance would be issued with enough time for laboratories to take necessary actions to come into compliance. Another comment requested that FDA provide guidance on the gaps that exist between the QSR and CLIA.

(Response 181) FDA understands that compliance with the FD&C Act and its implementing regulations, including part 820, is unfamiliar for many laboratories. We intend to engage in various educational activities, including issuing timely guidance, to assist laboratories with understanding and complying with applicable requirements. Additionally, FDA has just issued its final rule amending part 820 (see 89 FR 7496). This rule will take effect 2 years from publication on February 2, 2026. FDA anticipates providing to all its stakeholders, including laboratories, timely guidance on compliance with the regulatory requirements in that rule. Laboratories can take advantage of these efforts to obtain a better understanding of the applicable requirements.

As for the specific question about certification to ISO 13485, FDA is not requiring certification and such certification will not substitute for an FDA routine inspection under section 704 of the FD&C Act (89 FR 7496, 7518).

(Comment 182) We received several comments about the relationship between FDA's QSR and CLIA. A comment suggested that FDA should harmonize its QSR with CLIA. Another comment stated that FDA should specify whether compliance with part 820 obviates the need to maintain CLIA certification.

(Response 182) First, the requirement to comply with part 820 does not obviate the need for a laboratory to maintain CLIA certification. CMS administers CLIA and its implementing regulations, whereas FDA administers the FD&C Act and its implementing regulations, including the QSR. As FDA has explained elsewhere in this preamble, the schemes implemented by CMS and FDA are complementary and not duplicative; both are important to help assure quality testing with laboratory-manufactured tests.

Second, FDA disagrees that the QSR and CLIA regulations require harmonization because, as stated previously, the two schemes are complementary, not duplicative or conflicting. In addition, to the extent that the comments were suggesting that FDA needs to revise the QSR in light of CLIA, FDA disagrees. CLIA and its implementing regulations and FDA's QSR are two different regulatory frameworks based in different statutory authorities intended to achieve different goals. Unlike CLIA and its implementing regulations, the QSR provides a basic framework of requirements critical for a quality system for manufacturing devices. These requirements are flexible, apply to many device types, and recognize that manufacturing circumstances may vary. Under the QSR, manufacturers are responsible for complying with those parts of the regulation that are applicable to their operations, and the QSR is intended to be sufficiently flexible to be applied to the spectrum of devices as well as manufacturers of varying size and operation type. Although FDA has adopted a policy described in this preamble that takes into account certain assurances provided by CLIA for LDTs (see section V.C), that policy does not mean that the requirements are duplicative or conflicting or that amendments to the QSR are required (see comment response 82).

(Comment 183) Some comments argued that the QSR is not appropriate for laboratory testing and it does not cover all aspects of laboratory operation. A comment suggested that this is because laboratories that develop LDTs do not engage in manufacturing. Other comments stated that ISO 15189: Medical Laboratories (ISO 15189) is the more appropriate standard.

(Response 183) As stated above, the QSR provides a basic framework of requirements critical for a quality system for manufacturing devices. These requirements are flexible, applying to many device types, and recognize that manufacturing circumstances may vary. Under the QSR, manufacturers are responsible for complying with those parts of the regulation that are applicable to their operations, and the regulation is intended to be sufficiently flexible to be applied to the spectrum of devices as well as manufacturers of varying size and operation type. In this manner, the QSR is suited to the manufacture of IVDs in laboratories. Furthermore, because the QSR focuses on assuring the quality of the device itself, it need not cover ''all aspects of laboratory operation.''

FDA also disagrees with the comment that laboratories that develop LDTs do not engage in device manufacturing. Section 820.3(o) defines a manufacturer as ''any person who designs, manufactures, fabricates, assembles, or processes a finished device. Manufacturer includes but is not limited to those who perform the functions of contract sterilization, installation, relabeling, remanufacturing, repacking, or specification development, and initial distributors of foreign entities performing these functions.'' As explained in the NPRM and in section VI.D. of this preamble, LDTs are devices (88 FR 68006 at 68015–16). As such, when laboratories design, assemble, or process an LDT, they are manufacturers of a finished device and as such are subject to the QSR (for further discussion, see comment response 71).

ISO 15189, similar to CLIA, specifies requirements for quality and competence in medical laboratories, focusing on the competencies and qualifications of laboratory personnel and testing processes. The QSR is focused on a robust quality system that promotes safety and effectiveness of the device itself through controls such as adequate management oversight, procedures for validating changes, monitoring, and audits, and plans for handling non-conformances. In contrast, ISO 15189 does not address the processes involved in manufacturing an IVD, including design controls. Thus, ISO 15189 is not the appropriate standard for laboratory activities relating to device manufacturing.

(Comment 184) Several comments suggested that compliance with the QSR is not warranted because of the quality management systems laboratories already have in place. One comment went on to state that such systems comply with Federal and State facility licensure requirements, CLIA certification, medical test site requirements, CAP accreditation, and participation in CLIA-required proficiency testing surveys/challenges. Another suggested that CLIA regulation and CAP combined are sufficient. Another comment suggested that FDA did not present scientific data that having multiple quality systems produces a better test result.

(Response 184) FDA disagrees with these comments. As explained throughout this preamble, none of the requirements the comments referenced address the quality and manufacturing of the device itself. For example, the focus of CLIA is on the testing process as it is implemented in a given laboratory, focusing on the qualifications, responsibilities, and ongoing competencies of laboratory personnel, rather than the manufacture of the IVD itself. For more information about the differences between CLIA and FDA regulation, see our responses to comments in section VI.C.2.

Some commenters pointed to participation in CLIA-required proficiency testing surveys/challenges, but those surveys/challenges are only required for certain analytes; the majority of IVDs offered as LDTs test for analytes that do not have required proficiency testing (Refs. 181 and 182). Proficiency testing events are performed on a regularly scheduled basis to assess whether laboratories are performing tests appropriately. Such testing is not intended to assess a laboratory's ability to continually manufacture safe and effective IVDs, nor does it establish the performance of a particular test, as further described in response to comment 9.

With regard to CAP accreditation, as discussed in more detail in response to comment 18, CAP accreditation addresses the manner in which the laboratory performs a test and does not assess the laboratory's processes for making the test. Further, CAP accreditation is voluntary.

As for state licensure requirements, the comment did not identify specific states or their requirements for FDA to assess. When FDA considered comments about New Jersey's laboratory certification program and Washington's medical test site program, it concluded that they are focused on laboratory operations, like CLIA, and do not provide assurances regarding the analytical and clinical validity of LDTs (Ref. 84), see response to comment 22. FDA has included a policy for LDTs that are approved by NYS CLEP (see section V.B.2).

While none of the existing requirements discussed here are duplicative of the QSR, FDA is adopting an enforcement discretion policy with respect to QS requirements for LDTs in recognition that compliance with CLIA requirements provides some quality assurances that may be relevant to laboratories' manufacturing practices, as described in section V.C.

Finally, we disagree that FDA is required to produce or cite scientific data showing that ''having multiple quality systems produces a better test result.'' Regardless of the presence of other quality systems, the question is whether laboratory compliance with the quality system requirements under the FD&C Act, as applicable, will advance public health by helping assure that

IVDs are safe and effective. FDA has determined that it will, based on the evidence before it. FDA need not ''conduct or commission [its] own empirical or statistical studies'' to draw this conclusion. *FCC* v. *Prometheus Radio Project,* 141 S. Ct. 1150 at 1160.

(Comment 185) A comment concurred with the QS requirements that FDA proposed to focus on for LDTs; however, the comment indicated that FDA should also focus on § 820.70; production and process controls. The comment went on to state that CLIA does not fully address any of these regulations.

(Response 185) FDA agrees that CLIA does not duplicate QS requirements. However, CLIA does provide some relevant assurances, including with respect to § 820.70, in the context of manufacturing activities occurring within a single CLIA-certified laboratory that meets the regulatory requirements to perform high complexity testing and for which the IVD is not transferred outside that single laboratory. Section 820.70 requires manufacturers to develop, conduct, control, and monitor production processes to ensure that a device conforms to its specifications and to establish and maintain process control procedures where deviations from device specifications can occur due to the manufacturing process. This provision also has requirements addressing environmental controls, personnel cleanliness, contamination control, building suitability, equipment sufficiency, manufacturing material use and removal, and validation of software used in automated processes. CLIA regulations require that the laboratory have control procedures to monitor test accuracy and precision and detect immediate errors that occur due to test system failure, adverse environmental conditions, and operator performance (42 CFR 493.1256). This provision also addresses requirements for supply checks. Additionally, other CLIA requirements address facility requirements, including equipment, and personnel competency (42 CFR 493.1101 and 1235). FDA determined that these requirements, in combination with the QS requirements on which FDA is focusing oversight (such as the design controls in § 820.30), provide assurances relevant to § 820.70.

(Comment 186) Several comments raised concerns about the costs of compliance with the QSR. A comment took issue with FDA's statement, as characterized by the comment, that the final rule amending part 820 would not impose new requirements because that was a comparative statement about the differences between FDA's proposed rule and the current part 820, but that many LDT manufacturers would be complying with part 820 for the first time. Other comments asserted that the cost of QS compliance will prohibit small companies from marketing tests, hurting patients.

(Response 186) FDA acknowledges that many laboratories may not have experience with part 820. In the NPRM, FDA stated that FDA's proposed amendment of part 820 was substantially similar to the current QS requirements simply to explain that laboratories can use the current part 820 to understand FDA's requirements with respect to quality systems, and to prepare for compliance even though the final QS rule had not been issued at that time—not to diminish the effort needed to comply (see 88 FR 68006 at 68026).

FDA continues to believe that QS compliance is important to help assure the safety and effectiveness of IVDs offered as LDTs, as explained throughout this preamble (see, *e.g.,* section III.B.1). However, FDA has also considered the costs associated with QS compliance for laboratories, and has taken those costs into account in developing the policy for currently marketed IVDs offered as LDTs (see section V.B.3). Under that policy, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)), for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. This policy applies to all laboratories, including small laboratories. In light of this policy, FDA disagrees that the cost of compliance with the QSR, alone, would cause small laboratories to close. (For more information about impacts on small businesses, see section VI.G). We note that in the FRIA, we estimate $71 million less in one-time costs for compliance with QS requirements for all affected entities compared to the PRIA, and $354 million less in annual recurring costs (see Ref. 60).

Further, as discussed in the NPRM and in this preamble, FDA intends to exercise enforcement discretion with respect to certain QS requirements for LDTs as discussed in section V.C.3, which may reduce costs for such laboratories.

(Comment 187) A comment indicated that enforcing QS requirements for laboratories could have negative impacts on manufacturers of laboratory tools and instruments, and on producers of reagents and antibodies, because they may not be able to meet the supplier requirements. Another comment stated that the supplier requirements in § 820.50 (purchasing controls) expand the responsibility of the laboratory professional beyond the CLIA requirements, and inappropriately place ''liability'' on laboratory professionals, who are acting as healthcare providers, for ensuring the quality of reagents instead of placing that responsibility on suppliers.

(Response 187) The manufacturers of test components that are themselves finished devices, such as instruments, reagents, and antibodies, intended for clinical purposes should already be complying with the QSR, including requirements in § 820.50, and thus we would not expect negative impacts on suppliers as a result of this phaseout policy. FDA agrees that when a laboratory manufacturer makes a test system using components that are not intended for clinical use, such as components labeled RUO, the laboratory is subject to the purchasing controls set forth in § 820.50, which may require validation of such components for the clinical use.[87] FDA acknowledges that laboratory manufacturers may prefer to source components manufactured under a QS to help assure the quality of their test.

Section 820.50 (purchasing controls) requires that manufacturers of finished devices assess the capability of their suppliers to produce acceptable components. When the manufacturer ensures that components, such as laboratory instruments, reagents, and antibodies, are adequate for the IVD's intended use, this helps to ensure the accuracy of the IVD being manufactured. Ultimately, the laboratory manufacturer cannot be sure that the specifications for a finished IVD are met if they did not take steps to ensure that the individual components of the finished device meet specifications. As such, FDA disagrees that such a supplier requirement is inappropriate. Enforcement of supplier requirements will provide assurances that IVDs continue to be manufactured with quality components over time.

(Comment 188) A comment argued that the QSR does not translate well to laboratory activities, and that CLIA addresses many of the QS requirements on which FDA proposed to focus in the QS policy for LDTs. The comment stated that the acceptance activities in §§ 820.80 and 820.86 do not translate well to laboratories, specifically

[87] *See* Ref. 176, which states that it is important that research and investigational use only products should not be distributed for clinical diagnostic uses.

highlighting the requirements in § 820.80(d) and indicating, according to the commenter, that it is unclear how a laboratory might comply with the requirement that manufacturers establish and maintain procedures for finished device acceptance to ensure that each production run, lot, or batch of finished devices meets acceptance criteria. The comment also specified that a number of CLIA provisions in 42 CFR part 493, subparts J and K serve the same purposes as or cover the activities in § 820.30 (design controls), § 820.100 (corrective and preventive action), and part 820, subpart M (records requirements).

(Response 188) FDA disagrees that the CLIA regulations cited in the comment provide assurances relevant to the cited QS requirements in part 820. CLIA covers laboratory operations, including processes for handling and dealing with components and specimens, as well as documenting and responding to patient test result errors as a result of laboratory operations. None of the CLIA provisions include requirements for designing or monitoring issues with the IVD itself. For example, 42 CFR 493.1241 addresses the need for a test request, 42 CFR 493.1242 addresses policies for specimen handling, storage, and processing, 42 CFR 493.1252 addresses proper storage of reagents and specimens, 42 CFR 493.1253 addresses performance specification with regards to accuracy, precision, and range (without tying those specifications to the design of the test and without addressing design input and output review), and 42 CFR 493.1290 and 1291 address other issues related to laboratory operations rather than faulty device design, including the content of test reports, handling of abnormal results, error reporting requirements, and assessment and resolution of identified problems with regard to patient test result errors.

In contrast, the design controls in § 820.30, at a high level, address: design and development planning, procedures for ensuring that the design requirements are appropriate for the device intended use, including design inputs, procedures for defining and documenting design outputs, procedures for design review, verification, and validation, and procedures for documenting and validating design changes. Each of these requirements aims to ensure that devices perform as intended, which is a concept not covered by the CLIA requirements.

Similarly, the CLIA requirements on correcting errors (42 CFR 493.1291) and records requirements (42 CFR 493.1251 (procedure manual), 42 CFR 493.1101 (facilities), 42 CFR 493.1105 (retention requirements), 42 CFR 493.1291 (test report), and 42 CFR 493.1283 (test records)) are focused on addressing laboratory errors and laboratory recordkeeping. The QS requirements are focused on assuring the quality of the IVD offered as an LDT itself, and compliance with these requirements addresses issues of device quality. As detailed in comment 182, CLIA and the QSR are complementary but different in focus.

While FDA acknowledges that the terminology of the QSR may not be familiar to many laboratories, as stated in comment 181, FDA intends to engage in educational activities to assist laboratories in understanding compliance with the QSR. FDA disagrees that lack of familiarity means that the requirements are inappropriate for laboratories. The QSR is written in a flexible manner and there are many ways that a laboratory may comply with the QSR. For example, the comment cited uncertainty about how a laboratory would comply with acceptance activities in §§ 820.80 and 820.86 generally, and specifically questioned the ability for laboratories to comply with finished device acceptance requirements in § 820.80(d), which requires that manufacturers, including laboratories, establish and maintain procedures for finished device acceptance to ensure that each production run, lot, or batch of finished devices meets specified requirements; in other words, assessing whether the finished device is what you expected. For example, laboratories procure reagents from external sources for use as part of their LDT. The laboratory would need suitable methods to identify reagents in a way that distinguishes between those that have just been received and not yet evaluated, those that have been received and found unacceptable according to their purchasing controls, and those that have been received and found acceptable according to their purchasing controls and are therefore adequate for use as part of the final LDT. Manufacturers have the flexibility to choose a combination of methods to comply with these requirements, including finished device inspection and testing, acceptance criteria, and identification methods, provided such methods will accomplish the required result. For example, for final acceptance activities, laboratories may have a procedure that specifies the methods and materials and acceptance criteria (including confidence intervals) that would be used to assess whether the final LDT meets those specified acceptance criteria, prior to the LDT being used for clinical use.

(Comment 189) A comment recommended that FDA establish an ''umbrella approval'' for CGMP and software modules from each laboratory and that FDA should recognize results from third party quality efforts.

(Response 189) In general, FDA does not ''approve'' manufacturing practices, although they are reviewed within the context of a PMA. We note that, in premarket applications, manufacturers may rely on information that they previously submitted to FDA by referencing where the information was provided in a previous submission. Establishment of an ''umbrella approval'' for CGMP and software modules is outside the scope of this rulemaking.

With regards to third-party quality efforts, to the extent that the comment is referring to CAP accreditation or NYS CLEP assessments, see our response to comment 18 and section V.B.2 for more information on that topic.

13. Premarket Review Requirements

(Comment 190) Several comments expressed concern that compliance with premarket review requirements would be infeasible and cost-prohibitive for laboratories with limited resources and stated that FDA should take into account that these laboratories also pay fees to CMS associated with CLIA. One comment stated that FDA should ''[s]et reasonable pricing for LDT review and registration.'' One comment suggested that FDA should consider temporarily reducing user fees for premarket submissions during the phaseout timeline.

(Response 190) In the final phaseout policy, in recognition of patient reliance and cost considerations, among other things, FDA has included policies for enforcement discretion with respect to premarket review for several categories of IVDs, as described in section V.B. These policies should help address some of the concerns raised by the comments.

With respect to fees, FDA is unable to unilaterally change user fee amounts or adjust user fees to take into consideration other fees that laboratories may pay to CMS pursuant to CLIA. User fees associated with establishment registrations and certain premarket submissions are established by Congress in MDUFA. Under the current reauthorization of MDUFA, payment of either a standard fee or a small business fee is required for each submission type identified in 21 U.S.C.

379j(a)(2)(A) (unless the applicant qualifies for a fee waiver or for an exception under 21 U.S.C. 379j(a)(2)(B)). Payment of an establishment registration fee is required at the time of initial or annual registration (as applicable), except as provided in 21 U.S.C. 379j(a)(3)(B). More information about user fees is available on FDA's user fee website (see Ref. 183). However, FDA will have an opportunity to negotiate with industry regarding user fees at the time of the next reauthorization of MDUFA, which will occur in advance of stages 4 and 5 of the phaseout policy (when FDA intends to phase out the general enforcement discretion approach for premarket review requirements).

FDA disagrees that compliance with premarket review requirements is likely to be infeasible for laboratories with limited resources. As just noted, the existing program incorporates a different user fee amount for small businesses (see 21 U.S.C. 379j(d) and (e)), and review can occur relatively quickly when an IVD has been appropriately validated for its intended use. In addition, FDA implements premarket review consistent with several ''least burdensome'' statutory provisions and in accordance with Agency policy. This topic is discussed in detail in FDA's final guidance document entitled ''The Least Burdensome Provisions: Concept and Principles,'' which defines ''least burdensome'' to mean the minimum amount of information necessary to adequately address a relevant regulatory question or issue through the most efficient manner at the right time (Ref. 72). FDA also encourages IVD manufacturers to take advantage of FDA's industry resources, including final guidance documents and resources available through the Division of Industry and Consumer Education within CDRH (see Ref. 184). These resources may facilitate efforts by laboratories to comply with premarket review requirements and other applicable requirements. Ultimately, FDA recognizes that laboratories will need to make investments to comply with premarket review requirements, but these investments are important to help ensure that IVDs are appropriately safe and effective, so that patients and providers can rely on test results for clinical decision-making.

(Comment 191) We received several comments asking specific questions about what and how different types of data should be presented in premarket submissions, and how to know when a premarket submission is required, especially for modifications. For example, comments asked what specific data are necessary to bridge a premarket authorization to new specimen types, how to handle database curation for sequencing assays, and what types of software applications are considered part of a test system. Another comment stated that the NPRM did not provide sufficient guidance on what amount or type of data may be required.

(Response 191) FDA appreciates that many laboratory manufacturers may not be familiar with FDA's regulations and the premarket submission process. FDA intends to consider providing guidance on various topics and making additional resources available over the course of the phaseout period as appropriate, including on the topic of premarket review of IVDs offered as LDTs. FDA has already made resources available on several of the specific topics identified by the comments, including FDA's final guidance documents entitled ''Deciding When to Submit a 510(k) for a Change to an Existing Device'' and ''Modifications to Devices Subject to Premarket Approval (PMA)—The PMA Supplement Decision-Making Process,'' regarding modifications to devices (Refs. 61 and 185); information regarding the CLSI EP35 standard (1st Edition), ''Assessment of Equivalence or Suitability of Specimen Types for Medical Laboratory Measurement Procedures,'' regarding bridging to new specimen types (Ref. 186); FDA's final guidance document entitled ''Use of Public Human Genetic Variant Databases to Support Clinical Validity for Genetic and Genomic-Based In Vitro Diagnostics,'' regarding database curation (Ref. 187); and FDA's final guidance documents entitled ''Clinical Decision Support Software,'' ''General Principles of Software Validation,'' and ''Content of Premarket Submissions for Device Software Functions,'' regarding software (Refs. 188 to 190). The amount and type of data needed in premarket submissions varies depending on the circumstances. For questions that are specific to a particular IVD, laboratory manufacturers may request feedback from FDA through a Pre-Submission, which is further explained in FDA's final guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65).

(Comment 192) One comment questioned how premarket submissions may account for the various components of a test (*e.g.,* extraction kits, instrument platform, software, or reagent) when those components may not be manufactured by the laboratory manufacturer and the laboratory manufacturer may consider them to be interchangeable.

(Response 192) In the scenario described in the comment, the laboratory manufacturer is expected to establish specifications for such components and have purchasing and acceptance controls to ensure each component meets specifications. This is critical to help ensure the quality of the test over time. While evidence of purchasing and acceptance controls are generally not part of premarket review for 510(k) and De Novo submissions, they are required elements of a quality system. In addition, under the design control provisions of the QSR, the laboratory would be expected to validate its test system, including all components per established specifications, for its intended use. During premarket review, FDA would review analytical and clinical validation information for the test system. For PMAs, FDA would also review applicable quality system information.

(Comment 193) Some comments addressed what FDA should consider as evidence of a reasonable assurance of safety or effectiveness in premarket submissions for IVDs offered as LDTs. Some comments stated that clinical trials ''should not be required'' because they are too burdensome. One comment stated that FDA should expect less information in premarket submissions when tests are designed for use on ''commercially'' available instruments and using ''commercially'' available reagents. Another comment suggested that FDA consider peer-reviewed evidence of clinical validity and clinical utility and prior reviews by other regulatory bodies.

(Response 193) The content that must be included in a premarket submission can vary greatly based on several factors, including the type of submission and the type of device. Data relevant to the evaluation of a submission for one type of test may not be relevant to evaluating submissions for other types of tests. However, in general, FDA does not agree that the amount and type of evidence included in a particular submission should vary based on whether the IVD is manufactured by a laboratory or another manufacturer. FDA encourages IVD manufacturers to request feedback on individual submissions through FDA's Pre-Submission program, which is further explained in FDA's final guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65). FDA also implements premarket review consistent with several ''least

burdensome'' statutory provisions and in accordance with Agency policy. This topic is discussed in detail in FDA's final guidance document entitled ''The Least Burdensome Provisions: Concept and Principles'' (Ref. 72).

With respect to the consideration of peer-reviewed evidence, FDA would not expect laboratories to generate additional clinical validity data when available literature is adequate to demonstrate that the IVD is clinically valid. In reviewing submissions for IVDs, FDA considers applicable information from the literature submitted by the applicant. In addition, as discussed in response to comment 203, FDA has published a final guidance document describing a recognition program for publicly accessible databases of human genetic variants as sources of valid scientific evidence for genetic and genomic tests (Ref. 188). Under this policy, test manufacturers can use information in FDA-recognized databases to support the clinical validity of their tests.

FDA disagrees that FDA should expect less information in premarket submissions when tests are designed for use on ''commercially'' available instruments and with ''commercially'' available reagents. FDA's expectations for validation apply to the test system, which includes use of all components together. Any given instrument or reagent may be a part of a test system that works well and part of another test system that does not.

With respect to the comment suggesting that FDA consider prior reviews by other regulatory bodies, as described elsewhere in this preamble, FDA anticipates expanded use of the Third Party review program and intends to exercise enforcement discretion with respect to premarket review requirements for LDTs approved by NYS CLEP. Further, FDA will continue ongoing efforts towards international harmonization with other regulatory bodies.

(Comment 194) One comment expressed concern that FDA does not have the level or depth of expertise necessary to review premarket submissions for highly complex LDTs. Another comment stated that the NPRM was focused largely on clinical pathology, and that FDA has not considered that the large quantity of premarket submissions FDA will receive will be more varied and challenging, and include digital pathology products incorporating artificial intelligence/machine learning, liquid biopsies, multiplex assays, multianalyte tests incorporating complex algorithms, and whole genome sequencing.

(Response 194) FDA disagrees with the comment's suggestion that FDA has failed to consider a wide range of IVDs in connection with this rulemaking, such as the products listed in the comment. FDA is familiar with these products, as discussed below, and has taken into account its experience with IVDs generally in issuing this rule. FDA also notes that the term ''clinical pathology'' is broad. According to the Association of Academic Medical Centers, clinical pathology includes many subspecialties, including blood banking-transfusion medicine, chemical pathology, clinical informatics, cytopathology, hematology, microbiology, and molecular genetic pathology, among others.

FDA also disagrees that it lacks the level or depth of expertise necessary to evaluate premarket submissions for a wide variety of challenging and varied highly complex IVDs offered as LDTs. FDA employs hundreds of scientists with expertise in the review of IVD safety and effectiveness, including those who have worked in clinical laboratories and developed LDTs. This expertise includes knowledge of digital pathology products, liquid biopsy-based tests, multiplex assays, multi-analyte tests incorporating complex algorithms, and whole genome sequencing, among other things. FDA also works with experts across offices, including experts in the Digital Health Center of Excellence on artificial intelligence/machine learning matters. For example, FDA has already authorized artificial intelligence/machine learning-based software (see Ref. 191), digital pathology tests incorporating artificial intelligence/machine learning (see Ref. 192), liquid biopsy assays (see, *e.g.,* Refs. 144 and 193), multiplex assays (see, *e.g.,* Refs. 194 and 195), multi-analyte tests incorporating complex algorithms (see, *e.g.,* Refs. 196 and 197), and exome sequencing based NGS tests (see, *e.g.,* Refs. 198 and 199).

(Comment 195) Several comments requested clarity around device classification and offered suggestions for how FDA should classify IVDs offered as LDTs, including what factors should be considered. One comment suggested FDA determine and continuously seek input on classification of tests through a public process. Another comment suggested FDA use a request for information process to gather information on currently available IVDs offered as LDTs and use that data to establish classification panels that IVD manufacturers could look to as a resource in the premarket submission process, which would save them time and resources. Some comments stated that, when classifying tests, FDA should consider context, including how widely a test is distributed; whether it is offered by a laboratory that is integrated into patient care; and the history of the test manufacturer, including with respect to validation generally and for specific tests.

(Response 195) As discussed more fully in section VI.P of this preamble, FDA already has processes in place and has made multiple resources available to industry to help manufacturers determine the classification of their devices. FDA notes that some IVDs offered as LDTs may already be classified under existing classification regulations. FDA recommends that stakeholders consult FDA's classification database for more information (Ref. 200). Laboratory manufacturers may also seek feedback from FDA through a Pre-Submission, or may submit a request for information regarding the class in which a device is classified or the requirements applicable to a device under section 513(g) of the FD&C Act.

We note that standards for classification of a device are set forth in statute (21 U.S.C. 360c(a)). The existing device classification processes focus on the risk of the IVD itself and availability of controls to address such risk. In classifying devices, FDA considers, among other things, the device's intended use and indications for use, which includes consideration of the intended patient population. The risk the device poses to the patient and/or the user is a major factor in the class it is assigned. Refer to FDA's web page for more information on classification (Ref. 201).

With regard to the request for FDA to continuously seek input on classification of tests through a public process, we agree that public input can be important, and in fact required, in certain circumstances.

Among other things, there is a public process when FDA classifies a preamendments device for the first time under section 513(d) of the FD&C Act. This process involves a public meeting of the appropriate advisory committee panel and notice and comment rulemaking.

Postamendments devices are deemed to be class III by operation of law under section 513(f)(1) of the FD&C Act, but such devices can be reclassified under different processes. Under section 513(f)(3) of the FD&C Act, for example, stakeholders can petition FDA to change the classification of these devices (see § 860.134(b) (21 CFR 860.134(b))). FDA can also initiate reclassification under section 513(f)(3) of the FD&C Act, and

under that process, the public would have an opportunity to review and comment on the proposed classification and special controls, if applicable, which are published first by proposed order in the **Federal Register** (see § 860.134(c)). In addition, a manufacturer can submit a De Novo classification request under section 513(f)(2) of the FD&C Act requesting reclassification to class II or class I. FDA acts on such requests through written order, without a public comment process.

(Comment 196) Some comments stated that FDA's three-tier classification system for devices does not translate well to IVDs offered as LDTs. These comments expressed concern that FDA would inappropriately classify many IVDs offered as LDTs as high risk ''when in reality their risk is mitigated by the fact that they are part of a multi-faceted medical assessment and are rarely used in isolation for clinical decision-making.'' Some comments stated that most LDTs should be considered low- or moderate-risk because they are typically used as only one part of a more comprehensive patient evaluation and not the singular factor for clinical decisions. One comment stated that ''LDTs are comprised of not only medical products, but also analytic processes,'' and suggested that ''A regulatory review process for LDTs should consider both and achieve an appropriate balance between the two given where the risk lies in a particular test.''

(Response 196) FDA disagrees that FDA's device classification system does not translate well to IVDs offered as LDTs. FDA determines the risk class of devices, including IVDs, by applying the statutory standards set forth in the FD&C Act, including standards for class I (low-risk), class II (moderate-risk), and class III (high-risk) devices. *See* 21 U.S.C. 360c(a)(1). FDA's classification decisions take into account the risk of a device, which may depend on whether the device is the sole determinant for clinical decision-making, among other things. FDA is not aware of any unique feature of IVDs offered as LDTs that renders the statutory standards less applicable or less appropriate for these IVDs.

To the extent that the comments were suggesting that IVDs offered as LDTs are unique because they are ''part of a multi-faceted medical assessment and are rarely used in isolation for clinical decision-making,'' FDA disagrees. Many IVDs are indicated for use in conjunction with clinical assessments and not as the sole basis for clinical decisions, so IVDs offered as LDTs are not unique in that respect. For example, class III prostate specific antigen tests are intended to be used in conjunction with a digital rectal exam to aid in the detection of prostate cancer in men aged 50 years and older. Class II Duchenne muscular dystrophy newborn screening tests are intended to be used in conjunction with other clinical and diagnostic findings to aid in the screening of newborns. Class I cholesterol tests are intended to be used to aid in the diagnosis of lipid disorders. In general, any IVD, regardless of class, that is indicated to ''aid in the diagnosis'' of a clinical condition is intended to be used in conjunction with clinical assessments. Therefore, use in the context of a ''multi-faceted medical assessment'' is not unique to IVDs offered as LDTs.

FDA also disagrees that IVDs offered as LDTs should be considered low or moderate risk whenever they are part of a multifaceted medical assessment (*i.e.,* are not used in isolation for clinical decision-making). Even if such tests are used as a part of a multifaceted medical assessment and are not the sole determinant for clinical decision-making, false positive or false negative test results can still lead to unwarranted interventions or progression of disease without necessary intervention. Given the role that IVDs offered as LDTs play in modern medical care, test validity has a significant impact on the public health. However, FDA notes that most currently classified IVDs have been determined by FDA to be low or moderate risk (class I or class II).

With regard to the suggestion that FDA's regulatory review process should consider that LDTs are comprised of both ''medical products'' and ''analytic processes,'' the comment provided no additional discussion of these terms, and FDA is not clear on the distinction the commenter intended to draw. To the extent the commenter meant to distinguish between medical devices and the ''practice of medicine,'' see our responses to comments in section VI.D.6. With regard to the suggestion that FDA take a balanced approach in light of a test's risks, FDA agrees. We take a risk-based approach to the devices we regulate and determine the level of regulation warranted to provide reasonable assurance of safety and effectiveness. On January 31, 2024, FDA announced that it is undertaking an effort to initiate the process to reclassify most IVDs that are currently class III into class II because FDA believes there is sufficient information to establish special controls that, together with general controls, will provide a reasonable assurance of safety and effectiveness for these tests. The majority of these tests are infectious disease and CDx IVDs (Ref. 66). FDA aims to complete this reclassification process before stage 4 of the phaseout policy.

(Comment 197) One comment questioned how a high-risk IVD offered as an LDT that uses a class I instrument could be classified into a different class than the instrument, and whether the instrument would need to go through premarket review based on the classification of the high-risk IVD offered as an LDT.

(Response 197) The regulatory requirements applicable to a particular device can vary depending on the device's intended use. For example, the same instrument may be subject to certain requirements when it is not intended for use as part of a particular test system and subject to a different set of requirements when it is intended for use as part of a particular test system. Most instruments not intended for use as part of a particular test system are classified as class I 510(k)-exempt. However, if a manufacturer seeks to market a test system that includes such an instrument as a component, the instrument would be reviewed under the standards applicable to the overall test system. For example, in the context of a submission for a high-risk test system, FDA would review information to support use of the instrument in that test system.

(Comment 198) Several comments proposed that FDA streamline premarket submission or review for some or all IVDs offered as LDTs. Comments stated that FDA review should be expedited so that care is not delayed, and that quick turnaround times are particularly needed for infection prevention and control. Some comments suggested specific approaches FDA could take. One comment asked FDA to consider maintaining a MAF containing core data submitted by a manufacturer, which other laboratories could then draw from and use rather than repeat a data collection. Another comment suggested FDA provide standardized templates to help the manufacturers of IVDs offered as LDTs present data in a consistent and understandable format. Another comment suggested that FDA identify strategies to streamline validation of tests when there are well characterized biomarkers or numerous tests with a similar intended use.

(Response 198) Premarket pathways and certain submission requirements are

set forth in the FD&C Act,[88] and FDA cannot change those requirements. In addition, to the extent that the comments were suggesting that FDA should have a different approach to implementing premarket review for IVDs offered as LDTs compared with other IVDs, FDA disagrees.

However, in general, FDA supports tools for more efficient premarket review as consistent with applicable law. For example, FDA's device MAF system is available to device manufacturers, including laboratory sponsors of IVDs offered as LDTs. A laboratory sponsor can, with the data owner's permission, reference specific MAFs in a premarket submission for a third party's data and other information related to the subject IVD offered as an LDT. The MAFs would allow FDA's confidential review of such information to facilitate scientific evaluation of the IVD without disclosing trade secret or confidential information to the sponsor laboratory (see Ref. 202 for more details). Such use of MAFs in a manner that eliminates unnecessary burdens is consistent with the least burdensome principles directed by Congress.

FDA appreciates that standardized templates or additional guidance regarding data presentation and test validation may facilitate efforts by laboratories to comply with applicable premarket review requirements. As discussed more fully in response to comment 291, FDA anticipates issuing a small entity compliance guide, and intends to consider issuing additional guidance documents as appropriate and making additional resources available on specific topics, including test validation, over the course of the phaseout period. As described further in response to comment 293, there are multiple resources to help manufacturers, including laboratories, understand the type of data and information, including validation data and information, that is included in support of premarket submissions for IVDs. As stated elsewhere, FDA implements premarket review, including its review of analytical and clinical validation data, consistent with several ''least burdensome'' statutory provisions and in accordance with Agency policy. This topic is discussed in detail in FDA's final guidance document entitled ''The Least Burdensome Provisions: Concept and Principles,'' which defines ''least burdensome'' to mean the minimum amount of information necessary to adequately address a relevant regulatory question or issue through the most efficient manner at the right time (Ref. 75). Consistent with FDA's least burdensome principles, if available literature is adequate to demonstrate that the clinical validity of the biomarker detected by the test is well-established, FDA considers such applicable information from the literature submitted by the applicant.

(Comment 199) One comment suggested that FDA collaborate with CDC and other Federal agencies so that each public health laboratory does not need to submit a separate PMA to obtain premarket approval for their shared test types. The comment noted that this suggested approach would alleviate challenges when the public health laboratory does not hold the validation dataset, which, for some test types, is validated by Homeland Security and the Laboratory Response Network.

(Response 199) When a laboratory submits an application for premarket approval of an IVD, that application can include information to support the distribution of that IVD to other laboratories; for example, CDC can obtain approval for a test that involves the distribution of that test to the Laboratory Response Network. In addition, as discussed above, data owners may choose to submit a MAF and provide a right of reference to specific laboratories, which in turn can reference the data and information in the MAF in their PMA applications.

(Comment 200) One comment suggested that FDA work with CMS, CAP, and the Joint Commission to align requirements for clinical laboratories when performing validation experiments to avoid creating redundant and misaligned regulations that will lead to costly delays.

(Response 200) FDA is responsible for implementing the requirements of the FD&C Act with respect to IVDs, including requirements for safety and effectiveness of IVDs offered as LDTs. FDA takes a least burdensome approach in its implementation of premarket review requirements, in a manner that strives to eliminate redundancy and unnecessary burdens. However, this approach does not change the applicable statutory and regulatory requirements for premarket review, including premarket submission content requirements and requirements for valid scientific evidence. As discussed more fully in sections VI.C.2 and VI.C.3, CMS and laboratory accreditation bodies, such as CAP and the Joint Commission, address clinical laboratory operations and personnel, but do not address critical aspects of laboratory development, such as clinical validity. FDA has both the authority and the expertise to oversee IVDs offered as LDTs to better assure the safety and effectiveness of these devices. In addition, FDA and CMS meet regularly to share information and coordinate our approaches, as appropriate, and will continue to do so upon implementation of this rule.

FDA appreciates that additional guidance regarding IVD validation may facilitate efforts by laboratories to comply with premarket review requirements. FDA intends to consider issuing additional guidance documents as appropriate, and making additional resources available on specific topics, which may include clinical validity, over the course of the phaseout period. See our response to comment 291.

(Comment 201) We received comments asking what standard FDA will apply for IVDs offered as LDTs that remain on the market while FDA reviews a premarket submission for that IVD. One comment urged FDA to ''allow'' these IVDs to remain on the market while the laboratory manufacturer addresses FDA's questions unless there is a likelihood of serious harm. Another comment asked FDA to confirm whether the Agency commits to take action on premarket submissions during the same stage in which sponsors are expected to submit them (*e.g.,* during stage 4 for high-risk LDTs).

(Response 201) As described in section V.C, in stage 4 of the phaseout policy (3½ years after publication of this final rule), FDA is phasing out the general enforcement discretion approach with respect to premarket review requirements for high-risk IVDs offered as LDTs. In stage 5 (4 years after publication of this final rule), FDA is phasing out the general enforcement discretion approach with respect to premarket review requirements for moderate-risk and low-risk IVDs offered as LDTs (that are subject to premarket submission requirements). As described in section V.C, FDA generally does not intend to enforce against IVDs offered as LDTs for lacking premarket authorization after a complete PMA, HDE application, 510(k), BLA, or De Novo request has been submitted to FDA (by the corresponding stage of the phaseout policy) until FDA completes review of the submission. We note, however, that regardless of the phaseout timeline and enforcement discretion policies in this preamble, FDA retains discretion to pursue enforcement action at any time against violative IVDs when appropriate.

The phaseout policy does not address the timeframe within which FDA will complete review of premarket

[88] Some devices that are also biological products are licensed under the PHS Act.

submissions. FDA's timeline for phasing out the general enforcement discretion approach with respect to premarket review requirements aligns with the next reauthorization of MDUFA, which will provide an opportunity for FDA and industry to negotiate regarding user fees and performance goals with the knowledge that laboratory manufacturers will generally be expected to comply with applicable premarket review requirements.

(Comment 202) Several comments asked how premarket authorization will work when it is possible FDA will receive several De Novo requests for the same type of test. One comment stated that there would be a disincentive to being the first to submit a De Novo request for novel tests (specifically in reference to laboratories creating new intended uses for FDA-authorized tests) because such requests require payment of a higher user fee than 510(k) submissions. FDA also received comments asking about the logistics of the premarket review process when sponsors may not know whether another entity has submitted a De Novo request for the same type of test.

(Response 202) FDA has issued multiple final guidance documents outlining our policies for De Novo requests, including ''De Novo Classification Process (Evaluation of Automatic Class III Designation)'' (Ref. 203) and ''Acceptance Review for De Novo Classification Requests'' (Ref. 204), in addition to a final rule entitled ''Medical Device De Novo Classification Process'' (86 FR 54826, October 5, 2021).

With respect to the comments asking about the logistics of the premarket review process when multiple sponsors have submitted De Novo requests for the same type of IVD, FDA generally would not disclose the existence of a De Novo request under review to other submitters, but would notify them if/when a De Novo request for the same device type is granted. As further explained in our final guidance document entitled ''De Novo Classification Process (Evaluation of Automatic Class III Designation),'' when a De Novo request is granted while other devices of the same type are under review in additional De Novo requests, the additional De Novo requests will be declined. The submitters of the declined De Novo requests will be required to demonstrate substantial equivalence to the IVD that was granted a De Novo in a 510(k) submission, and comply with any applicable special controls for the device type; the sponsor may use all information in their initial De Novo request by incorporating it by reference into the new 510(k) submission.

To the extent this process and the higher user fees associated with De Novo requests compared to 510(k) submissions may disincentivize submission of De Novo requests for novel IVDs, as suggested in one comment, this concern is not specific to IVDs offered as LDTs, but rather relates to all devices. FDA is not changing the De Novo and 510k frameworks through this rulemaking.

(Comment 203) One comment requested guidance on how to handle database curation for sequencing assays, specifically regarding adding to databases without having to submit an application to FDA, and regarding regulations for curated databases pertaining to the authenticity and security of data and obtaining proper documentation for database submissions prior to inclusion in the database.

(Response 203) FDA has published a final guidance document entitled ''Use of Public Human Genetic Variant Databases to Support Clinical Validity for Genetic and Genomic-Based In Vitro Diagnostics,'' which describes a recognition program for publicly accessible databases as sources of valid scientific evidence for genetic and genomic tests (Ref. 187). This final guidance addresses recommendations for appropriate curation of publicly accessible databases using human expert evaluation, including recommendations around database procedures and operations, data quality and security, variant evaluation and assertions, and professional training and conflicts of interest. FDA recognition of a database indicates that FDA believes the data and assertions contained in the database can be considered valid scientific evidence. Test manufacturers can use the assertions within FDA-recognized databases to support the clinical validity of their tests.

We note that the clearance/approval of a PCCP may help manufacturers avoid the need for PMA supplements or new 510(k)s for modifications to a database that is used as part of test result generation. PCCPs provide the opportunity for a manufacturer to prospectively outline how changes to a device will be validated and implemented. This may include how a database that is used as part of the test result generation may be updated, such as to add variants. FDA can review and clear or approve the PCCP during review of a premarket submission. Manufacturers would not need to submit a PMA supplement or new 510(k) for subsequent changes when such changes are in accordance with the authorized PCCP. This approach has been successfully employed for various FDA-authorized IVDs.

(Comment 204) FDA received comments with specific questions about FDA premarket review, including the review process, FDA response timelines, associated user fees, and appeal rights, among other subjects.

(Response 204) Notably, neither the regulation amendment nor the phaseout policy changes applicable FDA requirements for IVDs or IVD manufacturers. As noted throughout this preamble, FDA has published numerous final guidance documents and resources for industry with information on how to comply with applicable requirements, including requirements for premarket review. We encourage interested parties to consult these materials, including final guidance documents and resources available through the Division of Industry and Consumer Education within CDRH (see Ref. 184). As appropriate, FDA also intends to develop guidance documents specific to the final phaseout policy, which will be forthcoming during implementation.

G. Impact on Small Businesses

(Comment 205) FDA received comments expressing concern that phasing out the general enforcement discretion approach for LDTs will put financial and administrative pressure on small laboratories, resulting in laboratory closures, consolidation of smaller entities, and monopolies in the testing space as large laboratories take more of the market share. Several comments stated that large laboratories will be advantaged as they have the resources to afford the necessary staffing and other costs related to test development and regulatory submission and emphasized the thin financial margins with which small laboratories operate. Some comments stated that the impact on small laboratories will result in a loss of expertise and infrastructure. In addition, comments noted that such centralization of LDTs at large laboratories may negatively impact medical education and training in pathology.

(Response 205) FDA appreciates the concerns regarding financial and administrative challenges for smaller laboratories. FDA anticipates that the enforcement discretion policies discussed in section V.B will sufficiently address these concerns and help to avoid undue disruption to the testing market. For example, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820,

subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. Premarket review costs and QS costs are a significant portion of the overall costs associated with compliance with applicable requirements under the FD&C Act and FDA's regulations, as described in section II.F.5 of the FRIA (see Ref. 10). Small laboratories that do not incur such costs will face significantly less of the financial and administrative pressure that the comments describe, reducing the likelihood of laboratory closures, laboratory consolidation, and monopolies predicted by the comments. For further discussion see section III.B of the FRIA. FDA also intends to issue a small entity compliance guide, which will assist small entities in complying with applicable requirements. For discussion of the potential impact of the phaseout policy on medical education and training, see our response to comment 301.

(Comment 206) Some comments enumerated specific questions for FDA regarding compliance and requested clarification as to whether FDA will make materials available to help small businesses come into compliance.

(Response 206) FDA intends to provide additional resources on specific topics that may be useful as laboratories come into compliance with applicable requirements, as discussed in response to comment 291. In addition, as noted in response to comment 205, FDA intends to issue a small entity compliance guide to provide additional guidance to small businesses.

H. Impact on Pricing

(Comment 207) Several comments stated that ending the general enforcement discretion approach for LDTs will lead to higher prices for clinical tests due to the costs of complying with applicable FDA requirements. Some comments further stated that the costs of complying with applicable requirements will result in the closure of many laboratories, the outsourcing of certain laboratory testing, or other supply chain contractions, which in turn will increase the costs of tests due to decreased test availability, decreased market competition, and increased handling costs (*e.g.,* costs associated with shipping samples to a centralized laboratory), or supply chain contractions. One comment expressed skepticism regarding FDA's statement that any losses may be offset by the market entry of IVDs from other manufacturers. FDA also received a comment which argued that increased prices for clinical tests will disincentivize people from seeking preventive care until they suffer an emergency, which will increase costs for the overall healthcare system. Collectively, these comments suggested that laboratories will pass increased costs to their customers, which some comments noted could result in higher insurance premiums. However, one comment stated that insurance companies will be more likely to cover tests (because they will have FDA authorization), which may allow for greater access to more affordable testing. Payors themselves commented in support of the rule ''given the proliferation of laboratory developed tests (LDTs) and concerns about the reliability of certain LDTs.'' One comment noted that it is inaccurate to assume that LDTs are always cheaper.

(Response 207) FDA recognizes that laboratories may pass the costs of compliance with applicable requirements, including the specific examples listed in the comments, to their customers by raising prices for IVDs offered as LDTs. We also recognize that if many laboratories reduce operations or exit the market, production may be concentrated in a few large laboratories, which may cause prices for certain IVDs offered as LDTs to increase. As we noted in section II.F.6 of the PRIA and the FRIA (Ref. 60 and 10), the exact effect of the phaseout policy on the price of IVDs offered as LDTs is unknown. A few comments received by FDA included discussion of the price differential between unauthorized LDTs and FDA-authorized tests, but comments did not otherwise provide empirical data to inform FDA's assessment of effects on test prices.

However, we note that in the final phaseout policy, after considering the public comments received on the NPRM, FDA has included certain enforcement discretion policies. As described in section V.B.3, FDA intends to exercise enforcement discretion and not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified in certain limited ways as described in section V.B.3. In addition, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP. FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system.

As noted in response to comment 205, the costs of compliance with premarket review requirements (as well as QS requirements) are a significant portion of the overall anticipated costs to laboratories of complying with applicable FDA requirements (see section II.F.5 of the FRIA (Ref. 10)). As a result, FDA's determination to include the enforcement discretion policies described above in the final phaseout policy may significantly reduce the costs of compliance under the final phaseout policy, thus reducing the number of laboratories that scale back operations or exit the market. FDA estimates the annualized cost over 20 years to be $4.6 billion less than the estimates in the PRIA (Ref. 60).

In addition, we anticipate that FDA oversight could help to support coverage and reimbursement determinations for IVDs offered as LDTs, which we anticipate will make certain IVDs offered as LDTs for which there is a reasonable assurance of safety and effectiveness more affordable for patients. As a result, FDA does not agree that patients will necessarily be disincentivized from seeking preventive care resulting in increased costs to the healthcare system as a result of the phaseout policy.

In addition, phasing out the general enforcement discretion approach for LDTs will help to reduce other healthcare costs. Greater oversight by FDA will help to address the hidden costs associated with unsafe or ineffective IVDs (including IVDs promoted with false or misleading claims), such as costs incurred from inappropriate treatments, additional or repeat testing, unnecessary consultations with providers, or additional treatments that become necessary due to the progression or worsening of a disease or condition following misdiagnosis. While certain costs may be passed on to individuals and insurers, we expect some of these costs will be offset by the associated benefits.

A more fulsome discussion of the estimated costs and benefits is provided in FDA's FRIA (Ref. 10).

(Comment 208) FDA received one comment which stated that some laboratories may decide to utilize tests that are more expensive for patients, regardless of medical necessity, in order

to recoup the costs of complying with applicable FDA requirements.

(Response 208) FDA does not agree that phasing out the general enforcement discretion approach for LDTs will cause laboratories to utilize more expensive tests regardless of medical necessity. FDA anticipates that, to the extent some laboratories may attempt to recoup costs by utilizing more expensive tests regardless of medical necessity, such laboratories would be likely to engage in such practices irrespective of FDA's determination to phase out the general enforcement discretion approach for LDTs. In addition, the use of any particular test is a decision to be made between patients and their healthcare providers. Finally, FDA anticipates that third party payors may review the medical necessity of tests for which claims for reimbursement are submitted.

I. Impact on Access and Innovation

(Comment 209) Several comments expressed concern that ending the general enforcement discretion approach for LDTs will negatively impact patient access to clinical testing. These comments generally asserted that the cost or complexity of complying with FDA requirements, and the burdens that may fall on laboratories from the phaseout of the general enforcement discretion approach, will cause many laboratories to reduce activities and stop offering some or all IVDs offered as LDTs, particularly in the context of other challenges that laboratories face with respect to staffing, supply chains, and other challenges. Several comments stated that in a recent American Society for Microbiology survey of its members, over 80 percent of the microbiology laboratories surveyed said they would consider discontinuing LDTs if FDA finalized its proposal. Another comment stated that in an internal survey of members of the Association of Pathology Chairs, out of 39 laboratories surveyed, 37 reported that more outsourcing of tests would be necessary if FDA finalized its proposal. Some comments stated that the impact would be particularly significant for laboratories that currently lack the infrastructure to comply with applicable requirements and for emerging companies.

Based on these concerns, many comments stated that patient access to tests will be reduced, and patients will potentially be deprived of important health-related information. Some comments stated that this would result in worse patient outcomes and higher healthcare costs; comments suggested that patients would lose access to IVDs offered as LDTs that perform well, even some IVDs offered as LDTs that may perform better than FDA-authorized IVDs, while other comments stated that patients would lose access to testing that supports rapid care decisions. A few comments asserted that harm may result from losing access to certain types of tests, such as infectious disease tests or genetic tests. Other comments suggested that reduced access to tests would mean less choice, flexibility, competition, or ability to withstand disruptions to the test market. One comment stated that more tests would be offered by large laboratories that prioritize financial profits over accountability or patient care and that cannot ''keep up with the necessary fine-tuned evolution of these tests.'' Another comment suggested that by reducing access to testing, the phaseout policy would infringe on patient and physician ''rights to timely and adequate care and the freedom to exercise clinical judgment.'' Other comments reiterated the suggestion that the phaseout policy would limit access and thereby constrain a physician's ability to use his or her discretion to make treatment decisions. Some comments questioned whether the market withdrawal of some IVDs offered as LDTs would be counterbalanced by the introduction of new IVDs.

In addition, some comments stated that by reducing the availability of IVDs offered as LDTs, the phaseout policy would lead to delays in testing, including by potentially increasing reliance on reference laboratories which may increase the time for individuals to obtain test results. Other comments argued that delays will result from FDA's premarket review process, which will slow down the ability of patients to access tests that they need. Comments also stated that if FDA were to finalize its proposal, delays could result due to less competition, and that if the phaseout policy results in centralization of tests to certain locations, patients who are not in the local area could face additional hurdles.

(Response 209) As described in section V, FDA has made several changes to the phaseout policy that was described in the NPRM, including the addition of certain enforcement discretion policies. These changes significantly reduce the economic impact of the phaseout policy, and thus the likelihood that laboratories may reduce their test offerings or exit the market. Based in part on the inclusion of these enforcement discretion policies in the final phaseout policy, FDA disagrees with concerns that the phaseout of the general enforcement discretion approach for LDTs will have a significant net negative impact on patient access to IVDs that have appropriate assurance of safety and effectiveness.

Most notably, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3.

FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP, and premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system, as discussed in sections V.B.2 and V.B.3.

FDA anticipates that these aspects of the final phaseout policy will substantially reduce the overall impact of the phaseout policy on patient access to clinical tests. In addition, FDA notes that, as explained in the NPRM and discussed in the FRIA, the FD&C Act and FDA's regulations do not require premarket review for all IVDs (88 FR 68006 at 68013). FDA estimates that approximately 50 percent of IVDs offered as LDTs will not require premarket review (see section II.F.2 of the FRIA (Ref. 10)). Moreover, under FDA's phaseout policy, FDA does not intend to phase out the general enforcement discretion approach for premarket review requirements for IVDs offered as LDTs until several years after publication of this final rule. FDA also generally does not intend to enforce against IVDs offered as LDTs for lacking premarket authorization after a complete PMA, HDE application, 510(k), BLA or De Novo request has been submitted to FDA by the start of the corresponding stage of the phaseout policy, until FDA completes review of the submission, so as not to interrupt access to IVDs that are already on the market and available to patients.

To the extent that some IVDs offered as LDTs come off the market because, for example, the IVD cannot meet applicable requirements under the FD&C Act and its implementing regulations, or the laboratory does not invest resources to meet those requirements, the value of access to such IVDs is diminished in the absence

of assurances regarding the IVDs' safety and effectiveness. Neither patients nor providers are helped by access to tests that are not safe and effective for their intended use. In addition, in the event some IVDs offered as LDTs exit the market, FDA expects that other manufacturers may fill the need with IVDs that comply with applicable FDA requirements. FDA also anticipates that applying the same general oversight approach to both laboratory and non-laboratory manufacturers of IVDs will encourage genuine innovation and facilitate access to IVDs for which there is a reasonable assurance of safety and effectiveness, as discussed further in response to comment 218 (see Refs. 15, 22, 88 to 90).

Finally, it is unclear to FDA how generalizable the survey data cited in comments may be. While comments stated that the American Society for Microbiology's survey of its members found that over 80 percent of the microbiology laboratories surveyed would consider discontinuing most LDTs if FDA finalized its proposal, only 88 of the American Society for Microbiology's 36,000 members (0.2 percent) responded to the survey (Ref. 205). Similarly, the Association of Pathology Chairs' survey of its members produced only 39 responses (Ref. 170), while their comment states that the Association of Pathology Chairs ''represents the entire academic pathology leadership team of over 160 departments nationwide.'' Regardless, the policy changes to the phaseout policy, including the addition of certain enforcement discretion policies, help address the concerns identified in these surveys as described above.

(Comment 210) A few comments stated that laboratories may begin offering their tests for ''surveillance use only,'' in reference to a category of tests that FDA proposed in the NPRM would not be affected by the phaseout policy.

(Response 210) Tests for public health surveillance are limited to tests manufactured and offered for use exclusively for public health surveillance and are distinct from tests used for other purposes in that they are intended solely for use on systematically collected samples for analysis and interpretation of health data in connection with disease prevention and control, and tests results are not reported to patients or their healthcare providers. Tests for which results are returned to a patient or healthcare provider would not be considered public health surveillance tests. Laboratories could not simply label tests ''for surveillance use'' to avoid oversight of broader use of the tests.

(Comment 211) FDA received a comment which stated that FDA should analyze the totality of circumstances that currently exist ''in healthcare'' before phasing out the general enforcement discretion approach for LDTs. This comment suggested that such circumstances support the conclusion that the phaseout policy will contribute to a ''total disruption'' in patient access to tests. Another comment asked whether the Agency has performed, or intends to perform, an impact analysis on patient care, patient access, and patient safety, and one comment expressed concern that action by FDA in the absence of comprehensive data regarding the use of LDTs will result in severe restrictions on access.

(Response 211) As described elsewhere in this preamble, the Agency has determined that increased FDA oversight is necessary to better assure the safety and effectiveness of IVDs offered as LDTs, and that maintaining the general enforcement discretion approach for LDTs is not in the best interest of the public health. In finalizing FDA's policy for phasing out the general enforcement discretion approach for LDTs, FDA has carefully considered issues related to patient care and access, including through the Agency's review and analysis of more than 6,500 comments submitted to the docket for this rulemaking. As discussed in response to comment 209, FDA's final phaseout policy includes several policies that will substantially reduce the overall impact of the phaseout policy on patient access to IVDs offered as LDTs. FDA has also conducted a detailed regulatory impact analysis that considers costs and benefits; please see discussion in the FRIA (Ref. 10).

(Comment 212) FDA received a comment which stated that ending the general enforcement discretion approach for LDTs would impact laboratories' willingness to share new methods and rare reagents with each other. The comment stated that as a result, the phaseout policy may impede efforts that aim to address barriers to care, such as the Cancer Moonshot Initiative.

(Response 212) FDA does not agree that ending the general enforcement discretion approach for LDTs will result in less scientific exchange between laboratories, or negatively impact initiatives such as the Cancer Moonshot Initiative. FDA anticipates that the phaseout policy will help to advance the Cancer Moonshot Initiative, as cancer care is often personalized based on the genetic makeup of the tumor, and helping to ensure that IVDs offered as LDTs have appropriate assurance of safety and effectiveness will help patients with cancer get the optimal treatment. Although FDA's phaseout of the general enforcement discretion approach may lead laboratories to incur additional costs, including in connection with premarket review requirements in some cases, FDA does not anticipate that these factors will necessarily cause laboratories that currently share new methods, rare reagents, or other information or materials to cease doing so.

Moreover, better assuring the safety and effectiveness of LDTs may foster test innovation and facilitate the collective efforts of the scientific and medical communities to identify promising technologies, new therapies, or areas worthy of future research (see Refs. 15, 22, 88 to 90). The FD&C Act's premarket review requirements provide an impetus for manufacturers to conduct scientifically sound and robust research to establish the safety and effectiveness of their devices, including IVDs. Basing decisions on scientifically reliable information can help to eliminate or reduce harms to health, such as misdiagnosis or delayed diagnosis with a lost opportunity for effective treatment, as well as the diversion of limited resources to ineffective treatments. *See* January 2017 Discussion Paper at 5–6 (Ref. 57).

(Comment 213) One comment stated that during a past recall of a particular IVD, FDA recommended the use of an LDT as an alternative to the recalled device. The comment expressed concern that ending the general enforcement discretion approach for LDTs may impede FDA's ability to respond to similar recalls.

(Response 213) FDA disagrees with this comment. By phasing out the general enforcement discretion approach for LDTs, FDA seeks to better protect the public health by helping to assure the appropriate safety and effectiveness of LDTs, including IVDs offered as LDTs, which may serve as alternatives to IVDs that are the subject of a recall. Moreover, as discussed in response to comment 209, FDA's final phaseout policy includes several policies that will substantially reduce the overall impact of the phaseout policy on patient access to IVDs offered as LDTs.

(Comment 214) FDA received comments stating that the phaseout policy would have a negative impact on innovation in the testing space, as laboratories working to come into compliance would be either unable or

unwilling to engage in innovative test development. Some comments stated that the regulatory constraints associated with the phaseout policy would cause laboratory manufacturers to develop fewer tests, hindering the timely development and deployment of cutting-edge therapies and diagnostic tools and ultimately harming patients. Comments noted that LDTs are an area of rapid advancement, with some being in use only for short periods of time, and some comments expressed concern that enforcing premarket review requirements for each individual assay or slight modification would not be adequate to keep up with the progress of testing. One comment stated that the phaseout policy would force laboratories to focus efforts on developing premarket applications for current tests instead of innovating to improve patient care. Some comments stated that the phaseout policy would cause delays in the development of new diagnostics, impacting the ''competitive edge of U.S. medical research and development.''

(Response 214) FDA does not agree that the phaseout policy will hinder the timely development and deployment of innovative IVDs offered as LDTs. In fact, as discussed in response to comment 218, applying the same general oversight approach to laboratories and non-laboratories that manufacture IVDs may facilitate the development of innovative IVDs from non-laboratory manufacturers.

Even when premarket review is required for an IVD offered as an LDT, FDA does not agree that such review generally impairs innovation. The evidentiary requirements of premarket review spur innovation based on reliable scientific evidence that enables an informed determination of the safety and effectiveness of medical devices for each intended use and product labeling that provides information for using the product safely and effectively for such use. The generation of scientific evidence that is independently reviewed by FDA supports physicians in making sound clinical decisions. *See* January 2017 Discussion Paper at 3 (Ref. 57).

We note that sponsors have sought and obtained FDA authorization for innovative IVDs offered as LDTs. For example, a list of authorized CDx IVDs, which include innovative IVDs offered as LDTs, is available on FDA's website (Ref. 206). Furthermore, FDA's Breakthrough Devices program is intended to help expedite the development and review of certain devices that provide for more effective treatment or diagnosis of life-threatening or irreversibly debilitating diseases or conditions (21 U.S.C. 360e–3).

We agree that test innovation and development is important for patients and the public health, and we recognize the concern that expecting currently marketed IVDs offered as LDTs to come into compliance may cause laboratories to divert resources from the development of new IVDs, due to the time and resources that would be needed to comply with the regulatory requirements for their existing IVDs offered as LDTs. Based on these considerations along with concerns about reliance, and as discussed further in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this final rule. This enforcement discretion policy will improve patient access by allowing laboratories to focus resources on submissions for new, innovative tests based on reliable scientific evidence, rather than expend such resources in support of tests already on the market.

In addition, FDA intends to continue exercising enforcement discretion and generally not enforce premarket review and most QS requirements for such currently marketed IVDs offered as LDTs when they are modified in certain limited ways as described in section V.B.3. This aspect of the enforcement discretion policy will help to facilitate patient access to these tests by permitting certain modifications to be made within the scope of the enforcement discretion policy.

To further facilitate access going forward, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system.[89] In the context of tests for unmet needs, there may be less opportunity to recoup costs of premarket review. This policy is intended to reduce the risk that premarket review costs would dissuade development of and access to such tests, taking into account the mitigations described in section V.B.3.

Moreover, although we acknowledge that the preparation and submission of PMAs and 510(k)s impose the majority of costs estimated for laboratories under the final phaseout policy, we also note that as explained in the NPRM, under FDA's device authorities, FDA premarket review is required only for certain tests (88 FR 68006 at 68009). FDA estimates that approximately 50 percent of IVDs newly offered each year as LDTs will not require premarket review.

For these reasons, FDA does not anticipate that the phaseout policy will hinder the timely development and deployment of cutting-edge diagnostic tools, impair the competitiveness of U.S. medical research and development, or ultimately harm patients, as suggested by the comments. See also our response to comment 218 for discussion regarding how applying the same general oversight approach to laboratories and non-laboratories that manufacture IVDs may facilitate the development of innovative IVDs.

(Comment 215) Several comments noted that laboratories must be able to modify existing tests quickly to diagnose new conditions and monitor the impact of new therapies. Some comments stated that stifling modifications of currently marketed IVDs offered as LDTs would force pathologists and other healthcare providers to use older, less optimal tests, and noted that many patients do not have the time to wait for diagnostic development and rely on laboratories to be nimble and adapt to changing diagnostic criteria. One comment noted the ''redundancy and inability to update markers in flow cytometry panels based on new evidence'' as a longstanding issue and recommended FDA address the barriers that prevent laboratories from readily adapting tests in response to evolving scientific knowledge.

(Response 215) FDA appreciates the need for improvements to existing tests to better serve patients and providers, and notes that a manufacturer's modifications to its tests that have already been cleared, approved, licensed, or had a De Novo request granted by FDA require FDA review only in certain circumstances (see §§ 814.39, 807.81(a)(3), and 601.12 (21 CFR 601.12)). FDA has published several resources to help stakeholders determine whether a certain change or modification to a test may require a regulatory submission, including: (1) FDA's final guidance document entitled ''Modifications to Devices Subject to Premarket Approval (PMA)—The PMA Supplement Decision-Making Process'' (Ref. 185), (2) FDA's final guidance document entitled ''Deciding When to Submit a 510(k) for a Change to an Existing Device'' (Ref. 61), and (3) FDA's

[89] FDA recognizes that innovation often takes place in AMCs. *See e.g.,* Refs. 207–210.

final guidance document entitled ''Deciding When to Submit a 510(k) for a Software Change to an Existing Device'' (Ref. 211).

FDA recognizes that tests evolve in response to new scientific information, and FDA wants to avoid disincentivizing minor improvements to existing tests. As detailed in section V.B.3, for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) even if the IVD is modified in certain limited ways as described in section V.B.3. FDA intends to issue a draft guidance with additional details and examples and will seek public comment on such draft guidance.

(Comment 216) Some comments expressed concern regarding the potential impact of the phaseout policy on innovative academic research and clinical trials, suggesting that researchers will have little incentive or ability to develop new LDTs due to the costs associated with compliance with statutory and regulatory requirements. Several comments noted that non-profit AMCs are often the nexus for innovation in medicine and that LDTs developed by AMCs play a critical role in education, development, and quality monitoring for rare disease tests and other conditions that do not have a viable market for commercial test development. One comment stated that the phaseout policy may result in LDTs that are very expensive or limited to common health conditions with established demand.

(Response 216) As discussed above, FDA anticipates that the enforcement discretion policy for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified in certain limited ways as described in section V.B.3, will address concerns that patient access to new tests would be reduced due to laboratories' focus on premarket submissions, as well as concerns that LDTs will become more expensive due to the cost of resources that would be needed to prepare and submit premarket submissions for currently marketed tests under the phaseout policy as proposed in the NPRM. The Agency believes that the policies described herein will help avoid undue disruption to the testing market, specifically for healthcare providers and patients that are relying on continued access to currently offered tests, and will encourage genuine innovation.

To facilitate access going forward, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. This policy carefully balances the risk of not having a test available with the risk of not having assurances of premarket review in the context of the mitigations described in section V.B.3.

For additional discussion regarding the application of the phaseout policy in the clinical trial context, see our response to comment 175.

(Comment 217) FDA received some comments disagreeing with the view that increased oversight of LDTs may lead to increased innovation in the IVD space. These comments stated that LDTs and the laboratories that develop them are the catalysts for innovation, as they are typically developed when no ''commercial'' option is available and later acquired by manufacturers after technology and market development. On the other hand, one comment stated that the investment community and some LDT manufacturers have indicated that FDA's proposal ''will not significantly impede the ability of LDTs to reach the market.''

(Response 217) FDA recognizes the concerns regarding potential impact on innovation, but for the reasons discussed in our response to comment 214, FDA disagrees with the statement that the phaseout policy will not foster innovation and access to IVDs that have appropriate assurance of safety and effectiveness. While continued patient and provider access to certain tests is important, FDA also recognizes that an uneven oversight approach for laboratory and non-laboratory manufacturers of IVDs may discourage test development and innovation, as further discussed in response to comment 218 (see also Ref. 88). By applying the same general oversight approach to laboratories and non-laboratories that manufacture IVDs, FDA will give stakeholders greater clarity regarding regulatory expectations, and may facilitate investment in the development of innovative IVDs. Additionally, as recently noted in a joint statement issued by CMS and FDA regarding the oversight of LDTs, FDA's phaseout approach will remove a disincentive for non-laboratory manufacturers to develop novel tests (Ref. 71). We anticipate that phasing out the general enforcement discretion approach for LDTs will spur genuine innovation for IVDs for which there is a reasonable assurance of safety and effectiveness.

J. Level Playing Field

(Comment 218) FDA received a few comments discussing the impact of applying the same oversight approach to laboratories and non-laboratories that manufacture IVDs. One comment expressed support for a consistent framework for LDT risk assessment and the enforcement of FDA review requirements according to a test's intended use and stated that ''[a] level playing field is critical to maintaining the integrity of FDA review, fostering innovation, and providing patients with high-quality care.'' Another comment asserted that FDA's statements that application of the same oversight approach to laboratory and non-laboratory manufacturers may remove a disincentive for non-laboratory manufacturers to innovate and thus spur innovation is speculative as FDA has not surveyed manufacturers. The comment added that ''market forces, financial considerations, and challenges with patient enrollment in clinical trials for low prevalence pathogens are more likely the disincentivizing factors.''

(Response 218) FDA agrees that it is appropriate to apply the same general oversight approach to both laboratories and non-laboratories that manufacture IVDs. The general enforcement discretion approach for LDTs has led to an oversight scheme that does not best serve the public health, and there is no longer a sound basis to have a bifurcated enforcement approach for LDTs and other IVDs. As discussed in section III.B and our responses to comments in section VI.C, most IVDs offered as LDTs are functionally the same as those made by other manufacturers of IVDs, and evidence has exposed problems associated with certain IVDs offered as LDTs.

In addition, FDA agrees that applying the same general oversight approach will result in more stability to the testing market overall, which could help to encourage the manufacture of IVDs for which there is a reasonable assurance of safety and effectiveness. FDA is also aware that some firms have claimed a superficial connection to laboratories and then offered IVDs as LDTs (see Refs. 212 to 215). Given FDA's general enforcement discretion approach for LDTs, firms that use this business model have offered tests to patients in the absence of FDA oversight, with the potential for inaccurate or incomplete results that may impact patients' healthcare decisions. In addition, FDA is aware of concerns that the use of this type of

business model unfairly disadvantages non-laboratory IVD manufacturers that manufacture and market similar tests that comply with applicable FDA requirements. The increase in firms using these business models underscores the need for more oversight.

FDA is also aware of concerns that non-laboratory IVD manufacturers may currently be discouraged from investing time and resources into developing novel tests due to the concern that once the manufacturer receives marketing authorization for its test, laboratories will develop similar tests and market them without complying with FDA requirements, thereby disincentivizing innovation (see response to comment 217).[90] We anticipate that applying the same general oversight approach to laboratories and non-laboratories that manufacture IVDs will address these business strategies that take advantage of the current bifurcated system.

However, FDA also recognizes the effect that its longstanding enforcement discretion approach has had on the market, the role that laboratory-manufactured tests play in modern healthcare, and the presence of other expert regulatory bodies. Many comments emphasized these considerations and FDA agrees with certain comments' concern, for example, that the proposed phaseout policy could lead to the widespread loss of access to safe and effective IVDs on which patients currently rely and certain LDTs for unmet needs. As such, and as further discussed in section V.B, while FDA believes it is appropriate to apply the same general oversight approach to both laboratories and non-laboratories that manufacture IVDs, the Agency has determined that targeted enforcement discretion policies for certain categories of IVDs manufactured by laboratories is appropriate and in the best interest of the public health.

(Comment 219) One comment disagreed with the statement that the phaseout of the general enforcement discretion approach would advance innovation by both laboratory and non-laboratory manufacturers, stating that under the general enforcement discretion approach, laboratory manufacturers, especially AMCs, provide innovative, personalized LDTs to fill gaps in test offerings, which then allow conventional manufacturers to assess the market impact of these LDTs and make business decisions based on the LDT experience.

(Response 219) FDA believes that the phaseout of the general enforcement discretion approach for LDTs is necessary to better assure the safety and effectiveness of IVDs offered as LDTs and that the same general oversight approach for LDTs and other IVDs will bring more stability to the market overall. FDA recognizes that laboratory manufacturers of LDTs, including AMCs, may manufacture LDTs that are in lower demand and currently fill gaps in test offerings. As discussed further in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA believes that this policy will address concerns that laboratories integrated within a system and that manufacture LDTs for unmet needs will stop doing so in light of the limited market for such LDTs and the perceived costs of compliance with premarket review and QS requirements.

(Comment 220) One comment noted that FDA's proposal could lead to an unfair playing field between AMCs and for-profit laboratories. The comment indicated that IVDs offered as LDTs by AMCs are typically tests for rare diseases that are not profitable, and suggested that the phaseout policy should perhaps distinguish between for-profit and non-profit laboratories.

(Response 220) As discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA anticipates that this approach will help to reduce the possibility that laboratories in AMCs, or other healthcare systems, may stop manufacturing LDTs for unmet needs.

K. Impact to Specific Patient Populations

(Comment 221) FDA received several comments expressing concern that ending the general enforcement discretion approach for LDTs will negatively impact patient access to necessary tests and thus worsen disparities in healthcare, particularly for racial and ethnic minorities that rely on IVDs offered as LDTs for diagnosis and to inform treatment.

(Response 221) FDA disagrees with the comments stating that phasing out the general enforcement discretion approach for LDTs will exacerbate health inequities for underrepresented patient populations. As detailed in the NPRM, there are concerns that in the absence of greater FDA oversight, IVDs offered as LDTs may be exacerbating health inequities due to higher rates of inaccurate results among underrepresented patient populations, particularly racial and ethnic minorities undergoing genetic testing (88 FR 68006 at 68013; Refs. 21 and 216 to 219). Some IVDs offered as LDTs have not been validated for use across patient populations within a disease state, which may result in decreased accuracy for underrepresented patient populations and further contribute to health disparities (Ref. 220). With increased oversight, FDA will be able to help promote adequate representation of the intended use population in validation studies, and transparency regarding potential differential performance and unknown performance in certain patient populations, which will ultimately help advance health equity.

FDA also recognizes that IVDs offered as LDTs might serve communities in rural, medically underserved areas with disparities in access to diagnostic tests. However, the benefits of test access depend on the ability of tests to work as intended, and the harms of unsafe or ineffective IVDs offered as LDTs might disproportionately occur among medically underserved patient populations that such tests might aim to reach. Without appropriate oversight, IVDs offered as LDTs might exacerbate health disparities.

Nevertheless, FDA recognizes the concerns articulated in these comments regarding potential access issues resulting from the proposed phaseout policy and has adopted several targeted enforcement discretion policies to address those issues, among other things. For example, FDA acknowledges the importance of avoiding widespread loss of access to IVDs on which patients and the healthcare community currently rely, which ultimately could be more harmful than helpful to the public. As such, and for the reasons further discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M

[90] FDA also recognizes that challenges in conducting clinical trials for low prevalence pathogens may disincentivize the development of certain novel tests. As noted in section V.B.3 and in response to comment 142, FDA intends to consider whether issuing additional guidance regarding validation of tests, including those for rare diseases that takes into consideration the challenges in obtaining a robust number of samples for validation, would be helpful. In the event FDA were to issue any such guidance, FDA would do so in accordance with good guidance practices (see § 10.115).

(Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3.

FDA is also adopting a targeted enforcement discretion policy for certain unmet need LDTs to help avoid patients being deprived of critically needed LDTs where certain risk mitigations exist (see further discussion in section V.B.3).

(Comment 222) One comment stated that ending the general enforcement discretion approach for LDTs will limit access to necessary tests and make it more difficult to enroll underrepresented patients in clinical trials, which will reduce clinical trial diversity.

(Response 222) As discussed above, FDA is adopting enforcement discretion policies for currently marketed IVDs offered as LDTs and unmet needs LDTs, as described in section V.B.3. These policies will help to address concerns regarding limiting access to such IVDs and resulting difficulties in enrolling diverse populations in clinical trials.

(Comment 223) FDA received one comment that stated that FDA had ignored the special needs of the Native American population, as LDTs are used to analyze mutations with high prevalence in this population, and the population may be ''disenfranchised by the loss of LDTs diagnosing their genetic disorders'' as a result of phasing out the general enforcement discretion approach for LDTs. The comment suggested that FDA's tentative determination that ''the rule does not contain policies that would have a substantial direct effect on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes,'' as stated in section XII of the NPRM, was incorrect. The comment also suggested that other populations, specifically ''immigrant populations,'' would be similarly, negatively affected by the phaseout policy. Another comment stated that there could be legal implications if patients or groups argue that FDA's actions disproportionately affect certain populations' access to healthcare.

(Response 223) FDA appreciates the need to consider potential impacts on the Native American population and other specific patient populations. The Agency recognizes that some IVDs offered as LDTs may be currently used to diagnose genetic disorders common in the Native American population. In light of the enforcement discretion policy for currently marketed IVDs offered as LDTs that FDA is adopting, FDA does not anticipate that the Native American population will lose access to such IVDs. In addition, we believe the unmet needs policy described in this preamble, see further discussion at section V.B.3, will help to avoid laboratories integrated in healthcare systems from no longer manufacturing LDTs that meet the unique needs of the Native American population due to the limited market for such tests and perceived costs of compliance with premarket review and QS requirements. As such, FDA does not believe that the Native American population will be disenfranchised as a result of the phaseout policy. For additional discussion regarding FDA's analysis of the rule in accordance with the principles set forth in E.O. 13175, please see section XII.

The concepts described above with respect to the Native American population are also applicable to other groups, such as ''immigrant populations,'' mentioned in the comments.

(Comment 224) FDA received comments regarding the impact of the phaseout policy on medically underserved patient populations. Some comments stated that the phaseout is likely to exacerbate health inequities by further limiting access to testing in rural areas and disproportionately impacting vulnerable patient populations such as pediatric, low-income, lesbian, gay, bisexual, transgender, queer, intersex, and asexual (LGBTQIA+), and minority communities. A few comments stated that the phaseout will further disadvantage underserved populations from both medical and financial perspectives, as AMC laboratories and other laboratories serving these populations will not have the resources to complete FDA submissions for their tests and will need to outsource testing. One comment voiced concern that FDA has not adequately or accurately assessed the impact of the phaseout on the practice of medicine and patient care, specifically for patients in underserved geographies and those with possible rare diseases. Additionally, a few comments stated that the phaseout will have a detrimental impact on the affordability and speed of testing, which will hinder the ability of some laboratories (particularly public health laboratories) to serve marginalized groups including incarcerated, elderly, and homeless populations.

(Response 224) FDA disagrees that phasing out the general enforcement discretion approach for LDTs will negatively impact medically underserved populations' access to IVDs. FDA recognizes that IVDs offered as LDTs may serve rural communities and other patient populations with disparities in access to diagnostic tests, and recognizes the concern regarding potential disruption of access to IVDs offered as LDTs, particularly for underserved and vulnerable patient populations. However, FDA anticipates that the targeted enforcement discretion policies described in this preamble will help to address the concerns raised in the comments. For example, with respect to AMCs that serve medically underserved populations, as discussed further in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system (including an AMC) to meet an unmet need of patients receiving care within the same healthcare system. We believe this policy addresses the concerns raised in the comment regarding AMCs.

FDA disagrees with the comment that the Agency has not adequately or accurately assessed the impact of the phaseout policy on patients in underserved geographies. As indicated in the PRIA, and again in section II.K of the FRIA (Ref. 10), FDA has considered the potential effects of the phaseout on health inequities to the extent we are able to do so based on available information. FDA recognizes that IVDs offered as LDTs might serve communities in underserved geographies with disparities in access to diagnostic tests, and the harms of unsafe or ineffective IVDs offered as LDTs might therefore disproportionately occur among individuals in such geographies. As noted in response to comment 221, the benefits of test access depend on the ability of tests to work as intended, and without appropriate oversight, IVDs offered as LDTs might exacerbate health disparities.

FDA has carefully assessed information about IVDs offered as LDTs in scientific literature, news articles, submissions to FDA, and allegations and adverse event reports submitted to the Agency, among other sources, and this information supports a phaseout of FDA's general enforcement discretion approach for LDTs. By phasing out the general enforcement discretion approach, FDA seeks to better prevent and mitigate harm to patients, including those in underserved populations, that may result from inaccurate and unreliable tests, while also accounting for other important public health

considerations such as patient access and reliance.

For discussion of the impact of the phaseout policy on the affordability and speed of testing, see our responses to comments 207 and 209 in sections VI.H and VI.I of this preamble.

(Comment 225) FDA received comments expressing concern that ending the general enforcement discretion approach for LDTs will negatively impact Medicare beneficiaries. One comment stated that increased costs for tests will lead to increased Medicare and Medicaid costs, and some comments inquired whether Medicare reimbursements will be adjusted to support the increased costs resulting from the phaseout of the general enforcement discretion approach for LDTs.

(Response 225) As discussed in response to comments in section VI.H, and as noted in section II.F.6 of the PRIA and in the FRIA (Refs. 60 and 10), the exact effect of the phaseout policy on the price of IVDs offered as LDTs is unknown. However, FDA's decision to include certain enforcement discretion policies in the final phaseout policy is predicted to significantly reduce the costs of compliance under the final phaseout policy, thus reducing the number of laboratories that scale back operations or exit the market, which may in turn reduce any impact of the phaseout policy on pricing. In addition, as noted in response to comment 207, phasing out the general enforcement discretion approach for LDTs will help to reduce other healthcare costs. While certain costs may be passed on to individuals and insurers, we expect some of these costs will be offset by the associated benefits.

In terms of coverage and reimbursement, Medicare is administrated by CMS under different statutory authorities than those governing FDA regulation of IVDs, and future decisions regarding reimbursement are outside the scope of this rulemaking and phaseout policy.

(Comment 226) Other comments articulated concerns regarding the impact of the phaseout policy on laboratory testing for hospitals and providers that serve Medicare and Medicaid patients. These comments expressed concern regarding the potential for the phaseout policy to increase costs for such providers and decrease access to testing for vulnerable patients, particularly children. One comment noted that Medicaid has limited coverage policies for certain laboratory tests and large reference laboratories often do not provide services to Medicaid patients unless the services are covered.

(Response 226) As discussed above, the exact effect of the phaseout policy on the price of IVDs offered as LDTs is unknown, but the enforcement discretion policies described in this preamble are predicted to significantly reduce the costs of compliance associated with the final phaseout policy, thus reducing the number of laboratories that scale back operations or exit the market, which may in turn reduce any impact of the phaseout policy on pricing.

In terms of the comments regarding Medicaid coverage policies, as Medicaid is administrated by CMS and the States under different statutory authorities than those governing FDA's regulation of IVDs, such comments are outside the scope of this rulemaking and phaseout policy.

(Comment 227) FDA received comments stating that the phaseout policy will disproportionately impact pediatric patients. Several comments noted that tests for pediatric patients often do not have any FDA-authorized or ''commercial'' equivalents, and that tests must be modified to serve the pediatric patient population. As an example, some comments pointed to the lack of FDA-authorized tests to detect sexually transmitted infections (STIs) in children, which must be used in cases of sexual abuse and assault against children. Other comments noted that pediatric patients and their healthcare providers are highly reliant on LDTs because many conventional manufacturers do not seek FDA approval for all age groups and often choose not to develop tests for pediatric diseases, due to the challenges in studying pediatric populations and the relatively slim financial margins for such tests. These comments stated that any action that leads to LDTs not being offered for pediatric patients will result in delayed diagnosis and care for such patients.

(Response 227) FDA understands that laboratories have been using IVDs offered as LDTs to test pediatric patients, and we recognize concerns that phasing out the general enforcement discretion approach for LDTs may lead to a higher chance that laboratories stop offering these tests. FDA believes that the enforcement discretion policies discussed further in section V.B.3, specifically the policies for currently marketed IVDs offered as LDTs and for LDTs for unmet needs, will help to avoid access issues to currently marketed IVDs for pediatric patients as well as LDTs for pediatric patients that meet the unique needs of the patient (see response to comment 228).

(Comment 228) Some comments noted that specialized IVDs offered as LDTs are often vital to medical management for patients with complex medical needs. Comments asserted that the phaseout policy would leave gaps in detection and treatment for these and other vulnerable patients. One comment provided as an example the modification of FDA-authorized assays for more rapid assessment of tuberculosis.

(Response 228) FDA recognizes the need for specialized testing for patients with complex medical needs and for vulnerable populations, like children, who may not have access to FDA-authorized tests. As noted above, FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for currently marketed IVDs offered as LDTs as described in section V.B.3. FDA believes this policy will help to address concerns regarding continued access to currently marketed IVDs for patients with complex medical needs and vulnerable populations. FDA also intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA believes that as a result of this policy, laboratories integrated within healthcare systems will be less likely to not manufacture LDTs for unmet needs due to the limited market for such tests and the perceived costs of compliance with premarket review and QS requirements. Additionally, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements when a laboratory certified under CLIA and meeting the regulatory requirements under CLIA to perform high complexity testing modifies another manufacturer's lawfully marketed test that is not a PMA-approved or BLA-licensed test, in a manner that could not significantly affect the safety or effectiveness of the test or its intended use, as described in sections V.C.4 and V.C.5.

L. Specific Types of IVDs

1. Direct-to-Consumer IVDs

(Comment 229) FDA received comments stating that regulation of direct-to-consumer tests should be prioritized because, unlike in AMCs and hospitals, they are provided to

consumers outside of a regulated environment. Comments noted that the direct-to-consumer market is where much of the public concern currently lies regarding unreliable results, as they are not subject to the same controls as LDTs in clinical laboratory settings (*i.e.,* CLIA requirements). Other comments further stated that direct-to-consumer tests are often provided without accompanying healthcare counseling, which puts users at risk for misinterpretation or patient harm and therefore ''should be regulated by FDA.''

(Response 229) FDA agrees with comments that direct-to-consumer tests present risks that are unique and different from some of those posed by IVDs offered as LDTs used in clinical laboratory settings. Indeed, FDA's general enforcement discretion approach for LDTs has not applied to direct-to-consumer tests, including for this reason. FDA's general enforcement discretion approach was originally premised, in part, on the participation of medical professionals who, among other things, help determine whether a particular test is appropriate, counsel patients, assist in interpreting results, and assess how the results fit in the overall clinical picture. FDA believes there is a heightened need for oversight of tests where test results are used by consumers to make potentially significant healthcare decisions without the involvement of a learned intermediary in a legitimate healthcare practitioner-patient relationship.

(Comment 230) Some comments stated that the phaseout policy would make it harder for consumers to obtain and use at-home tests, particularly for STIs and human immunodeficiency virus (HIV). Comments noted that this would especially impact those in the LGBTQIA+ community who benefit from at-home tests that can be done discreetly and requested FDA consider ''exemptions'' for direct-to-consumer tests that further ''public health initiatives.''

(Response 230) FDA disagrees that the phaseout policy would make it more difficult for consumers to obtain necessary at-home tests, and notes that FDA has approved a home use test for HIV (Ref. 221) and has authorized an STI test with at-home sample collection for chlamydia and gonorrhea (Ref. 222). As noted in the NPRM and this preamble, FDA's general enforcement discretion approach for LDTs has not applied to direct-to-consumer tests given the greater risks to consumers presented by these tests (88 FR 68006 at 68022). In situations where consumers may be relying on direct-to-consumer tests to rule out, or otherwise diagnose, a disease or condition, there is a heightened need for FDA oversight. For these tests, FDA has generally expected compliance with applicable requirements, and the Agency is not changing that approach with the phaseout policy.

(Comment 231) One comment stated that the NPRM ''specifies [an] exemption for direct-to-consumer testing,'' the danger of which cannot be understated and noted that direct-to-consumer testing ''is the exact type of testing the FDA should be focusing on.''

(Response 231) FDA agrees that direct-to-consumer tests should be a focus of FDA oversight due to the risks they present. This comment appears to reflect a misunderstanding of FDA's proposal. The NPRM indicated that direct-to-consumer tests would not be included in the phaseout policy and, as a result, FDA would continue to expect compliance with applicable regulatory requirements for direct-to-consumer tests. As discussed above and in the NPRM, FDA's general enforcement discretion approach for LDTs has not applied to direct-to-consumer tests (88 FR 68006 at 68022). FDA has generally expected compliance with applicable requirements for direct-to-consumer tests and the phaseout policy does not change that approach.

2. Forensic Tests

(Comment 231) FDA received several comments regarding the Agency's proposal to continue its general enforcement discretion approach for tests intended solely for forensic (law enforcement) purposes. The majority of these comments supported FDA's proposed approach, including one comment which expressed that it was appropriate for FDA to focus on ''clinical uses'' and to exercise enforcement discretion for tests intended solely for forensic purposes.

(Response 232) FDA agrees with the comments supporting continued enforcement discretion for tests intended solely for forensic (law enforcement) purposes. We described an enforcement discretion approach for tests intended solely for forensic (law enforcement) purposes more than 20 years ago (see, *e.g.,* 65 FR 18230, April 7, 2000). This policy recognized that protections within the judicial process could mitigate risk related to test accuracy and sample collection. Additionally, FDA agrees that it should focus its limited resources on tests that present risks to patients, where sufficient mitigations for test accuracy and sample collection do not otherwise exist. FDA did not receive any data to justify changing its longstanding policy. FDA, therefore, intends to continue to exercise enforcement discretion for tests intended solely for forensic (law enforcement) purposes. In addition, since the policy on tests for forensic (law enforcement) purposes applies to all tests for forensic (law enforcement) purposes, including those manufactured by non-laboratory manufacturers, changing that policy would not be appropriate in the context of this rulemaking and related policies which are focused on IVDs that are manufactured by laboratories.

(Comment 233) We received a few comments that advocated against FDA's proposal to continue its enforcement discretion approach for tests intended solely for forensic (law enforcement) purposes, primarily because, according to these comments, such tests should be ''regulated'' the same as other IVDs, and FDA authorization would likely enhance fairness of the judicial system. Another comment indicated that forensic laboratories are not typically CLIA-certified and that NYS CLEP currently requires review of forensic tests. Some laboratories offering forensic tests are accredited by the Substance Abuse and Mental Health Services Administration (SAMHSA), but this level of accreditation is currently required only if a laboratory is testing for certain Federal programs. The comment went on to argue for broader Federal oversight of this test category.

(Response 233) FDA disagrees that ceasing its longstanding enforcement discretion approach for tests intended solely for forensic (law enforcement) purposes is warranted. As FDA explained in the **Federal Register** (65 FR 18230), tests intended solely for forensic (law enforcement) purposes are subject to additional protections such as the use of rules of evidence in judicial proceedings and the representation of the accused (*i.e.,* the person being tested) through the judicial process. The fairness of the judicial process is a separate issue that is not within the scope of this rulemaking.

Further, because FDA's longstanding enforcement discretion approach for these tests is grounded in the sufficient mitigations in the judicial process, it is inapposite whether these laboratories or their tests are accredited or reviewed by/under CMS, NYS CLEP, or SAMHSA.

(Comment 234) A comment requested that FDA clarify that the general enforcement discretion approach for tests intended solely for forensic purposes includes only tests within FDA's jurisdiction and that it does not capture tests performed by forensic DNA testing laboratories that fall

outside of FDA's purview. The comment explained that tests at forensic DNA testing laboratories are not ''intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease,'' or ''intended to affect the structure or any function of the body.'' Rather, relationship testing (DNA) facilities use forensic tests exclusively for legal and immigration proceedings, criminal investigations, and identification of human remains. The comment explained that the National Institute of Justice within the Department of Justice is the lead Federal Government Agency supporting forensic laboratories, including relationship testing facilities accredited by AABB.

(Response 234) A device is defined, in relevant part, as ''an instrument, apparatus, implement, machine, contrivance, implant, in vitro reagent, or other similar or related article, including any component, part, or accessory, which is . . . (B) intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease, in man or other animals.'' Section 201(h)(1) of the FD&C Act. The determination of whether a product meets the definition of a device is a highly fact-dependent analysis and the context of use may not be determinative of whether a product is intended for ''diagnosis.'' [91] In any event, FDA intends to continue to exercise enforcement discretion for tests intended solely for forensic (law enforcement) purposes, meaning that it generally does not intend to enforce applicable device requirements for such tests. Moreover, FDA would not be able to enforce device requirements for any tests that do not meet the definition of a device.

3. 1976-Type LDTs

(Comment 235) A number of comments supported FDA's proposal to continue to exercise enforcement discretion for 1976-Type LDTs. However, a few comments stated that while they agreed with the spirit of this proposal, they were concerned that FDA's focus on 1976-Type LDTs ignores perceived accuracy enhancements from basic automation techniques. Other similar comments stated that FDA's proposed enforcement discretion policy for 1976-Type LDTs should be expanded to include automated techniques using components legally marketed [92] for clinical use and interpreted by a pathologist. Some comments pointed to immunohistochemistry automated staining process as an example of such automated techniques, and one comment stated that ''the technical aspect of immunohistochemistry is virtually always automated these days, while interpretation is manual.'' Another comment indicated that automation was associated with a reduction in human error rate in that particular laboratory.

(Response 235) As described in section V.B.1, FDA intends to exercise enforcement discretion and generally not enforce applicable requirements for 1976-Type LDTs given that the characteristics of these tests—*i.e.,* they involve manual techniques (without automation), are performed by laboratory personnel with specialized expertise, use components legally marketed for clinical use, and are designed, manufactured, and used within a single CLIA-certified laboratory that meets the requirements under CLIA for high complexity testing—mitigate the risks associated with these tests. In particular, and as explained in the NPRM, these characteristics provide the greatest risk mitigation among the characteristics that were commonly associated with LDTs offered in 1976, which resulted in the emergence of FDA's general enforcement discretion approach for LDTs (88 FR 68006 at 68022). Automation, including automated slide preparation used in immunohistochemistry, can enhance test performance, but automation also introduces new opportunities for error and other risks that, due to the nature of automation, are not easily identifiable. For these reasons, FDA does not believe that expanding the policy for 1976-Type LDTs beyond these characteristics that were commonly associated with LDTs offered in 1976 to include IVDs offered as LDTs with automation is appropriate.

(Comment 236) We received comments requesting clarity on the type of tests that FDA would consider to be 1976-Type LDTs. These comments included requests that FDA define terms such as ''automation,'' ''specialized expertise,'' or ''manual.'' Other comments asked for examples of 1976-Type LDTs.

(Response 236) Examples of tests that might be considered 1976-Type LDTs when done manually and without automation (*e.g.,* without use of software) include: various tests that use staining antibodies and general purpose reagents for cytology, hematology, and bacterial infections; cystic fibrosis sweat tests; certain colorimetric newborn screening tests; certain immunohistochemistry tests; karyotyping tests; and fluorescence in situ hybridization (FISH) tests. We reiterate that the purpose behind this category of continued enforcement discretion is to recognize the tests that have the sort of mitigations in place that resulted in the emergence of FDA's general enforcement discretion approach for LDTs, and to help focus FDA's oversight on more complex tests and tests posing higher risks.

FDA understands that commenters requested more information about the terms ''automation,'' ''specialized expertise,'' and ''manual.'' We generally intend for these terms to have their ordinary meaning. To the extent that additional information and examples would be helpful, FDA will consider issuing guidance on this topic as appropriate and in accordance with good guidance practices (§ 10.115).

(Comment 237) A few comments expressed concern that FDA's continuation of the general enforcement discretion approach for 1976-Type LDTs will encourage laboratories to avoid automation and instead perform manual tests. The comments stated that this will disincentivize efficiency and improvement, cause laboratories to close, or increase risks to patients because the comments perceived that manual tests have more room for error.

(Response 237) FDA disagrees with these comments. FDA does not anticipate that the final phaseout policy will cause laboratories to avoid automation and instead perform manual tests. Many comments from laboratories described the substantial benefits of automated approaches. These comments stated that automation improves efficiency, because, for example, fewer individuals are needed to perform a test and testing can occur more quickly. Therefore, FDA thinks it is unlikely that laboratories will stop offering automated tests and switch to manual processes so that their tests may be considered 1976-Type LDTs in the future.

FDA also does not believe that IVDs currently on the market are likely to change from an automated to manual methodology because FDA generally

[91] See, *e.g., United States* v. *An Undetermined Number of Unlabeled Cases,* 21 F.3d 1026, 1028–29 (10th Cir. 1994) (finding that containers used to collect urine and saliva specimens for HIV testing for insurance purposes were devices because ''[t]he plain meaning of 'diagnosis' disregards context and bears no connection to medical treatment''; and ''the fact insurance companies rather than health professionals considered [the results] to make business rather than medical decisions does not erase the diagnostic character of . . . the containers' use.'').

[92] As used through this rulemaking, a ''lawfully marketed'' device means a device that is in compliance with FDA requirements, which may include premarket authorization.

intends to exercise enforcement discretion with respect to premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. Although this enforcement discretion policy pertains only to premarket review and most QS requirements, whereas FDA intends to exercise enforcement discretion and generally not enforce any applicable requirements for 1976-Type LDTs, the costs of compliance with applicable requirements other than premarket review and QS requirements are only a small fraction of the costs of compliance with applicable requirements under the FD&C Act and FDA's regulations (see section II.F of the FRIA (Ref. 10)). Out of the total estimated costs to industry of $1.17 billion, the estimated costs of compliance with requirements other than premarket review and QS requirements are about $95.35 million. Therefore, FDA anticipates that laboratories will not drastically change their current practices or cease to use automation for IVDs currently on the market.

Finally, FDA does not agree that 1976-Type LDTs pose more risk to patients than other tests. As previously noted, features like automation can lead to improved performance and efficiency but can also introduce new opportunities for error and other risks.

(Comment 238) A comment supported the concept of FDA continuing its general enforcement discretion approach for 1976-Type LDTs. This comment suggested, however, that FDA instead use certain other factors (instead of the 1976-Type LDT characteristics) such as the risk to the patient posed by incorrect results, availability of laboratory controls to mitigate these risks, qualification required of those performing or interpreting the test, CLIA certification level of the laboratory, the level of integration between the healthcare provider, test provider, and patient, and whether there is an IVD available, to determine if FDA's general enforcement discretion approach should continue to apply—noting that FDA should continue to exercise enforcement discretion only for an LDT where all of these elements are present.

(Response 238) FDA appreciates the support for its approach to 1976-Type LDTs; however FDA does not agree with expanding the policy for 1976-Type LDTs in the manner suggested by the comment. The purpose behind this policy is to recognize the tests that have the sort of mitigations in place that resulted in the emergence of FDA's general enforcement discretion approach for LDTs and to help focus FDA's regulatory oversight on more complex tests and tests posing higher risks. The factors proposed by the comment do not achieve the same purpose. FDA notes, however, that many of the factors identified by the comment have informed FDA's policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients (see section V.B.3).

(Comment 239) Comments requested clarification regarding whether adsorption of warm-reactive autoantibodies using allogeneic or autologous red blood cells to prepare samples for further immunohematology testing would be considered a 1976-Type LDT.

(Response 239) Adsorption of warm-reactive autoantibodies using allogeneic or autologous red blood cells to prepare samples for further immunohematology testing generally involves only manual techniques performed by laboratory personnel with specialized expertise, and therefore would generally be considered a 1976-Type LDT that would fall under the enforcement discretion policy for those tests provided it uses components legally marketed for clinical use and the design, manufacture, and use is all within a single CLIA-certified laboratory that meets the requirements under CLIA for high complexity testing.

4. Low-Risk IVDs Offered as LDTs

(Comment 240) FDA received several comments recommending FDA adopt a different approach for lower risk tests. One comment suggested FDA provide a ''tiered risk-based approach and have streamlined submission and approval options for simpler, lower risk LDTs'' to help reduce any negative consequences stemming from the phaseout policy. Another comment recommended the Agency ''adopt a new premarket review pathway'' for laboratories seeking FDA authorization for low- or moderate-risk tests. One comment stated that there should be an enforcement discretion policy for low-risk LDTs so that clinical microbiology laboratories would continue offering infectious disease LDTs to serve vulnerable communities.

(Response 240) FDA does not intend to have a separate policy for low-risk IVDs offered as LDTs. The statutory framework for device regulation is already risk-based and provides different premarket pathways for devices based on their risk, and FDA can neither change the review pathways established by statute nor create new review pathways not authorized by the statute. Most low-risk tests are exempt from premarket review, and moderate-risk tests are reviewed through the 510(k) and De Novo pathways rather than being subject to premarket approval.

With respect to infectious disease tests, FDA disagrees that all such tests are low-risk or that FDA should adopt an enforcement discretion policy for all clinical microbiology laboratories offering infectious disease LDTs. There are over 500 distinct product codes for infectious disease IVDs in FDA's classification database, and less than half of those are considered low-risk, or class I (most of which are exempt from premarket notification). Infectious disease IVDs pose risks that are not necessarily mitigated by other safeguards, and these tests have implications both for an individual patient and other members of the public. Therefore, FDA does not agree that it should continue the general enforcement discretion approach for all infectious disease LDTs offered by clinical microbiology laboratories. However, as described in section V.B, FDA generally intends to exercise enforcement discretion with respect to premarket review requirements for certain categories of tests, including currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3, and LDTs that are approved by NYS CLEP. FDA anticipates that these policies will help patients, including those in vulnerable communities, have continued access to existing beneficial tests on which they rely, and minimize undue disruption to the provision of care, while providing FDA with information about test performance through labeling, MDR reporting, and other applicable requirements.

(Comment 241) One comment expressed concern that the proposed phaseout policy could ''inadvertently result in millions of Americans abruptly losing access to much needed tests'' due to ''undue delay'' of FDA premarket review and recommended that FDA should continue the general enforcement discretion approach with respect to premarket review and QS requirements for low- and moderate-risk LDTs until FDA has demonstrated its ability to review and ''regulate'' high-risk LDTs.

(Response 241) Although FDA does not agree that FDA premarket review itself will cause ''undue delay,'' FDA is concerned that laboratories may stop

offering IVDs on which patients are currently relying if FDA expects compliance with premarket review and all QS requirements for currently marketed IVDs offered as LDTs. Therefore, as discussed elsewhere in the preamble, to address concern regarding potential disruption of access to currently marketed IVDs offered as LDTs, FDA generally intends to exercise enforcement discretion with respect to premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3.

FDA disagrees with the comment's suggested approach for low- and moderate-risk IVDs offered as LDTs as it relates to IVDs introduced on or after the date of issuance of this rule. In general, low-risk devices are not subject to premarket review or the QS design control requirements (the main source of QS costs under the FRIA), so FDA does not consider the proposed enforcement discretion policy fitting with respect to those IVDs. In addition, FDA expects that compliance with premarket review and QS requirements for moderate-risk IVDs offered as LDTs will have substantial public-health benefits going forward. For example, FDA anticipates that oversight will help ensure the safety and effectiveness of tests that predict a person's risk of cancer, are used in newborn screening, provide information on the risk of adverse events from a therapeutic product, aid in the diagnosis of heart disease, aid in the diagnosis of chlamydia and gonorrhea, and aid in the diagnosis of neurodegenerative disease such as Alzheimer's, among others. Overall, IVDs that may be considered low- or moderate-risk still inform decisions by patients and their healthcare providers, and uncertainty about whether IVDs offered as LDTs provide accurate and reliable results can significantly impact public health. To the extent they apply, premarket review and QS requirements are valuable tools that will help to better ensure the safety and effectiveness of IVDs offered as LDTs by laboratories. Therefore, under the final phaseout policy, the general enforcement discretion approach with respect to premarket review requirements for low- and moderate-risk IVDs introduced on or after the date of issuance of this rule will end 4 years after publication of this final rule.

Further, to the extent this comment is suggesting FDA will lack sufficient resources or technical expertise to conduct premarket review of IVDs offered as LDTs in a timely manner, FDA disagrees as explained in sections VI.C.2, VI.C.3, and VI.N.

(Comment 242) One comment from a laboratory stated that results from its ''drugs of abuse screening tests'' are not used to ''diagnose, treat, or prevent any illness'' but rather ''provide accountability of patient use of controlled substances and are used as a means to monitor patient progress,'' and false positives or negatives are unlikely to result in patient harm. The comment concluded that such tests are low risk, and that low-risk tests should remain under the general enforcement discretion approach.

(Response 242) FDA disagrees with the blanket statement that ''drugs of abuse screening tests'' are low-risk tests. ''Drugs of abuse'' tests are used to diagnose a clinical condition (drug intoxication), which informs a state of health, and to monitor patient use of controlled substances or track patient progress with respect to substance use, which FDA does not consider to be low-risk. FDA generally regulates clinical toxicology tests for drugs of abuse as class II devices with special controls. *See, e.g.,* 21 CFR 862.3650 (opiates), 21 CFR 862.3250 (cocaine and metabolites). For additional information about drugs of abuse tests that FDA has cleared for marketing, we recommend consulting decision summaries in FDA's 510(k) database by searching under the toxicology panel. Although FDA has determined that it is appropriate to exercise enforcement discretion and generally not enforce any applicable requirements for drugs of abuse tests used solely for law enforcement purposes (see comment response 247), FDA does not see a reason to adopt an enforcement discretion policy for other drugs of abuse tests (see comment responses 248 and 249 for additional information).

(Comment 243) One comment urged FDA to establish classification panels that can act quickly to down-classify IVDs to class I or class II based on a risk assessment before enforcing any regulatory requirements related to LDTs. The comment noted that this would decrease regulatory burden on the Agency and laboratories and provide clarity on the number of class III IVDs offered as LDTs that would require premarket approval. As an example, the comment discussed CDx devices, which are generally class III devices. The comment also stated that ''it is critical that decisions regarding IVD risk classification be reexamined and that LDT device types be unambiguously assigned well before marketing application submission deadlines.''

(Response 243) Generally, FDA believes that IVDs offered as LDTs and other IVDs for the same indications should be under the same classification, so FDA intends to consider any reclassification efforts for IVDs holistically, rather than separating out IVDs offered as LDTs.

On January 31, 2024, FDA announced its intent to initiate the reclassification process for most IVDs that are currently class III into class II (Ref. 66). The majority of these tests are infectious disease and CDx IVDs. Reclassification would allow manufacturers of certain types of IVDs to seek clearance through the less burdensome 510(k) pathway rather than the PMA pathway, the most stringent type of FDA device review. The reclassification process will include opportunities for public comment and FDA aims to complete the process before stage 4 of the phaseout policy.

For discussion of the use of classification panels in the context of other IVDs offered as LDTs, please see comment response 195. In addition, FDA intends to continue taking a risk-based approach in the initial classification of individual IVDs (including IVDs offered as LDTs) to determine the appropriate level of regulatory controls and whether a new IVD may be classified into class II or class I through De Novo classification (and special controls established), rather than being class III and subject to the PMA pathway. FDA also regularly considers whether there are class II IVDs that can be reclassified to class I and intends to continue to do so.

5. IVDs Offered as LDTs for Rare Diseases/Unmet Needs

(Comment 244) Many comments reported that LDTs address unmet needs for which there are no FDA-authorized alternatives. For example, comments cited various tests for rare diseases, pediatric patients, infectious diseases including STIs, confirmation of drugs of abuse screening test results, candida auris, immunohistochemistry, and chimerism analysis for monitoring bone marrow transplants. Comments stated that in some cases, laboratories modify FDA-authorized IVDs to meet unmet needs, such as when an alternative specimen type must be used for a patient. One patient's parent wrote about their child's multiyear diagnostic journey that concluded when a whole genome sequencing LDT revealed a pathogenic genetic alteration. Several comments described challenges in rare disease test development, including the lack of potential profit due to low

volume use. Comments stated that most patients with rare diseases are treated at AMCs. Comments expressed concern that increased FDA oversight could further disincentivize rare disease test development, noting that the HDE program does not effectively address the issue, including because the 8,000 tests per year limit is too restrictive and the perceived burden of IRB and reporting requirements dissuade use of the program. Some comments recommended that FDA expand the HDE program. In addition, some comments claimed that the shorter turnaround time for results from certain LDTs (*e.g.,* LDTs for inflammatory cytokines and NK cell killing LDTs) compared to sending a sample to a reference laboratory can impact a physician's ability to cure a patient with a rare disease or condition.

(Response 244) FDA recognizes the challenges faced by patients with rare diseases, their families, and their treating physicians. FDA also recognizes that IVDs offered as LDTs play an important role in healthcare and may address various unmet needs including for rare diseases. We believe several of the enforcement discretion policies adopted in the final phaseout policy will help to address the concerns raised in the comments regarding the availability of IVDs for unmet needs and rare diseases. For example, for the reasons discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs, including IVDs for unmet needs and rare diseases, as long as they are not modified following the issuance of this final rule, or are modified as described in section V.B.3. In addition, for the reasons discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. This policy is intended, among other things, to address situations described in comments where there is no available FDA-authorized IVD for the disease or condition, where a laboratory needs to modify an FDA-authorized IVD to meet a specific patient need, or where the improved turnaround time of an LDT compared to an FDA-authorized IVD may be critical for the patient's care.

Several comments suggested FDA expand the HDE program. It is not clear what the comments meant by such an expansion, but to the extent this was a suggestion to change the criteria necessary for HDE approval, we note that such criteria are established by statute and cannot be expanded by FDA (see 21 U.S.C. 360j(m)).

FDA intends to consider whether issuing additional guidance regarding validation of tests, including those for rare diseases that takes into consideration the challenges in obtaining a robust number of samples for validation, would be helpful, as discussed in section V.B.3. In the event FDA were to issue any such guidance, FDA would do so in accordance with good guidance practices (see § 10.115).

(Comment 245) One comment expressed concern about applying the HUD program to IVDs offered as LDTs due to the program's complexity and constraints. This comment noted that tests for rare diseases are often developed and run at the request of clinicians, do not have an FDA-authorized alternative, and do not have the volume to support an FDA authorization. This comment recommended that tests for rare diseases remain under an enforcement discretion approach if they serve a local community, use a well-characterized standard test, and are offered in small volumes.

(Response 245) FDA acknowledges concerns regarding the constraints of the HUD program. For these and other reasons discussed in section V.B.3, FDA believes that an enforcement discretion policy for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system is appropriate. This policy should help avoid laboratories integrated within healthcare systems from no longer manufacturing LDTs to meet the unique needs of their patients, such as when there is no available FDA-authorized alternative (often the case for rare diseases).

FDA disagrees that an enforcement discretion policy for tests for rare diseases that serve a local community, use a well-characterized standard test, and are offered in small volumes would be appropriate as FDA has concerns that there would not be sufficient risk mitigations in such circumstances. Further, limiting an enforcement discretion policy for rare diseases to ''well-characterized standard tests'' would exclude certain LDTs for rare diseases that are critical to patients and that may not be manufactured by laboratories due to the limited market for such LDTs and the perceived costs of compliance with premarket review requirements.

6. IVDs Offered as LDTs Intended Only for Public Health Surveillance

(Comment 246) FDA received comments regarding our proposal that tests exclusively used for public health surveillance remain unaffected by the phaseout policy. Some comments supported this while others suggested oversight of such tests should be considered, regardless of whether results are returned to the patient or provider. One cited an example of a test that monitors for the presence or spread of a microorganism in a healthcare facility, which may not be used ''explicitly'' for patient management but is ''actionable'' by the facility and results may be made available to healthcare providers. The comment encouraged FDA to consider whether the phaseout policy should apply to certain surveillance tests, like this example.

(Response 246) FDA continues to believe that tests manufactured and offered for use exclusively for public health surveillance should remain unaffected by the phaseout policy. As described in the NPRM and this preamble, the scope of public health surveillance tests is limited to tests where results are not reported to patients or their healthcare providers (see section V.A.2, 88 FR 68006 at 68023). Where test results are not reported to patients or their healthcare providers, they are not informing the care of that patient, and increased FDA oversight is less critical. As to the comment's example of tests for microorganisms in a healthcare facility, if those tests are not on human specimens, they are not IVDs, and are therefore outside the scope of this rulemaking.

7. IVDs Offered as LDTs Intended To Detect the Presence of Drugs of Abuse

(Comment 247) FDA received several comments on ''drugs of abuse'' tests. Some suggested that FDA continue the general enforcement discretion approach for drugs of abuse IVDs offered as LDTs used in employment and insurance testing as well as for law enforcement purposes.

(Response 247) Drugs of abuse tests intended solely for employment and insurance testing and not for Federal drug testing programs are exempt from premarket review and would continue to be, regardless of whether they are

offered as an LDT (see 21 CFR 862.3100, 862.3150, 862.3170, 862.3250, 862.3270, 862.3580, 862.3610, 862.3620, 862,3630, 862.3640, 862.3650, 862.3700, 862.3870, 862.3910; *see also* 84 FR 71794 to 71819, December 30, 2019). With respect to other requirements applicable to drugs of abuse tests used in employment or insurance testing, FDA does not see a reason to treat IVDs offered as LDTs differently from other IVDs going forward; FDA believes it is important, for example, for such IVDs to be listed in FDA's database, labeled as required under FDA regulations, and manufactured in compliance with QS requirements, given their risks. FDA has not identified any characteristics that are unique to IVDs offered as LDTs intended to detect the presence of drugs of abuse tests that would justify treating them differently from other drugs of abuse tests.

With respect to drugs of abuse tests used solely for law enforcement purposes, FDA has explained elsewhere in this preamble that it is appropriate to exercise enforcement discretion and generally not enforce any applicable requirements for such tests. This reflects current policy, regardless of whether the tests are IVDs offered as LDTs (see sections V.B.1 and VI.L.2 for additional information).

(Comment 248) One comment stated that the general enforcement discretion approach should continue for all IVDs offered as LDTs intended as drugs of abuse tests because laboratories need to be able to adapt to combat modifications made to illicit drugs to evade detection. The comments stated, for example, that the FDA-cleared test for fentanyl does not detect modified versions of the drug.

(Response 248) FDA disagrees with the comment suggesting FDA continue the general enforcement discretion approach for all IVDs offered as LDTs to test for drugs of abuse. We acknowledge that such drugs may be modified and that tests for drugs of abuse may need to be modified in order to detect the new versions of these substances. However, FDA oversight does not preclude laboratory manufacturers from making such changes. FDA believes this oversight is important due to the risks to patients from false positive and false negative drugs of abuse test results. False positive results may delay treatment for the patient's true condition if that condition involves symptoms that overlap with drug intoxication (for example, missing a critical opportunity to treat cerebral hemorrhage or stroke). False negative results may put the patient at risk—for example, if they were to drive or were to need urgent treatment for overdose. Compliance with quality system requirements, such as design controls, will help assure that these drugs of abuse tests perform as intended, and compliance with premarket review, where applicable, will help assure that the drugs of abuse test's performance is suitable for the test's intended use.

Where a manufacturer may anticipate the types of changes it intends to make, it may consider seeking clearance or approval of a PCCP. Under section 515C of the FD&C Act, a PMA supplement or new 510(k) is not required for a modification to a device that would otherwise be required if the change is consistent with a PCCP previously approved or cleared by FDA. To the extent a PCCP is approved or cleared by FDA for a particular IVD, any changes within the bounds of that PCCP would not necessitate a new submission to FDA.

(Comment 249) Because the FDA-cleared drugs of abuse tests are only for screening, comments suggested that FDA continue the enforcement discretion approach for confirmatory LDTs intended as drugs of abuse tests, given that these tests are addressing an unmet need.

(Response 249) FDA acknowledges that in drugs of abuse testing, most confirmatory diagnostic tests are currently offered as LDTs. However, as discussed in response to comment 248, FDA oversight of drugs of abuse tests is important, including when such tests are confirmatory.

With respect to the comments' concerns, FDA notes that the final phaseout policy includes several new enforcement discretion policies that may help address those concerns. As explained in section V.B.3, FDA generally intends to exercise enforcement discretion with respect to premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule, including drugs of abuse IVDs offered as LDTs, and that are not modified, or that are modified as described in section V.B.3. In addition, going forward, LDTs may fall within the enforcement discretion policy for unmet needs when they are manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system (see section V.B.3).

8. Genetic IVDs Offered as LDTs/Next Generation Sequencing

(Comment 250) Comments asserted that the phaseout policy is problematic for genetic tests because if such tests are expected to comply with FDA requirements, that will hamper innovation and compromise patient care. One comment claimed that FDA's validation requirements for each variant are unmanageable for LDTs that analyze tens of thousands of variants from multiple sample types. The comment asserted that FDA requires 20 unique wildtype samples and 3–20 unique positive samples per variant per sample type. Other comments asserted that oversight is needed for genetic tests. One comment suggested FDA hire genetic counselors to facilitate decision-making focused on the risk of harm for genetic tests. Another expressed particular concern with pharmacogenomic tests making false claims.

(Response 250) FDA agrees with comments expressing the need for oversight of genetic tests. As illustrated by the pharmacogenomic example cited by comments, FDA is concerned that test offerings are outpacing the science that supports them. Technological advances have made it possible to sequence DNA in large volumes quickly, but there is not always evidence of clinical validity for the variants reported and used for clinical decision-making. FDA oversight will help ensure appropriate clinical validation. FDA's office that oversees in vitro diagnostics employs individuals with a wide range of expertise in genetics, currently including molecular pathologists, a genetic counselor, and Ph.D. trained scientists.

With respect to NGS tests for the detection of human genetic variants, FDA does not agree that its premarket expectations are unmanageable, and we do not necessarily require 20 unique positive samples for each variant for each specimen type. During premarket review, FDA considers prevalence when considering the number of samples necessary to validate an NGS assay and generally considers a representative approach to validation across variant types. For example, such an approach is described in FDA's final guidance document entitled ''Considerations for Design, Development, and Analytical Validation of Next Generation Sequencing (NGS)-Based In Vitro Diagnostics (IVDs) Intended to Aid in the Diagnosis of Suspected Germline Diseases'' (Ref. 223). This is feasible to do as demonstrated by the many NGS tests, including IVDs manufactured by laboratories, that have received premarket authorization from FDA (see, *e.g.,* information available in FDA's PMA database (Ref. 165) for PMA numbers P210011, P160018, P190032,

P200011, and P190014; information available in FDA's De Novo database (Ref. 166) for De Novo numbers DEN170058 and DEN200059; and information available in FDA's 510(k) database (Ref. 224) for 510(k) numbers K210017, K202304, K192063, and K190661).

9. Antimicrobial Susceptibility Tests (ASTs)

(Comment 251) Comments asserted that susceptibility test panels for bacteria, fungi, Nocardia, and mycobacteria are mostly LDTs, as the few FDA-authorized panels have substantial limitations and there is a lack of FDA authorization for less common pathogens. Comments further asserted that there are no FDA breakpoints for susceptibility tests for many of the pathogens listed by CDC as urgent and serious antibiotic resistance threats, including, for example: *Candida auris,* drug resistant *N. gonorrhoeae,* and carbapenem-resistant *Acinetobacter baumannii.* Comments claimed that it would be unlikely that a laboratory would be able to get FDA authorization for a test that applies non-FDA interpretive breakpoints (CLSI or European Committee on Antimicrobial Susceptibility Testing (EUCAST)), which creates a ''catch-22'' situation given the Agency's role in breakpoint approval. The comment stated that laboratories will have to default to the breakpoints for which the assays received FDA approval, which are also out of sync with many of the CLSI updated breakpoints.

(Response 251) FDA recognizes the importance of using updated susceptibility test interpretive criteria (STIC), also referred to as breakpoints, when using antimicrobial susceptibility test (AST) systems. FDA's Center for Drug Evaluation and Research (CDER) maintains a website with the most up-to-date STIC for antibacterial and antifungal drugs, including FDA's recognition of STIC established by standards development organizations (SDOs) (Ref. 225). FDA has cleared hundreds of ASTs (addressing hundreds of individual organism/drug combinations) and has worked to ensure that the most up to date STIC are used, including having cleared more than 60 ASTs with breakpoint change protocols, allowing for the rapid adoption of updated breakpoints without further FDA review. To help address the importance of adopting updated breakpoints quickly, FDA recently issued a final guidance entitled ''Antimicrobial Susceptibility Test (AST) System Devices—Updating Breakpoints in Device Labeling,'' which describes least burdensome approaches for AST manufacturers to update their device labeling with the updated breakpoints listed on the FDA's STIC website (see Refs. 225 and 226). This final guidance provides FDA's recommendations for submission of PCCPs for new AST systems, describes a policy regarding device manufacturers applying certain change protocols submitted to FDA in a separate 510(k) to implement breakpoint updates for the sponsor's legacy AST system device without a new 510(k) submission to FDA, and clarifies the process for incorporating by reference a cleared PCCP or breakpoint change protocol into a new submission. FDA believes these approaches will facilitate more timely adoption of updated breakpoints for numerous marketed devices with out-of-date breakpoints and streamline the process for future updated breakpoints to be incorporated quickly on an ongoing basis.

FDA disagrees that ''there are no FDA breakpoints for susceptibility tests for many of the pathogens listed as CDC urgent and serious antibiotic resistance threats (including *Candida auris,* drug resistant *N. gonorrhoeae,* carbapenem-resistant *Acinetobacter baumannii,* and more)'' as stated in the comment. The CDC list often includes qualifiers such as noting resistance to a particular drug. Generally, breakpoints are established for organism groups without resistance qualifiers, with notable exceptions like methicillin-resistant *S. aureus* and vancomycin-resistant Enterococci for which there is specific and significant data to support inclusion of the qualifiers. For other organisms, the same breakpoint is used regardless of the isolates. For example, there are FDA recognized breakpoints for *Acinetobacter* with many drugs; however, there are no separate breakpoints identified for drug-resistant *Acinetobacter* as the differentiation between drug-resistant and non-drug resistant *Acinetobacter* isolates has not been established in terms of breakpoint determination. It is important to note that CLSI and EUCAST similarly do not often have different breakpoints identified for drug-resistant and non-drug resistant isolates.

FDA also disagrees that ''[s]usceptibility test panels . . . are mostly LDTs'' and with the characterization that there are only a ''few FDA cleared panels.'' As noted, FDA has cleared ASTs addressing hundreds of organism/drug combinations and continues working towards assuring the breakpoints are updated expeditiously once recognized. In addition, referring to Table 2 in Simner *et al,* 2022, FDA notes that between 95.3 percent and 98.8 percent of surveyed CAP-accredited U.S. laboratories use automated AST devices (described in the paper as one of three commercial AST systems) (see Ref. 227). While some of these may be LDTs if the laboratory is modifying the original FDA-authorized AST device to use a different breakpoint or a non-cleared organism, the same study noted that between 37.9 percent and 70.5 percent of U.S. laboratories reported using out-of-date breakpoints for the antimicrobials that were queried. Therefore, this publication does not support the claim that the majority of ASTs are LDTs. This data supports the need for these tests to be updated with current breakpoints but does not support the claim that the majority of FDA-authorized AST devices are being modified and offered as LDTs in order to use updated breakpoints.

FDA notes in response to the statement that ''there is a lack of FDA clearance for less common pathogens,'' that there are FDA-authorized tests and FDA-recognized breakpoints for organism groups corresponding to commonly encountered pathogens described in CLSI M100 Table 1, ''Antimicrobial Agents That Should Be Considered for Testing and Reporting.'' While there are some drug/organism combinations that lack FDA-recognized breakpoints, this is due to the lack of adequate data (clinical, pharmacological, in vitro, etc.) to support the establishment of breakpoints. In most of these cases, as well as the above discussed cases of drug-resistant isolates, there are no breakpoints established by CLSI or EUCAST, either. It is important to note that any stakeholder, including a test manufacturer, also has the ability to submit a request to FDA requesting recognition of a particular breakpoint. This process is described in the docket to which these requests can be made (Ref. 228).

10. IVDs Offered as LDTs for Emergency Use

(Comment 252) Some comments stated that enforcement of premarket review requirements for emergency use tests is not appropriate while others stated it is necessary. Those opposed to such enforcement cited concerns with the ability of public health and AMC laboratories to respond to an outbreak quickly and the corresponding impact on patient access. Some also expressed concern about the impact of the phaseout policy on the availability of tests for emergent situations that do not

rise to the level of a declared public health emergency.

(Response 252) FDA agrees with comments that oversight of IVDs for emergency use is important. In this context, the potential for false results can have serious implications for disease transmission and public health decision-making, in addition to the individual patient's care. For these reasons, after all previous declarations under section 564(b) of the FD&C Act, FDA's general enforcement discretion approach generally has not applied to LDTs, and FDA is not changing its existing approach to tests for emergency use in this final rule (see section V.A.2). FDA issued EUAs to 116 IVDs from laboratories for COVID–19 and 1 IVD from a laboratory for Mpox.

We note that after a declaration is made under section 564 of the FD&C Act, FDA may issue EUAs to products that fall within the declaration and that meet certain statutory criteria. Notably, the statutory standard for EUAs is different than traditional premarket authorization. As discussed in FDA's final guidance entitled ''Emergency Use Authorization of Medical Products and Related Authorities'' (Ref. 229), ''the 'may be effective' standard for EUAs provides for a lower level of evidence than the 'effectiveness' standard that FDA uses for product approvals.'' This final guidance includes information on how to request an EUA.

FDA appreciates the need for immediate response to emergent situations (*e.g.,* harmful exposures or outbreaks) during the time between detection of the exposure or outbreak and either resolution of that exposure/outbreak or issuance of a declaration under section 564 of the FD&C Act. Accordingly, in parallel to this rulemaking, FDA is issuing draft guidance for an ''Enforcement Policy for Certain In Vitro Diagnostic Devices for Immediate Public Health Response in the Absence of a Declaration under Section 564.'' This draft guidance includes an enforcement discretion policy that is limited to certain tests needed for immediate response and limited to certain laboratories, such as those that are USG laboratories, State or local public health laboratories, or other laboratories that have agreements with the USG.

FDA also appreciates that different emergency situations may present unique circumstances for which additional enforcement discretion policies should be considered. FDA has issued a draft guidance document describing ''Consideration of Enforcement Policies for Tests During a Section 564 Declared Emergency,'' which describes factors FDA intends to consider in determining whether to issue an enforcement discretion policy during an emergency declared under section 564 for certain tests.

11. IVDs Offered as LDTs by Public Health Laboratories

(Comment 253) We received several comments that expressed concerns regarding the phaseout of FDA's general enforcement discretion approach with respect to IVDs offered as LDTs by public health laboratories. Comments stated that public health laboratories develop tests for unmet needs for: infectious diseases (*e.g.,* STIs, biological and chemical threat agents), foodborne diseases, newborn screening, toxicology (*e.g.,* blood lead), drugs of abuse testing, and low volume tests for rare diseases. Multiple state public health laboratories expressed concern with increased oversight of IVDs offered as LDTs for newborn screening. They stated that they use LDTs because there is no FDA-authorized IVD for some disorders on the Recommended Uniform Screening Panel and, in other cases, their LDTs are less costly or provide faster turnaround times compared to available FDA-authorized IVDs. Comments also discussed the significant financial burden associated with premarket submissions to FDA and expressed concern regarding the impact of the phaseout policy on public health laboratories that develop LDTs that are not for profit. Various proposals were provided, including continuing the general enforcement discretion approach for existing public health laboratories' LDTs, making the FDA review and authorization processes similar to that of NYS CLEP or relying on that program, streamlining the regulatory process when a public health laboratory modifies an FDA-authorized IVD, FDA offering fee waivers or exemptions, and FDA providing additional guidance, templates, or other resources to facilitate compliance.

(Response 253) FDA appreciates the important role public health laboratories play in our healthcare system. As discussed further in section V.B, FDA is adopting various enforcement discretion policies that should address some of the concerns raised in these comments. For example, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that are not modified or that are modified as described in section V.B.3 (including those manufactured by public health laboratories) and generally not enforce premarket review requirements for LDTs approved by NYS CLEP (including those manufactured by public health laboratories).

We acknowledge that public health laboratories may manufacture LDTs for unmet needs and that compliance with premarket review and other requirements will impose compliance costs on those laboratories. As discussed further in section V.B.3, we are adopting a policy for unmet needs LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. We believe that in such circumstances there are important risk mitigations present, particularly in the case of unmet need LDTs. We understand that this policy does not apply to most public health laboratories (as they are not integrated into a healthcare system and their public health mandate is to serve patients beyond the hospital system). We think it would be inappropriate to extend the policy to unmet needs LDTs developed and performed by public health laboratories, or other laboratories that are not integrated within a healthcare system, as there are not the same risk mitigations present for such LDTs that would help address and avoid the use of problematic LDTs.

FDA disagrees with comments suggesting a streamlined process for when a public health laboratory modifies an FDA-authorized IVD. FDA does not think modifications by a public health laboratory to an FDA-authorized IVD merit a different approach or policy, and the comments did not explain why the considerations raised in the comments are unique to public health laboratories. We note, however, that FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements when a laboratory, including a public health laboratory, certified under CLIA and meeting the regulatory requirements under CLIA to perform high complexity testing modifies another manufacturer's lawfully marketed test that is not a PMA-approved or BLA-licensed test, in a manner that could not significantly affect the safety or effectiveness of the test or its intended use, as described in sections V.C.4 and V.C.5. Further, FDA intends to develop appropriately targeted enforcement discretion policies for certain common changes to IVDs (including those manufactured and offered by public health laboratories), such as extension of specimen stability

and certain alternative specimen types, following good guidance practices.

Regarding comments about fee waivers or exemptions, please refer to the response to comment 190 describing when payment of a user fee is required under the current MDUFA authorization. Exceptions from the requirement to pay a user fee are established by statute (see sections 738(a)(2)(B) and 738(a)(3)(B) of the FD&C Act). The statute also provides authority for FDA to waive some user fees for certain small businesses (see sections 738(a)(3)(B) and 738(d)(1) of the FD&C Act). More information about MDUFA fees, user fee exceptions, and how to request a fee waiver are available on FDA's website (Ref. 183).

Finally, FDA intends to consider making additional resources available over the course of the phaseout period, which could potentially include guidance documents and templates to facilitate compliance.

12. IVDs Offered as LDTs for Research Use Only

(Comment 254) FDA received multiple comments requesting that FDA establish reasonable requirements to incentivize companies to seek FDA authorization for RUO IVD reagents or test kits. One asserted that the majority of LDTs performed in clinical laboratories use test kits distributed by large companies and labeled for RUO. Another comment stated it is common practice for laboratories to modify FDA-authorized IVDs to use RUO instruments or reagents rather than the specified instruments or reagents in the FDA-authorized IVD instructions for use. This comment stated that, in the event a laboratory makes an LDT from RUO components, only the final LDT should be required to comply with regulatory requirements.

(Response 254) FDA has issued a final guidance document that addresses RUO products (see Ref. 176). As explained in the final guidance, the RUO labeling is meant to serve as a warning to prevent such products from being used in clinical diagnosis, patient management, or an investigation that is not exempt from part 812. In general, IVD products that are intended for clinical diagnosis or patient management must be labeled ''For In Vitro Diagnostic Use'' (§ 809.10(a)(4)) and be in compliance with all applicable requirements for in vitro diagnostic devices. In other words, if an IVD is intended for clinical diagnostic use, it should not be labeled RUO. RUO products are generally not manufactured under the QS requirements, and therefore, are not expected to have the quality controls necessary for clinical use. A manufacturer that labels their product RUO but intends it for clinical diagnostic use would be in violation of the FD&C Act, including misbranding the product under section 502(a) of the FD&C Act due to the labeling being false or misleading.

If a laboratory chooses to use one or more RUO components in its IVDs offered as LDTs, then the laboratory is responsible for qualifying such components in its IVDs. For those IVDs offered as LDTs for which the phaseout policy with respect to the QS requirements would apply, as long as the laboratory has implemented a quality system that meets the QS requirements, as applicable, and is able to appropriately manage the quality of these components under that quality system, then the components may be incorporated as part of an IVD offered as an LDT (see section V.C.3 for a discussion of when FDA generally expects compliance with the QS requirements for IVDs offered as LDTs). The RUO-labeled component(s) will be reviewed in the premarket submission for the IVD offered as an LDT, if applicable.

13. IVDs Offered as LDTs for Sexually Transmitted Infections

(Comment 255) Comments expressed concern that FDA's proposed phaseout of enforcement discretion would negatively affect access to STI tests currently in use. Multiple comments asserted that LDTs are ''the only or most appropriate, and most timely tests available'' for HIV and other STIs, and that the proposed phaseout policy would ''make it substantially more difficult to adopt new tests or modify existing tests to meet urgent and emerging public health needs.'' A comment also expressed that home-testing programs implemented by public health departments and community-based organizations ''provide critical access to HIV, viral hepatitis, and STI testing'' that includes testing associated with pre-exposure prophylaxis (PrEP).

(Response 255) FDA disagrees with comments predicting that phasing out the general enforcement discretion approach for LDTs will have negative impact on access to STI tests to meet ''urgent and emerging public health needs.'' As discussed in section VI.L.10 (IVDs Offered as LDTs for Emergency Use) and VI.L.11 (IVDs Offered as LDTs by Public Health Laboratories), FDA anticipates that several of the enforcement discretion policies adopted in the final phaseout policy will help to address the specific concerns raised in the comments regarding the availability of IVDs for emerging public health threats by facilitating timely access to STI IVDs.

FDA also disagrees with the comment that ''the most appropriate tests'' for HIV and other STIs are currently offered as LDTs. We acknowledge the critical importance of access to safe and effective HIV tests, including tests that may inform decisions about beginning or continuing use of antiretroviral medications for PrEP. However, FDA-authorized HIV diagnostic and supplemental tests and HIV viral load monitoring tests are available to provide such access. We note that there is an FDA-approved OTC HIV test that individuals may use to test themselves at home or in a private location (Ref. 221). FDA also acknowledges the importance of access to safe and effective tests for other STIs, such as chlamydia, gonorrhea, mycoplasma genitalium, and syphilis, for which FDA-authorized tests are also widely available (see, *e.g.,* Refs. 230 to 233). This includes STI tests for use with self-collected samples in clinical settings and one STI test with at-home sample collection for chlamydia and gonorrhea (see, *e.g.,* Ref. 222). As described in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs, including STI tests, that were first marketed prior to the date of issuance of this rule. FDA anticipates that this policy will help address the concerns expressed in the comments regarding the impact of the proposed phaseout policy on access to STI tests currently in use. However, for the reasons described in the NPRM and in section V.A.2, we note that FDA's general enforcement discretion approach for LDTs has not applied to direct-to-consumer tests, including direct-to-consumer HIV and other STI tests, and they are not included in this enforcement discretion policy (88 FR 68006 at 68022).

14. IVDs Offered as LDTs Conducted by and Within Blood Establishments, Transfusion Services, and Cell and Gene Therapy Laboratories

(Comment 256) Several comments requested that FDA ''exempt'' all tests conducted by and within blood establishments, hospitals' transfusion services, and accredited cell and gene therapy laboratories and services from FDA's proposed phaseout of the general enforcement discretion approach. In support of this request, a comment asserted that ''the existing regulatory

framework ensures that [these entities] provide high quality, safe, and effective care,'' noting that these entities offer LDTs in CLIA certified laboratories that are part of Federal, State, or locally licensed facilities. The comment also noted that ''[e]xtensive FDA regulatory requirements'' apply to such laboratories such as registration, licensure of donor screening tests, and premarket review (PMA, 510(k), or New Drug Application (NDA)) requirements for certain products, and that some of these laboratories are also subject to heightened State regulation, such as the NYS CLEP. Some comments expressed concerns that FDA's proposal could negatively affect laboratories' abilities to perform compatibility testing for patients in need of blood or testing that supports safe use of cell and gene therapies. Some comments also requested that FDA exclude immunohematology reference laboratories from the scope of the final phaseout policy as their LDTs involve ''highly educated and highly trained technologists perform[ing] specialized testing using manual techniques on select, complex samples'' and without which accurate and complete antibody identification would not be possible, resulting in ''missed antibodies leading to increased transfusion reactions, strains to the blood supply due to unnecessary phenomatching of Red Cells and many other issues.''

(Response 256) FDA disagrees with adopting an enforcement discretion policy for all tests used in blood establishments, transfusion services, and accredited cell and gene therapy (CGT) laboratories, and for all immunohematology reference laboratories. In the NPRM, FDA identified categories of tests that have not been part of the general enforcement discretion approach for LDTs. These categories of tests include those that are intended to screen donors of blood and HCT/Ps for infectious diseases under §§ 610.40 and 1271.80(c), or for determination of blood group and Rh factors required under § 640.5 (88 FR 68006 at 68021–22). Such tests may be conducted in blood establishments, transfusion services and/or CGT laboratories. Under the cited regulations, a blood or HCT/P establishment must not use a test for the purposes described in the regulation unless the test is authorized by FDA for such use, and in our experience, establishments have been generally complying with these requirements. Therefore, for these tests, we would not expect the phaseout policy to negatively affect the ability to perform blood compatibility testing or testing to determine HCT/P donor eligibility that supports safe use of HCT/Ps, such as cellular therapies. As described in section V.A.2, these tests are not subject to any enforcement discretion policies included in the phaseout policy.

For other tests conducted by blood establishments, transfusion services, or CGT laboratories (*i.e.,* those not subject to the requirements under §§ 610.40, 640.5, or 1271.80(c)), we disagree with the comment's assertion that enforcement discretion is appropriate because such tests are developed by laboratories that are CLIA certified and part of Federal, State, or locally licensed facilities. For discussion of why CLIA does not provide sufficient assurances of safety and effectiveness for IVDs offered as LDTs, see our responses to comments in section VI.C.2. While the comment did not provide details regarding which Federal, State, and local facility licensure requirements would be relevant, as a general matter, we note that the requirements against which a *facility* is assessed do not necessarily address the analytical and clinical validity of (or other issues affecting the safety and effectiveness of) IVDs offered as LDTs by a laboratory within that facility.

With respect to the argument that FDA should exercise enforcement discretion for all LDTs conducted by blood establishments, transfusion services, or CGT laboratories because these entities already comply with FDA requirements for certain other products, such entities should already have familiarity with FDA's requirements and thus be better positioned to transition to compliance in accordance with the phaseout policy. Regarding the comment that some blood establishment and CGT laboratories are subject to State requirements like NYS CLEP, FDA considered comments received regarding NYS CLEP and intends to exercise enforcement discretion and generally not enforce premarket review requirements (but intends to phase out enforcement discretion with respect to other requirements) for LDTs that are approved by NYS CLEP. For further discussion of this policy and other comments received related to NYS CLEP see sections V.B.2 and VI.F.5. The comment did not mention other, specific state programs.

Although we disagree with the comments' request for a broad enforcement discretion policy for all LDTs conducted by or within blood establishments or CGT laboratories and for all immunohematology reference laboratories' LDTs, we note that several of the targeted enforcement discretion policies described in section V may encompass some of these tests and help address the concerns raised in the comments. For example, as proposed in the NPRM and described in section V.B.1 of this preamble, FDA intends to exercise enforcement discretion and generally not enforce any applicable requirements for 1976-Type LDTs (88 FR 68006 at 68022). This includes some tests cited in the comments that are used in blood establishments and immunohematology laboratories such as adsorbing warm-reactive autoantibodies using allogeneic or autologous red blood cells, the Donath-Landsteiner test for aiding in the diagnosis of paroxysmal cold hemoglobinuria, Ham's test to aid in the diagnosis of paroxysmal nocturnal hemoglobinuria, tests to evaluate drug-induced hemolysis or interference in compatibility testing, monocyte-monolayer test to assess possible clinical significance of RBC alloantibodies, modified Kleihauer-Bethke, and SDa antigen neutralization with urine.

In addition, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. As noted above, FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP, and to exercise enforcement discretion with respect to premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system.

Finally, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for non-molecular antisera LDTs for rare RBC antigens when such tests are manufactured and performed in blood establishments, including transfusion services and immunohematology laboratories, and when there is no alternative available to meet the patient's need for a compatible blood transfusion as described in section V.B.3. This enforcement policy is based, in part, on FDA's recognition that there are occasions where licensed IVDs are not available for rare RBC antigens but

testing for such rare antigens is necessary to help ensure that patients receive a compatible blood transfusion and avoid potentially life-threatening reactions. We believe that this policy, in addition to some of the other enforcement discretion policies described above, helps mitigate the concern raised by one comment that a phaseout of enforcement discretion for immunohematology laboratories' LDTs will result in ''missed antibodies leading to increased transfusion reactions.''

15. IVDs Offered as LDTs Used in Manufacturing and Development of Cell or Gene Therapy Products

(Comment 257) One comment recommended enforcement discretion for tests used as part of cell therapy product manufacturing. Another comment recommended enforcement discretion for tests on banked cord blood.

(Response 257) We do not agree that it is appropriate to exercise enforcement discretion for all tests used as part of cell therapy product manufacturing or tests on banked cord blood. For example, as discussed in the NPRM, the general enforcement discretion approach for LDTs has not applied to HCT/P donor screening tests required for infectious disease testing under § 1271.80(c), including screening tests for banked cord blood (88 FR 68006 at 68021–22); FDA is not changing this approach in the final phaseout policy. Under the cited regulation, HCT/P establishments must not use a test for the purposes listed in that regulation unless the test is authorized by FDA for such use. With respect to other tests used as part of cell therapy product manufacturing or performed on banked cord blood, we note that this would span a wide variety of tests depending on the particular product and nature of the manufacturing process, including tests that do not meet the definition of an IVD under § 809.3 and are therefore outside the scope of this rulemaking and the phaseout policy. We note that FDA has mechanisms in place, such as ''Section 513(g) Requests for Information,'' for manufacturers to obtain information regarding the regulatory requirements applicable to a specific product under the FD&C Act (Ref. 65).

To the extent tests about which the comments are concerned would fall within the definition of an IVD, we note that several targeted enforcement discretion policies are included in the final phaseout policy, as described in section V.B. These policies may help address the comments' concerns. For example, to help address harms that could result from widespread loss of access to IVDs currently on the market, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3.

(Comment 258) A comment suggested we should continue the general enforcement discretion approach for premarket review and QS requirements for tests used in cell and gene therapy product development, particularly when screening for clinical trial eligibility and monitoring participant response to investigational treatments, since these tests are typically conducted in low volumes and reviewed in connection with therapeutic product sponsor INDs and NDAs. The comment stated that additional regulatory requirements would create additional burdens without countervailing benefits to trial participants and patients.

(Response 258) FDA recognizes that some clinical investigations of therapeutic products (including cell and gene therapy products) use investigational IVDs to guide the management of participants, such as to determine eligibility or monitor response of participants to the investigational therapeutic product. However, the comment appears to suggest that because of the phaseout policy described in the NPRM, premarket review requirements would apply to and be enforced for all such IVDs when used in clinical investigations. Devices intended for use in clinical investigations, including IVDs offered as LDTs, are exempt from most regulatory requirements applicable to devices, including premarket review, as long as the investigation complies with applicable requirements under part 812. As discussed in more detail in response to comment 175, FDA's regulations do not necessarily require submission of an IDE application to FDA for use of a device in a clinical investigation. To the extent submission of an IDE application is required for use of an investigational IVD in a clinical investigation of a drug or biological product, there are steps that sponsors can take to help simplify the process. For example, IDE and IND applications may cross-reference each other through a letter of authorization. While we disagree that it is appropriate to exercise enforcement discretion with respect to applicable QS requirements for all IVDs used in CGT product development, we note that an investigational device with an approved IDE application (or deemed to have an approved IDE under § 812.2(b)) is generally exempt from most QS requirements issued under section 520(f) of the FD&C Act (see § 812.1). As described in section V.C, FDA intends to phase out the general enforcement discretion approach with respect to QS requirements during stage 3, including, as applicable, QS requirements for investigational devices.

In all cases, FDA is committed to advancing CGT product development while protecting the safety of trial participants. Compliance with applicable investigational use requirements is important for the protection of participants. Under the phaseout policy described in section V.C, FDA expects compliance with applicable IDE requirements and other applicable requirements, such as parts 50 and 56, for investigations that involve investigational IVDs offered as LDTs 2 years after publication of this final rule. The Agency has resources available that may help sponsors designing trials of therapeutic products that involve the use of investigational IVDs, which are discussed further in our response to comment 175. Sponsors can also engage with FDA under the Q-Submission Program to address questions related to IVD risk, study design, and regulatory requirements.

16. Histocompatibility

(Comment 259) FDA received multiple comments regarding HLA tests. Many comments supported FDA's proposed approach to HLA tests for transplantation. Multiple comments that supported this approach indicated that the extensive and multilayer national system of regulatory oversight provided through United Network for Organ Sharing, OPTN, the Scientific Registry of Transplant Recipients, NMDP, FACT, and the Center for International Blood and Marrow Transplant Research for histocompatibility laboratories has ensured analytical and clinical validity and patient safety for decades. One comment noted that these tests often need to be ''customized'' to the needs of the patient, and that requiring premarket approval, or even notification, could prevent testing that is critical for patient care. One comment requested that FDA include HLA tests used for blood transfusion in its enforcement discretion approach. Another comment proposed that FDA broaden the scope of its continued enforcement discretion for HLA tests for transplantation to all histocompatibility tests. Another comment suggested that

other tests beyond HLA tests are ''generally performed in urgent, life-saving situations for the patient'' and therefore should be treated similarly.

(Response 259) FDA agrees with the comments to the extent that they support the Agency's proposed approach related to HLA tests for transplantation. As discussed in the NPRM, and consistent with the 2014 draft guidance document on oversight of LDTs (Ref. 38), FDA intends to exercise enforcement discretion and generally not enforce any applicable requirements for HLA tests for transplantation used in histocompatibility laboratories that meet the regulatory requirements under CLIA to perform high complexity histocompatibility testing, when used in connection with organ, stem cell, and tissue transplantation to perform HLA allele typing, for HLA antibody screening and monitoring, or for conducting real and ''virtual'' HLA crossmatch tests (88 FR 68006 at 68022). While other tests may be performed in urgent and life-threatening situations, we note that HLA tests for transplantation are often modified rapidly in response to urgent situations and individualized within each medical facility based on local HLA polymorphisms and patient demographics. Further, we do not agree to exercise enforcement discretion with respect to all applicable requirements for HLA tests for blood transfusion. As described in the NPRM, and in contrast to HLA tests for transplantation, HLA tests for blood transfusion are highly standardized across institutions (88 FR 68006 at 68022). In addition, as noted by some of the comments and explained in more detail in section V.B.1, in the context of HLA tests for transplantation, there are other Federal oversight mechanisms (such as OPTN and NMDP requirements for histocompatibility laboratories and HLA testing) that help mitigate risks of inaccurate results.

17. Antisera Used To Test for Rare Red Blood Cell Antigens

(Comment 260) Several comments recommended FDA continue to exercise enforcement discretion for unlicensed antisera that are used to test for rare RBC antigens. A comment also asserted that FDA's guidance document entitled ''Labeling of Red Blood Cell Units with Historical Antigen Typing Results'' recognizes that blood establishments use unlicensed reagents or unapproved molecular tests for RBC antigen typing and that such tests did not appear to be included in the categories of tests for which FDA proposed to continue to apply its current general enforcement discretion approach going forward.

(Response 260) FDA recognizes there are occasions where licensed IVDs are not available for rare RBC antigens but testing for such rare antigens is necessary to help ensure that patients receive a compatible blood transfusion. While there are molecular tests approved for use in genotyping RBC antigens, there may not be an available approved molecular test to use as an alternative for all rare antigens. After considering the comments on this issue, as discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for non-molecular antisera LDTs for rare RBC antigens when such tests are manufactured and performed in blood establishments, including transfusion services and immunohematology laboratories, and when there is no alternative available to meet the patient's need for a compatible blood transfusion. However, for the reasons discussed in section V.B.3, FDA does not intend to extend this enforcement discretion policy to molecular tests used for genotyping red blood cell antigens.

M. IVD Modifications

(Comment 261) FDA received comments about modifications to IVDs in different scenarios. Some referred to modifications laboratories make to their own IVDs offered as LDTs for various reasons, including to improve their IVDs. Some stated that laboratories often make modifications to other manufacturers' FDA-authorized tests to accommodate different specimen types, different patient populations, various storage conditions, additional variants for genetic tests, and many other factors. Comments stated that laboratories cannot afford the expense or significant administrative burden associated with seeking FDA review for each such modification. One comment detailed the flexibilities under the VALID Act for CLIA-certified high-complexity laboratories to make certain modifications to approved in vitro clinical tests without seeking independent premarket review and suggested FDA adopt a similarly flexible policy for modifications through amendments to the FD&C Act and CLIA regulations or through continued enforcement discretion. The comment noted that a flexible modifications policy should extend to ''grandfathered tests'' because failure to do so would make a ''grandfathering'' policy ''obsolete as modifications are routinely made to improve performance and adjust to changing circumstances.''

(Response 261) As discussed below, we believe the existing requirements and policies and the enforcement discretion policies described in section V above generally address laboratory modifications of IVDs.

FDA's regulations describe when manufacturers must submit a premarket submission for a modification to their own device. Specifically, premarket review is required when: an approved device is modified in a way that changes the safety or effectiveness of the device, with certain exceptions (pursuant to § 814.39(a)); a cleared device, or a device classified through the De Novo process and subject to 510(k) requirements, is modified in a way that could significantly affect the safety or effectiveness of the device (pursuant to § 807.81(a)(3)); [93] or a 510(k)-exempt device is modified outside the scope of the 510(k) exemption. In the context of IVDs, these standards have generally been interpreted to include changes to the operating principle, intended use and other changes that impact performance (see, *e.g.,* Refs. 224 and 61). Post-approval changes to a licensed device must be submitted in accordance with § 601.12. Where the manufacturer may anticipate the types of changes they intend to make, they may consider seeking clearance or approval of a PCCP. Under section 515C of the FD&C Act, a PMA supplement or new 510(k) is not required for a modification to a device that would otherwise require such a submission if the change is consistent with a PCCP previously approved or cleared by FDA. To the extent a PCCP is approved or cleared by FDA for a particular IVD, any changes within the bounds of that PCCP would not necessitate a new submission to FDA.

In the final phaseout policy described in this preamble, FDA is also including several policies under which FDA generally does not intend to enforce the premarket review requirements for certain modified IVDs offered as LDTs. For example, if an IVD offered as an LDT was first marketed prior to the date of issuance of this rule, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements when the IVD is modified in certain limited ways as described in section V.B.3. As described in response to comment 124, this policy is intended to preserve access to beneficial IVDs on which patients and the healthcare community currently rely, including

[93] FDA has published several guidance documents to help stakeholders navigate this process, including ''Deciding When to Submit a 510(k) for a Change to an Existing Device'' and ''Deciding When to Submit a 510(k) for a Software Change to an Existing Device'' (Refs. 61 and 211).

versions of that IVD with minor changes. In addition, the final phaseout policy described in this preamble includes an enforcement discretion policy under which FDA generally does not intend to enforce premarket review requirements for certain LDTs for unmet needs, which may consist of a laboratory modification to an LDT or to another manufacturer's legally marketed test to meet an unmet need for use by a laboratory integrated within a healthcare system (see section V.B.3). Third, as described in sections V.C.4 and V.C.5, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements when a laboratory makes certain changes to another manufacturer's lawfully marketed 510(k) cleared or De Novo authorized test.

FDA also intends to develop appropriately targeted enforcement discretion policies for certain common changes, such as extension of specimen stability and certain alternative specimen types, following good guidance practices. Although FDA does not anticipate that such enforcement discretion policies will be analogous to certain provisions in the VALID Act, FDA nonetheless anticipates that such enforcement discretion policies will further help to address concerns regarding modifications as described in comments submitted to the docket. Moreover, the custom device exemption in the FD&C Act (21 U.S.C. 360j(b)), or enforcement discretion decisions for individual manufacturers, IVDs, or IVD modifications, may be appropriate to address unique patient needs or unforeseen circumstances.

(Comment 262) FDA received comments discussing the use of PCCPs as an option in complying with FDA requirements addressed in the phaseout policy. One comment inquired as to whether the PCCP process would extend to all assays or if it would be specific to sequencing assays, and whether FDA would issue a document explaining the PCCP process, including the type of change that would still require submission to FDA.

(Response 262) The use of PCCPs is not limited to certain types of devices, such as sequencing assays. FDA intends to issue draft guidance for stakeholders on Predetermined Change Control Plans for Medical Devices, as noted in the list of proposed guidances for fiscal year 2024 prepared by CDRH (Ref. 234).

(Comment 263) Another comment stated that PCCPs would not alleviate the need for new 510(k)s and PMA supplements for modifications because it would apply only to changes that a manufacturer makes to its own device and would not allow laboratories to adapt cleared or approved tests from other manufacturers to meet evolving clinical needs; and further, it would apply only to changes that the manufacturer can anticipate at the time of submission and does not enable laboratories to modify tests in response to other changing circumstances like reagent shortages or unique patient needs.

(Response 263) FDA agrees that the use of a PCCP would not be applicable in all circumstances in which a laboratory modifies an IVD. Inclusion of a PCCP in the clearance or approval of a device is based on FDA's review of the manufacturer's approach for validating certain types of modifications and associated acceptance criteria. While PCCPs are necessarily limited to the types of modifications the manufacturer can anticipate for a device that is under premarket review, use of the PCCP is just one approach to support the iterative improvement of a manufacturer's own devices. In addition, FDA has adopted or intends to adopt other enforcement discretion policies that may be relevant to the modifications described by the comments, which are described in the previous comment response. Otherwise, FDA believes premarket review of modifications as described in response to comment 261 is appropriate, consistent with the overall goal of this rulemaking to better assure the safety and effectiveness of IVDs offered as LDTs.

(Comment 264) FDA received a few comments that questioned the extent to which PCCPs would alleviate regulatory burdens for industry and how well they would function. One comment stated that, from experience with the current PCCP process, reaching agreement has been burdensome and lengthy, which limits the utility of PCCPs. Other comments stated that it is premature for FDA to assume that PCCPs will help laboratories as the program is still very new and it is unclear how well it will work for various categories of devices; and further, that it is unreasonable to expect laboratories that previously were generally not expected to comply with FDA requirements to leverage tools that still challenge more seasoned manufacturers.

(Response 264) FDA recognizes that efforts around PCCPs are relatively new and not all manufacturers may utilize PCCPs when making IVD modifications. In order to provide additional information to stakeholders on this topic, FDA has announced that it intends to issue draft guidance on PCCPs in fiscal year 2024 (Ref. 234). In addition, by the time of stages 4 and 5 of the final phaseout policy, FDA anticipates that it will have more experience with PCCPs, including in the context of IVDs, in order to facilitate manufacturer use of this tool. FDA may also provide additional guidance and educational opportunities for stakeholders, as appropriate. In any event, whether laboratories choose to use the PCCP process does not affect the public-health need for this rulemaking.

(Comment 265) FDA received comments expressing concern that premarket review requirements will cause disruption in access to tests and requesting the Agency take a more flexible approach or provide simplified submission requirements for specific types of assay modifications. Some comments suggested that FDA create a new submission pathway whereby low-risk modifications are reviewed on an expedited 45-day timeline and use this pathway when a PCCP may not be possible or available for low-risk modifications (*i.e.,* those that do not change the intended use, indications for use, or adversely affect the approved analytical or clinical performance) so that test manufacturers may implement low-risk modifications more expeditiously and ensure patient access to cutting-edge technology.

(Response 265) At the outset, FDA notes that compliance with premarket review requirements protects and promotes public health by helping assure that devices are safe and effective. In addition, not all modifications require premarket review. For modifications requiring premarket review, FDA will use the well-established premarket pathways set forth in the statute and regulations. With respect to the 45-day review period proposed by the comments, FDA declines to adopt a new policy expediting review of these modifications, which would divert resources from other priorities. However, for certain modifications that require premarket submission, FDA anticipates that the established expedited premarket pathways, such as the Special 510(k) program for moderate-risk devices with a 30-day timeline and the Real Time PMA program for high-risk devices with a 90-day timeline (see Refs. 235 and 236), will help laboratories implement these modifications in a timely manner. In addition, FDA has adopted or intends to adopt other enforcement discretion policies that may be relevant to such modifications. See the discussion in comment response 261.

(Comment 266) One comment proposed a continued enforcement discretion approach for modifications of certain FDA-approved (third-party) IVDs by appropriately trained and ''certified'' clinical scientists/pathologists at certain clinical laboratories, such as laboratories with high sample volume, reference laboratories, and laboratories serving ethnically diverse patient populations. This comment further proposed that qualified laboratory personnel would develop, review, and validate the modifications and submit a final report to FDA ''for information only,'' which would be used to facilitate FDA's review of the test characteristics when a submission for the modified IVD is submitted by the initial third-party manufacturer. The comment proposed that this approach should be limited to modifications of an FDA approved assay adapted for the local clinical need.

(Response 266) FDA does not agree that it should adopt the approach proposed in the comment. By ''FDA-approved'' IVD, we assume that the comment is referring to an IVD that is approved under a PMA. Such IVDs are class III devices that are considered high risk. When an IVD is high risk, changes to that IVD pose corresponding increased risks. Therefore, although FDA has adopted an enforcement discretion policy for certain laboratory changes to another manufacturer's lawfully marketed 510(k) cleared or De Novo authorized test (see sections V.C.4 and V.C.5), this policy does not apply to IVDs approved under a PMA.

However, FDA is adopting several other enforcement discretion policies that may be relevant to the comment's concern. As described in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)), for: (1) IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule, including versions of those IVDs with minor changes and (2) LDTs manufactured and performed by a laboratory integrated within a healthcare system to address an unmet need of patients receiving care within the same healthcare system.

(Comment 267) With respect to laboratory modifications to another manufacturer's FDA-authorized test, another comment suggested that FDA ''clarify through special controls what laboratories are expected to do when performing such validations and the extent to which the modified test's performance can change from the originally authorized version.'' The comment stated that it would be more practical for FDA to expect a premarket submission from a laboratory only when the modification is to another manufacturer's already cleared or approved device and a ''significant change'' has been made, as defined in FDA's guidance document entitled ''Deciding When to Submit a 510(k) for a Change to an Existing Device'' (Ref. 61).

(Response 267) FDA agrees with this comment in that FDA intends to exercise enforcement discretion with respect to the premarket review requirements for certain modifications to certain lawfully marketed tests. Specifically, as described in sections V.C.4 and V.C.5, FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements when a laboratory certified under CLIA and meeting the regulatory requirements under CLIA to perform high complexity testing modifies another manufacturer's lawfully marketed 510(k) cleared or De Novo authorized test, following design controls and other quality system requirements for which FDA expects compliance as described in section V.C.3, in a manner that could not significantly affect the safety or effectiveness of the test and does not constitute a major change or modification in intended use, and where the modified test is performed only in the laboratory making the modification. The guidance document mentioned in the comment applies to a manufacturer's modification of its own legally marketed device that is subject to 510(k) requirements. However, its description of changes that could significantly affect the safety or effectiveness of a test or constitute a major change or modification in intended use would be helpful and relevant for purposes of the enforcement discretion policy described in this paragraph.

Further, FDA intends to develop appropriately targeted enforcement discretion policies for certain common changes, such as extension of specimen stability and certain alternative specimen types, following good guidance practices.

In addition, to the extent the comment suggested that FDA should not expect premarket submissions from laboratories when a modification is made to a laboratory's own IVD, we disagree. Even if a laboratory is making a change to its own IVD, certain of those changes warrant premarket review in order to protect and promote public health. For example, for a 510(k)-cleared device, premarket review is expected when a change could significantly affect the safety or effectiveness of the device.

If a manufacturer needs assistance in understanding FDA's expectations for validation for a particular test, whether the test is designed initially by the laboratory manufacturer or whether the laboratory manufacturer is modifying another manufacturer's test, it may seek information through FDA's Pre-Submission program, which is further explained in FDA's guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65). Validation expectations may also be included in device-specific special controls, guidance documents, decision summaries, and recognized standards, all of which can be found on FDA's website. Further, FDA plans to consider what other resources may be helpful for laboratory manufacturers that modify another manufacturer's FDA-authorized test. Any future such resources will also be made available on FDA's website.

(Comment 268) FDA received several comments regarding test modifications in various areas of medicine, such as genetic testing, STI tests, and others that would be impacted by the phaseout policy. One comment asserted that the ability to rapidly update tests has improved the accuracy of genetic testing and provides improved sensitivity and specificity of testing across diverse populations in the United States. Another comment stated that increased oversight of LDTs would have significant implications for ongoing improvements using real-world evidence and continuous feedback loops, which allows for iterative enhancements to tests that greatly benefit patients. Another comment discussed the modifications to another manufacturer's FDA-authorized tests that are used in the pediatric population, where information in the labeling, such as intended use statements, are restrictive regarding patient population and specimen collection.

(Response 268) FDA agrees that test modifications, including those implemented based on real-world evidence information and to expand the indications for use of another manufacturer's FDA-authorized test to include pediatrics, can greatly benefit patients when the modified test remains safe and effective. FDA has seen modifications to tests that were intended to improve the test but did not actually do so; once the modified test underwent validation testing, the performance of the test was worse than the unmodified test and the test was no

longer safe and effective for its intended purpose. FDA has also seen modifications to tests that have not been supported by valid scientific evidence—for example, when there has been a lack of valid scientific evidence demonstrating the clinical validity of the modified test. FDA does not agree with the underlying implication of these comments that being able to modify IVDs without premarket review, regardless of the type of modification, best serves public health. FDA premarket review of modifications that could affect a test's safety and effectiveness helps ensure that modified IVDs are safe and effective. For example, FDA premarket review helps ensure appropriate clinical validation for modifications, among other things, including for genetic and STI tests, which were specifically raised by one comment.

(Comment 269) One comment expressed concern regarding the ''potential rigidity'' of the device regulatory scheme and its impact on the ability to ''routinely adjust DNA/RNA extraction processes to obtain more quality material for testing based on improving technology.'' The comment went on to propose FDA adopt an ''improved technology verification protocol'' that will allow a party to submit the reasons for modifications with a justification of improvements and demonstration that QC measures are being maintained.

(Response 269) The comment proposed a new regulatory approach to device modifications based on an ''improved technology verification protocol.'' Even assuming such an approach were within FDA's statutory authority, creating a new regulatory approach for all device or IVD modifications is not within the scope of this rulemaking, which is focused on phasing out the general enforcement discretion approach for LDTs. FDA notes that it may be appropriate to include certain changes, such as the modification to DNA/RNA extraction methods mentioned in the comment, in a PCCP in a premarket submission to FDA. For a more detailed discussion of PCCPs, see comment responses 262–264.

(Comment 270) Several comments discussed antimicrobial breakpoints and whether updates to breakpoints of ASTs should fall within the phaseout policy. One comment asserted that FDA's policy for requiring manufacturers of automated AST devices to wait for FDA to recognize updated breakpoints forces laboratories ''to choose between FDA's outdated breakpoints . . . or performing internal validation of CLSI's updated breakpoints.'' Another comment asserted that manufacturers of ''FDA-cleared or approved automated devices are not required to update breakpoints, and therefore modified FDA-cleared/approved (LDT) testing must be used'' and further asserted that their laboratory would not have the necessary staffing and financial resources to submit premarket submissions for revised breakpoints.

(Response 270) FDA disagrees with the premise that FDA's recognized breakpoints are outdated. Section 3044 of the Cures Act created a system to expedite the recognition of breakpoints, referred to in the Act as antimicrobial STIC (section 511A of the FD&C Act, 21 U.S.C. 360a–2). Since implementation of this statutory provision, FDA posts information online about FDA's recognition, or withdrawal from recognition, in whole or in part, of STIC established by an SDO and lists of exceptions or additions to the recognized STIC that the SDO established (Ref. 225). These online references are updated regularly. This approach allows FDA to more quickly communicate updated STIC than would be possible through updating and re-updating drug labeling. FDA has also created corresponding processes for rapid updates of breakpoints in AST devices. For example, FDA works with manufacturers to include PCCPs in their premarket submissions so that they can update their devices to address updated breakpoints without premarket review. In 2023, FDA issued a final guidance document, ''Antimicrobial Susceptibility Test (AST) System Devices—Updating Breakpoints in Device Labeling'' (Ref. 226), in which FDA describes least burdensome approaches for AST system device manufacturers to update their device labeling with the updated breakpoints listed on FDA's STIC website (Refs. 225 and 226). Generally, updating the STIC could significantly affect the safety and effectiveness of the AST system device and would therefore require a 510(k) submission prior to updating the device labeling. However, the final guidance provides recommendations on the marketing submission content for PCCPs for new AST system devices, describes an enforcement policy regarding applying such updates to ''legacy'' AST system devices (AST system devices that were reviewed and cleared by FDA and did not include a breakpoint change protocol), and clarifies the process for incorporating by reference a cleared PCCP or breakpoint change protocol into a new 510(k) submission for an AST system device. FDA anticipates that this final guidance will facilitate timely adoption of updated breakpoints in AST system devices, which helps to maintain device safety and effectiveness. This should also reduce the burden on laboratories regarding the need to modify automated devices or submit premarket submissions where the manufacturers of the automated devices are using these streamlined approaches to quickly adopt updated breakpoints.

Additionally, for laboratories that are already offering AST devices as LDTs, as discussed in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule, and for certain modifications to such currently marketed IVDs offered as LDTs. In general, future updates to breakpoints of currently marketed ASTs offered as LDTs are within the scope of this enforcement policy, provided that such update is validated, does not change the indications for use of the AST, does not alter the operating principle of the AST, does not include significantly different technology, and does not adversely change the performance or safety specifications of the AST. For a modification to the breakpoint to an IVD currently offered as an LDT to be considered clinically validated, FDA expects the updated breakpoint to reflect that identified on the STIC website.

(Comment 271) Some comments stated that enforcing premarket review requirements for manufacturing changes will hamper process innovation, which will disincentivize changes that may improve laboratory operations and costs to patients, such as updating software, adding automation, and adjusting workflow to accommodate throughput needs of the institution.

(Response 271) As an initial matter, FDA notes that updating software, adding automation, and adjusting workflow to accommodate throughput could be examples of manufacturing process changes or changes to the design of an IVD, depending on how the change applies. For example, an update to the software used by a test would generally be considered a design change. For additional information regarding modifications to IVDs offered as LDTs, including design modifications, see the responses to comments 261 through 270. To the extent the comments are specific to changes made to the manufacturing

process, FDA requirements for premarket review of manufacturing process changes are calibrated to the significance of the change and risk of the device, such that premarket review (to the extent required) of minor changes is more streamlined than for major manufacturing changes. We believe this framework helps address some of the comments' concerns.

For example, for devices approved under a PMA or licensed under a BLA, FDA regulations require the submission of a supplement or a 30-day notice for certain manufacturing changes (see §§ 814.39 and 601.12). The appropriate type of submission varies with the nature of the change, as discussed in FDA's final guidance, ''Modifications to Devices Subject to Premarket Approval (PMA)—The PMA Supplement Decision-Making Process'' (Ref. 185) (see also § 601.12(b)–(c)). In some cases, which generally involve minor changes, manufacturing changes may be noted in a PMA or BLA annual report after they have been implemented (see §§ 814.39(b) and (e) and 601.12(e)). We also note that FDA estimates that premarket approval or licensure requirements will apply to only a small percentage of IVDs offered as LDTs (see Appendix A of the FRIA (Ref. 10)).

For devices subject to premarket notification, which are generally lower risk than those subject to PMA or BLA requirements, a change in the device manufacturing process would require a new 510(k) only if the change was one that could significantly affect the safety or effectiveness of the device (see § 807.81(a)(3)). Although, the need for premarket review of a manufacturing process change for an IVD is typically a case-specific evaluation, many changes implemented to improve laboratory operations may not trigger the requirement for a new 510(k) submission under FDA regulations. As discussed in FDA final guidance, manufacturers should consider the impact of manufacturing changes on device labeling, technology, engineering, performance, and/or materials to determine if a new 510(k) submission is required (Ref. 61).

In our experience, FDA premarket review of certain manufacturing changes is important to prevent adverse effects on device safety and effectiveness. For example, if a new manufacturing line is introduced that significantly alters the specificity of an antibody used for colon cancer screening, hundreds of individuals may receive false negative cancer screening results and miss critical early detection of colon cancer. In this example, even if introduction of the new manufacturing line was intended to improve operations, the change could have a significant, unintended adverse impact on the device's safety and effectiveness and, ultimately, on patients.

Moreover, as discussed in response to comment 261, FDA is issuing several policies under which FDA generally does not intend to enforce the premarket review requirements for certain modifications to IVDs offered as LDTs. The Agency anticipates these enforcement discretion policies will also help alleviate some of the concerns expressed in these comments.

(Comment 272) One comment stated that FDA should ''differentiate permitted off-label use from actions that create a 'new' or 'modified' test such that FDA would have jurisdiction'' and that FDA should ''ensure that it protects the legitimate (and statutorily protected) right of a healthcare professional to utilize a legally marketed test for an unapproved use.''

(Response 272) Section 1006 of the FD&C Act sets forth what conduct falls outside FDA's statutory authority as the ''practice of medicine,'' 21 U.S.C. 396, meaning Congress has already ''differentiate[d]'' in the manner suggested by the comment. For further discussion of the practice of medicine, see sections VI.D.6 and VI.D.7 of this preamble.

(Comment 273) One comment requested guidance ''on the use of specific IVD Cleared reagents and the conditions under which an LDT status is assigned.''

(Response 273) To the extent this comment is requesting clarification on whether the use of 510(k)-cleared reagents to develop a new test system would be considered manufacture of an IVD offered as an LDT, the answer is that it would. A test system is itself a device subject to applicable device requirements, regardless of whether the components of the system comply with FDA requirements.

N. FDA Resources

(Comment 274) Some comments expressed concerns that FDA would not have sufficient resources to conduct timely premarket review of IVDs offered as LDTs to meet the public health needs. Some recommended that FDA modify the phaseout policy to prolong the period of time prior to phasing out the general enforcement discretion approach with respect to premarket review requirements, and/or continue to apply the general enforcement discretion approach with respect to premarket review requirements for certain LDTs, to reduce the FDA resource needs.

(Response 274) FDA has considered Agency resources in developing the final phaseout policy (see section II.G of the FRIA (Ref. 10)). FDA disagrees that the Agency will lack sufficient resources to conduct premarket review of IVDs offered as LDTs in a timely manner.

First, FDA does not intend to phase out the general enforcement discretion approach with respect to premarket review requirements for high-risk IVDs offered as LDTs until 3½ years after publication of this final rule (stage 4 of the phaseout policy), and for moderate- and low-risk IVDs offered as LDTs (that require premarket submissions), until 4 years after publication of this final rule (stage 5 of the phaseout policy). This timeline aligns with the next reauthorization of MDUFA. This alignment will provide an opportunity for FDA and industry to negotiate regarding user fees and performance goals with the knowledge that laboratory manufacturers will be expected to comply with applicable premarket review requirements. Additional discussion regarding FDA's implementation of the phaseout policy is provided in response to comment 291. As discussed further in that response and in section V.C, for IVDs offered as LDTs for which a complete PMA, HDE application, 510(k) submission, BLA, or De Novo request has been received by the beginning of stage 4 or stage 5 of the phaseout policy (as applicable), FDA generally does not intend to enforce premarket review requirements until FDA completes its review of the application/submission. Thus, the timeliness of review of these submissions generally should not impact patient access.

Second, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs approved by NYS CLEP, and to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. These aspects of the phaseout policy are

discussed further in section V.B of this preamble, and collectively will significantly reduce the number of premarket submissions for IVDs offered as LDTs, as compared to the estimates in the PRIA. In particular, the total estimated number of affected tests has been reduced from 88,176 (see Ref. 60) to 7,606 (Ref. 10).

Third, FDA will gain more visibility into the universe of IVDs offered as LDTs through registration and listing in stage 2, which should help the Agency facilitate the efficient allocation of premarket review resources for those IVDs. As explained in the NPRM and discussed in the FRIA, FDA's device authorities require premarket review only for certain IVDs (88 FR 68006 at 68013). FDA estimates that approximately 50 percent of IVDs offered as LDTs will not require premarket review (see section II.F.2 of the FRIA (Ref. 10)). However, there are uncertainties surrounding the estimate of total numbers of IVDs offered as LDTs on the market because FDA generally has not enforced the registration and listing requirements for LDTs under section 510 of the FD&C Act and parts 607 and 807 (excluding subpart E). By 2 years after publication of this final rule, during stage 2 of the phaseout policy, FDA will obtain registration and listing information from laboratory manufacturers offering IVDs as LDTs. This information will help FDA assess and plan for the resources needed for premarket review of those IVDs before stages 4 and 5 of the phaseout policy. In addition, on January 31, 2024, FDA announced its intent to initiate the reclassification process for most IVDs that are currently class III into class II (Ref. 66). The majority of these tests are infectious disease and CDx IVDs. FDA aims to complete this reclassification process before stage 4 of the phaseout policy. Reclassification would allow manufacturers of certain types of tests to seek marketing clearance through the less burdensome 510(k) pathway rather than the PMA pathway, the most stringent type of FDA medical device review. FDA also intends to continue taking a risk-based approach in the initial classification of individual IVDs to determine the appropriate level of regulatory controls and whether a new test may be classified into class II through De Novo classification (and special controls established), rather than being class III and subject to the PMA pathway. Based on our experience, we believe that special controls could be developed, along with general controls, that could provide a reasonable assurance of safety and effectiveness for most future CDx and infectious disease IVDs. We therefore anticipate the percent of IVDs, including LDTs, eligible for 510(k) review to increase.

Fourth, other aspects of FDA's phaseout policy and related FDA actions will help to reduce premarket review resource needs. For example, FDA is currently working to enhance its Third Party review program to handle the review of low- and moderate-risk devices by 3P510k Review Organizations. This will free up Agency staff time to review more complex, innovative, high-risk devices. FDA estimates that half of the IVDs offered as LDTs subject to 510(k) requirements will be reviewed under the Third Party review program.

Fifth, FDA anticipates that laboratories may utilize PCCPs, and as discussed in response to comment 261, for certain common changes (like extension of reagent stability and certain alternative specimen types), FDA intends to develop appropriately targeted enforcement discretion policies, following good guidance practices. See additional discussion regarding test modifications in our responses to comments in section VI.M. FDA believes that PCCPs and targeted enforcement discretion policies will minimize the number of premarket submissions for modifications to IVDs offered as LDTs.

(Comment 275) Some comments questioned whether FDA would have adequate capacity to provide timely review of LDT applications/submissions because many EUA requests were not reviewed due to resource limitations during the COVID–19 pandemic. At least one comment cited FDA's review of a particular EUA request for an LDT during the COVID–19 pandemic, in which FDA's review of the request did not conclude until after the subject LDT had been removed from the market, as proof that FDA does not have adequate resources to conduct premarket review of LDTs.

(Response 275) FDA disagrees that its review of any one particular EUA request submitted for an LDT during the COVID–19 pandemic is indicative of how FDA will review premarket applications/submissions for IVDs offered as LDTs generally. FDA also disagrees that decision timelines on EUA requests, in general, are a good indicator to predict FDA's timelines for review of premarket applications/submissions for IVDs offered as LDTs.

First, EUAs differ substantially from standard premarket review pathways. FDA's authority to issue EUAs for LDTs is under a different statutory provision (section 564 of the FD&C Act) than traditional premarket reviews. Moreover, FDA is not required to review individual EUA requests submitted to FDA or review them on a specific timeline, or to authorize the emergency use of a medical product even if it meets the relevant criteria for an EUA, giving FDA flexibility to determine how to prioritize its efforts in emergencies to protect and promote public health. Second, during the COVID–19 pandemic, FDA received a large influx of submissions that had not been anticipated. In the context of the phaseout policy, FDA has estimated the number and type of premarket submissions we can expect in stages 4 and 5, and annually thereafter, and can prepare for those submissions.

Third, as noted in an FDA memorandum to file that was part of the record for this rulemaking (Ref. 18), FDA identified many issues with EUA requests from laboratories. When data are not presented clearly or data are inadequate to support authorization, FDA works with the submitter to address these issues and, in most cases, achieve authorization. This process extends review times. FDA anticipates that phasing out the general enforcement discretion approach for LDTs, combined with additional education or guidance, will ultimately lead to better submissions from laboratory manufacturers once they become familiar with FDA's expectations.

(Comment 276) Some comments referenced FDA's MDUFA IV performance report from FY2020 to 2022 (during the COVID–19 pandemic) and predicted that the increased volume of submissions from laboratory manufacturers that would result from the phaseout policy would affect FDA's overall ability to review premarket submission for all IVDs, meet its MDUFA performance goals, and conduct other essential work, including policy and post-market activities.

(Response 276) MDUFA performance goals include shared outcome goals agreed to by both FDA and representatives of the industry. FDA and applicants share the responsibility for achieving the Total Time to Decision objectives. Since premarket review of IVDs offered as LDTs is based on significant interaction between the Agency and applicants, high quality submissions will generally help reduce FDA's review time. FDA anticipates providing more targeted guidance on various topics, such as validation, and making additional resources available on the topic of premarket review of IVDs offered as LDTs over the course of the phaseout period. Further, as noted in

response to comment 274, the phaseout of enforcement discretion for premarket review requirements aligns with the next reauthorization of MDUFA, providing an opportunity for FDA and industry to negotiate regarding user fees and performance goals with the knowledge that laboratory manufacturers will be expected to comply with applicable premarket review requirements.

(Comment 277) Another comment referenced FDA's ''prolonged review'' of a particular consensus standard and suggested that ''such an extended review period raises concerns about the FDA's capacity to regulate and approve essential LDTs in a timely manner.''

(Response 277) FDA disagrees that our standards recognition process has any bearing on our ability to conduct timely premarket reviews, including reviews of LDTs. The premarket review process and the standards recognition process are independent and have different timelines and prioritization. Further, FDA's participation in standards writing committees does not automatically signal that FDA intends to recognize the standard. As these are consensus standards with many participants, FDA may or may not agree with the final published content and has a formal process for considering recognition.

(Comment 278) Some comments expressed concerns that a substantial increase in FDA staff and review capacity will be required to implement the phaseout policy, and workforce shortages will make it difficult to recruit and retain adequate numbers of qualified reviewers who are trained in laboratory diagnostics. Some comments stated that FDA lacks the personnel with relevant knowledge and expertise in laboratory medicine to effectively oversee molecular genetic IVDs offered as LDTs. One comment concluded that FDA had not kept up with the state-of-the-art methods for evaluating whole genome sequences, based on the fact that FDA declined to accept the Average Nucleotide Identity (ANI) results offered to correct the FDA–ARGOS database because the ANI results had not yet been standardized through the National Center for Biotechnology Information (NCBI).

(Response 278) FDA disagrees that the Agency lacks the knowledge and expertise to oversee IVDs offered as LDTs in the field of molecular genetics or in other fields. FDA has regulated IVDs under the comprehensive device authorities of the FD&C Act for almost 50 years, and it has the expertise and experience to regulate these tests, as discussed in response to comments 10 and 92. Specifically, OHT7 is staffed with scientific and medical experts who specialize in IVDs. OHT7 is responsible for overseeing total product lifecycle activities for IVDs. As noted previously, FDA also plans to utilize resources outside the Agency to support the implementation of the phaseout policy via the Third Party review program, and intends to exercise enforcement discretion and generally not enforce certain requirements for currently marketed IVDs offered as LDTs that were first marketed prior to the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3; LDTs approved by NYS CLEP; LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system; and LDTs manufactured and performed within VHA and DoD. Additional discussion can be found in response to comments in sections VI.F.5, VI.O, and VI.P of this preamble.

FDA also disagrees that its decision to follow the established quality control procedures for inclusion of genome sequences in the FDA–ARGOS database suggests that FDA's regulatory science in this area is outdated. Rather, the ongoing FDA–ARGOS project demonstrates FDA's investment in tools to support innovation of emerging technologies and commitment to regulatory science. The public FDA dAtabase for Reference Grade MicrObial Sequences (FDA–ARGOS) was established in 2014 and is a collaboration between FDA and DoD, the Institute for Genome Sciences at the University of Maryland, and NCBI (Ref. 237). FDA–ARGOS contains quality controlled and curated genomic sequence data to support research and regulatory decisions (Ref. 238). This is an evolving database that can be used as a tool for in-silico (computer simulation) performance validation and potentially reduce the testing burden on manufacturers of infectious disease NGS devices. There are ongoing projects focused on expanding the FDA–ARGOS database (Ref. 239). To maintain quality control of FDA–ARGOS as a reliable genome reference database, established quality metrics must be met and any updates to the quality control process are appropriately considered and vetted.

(Comment 279) Some comments expressed concerns related to whether FDA has sufficient resources to enforce compliance with requirements during stages 1 through 3 of the phaseout policy, which will occur before the next MDUFA reauthorization. Some of these comments stated that FDA would require additional resources before the next MDUFA reauthorization to support a significant increase in Pre-Submissions from laboratory manufacturers in anticipation of the phaseout of premarket review requirements for new and modified IVDs offered as LDTs. The comments suggested that FDA would need to hire more staff to review Pre-Submissions seeking FDA's input on the potential risk classification of many IVDs offered as LDTs for which there are no predicate devices. According to the comments, this increase in Pre-Submissions would not be addressed by issuing guidance documents, unless FDA issued those guidance documents expeditiously.

(Response 279) FDA believes that there will be adequate resources available from user fees (as permissible) and budget authority in stages 1 through 3 of the phaseout policy to provide advice, guidance, and education on premarket review and other regulatory requirements applicable to IVDs offered as LDTs. Also, during stages 1 through 3, FDA is phasing out the general enforcement discretion approach with respect to various requirements (*e.g.,* MDR requirements, correction and removal reporting requirements, and QS requirements under § 820.198 (complaint files) in stage 1; registration and listing, labeling, and investigational use requirements in stage 2; and QS requirements in stage 3 (other than requirements under § 820.198 (complaint files), which are already addressed in stage 1)) and we believe information FDA receives as a result of compliance with those requirements will help FDA's allocation of anticipated available resources. FDA's estimate of the resources associated with stages 1 through 3 can be found in section II.G of the FRIA (Ref. 10).

FDA's projections do not presume a disproportionate increase in Pre-Submissions for IVDs offered as LDTs during stages 1 through 3 of the phaseout period in light of the enforcement discretion policies relating to premarket review described in section V.B, including for currently marketed IVDs offered as LDTs; LDTs approved by NYS CLEP; and LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system.

For all of the foregoing reasons, FDA believes that the resources authorized under MDUFA V, combined with budget authority, are sufficient to fund the activities necessary for the review of voluntary Pre-Submissions received

during stages 1 through 3 of the phaseout policy.

(Comment 280) Some comments predicted that FDA's phaseout of the general enforcement discretion approach for LDTs will face challenges similar to those experienced in Europe in connection with the implementation of the In Vitro Diagnostic Medical Device Regulation, 2017/746 (IVDR). The IVDR was reported to cause significant delays in drug clinical trials by creating a bottleneck with respect to IVD approvals, as well as the discontinuation of certain rare disease diagnostics.

(Response 280) FDA disagrees that the phaseout policy will likely result in significant delays in clinical trials or disruption in patient access to LDTs for unmet needs, including tests for rare diseases, akin to what the comment claims has been observed during the implementation of the IVDR in Europe.

First, FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for currently marketed IVDs offered as LDTs, and thus does not anticipate disruption of patient access to such tests, including those for certain rare diseases, due to the phaseout policy. Going forward, FDA also intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. FDA anticipates this policy will support continued innovation of new tests for rare diseases. For additional discussion regarding IVDs for unmet needs and IVDs for rare diseases, see our responses to comments in section VI.L.5.

With respect to use of IVDs offered as LDTs in clinical investigations of drugs, FDA does not anticipate that compliance with IDE requirements will meaningfully delay drug or IVD development activities, as described in response to comment 175. To the extent the comments are concerned about a potential review bottleneck due to resources, FDA disagrees that this will be the case for implementation of this rule, as described in response to comment 274.

O. 510(k) Third Party Review Program

(Comment 281) FDA received several comments supporting the use of FDA's Third Party review program to review 510(k) submissions for IVDs offered as LDTs. These comments stated that Third Party review will help to avoid strains on FDA's review capacity, streamline the timeline for review, limit redundancy with CLIA accreditation, and/or avoid detracting from other components of FDA's mission.

(Response 281) FDA agrees that use of the Third Party review program to review IVDs offered as LDTs could provide significant benefits to both industry and FDA, including by potentially reducing demand on FDA resources and facilitating timely review of 510(k) submissions. Under the MDUFA V commitment letter, FDA is currently working to enhance the Third Party review program, and the Agency anticipates interest in the Third Party review program among laboratories that manufacture IVDs offered as LDTs. As discussed in section II.G of the FRIA, FDA estimates that half of the IVDs offered as LDTs being submitted for 510(k) review will be reviewed under the Third Party review program. FDA also recognizes that if CLIA accreditation organizations seek accreditation under FDA's Third Party review program, there may be certain efficiencies or other advantages because the two programs are complementary, as described in response to comment 7.

(Comment 282) Some comments questioned the likelihood that a significant percentage of laboratories that manufacture IVDs offered as LDTs that require a 510(k) submission will use FDA's Third Party review program, based on historical utilization of the program. Comments suggested that the Third Party review program currently includes only a small number of Third Party reviewers, who review only a small subset of types of IVDs that require a 510(k) submission, and that laboratories may choose not to utilize the Third Party review program given that use of the program is voluntary.

(Response 282) Under the MDUFA V agreement, FDA committed to undertake several activities intended to enhance the Third Party review program with the objective of eliminating FDA's routine re-review of Third Party reviews. These activities include providing training to Third Parties seeking accreditation, auditing 3P510k Review Organizations, providing tailored retraining to 3P510k Review Organizations (based on the results of audits), and other activities (Ref. 240).

In addition, FDA has heard from entities interested in potentially serving as 3P510k Review Organizations for 510(k)s submitted for IVDs. Some of these entities are CLIA accreditation organizations with whom laboratories may already be familiar. We anticipate that when a laboratory already has a relationship with an organization, the laboratory may be inclined to work with that organization through the Third Party review program.

FDA anticipates that improving the Third Party review program, including through continued efforts to eliminate routine re-review of 510(k)s that have already been reviewed by a 3P510k Review Organization, as well as potential accreditation of organizations with whom laboratories may already be familiar, will increase use of the Third Party review program (as noted in response to comment 281 and discussed in section II.G of the FRIA, FDA estimates that half of the IVDs offered as LDTs being submitted for 510(k) review will be reviewed under the Third Party review program). FDA intends to continue efforts to enhance and facilitate greater use of the Third Party review program during implementation of the phaseout policy, including in advance of stage 5 of the phaseout policy.

FDA nonetheless acknowledges that participation in the Third Party review program is voluntary. Although FDA anticipates increased participation in the Third Party review program, as discussed in FDA's response to comment 284, FDA also anticipates that it will have sufficient resources to review 510(k) submissions for IVDs offered as LDTs even if participation in the Third Party review program is lower than estimated.

We also note that, as stated in FDA's final guidance document regarding the Third Party review program, ''[m]ost in vitro diagnostic (IVD) devices are eligible for [Third Party] review,'' provided they meet certain factors described in the final guidance (Ref. 56). About 75 percent of product codes for IVDs that are subject to 510(k) requirements (*i.e.,* ~750 out of 1,000 product codes) are currently eligible for submission to a 3P510k Review Organization, and FDA anticipates that this list may continue to grow as more IVDs are classified into class II (*i.e.,* through reclassification or De Novo classification) and as FDA gains experience with newer types of class II devices that are subject to 510(k) requirements.

(Comment 283) One comment noted that many devices do not qualify for Third Party review. Another comment noted that the Third Party review program does not extend to PMAs or De Novo submissions. These comments asserted that based in part on these factors, the Third Party review program does not sufficiently address concerns regarding the potential high volume of premarket submissions that may be submitted by laboratories as a result of the phaseout policy.

(Response 283) FDA agrees that PMA and De Novo submissions are not eligible for Third Party review under the Third Party review program as currently authorized under section 523 of the FD&C Act (21 U.S.C. 360m). In the FRIA, FDA has estimated the potential impact of the Third Party review program on costs and transfers associated with 510(k) submissions, but has not anticipated any impact from the program on costs or transfers associated with PMA or De Novo submissions (see sections II.G and II.H of the FRIA (Ref. 10)). FDA also recognizes that some devices that require a 510(k) submission are not eligible for Third Party review (see 21 U.S.C. 360m(a)(3)). However, as discussed in response to comment 282, about 75 percent of product codes for IVDs that are subject to 510(k) requirements (*i.e.,* ~ 750 out of 1,000 product codes) are currently eligible for submission to a 3P510k Review Organization, and FDA anticipates that this list may continue to grow as more IVDs are classified into class II (*i.e.,* through reclassification or De Novo classification) and as FDA gains experience with newer types of class II devices that are subject to 510(k) requirements. In addition, as discussed in response to comment 274, the Agency anticipates that certain enforcement discretion policies with respect to premarket review requirements, among other requirements, described in section V.B will also help to address concerns regarding the potential high volume of premarket submissions that may be submitted by laboratories as a result of the phaseout policy.

Further, as previously announced, FDA intends to initiate the reclassification process for most IVDs that have been previously classified in class III to class II (Ref. 66). FDA aims to complete this reclassification process before stage 4 of the phaseout policy. In addition, FDA intends to continue taking a risk-based approach in the initial classification of IVDs to determine the appropriate level of regulatory controls and whether a new test may be classified into class II through De Novo classification (and special controls established), rather than being class III and subject to the PMA pathway. Based on our experience, we believe that special controls could be developed that, along with general controls, could provide a reasonable assurance of safety and effectiveness for most future CDx and infectious disease IVDs, such that they could be regulated as class II devices. We therefore anticipate the percent of IVDs, including IVDs offered as LDTs, reviewed in a 510(k) submission to increase, and that the number of IVDs eligible for review by a 3P510k Review Organization may also increase. As shown in Table A.5 of the FRIA, the estimated numbers of PMAs and PMA supplements are lower after potential reclassification, while the estimated numbers of 510(k) submissions and De Novo requests are higher after potential reclassification.

(Comment 284) FDA received comments stating that a high rate of re-review of 510(k)s that have already been reviewed by a 3P510k Review Organization may extend premarket review times, and one comment stated that Third Party review should not be a substantial part of FDA's plans for managing the anticipated workload associated with premarket submissions for IVDs offered as LDTs until FDA has eliminated routine re-review of 510(k)s that have already been reviewed by a 3P510k Review Organization. One comment stated that if FDA intends to utilize the Third Party review program as a critical part of FDA's plans to manage the Agency's anticipated workload, FDA should not phase out the general enforcement discretion approach with respect to premarket submissions until FDA has demonstrated in a pilot program that 3P510k Review Organizations can apply FDA's requirements in a least burdensome manner. In addition, one comment suggested that FDA conduct a study to better understand the historical lack of utilization of the Third Party review program before making the program a core part of FDA's plans for managing the Agency's anticipated workload associated with premarket submissions for IVDs offered as LDTs.

(Response 284) FDA disagrees with the comments indicating that it is premature for the Agency to incorporate use of the Third Party review program into its plans for managing review of 510(k)s for IVDs offered as LDTs. FDA also disagrees that it should delay the phase out of enforcement discretion with respect to premarket review requirements prior to conducting a pilot to demonstrate application of least burdensome principles in the Third Party review program. As discussed in response to comment 282, under the MDUFA V agreement, FDA committed to undertake several activities intended to enhance the Third Party review program with the objective of eliminating FDA's routine re-review of Third Party reviews. These activities include providing training to Third Parties seeking accreditation, auditing 3P510k Review Organizations, and providing tailored re-training to 3P510k Review Organizations. FDA anticipates that these activities will advance FDA's efforts to eliminate routine re-review of 510(k)s that have already been reviewed by a 3P510k Review Organization and does not expect that there will be a ''high rate of re-review'' of 510(k)s submitted for IVDs offered as LDTs as some comments suggest. We also expect that these activities will facilitate 3P510k Review Organizations' consistent application of FDA's requirements for 510(k) review in a least burdensome manner. Further, we note that FDA provides training materials on its ''least burdensome'' approach to medical device regulation as part of its training curriculum for 3P510k Review Organizations (Ref. 241).

As discussed in response to comment 282, FDA anticipates that improving the Third Party review program will increase the program's use and estimates that approximately half of IVDs offered as LDTs being submitted for 510(k) review will be reviewed under the Third Party review program (see section II.G of the FRIA (Ref. 10)). However, even if the majority of submitters do not choose to use the Third Party review program, FDA anticipates that the Agency will be able to effectively manage review of 510(k) submissions for IVDs offered as LDTs. As described in section V.B.3, FDA intends to exercise enforcement discretion and generally not enforce premarket review and QS requirements (except for requirements under part 820, subpart M (Records)) for currently marketed IVDs offered as LDTs. FDA also intends to exercise enforcement discretion and generally not enforce premarket review requirements for LDTs that are approved by NYS CLEP, and to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. Collectively, these policies significantly reduce the estimated number of premarket submissions for IVDs offered as LDTs, as compared to the preliminary estimates in the PRIA (see sections II.F and II.G of the FRIA (Ref. 10)). In addition, as noted in our response to comment 274, FDA does not intend to phase out enforcement discretion with respect to premarket review requirements for moderate- and low-risk IVDs offered as LDTs that require 510(k) submissions until after the next reauthorization of MDUFA. This will

provide an opportunity for FDA and industry to negotiate regarding user fees taking into consideration FDA's anticipated resource needs to review 510(k) and other submissions for IVDs offered as LDTs.

(Comment 285) Some comments stated that the Third Party review program should utilize 3P510k Review Organizations that are accustomed to CLIA, or that FDA should encourage laboratory accreditation bodies to become 3P510k Review Organizations, to facilitate integration of the two programs, ensure the involvement of expert reviewers, and be less burdensome for laboratories.

(Response 285) As discussed in section V.C, FDA recognizes that a laboratory may be particularly inclined to use the Third Party review program when the laboratory is already familiar with a 3P510K Review Organization. FDA is aware of certain CLIA accreditation organizations that may be interested in becoming 3P510k Review Organizations, and the Agency encourages such organizations to continue exploring potential participation in the Third Party review program. To the extent the comments advocating for ''integration'' of CLIA accreditation and FDA's Third Party review programs were suggesting that CLIA accreditation and review of a 510(k) overlap, we note that, while there may be certain efficiencies or other advantages associated with CLIA accreditation organizations also serving as 3P510k Review Organizations, these are separate programs with complementary but distinct purposes (see, *e.g.,* response to comment 7).

(Comment 286) Several comments raised concerns about potential conflicts of interest among 3P510k Review Organizations, given that 3P510k Review Organizations are paid by the laboratories whose submissions they review. One comment asserted that the potential conflicts of interest among 3P510k Review Organizations may be particularly significant when the 3P510k Review Organization is also a CLIA accrediting organization.

(Response 286) FDA recognizes that avoiding conflicts of interest among 3P510k Review Organizations is critical to the success of the Third Party review program. With respect to the fact that laboratories would pay 3P510k Review Organizations to review 510(k)s for their IVDs offered as LDTs, we note that section 523(b)(5) of the FD&C Act (21 U.S.C. 360m(b)(5)) specifically provides that compensation for 3P510k Review Organizations to review a 510(k) ''shall be paid by the person who engages such services.'' However, the FD&C Act also contains provisions related to conflicts of interest for 3P510k Review Organizations, including provisions concerning the minimum qualifications for 3P510k Review Organizations and certain recordkeeping requirements (see sections 523 and 704(f) of the FD&C Act). In addition, FDA's final guidance document entitled ''510(k) Third Party Review Program'' addresses safeguards against potential conflicts of interest among 3P510k Review Organizations. As explained in FDA's final guidance document, ''FDA expects 3P510k Review Organizations to be impartial and free from any commercial, financial, and other pressures that might present a conflict of interest or an appearance of a conflict of interest. Therefore, FDA will consider whether the potential 3P510k Review Organization has established, documented, and executed policies and procedures to prevent any individual or organizational conflict of interest or the appearance of a conflict of interest, including conflicts of interests pertaining to their external Technical Experts'' (Ref. 56). FDA's final guidance document also explains, among other things, that ''conflict of interest policies for a 3P510k Review Organization should be fully implemented and there should be an attestation that those policies have been implemented that is signed by the most responsible individual at the organization before any 510(k) is accepted for review.'' While FDA appreciates that concerns regarding potential conflicts of interest may be heightened when a 3P510k Review Organization is also a CLIA accreditation organization, the statutory provisions regarding the Third Party review program and FDA's implementation thereof already take potential conflicts of interest into account.

(Comment 287) One comment stated that FDA's discussion in the NPRM regarding use of the Third Party review program was vague. Another comment stated that with respect to Third Party review, FDA should provide ''better clarity and more information as to the participating entities, their capacities, throughput and turnaround time to review submissions by such entities.'' A third comment stated that FDA should ''formally withdraw inconsistent and outdated guidance,'' in particular FDA's draft guidance document regarding in vitro diagnostic multivariate index assays (IVDMIAs), as such guidance documents will create confusion among 3P510k Review Organizations and others if not withdrawn.

(Response 287) In the NPRM, FDA's discussion of the Third Party review program: (1) provided a general description of the program; (2) stated that FDA anticipated interest in the Third Party review program among test manufacturers and new 3P510k Review Organizations; and (3) explained the basis for anticipating that interest (see 88 FR 68006 at 68027). FDA does not agree that these statements were vague. However, to the extent stakeholders seek additional information regarding the Third Party review program, stakeholders may consult FDA's ''510(k) Third Party Review Program'' final guidance document (Ref. 56), which was cited as a reference in the NPRM (see 88 FR 68006 at 68027), as well as information available on FDA's website regarding the Third Party review program (Ref. 67). This includes information regarding current 3P510k Review Organizations and the devices they may review (Ref. 242). FDA publishes quarterly reports on the performance of 3P510k Review Organizations (Ref. 243). These reports include, among other things, data on the total number of submissions, review times, and decisions. FDA notes that 3P510k Review Organizations are best situated to address specific questions from potential submitters regarding their capacity and turnaround time for review of 510(k) submissions.

FDA agrees that inconsistent or outdated guidance documents may cause confusion among stakeholders. The Agency strives to maintain consistency across its final guidance documents and to update those documents when appropriate, consistent with good guidance practices (§ 10.115). We note that the specific guidance mentioned in the comment is a draft guidance. Draft guidance documents are not for implementation and explicitly state (on their title pages) that they are distributed for comment purposes only. Thus, the draft guidance mentioned in the comment should not cause confusion among stakeholders. With respect to final guidance documents, the Agency undertakes retrospective review of previously issued final guidance documents (21 CFR 10.115(k)) and is interested in receiving external feedback about final guidance documents that should be revised or withdrawn (see § 10.115(f)(4)). Stakeholders can submit comments on any guidance document at any time (§ 10.115(g)(5)).

(Comment 288) One comment stated that the ISO 15189 standard should be considered a viable alternative for quality management system requirements for laboratories that manufacture IVDs, and suggested that for specific provisions of the ISO 13485

standard that may not be covered in ISO 15189, FDA should include the provisions as a requirement (or through guidance) as part of the Third Party review program.

(Response 288) FDA does not agree that ISO 15189 is a viable alternative for quality management system requirements for laboratories that manufacture IVDs offered as LDTs, or that the Third Party review program is an appropriate mechanism to address any differences between the ISO 13485 [94] and ISO 15189 standards. For additional discussion of the ISO 15189 standard, see our response to comment 183. Further, the Third Party review program addresses 510(k) premarket review by accredited persons (see section 523 of the FD&C Act). It is not a mechanism to add or change the requirements that apply to a device manufacturer's quality system.

(Comment 289) FDA received a comment stating that FDA ''should leverage device performance reviews or external quality assessments of LDTs conducted by certified and creditable third parties'' as an alternative to premarket review by FDA for LDTs offered by AMCs.

(Response 289) The comment did not provide additional detail on what would constitute a ''certified and creditable'' third party that could provide such assessments. However, we note that FDA intends to continue supporting the use of its Third Party review program authorized under section 523 of the FD&C Act, as described in our responses to comments 281 through 288. The statute authorizes FDA to recognize Third Parties to review 510(k) submissions for certain types of devices and imposes various requirements on those organizations. We also note that FDA discusses comments received related to LDTs manufactured and performed by AMCs, including an enforcement discretion policy that may apply to certain LDTs manufactured and performed by AMC laboratories, in section VI.F.4 (see also section V.B.3).

P. Implementation

(Comment 290) FDA received comments suggesting that the Agency provide additional information regarding how FDA will be implementing the final phaseout policy. One comment recommended that the phaseout policy include timelines and ''criteria'' for transitioning from the general enforcement discretion approach for LDTs.

(Response 290) FDA agrees with the comment suggesting that FDA include timelines for transitioning from the general enforcement discretion approach for LDTs, and notes that section V.C of this preamble addresses this issue. As set forth more fully in that section:

- *Stage 1:* beginning 1 year after the publication date of this final rule, FDA will expect compliance with MDR requirements, correction and removal reporting requirements, and QS requirements under § 820.198 (complaint files) for IVDs offered as LDTs;
- *Stage 2:* beginning 2 years after the publication date of this final rule, FDA will expect compliance with requirements not covered during other stages of the phaseout policy, including registration and listing requirements, labeling requirements, and investigational use requirements, for IVDs offered as LDTs;
- *Stage 3:* beginning 3 years after the publication date of this final rule, FDA will expect compliance with QS requirements (other than requirements under § 820.198 (complaint files), which are already addressed in stage 1) for IVDs offered as LDTs;
- *Stage 4:* beginning 3½ years after the publication date of this final rule, FDA will expect compliance with premarket review requirements for high-risk IVDs offered as LDTs, unless a premarket submission has been received by the beginning of this stage in which case FDA intends to continue to exercise enforcement discretion for the pendency of its review; and
- *Stage 5:* beginning 4 years after the publication date of this final rule, FDA will expect compliance with premarket review requirements for moderate-risk and low-risk IVDs offered as LDTs (that require premarket submissions), unless a premarket submission has been received by the beginning of this stage in which case FDA intends to continue to exercise enforcement discretion for the pendency of its review.

(Comment 291) Comments requested that FDA publish clear guidance document(s), including regarding: practical instructions, examples, and case studies; definitions of and other information regarding LDT risk categories; guidance on how laboratories can tailor their validation processes based on the complexity and potential impact of their LDTs; scenarios addressing how the phaseout policy affects specialized LDTs, such as those for rare diseases; and other topics. Comments requested that stakeholders be offered the opportunity to participate in guidance document development. FDA also received questions regarding the content and format for premarket submissions.

(Response 291) FDA agrees with comments that recommended that FDA provide additional resources on specific topics that may be useful as laboratories come into compliance with applicable requirements. FDA anticipates issuing a small entity compliance guide and/or making additional resources available on topics such as applicable labeling requirements over the course of the phaseout period. FDA also anticipates offering robust educational resources, potentially including but not limited to a webinar, a Town Hall meeting, Frequently Asked Questions web pages, and other materials designed to guide laboratories and other stakeholders. FDA also intends to consider issuing additional guidance during the phaseout period as appropriate, and would do so in accordance with good guidance practice regulations, which set forth the processes for participating in the development and issuance of guidance documents (§ 10.115).

In response to the comments seeking information regarding how laboratories can determine the risk categories of their IVDs offered as LDTs, we note that this rule does not change the statutory framework under which FDA regulates medical devices, including the risk-based classification of devices. FDA has previously provided multiple resources intended to help manufacturers determine the classification of their devices, including on FDA's web page entitled ''Classify Your Medical Device'' (Ref. 201), and in FDA's classification database (Ref. 200). In addition, laboratory manufacturers may request feedback from FDA regarding the potential regulatory pathway for a device through a Pre-Submission, described in FDA's final guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65). Laboratory manufacturers may also consider submitting a request for information regarding the class in which a device is classified or the requirements applicable to a device under section 513(g) of the FD&C Act, the process for which is further described in FDA's final guidance document entitled ''FDA and Industry Procedures for Section 513(g) Requests for Information under the Federal Food, Drug, and Cosmetic Act'' (Ref. 244). For further information, you may view the training module available on FDA's website, entitled ''513(g) Requests for Information'' (Ref. 245).

[94] As noted elsewhere in this preamble, FDA recently finalized amendments to part 820, which take effect in February 2026. These amended QS requirements incorporate by reference the 2016 edition of ISO 13485 (see 89 FR 7496).

In response to comments seeking information regarding the content and format for premarket submissions, FDA offers Device Advice on Premarket Submissions: Selecting and Preparing the Correct Submission on FDA's web page (Ref. 246).

As discussed in section V.C, for IVDs offered as LDTs for which a complete PMA, HDE application, 510(k), BLA, or De Novo request has been received by the beginning of stage 4 or stage 5 of the phaseout policy (as applicable), FDA generally does not intend to enforce premarket review requirements until FDA completes its review of the submission.

(Comment 292) A comment stated that hospital and health system laboratories cannot currently assess how each part of the device regulations would apply to their LDTs under the phaseout policy. The comment noted that the uncertainty is problematic and underscores the need for continued enforcement discretion, most particularly in certain areas, such as for low- and moderate-risk tests.

(Response 292) As discussed further in the response to comment 162, FDA believes the information included in the phaseout policy, including the timeline for the various stages in the phaseout policy and information regarding enforcement discretion policies described in this preamble, provides clear expectations for laboratories that offer IVDs as LDTs. FDA appreciates that additional guidance regarding implementation of the phaseout policy may facilitate efforts by laboratories to comply with applicable requirements.

We note that FDA intends to exercise enforcement discretion and generally not enforce premarket review requirements and QS requirements (except for requirements under part 820, subpart M (Records)) for LDTs manufactured and performed by a laboratory integrated within a healthcare system to meet an unmet need of patients receiving care within the same healthcare system. For further discussion of this policy, refer to section V.B.3. As discussed further in the responses to comments in section VI.L.4, FDA is not adopting an enforcement discretion policy in the final phaseout policy for low- and moderate-risk tests.

Notably, and as set forth more fully in response to comment 291, FDA is not changing the statutory framework under which FDA regulates medical devices. In this rule, FDA has made explicit that IVDs are devices under the FD&C Act including when the manufacturer of the IVD is a laboratory. IVDs, as defined in § 809.3, are devices intended for human use and are subject to the FD&C Act. They include class I, class II, and class III devices, as well as both preamendments and postamendments devices. Like other devices, IVDs are subject to general controls, including premarket notification, reporting requirements regarding adverse events and corrections and removals, IDE requirements (though some investigations of IVDs are exempt from most provisions of the IDE regulation), and other applicable requirements under the FD&C Act and FDA's regulations. IVDs are also subject to specific labeling requirements in part 809. FDA has made numerous resources available to assist device manufacturers, including laboratories, in understanding device requirements.

(Comment 293) A comment stated that the phaseout policy does not provide enough guidance for laboratories to determine what data laboratories must submit for premarket review of existing or new LDTs.

(Response 293) Where premarket review is expected, the particular data required may vary based on the type of test at issue. There are multiple resources available to help IVD manufacturers, including laboratories, understand the type of data and information that is included in support of premarket submissions for IVDs. For example, FDA posts on its website the decision summaries for each IVD authorized (see Refs. 66, 166, 224, 247, and 248). These decision summaries describe the data and information that was provided to support the authorization and can be used as a model for manufacturers of the same types of tests. FDA also has issued general and device specific final guidance documents that describe recommendations for the data and information to be submitted in premarket submissions (see, *e.g.,* Refs. 234, 165, 190, and 249 to 253)), and has partially or fully recognized 110 CLSI consensus standards for In Vitro Diagnostics (Ref. 254). Many of these FDA recognized consensus standards describe recommendations for validation study designs. Manufacturers may also submit a Pre-Submission for specific feedback on individual tests (Ref. 65).

We note that FDA intends to exercise enforcement discretion and generally not enforce premarket review and most QS requirements for currently marketed IVDs offered as LDTs that were first marketed as of the date of issuance of this rule and that are not modified, or that are modified as described in section V.B.3. Thus, FDA generally does not expect laboratories to submit data for existing LDTs in a premarket review submission. FDA has also included several other enforcement discretion policies with respect to premarket review for certain LDTs as described in section V.B.

Further, we note that as more fully described elsewhere in this preamble, under FDA's device authorities, FDA premarket review is required only for certain IVDs (generally those classified into class II or class III), and FDA estimates that approximately 50 percent of IVDs offered as LDTs would not require premarket review.

In addition, when tests are modified, premarket review is required only in certain circumstances, as discussed elsewhere in this preamble (see response to comments 215 and 261).

(Comment 294) A number of comments suggested that FDA should assess the LDT marketplace to determine which LDTs present the ''highest risk,'' and implement the phaseout policy by risk category.

(Response 294) As described in section V.C, FDA's phaseout policy prioritizes the review of applications for high-risk IVDs offered as LDTs (stage 4) over those for moderate- and low-risk IVDs offered as LDTs that require premarket review (stage 5). For the reasons set forth in our response to comment 155, we do not believe the other stages of the phaseout should be ordered or dictated by the level of risk of an IVD offered as an LDT.

(Comment 295) FDA received a comment inquiring whether facilities that manufacture LDTs will be inspected in the same manner as other devices.

(Response 295) All domestic and foreign device establishments, including those that manufacture IVDs offered as LDTs, are subject to inspection. Section 704(a) of the FD&C Act provides FDA authority for inspections, specifically providing authority for duly designated officers or employees of FDA to enter, at reasonable times, and inspect, at reasonable times and within reasonable limits and in a reasonable manner, facilities subject to regulation under the FD&C Act.

FDA uses a risk-based evaluation to select device manufacturing facilities for inspection. *See* section 510(h)(2) of the FD&C Act (stating that the Secretary ''shall inspect establishments . . . that are engaged in the manufacture, propagation, compounding, or processing of a device or devices . . . in accordance with a risk-based schedule established by the Secretary.''). The Agency prioritizes device surveillance inspections deemed high-risk based on a variety of specific criteria, such as: (1)

facility type, such as manufacturer, control laboratory; (2) the facility's compliance history, including whether it has been inspected in the last 4 years; (3) hazard signals, including the record of signals, history and nature of product recalls linked to the facility; and (4) inherent risks of the device manufactured at a facility (Ref. 255). FDA does not intend to have a different approach for selecting laboratory manufacturing facilities for inspection.

(Comment 296) We received several comments that FDA should include industry experts and solicit outside expertise at various points during the implementation of the phaseout policy and in the regulation of IVDs offered as LDTs going forward. Comments suggested FDA solicit input on test classifications on an ongoing basis, convene expert panels to recommend risk categories and advise on specific types of technology and tests, and allow experts to participate in reviewing and approving premarket submissions in the areas of their expertise, and to ''have a seat at the table during the implementation of the FDA regulations, as well as long-term monitoring/approval'' of IVDs offered as LDTs.

(Response 296) To the extent the comments recommended that FDA seek input from stakeholders and outside experts, we agree that such input is important, and in fact required, in certain circumstances. For device classification, FDA follows the procedures required under section 513 of the FD&C Act and outlined in part 860. When classifying a preamendments device for the first time, for example, FDA provides a public process as required under section 513(d) of the FD&C Act. This process involves a public meeting of the appropriate advisory committee panel and notice and comment rulemaking.

More generally, FDA uses panels of the Medical Devices Advisory Committee (MDAC) to provide advice and recommendations to FDA on various regulatory issues. This may include advice on particular submissions, general issues, and device type classifications, among other things. The MDAC consists of 18 panels, including the following panels with established rosters reflecting expertise regarding IVDs, including LDTs: Clinical Chemistry and Clinical Toxicology Devices Panel (Ref. 256), Hematology and Pathology Devices Panel (Ref. 257), Immunology Devices Panel (Ref. 258), Microbiology Devices Panel (Ref. 259), and Molecular and Clinical Genetics Panel (Ref. 260). The rosters, calendars, and materials from past meetings are available on FDA's website as noted in the references above. For example, in September 2023, FDA convened the Microbiology Devices Panel to seek preliminary input on potential reclassification of certain types of IVDs for hepatitis B virus, human parvovirus B19, and M. tuberculosis from class III to class II with special controls (Ref. 261). In another recent example, FDA convened the Molecular and Clinical Genetics Panel in November 2023 to discuss and make recommendations on the design of multicancer detection in vitro diagnostic devices (tests) as well as potential study designs and study outcomes of interest that could inform the assessment of the probable benefits and risks of such tests (Ref. 262). The committee's discussion and recommendations from these meetings will help inform future Agency regulatory efforts for these tests.

FDA can also seek external expertise through its Network of Experts program, which is a vetted network of partner organizations and their members, scientists, clinicians, and engineers who can provide FDA rapid access to expertise when it is needed to supplement existing knowledge and expertise within CDRH (Ref. 263). There are multiple organizations within the Network of Experts with expertise relevant to IVDs. As has been FDA's practice, and when appropriate, FDA will continue to engage with experts and stakeholders through conferences, meetings, industry roundtables, town halls, and through collaborative communities in which we participate.

We note that FDA has long solicited and considered input from stakeholders regarding the Agency's oversight of LDTs. In 2010, FDA held a public meeting and requested comments on the ''Oversight of Laboratory Developed Tests'' (75 FR 34463, June 17, 2010). In 2014, FDA issued and requested comments on two draft guidance documents entitled ''Framework for Regulatory Oversight of Laboratory Developed Tests (LDTs)'' (Ref. 38) and ''FDA Notification and Medical Device Reporting for Laboratory Developed Tests (LDTs)'' (Ref. 112), and subsequently held and requested comments on a 2015 Public Meeting regarding the Agency's proposed oversight framework (Ref. 116). In 2017 we issued the 2017 Discussion Paper synthesizing the feedback that had been provided to the Agency (Ref. 57).

Furthermore, our Q-Submission program, in addition to providing IVD manufacturers with an opportunity to provide input to and request feedback from FDA on specific devices or submissions, also includes an opportunity to request an Informational Meeting to share with FDA information, among other purposes, to familiarize the FDA review team with new device(s) with significant differences in technology from currently available devices and provide an overview of ongoing or upcoming device development (see FDA's final guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65)).

We note, however, that industry participation in certain activities referenced in the comments, such as the review and authorization of premarket submissions, would raise issues related to confidentiality and conflicts of interest (*e.g.,* if IVD manufacturers, including those who may be developing similar or competitor products, review or influence the outcome of other IVD manufacturers' premarket submissions). FDA has obligations to maintain confidentiality of certain aspects of premarket submissions and to make decisions about whether to authorize devices without undue influence.

Q. Interplay With Oncology Drug Products Used With Certain In Vitro Diagnostic Tests Pilot Program

(Comment 297) Several comments addressed FDA's ongoing pilot described in the final guidance document entitled ''Oncology Drug Products Used with Certain In Vitro Diagnostic Tests: Pilot Program'' (Ref. 264). Most comments indicated support for the pilot; one did not. Supporters thought the model described in the pilot is valuable and should be considered in other disease areas, including rare diseases. Another comment suggested that the pilot's model should be used for tests used as part of cell and gene therapy product development. One suggested that FDA delay finalizing the rule until the pilot is completed and expanded.

(Response 297) FDA agrees that the concept of establishing performance expectations is valuable for test development generally, including for tests for rare disease. Such goals could be developed by the community and used to support premarket review submissions.

We note that the pilot program was initiated as one step that may be helpful in reducing the risks associated with LDTs used for oncology drug treatment decisions (then under the general enforcement discretion approach for LDTs), while the Agency continued to work on a broader approach for LDTs, including moving forward with this rulemaking. As discussed further in the

response to comment 298, the phasing out of the general enforcement discretion approach for LDTs means that FDA generally will expect compliance with applicable requirements for IVDs offered as LDTs, including those IVDs described in the oncology pilot program.

(Comment 298) Some comments asked for clarification regarding the impact of the phaseout policy on the pilot. One comment suggested pilot participants should be ''exempt'' from the phaseout. One comment asked if an unapproved clinical trial assay could be used upon approval of the therapeutic with a postmarket commitment to obtain approval of a CDx.

(Response 298) FDA disagrees with the suggestion to ''exempt'' unapproved assays used in the pilot from the phaseout policy. The types of LDTs discussed in the pilot program may provide information that is essential for the safe and effective use of a corresponding therapeutic product. As described in the NPRM, we have seen variability in performance among LDTs offered for a use that is the same as a CDx such that, in some cases, selection of a treatment for a given patient can be impacted by which test is used (see 88 FR 68006 at 680209–10). For example, the same patient may receive a particular therapeutic if they are tested with one LDT and not receive the therapeutic if they are tested with another LDT due to differences in test performance. For these reasons, the phaseout of the general enforcement discretion approach generally applies to LDTs offered for a use that is the same as a CDx, including the types of LDTs discussed in the pilot program.

(Comment 299) One comment asserted that the pilot program will amplify risks to patients by encouraging the use of tests that are not clinically validated.

(Response 299) The pilot program was initiated as one step that may be helpful in reducing the risks associated with using LDTs for oncology drug treatment decisions while the Agency continued to work on a broader approach for LDTs, including moving forward with this rulemaking. For the reasons in this preamble, FDA is phasing out the general enforcement discretion approach for LDTs, including the types of LDTs discussed in the pilot program final guidance.

(Comment 300) One comment suggested that FDA's general approach to CDx approvals is a barrier to innovation in that it requires clinical concordance studies to other PMA-approved devices or clinical trials in partnership with drug companies. The comment explained that there is no incentive for a drug company to conduct additional clinical trials to support diagnostic approvals and no incentive for the laboratory with the approved CDx to conduct clinical concordance studies with additional laboratories to support other diagnostic approvals. This comment expressed concern that increased oversight of LDTs is likely to put significant constraints on CDx availability, where doctors and patients would be forced to send samples to specific laboratories.

(Response 300) As discussed in response to comment 298, FDA has seen variability in performance among LDTs offered for a use that is the same as a CDx such that, in some cases, selection of a treatment for a given patient can be impacted by which test is used. For this reason, and for the reasons further discussed throughout this preamble, FDA believes that increased oversight for these and others IVDs offered as LDTs is generally necessary and appropriate. FDA understands the current system presents challenges for development of additional tests to select patients for a drug once one CDx is authorized. FDA seeks to engage with the community on additional efforts to create standardization, such as through reference materials, so that clinical validity can be extrapolated to other tests of the same type in more cases.

R. Miscellaneous

(Comment 301) We received many comments regarding the impacts that FDA's proposal would have on the medical education of those training in pathology. Comments noted that the increased financial and regulatory burdens on smaller teaching laboratories would reduce the number of tests available at those laboratories, which would eliminate, significantly delay, or make less attractive the opportunities for training clinical pathologists and additionally fewer laboratories would be able to meet the criteria for training programs prescribed by ACGME. Comments additionally stated that without robust opportunities to learn pathology principles and the skills needed to pass the pathology board certification exam, fewer trainees may be able to pass.

Comments stated that fewer learning opportunities would, in turn, exacerbate existing pathologist workforce burnout and shortages, and lead to fewer and less qualified and competent pathologists, which would lead to a decline in the practice of pathology that would reduce the quality and timeliness of patient care, and potentially the ability for healthcare to address advanced or new disease altogether. Additional comments noted that for-profit reference laboratories are not obligated to train pathology residents and fellows and that the pipeline of medical students who train at small laboratories is also an important pool of talent for IVD manufacturers, other clinical laboratory affiliated industries, and regulatory agencies, which will be similarly negatively affected.

Some comments stated that reduced medical training opportunities would particularly affect genetic and genomic medicine, an area of increasing demand and worsening workforce shortages, because it relies so heavily on LDTs. Another comment noted that if data available from LDTs was limited, then genomics and genetics biomedical research training at the Ph.D. graduate and postgraduate levels that depend on that data would also suffer and ultimately affect the health of the U.S. population and the competitiveness of the U.S. research enterprise.

(Response 301) As set forth in section V.B, FDA is adopting several enforcement discretion policies in the phaseout policy that reflects a balancing of the important public health considerations at issue in the rule (see further discussion of these considerations in section III.B). We anticipate the impact of these policies will address some of the concerns expressed in comments related to the impact on medical education, insofar as the financial burdens on laboratories will be reduced, resulting in fewer laboratories scaling back operations, exiting the market, or otherwise limiting educational opportunities. As a result of these policies and other adjustments, the FRIA estimates a 78 percent reduction in cost to industry compared to the PRIA. Specifically, the FRIA estimates a $1,166M 20-year annualized cost to industry—a reduction of $4,170M.

(Comment 302) A comment requested clarity about how FDA considers its potential enforcement actions or remedies when the Agency identifies a violation of the law. In particular, the comment was interested in whether enforcement actions apply to the laboratory activity, revenue, and operations or only the manufacturing of the test.

(Response 302) This comment was not entirely clear; we have interpreted this comment as seeking more information about FDA's approach to device enforcement. Such enforcement by FDA is taken on a case-by-case basis and the specifics of each enforcement action depend on the specific facts at issue. FDA generally seeks to work with

device manufacturers to address issues where the manufacturer or device is in noncompliance with requirements. FDA may issue a warning letter or take other advisory actions where appropriate. Administrative and enforcement actions authorized under the FD&C Act include: seizure of adulterated or misbranded devices (see section 304 of the FD&C Act); injunction against a manufacturer (see section 302 of the FD&C Act); and civil monetary penalties (see section 303 of the FD&C Act).

(Comment 303) One comment stated that FDA's characterization of LDTs as simple devices was incorrect, because all tests require professional interpretation given that test results should be interpreted in the context of a patient's overall clinical status and the specifics of a particular test. The comment stated that two tests assessing the same parameter may measure different things (*i.e.,* hot spot testing vs. sequencing of the entire coding region of a gene), while the same result may mean different things in different patients.

(Response 303) FDA is not clear what the comment is referencing when it states that FDA characterized LDTs as ''simple.'' FDA did not include such a description in the NPRM. Rather, FDA noted in the NPRM that many LDTs rely on high-tech or complex instrumentation and software to generate results and clinical interpretations (88 FR 68006 at 68008). Nevertheless, FDA agrees that test results should be interpreted in the context of overall clinical status and the specifics of a particular test. This is one reason why it is important that IVDs have appropriate assurance of safety and effective for their specific intended uses.

(Comment 304) FDA received comments discussing part 11 (21 CFR part 11). One comment asked whether IVDs offered as LDTs would be subject to part 11 and, if so, what type of documentation would be required for software associated with an IVD offered as an LDT, and requested guidance on how to treat software that analyzes results for automatic release or that analyzes sequencing data to identify mutations or other targets of interest.

(Response 304) This rule does not change the framework under which FDA regulates devices, including the scope and application of electronic records and electronic signatures regulations found at part 11.

The comment that asked about the applicability of part 11 and requested guidance does not appear to be speaking for or against any aspect of this rulemaking, or presenting any matter which is relevant to this rulemaking. FDA notes nevertheless that it has issued final guidance on part 11. For example, FDA's final guidance document entitled ''Part 11, Electronic Records; Electronic Signatures—Scope and Application'' (Ref. 265) provides guidance to persons who, in fulfillment of a requirement in a statute or another part of FDA's regulations to maintain records or submit information to FDA, have chosen to maintain the records or submit designated information electronically and, as a result, have become subject to part 11. People can comment on that final guidance document or any other at any time, and FDA will revise guidance documents in response to comments when appropriate (§ 10.115(g)(5)). FDA also periodically reviews existing final guidance documents to determine among other things whether they need to be changed (§ 10.115(k)(1)).

(Comment 305) One comment stated that it could be overly burdensome to meet the requirements of part 11 for systems that were designed to be used for clinical care but would now be used as the system of record for data that is included in a premarket submission.

(Response 305) It is not clear what particular submission requirements are being referred to by the comment that said it could be overly burdensome to comply, or what legal or policy changes, if any, this comment would recommend. While this comment talked about the requirements of part 11, FDA notes that submission requirements might arise under the FD&C Act, the PHS Act, and FDA regulations other than part 11, and that FDA's policies regarding part 11 would not affect such requirements. And, of course, this rulemaking does not change part 11.

In any event, in the ''Part 11, Electronic Records; Electronic Signatures—Scope and Application'' final guidance, FDA observed that some broad interpretations of the scope of part 11 ''could lead to unnecessary controls and costs and could discourage innovation and technological advances without providing added benefit to the public health.'' Accordingly, in that final guidance document, FDA stated that it ''intends to interpret the scope of part 11 narrowly.'' Moreover, FDA currently exercises enforcement discretion with respect to certain part 11 requirements. In particular, and as described in that final guidance, FDA currently does ''not intend to take enforcement action to enforce compliance with the validation, audit trail, record retention, and record copying requirements of part 11 as explained in this guidance'' and does ''not intend to take (or recommend) action to enforce any part 11 requirements with regard to systems that were operational before August 20, 1997, the effective date of part 11 (commonly known as legacy systems) under the circumstances described in section III.C.3 of this guidance.'' FDA believes that its interpretation of and enforcement policies regarding part 11 strike an appropriate balance between public health and innovation, without being overly burdensome. Nevertheless, and consistent with the ''Part 11, Electronic Records; Electronic Signatures—Scope and Application'' final guidance, as a result of its re-examination of part 11, FDA anticipates initiating rulemaking to change part 11 as appropriate.

(Comment 306) One comment asked if FDA will establish a fund to compensate physicians who face malpractice lawsuits that may result from misdiagnoses as a result of phasing out the general enforcement discretion approach for LDTs.

(Response 306) Malpractice lawsuits are outside the scope of this rulemaking.

(Comment 307) Some comments stated that FDA should work with Congress to advance new legislation regarding the regulation of IVDs more broadly, such as the VALID Act. These comments generally acknowledged that FDA has a role to play in the oversight of LDTs, but suggested that legislation could better balance a variety of considerations and objectives—such as promoting patient safety, ensuring flexibilities, facilitating innovation, and supporting patient access—as compared to what is possible with FDA's existing authorities. One comment suggested that legislation could better take into consideration unique characteristics of the diagnostics industry and the ''multitude of stakeholders'' affected by the regulation thereof, while other comments stated that new legislation could provide ''unequivocal'' statutory authority, as well as the resources necessary to effectively oversee diagnostics.

(Response 307) These comments are outside the scope of this rulemaking. The ability to enact new legislation rests with Congress. This rulemaking is focused on FDA's oversight of devices under the current statutory authorities set forth in the FD&C Act. Based on the evidence currently available to the Agency, FDA has determined that there is a public health need to better assure the safety and effectiveness of IVDs offered as LDTs, and FDA has determined to address that need consistent with our existing authorities by amending our regulations to make explicit that IVDs are devices under the

FD&C Act including when the manufacturer of the IVD is a laboratory, and by phasing out the general enforcement discretion approach for LDTs.

FDA recognizes that the Agency's current statutory authorities could be amended or supplemented to establish a different regulatory framework for IVDs than the one that currently exists. FDA notes that this rulemaking does not prevent Congress from enacting new legislation.

VII. Effective Date

This rule is effective July 5, 2024.

VIII. Economic Analysis of Impacts

We have examined the impacts of the final rule under E.O. 12866, E.O. 13563, E.O. 14094, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4).

E.O.s 12866, 13563, and 14094 direct us to assess all benefits, costs, and transfers of available regulatory alternatives and to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). Rules are ''significant'' under E.O. 12866 Section 3(f)(1) (as amended by E.O. 14094) if they ''have an annual effect on the economy of $200 million or more (adjusted every 3 years by the Administrator of OIRA for changes in gross domestic product); or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or tribal governments or communities.'' OIRA has determined that this final rule is a significant regulatory action under E.O. 12866 Section 3(f)(1).

Because this rule is likely to result in an annual effect on the economy of $100 million or more or meets other criteria specified in the Congressional Review Act/Small Business Regulatory Enforcement Fairness Act, OIRA has determined that this rule falls within the scope of 5 U.S.C. 804(2).

The Regulatory Flexibility Act requires Agencies to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because most facilities that will be affected by this rule are defined as small businesses and the final rule is likely to impose a substantial burden on the affected small entities, we find that the rule will have a significant economic impact on a substantial number of small entities.

We prepared an analysis consistent with the Unfunded Mandates Reform Act of 1995 (section 202(a)), which requires the preparation of a written statement that includes estimates of anticipated impacts before issuing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' The current threshold after adjustment for inflation is $177 million, using the most current (2022) Implicit Price Deflator for the Gross Domestic Product. This final rule will result in an expenditure in at least one year that meets or exceeds this amount.

This final rule amends FDA's regulations to make explicit that IVDs are devices under the FD&C Act including when the manufacturer of the IVD is a laboratory. As discussed in section V of the preamble to the final rule, FDA is phasing out its general enforcement discretion approach for LDTs so that IVDs manufactured by a laboratory will generally fall under the same enforcement approach as other IVDs.

We anticipate that the benefits of phasing out FDA's general enforcement discretion approach for LDTs includes a reduction in healthcare costs associated with unsafe or ineffective IVDs offered as LDTs (generally referred to in this document as ''problematic IVDs''), including IVDs offered as LDTs that are promoted with false or misleading claims, and from therapeutic decisions based on unreliable results of those tests. Quantified benefits are the annualized sum of both health and non-health benefits. Unquantified benefits include the reduction in costs from lawsuits. We discuss the benefits of the phaseout of FDA's general enforcement discretion approach for IVDs offered as LDTs in section II.E of the FRIA.

This phaseout policy will result in compliance costs for laboratories that are ensuring their IVDs offered as LDTs are compliant with statutory and regulatory requirements, as described in section V. We discuss the costs of the phaseout policy in section II.F of the FRIA. These costs overlap somewhat with effects associated with this phaseout policy in the form of user fees, including annual registration fees, fees for premarket applications/submissions, and annual fees for periodic reporting concerning PMA-approved devices, which are paid from laboratories to FDA. These fees are paid by laboratories but are revenue for FDA; the approach to estimating fee effects is distinct from the approaches for either benefits or costs, so they will be presented as transfers. We discuss transfers in section II.H of the FRIA.

Table 1 summarizes the annualized benefits, costs, and transfers of the phaseout policy. At a 7 percent discount rate, 20-year annualized benefits range from about $0.99 billion to $11.1 billion, with a primary estimate of $3.51 billion per year. At a 3 percent discount rate, 20-year annualized benefits range from $1.24 billion to $13.62 billion, with a primary estimate of $4.34 billion per year. At a 7 percent discount rate, 20-year annualized costs range from about $566 million to $3.56 billion, with a primary estimate of $1.29 billion per year. At a 3 percent discount rate, annualized costs range from about $603 million to $3.79 billion, with a primary estimate of $1.37 billion per year. At a 7 percent discount rate, 20-year annualized transfers range from $20 million to $81 million, with a primary estimate of $41 million per year. At a 3 percent discount rate, 20-year annualized transfers range from $29 million to $115 million, with a primary estimate of $58 million per year. These estimates do not include anticipated offsets from user fees. At a 7 percent discount rate, 20-year annualized costs to FDA range from $61 million to $243 million, with a primary estimate of $121 million per year. At a 3 percent discount rate, 20-year annualized costs to FDA range from $65 million to $259 million, with a primary estimate of $129 million per year. Factoring in offsets from user fees at current levels, estimated costs to FDA are reduced to $40 million to $162 million at a 7 percent discount rate, with a primary estimate of $81 million, and to $36 million to $144 million at a 3 percent discount rate, with a primary estimate of $72 million, covering approximately 30 to 40 percent of the estimated costs to FDA.

BILLING CODE 4164–01–P

Table 1.--Summary of Benefits, Costs and Transfers of the Final Rule (millions of 2022 U.S. dollars)

Category		Primary Estimate	Low Estimate	High Estimate	Units			Notes
					Year Dollars	Discount Rate	Period Covered	
Benefits	Annualized Monetized ($m/year)	$3,509	$988	$11,096	2022	7%	20 years	Major sources of benefits will be the avoidance of harms to patients from use of problematic IVDs offered as LDTs and the avoidance of spending on such IVDs.
		$4,341	$1,244	$13,619	2022	3%	20 years	
	Annualized Quantified					7%		
						3%		
	Qualitative							
Costs	Annualized Monetized ($m/year)	$1,287	$566	$3,559	2022	7%	20 years	A portion of foreign costs will be passed on to domestic consumers. We estimate that up to $147 million in annualized costs (7%, 20 years) to foreign facilities could be passed on to domestic consumers.
		$1,372	$603	$3,789	2022	3%	20 years	
	Annualized Quantified					7%		
						3%		
	Qualitative							
Transfers	Federal Annualized Monetized ($m/year)	$41	$20	$81	2022	7%	20 years	The main portion of transfers will be user fees for premarket submissions.
		$58	$29	$115	2022	3%	20 years	
		From: Device Industry			To: FDA			
	Other Annualized Monetized ($m/year)					7%		
						3%		
		From:			To:			
Effects	State, Local, or Tribal Government: No significant effects Small Business: The phaseout policy will have a significant economic impact on a substantial number of small laboratories that manufacture IVDs offered as LDTs. Wages: N/A Growth: N/A							

BILLING CODE 4164–01–C

We have developed a comprehensive Economic Analysis of Impacts that assesses the impacts of the phaseout policy. The full analysis of economic impacts is available in the docket for this phaseout policy (Ref. 10) and at *https://www.fda.gov/about-fda/economics-staff/regulatory-impact-analyses-ria.*

IX. Analysis of Environmental Impact

We have determined under 21 CFR 25.30(h) that this action is of a type that does not individually or cumulatively have a significant effect on the human

environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

X. Paperwork Reduction Act of 1995

FDA concludes that this rule contains no new collections of information. However, we expect that the phaseout of our general enforcement discretion approach for LDTs will necessitate adjustment to the burden estimates for several approved information collections, before the relevant phaseout stage begins. Such adjustments will account for an anticipated increase in the number of responses due to the expected compliance of laboratory manufacturers with applicable requirements for which FDA previously exercised enforcement discretion under the general enforcement discretion approach. Such adjustments will be submitted for review and clearance by OMB under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501–3521).

In section II.D.1 of the FRIA for this rulemaking, we estimate a range of 590 to 2,362 affected laboratories and 47 to 189 new affected laboratories entering the market per year. We intend to adjust the applicable information collection burden estimates to reflect additional responses to correspond with the phaseout policy.

As discussed in section V.C of this preamble, FDA has determined to gradually phase out its current general enforcement discretion approach for LDTs so that IVDs manufactured by a laboratory will generally fall under the same enforcement approach as other IVDs. This phaseout policy includes targeted enforcement discretion policies for specific categories of IVDs manufactured by a laboratory, including currently marketed IVDs offered as LDTs and LDTs for unmet needs, as described in section V.B of this preamble. FDA has structured the phaseout policy to contain five key stages. In the following paragraphs, we include a brief description of the stages and the OMB control numbers under which the related information collections (corresponding to the requirements for which FDA will expect compliance in each stage) are approved.

In stage 1, beginning 1 year after the publication date of this final rule, FDA generally will expect compliance with MDR requirements, correction and removal reporting requirements, and QS requirements under § 820.198 (complaint files). Information collections associated with the MDR requirements under 21 U.S.C. 360i(a) through (c) and part 803 are approved under OMB control number 0910–0437. Information collections associated with correction and removal reporting requirements under 21 U.S.C. 360i(g) and part 806 are approved under OMB control number 0910–0359. Information collections associated with QS requirements under part 820, including § 820.198 (complaint files), are approved under OMB control number 0910–0073. Costs associated with stage 1 are discussed in section II.F.1 of the FRIA.

In stage 2, beginning 2 years after the publication date of this final rule, FDA generally will expect compliance with requirements not covered during other stages of the phaseout policy. These other requirements include registration and listing requirements under 21 U.S.C. 360 and parts 607 and 807 (excluding subpart E) (related information collections are approved under OMB control numbers 0910–0052, and 0910–0625, respectively); labeling requirements under 21 U.S.C. 352 and parts 801 and 809, subpart B (related information collections are approved under OMB control number 0910–0485); investigational use requirements under 21 U.S.C. 360j(g) and part 812 (related information collections are approved under OMB control number 0910–0078); and, for certain devices that are biological products, investigational use requirements under 42 U.S.C. 262 and 21 CFR part 312 (related information collections are approved under OMB control number 0910–0014). Costs associated with stage 2 are discussed in section II.F.2 of the FRIA.

Additionally, for questions that are specific to a particular IVD, laboratory manufacturers may request feedback from FDA through a Pre-Submission, which is further explained in FDA's final guidance document entitled ''Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program'' (Ref. 65) (related information collections are approved under OMB control number 0910–0756).

In stage 3, beginning 3 years after the publication date of this final rule, FDA generally will expect compliance with QS requirements under part 820 (other than requirements under § 820.198 (complaint files), which are already addressed in stage 1). Information collections associated with QS requirements under part 820 are approved under OMB control number 0910–0073. Costs associated with stage 3 are discussed in section II.F.3 of the FRIA.

In stage 4, beginning 3½ years after the publication date of this final rule, FDA generally will expect compliance with premarket review requirements for high-risk IVDs. The premarket review requirements for PMAs are set forth in 21 U.S.C. 360e and part 814 (related information collections are approved under OMB control number 0910–0231). Premarket review requirements specific to HDE applications are set forth in 21 U.S.C. 360j(m) and part 814, subpart H (related information collections are approved under OMB control number 0910–0332). Licensure requirements are set forth in 42 U.S.C. 262 and 21 CFR part 601 (related information collections are approved under OMB control number 0910–0338). Costs associated with stage 4 are discussed in section II.F.4 of the FRIA.

In stage 5, beginning 4 years after the publication date of this final rule, FDA generally will expect compliance with premarket review requirements for moderate-risk and low-risk IVDs offered as LDTs (that require premarket submissions). These premarket submissions include 510(k) submissions, the requirements for which are set forth at 21 U.S.C. 360(k), 360c(i), and part 807, subpart E (related information collections are approved under OMB control number 0910–0120). These submissions also include De Novo requests, which laboratories may submit for IVDs offered as LDTs for which there is no legally marketed device upon which to base a determination of substantial equivalence, and for which the laboratory seeks classification into class I or class II. These requirements are set forth at 21 U.S.C. 360c(f)(2) and part 860, subpart D (related information collections are approved under OMB control number 0910–0844). Costs associated with stage 5 are discussed in section II.F.4 of the FRIA.

FDA also anticipates that laboratories may seek to utilize FDA's Third Party review program. FDA currently operates a Third Party review program for medical devices, and multiple organizations are accredited to conduct reviews of 510(k) submissions for certain IVDs (see Ref. 67). We anticipate interest in the Third Party review program among laboratory manufacturers, as well as potential new 3P510k Review Organizations. Information collections associated with the Third Party review program are approved under OMB control number 0910–0375.

XI. Federalism

We have analyzed this final rule in accordance with the principles set forth in E.O. 13132. We have determined that the rule does not contain policies that have substantial direct effects on the

States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, we conclude that the rule does not contain policies that have federalism implications as defined in the E.O. and, consequently, a federalism summary impact statement is not required.

One comment stated that FDA failed to conduct the required federalism analysis under E.O. 13132 and that the Agency erroneously stated in the NPRM that the proposed rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Another comment stated that the conclusions in the NPRM regarding federalism ''do not reflect the impact on practice of medicine'' given that, in the comment's view, FDA's proposal conflicts with certain state medical practice acts as well as NYS CLEP, which currently permits the review, approval, and use of LDTs.

As discussed in response to comment 101, the requirement for a federalism summary impact statement applies to the proposed amendment to § 809.3 (and not the phaseout policy), and because the proposed regulation would not establish any new requirements, it would not have any federalism implications under E.O. 13132. Moreover, even if the requirement for a federalism summary impact statement were to apply to the phaseout policy, the policy does not have federalism implications because it is not establishing any new requirements. For further discussion on the relationship between this rule and state medical practice acts and NYS CLEP, as raised in the comments summarized above, see comments 76 and 101 and the responses to those comments.

XII. Consultation and Coordination With Indian Tribal Governments

We have analyzed this rule in accordance with the principles set forth in E.O. 13175. We have determined that the rule does not contain policies that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. FDA received one comment on the NPRM that expressed concern that the rule, if implemented, would have significant tribal implications, resulting from loss of access to IVDs offered as LDTs that address special needs of the Native American population. As discussed in response to comment 223 (section VI.K), FDA does not anticipate that the Native American population will lose access to such IVDs offered as LDTs based on the final phaseout policy. We conclude that the rule does not contain policies that have tribal implications as defined in the E.O. and, consequently, a tribal summary impact statement is not required.

List of Subjects in 21 CFR Part 809

Labeling, Medical devices.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 809 is amended as follows:

PART 809—IN VITRO DIAGNOSTIC PRODUCTS FOR HUMAN USE

■ 1. The authority citation for part 809 is revised to read as follows:

Authority: 21 U.S.C. 321(h)(1), 331, 351, 352, 360, 360c, 360d, 360e, 360h, 360i, 360j, 371, 372, 374, 381, and 42 U.S.C. 262.

■ 2. In § 809.3, revise the last sentence of paragraph (a) to read as follows:

§ 809.3 Definitions.

(a) * * * These products are devices as defined in section 201(h)(1) of the Federal Food, Drug, and Cosmetic Act (the act) and may also be biological products subject to section 351 of the Public Health Service Act, including when the manufacturer of these products is a laboratory.

* * * * *

Dated: April 22, 2024.

Robert M. Califf,

Commissioner of Food and Drugs.

No. 88 May 6, 2024

Part III

Department of Health and Human Services

Food and Drug Administration

21 CFR Part 112

Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption Relating to Agricultural Water; Final Rule

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 112

[Docket No. FDA–2021–N–0471]

RIN 0910–AI49

Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption Relating to Agricultural Water

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration is issuing a final rule to amend the agricultural water provisions of the produce safety regulation. This rule replaces the microbial criteria and testing requirements for pre-harvest agricultural water for covered produce (other than sprouts) with a regulatory approach that incorporates recent science and Food and Drug Administration outbreak investigation findings to achieve improved public health protections as compared to the earlier requirements. The rule requires systems-based assessments, with required testing in certain circumstances, that focus on key risk factors for contamination by pre-harvest agricultural water and will enable farms to implement effective preventive measures. The rule requires farms to take timely action based on risk and includes a new requirement for expedited mitigation for certain hazards. The requirements are adaptable to future scientific advancements and provide sufficient flexibility to be practicable for all sizes and types of farms to implement across the wide variety of agricultural water systems, uses, and practices. These revisions to the produce safety regulation will more comprehensively address a known route of microbial contamination that can lead to preventable foodborne illness that is a significant public health problem.

DATES: This rule is effective July 5, 2024.

ADDRESSES: For access to the docket to read background documents or comments received, go to *https://www.regulations.gov* and insert the docket number found in brackets in the heading of this final rule into the ''Search'' box and follow the prompts, and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852, 240–402–7500.

SUPPLEMENTARY INFORMATION:

I. Executive Summary

A. Purpose and Coverage of the Final Rule

In this final rule, the Food and Drug Administration (FDA, the Agency, or we) is amending the ''Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption'' rule (2015 produce safety final rule), which was established in accordance with the FDA Food Safety Modernization Act (FSMA) and sets forth science-based minimum standards for the safe growing, harvesting, packing, and holding of produce, meaning fruits and vegetables for human consumption. This rule revises certain provisions in the 2015 produce safety final rule applicable to agricultural water[1] for covered produce other than sprouts, using a direct application method during growing activities (commonly referred to as ''pre-harvest agricultural water''[2]). It establishes a regulatory framework of systems-based assessments and risk-tiered outcomes through which farms subject to the 2015 produce safety final rule (covered farms) are required to identify known and potential hazards and implement effective preventive measures within specific timeframes based on risk.

The written assessments focus on agricultural water systems, including sources, and agricultural water practices that are key determinants of contamination risks associated with agricultural water, together with crop characteristics and environmental conditions that can impact the survival of pathogens. The assessments include a requirement to test pre-harvest agricultural water in certain circumstances—that is, when doing so would not delay action most critical to protect public health and would further inform the farm's determination as to whether measures are reasonably necessary. Moreover, the assessments are designed for use in diverse circumstances and require covered farms to evaluate a broad range of factors that impact pre-harvest agricultural water quality, providing results that are tailored to address hazards unique to their respective

[1] ''Agricultural water'' is defined at 21 CFR 112.3 as water used in covered activities on covered produce where water is intended to, or is likely to, contact covered produce or food-contact surfaces, including water used in growing activities (including irrigation water applied using direct water application methods, water used for preparing crop sprays, and water used for growing sprouts) and in harvesting, packing, and holding activities (including water used for washing or cooling harvested produce and water used for preventing dehydration of covered produce). Related to this definition is our definition of ''direct water application method,'' which means agricultural water used in a manner whereby the water is intended to, or is likely to, contact covered produce or food-contact surfaces during use of the water. If a specific use of water does not fit within the definition of agricultural water, then the requirements in subpart E do not apply to that specific use of water. See 80 FR 74354 at 74429.

[2] The 2015 produce safety final rule refers to pre-harvest agricultural water used during sprout production as ''sprout irrigation water.''

operations. This approach will be feasible to implement across the wide variety of agricultural water systems, practices, and uses, and it is adaptable to future advancements in agricultural water quality science.

Farms must use the information evaluated to make a written determination on the outcomes of their assessments. The outcomes are based on risk, and include the actions farms must take within a specific timeframe to ensure that their pre-harvest agricultural water is safe and is of adequate sanitary quality for the intended use(s). Within this framework for risk-tiered outcomes is a new expedited mitigation requirement relating to the impacts of certain adjacent and nearby land uses on pre-harvest agricultural water.

These amendments to the 2015 produce safety final rule are supported by scientific literature published since FDA promulgated the 2015 produce safety final rule and findings from FDA's outbreak investigations since FDA promulgated the 2015 produce safety final rule. These amendments are also supported by information and insights shared by an array of stakeholders through a variety of means since FDA promulgated the 2015 produce safety final rule (including through meetings, educational farm visits, and listening sessions), as well as information shared through the notice-and-comment process for this rulemaking. Feedback shared by stakeholders included information about the complexity of the previous pre-harvest agricultural water testing requirements, the practical implementation challenges associated with the uniform nature of those requirements, and findings from scientific studies demonstrating the need for additional testing in highly variable water with previously unaccounted for costs (see section III.C.). We have carefully considered the new information as we considered revisions to the 2015 produce safety final rule necessary to achieve our intended public health goals.

After considering available information, FDA has concluded this final rule will achieve improved public health protections by setting forth requirements for comprehensive pre-harvest agricultural water assessments. Those assessments will better enable covered farms to implement effective measures that minimize the risk of serious adverse health consequences or death, including those reasonably necessary to prevent the introduction of known or reasonably foreseeable biological hazards into or onto produce, and to provide reasonable assurances that produce is not adulterated due to those hazards. Moreover, these revisions provide sufficient flexibility to be practicable for all sizes and types of farms and to account for differences in risk across varying agricultural water systems, uses, and practices.

B. Summary of the Major Provisions of the Final Rule

FDA is amending the 2015 produce safety final rule by revising certain provisions relating to pre-harvest agricultural water for covered produce other than sprouts, while retaining the existing standards applicable to agricultural water for sprouts and for harvest and post-harvest activities conducted by covered farms.

For pre-harvest agricultural water for non-sprout covered produce, we are:

- Replacing the microbial quality criteria and uniform testing requirements in the 2015 produce safety final rule with new provisions for conducting pre-harvest agricultural water assessments for hazard identification purposes (including consideration of agricultural water sources, distribution systems, and practices, as well as adjacent and nearby land uses, and other relevant factors), and using the results of the assessments in making risk management decisions;
- Including a requirement to test pre-harvest agricultural water in certain circumstances (that is, when doing so would not delay action most critical to protect public health and would further inform the farm's determination as to whether measures are reasonably necessary) for generic *Escherichia coli* (*E. coli*) (or other appropriate indicator organism, index organism, or analyte) to help inform covered farms' agricultural water assessments;
- Adding new options for mitigation measures, providing covered farms additional flexibility in responding to findings from their pre-harvest agricultural water assessments;
- Requiring expedited implementation of mitigation measures for known or reasonably foreseeable hazards related to certain adjacent and nearby land uses;
- Requiring management review of pre-harvest agricultural water assessments; and
- Adding new definitions of ''agricultural water assessment'' and ''agricultural water system.''

We are making additional amendments, such as adding examples and making other edits that are designed to provide clarity, such as reorganizing subpart E to group provisions of a similar nature. We are also making conforming changes elsewhere in the 2015 produce safety final rule.

C. Legal Authority

We are issuing this final rule under FDA's authorities in sections 402, 419, and 701(a) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 342, 350h, and 371(a)) and sections 311, 361, and 368 of the Public Health Service Act (PHS Act) (42 U.S.C. 243, 264, and 271). We discuss our legal authority in greater detail in section IV.

D. Costs and Benefits

Our primary estimates of annualized costs are approximately $17.5 million at a 3 percent discount rate and approximately $17.7 million at a 7 percent discount rate over 10 years.

Our primary estimates of annualized benefits are approximately $10.3 million at a 3 percent discount rate and approximately $10.1 million at a 7 percent discount rate over 10 years. We discuss non-quantified benefits of the rule stemming from recalls averted and increased flexibility for covered farms to comprehensively evaluate their agricultural water systems.

II. Table of Abbreviations/Commonly Used Acronyms in This Document

TABLE 1—TABLE OF ABBREVIATIONS AND ACRONYMS

Abbreviation/acronym	What it means
BSAAO	Biological Soil Amendment of Animal Origin.
CAFO	Concentrated Animal Feeding Operation.
CAN	California Agricultural Neighbors.
CDC	Centers for Disease Control and Prevention.
CEA	Controlled Environment Agriculture.
CFR	Code of Federal Regulations.
CFU	Colony Forming Units.
CWA	Clean Water Act.

UV	Ultraviolet.

III. Background

A. FDA Food Safety Modernization Act

FSMA (Pub. L. 111–353), signed into law by President Obama on January 4, 2011, is intended to allow FDA to better protect public health by helping to ensure the safety and security of the food supply. FSMA transformed the nation's food safety system by shifting the focus from responding to foodborne illness to preventing it.

FSMA enables FDA to establish a prevention-oriented framework that focuses effort where food safety hazards are reasonably likely to occur and is flexible and practical in light of current scientific knowledge and food safety practices. The law also provides enforcement authorities for responding to food safety problems when they do occur. In addition, FSMA gives FDA important tools to help ensure the safety of imported foods and encourages partnerships with State, local, Tribal, and territorial authorities, as well as foreign regulatory counterparts.

FDA has issued nine foundational rules that create risk-based standards and provide oversight at various points in the supply chain for domestic and imported human and animal food. The produce safety regulation, established in the 2015 produce safety final rule (80 FR 74354, November 27, 2015), is one of the nine foundational rules.

B. 2015 Produce Safety Final Rule

In November 2015, FDA finalized the produce safety regulation, which establishes science-based minimum standards for the safe growing, harvesting, packing, and holding of fruits and vegetables grown for human consumption (codified in the Code of Federal Regulations (CFR) at part 112 (21 CFR part 112)). In accordance with section 419 of the FD&C Act (21 U.S.C. 350h), the 2015 produce safety final rule sets forth procedures, processes, and practices to minimize the risk of serious adverse health consequences or death, including those that are reasonably necessary to prevent the introduction of known or reasonably foreseeable biological hazards into produce and to provide reasonable assurances that produce is not adulterated on account of such hazards. The regulation focuses on biological hazards (defining a ''known or reasonably foreseeable hazard'' as a biological hazard that is known to be, or has the potential to be, associated with the farm or the food) and major routes of microbial contamination—including agricultural water; biological soil amendments; domesticated and wild animals; worker health and hygiene; and equipment, buildings, and tools. Farms subject to the requirements of part 112 are ''covered farms''; however, for purposes of readability, we use the term ''farms'' to mean ''covered farms'' within the meaning of part 112 in this document.

Subpart E of the 2015 produce safety final rule includes a general requirement that agricultural water must be safe and adequate for its intended uses (§ 112.41). It also included microbial water quality criteria (§ 112.44) and requirements for testing certain water sources (§ 112.46). The microbial quality criteria were based on the intended use of the agricultural water—*i.e.,* for growing activities for covered produce other than sprouts (including irrigation water applied to covered produce, other than sprouts, using a direct water application method and water used in preparing crop sprays) (commonly referred to as ''pre-harvest agricultural water'')[3], and for certain other specified uses, including sprout irrigation water and water applications that directly contact covered produce during or after harvest (commonly referred to as ''harvest and post-harvest agricultural water'').[4] For pre-harvest agricultural water for non-sprout covered produce, the microbial

[3] The 2015 produce safety final rule refers to pre-harvest agricultural water used during sprout production as ''sprout irrigation water.''

[4] Because sprouts present a unique safety risk, the 2015 produce safety final rule establishes sprout-specific requirements on multiple topics, including agricultural water. Sprouts are not the subject of this rulemaking.

water quality criteria consisted of a geometric mean (GM) of 126 or less colony forming units (CFU) generic *E. coli* per 100 milliliters (mL), and a statistical threshold value (STV) of 410 or less CFU generic *E. coli* per 100 mL. The 2015 produce safety final rule preamble explained that we established the pre-harvest agricultural water microbial criteria based on our analysis of the then-current scientific information; we also explained that that scientific information relied on an underlying dataset that had the necessary scientific rigor and described illness rates due to incidental ingestion generalized across different bodies of water (see 80 FR 74534 at 74416 and 74441–74442).

For untreated surface waters, farms were required to establish an initial microbial water quality profile (MWQP) of at least 20 samples collected over a 2 to 4-year period, followed by at least 5 annual samples thereafter; and for untreated ground water sources, this would consist of an initial profile of at least 4 samples collected during the growing season or over a period of 1 year, followed by at least 1 annual sample thereafter (80 FR 74354 at 74452) (Ref. 1).

In the 2015 produce safety final rule, we explained that the pre-harvest agricultural water microbial criteria and testing requirements were not a direct indicator of the safety of agricultural water for immediate use; rather, they were designed as a long-term water quality management tool for use in understanding the microbial quality of water over time and determining how to appropriately use water from that source. 80 FR 74354 at 74430. Moreover, we acknowledged gaps in the then-current science related to use of indicator organisms for monitoring water quality and predicting pathogen presence and/or fecal contamination. 80 FR 74354 at 74427–74428. We discussed that while testing water for pathogens has the obvious advantage of directly targeting microorganisms in water that are a risk to public health, doing so is not without significant challenges. 80 FR 74354 at 74427–74428. In response to comments received during that earlier rulemaking, we considered, and declined, the option to establish a qualitative standard alone in lieu of a quantitative microbial quality requirement for pre-harvest agricultural water. 80 FR 74354 at 74443. However, since 2015, new scientific findings as well as findings from FDA outbreak investigations have demonstrated the need for an updated systems-based approach.

Table 2 lists the key FSMA 2015 produce safety final rule documents published in the **Federal Register**. The complete set of **Federal Register** documents associated with the FSMA 2015 produce safety final rule, including supporting materials, are available in the docket folders at *https://www.regulations.gov/docket?D=FDA-2011-N-0921* and *https://www.regulations.gov/docket?D=FDA-2021-N-0471.*

TABLE 2—LIST OF KEY **Federal Register** 2015 PRODUCE SAFETY FINAL RULE DOCUMENTS

Description	Publication
Notice of proposed rulemaking (2013 proposed produce safety rule)	78 FR 3504, January 16, 2013.
Notice of correction for the 2013 proposed produce safety rule	78 FR 17155, March 20, 2013.
Supplemental notice of proposed rulemaking (2014 supplemental proposed rule)	79 FR 58434, September 29, 2014.
Final rule (2015 produce safety final rule or final rule)	80 FR 74354, November 27, 2015.
Technical amendment to the 2015 produce safety final rule	81 FR 26466, May 3, 2016.
FSMA: Extension and Clarification of Compliance Dates for Certain Provisions of Four Implementing Rules; Final rule.	81 FR 57784, August 24, 2016.
Extension of Compliance Dates for Subpart E; Notice of proposed rulemaking (2017 proposed compliance date extension).	82 FR 42963, September 13, 2017.
Extension of Compliance Dates for Subpart E; Final rule (2019 compliance date extension)	84 FR 9706, March 18, 2019.
Standards Relating to Agricultural Water; Notice of proposed rulemaking (2021 agricultural water proposed rule).	86 FR 69120, December 6, 2021.
Extension of Compliance Dates for Subpart E; Supplemental notice of proposed rulemaking (2022 supplemental proposed rule).	87 FR 42973, July 18, 2022.

C. New Information Since Issuance of the 2015 Produce Safety Final Rule

In November 2015, FDA began to conduct outreach to educate stakeholders about the requirements of the 2015 produce safety final rule, including through public meetings, speaking engagements, and participation in conferences convened by stakeholders representing a broad range of interests. FDA subject matter experts also participated in educational farm visits with State partners to observe a range of growing conditions and practices in varying regions. Through these efforts we heard consistent feedback that the pre-harvest agricultural water microbial criteria and testing requirements for non-sprout covered produce in the 2015 produce safety final rule were ''one-size-fits-all'' and did not sufficiently allow for the diversity of farms, including a variety of water uses and availabilities. For example, we received feedback that the long-term MWQPs required in the 2015 produce safety final rule can be difficult, and even impossible, to establish for farms that grow rotational crops or crops on leased land, both of which are common throughout industry. 86 FR 69120 at 69123–69124. FDA also received information and feedback from other stakeholders, including water quality specialists and researchers, indicating that the 2015 pre-harvest microbial water quality criteria and testing requirements did not adequately capture variability that can occur within a surface water source, and that sanitary surveys may better help inform water management decisions compared to testing.

In the face of these concerns, including new concerns not previously expressed, in March 2017, FDA announced that we were considering how we might simplify the microbial quality and testing requirements for agricultural water while still protecting public health and that we intended to work with stakeholders as these efforts progressed (Ref. 2). As part of these efforts, we participated in numerous additional meetings, educational farm visits, and listening sessions with an array of stakeholders—including produce industry members, food industry trade associations, researchers, extension educators, consumer groups, and State and Federal partners—to reflect various perspectives on managing risks associated with pre-harvest agricultural water for non-sprout

covered produce. See 86 FR 69120 at 69123–69125.

For example, in October 2017, FDA participated in a collaborative forum, sponsored by The Pew Charitable Trusts and the Robert Wood Johnson Foundation, where participants representing farms, academia, food industry trade associations, consumer groups, and State and other Federal partners discussed ideas for how to amend the agricultural water requirements within the then-current framework of the rule, as well as, and potentially in combination with, ideas for frameworks that could improve public health outcomes long-term and allow for the incorporation of new scientific knowledge and learnings as they become available (Ref. 3). Forum participants identified several possible approaches, including: (1) retaining the 2015 pre-harvest microbial water quality criteria and testing requirements and issuing companion guidance; (2) replacing the 2015 quantitative requirements with a qualitative standard and issuing companion guidance; (3) adopting private industry standards as a short-term measure while additional research continues; and (4) performing a multiyear quantitative microbial risk assessment to help fill research gaps. Forum participants identified advantages and disadvantages of each approach and also identified other areas for further consideration by FDA, including qualitative standards, data sharing, and the need for additional guidance.

The pre-harvest agricultural water requirements were also the focus of a 2-day Agricultural Water Summit, convened by the Produce Safety Alliance at Cornell University, in February 2018 (Ref. 4). The summit was attended by academics, produce industry, growers/grower associations, State agencies, Federal agencies, and supporting industries. During the summit, participants had many questions and concerns about reliance on testing as a mechanism for determining pre-harvest agricultural water quality, including that the 2015 pre-harvest agricultural water microbial criteria and testing requirements were not supported by scientific evidence sufficient to demonstrate their relevance to public health outcomes. Among other things, participants questioned the role of water testing, what the information tells farms about risks, and how farms would use that information to make water use management decisions. Some participants emphasized farms' interest in preventing produce contamination while expressing concern that the resources that would be required to conduct testing might be better used for other approaches with relevance to public health outcomes.

Many of the discussions at the summit addressed hazards in the growing environment, including examples of how risk assessment has been conducted in other fields of study, such as for drinking water and wastewater management. During the summit, participants identified ''agricultural water assessments'' as a promising approach for managing water quality, suggesting that assessments may provide a more effective risk management strategy to farms than a numerical testing standard can provide (Ref. 4).

Moreover, scientific information has become available since the 2015 produce safety final rule issued that indicates potential limitations in basing risk management decisions on the previous pre-harvest agricultural water testing requirements and that supports a shift in regulatory approach away from those requirements. For example, various studies since 2015 indicate a high degree of variability in generic *E. coli* levels in surface waters (Refs. 5–10), which can reduce the precision of estimation of the GM and STV of a water source (Refs. 1, 7). Other studies since 2015 have underscored the limitations of generic *E. coli* as an indicator for pathogen presence (Refs. 11–16).

Further, a scientific evaluation of the 2015 pre-harvest agricultural water testing requirements found that the rolling data set of five samples per year used to update GM and STV values for untreated surface water sources leads to highly uncertain results and delays in detecting shifts in water quality (Ref. 7). Specifically, Havelaar et al. found that the 20-sample MWQP for untreated surface water was not sufficient to reliably characterize the quality of the irrigation water with higher variability in generic *E. coli* levels than was determined for the 2015 produce safety final rule (Refs. 1, 7). In simulation modeling, the rolling 20-sample MWQP responded ''very slowly'' to shifts in water quality. Increases in generic *E. coli* levels were detected only after one to six sample sets, thus delaying signals of changes in water quality and (and any needed measures) by 1 to 6 years depending on the nature and magnitude of the shift.

For surface water that had standard deviations up to three times higher than accounted for in the 2015 produce safety final rule, Havelaar et al. determined that an 180-sample MWQP would be required to obtain the same precision of the GM as required by the rule (Ref. 7). Havelaar et al. observed that the (nine-fold) increase in sampling might address the problem, but it would increase testing costs. We acknowledge their findings on the need for substantial testing for highly variable pre-harvest agricultural water. Such testing would be beyond what is required for pre-harvest surface water testing under the 2015 produce safety final rule, with an attendant increase in costs. Additionally, other recent studies demonstrate a high degree of variability in generic *E. coli* levels in surface waters for pre-harvest application (Refs. 5–10), suggesting similar questions about necessary additional testing and costs that were not accounted for in the 2015 produce safety final rule.

Havelaar et al. also suggested that additional understanding of the processes that drive variability in the quality of irrigation water sources might inform preventive or rapid corrective actions that have a larger impact on produce safety than the 2015 pre-harvest agricultural water requirements (Ref. 7). Additionally, for several years, FDA has conducted investigations of produce outbreaks to learn what factors may have contributed to the outbreaks of foodborne illness or food contamination events (Ref. 17). Findings from investigations of several outbreaks linked to consumption of produce since 2015—including: (1) the spring 2018 *E. coli* O157:H7 outbreak linked to romaine lettuce from the Yuma growing region (Refs. 18 and 19); (2) the fall 2018 *E. coli* O157:H7 outbreak linked to romaine lettuce from California (Ref. 20); (3) the fall 2019 *E. coli* O157:H7 outbreaks linked to romaine lettuce (Ref. 21); (4) the fall 2020 *E. coli* O157:H7 outbreak linked to leafy greens (Ref. 22); and (5) the Summer 2020 *Salmonella* Newport outbreak linked to red onions (Ref. 23)—highlight the importance of pre-harvest agricultural water quality and the potential impacts of adjacent and nearby land uses on agricultural water, which can serve as a route of contamination of produce. These outbreak investigations reiterate decades of scientific research demonstrating that pre-harvest agricultural water is a potential contributing factor in the introduction and spread of contamination to produce. See 86 FR 69120 at 69125–69127. Findings such as these build upon our peer-reviewed ''FDA Qualitative Assessment of Risk to Public Health from On-Farm Contamination of Produce'' (QAR) (Ref. 17), which provides a scientific evaluation of the potential adverse health effects resulting from human exposure to microbiological hazards in

produce to inform FDA's implementation of section 419 of the FD&C Act, with a focus on public health risk associated with the on-farm contamination of produce, including from agricultural water.

D. 2021 Agricultural Water Proposed Rule

In light of recent studies and other new information gathered since issuance of the 2015 produce safety final rule, including findings from FDA produce outbreak investigations as well as feedback on the previous pre-harvest agricultural water requirements, on December 6, 2021, FDA issued a proposed rule, ''Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption Relating to Agricultural Water,'' (86 FR 69120; hereafter referred to as the ''2021 agricultural water proposed rule'') that proposed to revise certain requirements relating to pre-harvest agricultural water for covered produce other than sprouts, while retaining the existing standards applicable to agricultural water for sprouts and for harvest and post-harvest activities. For pre-harvest agricultural water for non-sprout covered produce, we proposed to replace the microbial quality criteria and uniform testing requirements with provisions for: requiring systems-based pre-harvest agricultural water assessments to evaluate the key determinants of risk attributable to agricultural water use practices, including a requirement to test pre-harvest agricultural water when doing so would not delay action most critical to protect public health and would further inform the farm's determination as to whether measures are reasonably necessary; adding new options for mitigation measures; and adding a new requirement for expedited implementation of mitigation measures for hazards related to certain adjacent and nearby land uses. We also proposed to require management review of records related to agricultural water assessments and to add new definitions of ''agricultural water assessment'' and ''agricultural water system'' to the 2015 produce safety final rule.

We solicited comments on these proposed amendments. We also proposed additional amendments, such as reorganizing subpart E to group requirements of a similar nature and ensure that interested parties could readily view the proposed pre-harvest agricultural water revisions.

Additionally, in the preamble to the 2021 agricultural water proposed rule (86 FR 69120 at 69147) we explained that at that time, farms were required to comply with the subpart E pre-harvest, harvest, and post-harvest agricultural water requirements for covered produce (other than sprouts) beginning on January 26, 2024, for very small farms; January 26, 2023, for small farms; and January 26, 2022, for all other farms (see also 84 FR 9706). We also explained that we intended to exercise enforcement discretion for the subpart E pre-harvest, harvest, and post-harvest agricultural water requirements for covered produce (other than sprouts) while working to address compliance dates in a targeted manner through the rulemaking process, with the goal of completing the rulemaking as quickly as possible.

The public comment period for the 2021 agricultural water proposed rule closed on April 5, 2022.

In the 2021 agricultural water proposed rule, we indicated that we were developing an online tool related to the pre-harvest agricultural water assessments described in the proposed rule. In March 2022, FDA released v1.0 of an online ''Agricultural Water Assessment Builder'' to help farms understand the proposed requirements for an agricultural water assessment (Ref. 24). Since then, we have released paper-based versions of the Builder in both English and Spanish to make the content more accessible to a broader array of users (Ref. 25). We have also updated the online version of the Builder to v1.1 to make it more user-friendly in response to stakeholder feedback. We expect to update the Builder to reflect the requirements we are finalizing here.

E. 2022 Supplemental Proposed Rule

On July 19, 2022, we published a supplemental notice to the 2021 agricultural water proposed rule (87 FR 42973) (2022 supplemental proposed rule) in which we proposed dates for compliance with the pre-harvest agricultural water requirements for covered produce other than sprouts in the 2021 agricultural water proposed rule. In light of the revisions we proposed to certain pre-harvest agricultural water requirements for non-sprout covered produce, we proposed to establish dates for compliance with the pre-harvest agricultural water requirements for covered produce other than sprouts as follows: 2 years and 9 months after the effective date of a final rule for very small businesses; 1 year and 9 months after the effective date of a final rule for small businesses; and 9 months after the effective date of a final rule for all other businesses.

We also specified the duration of the period of enforcement discretion for the harvest and post-harvest agricultural water requirements for covered produce other than sprouts until January 26, 2025, for very small businesses; January 26, 2024, for small businesses; and January 26, 2023, for all other businesses. As discussed in the 2022 supplemental proposed rule, we specified the duration of our intended period of enforcement discretion to provide farms, regulators, educators, and other stakeholders additional time to facilitate compliance with those requirements.

We explained in the 2022 supplemental proposed rule that the proposed compliance dates for pre-harvest agricultural water requirements and our intent to exercise of enforcement discretion were intended to facilitate successful implementation and optimize public health protections. We reopened the comment period only with respect to the extension of compliance dates for pre-harvest agricultural water for non-sprout covered produce. The comment period for the supplemental proposed rule closed on September 19, 2022.

In this document, we use the broad term ''agricultural water proposed rule'' to refer to the complete proposed rule, including both the 2021 agricultural water proposed rule and the 2022 supplemental proposed rule.

F. Public Comments

After issuing the agricultural water proposed rule, we conducted numerous outreach activities. We held two virtual public meetings on February 14, 2022, and February 25, 2022, to solicit public comments on the proposed rule, inform the public about the rulemaking process (including how to submit comments, data, and other information to the rulemaking dockets), and respond to questions about the proposed rule. The public meetings were attended by domestic and foreign industry representatives, academia, State and Federal regulators, retailers, third-party certification bodies, laboratories, consumer groups and others, and included discussion panels consisting of representatives from industry, the States, consumer groups, and retailers. We also held a consultation with Federally recognized Indian tribes on February 4, 2022, to provide an overview of the proposed rule, answer questions, and receive feedback.

Additionally, FDA participated in a webinar hosted by the National Association of State Departments of Agriculture (NASDA) on December 15, 2021, as well as five regional meetings (Southern Region (March 14, 2022); Western Region (March 11, 2022); Northwestern Region (March 2, 2022);

North Central Region (March 2, 2022); and Northeast Region (March 11, 2022)) that were sponsored by State regulatory partners and attended by farms, irrigation districts, educators, environmental groups, and others. We also participated in numerous other meetings and speaking engagements to discuss the proposed rule, respond to questions, and receive feedback.

We received approximately 180 comment submissions on the agricultural water proposed rule by the close of both comment periods, each containing one or more comments on one or more issues. We received submissions from diverse members of the public, including produce farms; coalitions; trade organizations; academia; consumers; consumer groups; State and foreign government agencies; and other organizations. Some submissions included statements from multiple individuals.

In sections V and VI of this document we describe these comments, respond to them, and explain the changes we made to the agricultural water proposed rule, in addition to discussing our consideration of alternative approaches, such as requiring all farms to test their water as part of their pre-harvest agricultural water assessments. We also discuss comments that ask us to clarify the proposed requirements or that disagree with, or suggest one or more changes to, the proposed requirements. Our responses to the comments include our reasons for determining whether to modify any of the proposed requirements. The remainder of this document establishes a final rule (''the final rule,'' ''this final rule,'' ''the rule,'' or ''this rule'') based on the agricultural water proposed rule.

G. General Overview of Changes in the Final Rule

In response to comments received and on our own initiative, we have made several changes to the proposed requirements for pre-harvest agricultural water assessments for non-sprout covered produce and for mitigation measures to reduce the potential for contamination of covered produce and food contact surfaces with known or reasonably foreseeable hazards associated with such agricultural water. We have provided clarification related to the timing of agricultural water assessments and exemptions from the requirement to prepare an agricultural water assessment. We have also revised the mitigation measures related to a time interval between last direct water application and harvest and a time interval between harvest and end of storage and/or use of other post-harvest activities to further emphasize the flexibility afforded to farms in ways to comply with those requirements and provide flexibility as science and post-harvest handling practices evolve. Consistent with the changes discussed above, we have revised the requirements for certain records that farms are required to establish and maintain. This final rule also includes a requirement to maintain scientific data or information in support of an alternative mitigation measure to align with the agricultural water records requirements in the 2015 produce safety final rule.

IV. Legal Authority

We are issuing this final rule under FDA's authorities in sections 402, 419, and 701(a) of the FD&C Act and sections 311, 361, and 368 of the PHS Act.

Section 419(a) of the FD&C Act, in relevant part, directs FDA to establish science-based minimum standards for the safe production and harvesting of those types of fruits and vegetables that are raw agricultural commodities for which we have determined such standards minimize the risk of serious adverse health consequences or death. Section 419(a)(3) of the FD&C Act further requires that these minimum standards provide sufficient flexibility and are appropriate to the scale and diversity of the production and harvesting of raw agricultural commodities. Section 402(a)(3) of the FD&C Act provides that a food is adulterated if it consists in whole or in part of any filthy, putrid, or decomposed substance, or if it is otherwise unfit for food. Section 402(a)(4) of the FD&C Act provides that a food is adulterated if it has been prepared, packed, or held under insanitary conditions whereby it may have become contaminated with filth, or whereby it may have been rendered injurious to health. Additionally, section 701(a) of the FD&C Act grants the authority to issue regulations for the efficient enforcement of the FD&C Act. This rule includes requirements that are necessary to prevent food from being adulterated, and a regulation that requires measures to prevent food from being held under insanitary conditions whereby either of the proscribed results may occur allows for the efficient enforcement of the FD&C Act. The amendments we are finalizing to the 2015 produce safety final rule thus allow FDA to efficiently enforce sections 402 and 419 of the FD&C Act.

In addition to the FD&C Act, FDA's legal authority for the final rule derives from sections 311, 361, and 368 of the PHS Act, which provides authority for FDA to issue regulations to prevent the spread of communicable diseases from one State to another. Specifically, the PHS Act authorizes the Secretary of HHS to make and enforce such regulations as ''are necessary to prevent the introduction, transmission, or spread of communicable diseases from foreign countries into the States . . . or from one State . . . into any other State'' (section 361(a) of the PHS Act). (See sec. 1, Reorg. Plan No. 3 of 1966 at 42 U.S.C. 202 for transfer of authority from the Surgeon General to the Secretary; see Staff Manual Guide 1410.10 at *https://www.fda.gov/about-fda/reports-manuals-forms/staff-manual-guides* for delegation from the Secretary to FDA.) The provisions in this final rule are necessary to prevent food from being contaminated with human pathogens such as *Salmonella, Listeria monocytogenes* (*L. monocytogenes*), and *E. coli* O157, and therefore to prevent the introduction, transmission, or spread of communicable disease from foreign countries into the United States, or from one state in the United States to another. These amendments to the 2015 produce safety final rule will help prevent the spread of communicable diseases associated with contaminated produce.

V. Comments on the Proposed Rule and FDA Response

A. Introduction

We received approximately 180 comment submissions on the proposed rule by the close of both comment periods, each containing one or more comments on one or more issues. We received submissions from diverse members of the public, including produce farms; coalitions; trade organizations; academia; consumers; consumer groups; State and foreign government agencies; and other organizations. Some submissions included statements from multiple individuals.

In the remainder of this document, we describe the comments that are within the scope of this rulemaking, respond to them, and explain the revisions we made to the proposed rule. We have grouped similar comments together under the same number, and, in some cases, we have separated different issues discussed in the same comment and designated them as distinct comments for purposes of our responses. The number assigned to each comment or comment topic is purely for organizational purposes and does not signify the comment's value or importance nor the order in which comments were received.

We received no comments regarding § 112.40 (''What requirements of this subpart apply to my covered farm?'') and are finalizing that provision as proposed. We received no comments regarding conforming changes in §§ 112.12, 112.151, or 112.161(b), or amendments to §§ 112.42, 112.44, and 112.46 through 112.49 related to providing additional clarity and reorganizing subpart E in its entirety to group provisions of a similar nature. We are finalizing these amendments without changes.

We received some comments on provisions we did not propose to revise and that are outside of the scope of this rulemaking. For example, we received comments on the definition of ''agricultural water'' (§ 112.3); the requirements for general agricultural water quality (§ 112.41); the requirements for inspections and maintenance of agricultural water systems (§ 112.42); the requirements for harvest and post-harvest agricultural water (§ 112.44); and the requirements for agricultural water treatment (§ 112.46). We do not address out of scope comments in this document.

We also received some comments that address FDA's plans for implementation activities that are outside the scope of this rulemaking. As such, we do not address those comments in this document. We nonetheless recognize the importance of having educational materials and technical assistance and are taking efforts to ensure that guidance, training, educational resources, and the FSMA Technical Assistance Network are available to help farms as they prepare to comply with the requirements in this rule.

Note that summaries of and responses to comments on the estimated costs and benefits of the proposed rule and other topics covered by the Preliminary Regulatory Impact Analysis (PRIA) may be found in the Final Regulatory Impact Analysis (FRIA) (Ref. 26).

B. General Comments on the Proposed Rule

Many comments made general remarks supporting or opposing the proposed rule without focusing on a particular proposed provision. Among comments that were supportive of the proposed rule, some provided general feedback suggesting that additional information would help clarify the rule. Several comments focused on other topics, such as alternative options to the regulatory approach for pre-harvest agricultural water and the shift from mandated agricultural water testing in the 2015 produce safety final rule to the proposed approach for pre-harvest agricultural water assessments. In the following paragraphs, we discuss and respond to such general comments.

1. General Comments

(Comment 1) Many comments support the proposed rule, suggesting that the proposed pre-harvest agricultural water assessments are more risk-based, flexible, and holistic than the pre-harvest agricultural water testing requirements in the 2015 produce safety final rule, which commenters characterized variously as complex, prescriptive, and ''one-size-fits-all.'' Many comments suggest that the proposed approach better accommodates the diversity in industry, noting the variety of conditions that can exist on farms when it comes to different regions, crops, water sources, and water uses. Many of these comments suggest that the proposed requirements will help prevent foodborne illness outbreaks and lead to improved public health outcomes. Among comments supportive of the proposed approach, some suggest that additional information on agricultural water assessments would be beneficial to further clarify the proposed requirements.

In contrast, a few comments suggest that the proposed requirements for pre-harvest agricultural water assessments are too complicated. Some of these comments suggest that quantitative metrics (such as criteria derived from testing) would be easier for farms to understand and easier for regulators to enforce than agricultural water assessments, which are more qualitative in nature. Some of these comments suggest that the requirements for agricultural water assessments will not be more effective at preventing foodborne illness than mandated pre-harvest agricultural water testing.

(Response 1) We agree with comments received that support the proposed rule, including the systems-based assessments that are grounded in our QAR (Ref. 17), incorporate recent scientific data and other information available to FDA, and are designed to ensure that farms have robust and meaningful information about the quality of their pre-harvest water for use in risk management decision making. We developed this approach to pre-harvest agricultural water by considering the public health objectives we aim to achieve through pre-harvest agricultural water measures for covered produce other than sprouts while recognizing that each farm—whether foreign or domestic—has a unique combination of agricultural water source(s), growing practices, current and previous uses of the farmland, and adjacent and nearby land uses, among other factors, that may influence the safety of its agricultural water.

The rule establishes assessment factors with sufficient specificity to provide farms robust and meaningful information on the quality of pre-harvest agricultural water, while also offering adequate flexibility to account for the diversity of operations that we are required to consider in developing the regulations under 419(a)(3)(A) of the FD&C Act.

The requirements for comprehensive, systems-based pre-harvest agricultural water assessments and appropriate corrective and mitigation measures as needed will help farms identify potential sources of contamination and effectively manage their water. Specifically, farms must use the results of assessments to determine when, within the framework for risk-based outcomes, they are required to take measures to ensure that their pre-harvest agricultural water is safe and is of adequate sanitary quality for the intended use(s). The combination of assessments and risk-tiered outcomes require farms to identify and address sources of potential hazards through implementation of effective prevention-oriented mitigation measures within specified timeframes. Under the final rule, farms will assess hazards at the beginning of the growing season and implement mitigation measures for certain hazards earlier than under the 2015 produce safety final rule. Further, under the 2015 produce safety final rule, farms were required to test pre-harvest agricultural water as close in time as practicable to, but prior to harvest, and use those results to determine whether to implement mitigation measures without the benefit of the written systems-based evaluation of potential sources of contamination we are requiring in this final rule.

We recognize that agricultural water assessments, by their nature, will require farms to consider a broader set of factors as part of the systems-based approach we are finalizing here, compared to the microbial quality criteria and testing requirements for pre-harvest agricultural water in the 2015 produce safety final rule. In addition to providing the specific factors farms must consider in their pre-harvest agricultural water assessments in § 112.43(a), we provide additional information on the requirements for agricultural water assessments throughout the remainder of section V. We reiterate our commitment to providing farms education, outreach, and technical assistance to facilitate

compliance with the rule. We intend to pursue various mechanisms, such as publishing guidance, holding webinars, and developing other educational resources, including work with other stakeholders (such as State agencies, educators, and extension agents), to do so. See also the response to comment 29.

Further, the knowledge and experiences gained since 2015 will be helpful in supporting successful implementation of the rule, including compliance with the requirements for pre-harvest agricultural water assessments. For example, we developed the 2015 produce safety final rule after considering, in part, that at the time of rulemaking, some farms had significant expertise in the area of food safety, and other farms had minimal knowledge in the area. We also considered that the produce farming community did not have the history of regulatory interaction with FDA and the same experience with food safety regulations as did the food manufacturing industry. 78 FR 3504 at 3530. However, we recognize that since that time, knowledge and awareness of food safety, as well as the produce farming community's experience with food safety regulations, has evolved. For example, many farms, whether for the purposes of required training in accordance with § 112.22(c) (which we did not propose to change) or for other purposes, have since received food safety training, including on topics related to potential hazards in the growing environment.

Additionally, FDA has provided investigation reports for various produce-related outbreaks that have occurred since 2015 (*e.g.,* Refs. 18–23), many of which discuss factors potentially contributing to contamination and provide recommendations for farms to consider in light of those findings. Moreover, other provisions in the 2015 produce safety final rule for which compliance dates have passed, such as those in subpart I, ''Domesticated and Wild Animals'' (§§ 112.81–112.83), may provide farms with useful information when evaluating the degree of protection of a pre-harvest agricultural water system as part of an agricultural water assessment (see response to comment 55).

For these reasons we have concluded that sufficient support exists—including through identification of specific factors that farms must consider in § 112.43(a), information provided throughout this final rule, and knowledge and experiences gained since 2015 (including lessons learned from various produce-related outbreaks)—for farms to effectively implement the requirements for agricultural water assessments and risk-tiered outcomes that we are finalizing with this rule.

With respect to comments suggesting that the requirements for pre-harvest agricultural water assessments will be difficult to enforce, we disagree. The annual assessments employ a prevention-oriented quality-systems approach to food safety regulation that FDA has long used and successfully enforced across the highly diverse food industry that FDA regulates. For example, FDA issued the juice hazard analysis and critical control point (HACCP) regulation (that is, the Hazard Analysis and Critical Control Point Systems regulation in 21 CFR part 120) and the seafood HACCP regulation (that is, the Fish and Fishery Products regulation in 21 CFR part 123) more than 20 years ago, which establish mandatory frameworks through which industry assesses hazards that are reasonably likely to occur and designs tailored controls to prevent or eliminate them or reduce them to an acceptable level. More recently, in 2015, FDA issued the Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food regulation (21 CFR part 117), under which food facilities conduct a qualitative assessment to identify and evaluate known or reasonably foreseeable hazards for each type of food manufactured, processed, packed, or held at the facility to determine whether there are any hazards requiring a preventive control. These regulations all require the development of a food safety plan.

As discussed in comment 18, we have incorporated many of these principles—such as an assessment of risk and the development of a food safety plan based on that assessment—into the requirements for pre-harvest agricultural water assessments in § 112.43. For example, in § 112.43(a), we require farms to evaluate and document specific factors as part of an assessment, all of which are key determinants of contamination risks associated with pre-harvest agricultural water. Based on that evaluation, in § 112.43(c), we require farms to make written determinations on whether measures under § 112.43(d) are reasonably necessary. We further require farms to take necessary and timely action in accordance with those determinations. Thus, the requirements we are finalizing here share common principles with other FDA food safety regulations that have been enforced.

Thus, based on the specific criteria we have included in § 112.43 and our experience enforcing other regulations that rely on similar food safety principles and approaches to operation-specific assessments, we have concluded we can enforce the requirements we are finalizing here. For example, the Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food regulation includes requirements for hazard identification (see 21 CFR 117.130), and FDA has enforced that regulation. Additional information on inspection, compliance, and enforcement-related information can be found on the ''FDA Data Dashboard'' at *https://www.fda.gov/about-fda/transparency/fda-data-dashboard*.

To the extent that comments voicing concerns with the proposed rule are suggesting that the requirements for pre-harvest agricultural water assessments are more than what is necessary for public health purposes, we disagree. While we believe that requiring operational assessments and food safety plans that address the entirety of a farm's operations (including potential sources and routes of contamination addressed in other subparts of the 2015 produce safety final rule) would be more than a minimum standard and more than what is reasonably necessary for us to require to achieve the statutory purposes (80 FR 74354 at 74380), given the scientific support for pre-harvest agricultural water assessments; the limited scope of the assessments (*i.e.,* the requirements only apply for pre-harvest agricultural water for non-sprout covered produce); and the knowledge and experiences gained since 2015, we continue to conclude that requiring farms to prepare a pre-harvest agricultural water assessment for non-sprout covered produce is a science-based minimum standard as described in section 419 of the FD&C Act. There is significant public health benefit in requiring farms to prepare a written assessment that considers various factors that affect the safety of their pre-harvest agricultural water and its appropriate use during pre-harvest activities for non-sprout covered produce. Such written assessments also require farms to identify the actions they will take to manage risks associated with their pre-harvest water. Further, in some instances, the written assessments will provide farms with a historical record that will allow them to more readily detect changes and react in a timely manner to protect public health.

With respect to comments suggesting that the requirements for agricultural water assessments will not be more effective at protecting public health than

the 2015 pre-harvest agricultural water testing requirements, we disagree. As discussed further in response to comment 3, there are various limitations associated with testing, including that: the presence of indicators does not always signal the presence of pathogens, and the absence of detection of indicators does not guarantee that pathogens are absent (Refs. 27–30) (80 FR 74354 at 74428). Moreover, since sampling frequency and location relative to the source of contamination are reported to affect the performance of generic *E. coli* as an indicator of fecal contamination (Refs. 31 and 32), non-detection of generic *E. coli* cannot be considered absolute confirmation that fecal contamination has not occurred (80 FR 74354 at 74428). In light of these challenges, testing may inadvertently provide farms with a false sense of security as to the quality of their water, potentially resulting in farms not taking action where necessary to protect public health. Moreover, as discussed in response to comment 11, rather than relying on results of a multi-year rolling profile that might not always reflect a need for mitigation or elicit a timely reaction from farms to address potential hazards (Ref. 7), the approach we are finalizing here establishes requirements for measures that are directly responsive to the conditions identified as part of an assessment and requires that farms implement those measures within specific timeframes based on risk.

As noted in comment 11, our FRIA (Ref. 26) indicates that the increase in costs associated with this rule compared to the 2015 pre-harvest agricultural water testing requirements is largely a result of more mitigation occurring in response to findings from pre-harvest agricultural water assessments than as a result of the previous testing requirements. As also discussed in the FRIA, we estimate likely greater benefits under the requirements we are finalizing here, with more mitigation occurring in response to assessment findings than in response to the testing approach in the 2015 produce safety final rule.

(Comment 2) Some comments support the proposed requirements for pre-harvest agricultural water assessments, and further suggest that agricultural water assessments should be required for all agricultural water, including treated water, water from public water sources, water used for harvest and post-harvest activities, and for sprout irrigation water.

(Response 2) In light of these comments, we considered removing the proposed exemptions from the requirement to prepare an agricultural water assessment, including for water meeting certain requirements applicable to harvest and post-harvest agricultural water (proposed § 112.43(b)(1)); water from public water systems or supplies meeting certain requirements (proposed § 112.43(b)(2)); and agricultural water treated in accordance with § 112.46 (proposed § 112.43(b)(3)). However, we ultimately determined that eliminating the exceptions was not necessary, for the reasons described below.

Section 419 of the FD&C Act directs FDA to establish science-based minimum standards, including procedures, processes, and practices that are reasonably necessary to prevent introduction of hazards and provide reasonable assurances produce is not adulterated under section 402 of the FD&C Act. Subpart E of the 2015 produce safety final rule establishes requirements that are broadly applicable to all agricultural water—namely, the requirement in § 112.41 that all agricultural water must be safe and of adequate sanitary quality for its intended use, and the requirements in § 112.42 related to inspections and maintenance of agricultural water systems to identify conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces and prevent the systems from being a source of contamination to covered produce, food contact surfaces, or areas used for a covered activity. We consider applying these requirements to all agricultural water (including that used during pre-harvest, harvest, and post-harvest activities, even if an exemption from other provisions in subpart E applies) as commensurate with the risk associated with the use of agricultural water for the growing, harvesting, packing and holding of covered produce.

With respect to comments about water from public water supplies, in the U.S., Public Water Systems are required under U.S. Environmental Protection Agency (EPA) National Primary Drinking Water Regulations (NPDWR) in 40 CFR part 141 to provide safe, clean water suitable for drinking and thus are at the lowest likelihood for pathogen contamination (Ref. 17). Similarly, public water supplies that meet the microbial requirement in § 112.44(a) are included in the exemption under proposed § 112.43(b)(2) (final § 112.45(b)(1)(ii)) to accommodate other public water supplies that are not governed by the requirements of the EPA drinking water program, but provide water of a quality that meets the microbial requirement of § 112.44(a). See also 78 FR 3504 at 3571. Given the nature of Public Water Systems and public water supplies meeting these requirements and the low likelihood of pathogen contamination of such systems, we consider it appropriate to exempt farms using such water sources as pre-harvest agricultural water for non-sprout covered produce from the requirement to prepare an agricultural water assessment under § 112.43 provided all requirements are met (including that the farm have results or certificates of compliance demonstrating that relevant requirements are met). (See § 112.45(b)(1)(ii) and by reference, § 112.44(c).) In light of the nature of these water sources, we have concluded that to require farms to prepare an agricultural water assessment for such water sources would be more than a science-based minimum standard as described in section 419 of the FD&C Act. We also note that the exemption for public water systems or public water supplies meeting the requirements in § 112.45(b)(1)(ii) is consistent with the exemption from the pre-harvest agricultural water testing requirements in the 2015 produce safety final rule as well as the exemption at § 112.44(c)(1) and (2) from the requirement to test agricultural water used for sprout irrigation and for harvest and post-harvest activities for covered produce.

In consideration of the risks associated with agricultural water uses outlined in § 112.44(a) (including harvest and post-harvest agricultural water), we have also established requirements in subpart E specific to those uses. This includes a stringent microbial quality criterion of no detectable generic *E. coli* per 100 mL of agricultural water and a prohibition on the use of untreated surface water (§ 112.44(a)). We established requirements applicable to the water uses specified in § 112.44(a) in the recognition that such water uses have high potential to serve as a vehicle of fecal contamination because if fecal contamination is present (along with the corresponding potential for pathogen presence), it is reasonably likely it could be transferred directly to covered produce through direct or indirect (via food-contact surfaces) contact with the agricultural water. See 80 FR 74354 at 74440. Moreover, we have established requirements in subpart E that are specific to agricultural water treatment. Specifically, § 112.46 establishes requirements related to treatment efficacy, delivery, and monitoring to ensure that treated agricultural water is safe and of adequate sanitary quality for its intended use and/or meets the relevant microbial quality criterion in

§ 112.44(a), as applicable. We also note that with respect to treated agricultural water, an exemption for water treated in accordance with § 112.46 is consistent with the exemption from the pre-harvest agricultural water testing requirements in the 2015 produce safety final rule as well as the exemption at § 112.44(c)(3) from the requirement to test agricultural water used for sprout irrigation and for harvest and post-harvest activities for covered produce.

We consider the requirements in subpart E that apply for agricultural water treatment, agricultural water used for sprout irrigation and harvest and post-harvest activities on covered produce, and public water systems and public water supplies meeting the requirements in § 112.44(c) to be reasonable and appropriate based on the risk associated with such water sources and practices. We do not consider it necessary or appropriate to require farms to prepare an agricultural water assessment for such water sources and practices, as doing so would be more than a science-based minimum standard as described in section 419 of the FD&C Act. Thus, we decline the request in the comments to broaden the provisions for agricultural water assessments in § 112.43 to apply to all agricultural water.

(Comment 3) While supportive of the general proposed approach for pre-harvest agricultural water assessments, some comments suggest that all farms should be required to test their pre-harvest agricultural water as one part of their agricultural water assessments. Several of these comments suggest that mandatory testing with assessments for all farms would help with objectivity and provide more certainty for farms and regulators. Some comments suggest that if testing is not required for all farms as part of an agricultural water assessment, farms may avoid testing water, lest the results show a need for treatment or other mitigation. Some comments suggest that farms should only be exempt from testing as part of an agricultural water assessment if they can demonstrate that testing is not necessary for public health purposes.

Conversely, some comments express support for what they consider to be a flexible approach to testing in the proposed rule, noting that they found the testing requirements in the 2015 produce safety final rule to be inflexible, expensive, cumbersome, and not risk-based. Some of these comments suggest that testing should not be required for all situations, and that mandatory testing for all farms would create unnecessary economic hardship for farms.

(Response 3) In light of these comments, we considered adding a requirement for all farms to test their pre-harvest agricultural water as one part of their agricultural water assessments. We considered the additional burden that would be imposed on farms by such a requirement and the impacts on public health that might result. For the reasons discussed below, we have concluded that a requirement for all farms to test their pre-harvest agricultural water as part of an assessment would be more than a minimum standard and more than what is reasonably necessary to prevent introduction of hazards and provide reasonable assurances produce is not adulterated under section 402 of the FD&C Act. Thus, we are retaining the requirements for agricultural water assessments and risk-tiered outcomes as proposed, including a requirement in § 112.43(c)(4) to test pre-harvest agricultural water as part of an assessment in certain circumstances.

First, a requirement for all farms to test pre-harvest agricultural water as one part of an assessment is not necessary given the nature of the potential sources of hazards for which immediate action is most critical to protect public health. For example, if a farm's agricultural water system was impacted by the presence of dead sheep in a canal or discharge of untreated sewage into a river, the outcome in § 112.43(c)(1), which requires immediate discontinuation of the relevant use(s) of the water and corrective measures prior to resuming that use, would apply, and agricultural water test results would be unlikely to provide information suggesting that those steps would not be appropriate or necessary to protect public health.

Moreover, requiring all farms to test in such circumstances could undermine public health protections by inadvertently providing farms with a false sense of security as to the quality of their water, potentially resulting in farms not taking action where necessary to protect public health. For example, throughout rulemaking for the 2015 produce safety final rule, we discussed the role of water testing when it comes to understanding and managing water quality, including various challenges with using test results as a direct indicator of the safety agricultural water (78 FR 3504 at 3561–3563; 80 FR 74354 at 74427–74428). Of particular note, we discussed that the presence of indicators does not always signal the presence of pathogens, and the absence of detection of indicators does not guarantee that pathogens are absent (Refs. 27–30). We also discussed that since sampling frequency and location relative to the source of contamination are reported to affect the performance of generic *E. coli* as an indicator of fecal contamination (Refs. 31 and 32), non-detection cannot be considered absolute confirmation that fecal contamination has not occurred. 80 FR 74354 at 74428. We emphasized that we viewed the 2015 requirement outlining the GM and STV criteria as a water management tool for use in understanding the microbial quality of water over time and determining how to appropriately use water from that source, rather than as a direct indicator of the safety or adequacy of the sanitary quality of water for its immediate purposes. 80 FR 74354 at 74430. Further, we acknowledged that while testing water for pathogens allows for direct targeting of microorganisms in water that are a risk to public health, it can also present significant challenges, including those associated with large sample sizes, high costs, and the wide array of potential target pathogens (*i.e.,* the presence or absence of one pathogen may not predict for the presence or absence of other pathogens). See response to comment 91 and 80 FR 74354 at 74427–74428.

Indeed, these challenges with using water test results as a direct indicator of water safety, particularly when it comes to surface water sources, have long been recognized, even before FDA initiated rulemaking to establish the 2015 produce safety final rule (see 78 FR 3504 at 3561–64 and 3567–71 and references cited therein, for example). However, despite the historical record of these challenges, comments received for the current rulemaking indicate that some farms continue to believe that, even under the assessment framework, agricultural water test results should alone dictate the level of risk associated with a water system and whether action related to the farm's pre-harvest agricultural water is warranted (see comment 96). As such, we are concerned that—particularly in circumstances where quick action is most critical to protect public health (*i.e.,* those situations that would lead to the outcomes in § 112.43(c)(1) or (2))—a requirement for all farms to test their water as part of an assessment would result in some farms using test results inappropriately to justify not taking action, to the detriment of public health. Further, a requirement for all farms to test pre-harvest agricultural water as part of an assessment could undermine public health protections by 1) delaying discontinuance and necessary corrective action for water that is not safe or of

adequate sanitary quality for the intended use(s) (per § 112.43(c)(1)), and 2) delaying prompt implementation of mitigation measures to address conditions related to animal activity, BSAAOs, or the presence of untreated or improperly treated human waste on adjacent or nearby lands (per § 112.43(c)(2)).

Of particular note, when testing agricultural water, it can take time to develop a plan, collect samples, test the samples, and analyze the results in the context of the other information evaluated as part of an assessment—particularly when a farm is collecting samples over time to better understand the effects of certain conditions on water quality. As a result, if a farm initially identified a potential source of hazards as part of its assessment and were then to test the farm's agricultural water to better understand that condition, it could delay steps the farm takes to protect public health. This would be particularly problematic when it comes to conditions for which the outcomes in § 112.43(c)(1) and (2) are appropriate. While we considered whether to require farms to immediately discontinue the relevant use of the water until they have agricultural water test results demonstrating safety of the water, we determined that this, too, would not be in the best interest of public health due to the challenges discussed above with using testing results as a direct indicator of the safety of the water and that doing so may result in farms inappropriately using test results to justify not implementing necessary measures.

Moreover, we emphasize that for some farms, a requirement to test their pre-harvest agricultural water as one part of an assessment would impose significant burden without necessarily leading to additional public health benefits. For example, in preparing an agricultural water assessment, a farm that uses water from a pond as pre-harvest agricultural water might find that the pond is at a higher elevation than the surrounding land, and that conditions, such as large numbers of animals, are not present that would be reasonably likely to introduce known or reasonably foreseeable hazards. Depending on the circumstances, the farm might determine, along with the other factors evaluated under § 112.43(a), that the outcome in § 112.43(c)(3) is appropriate and that measures under § 112.45 are not reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces. Because test results would be unlikely to change the farm's determination in this (and similar) situations, and because the farm would not be implementing measures as a result of its assessment findings, requiring the farm to test would impose significant burden on the farm without providing added public health benefit.

In light of the concerns discussed above that a requirement for all farms to test their pre-harvest agricultural water as part of an assessment would provide farms with a false sense of security as to the quality of their pre-harvest agricultural water; delay or preclude action most critical to protect public health; and impose significant burden on farms without commensurate public health benefits, we have concluded that a requirement for all farms to test their pre-harvest agricultural water as part of an assessment would be more than a minimum standard and more than what is reasonably necessary to prevent introduction of hazards and provide reasonable assurances that produce is not adulterated under section 402 of the FD&C Act.

(Comment 4) Some comments suggest that farms should be subject to different requirements depending on the risk associated with their crop, water source, or water use practices (such as the method and timing of water application). For example, several comments suggest that farms that grow certain low-risk crops or that use low-risk irrigation methods should be exempt from preparing an agricultural water assessment and/or from testing their agricultural water. Some comments suggest that farms growing low-risk crops and using low-risk water sources should be allowed to choose whether to conduct agricultural water testing, agricultural water systems inspections under § 112.42(a), or a combination of the two, while those growing higher-risk covered produce or using higher-risk water should be required to conduct both.

(Response 4) This rule, and the produce safety rule of which it is a part, acknowledges and differentiates requirements as appropriate based on the varying risks presented by different crops, water sources, and water use practices. For example, the requirements for agricultural water in subpart E do not apply to water that is not intended to, or not likely to, contact covered produce or food-contact surfaces because we previously concluded that applying the requirements in subpart E to such water is more than what is reasonably necessary for us to require to achieve statutory purposes set forth in section 419 of the FD&C Act (that is, it is not reasonably necessary to apply the requirements to such water to prevent the introduction of known or reasonably foreseeable hazards into produce and to provide reasonable assurances that produce is not adulterated). 80 FR 74254 at 74429.

However, we decline to establish differing requirements for pre-harvest agricultural water based on crop, water source, and/or agricultural water use practices alone.[5] The QAR (Ref. 17) concluded that using crop physical characteristics alone seems to be a poor indicator of which commodities are at a greater or lesser likelihood of contamination that may lead to a foodborne illness outbreak. Rather, the specific conditions and practices associated with a produce commodity also influence the potential routes of contamination and the likelihood that a given route could lead to contamination and illness. Additionally, with respect to water sources, the QAR (Ref. 17) concluded that the microbial quality of source water is one of the key determinants in assessing the relative likelihood of contamination attributable to agricultural water. While noting that surface waters pose the highest potential for contamination and the greatest variability in quality of the agricultural water sources, the QAR also concluded that though less likely to be contaminated than surface water, ground water continues to pose a public health risk, despite the regulation of many U.S. public wells under the Ground Water Regulation. Moreover, ground water sources (such as some wells) may contain deficiencies which, if left uncorrected, can result in hazards being introduced to the water source (Ref. 17).

While we continue to include agricultural water systems, water use practices, and crop characteristics as factors that farms must consider as part of their pre-harvest agricultural water assessments under § 112.43, we emphasize that this information must be considered in concert with the other factors of the systems-based assessment identified in § 112.43(a)(1) through (5). While we have incorporated testing agricultural water as part of a pre-harvest agricultural water assessment under § 112.43(c)(4), farms must not rely on test results alone in making decisions around the safe use of their agricultural

[5] We note that because sprouts present a unique safety risk, the final 2015 produce safety final rule established sprout-specific requirements on multiple topics, including agricultural water. The agricultural water requirements for sprouts are different from the agricultural water requirements for other produce commodities (for example, sprout irrigation water is subject to the microbial criterion and testing requirements in § 112.44(a) and (b)).

water. Rather, results from pre-harvest agricultural water testing serve as an additional source of information for farms to consider alongside the other factors evaluated in § 112.43(a)(1) through (5) in making a determination as to whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce or food contact surfaces with biological hazards associated with agricultural water. See also response to comment 83.

(Comment 5) Several comments request that FDA modify various requirements (such as the requirements for mitigation measures in § 112.45(b), and the definition of ''agricultural water assessment'' in § 112.3) so that farms may consider strategies or other practices already being implemented to control hazards with respect to agricultural water.

(Response 5) We agree that strategies or practices a farm is already implementing to control potential hazards may affect whether a condition is reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces. Further, farms must consider such strategies or practices in complying with various agricultural water requirements. For example, farms must consider the degree of protection of their agricultural water system under § 112.43(a)(1); this includes a situation in which a farm has a berm established that prevents runoff (which may contain hazards) from being introduced to an agricultural water system. As another example, farms must consider their agricultural water practices under § 112.43(a)(2); this includes a situation in which a farm only applies agricultural water from a certain water source to non-sprout covered produce early in the growing season. Farms must consider the relevant strategy or practice, along with the other information evaluated under § 112.43(a)(1) through (5), in determining whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water. As farms must consider such strategies or practices they are currently implementing in complying with the requirements for pre-harvest agricultural water assessments, we do not consider it necessary to revise the requirements related to agricultural water to further emphasize the point.

(Comment 6) Several comments seek clarity on what is expected of farms in terms of assessing water that is outside the scope of ''agricultural water.'' A few comments express concern that in some of the outbreaks cited in the 2021 agricultural water proposed rule, the water used to grow the produce would not have been subject to the requirements in the proposed rule.

(Response 6) We define agricultural water in § 112.3, in part, as ''water used in covered activities on covered produce where water is intended to, or is likely to, contact covered produce or food-contact surfaces.'' If a specific use of water does not fit within the definition of agricultural water, then the requirements in subpart E, including those for pre-harvest agricultural water assessments for non-sprout covered produce, do not apply to that specific use of water. See 80 FR 74354 at 74429.

With respect to comments related to the outbreaks referenced in the 2021 agricultural water proposed rule (86 FR 69120 at 69125–69127) (Refs. 18–23), we acknowledge that a definitive source or route of contamination of the implicated produce could not always be determined. Nevertheless, findings from these outbreaks underscore the potential impacts of adjacent and nearby land uses on agricultural water, which we designed the requirements for pre-harvest agricultural water assessments, in part, to address. See 86 FR 69120 at 69125–69127 and responses to comment 16 and comment 56.

(Comment 7) A few comments state that produce contamination can be attributed to more than agricultural water (*e.g.,* airborne transmission or long-term persistence in soil) and request that FDA include these other methods of pathogen transmission in the proposed rule.

(Response 7) We agree that produce can become contaminated through various routes, including those other than water (Ref. 17). As such, the 2015 produce safety final rule focuses on major routes of microbial contamination—including agricultural water; biological soil amendments; domesticated and wild animals; worker health and hygiene; and equipment, buildings, and tools. This rulemaking, however, focuses specifically on certain requirements in Subpart E of that regulation relating to agricultural water.

(Comment 8) A few comments argue that the scope of the proposed rule is too narrow and FDA should include chemicals and biological toxins in the requirements for agricultural water assessments, since, the comments suggest, these agents pose a potential toxic disease risk to humans. Some comments seek clarity regarding what testing, if any, is expected for non-microbial contaminants, such as heavy metals and chemicals.

(Response 8) We disagree with suggestions to expand the scope of hazards covered by the rule. Section 419(c)(1)(A) of the FD&C Act requires that the 2015 produce safety final rule set forth those procedures, processes, and practices that the Secretary determines to minimize the risk of serious adverse health consequences or death, including procedures, processes, and practices that the Secretary determines to be reasonably necessary to prevent the introduction of known or reasonably foreseeable biological, chemical, and physical hazards and to provide reasonable assurances that the produce is not adulterated under section 402 of the FD&C Act. This language provides FDA with discretion to determine what procedures, processes, and practices are ''reasonably necessary'' for the purposes identified in the statute with respect to the identified types of hazards.

As discussed in the 2015 produce safety final rule, FDA carefully considered different types of hazards and determined that the available data and information clearly establish that human pathogens constitute a biological hazard with the potential to cause serious adverse health consequences or death and result in the vast majority of foodborne illness known to be associated with produce consumption. On that basis we concluded that it was appropriate to establish the 2015 produce safety final rule to cover biological hazards and science-based standards necessary to minimize the risk of serious adverse health consequences or death associated with biological hazards (80 FR 74354 at 74377). Foodborne illness attribution data reported by the Interagency Food Safety Analytics Collaboration (IFSAC) (Refs. 33–35), a tri-agency group created by the Centers for Disease Control and Prevention (CDC), FDA, and U.S. Department of Agriculture's (USDA) Food Safety and Inspection Service, reinforce the significance of biological hazards in produce. See also comment 13.

As further explained in the 2015 final rule, although the potential exists for physical or chemical (including radiological) hazards to contaminate produce, our analysis led us to conclude that non-biological hazards associated with produce rarely pose a risk of serious adverse health consequences or death for individuals that would consume the product. Chemical and physical hazards in produce: (1) occur only rarely at levels that can pose a risk of serious adverse health consequences

or death (*e.g.,* radiological contamination as a result of a nuclear power plant accident); (2) occur with greater frequency, but rarely at levels that can pose a risk of serious adverse health consequences or death (*e.g.,* pesticide or mycotoxin residues); or (3) occur infrequently and usually do not pose a risk of serious adverse health consequences or death (*e.g.,* physical hazards). Moreover, there are other programs in place for monitoring and/or controlling physical and chemical hazards that may contaminate produce. These programs include FDA's routine monitoring of chemical and pesticide residues, other FDA efforts (such as Closer to Zero to address environmental contaminants in food [6]), EPA's registration of pesticides, and various State and industry initiatives. In light of the severity and frequency of occurrence of these hazards in produce, and the existing regulatory structures that apply to these hazards, we concluded that it was not reasonably necessary to establish controls for physical or chemical hazards in the 2015 produce safety final rule. See 80 FR 74354 at 74376–74379.

We note that comments on the 2021 agricultural water proposed rule did not include data or other information demonstrating a need to expand the scope of the pre-harvest agricultural water requirements for covered produce other than sprouts to include chemical and physical hazards, nor is FDA aware of any such data or information. Therefore, we conclude that expanding the scope of the pre-harvest agricultural water requirements for covered produce other than sprouts is not reasonably necessary.

(Comment 9) Some comments seek clarity on which requirements of Subpart E the proposed rule supersedes or replaces.

(Response 9) As finalized with this rule, we are reorganizing subpart E in its entirety to group similar requirements. We note in particular that with this final rule, we are replacing §§ 112.44(b) and 112.46(b) in the 2015 produce safety final rule (microbial criteria and testing requirements, respectively, for pre-harvest agricultural water for covered produce other than sprouts) with requirements for written pre-harvest agricultural water assessments. While the requirement numbers may have changed for agricultural water used for sprouts; agricultural water used during harvesting, packing, and holding activities; and for treatment of agricultural water, this final rule does not substantively alter those standards as established in part 112, subpart E.

Table 3 summarizes the major changes made to the agricultural water provisions in subpart E between the 2015 produce safety final rule and this final rule, including the location of the relevant requirements. The second column does not reflect technical edits made to provisions that were designed to provide added clarity (for example, edits to add descriptive headings). While not reflected in the table below, conforming changes are also being made to §§ 112.12, 112.151, and 112.161(b) in light of our revisions to the microbial water quality criteria in § 112.44(b), the microbial die-off (calculated log reduction) rate in § 112.45(b), and the testing requirements in § 112.46(b) as set forth in the 2015 produce safety final rule. As discussed in sections V.A., we received no comments on these conforming changes and are finalizing them without changes.

TABLE 3—SUMMARY OF CHANGES MADE TO SUBPART E REQUIREMENTS SINCE THE 2015 PRODUCE SAFETY FINAL RULE

Subpart E provisions in the 2015 produce safety final rule	Changes made with this final rule	Location of relevant provision as established with this final rule
§ 112.41: All agricultural water must be safe and of adequate sanitary quality for its intended use.	None	§ 112.41.
§ 112.42: Regularly inspect and maintain all agricultural water systems and implement measures to reduce potential for contact between covered produce and pooled water.	None	§ 112.42.
§ 112.43: If treating agricultural water, ensure that the treatment is effective and that treatment is delivered and monitored appropriately.	None	§ 112.46.
§ 112.44(a): Ensure that water used for certain purposes (for example, for sprouts and for harvest and post-harvest uses) contains no detectable generic *E. coli* per 100 mL and not use untreated surface water for such purposes.	None	§ 112.44(a).
§ 112.44(b): Ensure that water used during pre-harvest activities for covered produce (other than sprouts) meets a GM of 126 generic *E. coli* per 100 mL and a STV of 410 generic *E. coli* per 100 mL.	Replaced with provisions for pre-harvest agricultural water assessments and risk management determinations, with a requirement to test in certain circumstances.	§ 112.43.
§ 112.45(a): Immediately discontinue use (and take corrective measures prior to resuming use) if water is not safe or is not of adequate sanitary quality or if the microbial criterion of no detectable generic *E. coli* per 100 mL is not met for certain uses of water.	None	§ 112.45(a).
§ 112.45(b): Implement risk-reduction measures as soon as practicable but no later than the following year if the GM and STV microbial criteria in § 112.44(b) are not met for pre-harvest water uses for non-sprout covered produce.	Removed pre-harvest microbial criteria and revised to account for pre-harvest agricultural water assessments; expanded measures to include the flexibility to change the water application method to reduce the likelihood of contamination of covered produce or to use an alternative mitigation measure; added expedited timing for mitigation related to certain uses of adjacent and nearby lands.	§ 112.45(b).
§ 112.46(a): There is no requirement to test if farms can demonstrate that water: comes from a Public Water System that meets Safe Drinking Water Act regulations; comes from a public water supply that meets the microbial criterion in § 112.44(a); or is treated in accordance with § 112.43.	Added similar exemptions from the requirements for a written pre-harvest agricultural water assessment.	§ 112.44(c) for exemptions from testing water for uses specified in § 112.44(a); § 112.43(b) for exemptions from requirements for pre-harvest agricultural water assessments.

TABLE 3—SUMMARY OF CHANGES MADE TO SUBPART E REQUIREMENTS SINCE THE 2015 PRODUCE SAFETY FINAL RULE—Continued

Subpart E provisions in the 2015 produce safety final rule	Changes made with this final rule	Location of relevant provision as established with this final rule
§ 112.46(b): For untreated surface water sources used for pre-harvest applications for non-sprout covered produce, establish an initial MWQP with ≥20 samples collected over 2–4 years and update with ≥5 samples per year thereafter; for untreated ground water sources, establish an initial MWQP with ≥4 samples collected over 1 year and update with ≥1 sample per year thereafter.	Replaced with provisions for pre-harvest agricultural water assessments, with a requirement to test in certain circumstances.	§ 112.43.
§ 112.46(c): For untreated ground water used for certain uses in § 112.44(a), initially test ≥4 samples over the course of 1 year and ≥1 sample per year thereafter.	None	§ 112.44(b).
§ 112.47: Ensure that testing is done by the farm or other entity or third-party acting on its behalf, and that water samples be aseptically collected and tested using a method set forth in § 112.151.	None	§ 112.47.
§ 112.48: For water used during harvest, packing, and holding activities, ensure that: water is managed as necessary (such as by establishing and following water change schedules); water is visually monitored for buildup of organic material; and an appropriate temperature differential between the commodity and the water is maintained and monitored.	None	§ 112.44(d).
§ 112.49: For pre-harvest water for non-sprout covered produce, farms may establish alternative microbial criteria, sampling frequencies for untreated surface water sources, or die-off rates between last direct water application and harvest so long as certain requirements are met.	Replaced with provision allowing for alternative mitigation measures to those listed in § 112.45(b)(1)(i) through (v).	§ 112.45(b)(1)(vi).
§ 112.50: Maintain certain records related to the farm's agricultural water, including test results.	Added recordkeeping requirements related to pre-harvest agricultural water assessments; conforming changes to remove records related to microbial criteria and testing for pre-harvest agricultural water.	§ 112.50.

2. Scientific and Public Health Support

(Comment 10) Some comments express concern that FDA lacks scientific support for the proposed rule. Of these, some comments raise general concerns about the state of the science on pre-harvest agricultural water quality as a basis for rulemaking. Other comments focus on the science relating to specific requirements, such as the assessment of crop characteristics, environmental conditions, and potential impacts of cattle operations on adjacent and nearby land, as well as the application of a pre-harvest time interval as a mitigation measure. These include comments focused on how farms will implement the rule with an emphasis on the need for scientific research reflecting real-world conditions for farms in various circumstances.

(Response 10) We disagree with the suggestion that the requirements for pre-harvest agricultural water assessments and risk-tiered outcomes lack scientific support. We address comments on the scientific support for specific provisions in relevant sections of this document. See, for example, comment 16 for discussion of comments of the scientific evidence on potential risks posed by cattle operations and other animal activities on adjacent and nearby lands. We address comments on the scientific support for crop characteristics and environmental conditions as assessment factors in comment 63 and comment 68, respectively. Comment 114 discusses comments on the scientific basis for the 4-day pre-harvest time interval as a mitigation measure.

FDA outlined the history of contamination associated with produce, predominantly during growing, harvesting, packing, and holding, during the rulemaking to establish the 2015 produce safety final rule in part 112. See, for example, 78 FR 3504 at 3507 and 80 FR 74354 at 74731. As part of that rulemaking, we also developed a peer-reviewed QAR, which provides a scientific evaluation of the potential adverse health effects resulting from human exposure to microbiological hazards in produce, including from contaminated water used in growing, harvesting, packing, and holding activities (Ref. 17). With respect to water used during growing, harvesting, and post-harvesting activities, the QAR concludes in part that agricultural water can be a source of contamination of produce and that the microbial quality of source waters, method of application, and timing of application are key determinants in assessing relative likelihood of contamination attributable to agricultural water use practices. The QAR also concludes that while different commodities may have different risk profiles at different stages of production, all commodities have the potential to become contaminated through one or more of the routes identified, especially if practices are poor and/or conditions are insanitary. See also 86 FR 69120 at 69128.

Scientific information has also become available since FDA issued the 2015 produce safety final rule indicating potential limitations in basing risk management decisions on the previous pre-harvest agricultural water testing requirements. For example, various studies indicate a high degree of variability in generic *E. coli* levels in surface waters (Refs. 5–10), which can reduce the precision of estimation of the GM and STV of a water source (Refs. 1, 7). Additionally, a scientific evaluation of the 2015 pre-harvest agricultural water testing requirements found that the rolling data set of five samples per year used to update GM and STV values for untreated surface water sources results in highly uncertain results and delays in detecting shifts in water quality (Ref. 7). Specifically, Havelaar et al. found that the 20-sample MWQP for untreated surface water was not sufficient to reliably characterize the quality of the irrigation water with higher variability in generic *E. coli* levels than assumed in the 2015 produce safety final rule. In simulation modeling, the rolling 20-sample MWQP responded ''very slowly'' to shifts in water quality. Increases in generic *E. coli* levels were detected only after one to six sample sets, thus delaying signals of changes in water quality and (and any needed measures) by one to six years depending on the nature and magnitude of the shift. Havelaar et al. suggested that additional understanding of the processes that drive variability in the

quality of irrigation water sources might inform preventive or rapid corrective actions that have a larger impact on produce safety than the 2015 pre-harvest agricultural water requirements.

Moreover, we have extensively discussed other information that has become available since 2015, such as findings from several produce-related outbreak investigations, that support this rulemaking. In particular, in the 2021 agricultural water proposed rule, we discussed: (1) the spring 2018 *E. coli* O157:H7 outbreak linked to romaine lettuce from the Yuma growing region (Refs. 18 and 19); (2) the fall 2018 *E. coli* O157:H7 outbreak linked to romaine lettuce from California (Ref. 20); (3) the fall 2019 *E. coli* O157:H7 outbreaks linked to romaine lettuce (Ref. 21); (4) the fall 2020 *E. coli* O157:H7 outbreak linked to leafy greens (Ref. 22); and (5) the summer 2020 *Salmonella* Newport outbreak linked to red onions (Ref. 23); that highlight the importance of pre-harvest agricultural water quality and the potential impacts of adjacent and nearby land uses on agricultural water. These outbreak investigations underscore decades of scientific research demonstrating that pre-harvest agricultural water is a potential contributing factor in the introduction and spread of contamination to produce. 86 FR 69120 at 69125–69127. We also discussed foodborne illness attribution data reported by IFSAC (Ref. 33), a triagency group created by the CDC, FDA, and the USDA Food Safety and Inspection Service, that reinforce the significance of biological hazards in produce. 86 FR 69120 at 69127. See also comment 13.

Comments did not indicate what data or information they considered to be lacking or provide information that alters FDA's conclusions made in light of the information referenced above. As such, we have concluded that the scientific information available supports this rulemaking and are finalizing the requirements for pre-harvest agricultural water assessments for non-sprout covered produce. However, we recognize that additional information on the requirements for agricultural water in subpart E will help support farms as they work to come into compliance. We provide information on the agricultural water requirements throughout this final rule, and, to the extent that certain requirements are not substantively changing with this rulemaking (such as the requirements in § 112.42 for agricultural water system inspection and maintenance), in the preamble to the 2015 produce safety final rule. Additionally, we recognize the need to provide farms with education, outreach and technical assistance to facilitate compliance with the rule, and we intend to pursue various mechanisms, such as publishing guidance, holding webinars, and developing other educational resources, including work with other stakeholders (such as State agencies, educators, and extension agents), to do so.

(Comment 11) Some comments express concern that FDA changed the pre-harvest microbial quality and testing requirements in the 2015 produce safety final rule in response to industry concerns, rather than in an effort to improve public health.

(Response 11) We are issuing this final rule having determined that it will enhance public health protections by setting forth requirements for comprehensive, systems-based agricultural water assessments evaluating a broad range of factors that may impact the quality of pre-harvest agricultural water to assist farms in identifying and managing risks using appropriate corrective and mitigation measures, including expedited mitigation in certain circumstances. As discussed in the proposed rule, this comment response, and elsewhere in this rule, these revisions to the 2015 produce safety final rule reflect findings of our QAR (Ref. 17), new information we have gathered since publication of the 2015 produce safety final rule (including findings from several produce-related outbreaks), as well as information and feedback from an array of stakeholders, including the produce industry, educators, researchers, and regulators. As discussed in response to comment 1, we continue to conclude that the requirements for systems-based agricultural water assessments and risk-management determinations are consistent with our mandate to establish science-based minimum standards for the safe production and harvesting of produce to minimize the risk of serious adverse health consequences or death. As such, we disagree with comments suggesting that we are making these revisions to the 2015 produce safety final rule in response to industry concerns alone, and not in an effort to improve public health.

As part of rulemaking for the 2015 produce safety final rule, we developed a peer-reviewed QAR (Ref. 17), which provides a scientific evaluation of the potential adverse health effects resulting from human exposure to microbiological hazards in produce, including from contaminated water used in growing, harvesting, packing, and holding activities (Ref. 17). In part, the QAR discusses that public drinking water is generally considered the least likely to serve as a source of contamination, followed by ground water, surface water protected from runoff, and surface water unprotected from runoff. The QAR also notes that where contamination in a water source is known to exist, the likelihood of contamination is a function of contact with the commodity (example, whether contact is indirect or direct); commodity effects (characteristics) (for example, whether the surface is conducive to adhesion); and application timing (for example, early or late in crop growth). These factors—the water source, method and timing of water application, and commodity characteristics—are all reflected in the requirements for comprehensive agricultural water assessments under § 112.43(a) due to the impact they can have on risk associated with pre-harvest agricultural water use.

Further, findings from investigations of several outbreaks linked to consumption of produce that have occurred since 2015 (Refs. 18–23) highlight the importance of pre-harvest agricultural water quality and the potential impacts of adjacent and nearby land uses on agricultural water. These outbreak investigations underscore decades of scientific research demonstrating that pre-harvest agricultural water is a potential contributing factor in the introduction and spread of contamination to produce. 86 FR 69120 at 69125–69127. Findings from our investigations into these outbreaks also informed the requirements that we are finalizing here—in particular, the requirement in § 112.43(c)(2) for expedited mitigation for conditions related to animal activity, BSAAOs, and untreated or partially treated human waste associated with adjacent and nearby lands.

With respect to feedback from stakeholders in the regulated community, as described further in response to comment 14, we designed the requirements for pre-harvest agricultural water assessments, in part, by taking into account the realities of many agricultural operations that resulted in the 2015 pre-harvest agricultural water testing requirements being challenging, and in some cases, impossible, for farms to implement. For example, while the long-term MWQPs required in the 2015 produce safety final rule can be difficult, and even impossible, to establish for farms that grow rotational crops or on leased land, we have incorporated flexibility in the requirements for the once-annual assessments we are finalizing with this rule to allow farms to account for these realities, which will assist farms in better evaluating and making decisions

regarding the use of pre-harvest agricultural water as appropriate to their unique operations and circumstances.

However, we emphasize that this rule is reflective of information and insights from stakeholders beyond just the regulated industry. For example, the pre-harvest agricultural water requirements were the focus of a 2-day Agricultural Water Summit, convened by the Produce Safety Alliance, in February 2018 (Ref. 4). The summit was attended by academics, produce industry, growers/grower associations, State agencies, Federal agencies, and supporting industries. During the summit, participants had many questions and concerns about water testing, what the information tells them about risks, and how to use that information to make water use management decisions. Participants also had questions about the generic *E. coli*-based standards in the 2015 produce safety final rule and suggested that the testing frequency required to establish a MWQP for surface or ground water sources lacked the necessary science to support its relevance to public health outcomes. Many of the discussions at the summit addressed hazards in the growing environment, including examples of how risk assessment has been conducted in other fields of study, such as for drinking water and wastewater management. During the summit, participants identified ''agricultural water assessments'' as a promising approach for managing water quality, suggesting that assessments may provide a more effective risk management strategy to farms than a numerical testing standard can provide.

Additionally, information has become available since issuing the 2015 produce safety final rule indicating potential limitations in basing risk management decisions on the previous pre-harvest agricultural water testing requirements. For example, various studies indicate a high degree of variability in generic *E. coli* levels in surface waters (Refs. 5–10), which can reduce the precision of estimation of the GM and STV of a water source (Refs. 1, 7). Other studies have further contributed to our knowledge about the limitations of generic *E. coli* as an indicator for pathogen presence (Refs. 11–16). Further, a scientific evaluation of the 2015 pre-harvest agricultural water testing requirements found that the rolling data set of five samples per year used to update GM and STV values for untreated surface water sources results in highly uncertain results and delays in detecting shifts in water quality (Ref. 7). Havelaar et al. suggested that while increasing the number of samples might address these issues, doing so would increase costs and would not be an effective or efficient way to control the microbial quality of agricultural water sources. Rather, they suggested, additional understanding of the processes that drive variability in the quality of irrigation water sources might inform preventive or rapid corrective actions that have a larger impact on produce safety than the 2015 pre-harvest agricultural water requirements (Ref. 7).

While we established the 2015 pre-harvest agricultural water testing requirements as a long-term strategy to ensure that farms understand the quality of their water, pay attention to changes that may affect water quality, and make appropriate decisions about use of that water (80 FR 74354 at 74458), we recognize that if farms focus too heavily on results of microbial testing and whether quantitative metrics are met, they may be left with a false sense of security as to the quality of their water, and as a result, not investigate for conditions that may warrant further action to protect public health. Indeed, rather than relying on results of a multi-year rolling profile that might not always reflect a need for mitigation or elicit a timely reaction from farms to address potential hazards (Ref. 7), the approach we are finalizing here establishes requirements for measures that are directly responsive to the conditions identified as part of an assessment and requires that farms implement those measures within specific timeframes based on risk. Further, as our FRIA indicates (Ref. 26), the increase in costs associated with this rule compared to the 2015 pre-harvest agricultural water testing requirements is largely a result of more mitigation occurring in response to findings from pre-harvest agricultural water assessments than as a result of the previous testing requirements. As also discussed in the FRIA, we estimate likely greater benefits under the requirements we are finalizing here, with more mitigation occurring in response to assessment findings than in response to the testing approach in the 2015 produce safety final rule.

In light of the foregoing, we disagree with comments suggesting that we are replacing the previous pre-harvest agricultural water testing requirements with requirements for agricultural water assessments and risk-management determinations in response to industry concerns alone, and not in an effort to improve public health. We continue to consider it appropriate to pursue an alternative approach to the 2015 pre-harvest agricultural water testing requirements that protects public health and is adaptable for use in diverse circumstances. As such, with this rule, we are replacing the pre-harvest agricultural water testing requirements in the 2015 produce safety rule for covered produce other than sprouts with requirements for systems-based agricultural water assessments that are designed to achieve improved public health protections, while also being more feasible to implement across the wide variety of agricultural water systems, uses, and practices, and adaptable to future advancements in agricultural water quality science.

3. Options for Regulatory Approach

(Comment 12) A few comments suggest that issuing guidance would be a more appropriate approach to addressing pre-harvest agricultural water than rulemaking.

(Response 12) As discussed in the 2021 agricultural water proposed rule, FDA considered various options to address stakeholder concerns about complexity and practical implementation challenges with the pre-harvest agricultural water testing requirements in the 2015 produce safety final rule, one of which entailed developing additional guidance to support the requirements that were outlined in the 2015 produce safety final rule. We concluded that issuing additional guidance alone would not adequately address the practical implementation issues associated with the pre-harvest agricultural testing requirements in the 2015 produce safety final rule. For example, we contemplated issuing additional guidance to describe circumstances in which farms might satisfy the pre-harvest sampling and testing requirements through shared data with other farms. However, there are several limitations with this option, including challenges related to establishing data-sharing arrangements and difficulties in establishing such programs given the diversity of agricultural water systems and the 2015 requirements related to sample collection timing. Moreover, guidance alone could not overcome difficulties related to rotational crops or growing non-sprout covered produce on leased land, in which a farm may not be using (or have access to) the same water source over multiple years. See also response to comment 14. Further, while subpart P of the 2015 produce safety final rule allows requests for variances from one or more requirements of part 112, under § 112.171, only States, Federally recognized tribes, or countries from which food is imported into the

United States are able to make such a request. See 86 FR 69120 at 69129.

Comments received on the 2021 agricultural water proposed rule do not provide new information on overcoming these practical implementation challenges through the issuance of guidance alone. As such, we have concluded that guidance alone would not adequately address the practical implementation issues associated with the pre-harvest agricultural testing requirements in the 2015 produce safety final rule.

(Comment 13) Some comments state that FDA did not directly address why the option to conduct a risk assessment and research followed by rulemaking was not chosen, suggesting that the Agency moved forward with the proposed rule despite lacking sufficient information.

(Response 13) As discussed in the 2021 agricultural water proposed rule, FDA considered whether to conduct another risk assessment, followed by a rulemaking to revise the pre-harvest agricultural water testing requirements. We also considered whether to issue guidance on pre-harvest agricultural water based on industry standards while additional research is conducted, followed by rulemaking to revise the pre-harvest agricultural water testing requirements. For the reasons discussed below, we continue to conclude that it is not necessary for additional risk assessment or research to take place before conducting or finalizing this rulemaking.

As part of the rulemaking to establish the 2015 produce safety final rule in part 112, we developed a peer-reviewed QAR, which provides a scientific evaluation of the potential adverse health effects resulting from human exposure to microbiological hazards in produce, including from contaminated water used in growing, harvesting, packing, and holding activities (Ref. 17). In considering the option to conduct a risk assessment or additional research followed by a rulemaking to revise the pre-harvest agricultural water testing requirements, FDA reviewed the conclusions of the QAR. With respect to water used during growing, harvesting, and post-harvesting activities, the QAR concludes as follows:

- Agricultural water can be a source of contamination of produce.
- Public drinking water systems (domestically regulated by the EPA) have the lowest relative likelihood of contamination due to existing standards and routine analytical testing.
- Though less likely to be contaminated than surface water, ground water continues to pose a public health risk, despite the regulation of many U.S. public wells under the Ground Water Regulation.
- There is a significant likelihood that U.S. surface waters will contain human pathogens, and surface waters pose the highest potential for contamination and the greatest variability in quality of the agricultural water sources.
- Susceptibility to runoff significantly increases the variability of surface water quality.
- Water that is applied directly to the harvestable portion of the plant is more likely to contaminate produce than water applied by indirect methods that are not intended to, or not likely to, contact produce.
- Proximity of the harvestable portion of produce to water is a factor in the likelihood of contamination during indirect application.
- Timing of water application in produce production before consumption is an important factor in determining likelihood of contamination.
- Commodity type (growth characteristics, *e.g.,* near to ground) and surface properties (*e.g.,* porosity) affect the probability and degree of contamination.
- Microbial quality of source waters, method of application, and timing of application are key determinants in assessing relative likelihood of contamination attributable to agricultural water use practices.

The QAR (Ref. 17) discusses that potential contributing factors cited in produce-associated outbreaks where water was identified as the likely source of contamination include runoff from nearby animal pastures and feed lots, raw sewage, and surface waters contaminated with feces (Ref. 36).

We have also considered scientific information that has become available since issuing the 2015 produce safety final rule indicating potential limitations in basing risk management decisions on the previous pre-harvest agricultural water testing requirements. For example, various studies indicate a high degree of variability in generic *E. coli* levels in surface waters (Refs. 5–10), which can reduce the precision of estimation of the GM and STV of a water source (Refs. 1, 7). Other studies have contributed to our knowledge about the limitations of generic *E. coli* as an indicator for pathogen presence (Refs. 11–16). Further, a scientific evaluation of the 2015 pre-harvest agricultural water testing requirements found that the rolling data set of five samples per year used to update GM and STV values for untreated surface water sources results in highly uncertain results and delays in detecting shifts in water quality (Ref. 7). Havelaar et al. suggested that additional understanding of the processes that drive variability in the quality of irrigation water sources might inform preventive or rapid corrective actions that have a larger impact on produce safety than the 2015 pre-harvest agricultural water requirements.

In addition to the findings from the QAR and scientific information on the previous pre-harvest agricultural water testing requirements that has become available since 2015, we considered conclusions from the 2019 IFSAC report (Ref. 33), and more recently, the 2020 and 2021 IFSAC report (Refs. 34 and 35, respectively), which reinforce the significance of biological hazards in produce. We also considered FDA's experience with investigations of produce-related outbreaks that occurred since we issued the 2015 produce safety final rule (Refs. 18–23), which underscore the importance of pre-harvest agricultural water quality and highlight the potential impacts of adjacent and nearby land uses on agricultural water, which can serve as a route of contamination of produce. 86 FR 69120 at 69125–69127. These sources of information helped to inform the requirements we are finalizing here—in particular, the requirement for expedited mitigation for known or reasonably foreseeable hazards related to certain activities associated with adjacent or nearby lands in light of findings from several produce outbreak investigations—and further support the conclusions of our QAR (Ref. 17). See also response to comment 10.

Commenters did not indicate what data or information they felt was lacking regarding the option to conduct an additional risk assessment, nor did they provide information demonstrating that our conclusions in the proposed rule regarding that option were inappropriate. Therefore, we continue to conclude that it is not necessary for FDA to conduct an additional risk assessment or research before conducting rulemaking to establish new pre-harvest agricultural water standards. Further, given that the requirements for assessments are well-grounded in science, we do not consider it necessary to establish interim guidance based on industry standards in lieu of the requirements we are finalizing here.

While we do not consider it necessary to conduct additional risk assessment or research in order to establish standards for pre-harvest agricultural water, we note that the requirements for agricultural water assessments are designed, in part, to be adaptable to scientific advancements. To the extent

that risk assessment and/or additional research related to pre-harvest agricultural water may continue to develop in the future, farms may use such information as an additional resource to further inform their agricultural water assessments under the approach we are finalizing here.

(Comment 14) A few comments express a preference for pre-harvest agricultural water testing requirements in the 2015 produce safety final rule compared to the proposed pre-harvest agricultural water assessments because, the comments suggest, many farms have already worked towards compliance with the 2015 testing requirements.

(Response 14) We understand that not all farms may have faced challenges with the pre-harvest microbial quality and testing requirements in the 2015 produce safety final rule. However, in light of frequent, consistent feedback from industry stakeholders regarding challenges associated with the pre-harvest microbial quality and testing requirements, as well as information and insights from other relevant stakeholders (such as academic researchers), findings of our QAR (Ref. 17), and new information gathered since publication of the 2015 produce safety final rule, we concluded that the most appropriate regulatory approach is to undertake rulemaking. See 86 FR 69120 at 69129–69130. As discussed further in response to comment 10, we continue to consider it appropriate to pursue and finalize an alternative approach that is adaptable for use in diverse circumstances. Thus, we are finalizing requirements for pre-harvest agricultural water assessments that are designed to achieve improved public health protections, while also being more feasible to implement across the wide variety of agricultural water systems, uses, and practices, and adaptable to future advancements in agricultural water quality science. We designed the requirements for pre-harvest agricultural water assessments to be flexible to account for the diversity of water systems, commodities, and operations that exist across industry, which included, as discussed below, taking into account the realities of many agricultural operations that resulted in the 2015 pre-harvest agricultural water testing requirements being challenging, and in some cases, impossible, for farms to implement.

For example, feedback on the 2015 pre-harvest agricultural water testing requirements indicated that long-term MWQPs can be difficult, and even impossible, to establish for farms that grow rotational crops or on leased land, both of which are widespread throughout the produce industry (Refs. 3 and 4). It has further been suggested that the financial investment needed to develop a long-term profile for a water source that is only used every few years may not result in commensurate food safety benefits (Ref. 4). Conversely, the requirements for once-annual assessments that we are finalizing here incorporate flexibility to allow farms to account for these realities. Such flexibility will assist farms in better evaluating and making decisions regarding the use of pre-harvest agricultural water as appropriate to their unique operations and circumstances, allowing risk-management decisions to be made even in the absence of historical knowledge of a water system. See also comment 35.

Farms with multiple water sources, for example, would face significant logistical challenges in complying with the 2015 testing requirements, since separate MWQPs would be required for each source (Ref. 4). These challenges would be particularly difficult to navigate for farms that grow multiple types of covered produce using different water application timings, given the 2015 requirements for samples to be representative of use and collected as close in time as practicable to, but prior to, harvest. As discussed further in response to comment 34, while we acknowledge that farms using multiple agricultural water systems during pre-harvest activities for covered produce (other than sprouts) will need to conduct an assessment for each system, several of the factors evaluated in the assessment might be similar across agricultural water systems, thus limiting the amount of information a farm needs to collect and consider. Further, the pre-harvest agricultural water assessments enable farms to focus on the key determinants of contamination risks, without doing so in a way that will add significant burden to stakeholders.

Additionally, while data-sharing is one way that implementation challenges associated with 2015 pre-harvest agricultural water testing requirements may have been reduced, such data-sharing programs among multiple parties could be difficult (or impossible) to establish due to the aforementioned 2015 requirements for samples to be representative of use and collected close to harvest (Refs. 3 and 4). Conversely, the requirements for pre-harvest agricultural water assessments were built to be flexible enough for farms to consider and adjust for their unique circumstances without having to rely on others' actions in order to make use of the inherent flexibility. Moreover, because farms that test their water in accordance with § 112.43(c)(4)(ii) will be testing to better understand a narrow set of circumstances using an approach that incorporates greater flexibility related to sample collection requirements, concerns about testing burden associated with the 2015 pre-harvest agricultural water testing requirements are largely addressed with this rule.

Thus, although we recognize that some farms may not have faced practical implementation challenges with the 2015 pre-harvest agricultural water testing requirements, we continue to conclude that the requirements for pre-harvest agricultural water assessments achieve public health protections, while also being more feasible to implement across the diversity of farms and their agricultural water systems, uses, and practices. To the extent that some farms may be testing their pre-harvest agricultural water using the 2015 (or other) approach, we emphasize that nothing in this rule precludes them from continuing to do so, as long as they also comply with the requirements we are finalizing here, as applicable.

4. Responsibility

(Comment 15) Some comments, while generally supportive of the proposed pre-harvest agricultural water assessments, voice concern that farms will be required to account for and manage hazards that are outside the farm's control (for example, hazards that may be introduced by other water users or adjacent and nearby land uses). Some comments indicate that the Clean Water Act (CWA) requires State and/or Federal governments to hold polluters accountable, suggesting that it is therefore unjust to place that responsibility on farms. One comment suggests that irrigation districts should not allow livestock to graze in open drains, as doing so will introduce risk for downstream users who do not have control over that activity.

(Response 15) We recognize that farms may have little or no control over factors such as weather events, other water users, and adjacent and nearby lands. However, considering factors such as these, which may affect the quality of water source(s) even though they are not necessarily under a farm's control, is an important part of evaluating whether a farm's water source(s) meets the requirement in § 112.41 that agricultural water must be safe and of adequate sanitary quality for its intended use. Considering these factors under § 112.43(a), will help farms determine the appropriate and safe use of the agricultural water from their water source(s).

Further, we recognize that the CWA (33 U.S.C. 1251 *et seq.*) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters (Ref. 37). Under the CWA, the EPA has implemented pollution control programs and developed national water quality criteria recommendations for pollutants in surface waters. We recognize that hazards may be introduced into an agricultural water system under conditions that may or may not be covered by the CWA and that in many instances, this may occur before an agricultural water system comes under a farm's control. We emphasize that farms are not required to mitigate such hazards at the location where they originate, nor are farms expected to take action against other entities that may be introducing contaminants into a water system. Rather, farms are required to assess potential impacts from activities on nearby and adjacent lands and/or other water users on the quality of their agricultural water and, as appropriate, implement measures that are under the farm's control to reduce the risk associated with that water source or system to protect public health. For example, depending on the circumstances, this might entail the use of earthen berms on land that is under the farm's control to divert runoff from a nearby land use from entering the farm's surface water source. See also response to comment 105.

Additionally, we recognize the need to provide farms with outreach and education to facilitate compliance with the rule, including in those situations where hazards may originate outside of a farm's control. We are also aware of efforts underway to bring together members of agricultural communities on a large scale to further conversations and encourage discussions between land users in agricultural areas. For example, the California Agricultural Neighbors (CAN) Initiative is designed to provide an opportunity to foster collaboration and discuss enhanced neighborly food safety practices when various agricultural operations such as leafy green fields, cattle ranches, vineyards and compost sites are adjacent to one another (Ref. 38). Various action items have been identified as part of CAN, one of which entails steps that can be taken to foster neighbor-to-neighbor interactions and conversations (Ref. 39). See also response to comment 33. As efforts such as these progress, farms may consider participating as an additional means to help address crosscutting food safety issues.

(Comment 16) Some comments suggest that cattle producers will be negatively impacted by the requirement that farms assess the use of nearby and adjacent land. These comments suggest that the proposed rule implies that adjacent or nearby cattle operations increase food safety risks for produce farms without sufficient scientific justification. Comments also request clarification that cattle operations are not required to change practices in order to assist produce farms in complying with the rule.

(Response 16) As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69135–69136), it is well established in the literature that animal activities on adjacent and nearby lands—including grazing, livestock operations, and wildlife intrusion—may introduce contamination to surface and ground water through runoff and through direct access by animals to waterways (Refs. 40–43). Moreover, we discussed in the proposed rule various produce related outbreaks (Refs. 18–22) in which investigators noted presence of concentrated animal feeding operations (CAFOs) or cattle grazing operations as potential sources of contamination to agricultural water systems and covered produce. See 86 FR 69120 at 69125–69127. In light of this information and findings from several produce related outbreaks, we consider it important for farms to evaluate animal impacts and activities in identifying conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces as part of their agricultural water assessments.

We acknowledge the longstanding colocation of animals and plant food production systems in agriculture and note that this rule does not prohibit the presence of animals on or near a farm, nor does it establish requirements or responsibilities for entities other than farms covered by the rule. Rather, the rule requires a farm to conduct an agricultural water assessment for hazard identification purposes and take any measures that are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with its pre-harvest agricultural water. This may involve, for example, the farm implementing measures that are within its control, such as changing the method of water application under § 112.45(b) to reduce the likelihood of contamination of the covered produce.

5. Other Food Safety Standards

(Comment 17) Several comments note that many farms are already subject to third-party water quality standards that some produce farms follow. Comments seek clarity on whether the proposed rule aligns with these standards and, if some third-party standards are more stringent than FDA's regulation, whether an audit to those standards could be used to meet the rule's requirements.

(Response 17) We acknowledge the important role third-party standards may play in ensuring food safety and questions about alignment of FDA's produce safety rule requirements and third-party standards. For example, in 2018, FDA and USDA announced the alignment of the USDA Harmonized Good Agricultural Practices Audit Program (USDA H–GAP) with the requirements in the 2015 produce safety final rule (Ref. 44), which preceded both the 2021 agricultural water proposed rule and this final rule. In the announcement, we explained that while the requirements of both programs are not identical, the relevant technical components in the 2015 produce safety final rule are covered in the USDA H–GAP Audit Program. We also explained that the alignment will help farms by enabling them to assess their food safety practices as they prepare to comply with the produce safety rule. However, we also noted that USDA audits are not a substitute for FDA or state regulatory inspections.

In October 2023, FDA announced the final results of a voluntary pilot program on alignment of private third-party food safety audit standards with applicable FDA regulations (Ref. 45). It included a third-party primary production standard for non-sprout produce that we found to be in alignment with applicable provisions of the produce safety regulation—except for the subpart E agricultural water requirements that were excluded from the review as they were under reconsideration through this rulemaking. Our conclusion from the pilot is that FDA currently does not have adequate resources to review and evaluate the alignment of third-party food safety standards beyond the pilot—notwithstanding the value that such standards may have in facilitating industry's implementation of FSMA and the potential of these audits to inform risk prioritization. FDA will continue to assess future opportunities but is unable to undertake any additional alignment reviews at this time, including review of third-party standards for pre-harvest

agricultural water for non-sprout produce.

Finally, as a general matter, a determination of alignment alone does not indicate that a farm audited to that standard is necessarily in compliance with the 2015 produce safety final rule. While a determination of alignment may help farms as they prepare to comply with requirements in the 2015 produce safety final rule, as discussed above, audits conducted under third-party standards found to be in alignment are not a substitute for FDA or State regulatory inspections.

(Comment 18) Some comments seek clarity on whether the proposed approach for pre-harvest agricultural water assessments is intended to be similar to a HACCP approach.

(Response 18) As discussed in response to comment 1, the annual pre-harvest agricultural water assessments employ a prevention-oriented quality-systems approach to food safety regulation that FDA has long used for the highly diverse food industry that FDA regulates. For example, FDA's juice HACCP regulation (21 CFR part 120), seafood HACCP regulation (21 CFR part 123), and Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food regulation (21 CFR part 117), establish frameworks under which industry qualitatively assesses, and as necessary, controls, potential hazards as appropriate to their operations. While we believe that a HACCP approach—particularly at the level required in parts 120, 123, and 117—would not necessarily be appropriate at the farm level (80 FR 74354 at 74379), many of the principles of HACCP can still be applied, such as an assessment of risk and the development of a food safety plan based on that assessment, and we have incorporated elements such as these within the requirements for pre-harvest agricultural water assessments in § 112.43.

6. Other Comments

(Comment 19) A few comments note the phrasing in the proposed rule that assessments are designed to be ''adaptable to future advancements in agricultural water quality science'' and express concerns that this language implies that FDA will make significant implementation decisions in the future without public discussion and input. A few comments seek clarity on whether and how emerging science or additional information relevant to agricultural water assessments will be incorporated into trainings.

(Response 19) We acknowledge that water quality science is expected to evolve over time, and we have designed the rule to achieve improved public health protections, while also being feasible to implement across the wide variety of agricultural water systems, uses, and practices, and adaptable to future scientific advancements. For example, we discuss in response to comment 115 that as more studies are conducted that examine in-field die-off for various circumstances (for example, different regions, environmental conditions, commodities, pathogens, and crop growth characteristics) (Refs. 46–49), farms may use that information to inform a time interval between last direct water application and harvest under § 112.45(b)(1)(ii). We anticipate that as new information becomes available, it will be shared with farms and other interested stakeholders through various mechanisms, including guidance in accordance with our good guidance practices regulation, 21 CFR 10.115, which generally provides an opportunity for public comment before a guidance document is finalized.

Additionally, new information and scientific advancements will likely be incorporated into training programs and other education and outreach materials in order to increase awareness by farms. For example, we are aware that food safety trainings intended to be specific to certain commodities (or commodity groups) have been held, which could be a mechanism in the future by which information relevant to specific commodities will be shared. We are also aware of research organizations and universities that prioritize sharing their findings with the produce industry and related stakeholders. We also expect that as new science relates to region-specific considerations, local extension agents will play an important role in disseminating that information to interested parties.

(Comment 20) A few comments express concerns that the rule will result in farms increasing their reliance on ground water sources, which could be in conflict with the goals of certain state laws designed to help protect ground water resources. For example, some comments suggest that the exemption from the requirements to prepare an agricultural water assessment in proposed § 112.43(b)(1) related to untreated ground water will incentivize farms to make greater use of already-stressed resources. Several comments suggest that changing from surface water to ground water as a way to reduce risk associated with agricultural water may be difficult for some farms due to existing conservation laws.

(Response 20) We are not requiring farms to change their water sources, either for the purposes of an exemption from the requirements to prepare a pre-harvest agricultural water assessment or as a mitigation measure. Rather, we have incorporated flexibility to provide farms viable options to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water without needing to alter the source of agricultural water. See also response to comment 124.

In the Environmental Impact Statement (EIS) that was prepared during rulemaking for the 2015 produce safety final rule (Ref. 50), we discussed that, based on our qualitative analysis, we did not consider impacts to water resources to be significant, with the potential exception related to ground water withdrawal, where existing significant adverse long-term impacts (*i.e.,* water drawdown, potential subsidence, and the related continued degradation of water quality) may continue to be exacerbated as a result of excessive ground water use.

We also noted that we did not anticipate that the approach taken for pre-harvest agricultural water in the 2015 produce safety final rule (*i.e.,* microbial criteria consisting of a GM and STV, with various actions a farm may take if the GM and/or STV are exceeded) would result in farms on a regional or national scale switching to ground water sources. For example, stakeholder feedback indicated that allowing for microbial die-off between last irrigation and harvest and/or microbial reduction or removal resulting from post-harvest practices provides farms viable options to meet the microbial quality criteria without needing to, for example, treat water or switch to a ground water source (Ref. 50).

Under this rule, those mitigation measures remain available as options. Further, with this rule we are incorporating additional mitigation measures beyond those in the 2015 produce safety final rule to provide farms with even more flexibility in ways to manage risks associated with pre-harvest agricultural water. (Specifically, this rule adds mitigation measures for changing the method of water application or taking an alternative mitigation measure in accordance with § 112.45(b)(1)(iv) and (vi), respectively.). We have provided various options for mitigation measures encompassing a range of possible costs (see the FRIA (Ref. 26)) to provide farms with

flexibility in managing risks associated with their agricultural water as appropriate to their agricultural water systems, water use practices, and unique circumstances. Given the various options farms have under this rule, including options that involve more targeted changes (such as making necessary repairs to agricultural water systems), we do not expect farms to preferentially alter the source of their agricultural water as a mitigation measure or for the purposes of an exemption from the requirements to prepare a pre-harvest agricultural water assessment.

As discussed in the Agency's finding of no significant impact for the current rulemaking and the evidence supporting that finding (Refs. 51–53), the potential number of farms that could switch to ground water, potentially exacerbating drawdown, would be reduced compared with the 2015 produce safety final rule with the revisions to the subpart E provisions we are finalizing here (Ref. 50). No significant adverse environmental impacts have been identified with this rule. See also section VIII.

(Comment 21) FDA received several comments related to conservation practices and environmental protection programs, which generally appear to be out of scope. Specifically, commenters urge FDA to encourage the co-management of food safety, conservation, and environmental protection. A few comments request that guidance and training on the rule for covered farms and inspectors acknowledge that animals and covered farms can co-exist, noting that this is especially important when it comes to conservation practices and/or diversified farms. In addition, one comment discusses state programs providing incentives for farmers to implement climate and environmentally friendly agricultural practices, such as use of energy-efficient irrigation systems, healthy soil practices (such as compost application), and establishment of seasonal and/or permanent vegetation for pollinators and wildlife. The comment expresses concern that farms may not participate in such environmental stewardship programs if doing so might be in conflict with the proposed requirements for pre-harvest agricultural water assessments. Further, comments recommend that FDA work with stakeholders to develop solutions that will help farmers co-manage such environmental sustainability goals with food safety.

(Response 21) As indicated, FDA considers these comments to generally be outside the scope of this rulemaking. However, to the extent they are in scope, FDA acknowledges the longstanding co-location of animals and plant food production systems in agriculture. 80 FR 74354 at 74482. As discussed in the 2021 agricultural water proposed rule, this rule does not prohibit the presence of animals (such as grazing animals or working animals) on a farm, nor does it require the destruction of wildlife habitat or the clearing of farm borders. Rather, the rule requires farms to evaluate and take measures to prevent the introduction of known or reasonably foreseeable hazards into or onto non-sprout covered produce or food contact surfaces by pre-harvest agricultural water. 86 FR 69120 at 69135.

Additionally, as discussed in the 2015 produce safety final rule, we continue to encourage the co-management of food safety, conservation, and environmental protection. We consider it important to take into account the environmental practice standards and policies of other agencies in the context of food safety. 80 FR 74354 at 74365. We believe that the provisions of part 112 are consistent with existing conservation and environmental practice standards and policies and are not in conflict with Federal or State programs. In addition, § 112.84, which we did not propose to change, codifies a statement that the requirements of part 112 do not require or permit the use of practices in violation of the Endangered Species Act (16 U.S.C. 1531–1544), and that the regulation does not require the use of practices that may adversely affect wildlife, such as removal of habitat or wild animals from land adjacent to produce fields. 80 FR 74354 at 74365.

C. Definitions (§ 112.3)

We proposed to add two new definitions for ''agricultural water assessment'' and ''agricultural water system'' in § 112.3 to provide clarity for terminology used in the proposed requirements for pre-harvest agricultural water assessments. We received several comments on those proposed definitions and respond to comments about these definitions in the following paragraphs. We are finalizing the definitions for ''agricultural water assessment'' and ''agricultural water system'' as proposed, without changes.

1. Agricultural Water Assessment

(Comment 22) Several comments express support for the definition of ''agricultural water assessment,'' noting that the assessment, as defined, provides broad, science-based flexibility so as to be applicable to a wide variety of growing scenarios. One comment suggests the definition be revised to include an assessment of the severity of illness and injury from the hazard and the probability that the hazard will occur. Another comment recommends that FDA clarify in its definition of ''Agricultural Water Assessment'' that the assessment must be in written form.

(Response 22) We considered these comments, and as discussed below, are finalizing the definition of ''agricultural water assessment'' as proposed, without changes. An ''agricultural water assessment'' means an evaluation of an agricultural water system, agricultural water practices, crop characteristics, environmental conditions, and other relevant factors (including test results, where appropriate) related to growing activities for covered produce (other than sprouts) to: (1) identify any condition(s) that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces and (2) determine whether measures are reasonably necessary to reduce the potential for contamination of covered produce or food contact surfaces with such known or reasonably foreseeable hazards (§ 112.3).

With respect to comments suggesting the definition be revised to capture the severity of illness and injury from the hazard and the probability that the hazard will occur, we note that as discussed in response to comment 27 and comment 76, the requirements for agricultural water assessments provide a mechanism through which farms evaluate the risk associated with their pre-harvest agricultural water and use that information to determine whether measures are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water. See also comment 18, where we discuss comments related to HACCP. As such, we do not consider this a necessary change to make. In response to comments suggesting that the definition of ''agricultural water assessment'' be revised to clarify that the assessment must be in written form, we note that § 112.43(a) already specifies that farms ''must prepare a written agricultural water assessment'' and that § 112.50(b)(2) requires farms to maintain a record of that agricultural water assessment. Therefore, we also do not consider this a necessary change to make. As such, we are finalizing the definition of ''agricultural water assessment'' as proposed, without changes.

2. Agricultural Water System

(Comment 23) Several comments support the proposed definition of ''agricultural water system,'' suggesting that the proposed definition helps provide clarity. In reference to farms that draw agricultural water from systems that span long distances (such as canals), a few comments suggest that the definition of ''agricultural water system'' be revised to better account for the point at which the water comes under the farm's control.

(Response 23) We reviewed comments for the proposed definition of ''agricultural water system'' and agree that it will provide stakeholders with additional clarity that will be helpful, for example, to farms in determining the scope of where and what to inspect and maintain under § 112.42 and for those farms required to conduct a pre-harvest agricultural water assessment pursuant to § 112.43.

With respect to the comment requesting we revise the definition of ''agricultural water system'' to provide limitations regarding the point at which the water comes under a farm's control, we note that certain factors over which a farm may have little or no control (such as water users upstream of a farm), will likely influence the identification or characterization of potential hazards associated with the farm's agricultural water system(s). See also comment 15. As such factors are important to consider in meeting relevant requirements that apply for agricultural water systems (such as those in § 112.42 for inspections and maintenance of agricultural water systems and § 112.43 for pre-harvest agricultural water assessments), we decline to revise the definition of ''agricultural water system'' as requested by the comment. We also note that § 112.42 requires farms, in part, to inspect and maintain agricultural water systems *to the extent they are under the farm's control* (emphasis added) to identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces and prevent the systems from being a source of contamination to covered produce, food contact surfaces, or areas used for a covered activity. As such, we are finalizing the definition for ''agricultural water system'' as proposed, without changes, to mean a source of agricultural water, the water distribution system, any building or structure that is part of the water distribution system (such as a well house, pump station, or shed), and any equipment used for application of agricultural water to covered produce during growing, harvesting, packing, or holding activities (§ 112.3).

We also anticipate that the configuration of agricultural water systems will vary from operation to operation, depending on individual water sources, the type of distribution system (including whether a building or structure is a component), and the type of equipment used to apply agricultural water. Related to our definition of ''agricultural water system'' is our definition of ''water distribution system,'' which means a system to carry water from its primary source to its point of use, including pipes, sprinklers, irrigation canals, pumps, valves, storage tanks, reservoirs, meters, and fittings (§ 112.3).

D. General Comments Regarding Pre-Harvest Agricultural Water Assessments (§ 112.43)

In the 2021 agricultural water proposed rule, we proposed to require farms to prepare systems-based agricultural water assessments for pre-harvest agricultural water for non-sprout covered produce (proposed § 112.43). We proposed that the assessments would be conducted annually (and more frequently as needed), documented in writing, and used for hazard identification and risk management decision-making purposes. We respond to comments of a general nature regarding the requirement for farms to prepare an agricultural water assessment in the following paragraphs. As discussed below, in response to comments received, we are revising § 112.43(a) to clarify that agricultural water assessments must be prepared at the beginning of the growing season, as appropriate, but at least once annually. Comments on exemptions from the requirement to prepare an agricultural water assessment, the factors that farms must evaluate as part of an agricultural water assessment, and outcomes of an agricultural water assessment are discussed in sections V.E., V.F., and V.G., respectively.

(Comment 24) Several comments request greater specificity on when farms should conduct their annual agricultural water assessment (for example, prior to planting, prior to harvest, between planting and harvest, or prior to water use). Some comments request clarity on how frequently FDA expects farms to determine the likelihood of any given hazard (for example, at least annually). Other comments suggest that farms should be required to prepare an agricultural water assessment at least annually, with an additional assessment within a week prior to harvest.

(Response 24) We anticipate that preparing an annual agricultural water assessment towards the beginning of the growing season may be of benefit for farms, as doing so may allow for early identification of conditions for which measures under § 112.45 may be reasonably necessary. (See, for example, § 112.43(c)(2), which outlines circumstances in which mitigation measures must be implemented promptly, and not later than the same growing season as the assessment.) However, we recognize that flexibility is needed to account for certain situations, such as for crops that have year-round growing seasons, and for farms that may have multiple crops with year-round or staggered growing seasons throughout the year. As such, to provide additional clarity, we are revising § 112.43(a) to require farms to prepare an agricultural water assessment ''at the beginning of the growing season, as appropriate, but at least once annually.'' We note that this change aligns with the requirement in § 112.42(a) for timing of agricultural water system inspections, which we did not propose to revise. See 80 FR 74354 at 74433.

Recognizing that farms may be more likely to prepare their agricultural water assessments towards the beginning of their growing season in light of this clarification, we also considered whether it would be warranted to require farms to conduct a reassessment close to harvest to reflect different practices and operations than might exist earlier in the growing season (such as during planting). However, we do not consider it necessary for farms to prepare an additional assessment close to harvest, as farms are already required to account for harvest conditions within their initial agricultural water assessments. (For example, the requirement in § 112.43(a)(2) for farms to evaluate the time interval between the last direct application of agricultural water and harvest of the covered produce indicates that farms must consider conditions that are close to harvest as part of their assessments.) However, we emphasize that a farm must conduct a reassessment whenever a significant change occurs in the farm's agricultural water system, water use practices, crop characteristics, environmental conditions, or other relevant factors that make it reasonably likely that a known or reasonably foreseeable hazard will be introduced into or onto covered produce (other than sprouts) or food contact surfaces. A reassessment conducted under § 112.43(e) due to a significant change

must evaluate any factors and conditions affected by the change.

(Comment 25) Some comments seek clarity on the relationship between inspections, maintenance, and pre-harvest agricultural water assessments in proposed §§ 112.42(a), 112.42(b), and 112.43, respectively. A few comments ask whether conducting an agricultural water system inspection would eliminate the need for an agricultural water assessment and vice versa. One comment requests clarification as to whether the intent is for inspections to inform assessments, which in turn, inform maintenance activities such as monitoring—and if so, requests that FDA clarify as such by reordering the sequence of those requirements to reflect that intent. Another comment suggests that FDA limit the scope of the inspection and maintenance requirements to water system components that are under the ownership, management, or contractual oversight of the operator to help clarify the differences in expectations between inspections and maintenance under § 112.42 and agricultural water assessments under § 112.43, the latter of which are intended to be more comprehensive in nature.

(Response 25) We agree that there are differences between the requirements in § 112.42 for inspection and maintenance of agricultural water systems used for all covered activities and the requirements we are finalizing in § 112.43 for pre-harvest agricultural water assessments for covered produce other than sprouts.

As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69133–69134), the requirements for pre-harvest agricultural water assessments in § 112.43 supplement the requirements for inspection and maintenance of agricultural water systems in § 112.42, the latter of which requires a farm to regularly inspect and routinely maintain the components of its agricultural water systems, to the extent that such components or systems are under its control. While § 112.42 entails inspecting and maintaining components of an agricultural water system to the extent that they are under the farm's control, and applies for all uses of agricultural water (not just water used for pre-harvest activities), § 112.43(a) requires farms to conduct a more comprehensive assessment of possible sources and routes by which known or reasonably foreseeable hazards are reasonably likely to be introduced into its pre-harvest agricultural water for non-sprout covered produce. Additionally, farms are required to establish records of the findings of their inspections under § 112.42 (§ 112.50(b)(1)), whereas they are required to establish more comprehensive records of their written agricultural water assessments, including the descriptions of factors evaluated and written determinations, in accordance with § 112.43 (§ 112.50(b)(2)). Moreover, unlike the inspection and maintenance requirements in § 112.42, findings from a farm's agricultural water assessment are directly tied to implementation of corrective or mitigation measures, as described in § 112.43(c).

While results of inspections and maintenance under § 112.42 can be used to inform an agricultural water assessment under § 112.43(a) (or the need for a reassessment under § 112.43(e)), meeting the requirements in § 112.42 does not eliminate the need for a farm to prepare an agricultural water assessment in accordance with § 112.43. For discussion related to records of agricultural water system inspections and assessments, see response to comment 133.

With respect to comments requesting that we reorder the provisions to clarify that inspections inform assessments, which in turn inform maintenance, we decline to make this change. Not only do the requirements for inspections and maintenance under § 112.42 have different applicability than the requirements for agricultural water assessments under § 112.43 as discussed above, but farms are required to base their agricultural water assessments, in part, on the results of any inspections and maintenance conducted under § 112.42. We expect that reordering the provisions may result in confusion as to their applicability and relationship, and as such, are finalizing the order of §§ 112.42 and 112.43 without change.

(Comment 26) A few comments ask FDA to clarify in the final rule that the assessment is intended to identify known or reasonably foreseeable *microbial* hazards, specifically.

(Response 26) As discussed in the 2015 produce safety final rule, the regulation focuses on biological hazards related to produce growing, harvesting, packing, and holding. We conducted a QAR (Ref. 17) and considered the findings of that assessment in finalizing the 2015 produce safety final rule. While we acknowledged the potential for nonbiological (physical or chemical (including radiological)) hazards in produce, we explained that we do not address such hazards in the produce safety rule. See 80 FR 74354 at 74355 and 74377 and response to comment 8. Further, the 2015 produce safety final rule defines ''known or reasonably foreseeable hazard'' to mean a biological hazard that is known to be, or has the potential to be, associated with the farm or the food (§ 112.3). We did not propose to change this definition from the 2015 final produce safety final rule. As the scope of the regulation and definition of ''known or reasonably foreseeable hazards'' are specific to biological hazards, we do not consider it necessary to revise the requirements for pre-harvest agricultural water assessments as suggested by the comments.

(Comment 27) One comment seeks clarity on how to assess known or reasonably foreseeable hazards that are inherent in the environment, such as *Listeria,* for purposes of an agricultural water assessment under § 112.43.

(Response 27) The information considered as part of an agricultural water assessment in § 112.43(a) will assist farms in determining whether measures under § 112.45 are reasonably necessary in light of concerns for the potential presence of environmental pathogens. For example, if a farm suspects that adjacent or nearby land that had historically been used for a grazing operation may contain pathogens, the farm might consider the topography of the land and likelihood of whether those hazards may be introduced to the water system. In combination with the other factors considered as part of its agricultural water assessment (for example, the farm's water use practices, crop characteristics, and environmental conditions (such as air temperature and UV))—the farm must then consider whether measures are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces.

We also note that the requirements for systems-based agricultural water assessments are designed, in part, to be adaptable to future advancements in agricultural water quality science. We anticipate that this is an area where science will continue to evolve and provide stakeholders with an enhanced understanding of the ecology of human pathogens in the environment that may cause foodborne illness outbreaks. For example, FDA sometimes conducts multiyear environmental studies that are designed to elucidate environmental conditions that can impact food safety (Ref. 54). Factors that are studied may include, but are not limited to, pre-harvest water sources and uses, soil and soil amendments, topography of the growing region, areas where animals are present (such as wildlife and livestock), wind speed and direction, airborne particulates, water runoff, and

environmental factors (such as temperature, rainfall, fog, and dew). Within recent years, FDA, with support from State and local partners, has initiated two longitudinal multiyear studies that examine how pathogens survive, move through the environment of two different regions, and possibly contaminate produce (Refs. 55 and 56). As these and similar efforts progress, farms will be able to use similar information learned about regions as an additional resource to further inform their agricultural water assessments.

(Comment 28) Many comments suggest that the proposed requirements for pre-harvest agricultural water assessments do not sufficiently acknowledge that the presence of a hazard does not necessarily represent a risk to water or produce that needs to be managed. Some of these comments express concerns that, as written, the proposed rule would require farms to implement mitigation measures if a hazard is present, even if the overall risk associated with the water (for example, in light of the other information evaluated as part of an assessment) is low.

(Response 28) We consider that the identification of potential sources of known or reasonably foreseeable hazards and consideration of the likelihood of those hazards being introduced to an agricultural water is an appropriate approach, within a risk-based framework, to implement the requirements of section 419 of the FD&C Act to set forth procedures, processes, and practices that minimize the risk of serious adverse health consequences or death, including those reasonably necessary to prevent the introduction of known or reasonably foreseeable biological hazards into or onto produce and to provide reasonable assurances that the produce is not adulterated on account of such hazards. The systems-based framework in § 112.43 of evaluating conditions that are reasonably likely to introduce known or reasonably foreseeable hazards will help a farm determine, alongside the results of inspections and maintenance under § 112.42, whether corrective or mitigation measures under § 112.45 are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water.

In particular, we note that agricultural water assessments must identify conditions that are *reasonably likely* (emphasis added) to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces based on an evaluation of all factors identified in § 112.43(a)(1) through (5). These factors include: the agricultural water system (including the source, water distribution system, and degree of protection from possible sources of contamination); agricultural water use practices; crop characteristics; environmental conditions; and other relevant factors, including test results, where appropriate. (See also comment 29, where we respond to comments regarding the terms ''reasonably likely'' and ''reasonably necessary.'')

Thus, if a farm identifies a potential source of contamination under § 112.43(a)(1), it is not a foregone conclusion that measures under § 112.45 are reasonably necessary. Rather, in consideration of all of the information evaluated under § 112.43(a)(1) through (5), the farm might ultimately determine, for example, that measures under § 112.45 are not reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with its agricultural water used in growing covered produce (other than sprouts).

Similarly, while two different farms might identify similar potential sources of contamination under § 112.43(a)(1), depending on the other information they evaluate in § 112.43(a)(1) through (5), their determinations under § 112.43(c) might differ. For example, one farm with a surface water source that is regularly subject to runoff from lands where animal grazing occurs may determine that mitigation measures are reasonably necessary under § 112.45, since the farm applies agricultural water from that source to covered produce close to harvest, and environmental conditions and crop characteristics are not conducive to microbial die-off. However, another farm with different crop characteristics, environmental conditions and water use practices may determine that mitigation measures are not reasonably necessary, even if it uses pre-harvest agricultural water from a surface water source with similar runoff conditions.

As discussed further in comment 29, we have provided various examples throughout the proposed rule and this final rule that farms should consider in determining whether (and what kind of) measures are reasonably necessary. We remain committed to providing education, outreach, and training, and intend to pursue various mechanisms for disseminating information about the requirements of this rule to farms.

(Comment 29) Many comments request clarity related to the terms ''reasonably likely'' and ''reasonably necessary'' as they relate to the requirements for agricultural water assessments These comments suggest that the terms are subjective and that without a more objective benchmark it will be difficult to consistently determine what is ''reasonably likely'' for a farm.

(Response 29) Given the diversity that exists across the operations of foreign and domestic farms and their agricultural water systems, uses, and practices, phrases such as ''reasonably likely to introduce known or reasonably foreseeable hazards'' and ''determine whether measures are reasonably necessary'' provide flexibility for farms to make decisions around the use of agricultural water as appropriate to their unique circumstances and operations, taking into account the requirement in § 112.41 that all agricultural water must be safe and of adequate sanitary quality for its intended use. We note that similar language appears in section 419(c)(1)(A) of the FD&C Act,[7] in the agricultural water requirements for harvest-, post-harvest, and sprout uses (which we did not propose to change) (*e.g.,* § 112.44(d)), and in FDA's HACCP regulations (21 CFR part 120 and 21 CFR part 123) and FDA's Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food regulation (21 CFR part 117). This language is designed to be flexible given the diversity of commodities and operations to which these requirements apply, and in keeping with the principle that the farm bears the responsibility and accountability for establishing and implementing food safety systems tailored to its circumstances. We also note that such language is flexible to account for future scientific advancements, consistent with the requirements for pre-harvest agricultural water assessments we are finalizing with this rule.

What is considered a known or reasonably foreseeable hazard for one farm, in light of the conditions and potential impacts to its agricultural water system, may not be known or

[7] Section 419(c)(1)(A) of the FD&C Act requires that the 2015 produce safety final rule set forth those procedures, processes, and practices that the Secretary determines to minimize the risk of serious adverse health consequences or death, including procedures, processes, and practices that the Secretary determines to be reasonably necessary to prevent the introduction of known or reasonably foreseeable biological, chemical, and physical hazards and to provide reasonable assurances that the produce is not adulterated under section 402 of the FD&C Act.

reasonably foreseeable hazard in the light of the conditions and potential impacts to the agricultural water system of another farm. For example, while a farm in one region might identify wild pigs as a potential source of known or reasonably foreseeable hazards to agricultural fields and surface waterways (Refs. 57 and 58), wild pigs might not be considered a likely source of known or reasonably foreseeable hazards in regions where pigs are not prevalent. As another example, if runoff is likely to serve as a source of hazards, but the farm's agricultural water system is sufficiently protected (*e.g.,* water from a well is conveyed through a piped distribution system, and both the well and distribution system are properly constructed and maintained), then the farm might determine that runoff is not a condition that is reasonably likely to introduce known or reasonably foreseeable hazards to covered produce (other than sprouts) or food contact surfaces.

Further, farms must use information on the various factors evaluated as part of an agricultural water assessment under § 112.43(a)(1) through (5)—including information related to their agricultural water systems; agricultural water use practices; crop characteristics; environmental conditions; and other relevant factors, such as the results of pre-harvest agricultural water testing, where appropriate—to determine whether, given their unique conditions, measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with agricultural water used in growing covered produce (other than sprouts). Given the diversity that exists across industry in these factors, situations in which measures under § 112.45 are reasonably necessary for one farm will not necessarily be the same for another. Rather, the unique factors that are relevant to a farm and its agricultural water systems will together assist the farm in decision-making related to its pre-harvest agricultural water as appropriate for its relevant conditions, practices, and circumstances. See also response to comment 28.

We have provided various examples throughout the proposed rule and this final rule that farms should consider in identifying potential sources of hazards, evaluating the likelihood of hazards being introduced to covered produce (other than sprouts) or food contact surfaces, and determining whether (and what kind of) measures are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water. See 86 FR 69120 at 69133 and sections V.F., V.G., and V.J. Such examples, and consideration for the principles presented in the context of each farm's unique conditions, will assist farms in conducting their pre-harvest agricultural water assessments under § 112.43. However, we also recognize that guidance, educational materials, as well as trainings, will help farms understand the requirements of this final rule. We remain committed to providing education, outreach and training and intend to pursue various mechanisms for disseminating information to farms.

(Comment 30) A few comments suggest that under the proposed rule, any surface water source that a farm is preparing an agricultural water assessment for will be considered ''hazardous,'' and therefore require that the farm conduct mitigation measures.

(Response 30) The risk associated with agricultural water will vary from source to source. For example, ground water obtained from deep underground aquifers, with properly designed, located, and constructed wells, generally yields higher quality water with little variability due to the natural filtering capacity of soils, the depth pathogens would have to travel to compromise the source, and because it is not expected to be subject to environmental factors such as runoff (Refs. 17 and 59). By contrast, surface waters, which are exposed to the environment, pose a higher potential for becoming contaminated with human pathogens due to runoff and greater variability in quality because of the potential for external influences (Ref. 17). However, we recognize that even within a single type of water source (*e.g.,* surface water), the associated risk may vary depending, in part, on the nature and likelihood of hazards being introduced. For example, if a farm has two different holding ponds—one that is at a higher elevation than surrounding lands, and the other that is at a lower elevation—both are considered surface water sources. However, the holding pond at the higher elevation may be more well-protected from the introduction of hazards via runoff than the other holding pond and may therefore present less risk when used as pre-harvest agricultural water.

Additionally, we recognize that the risk associated with agricultural water also depends on how and when agricultural water is applied to covered produce, characteristics of the covered produce, and environmental conditions. As such, we require farms to evaluate these various factors under § 112.43(a) as part of their agricultural water assessments to assist them in determining whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water. See also response to comment 28. Given the variability that exists across industry in water systems, operations, and conditions, not every surface water source will require that corrective or mitigation measures be implemented under § 112.45.

(Comment 31) Several comments seek clarity on how to weigh ''low risk'' and ''high risk'' elements within an assessment. For instance, comments seek clarity on how farmers should weigh a ''low risk'' crop irrigated with water from a ''high risk'' source. One comment seeks clarity on whether farms can continue using ''low'' or ''medium-risk'' practices until ''specific science determines there is a real, attributable risk.''

(Response 31) Throughout the 2021 agricultural water proposed rule, this final rule, and supporting materials (such as the QAR (Ref. 17)), we have provided principles related to general risk associated with conditions and practices related to pre-harvest agricultural water sources and uses. For example, table 7 of the QAR (Ref. 17) demonstrates that public drinking water is generally considered the least likely to serve as a source of contamination, followed by ground water, surface water protected from runoff, and surface water unprotected from runoff. Further, that table notes that where contamination in a water source is known to exist, the likelihood of contamination is a function of:

- Contact with the commodity (example, whether contact is indirect or direct);
- Commodity effects (for example, whether the surface is conducive to adhesion); and
- Application timing (for example, early or late in crop growth).

Given the diversity that exists across the operations of foreign and domestic farms and their agricultural water systems, uses, and practices, what might be considered ''low'' or ''high'' risk for one farm will not necessarily be the same for another.

As such, in establishing the requirements for pre-harvest agricultural water assessments, we have provided flexibility for farms to make decisions

around the use of agricultural water as appropriate to their unique circumstances and operations. See also response to comment 29.

To the extent that comments are voicing concern over the scientific basis for the requirements for pre-harvest agricultural water assessments in § 112.43, comment 10 addresses those comments.

(Comment 32) One comment asserts that quantitative microbial risk assessment and risk modeling tools may help establish when certain ''safe harbors,'' such as the use of four days or more between last direct water application and harvest as a mitigation measure, may be appropriate for farms to use. Specifically, this comment suggests that the proposed approach for mitigation measures provides options for farms to choose from without caveats or limitations.

(Response 32) Given the diversity of operations, agricultural water sources, and agricultural water uses of domestic and foreign farms, the requirements for comprehensive, systems-based pre-harvest agricultural water assessments, which require farms to evaluate a broad range of factors that may impact the quality of the water they use during pre-harvest activities, will assist farms in identifying, and managing, risks associated with pre-harvest agricultural water as appropriate for their relevant agricultural water systems, conditions, and practices. While we do not believe that quantitative risk benchmarks are necessary in order to establish science-based minimum standards within the framework of the comprehensive, systems-based agricultural water assessment we are finalizing here, we have included a requirement to test pre-harvest agricultural water as part of an assessment when doing so would not delay action most critical to protect public health and would further inform the farm's determination as to whether measures are reasonably necessary. See § 112.43(c)(4).

We also recognize that additional clarification, such as related to the circumstances under which certain mitigations may be appropriate, is appropriate. As such, we provide various examples throughout the proposed rule and this final rule that farms should consider in preparing their agricultural water assessments and taking actions based on their assessments. See 86 FR 69120 at 69133 and sections V.F., V.G., and V.J. For example, in comment 115, we explain that the use of microbial die-off between last direct water application and harvest as a mitigation measure under § 112.45(b) can be impacted by a broad range of conditions specific to a farm, such as the timing of water its water applications and relevant environmental conditions, crop characteristics, and pathogen characteristics.

Further, the QAR (Ref. 17) explains that where contamination of a water source is known to exist, the likelihood of contamination is a function of various factors, including contact with the commodity, commodity effects (characteristics), and application timing. Moreover, we discuss in our memos supporting the pre-harvest microbial die-off requirements in the 2015 produce safety final rule (Refs. 60 and 61) that the reduction of pathogen populations on produce surfaces to the point of non-detection is not guaranteed. As such, we disagree that use of a time interval between last direct water application and harvest alone can serve as a ''safe harbor.''

We also note that the requirements for agricultural water assessments are designed, in part, to be adaptable to scientific advancements. To the extent that risk modeling and predictive analytics related to pre-harvest agricultural water may continue to develop in the future, farms will be able to use such information as an additional resource to further inform their agricultural water assessments under the approach we are finalizing here.

(Comment 33) A few comments suggest that evaluating various factors (such as the agricultural water source's degree of protection under proposed § 112.43(a)(1)) will present a significant challenge to many farms and argues that broader collaborations across the agricultural sector will need to occur to achieve compliance with this requirement. The comment suggests that FDA foster relationships with irrigation water districts and engage in conversations with animal operations and livestock associations, or other Federal partners such as the EPA and USDA's Natural Resources Conservation Service to achieve compliance.

(Response 33) We are aware of efforts underway to bring together members of agricultural communities on a large scale, such as through the CAN (Ref. 38), which provides a roundtable opportunity to foster collaboration and discuss enhanced neighborly food safety practices when various agriculture operations such as leafy green fields, cattle ranches, vineyards, and compost sites are adjacent to one another. Various action items have been identified as part of the CAN initiative, including fostering neighbor-to-neighbor interactions and conversations, and building a research roadmap to understand key landscape processes to guide decision-making both now and into the future (Ref. 39).

Additionally, FDA sometimes conducts multiyear environmental studies in collaboration with State and local public health officials, academia, and members of the produce industry, that are designed to shed light on environmental conditions that can impact food safety (Ref. 32). Within recent years, FDA, with support from State and local partners such as extension specialists, academic researchers, irrigation districts, industry groups, and farms, has initiated two longitudinal multiyear studies that examine how pathogens survive, move through the environment of two different regions, and possibly contaminate produce (Refs. 55 and 56). Information learned through such efforts may help inform agricultural water assessments.

Further, as discussed in section V.K., FDA has collaborated with EPA to develop a testing protocol for evaluating the efficacy of antimicrobial chemical treatments against certain foodborne pathogens in agricultural water sources. We recognize the value of collaborating with Federal partners in related disciplines, and will consider additional collaborative efforts related to the requirements we are finalizing here.

(Comment 34) Some comments voice concern that it will be difficult to prepare agricultural water assessments for farms that use multiple sources of water for pre-harvest activities.

(Response 34) We acknowledge that farms using multiple agricultural water systems during pre-harvest activities for covered produce (other than sprouts) will need to conduct an assessment for each system unless an exemption under § 112.43(b) applies. However, several of the factors evaluated in the assessment (for example, agricultural water use practices, commodity characteristics, and environmental conditions) might be similar across agricultural water systems, thus limiting the amount of information a farm needs to collect and consider. We emphasize that under Subpart O, ''Records'' of the 2015 produce safety final rule, it is not necessary for farms to keep all of the required information in only one set of records, nor do farms need to duplicate existing records, provided that, taken together, the records satisfy all of the applicable requirements. See § 112.163. Therefore, farms have flexibility in maintaining records for agricultural water assessments as long as all relevant requirements are met.

(Comment 35) Some comments voice concern that farms who lease land for short-term use (for example, one

growing season) may face challenges in implementing the requirements for agricultural water assessments as they lack historical knowledge on adjacent lands and water systems available to them. One comment suggests that having multiple years of experience using surface water to cool strawberries in the field without any history of problems makes it difficult to identify risks.

(Response 35) We recognize that not all farms (including, for example, new farms and those growing covered produce on land under short-term lease), will have a historic understanding of their agricultural water systems, including uses of adjacent and nearby lands. While we understand that historical knowledge may be useful in preparing an agricultural water assessment, the absence of it does not preclude a farm from evaluating the factors in § 112.43(a)(1) through (5).

Moreover, we do not consider a lack of reported issues in the past as necessarily being indicative of the risks associated with a farm's agricultural water systems and pre-harvest water use. For example, between June and October 2020, Federal and State agencies investigated a *Salmonella* Newport foodborne illness outbreak associated with consumption of red onions (Ref. 23). We noted that the food vehicle in this outbreak, whole red onions, is a raw agricultural commodity that had not previously been documented as associated with a foodborne illness outbreak. Although a conclusive root cause could not be identified, several potential contributing factors were identified, including a leading hypothesis that contaminated irrigation water used in a growing field may have led to contamination of the onions.

The QAR (Ref. 17) concluded that, although some types of produce have been repeatedly associated with outbreaks, all types of produce commodities have the potential to become contaminated through one or more of the potential routes of contamination, including water. Use of poor agricultural practices can lead to contamination and illness, even where the potential for contamination is relatively low. As such, it is important for all farms to consider the various factors under § 112.43(a) as part of their agricultural water assessments, even in the absence of any reported history of safety problems associated with their covered produce.

E. Exemptions From Agricultural Water Assessments (§ 112.43(b))

In § 112.43(b), we proposed various exemptions from the requirement to prepare a pre-harvest agricultural water assessment. We tentatively concluded that an agricultural water assessment would not be necessary when a farm can demonstrate that its pre-harvest agricultural water for non-sprout covered produce:

- Meets the requirements in § 112.44(a), including the microbial quality criterion, and, if untreated ground water, also meets the testing requirements in §§ 112.44(b), 112.47, and 112.151 (proposed § 112.43(b)(1));
- Meets the requirements in § 112.44(c) for water from a Public Water System or public water supply (proposed § 112.43(b)(2)); or
- Is treated in accordance with § 112.46 (proposed § 112.43(b)(3)).

We received numerous comments on the exemptions in proposed § 112.43(b) and respond to those comments below. As discussed below, we are finalizing the exemptions from the requirement to prepare a pre-harvest agricultural water assessment and clarifying that an exemption only applies if it is reasonably likely that the relevant quality of water will not change prior to the water being used as agricultural water.

(Comment 36) Some comments voice concern with the proposed exemptions in § 112.43(b), noting that while farms may be exempt from preparing an agricultural water assessment for water from a municipal source or treated water, depending on how the water is used, the water quality may change. These comments suggest that exempting water in these situations could be a gap in assessing the safety of the water.

(Response 36) We recognize that where the quality of water meeting the requirements in proposed § 112.43(b) may change before a farm uses it as pre-harvest agricultural water, it would be inappropriate for the farm to be eligible for an exemption from the requirement to prepare an agricultural water assessment for that water. As such, we are revising proposed § 112.43(b) to clarify that a farm is only exempt from preparing a written agricultural water assessment if the farm can demonstrate that the water meets the requirements in § 112.43(b)(1)(i), (ii), or (iii) and it is reasonably likely that the relevant quality of water will not change prior to the water being used as agricultural water (for example, due to the manner in which the water is held, stored, or conveyed) (§ 112.43(b)(2)).

For example, if a farm receives water that meets the requirements in § 112.44(c) for water from a Public Water System that furnishes water meeting the microbial requirements in 40 CFR part 141 and conveys that water through a closed distribution system that allows for water quality to be maintained, the farm may be eligible for an exemption under § 112.43(b), provided all requirements are met (including the requirement that the farm have results or certificates of compliance demonstrating that relevant requirements are met). However, if a farm conveys that water through an open canal system prior to using it as pre-harvest agricultural water for non-sprout covered produce and it is reasonably likely that the quality of water will change prior to use of the water, the farm is not eligible for an exemption from the requirement to prepare an agricultural water assessment. The farm must consider the nature of the water source as part of their evaluation of the agricultural water system under § 112.43(a)(1).

(Comment 37) Several comments support the exemption in proposed § 112.43(b)(1) for water that meets the requirements of proposed § 112.44(a), noting that, in some cases, it may make sense for some farms to rely on test results rather than conducting annual (or more frequent, as appropriate) assessments. Some comments seek clarity about whether FDA intends for water tests to be performed each growing season for the sole purpose of demonstrating one's exemption from performing an agricultural water assessment. Comments also seek clarity as to when FDA would expect the testing to be completed (for example, before the season starts). Further, some comments question whether historical water testing data could be used for the purposes of an exemption from preparing an agricultural water assessment. Comments also request clarification on whether this exemption could be used for a farm that only uses pre-harvest water, but tests to the same standard as post-harvest water and meets all other relevant requirements.

(Response 37) We reviewed comments related to the exemption in proposed § 112.43(b)(1) and conclude that an agricultural water assessment is not necessary when a farm can demonstrate that its pre-harvest agricultural water for non-sprout covered produce meets the requirements in § 112.44(a) (including the stringent microbial quality criterion of no detectable generic *E. coli*) and the testing requirements in §§ 112.44(b), 112.47, and 112.151 that are applicable to agricultural water for sprout irrigation and harvest and post-harvest uses. While the provisions referred to in

§ 112.43(b)(1)(i) apply to water that is used for purposes outlined in § 112.44(a) (such as water used for harvest and post-harvest purposes), we note that a farm that only uses agricultural water for pre-harvest activities may still be eligible for this exemption, provided all applicable requirements are met.

For the exemption from the requirement to prepare an agricultural water assessment in § 112.43(b)(1)(i), if the water is untreated ground water, § 112.44(b) requires that a farm initially test the microbial quality of each source of the untreated ground water at least four times during the growing season or over a period of 1 year, using a minimum total of four samples collected aseptically and representative of the intended use(s). If the four initial sample results meet the microbial quality criterion under § 112.44(a), the farm may test once annually thereafter. As such, in order to be eligible for the exemption in § 112.43(b)(1)(i), the farm must test the source of untreated ground water each growing season or year.

Recognizing the diversity that exists in industry as to when and how agricultural water is used, the requirement that samples be ''representative of the intended use(s) of the water'' provides farms with flexibility for sample collections under § 112.44(b). While one farm may, for example, collect a sample that is representative of use at the beginning of the growing season, another farm may, for example, collect a sample that is representative of use later in the year, or at some other time such as when production occurs year-round.

Regarding the use of historical data, we note that if a farm already possesses sufficient data (consisting of the minimum required number of samples) collected in the manner required under § 112.44(b), the farm is permitted to use that data in support of the exemption in § 112.43(b)(1)(i).

(Comment 38) Several comments address the exemption in proposed § 112.43(b)(2) for water that meets the requirements in § 112.44(c) for water from a Public Water System or public water supply that furnishes water that meets the microbial water quality criterion on § 112.44(a). Some comments suggest that other water sources, such as water from public wastewater treatment systems, should be similarly exempt from preparing an agricultural water assessment, even if they do not meet the microbial criterion in § 112.44(a). A few comments specifically ask that the exemption be revised to apply to water from publicly owned systems (including from drinking water systems and wastewater treatment systems) that has been treated to meet a GM of 126 or less and an STV of 410 or less CFU generic *E. coli* per 100 mL, as opposed to expecting such water to meet the microbial criterion of no detectable generic *E. coli* per 100 mL. Some comments suggest that use of the GM and STV criteria for such purposes would shift the burden of proof to the water supplier, as compared to under the 2015 produce safety final rule requirements in which farms would be responsible for demonstrating that water meets such criteria.

(Response 38) In the U.S., Public Water Systems are required under NPDWR in 40 CFR part 141 to provide safe, clean water suitable for drinking and thus are at the lowest likelihood for pathogen contamination (Ref. 17). Similarly, public water supplies that meet the microbial requirement in § 112.44(a) are included in the exemption under proposed § 112.43(b)(2) to accommodate other public water supplies that are not governed by the requirements of the EPA drinking water program, but provide water of a quality that meets the microbial requirement of § 112.44(a). See 78 FR 3504 at 3571. Where a farm can demonstrate that its pre-harvest agricultural water for non-sprout covered produce meets microbial EPA drinking water standards or other comparable public water supply standards, we have concluded that it is not necessary to require farms to prepare a pre-harvest agricultural water assessment under § 112.43(a) provided all requirements are met (including that the farm have results or certificates of compliance demonstrating that relevant requirements are met). See also response to comment 2.

We do not consider it appropriate to broaden the exemption in proposed § 112.43(b)(1) to include water from other public water supplies, such as wastewater treatment systems, since, as the comments note, water from these systems is often not treated to meet or be comparable to EPA's drinking water standards and may not similarly be at the lowest likelihood for pathogen contamination.

We also decline to provide an exemption from the requirements to prepare an agricultural water assessment for water supplied by a public water system that meets a GM of 126 and STV of 410 CFU generic *E. coli* per 100 mL of water, as we do not consider water meeting those criteria to provide the same level of confidence in the quality of water compared to water from a Public Water System or public water supply that meets or is comparable to microbial EPA drinking water standards. As such, we are finalizing the exemption in final § 112.43(b)(1)(ii) to refer to agricultural water that meets the requirements in § 112.44(c) for water from a public water system or public water supply.

(Comment 39) One comment notes that the exemption for water from a municipal source does not provide guidance on what farms should do in the case of potential water main breaks or other failures of the system. The comment suggests that FDA account for such circumstances and establish requirements for what farms should do when there are microbiological risks associated with a municipal source.

(Response 39) We recognize that water main breaks or other issues may occur on occasion that have the potential to affect the quality of water coming from public water systems. We emphasize that it is the farm's responsibility to ensure that the water the farm uses meets all applicable requirements in subpart E, including that all agricultural water be safe and of adequate sanitary quality for its intended use (§ 112.41), even if the farm is eligible for an exemption from the requirement to prepare a pre-harvest agricultural water assessment under § 112.43(b).

Nonetheless, as discussed in comments 3 and 37, where a farm can demonstrate that its pre-harvest agricultural water for non-sprout covered produce meets microbial EPA drinking water standards or other comparable public water supply standards, we have concluded that it is not necessary to require farms to prepare a pre-harvest agricultural water assessment under § 112.43(a) provided all requirements are met (including that the farm have results or certificates of compliance demonstrating that relevant requirements are met). See § 112.43(b)(1)(ii) and, by reference, § 112.44(c). In the case of issues such as water main breaks or other failures occurring in a public water system or public water supply meeting the requirements in § 112.44(c), the system authority will oftentimes communicate the issue, along with recommendations for whether and how to use the impacted water, in an advisory to their affected constituents. Farms may find it helpful to consider such information in ensuring that the requirement in § 112.41 that all agricultural water be safe and of adequate sanitary quality for its intended use is met.

(Comment 40) Several comments voice concern over how the exemptions in proposed § 112.43(b) relate to controlled environment agriculture

(CEA) farms (for example, indoor farms), including hydroponic or aquaponic operations. For example, one comment suggests that recirculated water used in such operations would be considered untreated surface water, and therefore, the exemption in proposed § 112.43(b)(1) would not apply. Some comments note that while hydroponic and aquaponic operations may source their water from a public water supply, water in these operations can be recirculated and/or held for extended periods of time prior to its use for produce. A few comments note that if farms recirculate that water without treatment or other controls, they could end up irrigating produce using contaminated water. Other comments suggest that chemical treatment for the purposes of an exemption in proposed § 112.43(b)(3) may not be applicable in hydroponic and aquaponic operations due to concerns over a lack of treatment efficacy and that chemical treatment is not currently an option for aquaponic operations. For example, one comment notes that chlorine and chloramine are toxic to fish at certain concentrations and not labeled for use in aquaculture.

(Response 40) As discussed in comment 36, we are revising proposed § 112.43(b) to clarify that a farm is only exempt from preparing a written agricultural water assessment if the farm can demonstrate that the water meets the requirements in § 112.43(b)(1)(i), (ii), or (iii) and it is reasonably likely that the relevant quality of water will not change prior to the water being used as agricultural water (for example, due to the manner in which the water is held, stored, or conveyed) (§ 112.43(b)(2)). As such, it is important that each farm, including those involved in CEA, consider its unique operations in determining whether it is eligible for an exemption from the requirement to prepare an agricultural water assessment under § 112.43(b), including how the farm conveys and/or holds the water; how the farm manages the water prior to its point of intended use; and how the farm uses pre-harvest agricultural water for non-sprout covered produce.

For example, we are aware that in some CEA operations, such as those that employ deep water culture methods, pre-harvest agricultural water can be used for extended periods of time to grow multiple batches of covered produce in continuous production. For example, some operations introduce a new production raft to a growing pond when another raft is removed for harvest. Unless there are measures that will allow for the quality of water in § 112.43(b)(1)(i), (ii), or (iii) to be maintained as new batches of covered produce are added to the system, a farm that implements such water use practices is unlikely to satisfy the requirements for an exemption in § 112.43(b). Examples of measures that may allow for the quality for water to be maintained prior to use as agricultural water for sequential batches of covered produce include, but are not limited to, ensuring that distribution system components and equipment surfaces do not serve as a source of contamination to the water and/or using other measures, such as adequate treatment, to maintain the quality of water.

Regardless of whether an exemption from the requirement to prepare an agricultural water assessment under § 112.43(b) applies, farms remain responsible for meeting all other applicable requirements of subpart E, including those related to inspection and maintenance of agricultural water systems (§ 112.42) and the requirement that all agricultural water be safe and of adequate sanitary quality for its intended use (§ 112.41).

(Comment 41) A few comments assert that in the 2021 outbreak of *Salmonella* Typhimurium associated with product from a hydroponic leafy green facility, the water would have been exempt from the requirement to prepare an agricultural water assessment under the proposed rule, as the water was from a municipal water source and was treated.

(Response 41) In response to comment 40, we discuss information that CEA farms should consider in determining whether they are eligible for an exemption under § 112.43(b). We also explain that regardless of whether a farm is eligible for an exemption under § 112.43(b), the farm remains responsible for ensuring the safe and adequate sanitary quality of the water used to grow covered produce (§ 112.41).

Regarding the outbreak of *Salmonella* Typhimurium associated with packaged leafy greens produced in a CEA indoor hydroponic operation specifically, we note that our investigation did not result in the identification of the specific source or route of contamination of the leafy greens (Ref. 62). However, we explained in our investigation report (Ref. 62) that recovery of *Salmonella* Liverpool, a strain not associated with the outbreak, from a water sample of an indoor production pond highlights the importance of minimizing sources of microbial contamination as well as operating and maintaining production ponds in a manner that does not result in the spread of pathogens to produce. For example, while the growing ponds in the operation were filled with water sourced from a public water supply that was further treated on-site using a sand filtration and ultraviolet (UV) system, as our investigation report notes, once water was in the growing ponds, it was not routinely disinfected or otherwise treated. Moreover, while the operation indicated to investigators that ponds get treated in response to sample results revealing the presence of generic *E. coli,* the operation did not have a procedure or systematic approach to ensure adequate water treatment. We also noted that a water sample collected from a stormwater retention basin located outside of the CEA operations' property but approximately 25 feet from the CEA structure tested positive for the outbreak strain.

Although investigators did not observe specific routes of contamination to or from areas surrounding the CEA operation, we note that the report findings provide further evidence supporting the requirements that farms, including those involved in CEA, assess and mitigate risks associated with adjacent and nearby land uses that may impact operations in both rural and more urbanized settings. While we recognize that CEA may provide an additional degree of control compared to more traditional outdoor farming operations, we emphasize that it is still important for farms that participate in CEA to consider a range of potential sources of hazards in ensuring that subpart E requirements are met, including those above.

(Comment 42) A few comments request clarification on the documentation farms need to support an exemption from the requirement to prepare an agricultural water assessment. For example, one comment asks if all farms need to prepare an agricultural water assessment, but that for farms eligible for an exemption, doing so would only entail maintaining information relevant to the exemption.

(Response 42) If a farm satisfies the criteria for an exemption under § 112.43(b), the farm is not required to prepare a written agricultural water assessment. However, the farm is required to maintain records applicable to the exemption, such as:

- In support of the exemption in § 112.43(b)(1)(i), documentation of test results (§ 112.50(b)(5)) and analytical methods (if applicable) (§ 112.50(b)(12));
- In support of the exemption in § 112.43(b)(1)(ii), annual documentation of the results or certificates of compliance from a public water system or public water supply demonstrating that the water meets the relevant requirements in § 112.44(c) (§ 112.50(b)(6)); and

• In support of the exemption in § 112.43(b)(1)(iii), documentation of scientific data or information the farm relies on to support the adequacy of a treatment method (§ 112.50(b)(10)) and documentation of the results of water treatment monitoring (§ 112.50(b)(11)).

(Comment 43) Some comments seek clarity on whether the exemptions in proposed § 112.43(b) are permanent or temporary.

(Response 43) Farms are eligible for an exemption from the requirement to prepare a written agricultural water assessment under § 112.43(b) for as long as the relevant requirements are met. This includes maintaining records applicable to the exemption, as discussed in response to comment 42.

F. Elements of an Agricultural Water Assessment (§ 112.43(a))

We proposed to require farms that use pre-harvest agricultural water for non-sprout covered produce to prepare a written agricultural water assessment that would identify conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces, based on an evaluation of the farm's agricultural water system; agricultural water practices; crop characteristics; environmental conditions; and other relevant factors, including, if applicable, results of any testing conducted (proposed § 112.43(a)). We respond to the comments on proposed § 112.43(a) in the following paragraphs. We note that comments on testing conducted under § 112.43(d) are discussed in section V.H. As discussed in our response to comments, we are finalizing § 112.43(a) as proposed, with minor edits for clarification.

1. Agricultural Water Systems

(Comment 44) Several comments contend that the proposed rule does not adequately address various types of agricultural water, since only ground water and surface water are identified in proposed § 112.43(a)(1), which would require farms to evaluate each agricultural water system (*i.e.,* source and distribution system) used for growing activities for covered produce. These comments request that FDA clearly define various agricultural water types (including surface water, ground water, municipal water, and recycled water) and provide examples of when classification may change. For example, one comment requests clarity on what requirements in the proposed rule would apply for shallow ground water influenced by surface water.

(Response 44) We recognize that farms may use a variety of water sources and distribution systems for their pre-harvest agricultural water. As such, we are revising the requirement to clarify that considering whether a water source is ground water or surface water is just one example of the information farms might consider in evaluating the location and nature of the water source (see § 112.43(a)(1)(i)).

We do not consider it necessary or practical for us to define types of water sources other than ''ground water'' and ''surface water'' in § 112.3, as the conditions associated with such other sources are expected to vary widely and contain elements addressed within the definitions for ground water and surface water, which may result in confusion. For example, the term ''recycled water'' in common usage can refer to many different things—such as use of water from a canal system that is subject to return flows, or use of treated, recycled wastewater—such that it would be difficult to define ''recycled water'' in a way that is meaningful for hazard identification purposes across categories of recycled water. Rather, we intend farms to describe the specific conditions and characteristics associated with a water source that may affect the likelihood of known or reasonably foreseeable hazards being introduced when evaluating the location and nature of the source under § 112.43(a)(1)(i), including for recycled water. We provide examples of such considerations, including situations in which classification of a water source may change, in response to comment 30.

With respect to comments requesting clarity on whether different requirements apply based on water source, we note that the requirements for agricultural water quality in §§ 112.41 and 112.43 apply regardless of the source or type of water used as agricultural water. Farms must determine the appropriate use of their water sources by assessment as required under § 112.43, taking into account the standard in § 112.41 that all agricultural water must be safe and of adequate sanitary quality for its intended use. As such, we are not establishing different requirements for pre-harvest agricultural water based on the nature of a farm's water source.

(Comment 45) A few comments seek clarity on how to classify municipal water stored in jugs, enclosed cisterns, food-grade tanker trucks, or barrels, and rainwater that is collected prior to use.

(Response 45) In evaluating each agricultural water system a farm uses for pre-harvest agricultural water in § 112.43(a)(1), farms are required to evaluate the location and nature of the water source; the type of water distribution system; and the degree of protection from possible sources of contamination. Considering such information will assist farms in evaluating the likelihood of known or reasonably foreseeable hazards being introduced to their pre-harvest agricultural water, the latter of which may then serve as a source of contamination to covered produce or food contact surfaces. For example, if farms hold pre-harvest agricultural water in storage vessels such as jugs, cisterns, or barrels, the following factors are relevant to consider as part of their agricultural water assessment under § 112.43(a)(1):

• Where they sourced the water from (and what they know about its quality at that point);

• Whether the storage vessels are structured to protect that quality of water (such as whether they are kept closed to prevent entry of contaminants, such as from birds or other pests); and

• Whether the storage vessels undergo any regular maintenance, cleaning and/or sanitizing to prevent them from serving as a source of contamination for the water.

Such storage vessels are part of the farm's agricultural water system as defined in § 112.3, and as such, under § 112.42 the farm must inspect and maintain the vessels, to the extent that they are under the farm's control, to identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards and prevent the systems from being a source of contamination to covered produce, food contact surfaces, or areas used for a covered activity. In accordance with § 112.43(a), farms must also consider the results of any inspections and maintenance conducted under § 112.42 in preparing an agricultural water assessment.

(Comment 46) One comment requests that FDA provide information on the scope of water sources that would be considered adjacent and how those would be incorporated into agricultural water assessments.

(Response 46) We recognize that in some instances, known or reasonably foreseeable hazards may be introduced into an agricultural water system (defined at § 112.3) from a body of water that is not otherwise a part of that system. For example, a canal that a farm uses for pre-harvest agricultural water may be subject to known or reasonably foreseeable hazards from a nearby pond if, when it rains, runoff from the pond is introduced into the canal. If there are other bodies of water that may introduce

known or reasonably foreseeable hazards to an agricultural water system (as in the above example), farms must consider that information in evaluating the degree of protection of the agricultural water system from possible sources of contamination under § 112.43(a)(1)(iii). For example, a farm might consider the nature of the other body of water, the proximity of the other body of water to the farm's agricultural water system, and local topography, as these factors might affect the likelihood of known or reasonably foreseeable hazards being introduced to the agricultural water system from the other body of water.

(Comment 47) Some comments seek clarity as to how the requirements to consider the location and nature of the water source in proposed § 112.43(a) applies in CEA farms, such as some hydroponic and aquaponic operations. Additionally, one comment suggests that indoor farms should consider whether the surrounding building and/or other infrastructure may impact the quality of pre-harvest agricultural water.

(Response 47) Section § 112.43(a)(1) requires farms to evaluate each agricultural water system that they use for growing activities for covered produce, including, in part, the location and nature of the water source (for example, whether it is ground water or surface water) and the degree of protection from possible sources of contamination. Although CEA operations may provide an additional degree of control over some types of hazards compared to other operations, we emphasize that it is still important to consider a range of potential sources of hazards that might affect agricultural water used in CEA. For example, in our investigation report for the 2021 outbreak of *Salmonella* Typhimurium associated with packaged leafy greens produced in a CEA indoor hydroponic facility, we discussed various findings related to water use and highlighted the importance of assessing and mitigating risks associated with adjacent and nearby land uses that may impact CEA operations, in both rural and more urbanized settings (Ref. 62). See response to comment 41.

We also agree that it is important for farms in general (not just those participating in CEA) to consider buildings and/or other infrastructure that might affect the quality of their pre-harvest agricultural water. We note in particular that the definition of ''agricultural water system'' includes, in part, ''any building or structure that is part of the water distribution system (such as a well house, pump station, or shed), and any equipment used for application of agricultural water to covered produce during growing, harvesting, packing, or holding activities'' (§ 112.3). As such, to the extent that any building, structure, or equipment is a component of a farm's agricultural water system, the farm must inspect and maintain those components to the extent that they are under the farm's control in accordance with § 112.42 and consider those components in conducting an agricultural water assessment pursuant to § 112.43. For example, in evaluating the degree of protection of an agricultural water system from possible sources of contamination under § 112.43(a)(1)(iii), farms should consider whether buildings or structures that are part of its agricultural water system protect other components of the agricultural water system from possible sources of contamination (such as where a well house or storage shed might protect wells and/or water application equipment from debris, trash, domesticated animals, or other possible sources of contamination).

1. Degree of Protection of Each Agricultural Water System

a. General

(Comment 48) A few comments request examples of types of hazards beyond animals, biological soil amendments of animal origin (BSAAOs), and human waste that should be considered as part of an agricultural water assessment. One comment suggests that farms might also consider maintenance activities in an irrigation district and whether a farm is near an airport subject to nearby chemical intrusion as part of an agricultural water assessment.

(Response 48) Section 112.43(a)(1)(iii) requires that as part of an agricultural water assessment, farms evaluate the degree of protection of the agricultural water system from possible sources of contamination. While other water users, animal impacts, and adjacent and nearby land uses related to animal activity, BSAAOs, or presence of untreated or improperly treated human waste are provided as examples of possible sources of contamination, we note that the list of examples in § 112.43(a)(1)(iii) is not exhaustive. For example, if applicable to the circumstances, the farm must consider the following potential sources of contamination as part of its agricultural water assessment: upstream maintenance activity (such as dredging) within a canal system that may affect the microbial quality of the water; urban development activities from which runoff may introduce hazards to the agricultural water system; and human activities (such as recreational vehicle parks) that may introduce hazards to the agricultural water system. We note, however, that the 2015 produce safety final rule applies to biological hazards and not, for example, chemical hazards. See response to comment 8.

(Comment 49) Some comments suggest that farms with agricultural water systems that span long distances from source to point of delivery (such as some irrigation canals) will face challenges when preparing agricultural water assessments, as certain portions of the water system, such as those that relate to adjacent and nearby lands and/or other water users, may not be under the farm's control. A few comments suggest that additional clarity on how far upstream farms are required to consider impacts on their water systems would help, and request more information on what distance upstream farms are responsible for considering.

(Response 49) We recognize that some farms have pre-harvest agricultural water systems with water sources and/or distribution systems, such as irrigation canals or rivers, that span long distances or are impacted by land uses covering a wide area. We further recognize that factors that can affect water sources, including those related to adjacent and nearby lands and/or other water users, may be outside of a farm's control.

More broadly, due to the variability that exists in agricultural water systems and across different growing regions, including in the characteristics of water sources and the nature of potential sources of hazards, farms' consideration of other agricultural water users and/or adjacent or nearby lands will vary widely, include factors that may be outside of a farm's control, and will likely depend on each farm's unique agricultural water systems and growing operations. For example, the QAR (Ref. 17) found that the composition and chemistry of flowing waters can be expected to be largely influenced by their course through land used for purposes that may lead to their contamination and, potentially, to the contamination of produce exposed to those waters. As such, we do not consider it appropriate to prescribe a distance for which farms must consider factors that have the potential to impact their water quality.

While we are not requiring farms to physically visit areas of an agricultural water system that are outside of their control, farms must include in their assessments information on sources of hazards (such as adjacent and nearby

land uses and other water users) that have the potential to result in contamination of covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with agricultural water. We note that there are a variety of resources available to farms that may provide information as to the presence and nature of impacts that might affect the quality of their agricultural water. See response to comment 51.

(Comment 50) One comment requests that FDA revise the requirements for agricultural water assessments in proposed § 112.43(a) to clarify that farms are only required to consider the degree of protection and/or adjacent and nearby land uses for surface water sources, and that only possible sources of contamination within the surface water's drainage basin need to be considered.

(Response 50) We do not consider it appropriate to limit consideration for the degree of protection of an agricultural water system and/or adjacent and nearby land uses to surface water sources only, as doing so would not sufficiently capture the variety of water sources and potential sources of hazards that exist in industry. While surface water sources are generally more vulnerable to contamination, the potential for contaminants to be introduced to agricultural water is not limited to surface water (Ref. 17). For example, if a well is not sufficiently protected (for example, due to unprotected cross-connections or from having an impaired well cap, seals, and/or casing), it may increase the likelihood of hazards being introduced to the water. Similarly, if the well is situated at a lower elevation than adjacent and nearby lands and is subject to runoff from those lands, it may be subject to the introduction of hazards. As occurrences such as these are important for farms to consider in complying with the requirements for pre-harvest agricultural water assessments, we decline to make the change suggested by the comment.

(Comment 51) Some comments state that farms will face difficulties in getting information on factors that are outside of their control (for example, other users of water and adjacent and nearby lands), such as when those areas are not available for farms to access due to ownership or geographic barriers. A few comments indicate comfort speaking with neighbors about their land use(s), whereas other comments state that some farms may face challenges in obtaining information on adjacent and nearby lands due to land users either being unwilling to share information or providing incomplete or inaccurate information. Some of these comments request that farms should be able to assume that, in the absence of obvious evidence to the contrary, neighbors are following the law. One comment expresses a concern that situations could arise in which a neighbor informs a farm that they are appropriately controlling hazards but are not doing so, and seeks clarity as to whether the farm would be held responsible in this situation. While some comments acknowledge that there may be other sources of information on adjacent and nearby lands, a few suggest that some of these resources (such as visual observation and mapping tools) are inadequate because they cannot reveal all specific hazards.

(Response 51) Farms are responsible for ensuring that all applicable requirements of subpart E are met, including the requirement in § 112.41 that all agricultural water be safe and of adequate sanitary quality for its intended use. While farms are not required to physically visit areas of an agricultural water system that are outside of their control, in preparing an agricultural water assessment under § 112.43, farms must include in their assessments information on sources of hazards (such as adjacent and nearby land uses and other water users) that have the potential to result in contamination of covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with agricultural water.

Although farms may consider working with adjacent and nearby land users in evaluating adjacent and nearby land uses under § 112.43(a), there are a variety of resources available that may provide insight as to the presence and nature of impacts that can affect the quality of agricultural water. For example, information can be acquired through visual observation, from local extension agents and/or industry associations, or from online resources such as mapping tools, which may provide helpful information on topography and proximity to potential sources of hazards. Depending on the water source being used, there may also be organizations or water management authorities, such as irrigation district managers, that can serve as a source of information. We are also aware of efforts underway to bring together members of agricultural communities on a large scale, such as through the CAN Initiative (Ref. 38), to further conversations and encourage discussions between land users in agricultural areas. Various action items have been identified as part of CAN, one of which entails steps that can be taken to foster neighbor-to-neighbor interactions and conversations (Ref. 39). See also response to comment 33. As efforts such as these progress, they too may serve as an additional source of information for meeting the requirements in § 112.43. In some instances, farms may benefit from looking to a variety of resources to assist in their understanding of other water users and adjacent and nearby land uses to further inform their determinations under § 112.43(c) as to whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water.

We recognize that even with the variety of resources available to farms, farms may still face uncertainty with respect to other water users and adjacent and nearby lands that are outside of their control, such as if upstream users are not willing to share information. As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69137–69138), due to the nature of the risks associated with animal activity, BSAAOs, and untreated or partially treated human waste on adjacent and nearby lands, in the event of uncertainty, farms should consider accounting for the increased likelihood of hazard introduction to the water systems. Farms should use that information, particularly for surface water unprotected from runoff and in light of other factors evaluated under § 112.43(a), in determining whether measures under § 112.45 are reasonably necessary. See also response to comment 53.

(Comment 52) Some comments suggest that when evaluating the degree of protection of each agricultural water system, farms may recognize riparian buffers and filtrating vegetation for their role in protection water from sources of contamination.

(Response 52) We agree that buffers and filtrating vegetation, in addition to walls, earthen berms, ditches, or other barriers, may help minimize the influence of runoff on water sources and distribution systems. (See 86 FR 69120 at 69134 and 69136.) The comments did not request, nor are we requiring, farms to use any of these barriers in managing their identified risks. We further agree that there may be other mechanisms by which agricultural water systems are protected from possible sources of contamination via runoff, the impact of which farms may consider when

conducting their agricultural water assessments.

b. Adjacent and Nearby Land Uses

(Comment 53) Several comments support the proposed rule's requirement for farms to assess adjacent and nearby land uses. Conversely, some comments assert that the proposed requirement that covered entities must evaluate adjacent and nearby land uses represents an unreasonable burden on farms. A few of these comments claim that if farms are not able to prove that adjacent or nearby land use does not pose a risk, they would be forced to assume risks are present and undertake potentially overly conservative or unnecessary mitigations. One comment requests that FDA include in the final rule an alternative option for achieving the requirement to evaluate adjacent and nearby land use, suggesting that a provision for a written explanation for why the adjacent and nearby lands cannot be assessed, combined with water testing, would suffice. Another comment suggests that adjacent and nearby lands should only be evaluated for certain high-risk activities, although, the comment notes, what is considered ''high risk'' is also dependent on the water source and crop being grown.

(Response 53) As discussed in the 2021 agricultural water proposed rule (80 FR 74354 at 69126–69127), adjacent and nearby land uses have been identified as possible contributing factors in several produce outbreaks (Refs. 18–23, 58, 63 and 64). FDA's investigations of such outbreaks underscore the importance of pre-harvest agricultural water quality and the potential impacts of adjacent and nearby land uses on agricultural water, which can serve as a route of contamination of produce. The requirements we are finalizing with this rule are designed to address these concerns by requiring farms to evaluate adjacent and nearby land uses in preparing an agricultural water assessment under § 112.43(a) and manage use of their pre-harvest agricultural water accordingly. As such, we decline to provide an alternative to the requirement that adjacent and nearby lands be evaluated under § 112.43(a) as part of an agricultural water assessment.

Moreover, we are providing for expedited implementation of mitigation measures under § 112.45(b) for known or reasonably foreseeable hazards related to certain adjacent and nearby land uses. We recognize that activities associated with adjacent or nearby lands that introduce known or reasonably foreseeable hazards into a water source or distribution system are often not under a farm's control. While the farm may not have control over those potential hazards at their point of introduction into a water source or system, the potential hazards are important for the farm to consider in making decisions about the use of agricultural water on covered produce. Therefore, for animal activities, BSAAOs, or untreated or partially treated human waste associated with adjacent and nearby lands, it is important that the farm not only implement mitigation measures that are under its control to reduce the risk associated with that water source or system, but that it do so on an expedited basis to protect public health.

Many activities on adjacent or nearby lands may create or pose conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces, which farms must consider under § 112.43(a) as part of an agricultural water assessment if applicable to their operations. Examples include other agricultural operations (such as land used for growing operations, animal grazing, dairy production, poultry production, barnyards, commercial animal feeding operations, and farms with working animals); composting sites; lands used for recreational activities (such as campgrounds); wastewater treatment facilities (or other potential sources of human waste like toilet facilities and sewage disposal systems); urban/suburban development activities; and lands with significant wildlife intrusion or habitat.

We recognize that farms may face uncertainty around evaluating information related to adjacent and nearby land uses such as these, such as if upstream users are not willing to share information. As discussed in the 2021 proposed rule (86 FR 69120 at 69137–69138), in the event of uncertainty, due to the nature of the risks associated with animal activity, BSAAOs, and untreated or partially treated human waste on adjacent and nearby lands, farms should consider accounting for the increased likelihood of hazard introduction to the water systems from adjacent or nearby lands when making decisions around the use of their water. However, we disagree that this will ''force'' farms to assume risks are present and implement mitigation measures that might otherwise not be necessary. Rather, farms should consider the increased likelihood of hazard introduction from such adjacent and nearby land uses, in addition to other information evaluated in § 112.43(a)(1) through (5), in determining whether measures under § 112.45 are reasonably necessary. As a result, farms may find, for example, that in light of the information evaluated under § 112.43(a)(1) through (5), mitigation may not be reasonably necessary to address potential hazards from an adjacent or nearby land use.

(Comment 54) Many comments request that FDA clarify the definition of and/or narrowly define ''adjacent and nearby lands'' in terms of distance, arguing that absent such a definition, it will be unclear what lands farms are responsible for considering. One comment notes that other food safety schemes define adjacent land as no CAFOs closer than 0.25 miles or 400 feet buffer from hobby farms. Another comment expresses concerns that in the Fall 2019 *E. coli* O157:H7 outbreak linked to romaine lettuce referenced in the proposed rule, the outbreak strain was found at a point nearly two miles upslope from the impacted farms, a distance the comment deems unreasonable for a farm to consider in its assessment.

(Response 54) In the 2021 agricultural water proposed rule (86 FR 69120 at 69135), we discussed ''adjacent and nearby lands'' with respect to agricultural water systems specifically, as adjacent and nearby lands may affect the safety of covered produce in ways not related to agricultural water, such as through movement of animals, equipment and tools, run-off into growing fields, and wind. We recognize that this may have led to uncertainty as to the lands that farms are required to consider for assessment purposes, and are clarifying that for the purposes of subpart E, by ''adjacent'' land we are referring to land sharing a common border with the farm's land. By ''nearby'' land we are referring to a broader category of land, including land that does not adjoin the farm's land but has the potential to affect the farm's agricultural water systems(s) based on the land's location. For example, agricultural water may be affected by agricultural practices and runoff from those operations into surface water sources or open distribution systems that are used for agricultural water even if the operations' lands are not adjacent to a farm's land. See also 80 FR 74354 at 74433. Due to the diversity that exists in agricultural water systems and across different growing regions, what constitutes ''adjacent'' and ''nearby'' land will vary between farms and likely depend on each farm's unique agricultural water systems. As such, we do not consider it appropriate to prescribe an upstream distance for

which farms must consider uses of adjacent and nearby lands. See also response to comment 49.

c. Animal Impacts and Activities

(Comment 55) Several comments seek clarity on how a farm should translate evidence of animal activity (*e.g.,* scat from unidentified animals, tracks without scat, or damaged irrigation pipes from an unidentified animal) into risk, noting that different animals and animal activities represent different levels of risk to water safety. One comment expressed a concern that the requirement for farms to consider animal activity may lead to the outcome that a farm with any animal activity nearby will be expected to implement significant safety measures.

(Response 55) Examples of relevant factors for evaluating the degree of protection of agricultural water systems from potential sources of contamination associated with animals under § 112.43(a)(1)(iii) include, but are not limited to, the following:

- The presence and location of any animal activities, such as whether there are areas in which animals might be in close proximity and/or have direct access to pre-harvest agricultural water systems (such as for loafing or drinking). Included in this is consideration for any fencing, containment, or other measures that may affect animal access to agricultural water systems;
- The presence and location of potential attractants and habitats (such as heavy vegetation, wooded areas, water sources, or standing water) that may draw animals to agricultural water systems;
- Whether runoff into agricultural water systems from lands currently or historically associated with animals is likely to occur, including whether there are earthen diversion berms, ditches, or other barriers that minimize runoff;
- Whether animals have access to areas relevant to agricultural water systems at times when pre-harvest agricultural water is being applied to non-sprout covered produce; and
- Whether any systems or structures are in place to handle, convey, or store animal waste (such as animal stalls, composting piles, pits, manure lagoons, or other waste containment structures or systems) that may serve as a possible source of contamination to agricultural water systems. Included in this, for example, is whether vehicles carrying animal waste follow traffic patterns that may result in the introduction of known or reasonably foreseeable hazards from the animal waste to agricultural water systems.

As discussed in the 2021 proposed rule, visual observations by a farm for purposes of §§ 112.81–112.83 in subpart I, ''Domesticated and Wild Animals'' of the 2015 produce safety final rule may provide useful information for evaluating the degree of protection of a pre-harvest agricultural water system under § 112.43(a)(1)(iii) (86 FR 69120 at 69135). Additionally, a farm may be aware of potential animal impacts on agricultural water systems through inspections and maintenance performed on agricultural water sources and agricultural water systems it controls under § 112.42, which we did not propose to change. For example, pooled water in close proximity to the crop may serve as an attractant for pests and other animals which may in turn introduce hazards into pooled water that may contaminate produce. (See 80 FR 74354 at 74434.)

Given the diversity that exists across industry in water systems, operations, and conditions, we do not expect that every animal impact or activity will require that corrective or mitigation measures be implemented under § 112.45. While farms are required to evaluate the degree of protection of an agricultural water system from possible sources of contamination including animal impacts and adjacent and nearby land uses related to animal activity, they are required to consider that information, along with the other factors evaluated under § 112.43(a)(1) through (5), in determining whether measures under § 112.45 are reasonably necessary.

(Comment 56) One comment suggests that farms should take the type of animal activity into account when evaluating risks as part of an agricultural water assessment. For example, the comment asserts that management techniques such as prescribed grazing can result in less opportunity for contamination of water via runoff compared to CAFOs, since fecal matter is dispersed across a larger area of land where prescribed grazing occurs. The comment also states that dispersed feces in areas used for prescribed grazing are more likely to be inactivated by the sun's UV rays versus feces at a CAFO.

(Response 56) The risk posed by animal activities to a farm's agricultural water systems may depend on various factors and are not limited only to animal activities with high densities of animals, such as CAFOs. Animal activities have the potential to serve as a source of human pathogens, and depending on the circumstances, may introduce hazards to agricultural water systems (Ref. 17). Animal activities can include those related to wildlife (*e.g.,* birds or deer); animal intrusion, domesticated companion animals (*e.g.,* dogs, cats); animals for protection (*e.g.,* guard dogs); working animals (*e.g.,* horses, mules); grazing animals; livestock (including CAFOs); poultry production; dairy production; and barnyards.

For example, as discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69125–69127), in the fall 2018 *E. coli* O157:H7 outbreak linked to romaine lettuce from California (Ref. 20), investigators noted that extensive wild animal activity in the area and animal grazing on nearby land by cattle and horses, among other things, may have served as potential sources of hazards. Similarly, in the fall 2019 *E. coli* O157:H7 outbreaks linked to romaine lettuce (Ref. 21), investigators observed cattle grazing land in the hills above leafy greens fields, with numbers of cattle far lower than the volume of what is considered a large CAFO. As discussed in the QAR (Ref. 17), exposure of produce to hazards from animals may occur, among other means, through runoff that enters the growing area and contaminated agricultural water. As such, we consider it important for farms to consider various animal impacts and activities, not just those related to CAFOs, for the potential to serve as sources of known or reasonably foreseeable hazards that may be introduced into an agricultural water system and contaminate covered produce.

d. BSAAOs

(Comment 57) One comment requests more information on what FDA would consider to be ''high risk'' regarding agricultural water and the use of BSAAOs.

(Response 57) As discussed in response to comment 31, given the diversity across farms, ''risk'' related to BSAAOs will vary. For example, the QAR (Ref. 17) concluded that composting is less likely than controlled chemical or physical treatments to fully eliminate human pathogens from animal waste; incompletely treated, or re-contaminated, BSAAOs may contain human pathogens; and biological soil amendments can transmit human pathogens to surface water or ground water when stockpiled or applied to fields. The use of BSAAOs both by the farm and by users of adjacent and nearby lands are factors to consider for purposes of an agricultural water assessment under § 112.43(a), and in making a risk management determination under § 112.43. We intend farms to consider information relevant to their specific circumstances

in evaluating the various factors under § 112.43(a).

Examples of relevant factors for evaluating the degree of protection of agricultural water systems from potential sources of contamination associated with BSAAOs include, but are not limited to, the following:

- The location and proximity of areas where BSAAOs are held or applied to land in relation to agricultural water systems;
- Whether runoff or tailwater returns into agricultural water systems from areas where BSAAOs are held or applied to land is likely to occur, including whether there are earthen diversion berms, ditches, or other barriers that minimize runoff;
- Whether the BSAAOs are treated and to what extent;
- Whether BSAAOs are applied to the land during times when pre-harvest agricultural water is being applied to non-sprout covered produce; and
- Whether any systems or structures are in place to handle, convey, and store BSAAOs (such as composting piles, pits, manure lagoons, or other waste containment structures or systems) that may serve as a possible source of contamination to agricultural water systems. Included in this, for example, is whether vehicles carrying BSAAOs follow traffic patterns that may result in the introduction of known or reasonably foreseeable hazards from the BSAAOs to agricultural water systems.

For farms subject to the 2015 produce safety final rule, we note that requirements in subpart F of part 112 (§§ 112.51–112.60) may apply, including § 112.52(a), which requires that farms handle, convey, and store any BSAAO in a manner and location such that it does not become a potential source of contamination to water sources and water distribution systems.

(Comment 58) One comment seeks clarity as to whether there are ''specifications'' for the use of BSAAOs and different types of irrigation methods under the proposed rule.

(Response 58) It is unclear to us what type of ''specification'' the commenter is referring to. However, we note that this rule does not establish requirements for allowable pre-harvest agricultural water application methods based on the source of known or reasonably foreseeable hazards to an agricultural water system. Farms remain responsible for ensuring that all applicable requirements are met, including the requirement in § 112.41 that all agricultural water be safe and of adequate sanitary quality for its intended use.

e. Untreated and Improperly Treated Human Waste

(Comment 59) Some comments address the requirement in § 112.43(a)(1) to consider the degree of protection from possible sources of contamination, including untreated or partially treated human waste. One comment pertains to the regulations laid out in 40 CFR part 503 related to land applied biosolids, and suggest that the applications of treated municipal biosolids to land can be safely done. Conversely, other comments suggest that application of biosolids from municipal or industrial sources requires further evaluation and/or research as it relates to impacts on agricultural water and produce safety. One comment opposes the land application of municipal wastewater sludge and industrial waste (for example, slaughterhouse sludge), suggesting that there should be restrictions for the use of such materials on crops and that land applications of those materials may serve as a source of contamination to water sources.

(Response 59) As described in the QAR (Ref. 17), human waste may contain pathogens in relatively high concentrations. Runoff associated with human waste from adjacent and nearby lands may contaminate sources or distribution systems for pre-harvest agricultural water for non-sprout covered produce. As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69137), an evaluation of hazards associated with untreated or improperly treated human waste can include consideration of potential sources of contamination such as toilet facilities (portable and fixed), sewage systems, sewer overflows, septic tanks, and drain fields. 86 FR 69120 at 69137.

With respect to comments relating to land applications of treated sewage sludge (biosolids) and/or industrial waste (such as from slaughterhouses), we note that such comments are outside the scope of this rulemaking. Rather, as part of a pre-harvest agricultural water assessment under § 112.43(a), farms are required to identify conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces based on an evaluation of various factors, including the degree of protection of each agricultural water system from possible sources of contamination (§ 112.43(a)(1)(iii)). As part of this evaluation, farms consider the presence of potential sources of hazards (such as land applications of such materials); the likelihood of those hazards being introduced to their water systems (such as through runoff or seepage); and together with the other information evaluated in § 112.43(a)(1) through (5), make a determination as to whether measures are reasonably necessary to reduce the potential for contamination of covered produce or food contact surfaces from hazards associated with pre-harvest agricultural water.

We emphasize that other provisions of the 2015 produce safety final rule that we did not propose to change, including the prohibition on the use of human waste for growing covered produce (except sewage sludge biosolids used in accordance with the requirements of 40 CFR part 503, subpart D, or equivalent regulatory requirements) (§ 112.53), continue to apply.

It is important for farms to consider the increased likelihood of hazard introduction to their agricultural water systems for any land applications of materials such as treated sewage sludge (biosolids) and industrial wastes, because those materials may serve as a source of known or reasonably foreseeable hazards that can be introduced into an agricultural water system (such as through runoff). Farms should consider the increased likelihood of hazard introduction to their agricultural water systems, particularly for surface water unprotected from runoff and in light of other factors evaluated under § 112.43(a), in determining whether measures are reasonably necessary under § 112.45.

f. Other Water Users

(Comment 60) Several comments address FDA's request for comment on water reuse for pre-harvest agricultural water. Some comments state that reused water can be used as safely as other types of water and may help farms faced with dwindling water supplies from other sources. A few of these comments specifically suggest that wastewater can be treated to be ''fit for purpose,'' in which it is treated to a level that is safe for a specific use on irrigated food crops. Some comments also note that the requirements related to quality and use of pre-harvest agricultural water in §§ 112.41, 112.42, and 112.43 are appropriate to apply for all types of water. However, a few comments suggest that reused water should be subject to testing before being used as pre-harvest water. Another comment requests that FDA clarify in the final rule and in subsequent guidance that untreated or improperly treated human waste is not present in treated recycled wastewater because water recycling includes proper treatment of human

waste. The comment suggests that without additional guidance from FDA, a farm may interpret using a recycled water source as inherently risky even when it is not.

(Response 60) As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69134–69135), the requirements for agricultural water quality in §§ 112.41 and 112.43 apply regardless of the source or type of water used as agricultural water. Thus, a farm must determine the appropriate use of the recycled water in light of the conditions and practices on the farm by assessment as required under § 112.43, taking into account the standard in § 112.41 that all agricultural water must be safe and of adequate sanitary quality for its intended use. As comments suggest, farms also need to ensure that all other applicable requirements in subpart E are met, including those in § 112.42 for inspection and maintenance of agricultural water systems to the extent they are under a farm's control, the results of which farms will consider in preparing an agricultural water assessment under § 112.43(a).

We are not aware of, and comments did not provide, data or information suggesting the need to require that all recycled or reused water be tested to adequately complete an agricultural water assessment. Therefore, consistent with our mandate to establish science-based minimum standards, including procedures, processes, and practices that are reasonably necessary to prevent introduction of hazards and provide reasonable assurances produce is not adulterated under section 402 of the FD&C Act, we are not establishing separate requirements related to testing or quantitative thresholds for water reuse. Users of such water, if appropriate, may test that water as one part of an assessment under § 112.43(d). While we provide examples of scientifically valid microbial criteria and sampling frequencies in our responses to comment 95 and comment 93, respectively, we expect that as the science evolves and more information is learned about unique considerations relevant to certain sources of water (such as water reuse), such information may be incorporated in future guidance.

We also recognize that some suppliers of recycled water (for example, a public utility), may furnish information on the water's microbial quality which can be considered while preparing agricultural water assessments and determining whether measures are reasonably necessary under § 112.45.

2. Agricultural Water Practices

(Comment 61) Some comments address the requirement in proposed § 112.43(a)(2) that farms assess the time interval between the last direct application of agricultural water and harvest of the covered produce. These comments suggest that agricultural water used early in the production cycle is less risky than water used closer to harvest and request that FDA recognize this variation in risk when evaluating farms' assessments and records. Other comments note the variability in application-to-harvest intervals that exist across industry. For example, some comments note that for certain crops, agricultural water needs to be applied right up until harvest, whereas for other crops, there may be more flexibility as to the timing of the last water application. Others cite challenges associated with assessing the interval between the last direct application of agricultural water and harvest. These comments note that in some instances, the harvest date and/or the last water application is established by the shipper, and that such decisions may not be made until right before harvest.

(Response 61) As explained in the QAR (Ref. 17), the timing of water application is an important factor in determining the likelihood of contamination of produce, because many pathogens die off over time on the surface of produce. Generally, bacteria or pathogens in water that is applied early in the growing cycle are subject to die-off from several environmental forces, such as UV exposure, temperature, humidity, and the presence of competitive organisms (Ref. 65). In contrast, pathogens present in agricultural water that is applied shortly before harvest may not be exposed to the same environmental conditions for sufficient time to provide a similar magnitude of die-off (Ref. 17). We recognize that the time interval between last direct application of agricultural water and harvest is likely to vary widely across industry, and as such, each farm must capture the practices unique to its operation within its agricultural water assessments and use that information, alongside the other factors evaluated under § 112.43(a), in determining whether measures are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with the farm's pre-harvest agricultural water.

Further, we recognize that there may be some instances in which there is uncertainty as to what the time interval between last application of agricultural water and harvest will be. In such instances, farms may use their previous experience and knowledge of agronomic practices to provide an estimate in their agricultural water assessment as to what the expected interval might be. For example, if a farm knows that the last water application generally occurs 1 to 2 weeks before harvest, even though the precise interval may vary and not be known until right before harvest, the farm may note that in its agricultural water assessment and use that information alongside other factors evaluated in § 112.43(a) in making decisions regarding use of its pre-harvest agricultural water.

3. Crop Characteristics

(Comment 62) Many comments address the proposed requirement in § 112.43(a)(3) that farms evaluate crop characteristics as part of their agricultural water assessments. Several comments seek clarification from FDA that characteristics of the crop include aspects beyond what is explicitly listed in the preamble of the proposed rule, such as whether the crop is grown in a manner that is exposed to pooled water or wet soil, whether it supports the growth of foodborne pathogens, and whether it has historically been linked to outbreaks where pre-harvest water use was a known or suspected route to contamination.

(Response 62) Section § 112.43(a)(3) requires farms to evaluate crop characteristics, including the susceptibility of the covered produce to surface adhesion or internalization of hazards, as part of their agricultural water assessments. Crop characteristics that a farm considers may extend beyond those provided as examples in § 112.43(a)(3), which we are finalizing as proposed, without changes. For example, a farm may have information suggesting that characteristics of its covered produce support the attachment, survival and/or growth of pathogens that may be introduced via agricultural water. We also note that contact between covered produce and pooled water is addressed in § 112.42(b)(4), which we did not propose to substantively revise. Section 112.42(b)(4) requires that farms, as necessary and appropriate, implement measures reasonably necessary to reduce the potential for contamination of covered produce resulting from contact of covered produce with pooled water.

We emphasize that absence of a history of outbreaks associated with a particular commodity should not be

relied upon as being indicative of that commodity having characteristics that inherently make it ''safe''. For example, in our investigation of the summer 2020 outbreak of *Salmonella* Newport linked to red onions, we noted that the outbreak was remarkable because the food vehicle, whole red onions, is a raw agricultural commodity that had not been previously associated with a foodborne illness outbreak (Ref. 23). Although a conclusive root cause could not be identified, several potential contributing factors were identified, including a leading hypothesis that contaminated irrigation water used in a growing field may have led to contamination of the onions.

(Comment 63) Several comments oppose the proposed requirement in § 112.43(a)(3) that farms identify and assess crop characteristics in their agricultural water assessments and recommend that assessment of crop characteristics be included in guidance and/or training programs instead, rather than as enforceable requirements in the final rule. Some comments request that FDA provide research support and scientific information on characteristics that do, or do not, make a crop more susceptible to contamination. A few comments note that crop characteristics are not a factor in other produce safety programs, such as the Leafy Greens Marketing Agreement (LGMA) metrics, noting that under the assessment that LGMA requires, leafy greens are treated equal, and water should be of adequate quality for its intended use no matter what covered produce crop is being grown.

(Response 63) All agricultural water must be safe and of adequate sanitary quality for its intended use (§ 112.41), and we consider that evaluating crop characteristics, alongside other factors identified in § 112.43(a), as part of a farm's agricultural water assessment will assist farms in determining whether this standard is met.

While the QAR concluded that using crop physical characteristics alone seems to be a poor indicator of which commodities are at a greater or lesser likelihood of contamination that may lead to a foodborne outbreak, it also explains that where contamination of a water source is known to exist, the likelihood of contamination is a function of various factors, including contact with the commodity, commodity effects (characteristics), and application timing (Ref. 17). Moreover, in the 1998 Good Agricultural Practices (GAPs) Guide (Ref. 59), we explain that produce that has a large surface area (such as leafy vegetables) and produce with topographical features (such as rough surfaces) that foster attachment or entrapment may be at greater risk from pathogens, if they are present, especially if contact with agricultural water occurs close to harvest or during post-harvest handling. Studies have also shown that the contamination of produce by contact with irrigation water is dependent, in part, on the physical properties of the plant, such as surface texture (Ref. 66). Moreover, survival of pathogens on produce is known to be enhanced if the epidermal barrier has been broken by physical damage, such as punctures or bruising, or by degradation by plant pathogens or spoilage organisms (Refs. 67 and 68).

In light of the foregoing, we have concluded that there is sufficient evidence of the effect of crop characteristics on the safety of covered produce to which agricultural water is applied; therefore, and we are not removing crop characteristics as one of the factors farms are required to evaluate under § 112.43(a). Peer-reviewed literature, cooperative extension, and academic or trade organization research may serve as additional sources of information on the effect of crop characteristics on pre-harvest agricultural water.

(Comment 64) Several comments assert that the crop characteristics listed in the preamble of FDA's proposed rule are not specific to water and therefore are outside the scope of the proposed rule. For instance, one comment asserts that crop characteristics contribute to risks related to cultivation, harvesting, packing, and holding practices as a whole and not to agricultural water in particular. The comment recommends that if FDA intends to retain crop characteristics as a factor in the final rule related to agricultural water, the Agency should explicitly state that consideration of crop characteristics is limited to how the characteristics relate to potential contamination from direct application of agricultural water.

(Response 64) We disagree that including consideration of crop characteristics as part of a farm's agricultural water assessment under § 112.43(a) is outside the scope of this rulemaking, as crop characteristics have long been identified as a factor influencing the potential for water to contaminate produce (see response to comment 63). However, we recognize that not all crop characteristics may be relevant to potential contamination of covered produce by agricultural water, and we emphasize that farms are only required to evaluate those characteristics that might influence the safety of covered produce in light of a farm's pre-harvest agricultural water.

(Comment 65) Several comments suggest that the inclusion of crop characteristics in agricultural water assessments will result in confusion, because, the comments claim, crop characteristics are only relevant to consider if an agricultural water source is already contaminated. For example, comments suggest that crop characteristics are only relevant to agricultural water use if the agricultural water is not of adequate sanitary quality and, therefore, the farm would already need to undertake mitigation measures independent of crop characteristics.

(Response 65) We disagree that crop characteristics are only relevant to consider if a farm has already determined that water is not safe or not of adequate sanitary quality for its intended use. As discussed in the 2013 proposed rule, the principle of ''safe and of adequate sanitary quality for its intended use'' contains elements related both to the attributes of the source water used and the activity, practice, or use of the water. The way in which water is used for different commodities and agricultural practices can affect the risk of contamination of the produce. 78 FR 3504 at 3563. While the QAR concluded that crop physical characteristics alone seems to be a poor indicator of which commodities are at a greater or lesser likelihood of contamination that may lead to a foodborne outbreak (Ref. 17), consideration of various factors that play a role in the safety and quality of pre-harvest agricultural water on covered produce, of which crop characteristics is only one, will assist farms in making decisions around the use of their pre-harvest agricultural water. As such, farms are required to consider crop characteristics, in conjunction with each other factor in § 112.43(a)(1) through (5), in determining whether measures are reasonably necessary under § 112.45.

(Comment 66) A number of comments note that many farms grow a wide variety of crops and suggest that it would be burdensome and time-intensive for a farm to assess susceptibility for all crops, particularly for crops for which limited scientific data on susceptibility exists. Some question whether farms need to conduct separate assessments for each commodity they grow. One comment notes that some farms change what commodities they grow frequently, suggesting that requiring the farm to prepare an assessment with each change in commodity will be burdensome.

(Response 66) Farms have the flexibility to evaluate crop characteristics in § 112.43(a)(3) as appropriate given their pre-harvest

agricultural water uses and growing operations. For example, while we recognize that some farms may be growing multiple types of crops using the same agricultural water system, in some instances, crops may have similar characteristics such that the farm may group them based on broad similarities. For example, a farm that grows multiple types of leafy greens may assess the characteristics of all types at once, noting, for example, the large, rough surface area that may increase the likelihood of contaminants being trapped and surviving for extended periods of time. Similarly, a farm that grows oranges, mandarins, and lemons may assess the characteristics of citrus fruit in general. To the extent that a single commodity may have a unique factor that sets them apart from the others, the farm may choose to note that unique characteristic within its agricultural water assessment, rather than establishing a separate evaluation for that one crop. For example, a farm might explain whether one type of leafy green is particularly susceptible to physical damage that has the potential to result in survival and/or growth of pathogens, if introduced.

Farms that change crops frequently are likely aware of what commodities (or types of commodities) it is reasonably likely they may grow. This knowledge, along with practices such as grouping crops based on similarities in characteristics as discussed above, will assist farms in efficiently evaluating crop characteristics as part of their assessments. Further, in the instance where a farm does begin growing a commodity whose characteristics were not already evaluated as part of its agricultural water assessment, we note that reassessments under § 112.43€ must evaluate any factors and conditions affected by the change. As such, a farm's reassessment in light of a new crop may be more limited in scope than if a farm were to prepare a completely new assessment under § 112.43(a).

(Comment 67) One comment suggests that for some covered produce grown in hydroponic systems (such as green onions and lettuce), human pathogens may be internalized via plant roots and translocated throughout the plant. The comment also suggests that surface characteristics of some crops grown in hydroponic systems, such a lettuce, are also applicable to consider as part of an agricultural water assessment, as hydroponic lettuce leaves have been shown to be suitable for attachment of *Listeria.*

(Response 67) We recognize that CEA operations have unique considerations compared to more traditional outdoor growing operations. We agree that in a CEA operation, crop characteristics may affect the safety of the covered produce if contaminants are introduced via agricultural water. As such, farms must consider crop characteristics as part of their agricultural water assessments under § 112.43(a). In response to comment 63, we provide general information on crop characteristics relevant to agricultural water assessments for non-sprout covered produce. We agree that if a farm has information reflective of its unique conditions regarding the effect of crop characteristics on the safety of covered produce to which agricultural water is applied—for example, in the case of hydroponic operations, studies demonstrating crop characteristics that are particularly relevant to practices used in such operations—then that too is relevant to the farm's agricultural water assessment.

4. Environmental Conditions

(Comment 68) Many comments address the requirement in § 112.43(a)(4) that an evaluation of environmental conditions be included in a farm's agricultural water assessment. A few comments suggest that weather conditions can be relatively easily evaluated as part of the agricultural water assessment and that basic information regarding controlling hazards from weather events is already included in grower training courses. In contrast, some comments express concerns, suggesting that such a requirement is an unreasonable burden on farms that, the comments state, would have to obtain information on years of weather history, travel great distances to obtain information from U.S. Weather Service-approved stations, or access scientific journals for relevant data. Some comments suggest that scientific information on environmental impacts on produce safety is limited or nonexistent and it is unreasonable, therefore, to expect farms to evaluate it. Several comments seek clarity on how FDA will evaluate whether environmental factors have been sufficiently considered in the agricultural water assessment.

(Response 68) We considered the comments and are finalizing § 112.43(a)(4) as proposed, without changes. As described in the QAR (Ref. 17), survival of pathogens in the environment is influenced by complex physical, chemical, and biological interactions. Generally, bacteria or pathogens in water that is applied early in the growing cycle are subject to die-off from several environmental forces, such as UV exposure, temperature, and humidity (Ref. 65). Changes in temperature and seasonality are expected to impact persistence of foodborne pathogens in the environment (Ref. 68). Seasonal changes in rainfall—particularly heavy rainfall and flooding events—can greatly affect surface water quality (Refs. 69 and 70) and may result in sediments, which can serve as reservoirs for pathogens, being dispersed within the water column (Ref. 71). Airborne transmission may also result in contamination of the environment—such as agricultural water and growing areas—particularly when dry, windy conditions are present (Ref. 72). Moreover, weather events, such as freezing or hail, can result in physical damage to the epidermal barrier or produce (*e.g.,* punctures or bruising), that may allow for survival of pathogens on produce (Refs. 67 and 68). See the 2021 agricultural water proposed rule at 86 FR 69120 at 69138–69139.

In many instances, farms will be able to use their previous experience and knowledge of their growing region to assess the environmental conditions for their agricultural water assessment. For example, many farms already take weather and climatic conditions into account when making management decisions for the crops they grow, and when and how those plants are planted and harvested. We do not expect farms to obtain detailed reports of local conditions, conduct complex scientific analyses of weather events, or travel to weather stations in order to obtain such information. Rather, knowledge of general trends, such as the identification of wet seasons, average monthly temperatures, and seasonal trends in sun exposure, will likely provide farms with adequate information for their agricultural water assessment. If a farm is new to the growing region, the farm can obtain relevant information on environmental conditions from internet resources (such as average monthly temperatures and rainfall), cooperative extension, and other local resources.

(Comment 69) One comment notes that the weather in their area varies significantly by season (*e.g.,* a rainy season and a dry season) and seeks clarity on whether FDA expects farms to take different measures depending on the season. Several comments suggest that weather is unpredictable, for example, due to effects of climate change, and request clarity on how this should be accounted for in an agricultural water assessment. One comment seeks clarity about whether 1 year of historical weather data is enough, and why historical data can be

used to inform a current plan if weather can be variable year to year. Several comments assert that the proposed rule fails to adequately define environmental conditions (*e.g.,* ''regular weather'', ''extreme weather events'', and ''heavy rain''), making it difficult for farms to assess actual risk and for inspectors to consistently evaluate compliance. Several comments seek clarity on how a farm should assess rare weather events versus routine weather events, and seek guidance on what constitutes an unusual weather event and successful strategies for managing risks associated with different weather patterns that can occur by region.

(Response 69) We recognize that weather is likely to vary both seasonally and year-to-year and expect that farms will take this variability into account for their agricultural water assessment and determinations under § 112.45. For example, if a farm identifies February through May as a rainy season, the farm may determine, alongside the other factors evaluated under § 112.43(a), that measures are reasonably necessary under § 112.45 during that time due to concern over rainfall introducing hazards to its agricultural water system via runoff and/or by stirring up sediments. However, the farm may determine that measures are not reasonably necessary during other times of the year, when rainfall is not as likely to impact its agricultural water system(s). Conversely, a farm may determine that its rainy season occurs early enough in the growing season that, considered alongside the other factors evaluated under § 112.43(a), measures may not be reasonably necessary. In the event a farm determines that corrective or mitigation measures are reasonably necessary in relation to an environmental condition, what measures are appropriate will largely depend on the nature of the other factors evaluated under § 112.43(a). For example, depending on a farm's water use practices and crop characteristics, the farm may find it appropriate to change the water application method under § 112.43(b)(1)(iv) in response to hazards that may be introduced as a result of an environmental condition. See response to comment 113 for discussion regarding mitigation measures following environmental events.

In most instances, farms will be able to use their previous experience and historical knowledge of their growing region to assess not only general ''routine'' trends in environmental conditions (*e.g.,* yearly seasonal patterns in sun exposure), but also those conditions that might happen on a less frequent basis, but that nonetheless have the potential to impact their agricultural water systems or covered produce (*e.g.,* hurricanes, heavy winds, or rains that otherwise may occur on occasion). By recognizing these events within their agricultural water assessments, farms will be able to develop a plan to ensure the safety and quality of their pre-harvest agricultural water in the instance that such events do occur. However, we recognize that farms will not be able to anticipate every environmental condition that occurs. If an unanticipated environmental event occurs that is not already addressed within a farm's agricultural water assessment, the farm must consider whether it results in a significant change that necessitates a reassessment under § 112.43(e). For example, an earthquake that impairs a farm's piped distribution system, or series of atmospheric river events that repeatedly impact a farm's agricultural water system over a period of time, may necessitate a reassessment under § 112.43(e), depending on the circumstances. See also response to comment 100.

(Comment 70) Some comments suggest that by including the phrase ''or covered produce'' in proposed § 112.43(a)(4), FDA is requiring a farm to evaluate how environmental conditions affect each crop, independent of how the environmental conditions impact an agricultural water system. These comments contend that any requirement to evaluate how environmental conditions affects crops is outside the scope of Subpart E. Several comments suggest that environmental considerations are better addressed through guidance, training, or education.

(Response 70) We disagree that an evaluation of environmental conditions that may impact covered produce is outside the scope of this rulemaking, because some environmental conditions may have a direct effect on the susceptibility of the covered produce to surface adhesion or internalization of hazards from agricultural water. (See also the requirement in § 112.43(a)(3) to consider crop characteristics as part of an agricultural water assessment.) For example, if a weather event results in physical damage to a crop (such as if hail results in punctures or bruising), it may increase the susceptibility to survival of pathogens on the produce, if introduced by agricultural water (Ref. 68). As such, we continue to find it appropriate to require farms to consider environmental conditions that impact covered produce as part of their agricultural water assessments. However, we recognize that not all environmental conditions that affect covered produce may be relevant to potential contamination of covered produce by agricultural water, and we emphasize that farms are only required to evaluate those environmental conditions that may be relevant in light of a farm's pre-harvest agricultural water use.

(Comment 71) One comment asserts that weather and climate conditions vary by region, and it is unreasonable to expect farmers in one area of the country be required to account for potential weather events that do not apply to their region.

(Response 71) We do not expect farms to evaluate environmental conditions not relevant to their agricultural water systems and pre-harvest agricultural water use. As such, a farm in one region is not required to consider weather events that occur in another region, if the other region's weather is not relevant to the farm.

(Comment 72) One question seeks clarity on what FDA is looking for in terms of air temperatures and sun exposure. Specifically, the comment seeks clarity on whether a farm will need to provide separate assessments for each field depending on its sun exposure.

(Response 72) The requirements in § 112.43(a) to prepare an agricultural water assessment are specific to each agricultural water system that a farm uses for pre-harvest agricultural water. As such, farms are not necessarily required to prepare a separate agricultural water assessment for each field they use to grow covered produce. (However, if, for example, a farm uses different agricultural water systems for different fields, the farm is required to prepare an agricultural water assessment for each of those systems in accordance with § 112.43(a).)

To the extent that different fields are exposed to varying degrees of sun exposure and temperature, the farm may note as much within its agricultural water assessment. Farms may find such information particularly helpful in considering the appropriateness of relying on in-field microbial die-off as a mitigation measure, if they determine mitigation measures under § 112.45(b) are reasonably necessary and increase the time interval between last direct water application and harvest as a result.

(Comment 73) Some comments seek clarity on how a farm should assess heavy rain that occurs several miles upstream.

(Response 73) Factors to consider in assessing heavy rains as part of an agricultural water assessment include,

but are not limited to, the frequency of such events occurring; whether the rain event is reasonably likely to introduce known or reasonably foreseeable hazards into the agricultural water system (such as through runoff); and whether the farm can expect any other changes to occur by the time the water reaches the farm (such as adequate time to allow any stirred-up sediments to settle out of the water column). Considering this information, alongside the other factors evaluated under § 112.43(a), will assist farms in determining whether measures are reasonably necessary under § 112.45.

(Comment 74) One comment notes that farms may not irrigate after a heavy rain since the crops do not need additional water during that time, and requests clarity on how this should be considered under the proposed rule.

(Response 74) We recognize that the various factors identified in § 112.43(a) are likely to be interrelated, such as when farms cease irrigating their crops following a rain event. If a farm adjusts its water use practices based on other elements evaluated within its agricultural water assessment, the farm must include that as part of its evaluation and use all information considered under § 112.43(a) in determining whether measures are reasonably necessary under § 112.45.

(Comment 75) One comment suggests that environmental conditions may differ for CEA operations compared to outdoor farming, and provides various examples of environmental conditions they consider relevant to CEA, including condensation and subsequent dripping; use, maintenance, and cleaning of heating, ventilation, and cooling equipment; opening or closing of vents to the outdoor environment; and local pest populations. Moreover, the comment suggests that CEA operations such as hydroponic and aquaponic systems have other factors that should be considered as part of an agricultural water assessment, such as cleaning and sanitizing procedures for food contact surfaces; solids management (*i.e.* the accumulation of organic matter in the water); and UV irradiation and ozone treatments for water, which the comment suggests may have unknown efficacy in such systems.

(Response 75) We recognize that CEA operations face a unique set of conditions compared to more traditional outdoor growing operations and that environmental conditions such as weather events (*e.g.,* rain and exposure to sun), may be less relevant to their agricultural water systems and covered produce than in open-field systems. We also recognize that CEA operations may have other factors that are more relevant to their operations than to those growing covered produce in an outdoor capacity that nonetheless have the potential to impact their agricultural water systems and covered produce. Each farm must capture those conditions that are unique to its operation as part of its agricultural water assessment.

5. Other Relevant Factors

Comments regarding other relevant factors, with the exception of those related to testing as part of an assessment under § 112.43(d), are discussed below. Comments on testing conducted under § 112.43(d) are discussed in section V.H.

(Comment 76) Several comments support the language in proposed § 112.43(1)(5) that requires consideration of ''other relevant factors'' to provide farms with the option to incorporate unique circumstances or new scientific data in their agricultural water assessments.

(Response 76) We agree that it will be helpful for farms to capture any additional factors that are unique to their operations within their agricultural water assessments.

We also emphasize that there are provisions in other subparts of the 2015 produce safety final rule, which we did not propose to change, that specify requirements for protecting agricultural water sources and distribution systems from potential sources of contamination. For example, farms are required to handle, convey and store any biological soil amendment of animal origin in a manner and location such that it does not become a potential source of contamination to covered produce, food contact surfaces, areas used for a covered activity, water sources, water distribution systems, and other soil amendments (§ 112.52(a)). Additionally, subpart L of the 2015 produce safety final rule specifies requirements for ensuring that toilet facilities (§ 112.129(b)(1)); hand-washing facilities (§ 112.130(c)); sewage (§ 112.131(b) through (d)); trash, litter, and waste (§ 112.132(a)(2)); plumbing (§ 112.133(c) through (d)); and domesticated animal excreta and litter (§ 112.134(a)) do not serve as a source of contamination for covered produce, food contact surfaces, areas used for a covered activity, agricultural water sources, and agricultural water distribution systems.

G. Outcomes (§ 112.43(c))

In § 112.43(c), we proposed for a farm to determine, based on the farm's evaluation under proposed § 112.43(a), whether corrective or mitigation measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with its agricultural water used in growing covered produce (other than sprouts). We proposed that if a farm's pre-harvest agricultural water does not meet certain criteria in § 112.43(c), the farm would be required to either implement mitigation measures or test the water, consider the test results as part of the assessment, and take appropriate action (proposed § 112.43(c)(4)). We also proposed to require farms to record their determination and take appropriate action (proposed § 112.43(c)).

We received several comments related to outcomes under proposed § 112.43(c) and discuss these comments in the following paragraphs. We discuss comments related to testing in section V.H. As discussed below, we are finalizing § 112.43(c) as proposed, with minimal changes.

(Comment 77) A few comments express concerns with § 112.43(c)(1) through (3), arguing that the ''tiered approach'' to hazard analysis may result in farms expending efforts and resources toward strategies for addressing hazards that do not represent the biggest risk, while expending less effort and resources to address risks that may be more critical. For example, one comment suggests there is a lack of framework for determining when a hazard warrants immediate action or not, noting in particular that animal activity, BSAAOs, or untreated or improperly treated human waste may result in water not being safe or of adequate sanitary quality for its intended use. This comment also suggests the proposed rule could create challenges for farms when deciding which hazards to prioritize addressing when most hazards fall within the same tier.

(Response 77) As discussed in response to comment 28, we consider that the requirements for agricultural water assessments, in which farms evaluate various factors identified in § 112.43(a)(1) through (5), provide a mechanism through which farms evaluate the risk associated with their pre-harvest agricultural water and use that information to determine if measures are reasonably necessary under § 112.45. Further, we have established timeframes for implementing corrective or mitigation measures commensurate with the risk associated with the relevant condition. For example:

• Under § 112.43(c)(1), if pre-harvest agricultural water is not safe or not of adequate sanitary quality for its intended use(s), farms are required to immediately discontinue such use(s) of water and take corrective measures under § 112.45(a) prior to resuming use. We consider such situations to reflect circumstances where it is most necessary to take immediate action in order to protect public health;

• Under § 112.43(c)(2), for conditions that are reasonably likely to introduce known or reasonably foreseeable hazards and are related to animal activity, application of a BSAAOs, or the presence of untreated or improperly treated human waste on adjacent or nearby lands, the farm must implement mitigation measures under § 112.45(b) promptly, and no later than the same growing season as the agricultural water assessment. Because farms often do not have control over those potential hazards at their point of introduction into a water source or system, it is important that the farm not only implement mitigation measures that are under its control to reduce the risk associated with that water source or system, but that it do so on an expedited basis to protect public health; and

• Under § 112.43(c)(4)(i), for conditions that are reasonably likely to introduce known or reasonably foreseeable hazards and are not related to the aforementioned uses of adjacent or nearby lands, the farm must implement mitigation measures under § 112.45(b) as soon as practicable and no later than 1 year after the date of the farm's agricultural water assessment or reassessment. We note that this timing is consistent with the timing for implementing measures in § 112.45(b) of the 2015 produce safety final rule.

We recognize that one potential source of hazards may be associated with various outcomes depending on conditions relevant to the farm. For example, animal activity associated with adjacent and nearby lands, along with the other information evaluated in § 112.43(a)(1) through (5), can result in: the farm immediately discontinuing that use of the water and implementing corrective measures prior to resuming use (§ 112.43(c)(1)); the farm implementing mitigation measures on an expedited basis (§ 112.43(c)(2)); or there not being any conditions for which measures under § 112.45 are reasonably necessary (§ 112.43(c)(3)). Evaluation of the factors identified in § 112.43(a), which we discuss in section V.F., will assist farms in determining which outcome in § 112.43(c) is appropriate for their circumstances.

With respect to the comment suggesting that some farms have multiple sources of hazards that result in the same outcome, we note that the requirements for pre-harvest agricultural water assessments are designed to provide a holistic evaluation of a farm's agricultural water system, water use practices, and other conditions relevant to the farm for hazard identification purposes. Consistent with the comprehensive nature of agricultural water assessments, the requirements for outcomes in § 112.43(c), too, are designed to be implemented on a systems-wide basis. To further clarify the systems-based nature of these requirements, we are revising the requirements related to outcomes of agricultural water assessments in § 112.43(c). (See § 112.43(c)(2), which we have revised to read ''If you have identified *one or more* conditions'' in lieu of ''*a* condition,'' as proposed (emphasis added).) As such, measures that a farm implements under § 112.45 may be appropriate in light of the totality of information evaluated under § 112.43(a), such as where changing the water application method to reduce the potential for contamination of covered produce may be adequate to address various conditions that result in the same outcome under § 112.43(c).

(Comment 78) Some comments request that FDA provide additional clarity on what constitutes a situation where a farm might determine the water is not safe or not of adequate sanitary quality for its intended uses which would trigger a corrective measure versus situations in which mitigation measures would be an appropriate means of reducing risk.

(Response 78) Section 112.45 outlines two different types of measures—corrective measures and mitigations measures—that are required under § 112.43(c) if certain conditions exist. For pre-harvest agricultural water, ''corrective measures'' refer to those that farms must implement under § 112.45(a) if the water is not safe or is not of adequate sanitary quality for its intended use. Corrective measures are used in circumstances where it is necessary to take immediate action to protect public health, in that farms are required to immediately discontinue use of the water and implement corrective measures prior to resuming that use. Conversely, ''mitigation measures'' in § 112.45(b) provide more flexibility in the timing of decisions as compared to the immediate action required under § 112.45(a), in that the mitigation measures must be implemented as soon as practicable and no later than 1 year after the date of the farm's agricultural water assessment or reassessment (as required by § 112.43), except that mitigation measures in response to known or reasonably foreseeable hazards related to animal activity, BSAAOs, or the presence of untreated or improperly treated human waste on adjacent or nearby lands must be implemented promptly, and no later than the same growing season as such assessment or reassessment.

Given the diversity that exists across industry, and that risk associated with pre-harvest agricultural water is a function of the various factors evaluated as part of an assessment under § 112.43(a), we do not expect that situations in which measures under § 112.45 are reasonably necessary for one farm will necessarily be the same for another. However, there are some conditions that, absent information or circumstances indicating otherwise (such as if the farm is not using pre-harvest agricultural water during the time period of interest), are likely to result in the outcome in § 112.43(c)(1), in which the water is not safe or is not of adequate sanitary quality for its intended use(s) and the farm is required to immediately discontinue use of the water and take corrective measures under § 112.45(a) before resuming such use. For example:

• Incidents in which raw sewage is introduced to an agricultural water system (for example, leakage of sewage from a ruptured pipe or improper release of sewage from a sewage treatment facility into an agricultural water system);

• Situations where a significant amount of animal waste is introduced to an agricultural water system (such as might result from a manure lagoon overflowing into an agricultural water system); and

• The presence of dead and decaying animals in an agricultural water system (for example, a well in which an animal has died, or a canal in which sheep have entered and drowned).

We emphasize that these examples are not the only circumstances in which the outcome under § 112.43(c)(1) will apply, nor do circumstances need to be as clear-cut as these in order for § 112.43(c)(1) to be appropriate. For example, due to the nature of the above examples and the high likelihood for those conditions to introduce human pathogens to pre-harvest agricultural water, such conditions are likely to result in the outcome under § 112.43(c)(1) regardless of the agricultural water practices, crop characteristics, and environmental conditions evaluated under § 112.43(a) (*e.g.,* even if affected water is only

applied early in the growing season, a determination under § 112.43(c)(1) is likely appropriate). However, there may be other conditions (such as runoff from certain uses of adjacent and nearby lands), for which the factors evaluated under § 112.43(a) play a larger role as to whether a determination under § 112.43(c)(1) is appropriate. Considering the diversity that exists across industry, the requirement for farms to evaluate a broad range of factors as part of their pre-harvest agricultural water assessments will assist them in identifying and managing risks associated with pre-harvest agricultural water as appropriate for their agricultural water systems, conditions, and practices.

(Comment 79) One comment notes that § 112.43(c) references an ''evaluation'' required in § 112.43(a). However, the comment suggests, § 112.43(a) does not require an ''evaluation'', it requires an ''assessment,'' and as such, requests FDA to revise the phrasing in §§ 112.43(a) and (c) to avoid potential confusion.

(Response 79) Proposed § 112.43(a), which we are finalizing here, requires that an agricultural water assessment identify conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces, *based on an evaluation of* the factors identified in § 112.43(a)(1) through (5) (emphasis added). As this is consistent with use of the term ''evaluation'' in § 112.43(c), we decline to make the change requested by the comment.

(Comment 80) One comment recommends changes to the text of the codified to improve clarity, noting that, as written, § 112.43(c)(1) through (4) use both positive and negative criteria, which could lead to confusion.

(Response 80) We have considered the comment. To improve clarity, we are revising § 112.43(c)(3), which in the proposed rule read, ''If you have identified no conditions . . . ,'' to instead say ''If you have not identified any conditions . . .''. We also note that we have provided a plain language summary of the outcomes in § 112.43(c) in table 4 to aid in understanding of the requirements. See comment 81.

(Comment 81) One comment suggests that the third scenario described in table 4 of the 2021 agricultural water proposed rule (describing what must occur if there is one or more known or reasonably foreseeable hazards not related to animal activity, BSAAOs, or untreated or improperly treated human waste for which mitigation is reasonably necessary) is missing from § 112.43(c), and is therefore not enforceable.

(Response 81) In the preamble language accompanying the table referenced by the comment (86 FR 69120 at 69140), we explained that if a farm determines that mitigation measures are reasonably necessary to reduce the potential for contamination of such produce or food contact surfaces with a known or reasonably foreseeable hazard that is not related to animal activity, a biological soil amendment of animal origin, or untreated or improperly treated human waste on adjacent or nearby lands, the farm would be required to either: implement mitigation measures under § 112.45(b) as soon as practicable and no later than the following year; or test the water pursuant to § 112.43(d), consider the results as part of their assessment in making a determination under § 112.43(c), and implement measures as needed under § 112.45. This outcome corresponds to § 112.43(c)(4), which we are finalizing as proposed, without changes. However, we recognize that the phrasing used in the table may have resulted in uncertainty, and as such, we are revising the table to clarify the role that adjacent and nearby lands play in the outcomes under § 112.43(c). See table 4.

TABLE 4—SUMMARY OF OUTCOMES OF A PRE-HARVEST AGRICULTURAL WATER ASSESSMENT FOR COVERED PRODUCE (OTHER THAN SPROUTS)

[§ 112.43(c)]

If you determine . . .	Then you must . . .
that your agricultural water is not safe or is not of adequate sanitary quality for intended use(s).	immediately discontinue use(s) *AND* take corrective measures before resuming use of the water for pre-harvest activities.
there is one or more known or reasonably foreseeable hazards related to animal activity, BSAAOs, or untreated or improperly treated human waste on adjacent or nearby land for which mitigation is reasonably necessary.	implement mitigation measures promptly, and no later than the same growing season.
there is one or more known or reasonably foreseeable hazards not related to animal activity, BSAAOs, or untreated or improperly treated human waste on adjacent or nearby land, for which mitigation is reasonably necessary.	implement mitigation measures as soon as practicable and no later than the following year *OR* test water as part of the assessment and implement measures, as needed, based on the outcome of the assessment.
there are not any known or reasonably foreseeable hazards for which mitigation is reasonably necessary.	regularly (at least once each year) inspect and adequately maintain the water system(s).

H. Testing as Part of an Assessment (§ 112.43(d))

For farms that test agricultural water as one part of an assessment, we proposed that such testing must use scientifically valid collection and testing methods and procedures (proposed § 112.43(d)). We proposed to require that samples of pre-harvest agricultural water be collected aseptically immediately prior to or during the growing season and be representative of the water used in growing non-sprout covered produce (proposed § 112.43(d)). We proposed to require that samples be tested for generic *E. coli* as an indicator of fecal contamination, or for another scientifically valid organism, index organism, or other analyte (proposed § 112.43(d)(2)). Additionally, we proposed to require that the frequency of testing and any microbial criteria applied be scientifically valid and appropriate to assist in determining, in conjunction with other data and information evaluated under paragraph § 112.43(a), whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water (proposed § 112.43(d)(3)). We are finalizing the requirements as proposed, with minimal changes, and respond to the comments we received on testing as part of an assessment below.

1. General

(Comment 82) Some comments suggest that proposed § 112.43(d) should specify that when testing pre-harvest agricultural water as one part of an assessment, sample collection should occur at specific times, such as ''as close to harvest as reasonably possible,'' to reduce the opportunity for farms to ''cherry-pick'' collecting samples at times when water quality is expected to be good.

(Response 82) We do not consider it necessary to require farms that test pre-harvest agricultural water under § 112.43(c)(4) to collect samples at specific times (for example, as close to harvest as possible), as doing so may limit the usefulness of test results in further informing the farm's agricultural water assessment. For example, if a farm identifies a condition that may allow for the introduction of hazards to its agricultural water early in the growing season (*e.g.,* a well head that needs repairing) and tests pre-harvest agricultural water under § 112.43(c)(4), requiring that water samples be collected close to harvest would not provide the farm with information as to whether water quality was degraded and/or if repairs made to the well head were effective in as timely a manner as testing early in the growing season. As such, we decline to make this change.

(Comment 83) Several comments supportive of the general proposed approach for pre-harvest agricultural water assessments note that agricultural water testing only provides a ''snapshot in time'' of water quality. These comments suggest that because of this, water testing alone may be of limited effectiveness in ensuring produce safety.

(Response 83) While we have included a requirement in § 112.43(c)(4)(ii) for farms to test their pre-harvest agricultural water as part of an assessment in certain circumstances, it does not mean that farms can rely on test results alone in making decisions around the use of their water. Rather, results from pre-harvest agricultural water testing serve as an additional source of information that farms may use to further inform their agricultural water assessments. Specifically, farms that test their pre-harvest agricultural water as part of their assessment must consider the test results in concert with the other factors evaluated under § 112.43(a) and use information in making determinations under § 112.43(c) as to whether measures are reasonably necessary to reduce the potential for contamination of covered produce or food contact surfaces due to hazards associated with pre-harvest agricultural water.

(Comment 84) Some comments express a concern that because farms are not required to test pre-harvest agricultural water under the proposed rule, inspectors and farms may come to different conclusions about situations in which testing should occur.

(Response 84) As discussed in response to comment 3, we are not requiring all farms to test their pre-harvest agricultural water. Rather, § 112.43(c)(4) requires that farms either test the water, consider the results as part of the assessment, and take appropriate action; or implement mitigations measures as soon as practicable and no later than 1 year after the date of the assessment. Whether or not to test pre-harvest agricultural water or to implement mitigation measures under § 112.43(c)(4) is up to the discretion of the farm.

(Comment 85) Some comments voice opposition to mandatory product testing as a follow-up activity when water test results reveal unacceptable results.

(Response 85) Farms are not required to conduct product testing as a follow-up to results of pre-harvest agricultural water testing under § 112.43(c)(4).

(Comment 86) Some comments seek clarity on testing requirements that would apply for rainwater that is collected and stored.

(Response 86) If a farm that collects rainwater to use for pre-harvest agricultural water tests the water as one part of its assessment, the requirements in § 112.43(d) apply.

(Comment 87) Some comments address testing of agricultural water used in CEA farms, such as hydroponic and aquaponic operations. Some comments suggest that water used in hydroponic of aquaponic systems should be performed on a risk- and science-driven basis (*e.g.,* as applicable to each individual farm's unique food safety hazards) to support requirements in the proposed rule. Other comments state that if a hydroponic or aquaponic farm test its pre-harvest agricultural water as part of an assessment, a sampling frequency of 20 samples over a 2 to 4 year period would likely not be adequate for detection of hazards due to the nature of such systems and the use of recirculating water.

(Response 87) As discussed in response to comment 93, we are not establishing a specific testing frequency that farms are required to follow if testing their pre-harvest agricultural water as one part of an assessment. Rather, § 112.43(d)(3) provides flexibility for farms to use a sampling frequency that is scientifically valid and appropriate. This enables farms that test their pre-harvest agricultural water as part of an assessment under § 112.43(c)(4)(ii) to take into account conditions that are unique to their operations and practices when establishing appropriate sampling frequencies under § 112.43(d)(3). We discuss conditions that may be relevant to some CEA farms in response to comments 39, 40 and 46, which farms may consider in establishing an appropriate sampling frequency under § 112.43(d)(3).

(Comment 88) Several comments express concerns about the availability and/or cost of laboratories that can perform testing for agricultural water.

(Response 88) Farms that test their pre-harvest agricultural water as one part of an assessment under § 112.43(c)(4)(ii) are not required to use a third-party laboratory to analyze test samples. See § 112.47, which we did not propose to change, which specifies that farms may meet the requirements related to agricultural water testing in § 112.43(c)(4)(ii) using results performed by the farm or by a person or entity acting on the farm's behalf, or data

collected by a third-party (or parties), provided applicable requirements are met. Additionally, we have provided flexibility in analytes, sampling frequency, and microbial quality criteria farms may use (§ 112.43(d)). The approach taken for testing as part of an assessment, which provides for flexibility as science evolves, will allow farms to make decisions around pre-harvest agricultural water testing as applicable to their given operations and the nature of current science. See also response to comment 98, where we discuss test methods that may be used if testing agricultural water for generic *E. coli.*

(Comment 89) Many comments request real-world examples of what acceptable testing approaches may look like given the variety in commodity production practices, seasonal lengths, and growing environments. Some comments note that development of technical tools, such as statistical toolkits, would be of benefit to farms. These comments suggest that FDA work with industry organizations and other partners to develop such resources.

(Response 89) We provide information on analytes, sampling frequencies, and microbial criterion (or criteria) that may be used in accordance with the requirements in § 112.43(d) throughout the remainder of this section. While we have provided examples of analytes, sampling frequencies, and microbial water quality criteria that farms may choose to use (see, *e.g.,* comments 90, 93 and 95, respectively), we recognize that there is interest in the development of testing frameworks that are specific to various circumstances, such as those based on hazards, commodity(ies) grown, and regional considerations. We encourage collaborations across various groups in the agricultural community (for example, produce farms, State and Federal Government agencies, academic researchers, and extension specialists) as they relate to pre-harvest agricultural water assessments, including frameworks for testing agricultural water that are reflective of the variety of water systems and practices that exist across industry. We remain committed to working with stakeholders to advance critical work in the realm of agricultural water quality science.

2. Generic E. coli and Other Analytes

(Comment 90) Some comments seek clarification on the extent of flexibility offered to a farm in using an appropriate analyte (*i.e.,* different than generic *E. coli*) in their testing protocol. A few comments ask if farms must determine that generic *E. coli* is an appropriate fecal indicator bacteria to test for, and how a farm may determine if a different fecal indicator bacteria is more appropriate. Some of these comments request clarity on whether farms using an alternate analyte still have to test for generic *E. coli.* A number of comments assert that farms should be able to select the most appropriate analyte for their circumstances. Some comments address water testing for hydroponic and aquaponic systems, noting that generic *E. coli* may not be the most relevant indicator of water quality in these systems.

(Response 90) Final § 112.43(d)(2) provides farms that test their pre-harvest agricultural water as one part of an assessment the flexibility to test for generic *E. coli* or for any other scientifically valid indicator organism, index organism, or other analyte. As such, if testing for any other scientifically valid indicator organism, index organism, or other analyte, a farm does not also have to test for generic *E. coli.*

While generic *E. coli* has an extensive history of use as an indicator of fecal contamination and is considered the best indicator for monitoring water quality (Ref. 73) (78 FR 3504 at 3562), the potential use of other indicator organisms, index organisms, or other analytes for monitoring water quality continues to be of interest for agricultural water, as well as related disciplines. For example, in its 2012 Recreational Water Quality Criteria (RWQC) EPA provided various examples of possible alternate indicators, including *Bacteroidales, Clostridium perfringens,* human enteric viruses, and coliphages (Ref. 74). We anticipate that as science evolves and more information about other indicator or index organisms is learned, testing for organisms other than generic *E. coli* may be used to inform pre-harvest agricultural water assessments by farms.

We note that we are not requiring farms to notify or seek approval from FDA as to the analytes, sampling frequencies, and microbial criterion (or criteria) the farm uses when testing agricultural water as part of an assessment. However, if a farm uses a scientifically valid indicator organism, index organism, or analyte other than *E. coli,* the farm is required to maintain records of scientific data or information it relies on to support the use of that organism or analyte in accordance with § 112.50(b)(3). (Farms are not required to keep such documentation if testing their agricultural water for generic *E. coli.*) We discuss the term ''scientifically valid'' in the 2015 produce safety final rule to mean an approach that is based on scientific information, data, or results published in, for example, scientific journals, references, text books, or proprietary research (see 80 FR 74354 at 74371).

(Comment 91) Some comments seek clarity on whether farms will be expected to test for pathogenic microorganisms in their water, with some suggesting that doing so would not be of benefit to farms.

(Response 91) Farms are not required to test their pre-harvest agricultural water for human pathogens. As discussed in the 2015 produce safety final rule, we acknowledge that testing for pathogens allows for direct targeting of microorganisms in water that are a risk to public health; however, we continue to believe sampling water for pathogens presents challenges compared to sampling water for indicator organisms. For example, challenges associated with pathogen testing include those related to larger sample sizes; inherently higher costs; and the wide array of potential target pathogens (*i.e.,* the presence or absence of one pathogen may not predict for the presence or absence of other pathogens). See 80 FR 74354 at 74427–74428. As discussed in section I.A., we believe that this rule will enhance public health protections by setting forth procedures for comprehensive pre-harvest agricultural water assessments and corrective and mitigation measures that minimize the risk of serious adverse health consequences or death, including those reasonably necessary to prevent the introduction of known or reasonably foreseeable biological hazards into or onto produce, and to provide reasonable assurances that produce is not adulterated on account of those hazards.

(Comment 92) Some comments note that the bacteria detected in their water is often different than the bacteria found on their crops, and that water quality seems to change as it goes through their water distribution system. These comments seek clarity on how the rule would address such a situation.

(Response 92) In this scenario, if the farm tests its water under § 112.43, the farm must consider both its water test results as well as information about its water distribution system (in addition to the other factors evaluated under § 112.43(a)) in determining whether measures are reasonably necessary under § 112.45. For example, in preparing an agricultural water assessment under § 112.43(a), a farm finds that large flocks of birds rest in its open water distribution system, and that test results for samples collected upstream and downstream of the birds indicate that the birds are causing water

quality to degrade. In light of these findings, and depending on the other factors evaluated under § 112.43(a), the farm may determine that measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with the farm's pre-harvest agricultural water for non-sprout covered produce.

3. Frequency of Sampling

(Comment 93) Some comments interpret the rule as requiring a specific number of testing samples per year and oppose this requirement. Some comments seek clarity about whether the minimum frequency of testing for pre-harvest agricultural water changed from 20 samples within 2 to 4 years per the 2015 produce safety final rule, to four times during the growing season or over a period of 1 year per § 112.44(b)(1) of the proposed rule. Other comments request clarity as to whether testing may be conducted at a lower frequency than that established in the 2015 produce safety final rule. A few comments suggest that one test per season prior to use would likely be sufficient for deep wells. Some comments request that FDA support research and education to help farms understand what sampling frequency is adequate.

(Response 93) Section 112.43(d)(3) requires that for farms that test their pre-harvest agricultural water as one part of an assessment, the frequency of testing samples must be scientifically valid and appropriate to assist in determining, in conjunction with other factors evaluated under § 112.43(a), whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with their agricultural water used in growing covered produce (other than sprouts).

Farms have the flexibility to use any sampling frequency, as long as the requirements in § 112.43(d)(3) are met. For example, this could include sampling frequencies a farm establishes based on its historical data and/or knowledge of water quality variability within its source. Sampling approaches that take into consideration other site- or region-specific data or information may also be appropriate. We recognize that agricultural water quality science is likely to continue to evolve and may inform sampling frequencies appropriate for use when testing pre-harvest agricultural water as part of an assessment. As agricultural water quality science continues to develop, and as farms learn more about water quality relevant to their sources, systems, and operations—for example, through an evaluation of data shared between farms, within water systems, and/or within regions—such information can, and should, be used to establish sampling frequencies that are appropriate to farms' specific circumstances and conditions.

While the sampling frequencies for untreated surface water and untreated ground water used for pre-harvest agricultural water in the 2015 produce safety final rule are examples of approaches that farms may choose to use to comply with § 112.43(d)(3) if testing their water for generic *E. coli,* they are not required to do so. Further, if a farm tests its water for generic *E. coli* and has scientifically valid data or information to support use of a sampling frequency that is more reflective of its unique conditions than that used in the 2015 produce safety final rule, the farm must use that information in establishing an appropriate sampling frequency under § 112.43(d)(3). Moreover, because the sampling frequencies in the 2015 produce safety final rule were developed for farms that test their pre-harvest agricultural water for generic *E. coli,* a farm that tests for any other scientifically valid indicator organism, index organism, or other analyte in accordance with § 112.43(d)(2) may not use those sampling frequencies unless it has scientific data or information supporting use of those frequencies for the relevant organism or analyte.

We note that farms are required to maintain records of scientific data or information they rely on to support the use of a sampling frequency in accordance with § 112.50(b)(4). As discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69143), if a farm tests its water under § 112.43(d) for generic *E. coli* using the sampling frequencies and pre-harvest microbial water quality criteria outlined in the 2015 produce safety final rule, the farm can document its use of such sampling frequencies and microbial criteria in meeting the requirements of § 112.50(b)(4), as we have already determined these sampling frequencies and microbial criteria to be scientifically valid and appropriate for purposes of § 112.43(d). See also response to comment 95 regarding the use of the pre-harvest microbial water quality criteria from the 2015 produce safety final rule.

We would also like to clarify that the sampling frequency in § 112.44(b)(1) referenced by comments is specific to untreated ground water when used for any of the purposes specified in § 112.44(a) (*e.g.,* water used during or after harvest activities in a manner that directly contacts covered produce). This requirement does not apply for farms that test their pre-harvest agricultural water for non-sprout covered produce as part of an assessment under § 112.43(c)(4).

(Comment 94) Some comments seek clarity around whether historical test results can be used to justify the safety of their agricultural water. Several comments encourage flexibility with regard to sampling frequency requirements by allowing inclusion of historic testing data in an assessment that may not have been conducted at the same level of frequency as discussed in the proposed rule.

(Response 94) We recognize the value in utilizing historical test results, particularly when it comes to analyzing trends in water quality over time, which may help to further inform a farm's agricultural water assessment. Historical data may be particularly useful in situations in which potential hazards are introduced into a water system intermittently, such that a farm is able to compare data over time to further inform its conclusions of whether measures are reasonably necessary under § 112.45. For example, if a farm is concerned that the quality of its water may be affected by rain due to runoff into a water source and/or stirring up of sediments, the farm may use water quality data collected over time to determine if water quality is degraded following rain events compared to baseline (*i.e.,* limited or no rain) conditions.

As discussed in response to comment 93, we are not establishing a specific testing frequency that farms are required to follow if testing their pre-harvest agricultural water as one part of an assessment. Rather, if a farm tests its pre-harvest agricultural water as part of an assessment under § 112.43(c)(4)(ii), § 112.43(d)(3) provides flexibility regarding the frequency of sample collection. As also discussed in response to comment 93, farms can use historical data and/or knowledge of water quality variability within relevant water sources to inform sampling frequencies under § 112.43(d)(3) that are scientifically valid.

4. Microbial Water Quality Criteria

(Comment 95) Many comments support the additional flexibility in proposed § 112.43(d) for farms to apply any microbial criterion or criteria that would be scientifically valid and appropriate. Some comments support

inclusion of a GM of 126 or less CFU generic *E. coli* per 100 mL and an STV of 410 or less CFU generic *E. coli* per 100 mL in the preamble as a standard for agricultural water. In contrast, several comments oppose inclusion of these in the preamble, and suggest that because these standards were developed for recreational water, they are not suitable for agricultural water since agricultural water is not directly ingested by humans. Some of these comments request clarification on whether any studies have been conducted to determine thresholds of fecal indicator bacteria in agricultural water to levels of risk to human health. Some comments request FDA remove reference to the GM and STV in the preamble because, the comments state, use of those criteria, even if not included in the codified requirements, will result in the criteria continuing to be used as a benchmark even as new metrics are developed. Other comments suggest that FDA retain proposed § 112.43(d) as written and further clarify in the preamble that the 2015 microbial standards are not required in order to reduce confusion.

(Response 95) The microbial water quality criteria in the 2015 produce safety final rule for pre-harvest agricultural water consist of a GM of 126 or less CFU generic *E. coli* per 100 mL, and an STV of 410 or less CFU generic *E. coli* per 100 mL. We established these pre-harvest microbial water quality criteria using the science underlying EPA's 2012 RWQC (Ref. 74). We described the rationale for our use of the science underlying the RWQC and our thinking on its relevance to agricultural water in a reference memorandum that accompanied the 2014 supplemental proposed rule (Ref. 75). We are not aware of, and comments did not suggest, an alternative standard that is applicable across the diversity of operations, agricultural water sources, and agricultural water uses. However, we recognize that use of the GM and STV criteria for pre-harvest agricultural water for non-sprout covered produce is not without its challenges, particularly in light of information that has become available since 2015 indicating potential limitations in basing risk-management decisions on the 2015 pre-harvest agricultural water testing requirements.

Of particular note, a scientific evaluation of the 2015 pre-harvest agricultural water testing requirements found that the rolling data set of five samples per year used to update GM and STV values for untreated surface water sources results in highly uncertain results and delays in detecting shifts in water quality (Ref. 7). Additionally, various studies indicate a high degree of variability in generic *E. coli* levels in surface waters (Refs. 5–10), which can reduce the precision of estimation of the GM and STV of a water source (Refs. 1, 7). In recognition of such limitations associated with the previous pre-harvest testing requirements, findings from our QAR (Ref. 17), other information we have gathered since 2015 (including findings from several produce-related outbreaks), as well as information and feedback from an array of stakeholders, we are replacing the pre-harvest water quality criteria and uniform testing requirements in the 2015 produce safety final rule with requirements for systems-based agricultural water assessments that include testing in certain circumstances. See comment 11.

Further, we acknowledge that science around agricultural water quality and related disciplines is likely to continue to evolve. For example, in EPA's second 5-year review of the 2012 RWQC (Refs. 76 and 77), EPA notes plans to develop new quantitative polymerase chain reaction (PCR)-based RWQC that better protect certain sensitive populations; expand its recommended RWQC to protect people from exposure to viruses; and explore new methods to determine whether a waterbody is contaminated with human feces.

Thus, to allow for scientific advancements, we have incorporated flexibility into § 112.43(d)(3) so that farms that test their pre-harvest agricultural water as part of an assessment can use any microbial criteria (or criterion) provided certain requirements are met. A farm can rely on a microbial criterion or criteria available in the scientific literature or made available by a third party (such as a trade association, commodity board, academia, or cooperative extension services) provided that the microbial criterion or criteria is scientifically valid and appropriate based on the circumstances. (We discuss the term ''scientifically valid'' in the 2015 produce safety final rule (see 80 FR 74354 at 74371).)

We recognize that agricultural water quality science is likely to continue to evolve and may inform standards appropriate for use when testing pre-harvest agricultural water as part of an assessment. While farms that test their pre-harvest agricultural water as one part of an assessment may choose to use the criteria established in the 2015 produce safety final rule to meet the requirements in § 112.43(d)(3), they are not required to do so. Further, if a farm has scientifically valid data or information to support use of a microbial criterion or criteria that is more reflective of its unique conditions, the farm must use that information in establishing an appropriate microbial criterion or criteria under § 112.43(d)(3).

As discussed in response to comment 83, we emphasize that farms must not rely on test results alone in making decisions around the use of their water; rather, results from pre-harvest agricultural water testing serve as an additional source of information that farms may use to further inform their agricultural water assessments.

We intend to issue guidance on the requirements in § 112.43(d)(3), as appropriate.

(Comment 96) Some comments suggest that farms should be required to take action based on an individual test result, as doing so would emphasize the short temporal nature of many microbial hazards. Some comments seek clarity as to whether water that meets the EPA recreational water standards should be considered low, medium, or high risk. A few comments ask whether farms could choose to comply with the new rule through the previous rule's testing thresholds (including the GM and STV) rather than through preparing an agricultural water assessment. Some comments request FDA clarify that if a farm is conducting surface water testing and finds that the water has a MWQP with a GM of 126 or less CFU generic *E. coli*/100 mL water and an STV of 410 or less CFU generic *E. coli*/100 mL water, then no further mitigation measures should be required to use that water for pre-harvest activities. Conversely, some comments suggest that it is inappropriate to assume that water above or below this benchmark is always going to be higher or lower risk, and other factors (such as how the water is used, crop characteristics, etc.) should be considered, rather than strict adherence to quantitative water quality criteria.

(Response 96) We agree with comments suggesting that water below or above a certain microbial water quality criterion (or criteria) based on indicator organisms does not guarantee the absence of pathogens that can contaminate covered produce as a result of pre-harvest agricultural water. See 80 FR 74354 at 74428. We are not aware of, and comments did not provide, information suggesting that this conclusion is incorrect. As such, whether or not agricultural water meets a microbial criterion (or criteria) established in accordance with § 112.43(d) is not the sole determinant of whether corrective or mitigation measures are reasonably necessary

under § 112.45. See also response to comment 83.

For example, if a farm tests its water as one part of an assessment per § 112.43(c)(4), in addition to determining whether the water meets the criterion (or criteria) established in accordance with § 112.43(c)(3), the farm can, for example, look at test results collected over time for potential insight into changes in water quality that might indicate hazards being introduced into the water system. Even if the water does not exceed the criterion (or criteria) the farm establishes, the farm may find, for example, that migratory birds are causing water quality to degrade when present in the area. As another example, the farm may find when looking at historical data that test results had at one time consistently shown lower levels of generic *E. coli* than more recent data, potentially indicating that a change occurred that is affecting the farm's water system.

In such circumstances, even if the water does not exceed the criterion (or criteria) the farm establishes, the trends in water quality changes over time show a potential source(s) of contamination to a farm's agricultural water. A farm must consider this information, along with other factors, in conducting its agricultural water assessment (§ 112.43(c)(4)(ii)). As discussed in response to comment 95, while farms that test their pre-harvest agricultural water as part of an assessment may choose to use the GM and STV criteria established in the 2015 produce safety final rule to meet the requirements in § 112.43(d)(3), they are not required to do so.

(Comment 97) Some comments suggest that FDA mandate presence/absence indicator testing for pre-harvest agricultural water to make testing more simplified than the 2015 produce safety final rule while still providing insight into whether and which mitigation and corrective actions are required.

(Response 97) We disagree with comments suggesting that it would be appropriate to require presence/absence testing for indicator organisms for pre-harvest agricultural water. We consider that the flexibility in § 112.43(d)(3) is appropriate to maintain due to the diversity in agricultural water systems and practices that exists across industry. For example, a farm that uses pre-harvest agricultural water from a ground water source such as a well may determine that presence/absence testing is appropriate to use, as ground water sources generally provide high quality water and show little variability due to the natural filtering capacity of soils (Ref. 17). However, another farm that uses agricultural water from a surface water source may determine that quantification methods are appropriate to use, as surface water sources are subject to the influence of various environmental factors that can impact and change the system continually (Ref. 17).

(Comment 98) Some comments ask FDA to identify a unit of measurement for analytes to be ''organism'' or ''counts'' per 100 mL instead of CFU, because in some methods of analysis, results are provided as a most probable number (MPN). The comment asserts that use of CFU limits allowable testing methods.

(Response 98) We do not consider this necessary to do, as we do not specify microbial water quality criteria in CFU when testing pre-harvest agricultural water as part of an assessment. See, for example, § 112.43(d)(3), which requires that ''. . . any microbial criteria applied must be scientifically valid and appropriate to assist in determining, in conjunction with other data and information evaluated under paragraph (a) of this section, whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with your agricultural water used in growing covered produce (other than sprouts).''

Further, while the method of analysis in § 112.151(a) (EPA Method 1603) provides results for generic *E. coli* testing in terms of CFU, if a farm tests pre-harvest agricultural water for generic *E. coli* under § 112.43(d)(2), the farm may use a scientifically valid method that is at least equivalent to EPA Method 1603 in accuracy, precision, and sensitivity (§ 112.151(b)(1)). We have provided a list of testing methodologies that meet the requirements in § 112.151(b)(1) (Ref. 78). Included in this list are methods that report results in CFU and methods that report results as MPN, which farms may use when testing their agricultural water for generic *E. coli.*

I. Reassessment (§ 112.43(e))

In § 112.43(e)(1), we proposed that a farm must conduct an agricultural water assessment, at a minimum, each year that the farm applies pre-harvest agricultural water to non-sprout covered produce. In § 112.43(e)(2), we proposed that a farm must conduct a reassessment whenever a significant change occurs in its agricultural water system(s), agricultural water practices, crop characteristics, environmental conditions, or other relevant factors that would impact hazard identification or a risk management determination, as described in proposed § 112.43(c). For the reassessment in proposed § 112.43(e)(2), we proposed that a farm must evaluate the impacts of those changes on the factors in proposed § 112.43(a)(1) through (5), any new hazards identified, and the outcome and determination under proposed § 112.43(c). We received several comments seeking clarification on the proposed reassessments and respond to the comments in the paragraphs below. We are finalizing the requirements for reassessments in § 112.43(c) as proposed, without change.

(Comment 99) Several comments seek clarity on what situations would be considered a ''significant change'' in an agricultural water system that would warrant a reassessment.

(Response 99) In the 2021 agricultural water proposed rule, we tentatively concluded that it would be reasonable and appropriate to require farms to conduct a written pre-harvest agricultural water assessment annually, and whenever a significant change would impact the hazard identification or risk management determination relating to pre-harvest agricultural water for non-sprout covered produce. We are not aware of, and comments did not provide, information suggesting that this conclusion is incorrect. However, we recognize that additional information on the requirements in § 112.43(e) will help support farms as they work to come into compliance.

Section 112.43(e) requires, in part, that a farm conduct a reassessment whenever a significant change occurs in its agricultural water system(s), agricultural water practices, crop characteristics, environmental conditions, or other relevant factors that impacts hazard identification or a risk management determination as described in § 112.43(c). For example, as discussed in the 2021 agricultural water proposed rule (86 FR 69120 at 69138), a change from an untreated ground water source to an untreated surface water source, or the installation and use of a new water distribution system, is a significant change that requires a reassessment under § 112.43(e), as the degree of protection and likelihood of hazards being introduced are likely to differ and may impact risk management determinations. As another example, some changes in the use of adjacent or nearby land—such as if adjacent or nearby land is used for a new dairy production operation—are significant changes, as the new use of that land may differ in its potential to introduce

hazards into the agricultural water system.

Changes in agricultural water practices, including the method or timing of water application, also are significant changes that require a reassessment, as different practices present different risks to the crop. For example, overhead sprinkler irrigation may increase the risk of contamination as compared with furrow and subsurface drip irrigation (Ref. 79). Furthermore, bacteria or pathogens in water that is applied early in the growing cycle are subject to greater die-off from several environmental forces, such as UV exposure, temperature, humidity, and the presence of competitive organisms compared to bacteria or pathogens in water that is applied late in the growing cycle (Ref. 65). See 86 FR 69120 at 69138. Similarly, growing a different type of covered produce than previously grown is a significant change, as the unique characteristics associated with the crop might affect whether it is vulnerable to contamination from agricultural water. See 86 FR 69120 at 69138. As discussed further in response to comment 100, various environmental conditions, such as unexpected flooding that may introduce new hazards into an agricultural water system, are also significant changes that require a farm to conduct a reassessment.

Other sources of information may also indicate that a significant change has occurred for which a reassessment is required, such as, for example, if information suggests that a pathogen may be present in a farm's pre-harvest agricultural water (which the farm may be aware of through voluntary testing, knowledge or experience, or other means), or if an outbreak investigation or other findings indicate a potential role for pre-harvest agricultural water in serving as a source or route of contamination to covered produce.

In instances where there is a significant change for which a farm is required to conduct a reassessment, the farm must evaluate the impacts of those changes on the factors in § 112.43(a)(1) through (5), any new hazards identified, and the outcome and determination under § 112.43(c).

(Comment 100) Several comments seek clarity as to whether a reassessment is necessary in response to extreme weather events if those events are normal, expected, and included in a farm's initial assessment. Some comments question whether a farm can amend an assessment following such an extreme weather event rather than conducting an entirely new one.

(Response 100) The requirement to consider environmental conditions as part of an agricultural water assessment in § 112.43(a)(4) includes not only general ''routine'' trends in environmental conditions (*e.g.,* yearly seasonal patterns in rainfall), but also those conditions that, based on knowledge, history or experience, are reasonably likely to happen on a less frequent basis, but that nonetheless have the potential to impact agricultural water systems or covered produce (*e.g.,* heavy rains that occur on occasion). This includes, if applicable, any extreme weather events that have the potential to affect the farm's agricultural water systems or operations. Thus, if a farm evaluated relevant extreme weather events as part of its agricultural water assessment under § 112.43(a), the farm is not required to conduct a reassessment each time such an event occurs. See also response to comment 69.

However, we also recognize that not all weather events can be anticipated. Unanticipated weather events or weather changes that go beyond what was considered as part of a farm's assessment (such as unexpected flooding that may introduce new hazards into a surface or ground water source, or an earthquake, which may affect a farm's piped distribution system) are significant changes that warrant a reassessment under § 112.43(e)(2). The reassessment must evaluate any factors and conditions that are affected by such change, including the factors in § 112.43(a)(1) through (5), any new hazards identified, and the outcome and determination under § 112.43(c).

(Comment 101) Some comments note that what may be considered a ''significant change'' for one farm would not be considered a significant change for another. For example, the comment notes that switching water sources is a common practice in some areas and may not be perceived by farms as significant.

(Response 101) We recognize that some farms may make changes to their pre-harvest agricultural water systems and practices as a routine matter, such as farms that routinely use one water source early in the growing season and switch to another water source after plants become established; or those that change water sources throughout the season as weather and water availability changes. Farms that make routine changes to their systems or operations may account for such activities in their annual assessment, rather than conducting a reassessment each time a change is made, provided they conduct and document an assessment that accurately describes and evaluates each of their agricultural water systems, the water use practices associated with each of their agricultural water systems, and other factors required by § 112.43(a).

(Comment 102) Noting that farms may not become immediately aware of changes to certain factors that are outside of their control (such as uses of adjacent and nearby lands), a few comments suggest that proposed § 112.43(e) be revised to clarify that a farm is only responsible for conducting a reassessment if the farm is *aware* of there being a significant change (emphasis added).

(Response 102) Farms are responsible for ensuring that all applicable requirements of subpart E are met, including the requirement in § 112.41 that all agricultural water be safe and of adequate sanitary quality for its intended use.

We recognize that farms may not always be made immediately aware of changes to factors that are outside of their control (such as adjacent and nearby land uses and other water users) that might affect their agricultural water systems. As discussed in response to comment 51, farms must include in their assessments information on sources of hazards that have the potential to result in contamination of covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with agricultural water. Information as to the presence and nature of impacts that might affect the quality of their agricultural water can be acquired through a variety of resources, including from visual observation; local extension agents, industry associations, or local water management authorities; and online resources such as mapping tools, which may provide helpful information on topography and proximity to potential sources of hazards.

Further, § 112.42(b) requires farms to regularly monitor each system, to the extent that it is under the farm's control, to identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces. If during such monitoring a farm identifies a condition that that is considered a ''significant change,'' the farm must conduct a reassessment under § 112.43(e). See also response to comment 25, in which we discuss the relationship between inspections, maintenance, and pre-harvest agricultural water assessments.

Given the various resources available to farms that can provide information regarding factors that might otherwise be outside a farm's control (see

comment 51), we do not believe it is necessary to modify the language regarding significant changes that require a reassessment under § 112.43(e).

J. Corrective and Mitigation Measures (§ 112.45)

We proposed requirements for implementing corrective and mitigation measures for pre-harvest agricultural water that are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with agricultural water for covered produce (§ 112.45). We did not propose to change the requirement from § 112.45(a) of the 2015 produce safety final rule that if agricultural water is not safe or not of adequate sanitary quality for its intended use(s) as required under § 112.41, and/or if a farm's agricultural water used as sprout irrigation water or for harvesting, packing, or holding activities does not meet the requirements in § 112.44(a) (including the microbial quality criterion), the farm must immediately discontinue such use(s) and implement corrective measures prior to resuming such use. In § 112.45(b), we proposed various mitigation measures for pre-harvest agricultural water that farms would implement to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with the water.

We discuss comments received on proposed § 112.45 below. Note that in this section, we include comments specific to use of treatment as a corrective or mitigation measure; we discuss general comments related to agricultural water treatment and the pre-harvest agricultural water treatment efficacy testing protocol in section V.K.

1. General

(Comment 103) Several comments express general support for the range of options FDA has outlined as possible measures to reduce the potential for contamination of covered produce or food contact surfaces with known or reasonably foreseeable hazards. In contrast, many comments suggest the rule lacks sufficient criteria on when measures are necessary or which measures are effective in various scenarios. Some comments express a concern that the proposed rule places too much responsibility on farms to make decisions about mitigation measures without sufficient guidance or input from FDA. The comments request that FDA consider delineating specific requirements regarding necessary measures for the highest risk situations.

(Response 103) The provisions for pre-harvest agricultural water assessments are designed to be flexible to account for the diversity of operations, practices, and conditions that may impact the pre-harvest agricultural water used by foreign and domestic farms for non-sprout covered produce. Given the diversity that exists across industry, we recognize that measures implemented under § 112.45 will vary by farm.

By providing a range of possible measures, farms will be able to make decisions around their agricultural water as appropriate to their agricultural water systems, water use practices, operations, and local conditions. However, we recognize the need for clarity, and we have provided general principles throughout the preamble to assist farms in determining whether (and what kind of) measures may be appropriate for their given circumstances. For example, in our response to comment 105, we discuss that measures under § 112.45(b)(1)(i), which entails making necessary changes (for example, repairs), generally are more relevant when the farm has some control over the potential source of known or reasonably foreseeable hazards. However, that may not always be the case, such as if a farm builds a berm to reduce runoff from a source of hazards into an agricultural water system. As another example, in response to comment 123, we explain that changing the water application method under § 112.45(b)(1)(iv) for root crops may not be an appropriate mitigation measure, as it may be difficult to effectively minimize contact between agricultural water and the harvestable portion of the crop. For additional examples and information, see section V.G. for comments related to outcomes, and the remainder of this section for comments related to corrective and mitigation measures.

Further, we recognize the need to provide farms with education, outreach and technical assistance to facilitate compliance with the rule, and we intend to pursue various mechanisms, such as publishing guidance, holding webinars, and developing other educational resources, including working with other stakeholders (such as State agencies, educators, and extension agents), to do so.

(Comment 104) Some comments express concerns that the corrective and mitigation measures included in the proposed rule are not feasible for many farms due to challenges associated with increased costs, water scarcity, environmental conditions, farm setup/infrastructure, labor shortages, and the need to use water for pest management practices. Some of these comments suggest that measures like water treatment, which comments note can be costly and complex to implement, calibrate, and operate, may be particularly challenging for small farms. Many comments request that FDA explicitly allow for other mitigation measures beyond those specifically listed in the codified.

(Response 104) Given the diversity that exists across industry, we recognize the importance of flexibility in § 112.45, which we have included by providing a range of possible measures, including the option in § 112.45(b) to use an alternative mitigation measure that meets the requirements in § 112.12.

With respect to comments about small farms, we note that we are finalizing staggered compliance dates for the pre-harvest agricultural water requirements for non-sprout covered produce based on farm size as follows: 2 years and 9 months after the effective date of a final rule for very small businesses; 1 year and 9 months after the effective date of a final rule for small businesses; and 9 months after the effective date of a final rule for all other businesses. See also section VI for a discussion of comments about compliance dates. We expect that the flexibility in § 112.45, along with the extended compliance dates, will provide sufficient time and flexibility for small and very small farms to receive education and adjust their practices (if needed) to comply in a cost-effective manner with the requirements in subpart E.

Also with respect to comments about costs, we estimate costs of measures in our FRIA (Ref. 26).

(Comment 105) Some comments assert that the proposed rule lacks clarity on corrective or mitigation measures for farms to effectively control hazards from adjacent or nearby cattle operations and requests that FDA establish educational resources that define effective strategies, based on science and research. Some comments suggest that the farm's responsibility over the quality of water (including steps the farm takes to implement mitigation measures) should be based on the degree of control the farm has over the water, and that the farm should not be responsible for activities on adjacent or nearby lands or upstream water users that are not under the farm's control.

(Response 105) We recognize that farms may have little or no control over adjacent and nearby land uses and other

water users, and do not require farms to access areas that are not under their control to meet relevant requirements in subpart E. However, while farms may have little or no control of such uses of land and other water users, the requirement to consider these potential sources of hazards as part of an agricultural water assessment will help farms determine the appropriate and safe use of their water source(s). See also response to comment 15. While it is generally preferred that sources of known or reasonably foreseeable hazards be addressed at the point where potential hazards are introduced to an agricultural water system, we recognize that this may not always be feasible for farms (such as where hazards may originate from adjacent or nearby land uses or from other water users), nor are we suggesting that farms gain access to such lands or other water uses to do so.

Taking measures under § 112.45(a)(1) (which includes, but is not limited to, re-inspecting the affected agricultural water system and making necessary changes) and § 112.45(b)(1)(i) (which entails making necessary changes (for example, repairs)) generally are more relevant when the farm has some control over the potential source of known or reasonably foreseeable hazards. However, this may not always be the case. For example, even if a source of hazards is outside of a farm's control, depending on the circumstances, measures such as building a berm to reduce runoff, installing a windbreak, or making repairs to a well-head may be appropriate to reduce the potential for known or reasonably foreseeable hazards being introduced into its agricultural water system.

We have incorporated a range of options for measures in § 112.45 in the recognition that not every measure will be an appropriate or viable option for every farm. See also response to comment 103. We note in particular that the mitigation measures identified in § 112.45(b) include those that a farm can implement whether or not the farm has control over the potential source of known or reasonably foreseeable hazards at the point where hazards may be introduced to an agricultural water system. For example, while a farm may have little or no control over adjacent and nearby land uses, if the farm determines that mitigation measures are reasonably necessary under § 112.45(b), depending on the circumstances, the farm might determine that changing the water application method is appropriate to reduce the likelihood of contamination of the covered produce.

(Comment 106) While supportive of the proposed rule, some comments request that water testing be required as a way to verify that corrective or mitigation measures were effective. These comments seek clarity on how, without test results, farms might demonstrate that their water is safe and of adequate sanitary quality. One comment notes that the proposed rule differs from LGMA metrics in its omission of a retesting requirement for agricultural water that fails to meet a specified standard for generic *E. coli* and requests that FDA include such a retesting requirement, suggesting that retesting is essential to determine whether mitigation measures were effective.

(Response 106) We disagree that testing is essential to determine if corrective or mitigation measures were effective, as there are other actions farms may take to verify the effectiveness of such measures. For example, if a farm makes necessary changes as a mitigation measure under § 112.45(b)(1)(i), such as repairing a leak within the farm's piped distribution system in order to protect it from possible sources of contamination, re-inspection of the agricultural water system to visually confirm that the repair was successful may be sufficient. As another example, if a farm changes the method of water application to reduce the likelihood of contamination of covered produce as a mitigation measure under § 112.45(b)(1)(iv), the farm might regularly monitor the system while the covered produce is being irrigated to confirm that the water application method is limiting contact with the produce as intended. In yet other instances, such as when treating agricultural water as a mitigation measure (§ 112.45(b)(1)(v)); applying a time interval between last direct water application and harvest to allow for microbial die-off (§ 112.45(b)(1)(ii)); or applying a time interval between harvest and end of storage and/or using other activities during or after harvest to allow for microbial die-off and/or removal (§ 112.45(b)(1)(iii)), the farm is required to maintain scientifically valid data or information to support use of those measures (see § 112.50(b)(8) and (10)). While farms may choose to test their water to assist them in evaluating the efficacy of corrective or mitigation measures that they implement, we emphasize that as discussed in comment 83, farms must not rely on test results alone in making decisions around the safe use of their agricultural water.

If a farm determines that its mitigation measures are not effective to reduce the potential for contamination of the covered produce or food contact surfaces with known or reasonably foreseeable hazards, it must discontinue use of the agricultural water until it has implemented mitigation measures adequate to reduce the potential for such contamination, consistent with § 112.41 (§ 112.45(b)(2)).

(Comment 107) Some comments request that FDA provide specifics around when pre-harvest water must be treated as a corrective or mitigation measure. A few comments suggest FDA specify ''high-risk'' situations in which water must be treated, such as requiring that all surface water must be treated unless the farm has data demonstrating that pathogens are not present in the water. These comments note that farms participating in LGMA are not permitted to use untreated surface water in overhead irrigation systems in the 3 weeks leading up to harvest, and suggest that FDA could similarly specify uses for which untreated surface water is prohibited. Some comments suggest that treatment would be the only viable mitigation measure for some operations. A few comments suggest the rule state that if other effective options for mitigation are not available, then farms would be required to treat their water.

(Response 107) Recognizing the wide degree of diversity that exists in industry—including in potential sources of known or reasonably foreseeable hazards, agricultural water systems, growing operations, water use practices, crop characteristics, and environmental conditions—what might be considered ''low'' or ''high'' risk for one farm may not necessarily be the same for another. See comment 31. Moreover, given the diversity that exists in industry, we recognize that not every mitigation measure will be appropriate for every farm to use. As such, we do not consider it appropriate to specify situations in which farms are required to implement mitigation measures, or more specifically, treat their pre-harvest agricultural water.

With respect to commenters' suggestion to specify that if other mitigation measures identified in § 112.45(b) are not available to a farm that the farm would be required to treat the water, we note that § 112.45(b)(2) requires that if a farm fails to implement appropriate mitigation measures, or if the farm determines that the measures were not effective, the farm must discontinue use of the pre-harvest agricultural water until adequate mitigation measures have been implemented. As such, it is likely that farms will implement any of the measures available to them and

appropriate to their conditions, including treatment, to avoid being required to cease that use of pre-harvest agricultural water. As such, we consider the change requested in the comments to be unnecessary.

We also disagree with commenters' suggestion to require treatment of agricultural water unless the farm has data indicating that pathogens are not present in the agricultural water system. In the 2015 produce safety final rule, we discuss various challenges associated with sampling water for pathogens. These include challenges related to larger sample sizes; inherently higher costs, and the wide array of potential target pathogens (*i.e.,* the presence or absence of one pathogen may not predict for the presence or absence of other pathogens). See 80 FR 74354 at 74427–74428. We are not aware of, and comments did not provide, information to suggest otherwise. See also comment 91. As such, we decline this suggestion.

(Comment 108) A few comments ask for clarity regarding whether pre-harvest water treatment must be done during the entire growing season, or only a certain amount of time before harvest.

(Response 108) If a farm treats its pre-harvest agricultural water based on its agricultural water assessment, the necessary timing for implementing agricultural water treatment will depend on the specific conditions at the farm. For example, if the farm treats its pre-harvest agricultural water in response to a condition in which there may be ongoing introduction of known or reasonably foreseeable hazards into the agricultural water system, it may be an appropriate response for the farm to treat that water each time it is used as pre-harvest agricultural water. For example, in situations where runoff introduces known or reasonably foreseeable hazards into the agricultural water system, and the farm is not able to prevent such events from occurring, it may be appropriate for the farm to treat the water each time it is used. Or, depending on the nature of the potential source of hazards as well as other information evaluated under § 112.43(a), treatment of agricultural water only during certain times of the growing season may be sufficient to reduce the potential for contamination of covered produce. For example, depending on the circumstances, the farm might determine that treatment is only necessary when agricultural water is applied close to harvest.

Conversely, if a farm determines that the introduction of known or reasonably foreseeable hazards is not on-going, it may be appropriate to treat the water as an isolated event. For example, if the farm is able to prevent additional runoff from being introduced to the agricultural water system, it may be appropriate to treat contaminated water still residing in the water distribution system as a one-time event, rather than treating the water as a regular practice.

If a farm treats its pre-harvest agricultural water, it is required to comply with the requirements in § 112.46, which we did not propose to substantively revise, including that the treatment be effective to make the water safe and of adequate sanitary quality for its intended use, and be delivered and monitored in a manner and with a frequency adequate to ensure that the treated water is consistently safe and of adequate sanitary quality for its intended use.

2. Corrective Measures

(Comment 109) A few comments request clarity on what corrective measures would be appropriate for the example provided in the proposed rule in which a dead and decaying sheep results in water being not safe or not of adequate sanitary quality for its intended use.

(Response 109) In the 2021 agricultural water proposed rule, we provided the example that, if in performing the agricultural water assessment a farm finds that there is a dead and decaying sheep in the canal upstream and at a close distance to where it draws water, the farm would have reason to believe that the agricultural water is not safe or not of adequate sanitary quality for its intended use because the water is reasonably likely to contain human pathogens transferred by the dead and decaying sheep. Therefore, the farm would have to immediately discontinue that use of the water and take corrective measures under § 112.45(a) before resuming such use(s). 86 FR 69120 at 69141.

In this scenario, one appropriate response is for the farm to re-inspect the entire affected agricultural water system to the extent it is under the farm's control, identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food-contact surfaces, make necessary changes, and take adequate measures to determine if the changes were effective (§ 112.45(a)(1)). Steps the farm takes to meet the requirements in § 112.45(a)(1) include, at a minimum:

- Re-inspecting the entire water system potentially affected by the dead sheep to the extent it is under the farm's control to identify any relevant conditions (such as additional dead sheep, including carcass materials that may have contaminated the farm's water distribution system if applicable);
- Removing the dead sheep and any related hazards identified during the re-inspection and allowing time for contaminants to clear the canal and bypass the point at which the farm draws water from the canal;
- Cleaning any necessary equipment that may have been contaminated (such as the water distribution system impacted by the sheep); and
- Visually verifying that all carcass materials have been removed.

Once the farm has taken all of the appropriate steps in light of its specific circumstances, it may resume using the water for direct water application irrigation of its covered produce.

(Comment 110) With respect to the requirements in proposed § 112.45(a)(1), some comments seek clarity as to whether pre-harvest agricultural water for produce commodities other than sprouts needs to meet the water microbial quality criterion in § 112.44(a).

(Response 110) The requirements in § 112.44(a), including the microbial criterion of no detectable generic *E. coli* per 100 mL of agricultural water, do not apply to pre-harvest agricultural water for non-sprout covered produce (see § 112.40), and as such, the reference to § 112.44(a) within § 112.45(a)(1) also does not apply to pre-harvest agricultural water for non-sprout covered produce.

3. Mitigation Measures

In § 112.45(b), we proposed various mitigation measures for pre-harvest agricultural water that farms would implement to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with the water. We received various comments requesting clarification on the proposed mitigation measures and respond to such comments below.

Consistent with the requirements for pre-harvest agricultural water assessments that are designed to be adaptable to future advancements in agricultural water quality science, we are revising § 112.45(b)(1)(ii) regarding use of a time interval between last direct application or agricultural water and harvest to remove reference to a ''minimum interval of 4 days.'' We are also removing commercial washing as an example of a post-harvest activity in § 112.45(b)(1)(iii) to further emphasize that other post-harvest activities may be used as mitigation measures.

We did not receive comments on the proposed mitigation measure in § 112.45(b)(1)(i), in which farms would make necessary changes (such as repairs) to address any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces, and are finalizing that provision as proposed, without change. As noted above, we discuss general comments related to agricultural water treatment and the pre-harvest agricultural water efficacy testing protocol in section V.K.

a. General

(Comment 111) Several comments urge FDA to allow more time for farms to undertake mitigation measures, citing supply chain constraints. A few comments suggest that it may not be practical to implement mitigation measures (such as those requiring construction) mid-season. In contrast, several other comments express concern that the rule, as proposed, gives farms too much time to implement mitigation measures. Some comments are particularly concerned that the rule appears to allow farms up to 1 year to undertake mitigation measures for hazards not related to animal activity, BSAAOs, or untreated or improperly treated human waste on adjacent or nearby lands and question whether that timing adequately protects public health. Similarly, some comments question whether making mitigations for hazards related to animal activity, BSAAOs, or human waste on adjacent or nearby lands within the growing season is sufficiently protective of public health, particularly since growing seasons can span many months and include the growth of multiple covered crops. The comments seek clarity on the meaning of ''growing season'' within the rule.

(Response 111) The mitigation measures listed in § 112.45(b) provide greater flexibility in the timing of decisions as compared to the immediate action required under § 112.45(a), in that the mitigation measures must be implemented as soon as practicable and no later than 1 year after the date of the farm's agricultural water assessment or reassessment (as required by § 112.43), except that mitigation measures for known or reasonably foreseeable hazards related to animal activity, the application of BSAAOs or the presence of untreated or improperly treated human waste on adjacent or nearby lands must be implemented promptly, and no later than the same growing season as such assessment or reassessment. While the requirement that mitigation measures be implemented as soon as practicable and no later than 1 year after the date of the farm's agricultural water assessment or reassessment is consistent with the timing for implementing measures in § 112.45(b) of the 2015 produce safety final rule, as discussed in the 2021 agricultural water proposed rule, we have incorporated expedited mitigation measures for hazards related to certain activities associated with adjacent and nearby lands in light of several produce-related outbreaks that occurred since we issued the 2015 produce safety final rule. See 86 FR 69120 at 69145.

We have incorporated this flexibility to allow sufficient time to make any necessary adjustments to farms' current practices. For example, we recognize that some mitigation measures identified in § 112.45(b)(1), such as making necessary changes (for example, repairs) or changing the method of water application, may take time to implement, as they might entail changes to current, or adoption of new, infrastructure and equipment on the farm. Conversely, other mitigation measures, such as increasing the time interval between last direct water application and harvest to allow for microbial die-off, may be relatively easily adopted by farms without need for significant advance preparation or changes to the farm's infrastructure or operations.

The allowable timeframes for implementing mitigation measures in §§ 112.43(c)(4)(i) and 112.43(c)(2) (*i.e.,* ''no later than one year after the date of the agricultural water assessment'' and ''no later than the same growing season as the assessment,'' respectively) are included in the recognition that, as discussed above, farms may not be able to immediately implement mitigation measures in every circumstance. Moreover, these end points are important in that they provide a basis after which, if a farm does not implement mitigation measures, the farm is required to discontinue such use of the water until the farm has implemented adequate mitigation measures in accordance with § 112.45(b)(2). However, inclusion of these end points in § 112.43(c)(4)(i) and 112.43(c)(2) does not permit farms to wait until the end of the year after the date of the assessment or the end of the same growing season as the assessment (as applicable) to implement mitigation measures under § 112.45(b). Rather, farms must implement mitigation measures ''as soon as practicable'' or ''promptly,'' respectively, as applicable to their circumstances.

For example, if a farm determines that mitigation measures are reasonably necessary under § 112.45 in accordance with § 112.43(c)(4)(i), the farm must implement mitigation measures ''as soon as practicable.'' Various timeframes may be ''practicable,'' depending on circumstances relevant to the farm. For example, it may be practicable for the farm to make modifications for the crop in the field at the time the farm makes the determination; during the next harvest if the farm has multiple harvests of a crop; or during the next growing season if the farm has multiple growing seasons within a year. If none of these timeframes are practicable or applicable to the farm's operation, it must make the modifications to its water use practices no later than 1 year after the date of the agricultural water assessment. For this reason, too, we disagree with comments suggesting it would be appropriate to provide additional time to implement mitigation measures, and we are finalizing the timing for implementing mitigation measures as proposed, without change.

(Comment 112) Some comments seek clarification about whether crop characteristics should influence mitigation measures and, if so, request that FDA provide examples.

(Response 112) We recognize that appropriate mitigation measures in § 112.45(b) are likely to depend, in part, on the characteristics of the commodity being grown. For example, the effectiveness of microbial die-off (such as might occur prior to harvest and/or during post-harvest storage) and changing the water application method in reducing the risk associated with covered produce as a result of agricultural water are all likely to depend, in part, on the characteristics of the commodity. We discuss these measures further in comments 115, 121 and 123.

(Comment 113) Some comments seek guidance on when and how to mitigate hazards after a weather event, such as heavy rain, has occurred.

(Response 113) If a farm determines that mitigation measures under § 112.45(b) are reasonably necessary to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water, the nature of the mitigation measure and timing for implementation will depend on the specific circumstances relevant to the farm, including the nature of the other information evaluated under § 112.43(a).

For example, if rain events are expected to increase runoff from adjacent or nearby lands used to graze sheep, a farm might determine, after also considering the other factors required to be evaluated in § 112.43(a)(1) through (5), that mitigation measures are reasonably necessary under § 112.45(b). Depending on the circumstances, the farm might increase the time interval between last direct application of water and harvest based on scientifically valid data and information, which the farm is required to do promptly, and no later than the same growing season as the assessment in accordance with § 112.43(c)(2). Or, if appropriate to the covered produce being grown, the farm might change the water application method to reduce the likelihood of contamination of the covered produce.

As another example, if a farm experiences an earthquake and observes seepage on the soil surface above an underground pipe that carries spent wash water, it might indicate that the pipe ruptured. If the seepage is in proximity to a well used as pre-harvest agricultural water, depending on the information evaluated under § 112.43(a), the farm might determine that mitigation measures under § 112.45(b) are reasonably necessary. In this scenario, the farm might decide that making necessary changes (for example, repairs) to the piping system, as well as making any necessary repairs to protect the well from contamination, together is an effective mitigation measure, which the farm is required to do as soon as practicable, and no later than 1 year after the date of the farm's agricultural water assessment in accordance with § 112.43(c)(4)(i).

b. Time Interval Between Last Application and Harvest

(Comment 114) Several comments support the ability to increase the time interval between last water application and harvest to a minimum of 4 days as a mitigation measure under proposed § 112.45(b)(1)(ii). These comments suggest that this option is effective, adds flexibility, and does not require a farm to have extensive knowledge of mathematics or microbial science. In contrast, some comments voice concern over the use of a 4-day interval. Some of these comments suggest that by including a time interval of 4 days, it places a burden on regulators to develop evidence justifying why longer die-off may be necessary in some circumstances. Other comments oppose inclusion of a 4-day time interval because, comments state, it effectively creates a scientifically unsupported ''safe harbor'' for farms, with limited parameters on the conditions in which application of such a time interval may not be warranted. Several comments ask that FDA remove the 4-day time interval from codified and instead include it in subsequent guidance which can be more easily updated as science evolves.

(Response 114) Consistent with the requirements for pre-harvest agricultural water assessments that are designed to be adaptable to future advancements in agricultural water quality science, we are revising § 112.45(b)(1)(ii) to remove reference to a ''minimum interval of 4 days.'' Instead, final § 112.45(b)(1)(ii) entails farms ''increasing the time interval between last direct application of agricultural water and harvest of the covered produce to allow for microbial die-off, provided [the farm has] scientifically valid supporting data and information.'' We expect this change will further reinforce that farms may consider and adopt scientifically valid approaches other than that established for the 2015 produce safety final rule, both now and as agricultural water quality science continues to evolve. Further, recognizing that survival of pathogens and other microorganisms on produce commodities prior to harvest is dependent upon various factors (see response to comment 115), such a change will reinforce that farms may utilize scientifically valid time intervals as appropriate to their unique conditions.

While we are removing reference to a ''minimum interval of 4 days'' from § 112.45(b)(1)(ii), we continue to believe it is appropriate for farms to use a time interval between last direct water application and harvest based on that used in the 2015 produce safety final rule. As such, if a farm does not test its pre-harvest agricultural water but increases the time interval between last direct application of water and harvest as an appropriate mitigation measure, the farm may choose to increase its time interval to a minimum of 4 days, based on the data used to support the approach in the 2015 produce safety final rule. (See also response to comment 117, in which we discuss ''maximum'' vs. ''minimum'' intervals.) If a farm tests its pre-harvest agricultural water and increases the time interval between last direct application of water and harvest as a mitigation measure, in light of the approach established for the 2015 produce safety final rule, the farm may choose to use a microbial die-off rate of 0.5 log per day, for potentially less than 4 days between last direct water application and harvest, to achieve a calculated log reduction to meet the criteria the farm establishes in accordance with § 112.43(d)(3).

We consider the scientific data and information used to support the approach to a pre-harvest time interval established for the 2015 produce safety final rule as an example of adequate supporting scientific data and information farms may use in accordance with § 112.45(b)(1)(ii) (Refs. 60 and 61). See also 80 FR 74354 at 74444–74445. As such, a farm may use one of the approaches described immediately above for implementing a pre-harvest time interval as a mitigation measure under § 112.45(b) without having to develop and maintain additional supporting scientific data and information. Prior to using one of these approaches, however, the farm should consider whether the studies evaluated in support of pre-harvest microbial die-off in the 2015 produce safety final rule are reflective of conditions relevant to the farm. If a farm has scientifically valid data or information to support use of an increased time interval that is more reflective of its unique conditions, the farm must use that information in establishing an appropriate time interval under § 112.45(b)(1)(ii). See also comment 115.

(Comment 115) Several comments note that it may be difficult for a farm to make decisions regarding sufficient time intervals for microbial die-off due to lack of scientific information or expertise, and seek further guidance from FDA. Some of these comments contend that the effectiveness of microbial die-off as a mitigation method depends on various factors that are not listed in the proposed rule (*e.g.,* climate and environmental conditions, differences between pathogens, and crop characteristics that could impact bacterial survival). Some comments request that FDA clarify how pathogens capable of longer-term survival (*e.g., Listeria*) are to be considered in determining time intervals between last water application and harvest. Several comments ask FDA to provide scientific data for microbial die-off in response to UV rays and for specific pathogens and commodities. Some comments request that farms be required to ensure that any die-off period used is validated for the conditions of their operation and specific hazards being targeted.

(Response 115) We agree that microbial die-off between last direct water application and harvest can be impacted by a broad range of conditions, such as timing of water application, environmental conditions, crop characteristics, and pathogen characteristics. As discussed in

response to comment 114, we are revising § 112.45(b)(1)(ii) to remove reference to a ''minimum interval of 4 days.'' Instead, final § 112.45(b)(1)(ii) provides farms the opportunity to increase the time interval between last direct application of agricultural water and harvest of the covered produce to allow for microbial die-off, provided the farm has scientifically valid supporting data and information. We expect that such a change will further reinforce that farms may utilize scientifically valid time intervals as appropriate to their unique conditions.

As discussed in response to comment 114, we consider the scientific data used to support the approach to a time interval between last direct water application and harvest in the 2015 produce safety final rule to be one example of scientifically valid data and information (Refs. 60 and 61) (80 FR 74354 at 74444–74445). Further, we recognize that as science continues to evolve, time intervals that are more appropriate for a farm to use may become increasingly available.

For example, the studies we reviewed in determining an appropriate time interval for the 2015 produce safety final rule included those that looked at various types of leafy greens, carrots, and grass (the latter of which we considered a useful surrogate for at least some produce commodities with regard to leaf structure, and noted that particulates are just as likely to occur in grass irrigation water as in irrigation water used on produce crops) (Refs. 60 and 61). However, we recognize that microbial die-off on produce surfaces prior to harvest may differ for other commodities. Moreover, the studies evaluated included five field trials for *E. coli* O157:H7 (including surrogates), one field trial and one greenhouse study examining *Salmonella,* and three trials examining viral decay. While the studies evaluated reflect a few different growing conditions, we recognize that some farms may face different environmental conditions, which could affect the microbial die-off that occurs between last water application and harvest. Similarly, we recognize that not all pathogens or other microbial organisms will necessarily follow the same die-off kinetics as those assessed in studies evaluated for the 2015 produce safety final rule.

As more studies are conducted that examine in-field die-off for various circumstances (for example, different regions, environmental conditions, commodities, pathogens, and crop growth characteristics) (Refs. 46–49), it is likely that the science will continue to evolve. As we learn more about microbial die-off on produce surfaces prior to harvest, those findings can, and should, be accounted for if a farm increases the time interval between last direct application of agricultural water and harvest as a mitigation measure under § 112.45(b).

Scientific data and information used in support must be relevant to the farm's conditions (such as the region, crop, and environment), and be characterized in a manner that addresses the likely biphasic nature of microbial die-off (*i.e.,* rapid short-term die-off and a gradual long-term die-off) under § 112.45(b)(1)(ii). Evaluating various factors under § 112.43(a), such as the timing of water applications, environmental conditions, and crop characteristics, will help farms identify conditions relevant to establishing an increased time interval between last direct water application and harvest in accordance with § 112.45(b)(1)(ii). We intend to issue guidance on this topic, as appropriate.

(Comment 116) Several comments assert that a time interval for in-field microbial die-off only makes sense if preceded by microbial water testing, which would allow farms to calculate an acceptable die-off interval rate that may differ from 4 days. These comments note that the 2015 final rule indicated the importance of sampling water sources when a die-off period is used as a mitigation measure, whereas the 2021 proposed rule did not propose to require sampling to establish a baseline understanding of the microbial presence in the water.

(Response 116) While we recognize that pre-harvest agricultural water testing may provide information for farms to consider in implementing an increased time interval between last direct water application and harvest under § 112.45(b)(1)(ii), we disagree that farms should be required to test their pre-harvest agricultural water to do so. For example, if a farm increases the time interval between last direct water application and harvest as a mitigation measure, and in doing so, decides to only apply water from that agricultural water system early in the growing season (which could be, for example, weeks to months prior to harvest), calculations based on test results may not be needed in order to justify use of that time interval as a mitigation measure. Rather, the farm must implement that increased time interval as supported by scientifically valid data and information in accordance with § 112.45(b)(1)(ii). See also comment 115.

(Comment 117) A few comments note perceived inconsistencies as to whether the 4 days referenced in proposed § 112.45(b)(1)(ii) is intended to be a minimum interval between last direct application of agricultural water and harvest or a maximum interval. For example, these comments note that the 2015 final rule references research to determine that a maximum die-off period of four days is appropriate, but suggest that FDA now uses the same research in the 2021 proposed rule to say a minimum of 4 days for die-off is appropriate.

(Response 117) The mitigation measure involving an increased time interval between last direct application of agricultural water and harvest in the 2015 produce safety final rule consisted, in part, of using a microbial die-off rate of 0.5 log per day to achieve a (calculated) log reduction of the farm's GM and STV to meet the microbial water quality criteria in previous § 112.44(b), for no greater than 4 consecutive days (see § 112.45(b)(1)(i)(A) in the 2015 produce safety final rule). In light of our proposal to remove the quantitative pre-harvest microbial quality criteria in the 2015 produce safety final rule, we revised our approach to the mitigation measure involving an increased time interval between last direct application of agricultural water and harvest to better reflect the proposed requirements for systems-based pre-harvest agricultural water assessments.

As discussed in the 2015 produce safety final rule, a 4-day interval corresponds to the general mid-point in time representing neither end of the range where microbial die-off can be expected to occur (Refs. 60 and 61) (80 FR 74354 at 74445). In the proposed rule, we stipulated a minimum (as opposed to a maximum) time interval of 4 days in the recognition that not all farms will have the benefit of quantitative test data to support a time interval of fewer than 4 days, and that additional die-off is likely to occur beyond 4 days, even if not at the same rate.

However, as discussed in response to comment 114, we are removing reference to ''4 days'' from the codified provision at § 112.45(b)(1)(ii) to further reinforce that farms may use approaches based on scientific data and information other than that used to establish the 2015 produce safety final rule, both now and as agricultural water quality science continues to evolve. While farms may use an approach to a time interval between last direct water application and harvest based on that established for the 2015 produce safety final rule (see comment 114), the farm should first consider whether the studies evaluated in support of pre-harvest microbial die-

off in the 2015 produce safety final rule are reflective of conditions relevant to the farm (Refs. 60 and 61). See also 80 FR 74354 at 74444–74445 and response to comment 115.

(Comment 118) Many comments assert that a 4-day time interval between water application and harvest, or between harvest and the end of storage, is not feasible in some environments or for some crops. For example, some of these comments note that shippers sometimes request application of water to ''freshen'' crops before shipping, and that farms are unable to prevent this practice, which presents a challenge for using a 4-day time interval as a mitigation. Other comments suggest that a pre-harvest time interval may not be feasible for crops (such as strawberries, cabbages, and peas) that require frequent water applications to support crop viability (for example, due to soils being sandy, to reduce heat stress on crops, or as part of the farm's pest management strategy). A few comments note that some farms, for example, hydroponic and aquaponic operations, irrigate their produce continuously and that therefore, there is no interval between water application and harvest that would be applicable to their practices.

(Response 118) As discussed in comment 114, we are revising § 112.45(b)(1)(ii) to remove reference to a minimum interval of 4 days, as we expect this will further reinforce that farms may consider and adopt scientifically valid approaches other than that established in the 2015 produce safety final rule, both now and as agricultural water quality science continues to evolve. However, we recognize that even with this change, an increased time interval between last direct water application and harvest may not be appropriate for every farm to use as a mitigation measure. We expect that providing a range of possible measures, of which a time interval between last direct water application and harvest is only one, will assist farms in making decisions about their agricultural water use that reflects their agricultural water systems, operations, and conditions.

We would also like to clarify that the 4-day time interval referenced in the 2021 agricultural water proposed rule was specific to the time interval between last direct water application and harvest (proposed § 112.45(b)(1)(ii)), and not the time interval between harvest and end of storage (proposed § 112.45(b)(1)(iii)), for which we are not establishing a specific, broadly applicable, microbial die-off rate or time interval. See also comment 121.

(Comment 119) Some comments seek clarity on whether a farm can use the sampling framework in the 2015 final rule to define a time interval between last application of agricultural water and harvest of fewer than 4 days. Several comments ask whether FDA recognizes the MWQP calculator by University of California, Davis as ''other scientifically valid data'' and, if so, request clarification on whether a 1-day interval would be acceptable if justified by the calculator.

(Response 119) In comments 93, 95 and 114, we explain that the sampling frequency, microbial quality criteria, and approach to a time interval between last direct water application and harvest established for the 2015 produce safety final rule are examples of approaches supported by scientifically valid data or information that fulfill applicable requirements under §§ 112.43(d)(3) and 112.45(b)(1)(ii). (We discuss the term ''scientifically valid'' in the 2015 produce safety final rule (see 80 FR 74354 at 74371).) As such, farms that test pre-harvest agricultural water as one part of an assessment and increase the time interval between last direct application of water and harvest as a mitigation measure can choose to use those methods and approaches. However, as discussed in response to comment 114, if a farm considers using an approach to a pre-harvest time interval based on that established for the 2015 produce safety final rule, the farm should first consider whether the studies evaluated in support of pre-harvest microbial die-off in the 2015 produce safety final rule are reflective of conditions relevant to the farm (Refs. 60 and 61). See 80 FR 74354 at 74444–74445 and response to comment 115. To the extent that a farm uses a calculator or other tool to provide decision-making support, the farm remains responsible for ensuring that all applicable requirements are met, including that any microbial criteria (or criterion), sampling frequencies, pre- or post-harvest time intervals, or other activities (as applicable) be supported by scientifically valid data or information.

c. Time Interval Between Harvest and End of Storage and/or Conducting Other Activities

(Comment 120) A few comments request that increasing the time interval between harvest and the end of storage be removed as a mitigation measure in the final rule, since, the comments suggest, the factors associated with microbial die-off during storage are complex and may make it difficult to determine the adequacy of a post-harvest time interval. Other comments suggest that commercial washing specifically should be removed as an allowable mitigation, as including it reinforces an inaccurate perception that commercial washing always reduces pathogens on produce surfaces. A few comments note that commercial washing with an antimicrobial is designed to prevent the spread of pathogens from contaminated produce to other, uncontaminated produce, and not to remove microorganisms from contaminated produce. Some comments note that farms are not required to use an antimicrobial in their post-harvest wash water and suggest that including commercial washing as a mitigation measure may ultimately increase risk if water is not managed properly.

(Response 120) We recognize that microbial die-off and/or removal during post-harvest storage and as a result of other post-harvest activities is likely dependent on a variety of factors, such as commodity characteristics, storage time and conditions, and relevant production practices. Farms are not required to treat their post-harvest agricultural water, and post-harvest agricultural water, if not adequately managed, has the potential to serve as a source or route of contamination. However, if properly performed and scientifically valid given a farm's production practices, commercial washing has the potential to result in microbial die-off or removal from produce surfaces. For example, the World Health Organization has attributed a 1-log reduction in microbial load to washing (Ref. 65). See also 79 FR 58434 at 58446. As such, we are not removing § 112.45(b)(1)(iii) as an allowable mitigation measure.

However, we recognize there may be post-harvest activities other than commercial washing that have the potential to result in microbial die-off or removal on covered produce. See, for example, 80 FR 74354 at 74370, where we provide controlled atmosphere storage as another example of a post-harvest activity that may be appropriate for use as a mitigation measure with adequate supporting data and documentation. As such, we are removing commercial washing as an example of a post-harvest activity in § 112.45(b)(1)(iii) to further reinforce that farms may use other activities during or after harvest as a mitigation measure, provided the farm has adequate supporting data and documentation. This revision will further encourage farms to consider other post-harvest activities that may result in microbial die-off or removal from produce surfaces both now, and in the future as potential advancements in

post-harvest handling practices occur (Refs. 80 and 81). In light of our removal of the pre-harvest agricultural water microbial quality and testing requirements in the 2015 produce safety final rule, we are also revising § 112.45(b)(1)(iii) to remove reference to microbial die-off ''rates'' and microbial removal ''rates,'' specifically.

(Comment 121) A number of comments request that FDA provide further guidance, scientific information, and examples on how farms may use a time interval between harvest and end of storage or commercial washing as mitigation measures under proposed § 112.45(b)(1)(iii). For example, a few comments request additional guidance, noting that the factors associated with microbial die-off during post-harvest storage and handling are complex and may depend, for example, on crop characteristics. Some comments request clarity on what type of organisms should be studied in order to justify the use of post-harvest storage or handling as a mitigation measure, noting that if producers attempt to develop data in-house, they will not be able to use pathogens to conduct in-house studies.

(Response 121) As discussed in the 2014 supplemental proposed rule and the 2015 produce safety final rule, we do not have sufficient information to support the derivation of appropriate, broadly applicable microbial die-off or removal rates between harvest and end of storage or during post-harvest activities such as commercial washing. See 79 FR 58434 at 58446 and 80 FR 74354 at 74444. We have not been provided with and are not aware of information that changes our position. Rather, farms that increase the time interval between harvest and the end of storage and/or conduct other post-harvest activities as a mitigation measure in accordance with § 112.45(b)(1)(iii) must establish parameters for such practices as appropriate to their circumstances (for example, in consideration of commodity characteristics, storage time and conditions, and/or other relevant production practices), as supported by scientifically valid data and information.

For example, a farm that uses commercial washing as a mitigation measure under § 112.45(b)(1)(iii) must do so as appropriate to its circumstances. The appropriateness of using commercial washing as a mitigation measure may be affected by, for example, the characteristics of the covered produce being washed (such as where commodity characteristics may protect potential contaminants from removal); the method of commercial washing (such as through a single-pass system vs. one that uses recirculated water); and any monitoring or management practices the farm has in place to reduce the potential for the agricultural water to serve as a source or route of contamination to covered produce (for example, the practices specified in § 112.44(d)).

We are not requiring farms to conduct ''in-house'' studies in order to support use of a mitigation measure under § 112.45(b)(1)(iii), nor are we establishing parameters on what studies conducted to support such practices should entail. Rather, we require that any increased time interval between harvest and the end of storage and/or other post-harvest activities used in accordance with § 112.45(b)(1)(iii) be supported by scientifically valid data or information. See 80 FR 74354 at 74371.

(Comment 122) Some comments seek clarity around the term ''commercial washing'' in proposed § 112.45(b)(1)(iii), such as whether it would include processes that use water for cooling purposes (for example, hydrocooling, dump tank, spray bar, and ice-injection processes), and whether it is an available mitigation measure for all covered produce, or just select commodities.

(Response 122) As discussed in response to comment 120, we are removing commercial washing as an example of a post-harvest activity in § 112.45(b)(1)(iii) to reinforce that farms may use other activities during or after harvest that result in microbial die-off or removal, provided the farm has adequate supporting data and documentation. While post-harvest activities conducted under § 112.45(b)(1)(iii) could involve the use of agricultural water, it is not required, such as where controlled atmosphere storage may result in microbial die-off or removal (as supported by scientifically valid data and information). (See 80 FR 74354 at 74371).

Additionally, we note that activities allowed as mitigation measures under § 112.45(b)(1)(iii) are not limited to any commodities in particular. However, as discussed in response to comment 121, farms must establish parameters for any post-harvest activities used in accordance with § 112.45(b)(1)(iii) as appropriate to their circumstances (*e.g.,* in consideration of commodity characteristics, storage conditions, and/or other relevant production practices) and as supported by scientifically valid data and information.

d. Changing the Method of Water Application

(Comment 123) Some comments request that FDA identify use of drip and seepage irrigation as effective strategies for reducing risk because in such systems, the water distribution occurs below the soil surface (never touching any above-ground portion of the plant) and the soil naturally filters out any potential microbial hazards.

(Response 123) It is unclear to us whether comments are requesting that we identify drip and seepage irrigation as methods that do not result in contact between agricultural water and the crop, or that we identify use of drip and seepage irrigation as water application methods that could be broadly applied as mitigation measures under § 112.43(b)(1)(iv).

To the extent that comments are requesting we identify drip and seepage irrigation as broadly applicable mitigation measures in § 112.43(b)(1)(iv), we decline to do so, as the effectiveness of using those application methods as a mitigation measure is a function of multiple factors, including the water application method, characteristics of the crop (such as whether the harvestable portion grows near, on, or in the ground), and any relevant practices the farm may have in place. For example, changing the water application method for root crops may not be an appropriate mitigation measure, as it may be difficult to effectively minimize contact between agricultural water and the harvestable portion of the crop while allowing the crop access to water needed to survive and grow. However, for non-root crops, changing the water application method may be effective as a mitigation measure under § 112.45(b), if making the change minimizes the water that is in direct contact with the harvestable portion of the crop. For example, changing from overhead to microjet irrigation for some tree fruit (such as citrus) or from microjet to drip irrigation for some covered produce that grows near the ground (such as bell peppers) may reduce the likelihood of contamination of the covered produce in accordance with § 112.45(b)(1)(iv). Additionally, there may be instances where multiple practices—such as the use of plastic mulch along with changes in water application methods—together serve as effective mitigation measures under § 112.45(b)(1)(iv).

e. Alternative Mitigation Measure

(Comment 124) Several comments suggest that changing water sources (from surface water to ground water, for

instance) might be considered a possible alternative mitigation measure.

(Response 124) We have incorporated flexibility in § 112.45 to provide farms viable options to reduce the potential for contamination of non-sprout covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water without needing to alter the source of agricultural water, such as making necessary changes (for example, repairs) or changing the method of water application to reduce the potential for contamination of covered produce. However, if a farm changes the water source it uses for pre-harvest agricultural water, it is a significant change, and a reassessment under § 112.43(e) is required. The reassessment must evaluate the impacts of the change on the factors in § 112.43(a)(1) through (5), any new hazards identified, and the outcome and determination under § 112.43(c). See also section V.I.

We believe that providing a range of mitigation measures for farms to use in § 112.45(b), including the ability to use an alternative mitigation measure provided the requirements in § 112.12 are met, provides farms with an appropriate level of flexibility in selecting mitigation measures that are reasonably necessary to reduce the potential for covered produce or food contact surfaces with known or reasonably foreseeable hazards associated with pre-harvest agricultural water.

K. Treatment of Agricultural Water

The proposed rule contained edits designed to provide clarity, such as reorganizing subpart E to group provisions of a similar nature, which included moving the provisions related to agricultural water treatment to § 112.46. Additionally, as discussed in the 2021 agricultural water proposed rule, although we are not requiring farms to treat their agricultural water, scientists from FDA's Center for Food Safety and Applied Nutrition, in collaboration with EPA, developed a testing protocol for evaluating the efficacy of antimicrobial chemical treatments against certain foodborne pathogens in agricultural water sources (Ref. 82). Since the efficacy protocol was approved by EPA on April 29, 2020, we have worked with EPA to provide various updates to enhance flexibility (where appropriate) and meet the current needs scientifically and practically (Ref. 83).

We received various comments on agricultural water treatment in general, as well as the pre-harvest agricultural water efficacy testing protocol, which we discuss below. For comments regarding treatment as a corrective or mitigation measure, see section V.J.

As discussed in section V.A., we did not propose to substantively revise the requirements for agricultural water treatment in § 112.46; therefore, comments on § 112.46 are outside the scope of this rule. However, we intend to issue guidance on these requirements in the future.

(Comment 125) Many comments note that there are currently no chemical treatment options approved by EPA for use in pre-harvest agricultural water against human pathogens, and express concerns that this may prohibit the use of water treatment as a corrective or mitigation measure until such products are approved. Some comments suggest that the lack of available chemical treatments may result in some farms using pesticides in an unapproved manner in order to comply with the proposed rule.

(Response 125) Farms are not required to treat their agricultural water. Rather, farms have a range of options, and treatment of water is one such option. Additionally, if a farm treats agricultural water, § 112.46 allows for non-chemical suitable methods of treatment. See 80 FR 74354 at 74436–74437. Further, as discussed in the 2015 produce safety final rule, like all registered pesticide products, registrations for antimicrobial products are specific to the use that was considered as part of the registration process, and thus the products may be legally used for the specified registered use only. See 80 FR 74354 at 74436.

(Comment 126) Some comments voice concern that farms are not required to test the quality of their water prior to treating it. These comments suggest that the chemicals approved using the treatment efficacy protocol have limited usefulness in ensuring that treated pre-harvest water contains no detectable generic *E. coli* per 100 mL of water, as a farm would be unable to document that an EPA-labeled treatment that achieves 3-log removal is expected to result in pre-harvest water containing no detectable generic *E. coli* per 100 mL of water unless the farm knows that the starting concentration of generic *E. coli* is less than 1,000 CFU per 100 mL.

(Response 126) We understand commenters to be referring to language in the pre-harvest agricultural water treatment efficacy protocol specifying that results of testing should demonstrate a minimum of 3-log reduction of each of the test organisms as compared to the control count (Ref. 82). We understand that a 3-log reduction is the minimum level of reduction of pathogens the EPA will consider when registering an antimicrobial treatment that includes a public health claim. While the requirements for agricultural water treatment in § 112.46 refer in part to § 112.44(a) (which includes a microbial criterion of no detectable generic *E. coli* per 100 mL of water), we note that the requirements in § 112.44(a) do not apply to pre-harvest agricultural water for non-sprout covered produce (see § 112.40).

We did not propose to substantively revise § 112.46, which includes requirements related to treatment efficacy.

(Comment 127) Some comments request that FDA remove chemical treatment of irrigation water as an allowable mitigation strategy in the proposed rule so as to avoid potential effects on the environment.

(Response 127) As discussed in response to comment 125, farms are not required to treat their agricultural water. Rather, farms have a range of options, and treatment of water (such as with physical treatment, chemical treatment, or other suitable method) is one such option. With respect to environmental concerns related to chemical treatment of agricultural water, we note that environmental and health-related risk assessments of pesticide products are conducted by EPA prior to their registration and use. See 80 FR 74354 at 74434–74435.

However, we recognize that improper use, management, or disposal associated with chemical treatment of agricultural water can create adverse environmental impacts. During rulemaking for the 2015 produce safety final rule, and in accordance with the National Environmental Policy Act and its implementing FDA regulations, we evaluated the potential effects of the 2015 produce safety final rule on the human environment in the United States in an EIS (Ref. 50). That document has a detailed discussion of the potential impacts such as those related to pesticide use, chemical treatment of agricultural water, and changes in ground water demand. See also 80 FR 74354 at 74434–74435. At the time of this rulemaking, as was also the case at the time of preparation of the Agency's finding of no significant impact and environmental assessment for the 2021 agricultural water proposed rule (Refs. 51 and 52), there are no pesticide products which have been registered by EPA for treatment of agricultural water during pre-harvest activities. No significant adverse environmental impacts have been identified with this final rule (Ref. 53).

We are not aware of, and comments did not provide, data or information suggesting these findings are incorrect. Therefore, further analysis of potential impacts would be speculative.

(Comment 128) Several comments agree with FDA's tentative conclusion that the proposed rule does not conflict with or duplicate the requirements of organic certification under USDA's National Organic Program (NOP) standards (7 CFR part 205). However, a few comments express concern that chemical products approved by the EPA for use on pre-harvest water in the future (such as chlorine compounds) may not be allowed for use under the NOP.

(Response 128) As discussed in the 2015 produce safety final rule (80 FR 74354 at 74439–74440), compliance with the provisions of the 2015 produce safety final rule, including the provisions related to agricultural water in subpart E, does not preclude compliance with the requirements for organic certification in 7 CFR part 205. We continue to conclude that in accordance with section 419(a)(3)(E) of the FD&C Act, this rule does not include any requirements that conflict with or duplicate the requirements of the NOP established under the Organic Foods Production Act of 1990. See also 86 FR 69120 at 69132.

If a farm treats its agricultural water, non-chemical water treatment options (including pesticide devices such as filter units, UV light units, and ozonator units) may be also used in compliance with § 112.46, which we did not propose to substantively revise. Thus, this rule does not require organic farms to use a substance that is prohibited in organic production. We also note that the provisions for treatment of agricultural water in § 112.46 are not in conflict with or duplicative of NOP regulations which permit the use of chlorine materials in organic production and handling in accordance with certain limitations (see 7 CFR 205.601(a) and 205.605(b)). Additionally, NOP guidance, ''The Use of Chlorine Materials in Organic Production and Handling'' (Ref. 84), provides information about compliant use of chlorine under the organic regulations. See 86 FR 69120 at 69131.

(Comment 129) Some comments suggest that treatments that are effective against the bacterial pathogens identified in the efficacy protocol cannot necessarily be expected to have the same level of effectiveness against viral and protozoan pathogens, such as *Cyclospora cayatanensis.* Moreover, comments claim that in many situations, a farm may not know what specific microbial hazards may be present in an agricultural water and request that FDA clarify whether all known or reasonably foreseeable hazards must be considered when selecting a treatment.

(Response 129) We recognize that pathogens present in agricultural water systems may vary, and that not every treatment will be effective against every possible pathogen. While farms are required to consider the *conditions* that are reasonably likely to introduce known or reasonably foreseeable hazards as part of their pre-harvest agricultural water assessments (emphasis added), we do not necessarily expect farms to identify the specific microbial hazards associated with each condition in order to treat their water as a corrective or mitigation measure. Nonetheless, if a pathogen is known to be, or is likely to be, associated with a farm's pre-harvest agricultural water (which the farm may be aware of through voluntary testing, knowledge or experience, or other means) and the farm treats the water, the farm must consider the presence of that pathogen in selecting an appropriate method of treatment.

For example, the efficacy protocol for the development and registration of antimicrobial treatments for pre-harvest agricultural water, as updated in January 2023 (Ref. 82), specifies Shiga-toxin producing *E. coli* and *Salmonella enterica* as test organisms. As such, any chemistries approved using this protocol will specify those organisms on their labels. (While the protocol originally included *L. monocytogenes,* in a January 2023 update (Ref. 83), we explained that we were removing *L. monocytogenes* from the protocol at that time.) We emphasize that a variety of measures are available for farms to use in § 112.45, not just those related to chemical treatment of agricultural water. As we continue to learn more about the known or reasonably foreseeable hazards present in pre-harvest agricultural water sources and systems, we will consider working with EPA to account for other pathogens in efficacy protocols to support registration of chemical treatments.

(Comment 130) Some comments disagree with what they suggest is a requirement under the proposed rule for farms to treat their water with products labeled for specific pathogens. A few comments request that FDA provide flexibility related to the treatment efficacy protocol and requirements that chemical treatments be validated for efficacy against specific test organisms.

(Response 130) As discussed in the 2015 produce safety final rule, although some antimicrobial substances are regulated by FDA, most antimicrobial substances that might be used by farms in agricultural water are regulated by the EPA (Ref. 85) (80 FR 74354 at 74439). We anticipate that the treatment efficacy protocol (Ref. 82), which EPA approved, will facilitate the registration of chemical treatments and increase the options for corrective and mitigation measures available to farms. We anticipate that having several chemical treatment options available encompassing a range of chemistries and applications will help ensure coverage over an industry with such variable practices and conditions.

L. Records Relating to Agricultural Water (§ 112.50)

We proposed to add new requirements in § 112.50 for records relating to pre-harvest agricultural water assessments. We also made revisions to conform with the proposed changes to the subpart E provisions, including to revise the requirements of § 112.161(b) to require supervisory review of records of pre-harvest agricultural water assessments and determinations.

We received various comments on the recordkeeping requirements in § 112.50 and respond to those comments in the following paragraphs. As discussed below, we are revising § 112.50(b)(7) to further reinforce flexibility afforded to farms in establishing records related to certain actions taken under § 112.45. We are also revising § 112.50(b)(8) to reflect the changes we are making to § 112.45(b)(1)(ii) and (iii) (see section V.J.). Additionally, consistent with § 112.50(b)(8) in the 2015 produce safety final rule, we are adding the following record requirement: for farms using an alternative mitigation measure in accordance with § 112.45(b)(1)(vi), records of scientific data or information the farm relies on to support that measure (§ 112.50(b)(9)). We have renumbered the subsequent recordkeeping provisions accordingly. We received no comments on the conforming revisions to § 112.161(b) and are finalizing it without change.

(Comment 131) Some comments seek clarity on what standards of Subpart O, ''Records,'' apply for pre-harvest agricultural water assessments. A few comments request that FDA clarify which records, including those for agricultural water reassessments, are required to be in writing. A few comments request that FDA provide templates for records, with a few of those comments seeking clarity on whether a printed copy of the Agricultural Water Assessment Builder tool would satisfy the records

requirements in § 112.50. Others request that FDA provide sufficient education and outreach to assist farms in complying with the recordkeeping requirements.

(Response 131) Subpart O of the 2015 produce safety final rule established the general requirements applicable to documentation and records that farms must establish and maintain under part 112, including records related to agricultural water. We discuss the requirements in subpart O in the 2015 produce safety final rule. See 80 FR 74354 at 74510–74514.

Section 112.43(a) requires that farms, in part, prepare a *written* agricultural water assessment (emphasis added). The requirement that agricultural water assessments be in writing also applies for any reassessments conducted under § 112.43(e).

As referenced by the comments, we have made an Agricultural Water Assessment Builder (Ref. 24) available to help stakeholders understand the requirements in the 2021 agricultural water proposed rule for pre-harvest agricultural water assessments. While we expect to update the Builder to reflect this final rule, use of the Builder does not mean that farms are in compliance with the relevant requirements.

(Comment 132) A few questions seek clarity on whether agricultural water assessments prepared by farms will be accessible to outside parties.

(Response 132) Records obtained by FDA in accordance with part 112, including agricultural water assessments, are subject to the disclosure requirements under 21 CFR part 20 (§ 112.167). Our disclosure of information is subject to the Freedom of Information Act (5 U.S.C. 552), the Trade Secrets Act (18 U.S.C. 1905), the FD&C Act, and our implementing regulations under 21 CFR part 20, which include protection for confidential commercial information and trade secrets. See 80 FR 74354 at 74514.

(Comment 133) Several comments request that FDA clarify which records can satisfy multiple requirements both for subpart E and for other sections of the rule that may be related (for example, subparts I and F). Many comments ask whether records used for water system inspections can also be used to satisfy the agricultural water assessment recordkeeping requirements.

(Response 133) Under § 112.163(a), farms are not required to duplicate any existing records, including those for agricultural water assessments, if those records contain all of the required information and satisfy the relevant requirements. Similarly, if a farm has records containing some but not all of the required information, § 112.163(b) provides the flexibility to keep any additional information required either separately or combined with existing records.

With respect to comments asking about records for agricultural water system inspections and agricultural water assessments, we note that records of a farm's agricultural water system inspection in § 112.50(b)(1) may not be appropriate to fulfill, in full, the requirement to maintain records of written agricultural water assessments in § 112.50(b)(2), as the requirements in § 112.43 for agricultural water assessments require consideration of a broader range of factors than those considered for water system inspections under § 112.42(a). See also response to comment 25.

(Comment 134) Some comments request that FDA simplify the recordkeeping requirements for farms that choose to wait at least 4 days between the last direct water application and harvest by allowing farms to document practices in written standard operating procedures instead of requiring farms keep records documenting each individual time they use the 4-day interval on each crop.

(Response 134) We agree that flexibility with respect to records of certain mitigation measures is warranted and are revising proposed § 112.50(b)(7) to remove specific reference to § 112.45(b)(1)(ii) and (iii) (regarding a time interval between last water application and harvest, and a time interval between harvest and end of storage (and/or conducting other post-harvest activities), respectively). For example, if a farm implements an increased time interval between last direct water application and harvest as a mitigation measure under § 112.45(b)(1)(ii) and adopts that increased time interval as a routine practice, capturing that practice in a single record suffices such that maintaining a record of each individual instance the time interval is applied is not necessary. This, too, applies to any increased time intervals between harvest and end of storage and/or other post-harvest activities that a farm implements as a mitigation measure under § 112.45(b)(1)(iii), if the farm adopts the relevant practice(s) as a routine activity.

(Comment 135) One comment notes that proposed § 112.45(b) requires the implementation of certain ''mitigation measures'' under specified conditions, yet the associated records requirement in § 112.50(b)(7) requires ''documentation of actions you take in accordance with § 112.45.'' The comment requests that § 112.50(b)(7) be modified to read, ''Written documentation of mitigation measures you take in accordance with § 112.45.''

(Response 135) We decline to make this change, as § 112.45 includes required actions beyond the mitigation measures specified in § 112.45(b). See § 112.45(a), which requires, in certain circumstances, that a farm immediately discontinue use of agricultural water and, before resuming use of the water, implement corrective measures in § 112.45(a)(1) or (2).

VI. Effective and Compliance Dates

In the 2021 agricultural water proposed rule, we proposed to establish an effective date 60 days after the date of publication of the final rule. In the 2022 supplemental proposed rule, we proposed to establish dates for compliance with the pre-harvest agricultural water provisions for covered produce other than sprouts as follows: 2 years and 9 months after the effective date of a final rule for very small businesses; 1 year and 9 months after the effective date of a final rule for small businesses; and 9 months after the effective date of a final rule for all other businesses. We also specified the duration of the period of enforcement discretion for the harvest and post-harvest agricultural water requirements for covered produce other than sprouts until January 26, 2025, for very small businesses; January 26, 2024, for small businesses, and January 26, 2023, for all other businesses.

We received several comments in response to the 2021 proposed rule as well as the 2022 supplemental proposed rule regarding the proposed effective date for a final rule as well as the proposed compliance dates for the requirements that apply for pre-harvest agricultural water for non-sprout covered produce. We respond to these comments here. While in the 2022 supplemental proposed rule we noted that we were reopening the comment period only with respect to the compliance dates for the proposed pre-harvest agricultural water provisions for covered produce other than sprouts, we received some comments related to the end of our intended period of enforcement discretion for the harvest and post-harvest agricultural water requirements for non-sprout covered produce.

After considering comments, we are finalizing the effective date as proposed, *i.e.,* 60 days after publication of this rule. We are also finalizing compliance dates as proposed, such that compliance dates are those shown in table 5.

TABLE 5—COMPLIANCE DATES FOR REQUIREMENTS IN SUBPART E FOR COVERED ACTIVITIES INVOLVING COVERED PRODUCE

[Except sprouts subject to subpart M]

Size of covered farm	Provisions related to harvest and post-harvest agricultural water	Provisions related to pre-harvest agricultural water
	Compliance date	Proposed compliance date
Very Small Business	January 26, 2024	2 years and 9 months after the effective date of this rule.
Small Business	January 26, 2023	1 year and 9 months after the effective date of this rule.
All Other Businesses	January 26, 2022	9 months after the effective date of this rule.

(Comment 136) Several comments support FDA's proposed compliance dates for pre-harvest agricultural water requirements, suggesting that the proposed compliance dates allow sufficient time for farms to understand and comply with the requirements. In contrast, other comments express a concern that the proposed compliance dates for pre-harvest agricultural water requirements do not allow sufficient time for on-farm preparedness and development of educational and training materials to support successful implementation. A few comments suggest specific compliance dates from 1 to 3 years after the final rule publishes based on farm size would be appropriate, whereas others suggest that a single compliance date for all agricultural water provisions 2 years after publication of the final rule would be more appropriate.

(Response 136) In light of the extensive outreach we conducted following issuance of the proposed rule and anticipated education, outreach and training on this final rule, we decline commenters' request to provide additional time for farms to come into compliance with the pre-harvest agricultural water requirements for non-sprout covered produce and are finalizing compliance dates for those provisions as proposed, without change. To the extent that comments are suggesting we establish a single set of compliance dates for all uses of agricultural water (pre-harvest, harvest, and post-harvest) and/or establish a single compliance date that applies for farms of all sizes, we discuss such feedback in response to comments 141 and 137, respectively.

Regarding outreach conducted following issuance of the 2021 proposed rule, as discussed in further detail in section III.F., we conducted numerous outreach activities following issuance of the agricultural water proposed rule. These included participation in various webinars; consultations, two virtual public meetings; regional meetings sponsored by State regulatory partners; and numerous other meetings and speaking engagements to discuss the proposed rule, respond to questions, and receive feedback. Further, we are exploring other mechanisms, such as webinars, updated training programs, workshops, and educational resources, to provide industry with information to facilitate compliance the requirements we are finalizing here. We also anticipate updating our Agricultural Water Assessment Builder, including both the online and paper-based versions, to reflect the pre-harvest agricultural water requirements we are finalizing here.

Additionally, we note that although the compliance dates we are finalizing here apply for all requirements for pre-harvest agricultural water for non-sprout covered produce, many of these requirements have not changed since publication of the 2015 produce safety final rule. See § 112.40 and response to comment 9. For example, other than technical amendments to provide additional clarity (such as adding descriptive headings and consolidating certain requirements), the requirements in § 112.42 for agricultural water system inspections and maintenance remain the same as when the 2015 produce safety final rule published. As such, we expect that many farms may already be aware of, and have received education and training on, some of the requirements that apply for pre-harvest agricultural water that are not changing with this final rule. While we recognize the value of outreach and training regarding the requirements in § 112.43 for pre-harvest agricultural water assessments and outcomes, we disagree that farms will need more than the established compliance periods to adapt their programs to the specific requirements of this rule.

(Comment 137) Many comments support staggered compliance dates for the pre-harvest agricultural water provisions based on farm size. Some comments note that extended compliance dates are especially important in order to provide enough time for training, technical assistance, and updates to practices, infrastructure, and equipment to occur. Conversely, some comments do not support staggered compliance dates based on farm size, contending that staggered compliance dates create unnecessary complexity for organizations that conduct training since they will first have to target only large farms, and then conduct training for small farms as the different compliance dates grow near.

(Response 137) We disagree that we should establish a uniform compliance period for the pre-harvest agricultural water requirements for non-sprout covered produce across all farm sizes. The purpose of staggered compliance dates is to give businesses of various sizes time to come into compliance with the rule technically, financially, and operationally. In light of practical considerations for small and very small businesses, we consider that additional time for small and very small farms to come into compliance is warranted. Moreover, we note that staggered compliance dates based on farm size is consistent with compliance dates for requirements in the 2015 produce safety final rule that we did not propose to change, and is consistent with the statutory provisions in section 419(a)(3)(A) and (c)(1)(B) of the FD&C Act, which direct us to provide sufficient flexibility to be practicable for all sizes and types of businesses, including small businesses.

(Comment 138) Some comments urge FDA to set pre-harvest compliance dates only after sufficient research is conducted regarding the impact of farming practices on pre-harvest agricultural water quality and safety, and mitigation measures that are appropriate to address various conditions. Several comments suggest that ''proven'' mitigation measures need to be made available before farms should be expected to implement the requirements for agricultural water assessments.

(Response 138) We disagree with these comments. While we have designed the rule to be adaptable to future scientific advancements, we note that there is long-standing scientific

support for the mitigation measures identified in § 112.45(b). See, for example, the GAPs Guide (Ref. 59) and the QAR (Ref. 17). We also discuss the scientific reasoning behind the proposed requirements for agricultural water assessments (including mitigation measures) throughout the 2021 agricultural water proposed rule and in section V of this final rule. To the extent that science related to pre-harvest agricultural water quality continues to evolve, farms will be able to use such information to further inform covered their pre-harvest agricultural water assessments. We anticipate that as new information becomes available, it will be shared with covered entities through various means. See response to comment 19.

(Comment 139) A few comments suggest that FDA and States will need time to make progress on partnerships related to the pre-harvest agricultural water provisions. These comments suggest that partnerships should be in place before compliance with the pre-harvest requirements is required.

(Response 139) FSMA recognizes a critical role for FDA's State regulatory partners. To this end, FDA has established the FDA-State Produce Safety Implementation Cooperative Agreement Program,[8] through which most states have developed produce safety programs (Ref. 86).

(Comment 140) Several comments disagree with the proposed effective date of 60 days after publication of the final rule, arguing that 60 days is not enough time for farms to implement necessary changes in order to come into compliance with the proposed requirements.

(Response 140) ''Effective date'' and ''compliance date'' do not mean the same thing. The effective date is the date that requirements amend the current CFR; and for this rule, the compliance date is the date at which a farm is required to be in compliance with the pre-harvest agricultural water requirements for non-sprout covered produce.

We proposed that the effective date of this rule would be 60 days after the date of publication of the final rule in the **Federal Register**. However, we proposed to provide for a longer timeline for farms to come into compliance with the pre-harvest agricultural water provisions depending on the size of the farm—*i.e.,* 2 years and 9 months after the effective date of a final rule for very small businesses; 1 year and 9 months after the effective date of a final rule for small businesses; and 9 months after the effective date of a final rule for all other businesses. See also table 5. As discussed throughout this section, we are finalizing the effective and compliance dates as proposed.

(Comment 141) We also received various comments on FDA's intention to exercise enforcement discretion for harvest and post-harvest agricultural water. One comment notes that most farms have already begun complying with the harvest and post-harvest agricultural water requirements, and voices support for FDA's intent to exercise enforcement discretion for those requirements as described in the 2022 supplemental proposed rule. In contrast, some comments request that FDA provide more time for training and other outreach. A few of these comments note that even though FDA did not propose changes to the requirements for harvest and post-harvest agricultural water, some of the provision numbers for those requirements may change with a final rule, which could result in confusion. A few comments assert that bifurcated compliance dates will be confusing, and create unnecessary complexity by, for instance, requiring educators to conduct separate trainings for the harvest/post-harvest and pre-harvest agricultural water requirements.

(Response 141) As discussed in the 2022 supplemental proposed rule, we reopened the comment period on the 2021 proposed rule solely to request public comment on the proposed compliance dates for the proposed pre-harvest agricultural water provisions for covered produce other than sprouts. As we did not propose to change the requirements that apply for harvest and post-harvest agricultural water, we did not propose a compliance date extension for those provisions for covered produce other than sprouts. However, we stated our intent to exercise enforcement discretion for the harvest and post-harvest agricultural water requirements for non-sprout covered produce until specific dates, which were staggered according to the size of the farm, to provide farms, regulators, educators, and other stakeholders additional time to facilitate compliance with those provisions.

With respect to comments suggesting there will be confusion due to the renumbering of various provisions that apply for harvest and post-harvest agricultural water, we note that § 112.40 specifies which provisions in subpart E are applicable to harvest and post-harvest agricultural water. Additionally, our response to comment 9 summarizes the major changes being made to the agricultural water provisions in subpart E between the 2015 produce safety final rule and this final rule, including the location of the relevant requirements. We expect this information, along with training, technical assistance, educational visits, and on-farm readiness reviews, will reduce potential confusion associated with reorganizing the provisions of subpart E.

VII. Economic Analysis of Impacts

We have examined the impacts of the final rule under Executive Order 12866, Executive Order 13563, Executive Order 14094, the Regulatory Flexibility Act (5 U.S.C. 601–612), the Congressional Review Act/Small Business Regulatory Enforcement Fairness Act (5 U.S.C. 801, Pub. L. 104–121), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4).

Executive Orders 12866, 13563, and 14094 direct us to assess all benefits, costs, and transfers of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). Rules are ''significant'' under Executive Order 12866 Section 3(f)(1) (as amended by Executive Order 14094) if they ''have an annual effect on the economy of $200 million or more (adjusted every 3 years by the Administrator of the Office of Information and Regulatory Affairs (OIRA) for changes in gross domestic product); or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or tribal governments or communities.'' OIRA has determined that this final rule is not a significant regulatory action under Executive Order 12866 Section 3(f)(1).

Because this rule is not likely to result in an annual effect on the economy of $100 million or more or meets other criteria specified in the Congressional Review Act/Small Business Regulatory Enforcement Fairness Act, OIRA has determined that this rule does not fall within the scope of 5 U.S.C. 804(2).

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because some small entities may incur costs larger than 3 percent of annual revenues, we cannot certify that the final rule will not have a significant

[8] See ''FDA-State Produce Safety Implementation Cooperative Agreement Program'' at *https://www.fda.gov/federal-state-local-tribal-and-territorial-officials/grants-and-cooperative-agreements/fda-state-produce-safety-implementation-cooperative-agreement-program.*

economic impact on a substantial number of small entities.

The Unfunded Mandates Reform Act of 1995 (section 202(a)) requires us to prepare a written statement, which includes estimates of anticipated impacts, before issuing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' The current threshold after adjustment for inflation is $183 million, using the most current (2023) Implicit Price Deflator for the Gross Domestic Product. This final rule would not result in an expenditure in any year that meets or exceeds this amount.

We estimate costs of the rule resulting from reading the rule, conducting pre-harvest agricultural water assessments, conducting mitigation measures when reasonably necessary based on the outcomes of the pre-harvest agricultural water assessments, and recordkeeping as a result of the pre-harvest agricultural water assessments. Our primary estimates of annualized costs are approximately $17.5 million at a 3 percent discount rate and approximately $17.7 million at a 7 percent discount rate over 10 years.

We estimate benefits of this rule resulting from the dollar burden of foodborne illnesses averted, and we estimate forgone benefits of this rule resulting from foodborne illnesses not averted due to the pre-harvest agricultural water microbial quality criteria and testing provisions in the 2015 produce safety final rule. Our primary estimates of annualized benefits are approximately $10.3 million at a 3 percent discount rate and approximately $10.1 million at a 7 percent discount rate over 10 years. In the FRIA, we discuss non-quantified benefits of the rule stemming from avoiding overly broad recalls of products that would have occurred absent the rule. We also discuss non-quantified benefits relating to increased flexibility for covered farms to comprehensively evaluate their agricultural water systems, in light of the requirements for pre-harvest agricultural water assessments being designed to accommodate a wide range of agricultural water sources, uses, and practices.

We have developed a comprehensive Economic Analysis of Impacts that assesses the impacts of the final rule. The full analysis of economic impacts is available in the docket for this final rule (Ref. 26) and at *https://www.fda.gov/about-fda/reports/economic-impact-analyses-fda-regulations*.

VIII. Analysis of Environmental Impact

The Agency has carefully considered the potential environmental effects of this action. FDA has concluded that the action will not have a significant impact on the human environment, and that an environmental impact statement is not required. We have considered the changes made between the 2021 proposed rule and this final rule and have concluded that the Agency's finding of no significant impact for the proposed rule, and the evidence supporting that finding, contained in an environmental assessment, continue to apply (Refs. 51–53 and 87). The Agency's finding of no significant impact and the evidence supporting that finding may be seen in the Dockets Management Staff (see **ADDRESSES**) between 9 a.m. and 4 p.m., Monday through Friday.

IX. Paperwork Reduction Act of 1995

This final rule contains information collection provisions that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3521). A description of these provisions is given in the Description section with an estimate of the annual recordkeeping burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

Title: Standards for the Growing, Harvesting, Packing, and Holding of Produce; Recordkeeping—OMB Control Number 0910–0816—Revision.

Description: This rule replaces recordkeeping requirements (found in part 112, subpart E) associated with sampling and testing of pre-harvest agricultural water for non-sprout covered produce with requirements to prepare and maintain documentation of written pre-harvest agricultural water assessments for non-sprout covered produce.

Description of Respondents: Farms subject to the regulation in part 112.

In the following paragraphs, we describe and respond to the comments pertaining to the proposed information collection.

(Comment 142) One comment seeks clarity on how this rule adds to the paperwork burden of the produce safety rule in terms of hours and numbers of records. This comment also requests clarification as to whether the calculated time burden in the 2021 agricultural water proposed rule includes reassessments and maintenance activities, and expresses a view that FDA may have underestimated the time burden of this rule if such activities were not included in the calculations.

(Response 142) Our estimates of the burden of the information collection in the 2021 agricultural water proposed rule and this final rule reflect only the requirements that we are finalizing here for pre-harvest agricultural water assessments for non-sprout covered produce. This includes the requirement in § 112.43(e) for farms to conduct a reassessment at least once annually, and whenever a significant change occurs in their agricultural water system that make it reasonably likely that a known or reasonably foreseeable hazard will be introduced into or onto covered produce (other than sprouts) or food contact surfaces through direct application of agricultural water during growing activities. See the third column in table 6 below, in which we assume 1.1 agricultural water assessments per year in light of this requirement, consistent with our FRIA (Ref. 26). Comments did not provide information to suggest that revisions to this approach are necessary or appropriate. As such, we use the same approach to estimating the burden of information collection in this final rule as we did in the 2021 agricultural water proposed rule, with the only change being to update farm counts based on more recent data sources used in the FRIA compared to that used in the PRIA. For discussion related to the estimated time to conduct recordkeeping specifically, see comment 143.

(Comment 143) A few comments suggest that the estimates in the proposed rule for time to conduct recordkeeping for pre-harvest agricultural water assessments, which ranged from 4–9 hours depending on farm size, is too low in light of challenges that some farms may face. For example, a few comments suggest that some farms may face challenges in conducting agricultural water assessments, such as the following: having multiple water sources; having long growing seasons; having water sources than span long distances; lacking historical knowledge of water systems and adjacent lands; lacking technical background; having limited personnel and/or financial resources; and not speaking or reading English.

(Response 143) We recognize that the time it takes farms to conduct recordkeeping for pre-harvest agricultural water assessments is likely to range for a variety of reasons, including those referenced in the comments. To account for a range in the amount of time recordkeeping for

agricultural water assessments may take, in the FRIA (Ref. 26), we provide low, most likely, and high estimates based on farm size (see tables 31–33 in that document). To estimate the burden of information collection associated with the requirements for pre-harvest agricultural water assessments, we use the ''most likely'' values in the FRIA for each farm size. We are not aware of, and comments did not provide, data or information suggesting estimates that are more applicable across the diversity that exists in industry in agricultural water systems, operations, and conditions. As such, we use the same estimates for the time to conduct pre-harvest agricultural water assessments when estimating the burden of information collection in this final rule as we did in the 2021 agricultural water proposed rule, consistent with estimates in the PRIA (Ref. 88) and FRIA (Ref. 26).

Burden Table: Upon consideration of these comments and in light of updated farm count data in the FRIA compared to the PRIA, we estimate the burden of the information collection as follows:

TABLE 6—CUMULATIVE AVERAGE ANNUAL BURDEN, COVERED FARMS OF ALL SIZES

21 CFR part 112, subpart E: requirements that apply regarding records	Number of respondents	Number of records per respondent	Total annual records	Average burden per farm (in hours)	Total hours
Agricultural Water Assessment and Records Maintenance—Very small covered farms (§ 112.50(b)(2))	9,911	1.1	10,902	4	43,608
Agricultural Water Assessment and Records Maintenance—Small covered farms (proposed § 112.50(b)(2))	2,057	1.1	2,263	8	18,102
Agricultural Water Assessment and Records Maintenance—All other (Large) Covered Farms (proposed § 112.50(b)(2))	5,392	1.1	5,931	9	53,381
Cumulative totals for covered farms of all sizes	17,360	.....	19,096	7	11,5091
Cumulative average 7 burden hours per covered farm annually.					

Farms using pre-harvest agricultural water for non-sprout covered produce are required to prepare and maintain records of their agricultural water assessments unless exempt under § 112.43(b). We estimate that a total of 17,360 farms (9,911 very small farms, 2,057 small farms, and 5,392 other (large) farms) will be subject to information collection requirements under this rule, consistent with figures in our FRIA (Ref. 26) for this final rule and informed by a 2018 USDA survey of farms' irrigation practices (Ref. 89). The change in these numbers compared to estimates provided in the 2021 agricultural water proposed rule are a result of updates to farm counts between the PRIA for the 2021 agricultural water proposed rule (Ref. 88) and the FRIA for this final rule (Ref. 26). The PRIA relied on farm counts from the FRIA for the 2015 produce safety final rule (based on 2012 National Agricultural Statistics Service (NASS) Census of Agriculture data), whereas the FRIA relies on 2017 NASS Census of Agriculture data (the most recent available).

We assume affected farms will conduct approximately 1.1 assessments annually, in accordance with the requirement to conduct assessments annually and whenever a significant change occurs that increases the likelihood that a known or reasonably foreseeable hazard will be introduced into or onto covered produce or food contact surfaces (Ref. 26). We are assuming a range of burden: 4 hours of burden for very small farms, 8 hours of burden for small farms, and 9 hours for other (large) farms, based on estimates of the amount of time in hours to conduct recordkeeping for pre-harvest agricultural water assessments (Ref. 26). These numbers are consistent with that used in the 2021 agricultural water proposed rule as well as the PRIA (Ref. 88) and the FRIA for this final rule (Ref. 26).

The information collection provisions in this final rule have been submitted to OMB for review as required by section 3507(d) of the Paperwork Reduction Act of 1995.

Before the effective date of this final rule, FDA will publish a notice in the **Federal Register** announcing OMB's decision to approve, modify, or disapprove the information collection provisions in this final rule. An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

X. Federalism

We have analyzed this final rule in accordance with the principles set forth in Executive Order 13132. FDA has determined that the rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, we conclude that the rule does not contain policies that have federalism implications as defined in the Executive Order and, consequently, a federalism summary impact statement is not required.

XI. Consultation and Coordination With Indian Tribal Governments

We have analyzed this rule in accordance with the principles set forth in Executive Order 13175. We have determined that the rule does not contain policies that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. Accordingly, we conclude that the rule does not contain policies that have tribal implications as defined in the Executive Order and, consequently, a tribal summary impact statement is not required.

List of Subjects in 21 CFR Part 112

Administrative practice and procedure, Agriculture, Animals, Food grades and standards, Foods, Fruits, Packaging and containers, Reporting and recordkeeping requirements, Safety, Vegetables, Waste treatment and disposal.

Therefore, under the Federal Food, Drug, and Cosmetic Act, and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 112 is amended as follows:

PART 112—STANDARDS FOR THE GROWING, HARVESTING, PACKING, AND HOLDING OF PRODUCE FOR HUMAN CONSUMPTION

■ 1. The authority citation for part 112 continues to read as follows:

Authority: 21 U.S.C. 321, 331, 342, 350h, 371; 42 U.S.C. 243, 264, 271.

■ 2. Amend § 112.3 by adding in alphabetical order the definitions for ''Agricultural water assessment'' and ''Agricultural water system'' to read as follows:

§ 112.3 What definitions apply to this part?

* * * * *

Agricultural water assessment means an evaluation of an agricultural water system, agricultural water practices, crop characteristics, environmental conditions, and other relevant factors (including test results, where appropriate) related to growing activities for covered produce (other than sprouts) to:

(1) Identify any condition(s) that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces; and

(2) Determine whether measures are reasonably necessary to reduce the potential for contamination of covered produce or food contact surfaces with such known or reasonably foreseeable hazards.

Agricultural water system means a source of agricultural water, the water distribution system, any building or structure that is part of the water

distribution system (such as a well house, pump station, or shed), and any equipment used for application of agricultural water to covered produce during growing, harvesting, packing, or holding activities.

* * * * *

■ 3. In § 112.12, revise paragraph (a) to read as follows:

§ 112.12 Are there any alternatives to the requirements established in this part?

(a) You may establish alternatives to certain specific requirements of subpart E of this part, as specified in § 112.45(b), provided that you satisfy the requirements of paragraphs (b) and (c) of this section.

* * * * *

■ 4. Revise subpart E to read as follows:

Subpart E—Agricultural Water

Sec.

Subpart E—Agricultural Water

§ 112.40 What requirements of this subpart apply to my covered farm?

This subpart applies to agricultural water used for, or intended for use in, growing, harvesting, packing, or holding covered produce. If you are using agricultural water for a covered activity listed in the first column, then you must meet the requirements in the second column. You also must meet the requirements in the third column, if applicable.

TABLE 1 TO § 112.40

If you use agricultural water for this covered activity	Then you must meet these requirements		If applicable, you also must meet these requirements	
(a) Growing covered produce (other than sprouts)	§ 112.41	(quality standard)	§ 112.45	(measures).
	§ 112.42	(inspections and maintenance).	§ 112.46	(treatment).
	§ 112.43	(agricultural water assessment).	§ 112.47	(who may test).
	§ 112.50	(records)	§ 112.151	(test methods).
(b) Sprout irrigation water	§ 112.41	(quality standard)	§ 112.44(b)	(testing untreated ground water).
	§ 112.42	(inspections and maintenance).	§ 112.45	(measures).
	§ 112.44(a)	(microbial quality criterion).	§ 112.46	(treatment).
	§ 112.50	(records)	§ 112.47	(who may test).
			§ 112.151	(test methods).
(c) Harvesting, packing, or holding covered produce	§ 112.41	(quality standard)	§ 112.44(b)	(testing untreated ground water).
	§ 112.42	(inspections and maintenance).	§ 112.45	(measures).
	§ 112.44(a)	(microbial quality criterion).	§ 112.46	(treatment).
	§ 112.44(d)	(additional management and monitoring).	§ 112.47	(who may test).
	§ 112.50	(records)	§ 112.151	(test methods)

§ 112.41 What requirements apply to the quality of my agricultural water?

All agricultural water must be safe and of adequate sanitary quality for its intended use.

§ 112.42 What requirements apply to inspecting and maintaining my agricultural water systems?

(a) *Inspection of your agricultural water systems.* At the beginning of a growing season, as appropriate, but at least once annually, you must inspect all of your agricultural water systems, to the extent they are under your control, to identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces, including consideration of the following:

(1) The nature of each agricultural water source (for example, whether it is ground water or surface water);

(2) The extent of your control over each agricultural water source;

(3) The degree of protection of each agricultural water source;

(4) Use of adjacent and nearby land; and

(5) The likelihood of introduction of known or reasonably foreseeable hazards to agricultural water by another user of agricultural water before the water reaches your covered farm.

(b) *Maintenance of your agricultural water systems.* You must adequately maintain all agricultural water systems, to the extent they are under your control, as necessary and appropriate to prevent the systems from being a source of contamination to covered produce, food contact surfaces, or areas used for a covered activity. Such maintenance includes:

(1) Regularly monitoring each system to identify any conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce or food contact surfaces;

(2) Correcting any significant deficiencies (such as control of cross-connections and repairs to well caps, well casings, sanitary seals, piping tanks, and treatment equipment);

(3) Properly storing equipment and keeping the source and distribution system free of debris, trash, domesticated animals, and other possible sources of contamination of covered produce to the extent practicable and appropriate under the circumstances; and

(4) As necessary and appropriate, implementing measures reasonably necessary to reduce the potential for contamination of covered produce with known or reasonably foreseeable hazards resulting from contact of covered produce with pooled water (for example, through use of protective barriers or through equipment adjustments).

§ 112.43 What requirements apply to assessing agricultural water used in growing covered produce (other than sprouts)?

(a) *Elements of an agricultural water assessment.* Based in part on the results of any inspections and maintenance you conducted under § 112.42, at the beginning of the growing season, as appropriate, but at least once annually, you must prepare a written agricultural water assessment for water that you apply to covered produce (other than sprouts) using a direct application method during growing activities. The agricultural water assessment must identify conditions that are reasonably likely to introduce known or reasonably foreseeable hazards into or onto covered produce (other than sprouts) or food contact surfaces, based on an evaluation of the following factors:

(1) Each agricultural water system you use for growing activities for the covered produce, including:

(i) The location and nature of the water source (for example, whether it is ground water or surface water);

(ii) The type of water distribution system (for example, open or closed conveyance); and

(iii) The degree of protection from possible sources of contamination, including by other water users; animal impacts; and adjacent and nearby land uses related to animal activity (for example, grazing or commercial animal feeding operations of any size), application of biological soil amendment(s) of animal origin, or presence of untreated or improperly treated human waste;

(2) Agricultural water practices associated with each agricultural water system, including the type of direct application method (such as foliar spray or drip irrigation of covered produce growing underground) and the time interval between the last direct application of agricultural water and harvest of the covered produce;

(3) Crop characteristics, including the susceptibility of the covered produce to surface adhesion or internalization of hazards;

(4) Environmental conditions, including the frequency of heavy rain or extreme weather events that may impact the agricultural water system (such as by stirring sediments) or covered produce (such as damage to edible leaves) during growing activities, air temperatures, and sun exposure; and

(5) Other relevant factors, including, if applicable, the results of any testing conducted pursuant to paragraph (d) of this section.

(b) *Exemptions.* You do not need to prepare a written agricultural water assessment for water that you directly apply during growing activities for covered produce (other than sprouts), if your water meets the criteria in paragraphs (b)(1) and (2) of this section.

(1) You can demonstrate that the water:

(i) Meets the requirements in § 112.44(a), including the microbial quality criterion and the prohibition on the use of untreated surface water, and if untreated ground water, also meets the testing requirements in §§ 112.44(b), 112.47, and 112.151;

(ii) Meets the requirements in § 112.44(c) for water from a public water system or public water supply; or

(iii) Is treated in accordance with § 112.46.

(2) It is reasonably likely that the quality of water in paragraph (b)(1)(i), (ii), or (iii) of this section will not change prior to the water being used as agricultural water (for example, due to the manner in which the water is held, stored, or conveyed).

(c) *Outcomes.* Based on your evaluation under paragraph (a) of this section, you must determine whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with your agricultural water used in growing covered produce (other than sprouts). You must record your determination in the assessment, and you must take necessary and appropriate action, as follows:

(1) If your agricultural water is not safe or is not of adequate sanitary quality for its intended use(s), as required under § 112.41, you must immediately discontinue use of the water and take corrective measures under § 112.45(a) before resuming such use(s);

(2) If you have identified one or more conditions that are reasonably likely to introduce known or reasonably foreseeable hazards and are related to animal activity, application of a biological soil amendment of animal origin, or the presence of untreated or improperly treated human waste on adjacent or nearby lands, you must implement any mitigation measures under § 112.45(b) promptly, and no later than the same growing season as the agricultural water assessment;

(3) If you have not identified any conditions that are reasonably likely to introduce a known or reasonably foreseeable hazard for which measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces, you must:

(i) Regularly inspect and adequately maintain your agricultural water system(s) under § 112.42; and

(ii) Reassess your agricultural water annually and whenever a significant change occurs (such as a change in the manner or timing of water application) that increases the likelihood that a known or reasonably foreseeable hazard will be introduced into or onto covered produce or food contact surfaces; and

(4) If your agricultural water does not meet the criteria in paragraphs (c)(1), (2), or (3) of this section, you must either:

(i) Implement mitigation measures under § 112.45(b) as soon as practicable and no later than 1 year after the date of the agricultural water assessment (as required by this section); or

(ii) Test the water pursuant to paragraph (d) of this section, consider the results as part of your assessment, and take appropriate action under paragraphs (c)(1), (2), or (3), or (c)(4)(i) of this section.

(d) *Testing as part of an assessment.* In conducting testing to be used as part of your assessment under paragraph (a)(5) of this section, you must use scientifically valid collection and testing methods and procedures, including:

(1) Any sampling conducted for purposes of paragraph (c)(4)(ii) of this section must be collected aseptically immediately prior to or during the growing season and must be representative of the water you use in growing covered produce (other than sprouts).

(2) The sample(s) must be tested for generic *Escherichia coli* (*E. coli*) as an indicator of fecal contamination (or for another scientifically valid indicator organism, index organism, or other analyte).

(3) The frequency of testing samples and any microbial criterion (or criteria) applied must be scientifically valid and appropriate to assist in determining, in conjunction with other data and information evaluated under paragraph (a) of this section, whether measures under § 112.45 are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with your agricultural water used in growing covered produce (other than sprouts).

(e) *Reassessment.* You must conduct an agricultural water assessment and take appropriate action under paragraph (c) of this section:

(1) At least once annually when you apply agricultural water to covered produce (other than sprouts) during growing activities; and

(2) Whenever a significant change occurs in your agricultural water system(s) (including changes relating to animal activity, the application of biological soil amendments of animal origin, or the presence of untreated or improperly treated human waste associated with adjacent or nearby land uses), agricultural water practices, crop characteristics, environmental conditions, or other relevant factors that make it reasonably likely that a known or reasonably foreseeable hazard will be introduced into or onto covered produce (other than sprouts) or food contact surfaces through direct application of agricultural water during growing activities. Your reassessment must evaluate any factors and conditions that are affected by such change.

§ 112.44 What requirements apply to agricultural water used as sprout irrigation water and in harvesting, packing, and holding covered produce?

(a) *Microbial quality criterion.* When you use agricultural water for any one or more of the following purposes, you must ensure there is no detectable generic *Escherichia coli* (*E. coli*) in 100 milliliters (mL) of agricultural water, and you must not use untreated surface water for any of these purposes:

(1) Used as sprout irrigation water;

(2) Used during or after harvest activities in a manner that directly contacts covered produce (for example, water that is applied to covered produce for washing or cooling activities, water that is applied to harvested crops to prevent dehydration before cooling, and water that is used to make ice that directly contacts covered produce during or after harvest activities);

(3) Used to contact food contact surfaces or to make ice that will contact food contact surfaces; and

(4) Used for washing hands during and after harvest activities.

(b) *Untreated ground water.* You must test any untreated ground water used as sprout irrigation water or for harvesting, packing, or holding covered produce to determine if it meets the microbial quality criterion in paragraph (a) of this section, as follows:

(1) You must initially test the microbial quality of each source of the untreated ground water at least four times during the growing season or over a period of 1 year, using a minimum total of four samples collected aseptically and representative of the intended use(s). Based on these results, you must determine whether the water can be used for the intended purpose(s), in accordance with § 112.45(a).

(2) If your four initial sample results meet the microbial quality criterion, you may test once annually thereafter, using a minimum of one sample collected aseptically and representative of the intended use(s).

(3) If any annual test fails to meet the microbial quality criterion, you must:

(i) Immediately discontinue the use(s) and meet the requirements of § 112.45(a) before resuming such use(s); and

(ii) Resume testing at least four times per growing season or year, as required under paragraph (b)(1) of this section, until all of the survey results collected in a year meet the microbial quality criterion.

(4) You may meet these testing requirements using test results or data collected by a third party, as provided in § 112.47.

(c) *Exemptions.* There is no requirement to test agricultural water that is used as sprout irrigation water or for harvesting, packing, or holding covered produce when:

(1) You receive the water from a public water system, as defined under the Safe Drinking Water Act (SDWA) regulations, 40 CFR part 141, that furnishes water that meets the microbial requirements under those regulations or under the regulations of a State (as defined in 40 CFR 141.2) approved to administer the SDWA public water supply program, and you have public water system results or certificates of compliance that demonstrate that the water meets those microbial requirements;

(2) You receive the water from a public water supply that furnishes water that meets the microbial quality criterion in paragraph (a) of this section, and you have public water system results or certificates of compliance that demonstrate that the water meets that requirement; or

(3) You treat water in accordance with the requirements of § 112.46.

(d) *Additional management and monitoring practices.* (1) You must manage water used in harvesting, packing, and holding covered produce as necessary, including by establishing and following water change schedules for non-single-pass water (including recirculated water or reused water) to maintain its safe and adequate sanitary quality and minimize the potential for contamination of covered produce and food contact surfaces with known or reasonably foreseeable hazards (for example, hazards that may be introduced into the water from soil adhering to the covered produce).

(2) You must visually monitor the quality of water that you use during harvesting, packing, and holding activities for covered produce (for example, water used for washing covered produce in dump tanks, flumes, or wash tanks; and water used for cooling covered produce in hydrocoolers) for buildup of organic material (such as soil and plant debris).

(3) You must maintain and monitor the temperature of water that you use during harvesting, packing, and holding activities for covered produce at a temperature that is appropriate for the commodity and operation (considering the time and depth of submersion) and that is adequate to minimize the potential for infiltration of microorganisms of public health significance into covered produce.

§ 112.45 What measures must I take for agricultural water to reduce the potential for contamination of covered produce or food contact surfaces with known or reasonably foreseeable hazards?

(a) *Discontinue use(s).* If you have determined or have reason to believe that your agricultural water is not safe or of adequate sanitary quality for its intended use(s) in growing, harvesting, packing, or holding covered produce as required under § 112.41, and/or if your agricultural water used as sprout irrigation water or for harvesting, packing, or holding activities does not meet the requirements in § 112.44(a) (including the microbial quality criterion), you must immediately discontinue such use(s). Before you may use the water source and/or distribution system again for the intended use(s), you must either:

(1) Re-inspect the entire affected agricultural water system to the extent it is under your control, identify any conditions that are reasonably likely to introduce known or reasonably

foreseeable hazards into or onto covered produce or food contact surfaces, make necessary changes, and take adequate measures to determine if your changes were effective, and as applicable, adequately ensure that your agricultural water meets the microbial quality criterion in § 112.44(a); or

(2) Treat the water in accordance with the requirements of § 112.46.

(b) *Implement mitigation measures.* (1) You must implement any mitigation measures that are reasonably necessary to reduce the potential for contamination of covered produce (other than sprouts) or food contact surfaces with known or reasonably foreseeable hazards associated with your agricultural water. Such measures must be implemented as soon as practicable and no later than 1 year after the date of your agricultural water assessment or reassessment (as required by § 112.43), except that mitigation measures for known or reasonably foreseeable hazards related to animal activity, the application of biological soil amendments of animal origin, or the presence of untreated or improperly treated human waste on adjacent or nearby lands must be implemented promptly, and no later than the same growing season as such assessment or reassessment. Mitigation measures include:

(i) Making necessary changes (for example, repairs) to address any conditions that are reasonably likely to introduce such known or reasonably foreseeable hazards into or onto the covered produce or food contact surfaces;

(ii) Increasing the time interval between the last direct application of agricultural water and harvest of the covered produce to allow for microbial die-off, provided you have scientifically valid supporting data and information;

(iii) Increasing the time interval between harvest and the end of storage to allow for microbial die-off, and/or conducting other activities during or after harvest to allow for microbial die-off or removal, provided you have scientifically valid supporting data and information;

(iv) Changing the method of water application to reduce the likelihood of contamination of the covered produce (such as by changing from overhead spray to subsurface drip irrigation of certain crops);

(v) Treating the water in accordance with § 112.46; and

(vi) Taking an alternative mitigation measure, provided that you satisfy the requirements of § 112.12.

(2) If you fail to implement appropriate mitigation measures in accordance with paragraph (b)(1) of this section, or if you determine that your mitigation measures were not effective to reduce the potential for contamination of the covered produce or food contact surfaces with known or reasonably foreseeable hazards, you must discontinue use of the agricultural water until you have implemented mitigation measures adequate to reduce the potential for such contamination, consistent with § 112.41.

§ 112.46 What requirements apply to treating agricultural water?

(a) Any method you use to treat agricultural water (such as with physical treatment, including using a pesticide device as defined by the U.S. Environmental Protection Agency (EPA); EPA-registered antimicrobial pesticide product; or other suitable method) must be effective to make the water safe and of adequate sanitary quality for its intended use(s) and/or meet the microbial quality criterion in § 112.44(a), as applicable;

(b) You must deliver any treatment of agricultural water in a manner to ensure that the treated water is consistently safe and of adequate sanitary quality for its intended use(s) and, if applicable, also meets the microbial quality criterion in § 112.44(a); and

(c) You must monitor any treatment of agricultural water using an adequate method and frequency to ensure that the treated water is consistently safe and of adequate sanitary quality for its intended use(s) and, if applicable, also meets the microbial quality criterion in § 112.44(a).

(d) Treatment may be conducted by you or by a person or entity acting on your behalf.

§ 112.47 Who must perform the tests required under this subpart?

(a) You may meet the requirements related to agricultural water testing required under §§ 112.43(c)(4)(ii) and 112.44 using:

(1) Results from agricultural water testing performed by you or by a person or entity acting on your behalf; or

(2) Data collected by a third party or parties, provided the water sampled by the third party or parties adequately represents your agricultural water source(s) and all other applicable requirements of this part are met.

(b) Agricultural water samples must be aseptically collected and tested using methods as set forth in § 112.151, as applicable.

§§ 112.48–112.49 [Reserved]

§ 112.50 Under this subpart, what requirements apply regarding records?

(a) You must establish and keep records required under this subpart in accordance with the requirements of subpart O of this part.

(b) You must establish and keep the following records, as applicable:

(1) The findings of inspections of your agricultural water systems in accordance with the requirements of § 112.42(a);

(2) Your written agricultural water assessments, including descriptions of factors evaluated and written determinations, in accordance with § 112.43;

(3) Scientific data or information that you rely on to support the use of an index organism, indicator organism, or other analyte, other than testing for generic *E.coli* for purposes of § 112.43(c)(4)(ii);

(4) Scientific data or information that you rely on to support the frequency of testing and any microbial criterion (or criteria) you applied for purposes of § 112.43(c)(4)(ii), if applicable;

(5) Documentation of the results of all analytical tests for purposes of compliance with this subpart, including any testing conducted under §§ 112.43 and 112.44;

(6) Annual documentation of the results or certificates of compliance from a public water system required under § 112.44(c)(1) or (2), if applicable;

(7) Documentation of actions you take in accordance with § 112.45;

(8) Scientific data or information you rely on to support the time interval between last direct application of agricultural water and harvest in § 112.45(b)(1)(ii), and/or the time interval between harvest and end of storage and/or use of other activities during or after harvest in § 112.45(b)(1)(iii);

(9) Scientific data or information you rely on to support an alternative mitigation measure that you establish and use in accordance with § 112.45(b)(1)(vi).

(10) Scientific data or information you rely on to support the adequacy of a treatment method used to satisfy the requirements of § 112.46(a) and (b);

(11) Documentation of the results of water treatment monitoring under § 112.46(c); and

(12) Any analytical methods you use in lieu of the method that is incorporated by reference in § 112.151(a).

■ 5. In § 112.151, revise the section heading and paragraph (b)(2) to read as follows:

§ 112.151 What methods must I use to test the quality of water to satisfy the requirements of subpart E of this part?

* * * * *

(b) * * *

(2) For any other indicator of fecal contamination, index organism, or other analyte you may test for pursuant to § 112.43(d), a scientifically valid method.

■ 6. In § 112.161, revise paragraph (b) to read as follows:

§ 112.161 What general requirements apply to records required under this part?

* * * * *

(b) Records required under §§ 112.7(b); 112.30(b); 112.50(b)(2), (5), (7), and (11); 112.60(b)(2); 112.140(b)(1) and (2); and 112.150(b)(1), (4), and (6) must be reviewed, dated, and signed, within a reasonable time after the records are made, by a supervisor or responsible party.

Dated: April 24, 2024.

Robert M. Califf,

Commissioner of Food and Drugs.

RIN 0945–AA17

Nondiscrimination in Health Programs and Activities

AGENCY: Office for Civil Rights, Office of the Secretary, Department of Health and Human Services; Centers for Medicare & Medicaid Services, Department of Health and Human Services.

ACTION: Final rule and interpretation.

SUMMARY: The Department of Health and Human Services (HHS or the Department) is issuing this final rule regarding section 1557 of the Affordable Care Act (ACA) (section 1557). Section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in certain health programs and activities. Section 1557(c) of the ACA authorizes the Secretary of the Department to promulgate regulations to implement the nondiscrimination requirements of section 1557. The Department is also revising its interpretation regarding whether Medicare Part B constitutes Federal financial assistance for purposes of civil rights enforcement. Additionally, the Department is revising provisions prohibiting discrimination on the basis of sex in regulations issued by the Centers for Medicare & Medicaid Services (CMS) governing Medicaid and the Children's Health Insurance Program (CHIP); Programs of All-Inclusive Care for the Elderly (PACE); health insurance issuers and their officials, employees, agents, and representatives; States and the Exchanges carrying out Exchange requirements; agents, brokers, or web-brokers that assist with or facilitate enrollment of qualified individuals, qualified employers, or qualified employees; issuers providing essential health benefits (EHB); and qualified health plan issuers.

DATES: *Effective date:* July 5, 2024.

Applicability dates: Unless otherwise specified, the provisions of this final rule apply on or after July 5, 2024. See the **SUPPLEMENTARY INFORMATION** section for additional information.

FOR FURTHER INFORMATION CONTACT:

Office for Civil Rights

Daniel Shieh, Associate Deputy Director, HHS Office for Civil Rights (202) 240–3110 or (800) 537–7697 (TDD), or via email at *1557@hhs.gov*, for matters related to section 1557.

Centers for Medicare & Medicaid Services

John Giles, (410) 786–5545, for matters related to Medicaid.

Meg Barry, 410–786–1536, for matters related to CHIP.

Timothy Roe, (410) 786–2006 for matters related to Programs of All-Inclusive Care for the Elderly.

Becca Bucchieri, (301) 492–4341 or Leigha Basini, (301) 492–4380, for matters related to 45 CFR 155.120, 155.220, 156.125, 156.200, and 156.1230.

Lisa Cuozzo, (410) 786–1746, for matters related to 45 CFR 147.104.

Hannah Katch, (202) 578–9581, for general questions related to CMS amendments.

Assistance to Individuals With Disabilities in Reviewing the Rulemaking Record: Upon request, the Department will provide an accommodation or appropriate auxiliary aid or service to an individual with a disability who needs assistance to review the comments or other documents in the public rulemaking record for the final rule. To schedule an appointment for this type of accommodation or auxiliary aid, please call (202) 240–3110 or (800) 537–7697 (TDD) for assistance or email *1557@hhs.gov*.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Background

Section 1557 of the Affordable Care Act (ACA) (section 1557), 42 U.S.C. 18116, prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in a health program or activity, any part of which is receiving Federal financial assistance, including credits, subsidies, or contracts of insurance, except where otherwise provided in title I of the ACA. Section 1557 also prohibits discrimination on the basis of race, color, national origin, sex, age, or disability under any program or activity that is administered by an executive agency, or any entity established under title I of the ACA or its amendments. The statute cites title VI of the Civil Rights Act of 1964 (title VI), 42 U.S.C. 2000d *et seq.,* title IX of the Education Amendments of 1972 (title IX), 20 U.S.C. 1681 *et seq.,* the Age Discrimination Act of 1975 (Age Act), 42 U.S.C. 6101 *et seq.,* and section 504 of the Rehabilitation Act of 1973 (section 504), 29 U.S.C. 794, to identify the grounds of discrimination prohibited by section 1557. The entities to which section 1557 and this final rule apply (*i.e.,* recipients of Federal financial assistance, the Department, and title I entities) are collectively referred to as ''covered entities.'' The statute further specifies that the enforcement mechanisms provided for and available under title VI, title IX, the Age Act, or section 504 shall apply for purposes of violations of section 1557, 42 U.S.C. 18116(a). The statute authorizes the Secretary of the U.S. Department of Health and Human Services (HHS or the Department) to promulgate implementing regulations for section 1557, 42 U.S.C. 18116(c).

A. Regulatory History

On August 1, 2013, the HHS Office for Civil Rights (OCR) published a Request for Information in the **Federal Register**, 78 FR 46558,[1] followed by issuance of a notice of proposed rulemaking (NPRM) on September 8, 2015 (2015 NPRM), 80 FR 54171.[2] OCR finalized the first section 1557 regulation on May 18, 2016 (2016 Rule), 81 FR 31375. On June 14, 2019, the Department published a new section 1557 NPRM (2019 NPRM), 84 FR 27846, proposing to rescind and replace large portions of the 2016 Rule.[3] On June 12, 2020, OCR publicly posted its second section 1557 final rule (2020 Rule), which was published in the **Federal Register** on June 19, 2020, 85 FR 37160. The 2020 Rule remains in effect, save for the parts enjoined or set aside by courts, until the effective date of this final rule. In the meantime, entities that are subject to the 2020 Rule must continue to comply with the parts of the 2020 Rule that remain in effect.

On January 5, 2022, the Department proposed to amend CMS regulations such that Exchanges, issuers, and agents and brokers would be prohibited from discriminating against consumers based on their sexual orientation or gender identity in the HHS Notice of Benefit and Payment Parameters for 2023 NPRM, 87 FR 584 (January 5, 2022). CMS did not finalize the amendments in the Notice of Benefit and Payment Parameters for the 2023 final rule, 87 FR 27208 (May 6, 2022); instead, CMS proposed to make the amendments to its regulations in forthcoming Departmental rulemaking.

On July 25, 2022, OCR publicly posted the section 1557 NPRM associated with this rulemaking (2022 NPRM or Proposed Rule), which was published in the **Federal Register** on August 4, 2022, 87 FR 47824. OCR invited comment on the Proposed Rule by all interested parties. The comment period ended on October 3, 2022. In total we received 85,280 comments on the Proposed Rule.[4] Comments came from a wide variety of stakeholders, including but not limited to: civil rights/advocacy groups, including language access organizations, disability rights organizations, women's advocacy organizations, and organizations serving lesbian, gay, bisexual, transgender, queer, or intersex (LGBTQI+) individuals; health care providers; consumer groups; religious organizations; academic and research institutions; reproductive health organizations; health plan organizations; health insurance issuers; State and local agencies; and tribal entities. Of the total comments, 79,126 were identified as being submitted by individuals. Of the 85,280 comments received, 70,337 (80 percent) were form letter copies associated with 30 distinct form letter campaigns.

B. Overview of the Final Rule

Section 1557

This preamble is divided into multiple sections: section II describes changes to the section 1557 regulation and contains four subparts: subpart A sets forth the rule's general provisions; subpart B contains the rule's nondiscrimination provisions; subpart C describes specific applications of the prohibition on discrimination to health programs and activities; and subpart D describes the procedures that apply to enforcement of the rule. Section III provides official notice of HHS's change in interpretation that Medicare Part B meets the definition of ''Federal financial assistance.'' Section IV describes changes to CMS regulations.

OCR has made some changes to the Proposed Rule's provisions, based on the comments we received. Among the changes are the following:

OCR modified proposed § 92.4 (Definitions) to include new definitions for telehealth, State, relay interpretation, and patient care decision support tools.

OCR modified proposed § 92.201 (Meaningful access for individuals with limited English proficiency) to change ''limited English proficient individual'' to ''individual with limited English proficiency'' where applicable in this provision and elsewhere where the term is used. The text for proposed § 92.201(a) was updated to include ''companions with limited English proficiency'' for clarity and parity with the rule's effective communication

[1] Responses are available for public inspection at *https://www.regulations.gov/docket/HHS-OCR-2013-0007/comments.*

[2] The 2015 NPRM received roughly 2,160 comments, which are available for public inspection at *https://www.regulations.gov/docket/HHS-OCR-2015-0006/comments.*

[3] The 2019 NPRM received roughly 198,845 comments, which are available for public inspection at *https://www.regulations.gov/document/HHS-OCR-2019-0007-0001.* This count includes bundled submissions, including petitions and form letter campaigns, which were counted as individual comment submissions.

[4] This count includes bundled submissions, including petitions. The number of submission entries in the Federal Docket Management System is 75,254 submissions. Responses are available for public inspection at *https://www.regulations.gov/docket/HHS-OS-2022-0012.*

provision. OCR also modified proposed § 92.201(f) and proposed § 92.201(g) to address concerns that audio and video remote interpreting may not be appropriate to provide meaningful access in certain circumstances.

OCR modified proposed § 92.206 (Equal program access on the basis of sex) to clarify a covered entity's ability to raise legitimate and nondiscriminatory reasons for the denial of care under this provision, while stating that the basis for a denial or limitation must not be based on unlawful animus or bias, or constitute a pretext for discrimination.

OCR modified the text of proposed § 92.207 (Nondiscrimination in health insurance coverage and other health-related coverage), consistent with changes to § 92.206(c) to clarify that covered entities may raise a legitimate, nondiscriminatory reason for denials or limitations of health services in benefit design and in individual cases, while stating that the basis for a denial or limitation must not be based on unlawful animus or bias, or constitute a pretext for discrimination.

OCR revised proposed § 92.210 (Nondiscrimination in the use of clinical algorithms in decision-making) to change ''clinical algorithms'' and ''clinical algorithms in decision-making'' to ''patient care decision support tools.'' OCR further specified the scope of the application of this provision and the requirement that covered entities take reasonable steps to mitigate discrimination once made aware of the potential for discrimination resulting from use of these tools.

OCR modified proposed § 92.302 (Notification of views regarding application of Federal religious freedom and conscience laws) to clarify the application of religious freedom and conscience laws, and aspects of the administrative process set forth in the provision, including that a recipient may request an assurance of an exemption under such laws, the availability of a temporary exemption, and the availability of an administrative appeal process.

CMS Amendments

In response to comments, CMS is finalizing the proposed amendments to the CMS regulations with a revision to scope of sex discrimination to be consistent with section 1557's regulatory text at § 92.101(a)(2).

II. Provisions of the Proposed Rule and Analysis and Responses to Public Comments

Subpart A—General Provisions

Purpose and Effective Date (§ 92.1)

In the 2022 NPRM, proposed § 92.1(a) explained that the purpose of 45 CFR part 92 is to implement section 1557, which prohibits discrimination in certain health programs and activities on the ''ground[s] prohibited'' under title VI, title IX, the Age Act, or section 504. Section 1557 adopts the grounds of these statutes and prohibits discrimination based on race, color, national origin, sex, age, or disability.[5]

Proposed § 92.1(b) provided that the effective date of the section 1557 implementing regulation shall be 60 days after the publication of a final rule in the **Federal Register** and provided a delayed implementation date (referred to as ''applicability date'' in this final rule) for provisions of this part that require changes to health insurance or group health plan benefit design.

The comments and our responses regarding the purpose and effective date are set forth below.

Comment: Several commenters noted that the regulatory purpose described in the 2022 NPRM strengthens nondiscrimination protections in health care, and appropriately aligns with section 1557's statutory text and Congressional intent.

Response: As commenters noted, the 2022 NPRM's purpose is to prohibit discrimination in accordance with section 1557's statutory text. The Proposed Rule mirrors the statutory text and clarifies that the purpose of this rule is to regulate health programs and activities conducted and funded by the Department and those of title I entities. Thus, we maintain the regulatory language for § 92.1(a) as proposed in the 2022 NPRM.

Comment: One commenter observed that, in addition to title IX's general prohibition of discrimination on the ground of ''sex,'' section 904 of title IX (20 U.S.C. 1684) also prohibits discrimination on the ground of blindness or severe vision impairment.

Response: Both HHS's and the Department of Education's title IX regulations define title IX to exclude section 906. *See* 45 CFR 86.2(a); 34 CFR 106.2(a). While 20 U.S.C. 1684 prohibits certain forms of discrimination on the ground of blindness or severe vision impairment, such conditions are disabilities and section 1557 prohibits discrimination on the basis of disability as it is the ''ground'' of discrimination prohibited by the statute's reference to section 504. Accordingly, we decline to revise the regulatory text at § 92.1(a).

Comment: OCR received many comments about the proposed 60-day effective date for requirements other than those related to health insurance or group health plan coverage benefit design. Commenters identified several tasks covered entities would need to accomplish to comply with the final rule requirements within the proposed 60 days, including updating existing policies and procedures; developing and reviewing new content; developing written communications with members and distributing written documents, including preparing additional mailings; and familiarizing themselves with new requirements and OCR-provided tools and resources.

Most of these commenters expressed concern that covered entities would not be able to develop and implement the required policies and procedures (§ 92.8) and notices (§ 92.10, § 92.11), or complete the proposed training requirement (§ 92.9) within the allotted 60 days. A variety of commenters argued that the 60-day effective date for §§ 92.7 through 92.11 would be unreasonable for all covered entities, requesting that OCR consider allowing covered entities more time to come into compliance with the final rule.

Commenters' recommended compliance timeframes varied widely, from 180 days to three years following publication of the final rule in the **Federal Register**. One commenter asked that, for the first 18 to 24 months following publication of the final rule in the **Federal Register**, OCR's section 1557 enforcement efforts, including complaint investigations, primarily focus on providing covered entities technical assistance with respect to their section 1557 obligations.

Response: OCR appreciates comments regarding the effective date and commenters' identification of factors influencing feasibility of a single effective date for all section 1557 requirements. We are maintaining the overall 60-day effective date related to the general prohibition on discrimination on the basis of race, color, national origin, sex, age, and disability. This is consistent with the approach taken with respect to the effective date of our previous

[5] *See Schmitt* v. *Kaiser Found. Health Plan of Wash.,* 965 F.3d 945, 953 (9th Cir. 2020) (''Section 1557(a) incorporates only the prohibited 'ground[s]' and '[t]he enforcement mechanisms provided for and available under' the four civil rights statutes. A prohibited 'ground' for discrimination . . . is simply the protected classification at issue.'').

rulemakings.[6] However, in light of the comments received, OCR has determined that it is reasonable to allow additional time for covered entities to comply with certain procedural requirements. The additional time will provide covered entities with the opportunity to properly designate a Section 1557 Coordinator and designee(s) (as applicable); develop and tailor to their respective organization's policies and procedures; train relevant staff; and develop their required notices. For this reason, we are adopting phased-in applicability dates for certain provisions, as reflected in the chart at the end of this section.

Comment: Some commenters requested that OCR allow for temporary safe harbors for covered entities' compliance with certain aspects of the final rule. Specifically, commenters suggested that the final rule allow for an 18-month good faith safe harbor for covered entities currently operating in accordance with the 2016 Rule language access requirements, particularly the notice and tagline requirements at former 45 CFR 92.8.

Response: OCR declines to grant safe harbors for covered entities that are or have been operating in accordance with the 2016 Rule's notice and tagline requirements. Granting such a safe harbor would fail to recognize the importance of this final rule's requirement. The Notice of Availability of Language Assistance Services and Auxiliary Aids and Services (''Notice of Availability'') at § 92.11 requires notice of auxiliary aids and services in addition to language assistance services, which we have now revised to reflect a delayed applicability date of one year from the effective date. This revised applicability date reasonably allows enough time for covered entities to come into compliance with the Notice of Availability provision.

Comment: Comments from organizational health insurance issuers generally supported the Proposed Rule's delayed applicability date for provisions that require changes to health insurance or group health plan coverage benefits or benefit design, which proposed a delayed applicability date of the first day of the first plan year beginning on or after the year following the effective date of the final rule's publication in the **Federal Register**.[7] One commenter generally requested that OCR provide flexibility for plans depending on when the rule is finalized. Another commenter specifically requested that OCR consider allowing a temporary safe harbor compliance exception for group health plans and health insurance issuers of group health insurance coverage so that plan design changes for non-calendar-year plans may be implemented the first day of the new plan year occurring on or after January 1, 2024.

Response: OCR is cognizant that health insurance issuers and group health plans develop their health insurance coverage and other health-related coverage benefit designs in advance of the plan year that the coverage is offered. Accordingly, we are including a delayed applicability date to the extent that the final rule's provisions require changes to health insurance coverage or other health-related coverage, including group health plan coverage benefit design for health insurance coverage or other health-related coverage that is newly subject to certain provisions of § 92.207 (Nondiscrimination in health insurance coverage and other health-related coverage). In such circumstances, the final rule's applicability date is the first day of the first plan year beginning on or after January 1, 2025. This delayed applicability date applies equally to health insurance issuers and group health plans that are offering calendar-year and non-calendar-year plans. For example, a newly covered group health plan eligible for the delayed applicability date that offers a non-calendar year plan effective July 1, 2024, would have until the following plan year, effective July 1, 2025, to comply with the benefit design requirements, as July 1, 2025, would be the first day of the first plan year beginning on or after January 1, 2025.

The 2020 Rule remains in effect until the effective date of this final rule. In the interim, covered entities that are subject to the 2020 Rule must continue to comply with the parts of the 2020 Rule that remain in effect. Notwithstanding the repeal of the former § 92.207 (2016 Rule), the 2020 Rule prohibits discrimination in health insurance coverage that receives Federal financial assistance. Consistent with the 2020 Rule preamble, OCR interprets and enforces section 1557 under the 2020 Rule to prohibit discrimination in benefit design in health insurance coverage and other health-related coverage that receive Federal financial assistance.[8]

As such coverage is currently prohibited from having discriminatory benefit designs, the obligation to comply with this final rule's § 92.207(b)(1) through (5) does not require a delayed applicability date. Therefore, we have revised the delayed applicability date for § 92.207(b)(1) through (5) under § 92.1(b) to reflect that the delayed applicability date is for health insurance coverage and other health-related coverage that are not already subject to this part as of the date of publication of this final rule. Because § 92.207(b)(6) (most integrated setting) describes a category of prohibited benefit design features that OCR is not explicitly enforcing under the 2020 Rule, OCR will not enforce this provision until the delayed applicability of the first day of the first plan year beginning on or after January 1, 2025. The delayed applicability date for all provisions of § 92.207 is in effect for covered health insurance coverage and other health-related coverage that are not subject to the 2020 Rule as of the date of publication of this final rule and are therefore newly subject to this final rule.

Examples of health insurance coverage or other health-related coverage subject to the 2020 Rule (and thus the benefit design provisions under § 92.207(b)(1) through (5) as of July 5, 2024) include but are not limited to Medicare Advantage plans, Medicare Part D plans, Medicaid managed care plans, and qualified health plans.[9] For complaints received prior to January 1, 2025 alleging discrimination related to benefit design, OCR will examine whether the health insurance coverage or other health-related coverage is subject to the 2020 Rule. If OCR determines the coverage was subject to

[6] The 2016 Rule's effective date was 60 days after publication of the final rule, with the exception of the provisions on health insurance and benefit design, which went into effect the first day of the first plan year following the effective date. 81 FR 31375. The 2020 Rule's effective date was 60 days after publication, with no exceptions. 85 FR 37160.

[7] The term ''group health plan'' is generally used to refer to a health benefit arrangement that is a distinct legal entity and can also be used to refer to the underlying health coverage or benefits. For ease of reference, this document uses the term ''group health plan'' when referring the plan as a distinct legal entity and uses the term ''group health plan coverage'' to refer to the underlying health coverage or benefits provided by the group health plan.

[8] *See* 85 FR 37160 (stating the rule prohibits age discrimination, ''including [in] health plan marketing and benefit design''); *id.* at 37177 (stating that HHS ''will enforce vigorously Section 1557's prohibition on discrimination on the basis of disability against all covered entities, including when discrimination is alleged to have taken place in benefit design''); *id.* at 37201 (''OCR will examine carefully any allegations of discrimination by health insurance issuers, including through benefit design.'').

[9] Qualified health plans are covered by the 2020 Rule as a program or activity administered by an entity established under title I of the ACA (*i.e.,* an Exchange), pursuant to § 92.3(a)(3). *See* 85 FR 37174. Qualified health plans are also subject to the 2020 Rule to the extent they receive Federal financial assistance. *Id.*

the 2020 Rule, the covered entity providing the coverage is responsible for complying with the specific benefit design provisions of § 92.207(b)(1) through (5) on July 5, 2024. In its review of such complaints, OCR will consider the nature of the challenged benefit design feature and whether it would have been prohibited under the 2020 Rule. For example, a Medicare Advantage plan that imposes additional cost-sharing for health services related to a particular disease but not for other diseases would be investigated as potentially discriminatory under the 2020 Rule and under this final rule as of its general 60-day effective date. However, if a Medicare Advantage plan contains a potentially discriminatory design feature related to integration, OCR would not investigate such an allegation under this final rule unless the alleged discrimination took place after the delayed applicability date of the first day of the first plan year beginning on or after January 1, 2025.

Further, OCR clarifies that any covered entity offering health insurance coverage or other health-related coverage subject to the delayed applicability date for benefit design is still required to comply with all other provisions of this final rule, as of the general effective dates and specific applicability dates set forth under § 92.1(b).

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions in § 92.1(a) as written and amending § 92.1(b), with modifications.

In § 92.1(b), we have included a table that clearly provides the applicability date for each provision. It appears below:

Section 1557 Requirement and provision	Date by which covered entities must comply
§ 92.7 Section 1557 Coordinator	Within 120 days of effective date.
§ 92.8 Policies and Procedures	Within one year of effective date.
§ 92.9 Training	Following a covered entity's implementation of the policies and procedures required by § 92.8, and no later than one year of effective date.
§ 92.10 Notice of nondiscrimination	Within 120 days of effective date.
§ 92.11 Notice of availability of language assistance services and auxiliary aids and services.	Within one year of effective date.
§ 92.207(b)(1) through (5) Nondiscrimination in health insurance coverage and other health-related coverage.	For health insurance coverage or other health-related coverage that was not subject to this part as of the date of publication of this rule, by the first day of the first plan year (in the individual market, policy year) beginning on or after January 1, 2025.
§ 92.207(b)(6) Nondiscrimination in health insurance coverage and other health-related coverage.	By the first day of the first plan year (in the individual market, policy year) beginning on or after January 1, 2025.
§ 92.210(b), (c) Use of patient care decision support tools.	Within 300 days of effective date.

Application (§ 92.2)

Proposed § 92.2 addressed the application of this regulation. OCR proposed in § 92.2(a) to apply the final rule, except as otherwise provided in the regulation, to: (1) every health program or activity, any part of which receives Federal financial assistance, directly or indirectly, from the Department; (2) every health program or activity administered by the Department; and (3) every program or activity administered by a title I entity. Title I entities include State Exchanges (including those on the Federal platform) and Federally-facilitated Exchanges, both of which were created under title I of the ACA.[10]

In § 92.2(b), we proposed that this regulation would not apply to an employer with regard to its employment practices, including the provision of employee health benefits. We noted that, although the 2016 and 2020 Rules applied to employment in very limited circumstances, OCR determined that the proposed approach would minimize confusion among individuals seeking relief under Federal Equal Employment Opportunity laws and would promote clarity regarding the filing and processing of employment discrimination complaints. We stated our belief that, as is the case with employment discrimination complaints generally, concerns regarding the provision of employee health benefits are best resolved by our Federal partners.

In § 92.2(c), we proposed that if any provision of this regulation is held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, it shall be severable from this part and not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other, dissimilar circumstances.

We invited comment on the effects of the proposed scope of application of the regulation, including the application of this part to recipients of Federal financial assistance from executive agencies other than the Department; the application to programs and activities of the Department and other executive agencies; and the application to employment.

The comments and our responses regarding § 92.2 are set forth below.

Comment: Many commenters supported § 92.2(a), which commenters said would reinstate the scope of the section 1557 implementing regulation to that of the 2016 Rule and recognizes that section 1557 applies to Federal programs like Medicaid and Medicare, the State and Federal Marketplaces (referred to as ''Exchanges'' in this final rule) and the plans sold through them, as well as other commercial health plans if the issuer receives any form of Federal financial assistance. Commenters noted that ensuring section 1557 protections apply broadly to an array of entities and programs will ensure the greatest level of protection for individuals against discriminatory actions that may interfere with access to health care and health care coverage.

Many commenters noted that the Proposed Rule was consistent with congressional intent. These commenters noted that Congress was clear in extending nondiscrimination protections to a broad array of health programs and activities, and that section 1557 was intended to build and expand upon existing civil rights laws, while

[10] Section 1311 of the ACA (codified at 42 U.S.C. 18031) (establishing grants and requiring those grants to be used by States to create ''American Health Benefit Exchanges'') and section 1321(c) of the ACA (codified at 42 U.S.C. 18041(c)) (providing for the Secretary to establish an Exchange if a State elects not to establish an Exchange or fails to establish an Exchange under section 1311 of the ACA).

providing broad protection against discrimination in health care. These commenters further noted that Congress has repeatedly expressed that it intends civil rights laws to be broadly interpreted in order to effectuate their remedial purposes. Commenters also noted that the purpose of the ACA itself is to ensure broad access to and coverage of health care.

Response: We agree that section 1557 protections apply broadly and that this final rule is the best reading of the statute regarding the scope of applicability; as such, the 2022 NPRM properly identified those entities that are covered under section 1557.

Regarding plans sold through State and Federally-facilitated Exchanges, as discussed under the definition of ''Federal financial assistance'' at § 92.4, such plans are covered under this rule as a health program or activity when in receipt of Federal financial assistance, such as advance payments of the premium tax credit. This is consistent with the 2016 Rule. Further, as discussed under the definition of ''health program or activity'' at § 92.4, a health insurance issuer's other commercial health plans are covered under this final rule as part of the issuer's operations where the issuer is principally engaged in the provision or administration of any health projects, enterprises, ventures, or undertakings. For more information on the final rule's application to all operations of a health insurance issuer that is so principally engaged, please see the discussion below under the definition of ''health program or activity'' at § 92.4.

Comment: Some commenters requested that OCR clarify the extent to which a covered entity is required to oversee the section 1557 compliance of its vendors and subcontractors. For example, a health insurance issuer commented that an issuer should not be responsible for the discriminatory actions of a provider or facility with which the issuer has contracted for the provision of medical services. Another commenter requested clarification on when health insurance agents and brokers are subject to the rule, particularly when they are working under the auspices of a covered entity, such as an Exchange or a health insurance issuer. Other commenters suggested that subcontractors should be considered recipients by virtue of contracting with a recipient of Federal financial assistance.

Response: Health programs or activities may comprise more than one recipient of Federal financial assistance. For example, a primary recipient (or ''direct'' recipient) is an entity that accepts Federal financial assistance from a Federal agency. The direct recipient may then distribute the Federal financial assistance to a subrecipient (or ''indirect'' recipient) to carry out all or part of the health program or activity. Primary recipients and all subrecipients are covered and must comply with section 1557.[11] Under general civil rights principles, both the primary recipient and subrecipient are responsible for complying with applicable civil rights laws.[12] Therefore, if an entity receives Federal financial assistance—directly as a primary recipient or indirectly as a subrecipient—it would be a covered entity and responsible for complying with section 1557 and the part.

While both direct and indirect recipients must comply with section 1557 independently, a direct recipient may not absolve itself of its obligations by contracting with another entity to provide services or assistance for which it received Federal financial assistance or using an agent to do so.[13] Covered entities are responsible for the conduct of their subcontractors and cannot contract away their civil rights obligations through contractual arrangements with subcontractors. For example, section 1557 and the statutes referenced therein may cover a contractor that performs an essential function for the recipient, making the contractor itself a recipient. In *Frazier* v. *Board of Trustees,* 765 F.2d 1278, amended, 777 F.2d 329 (5th Cir. 1985), a case involving section 504, the court noted that the defendant hospital contracted out core medical functions, for which it received Federal financial assistance. The court ruled that this financial assistance to the hospital ''would not have been [provided] at all were it not for [the contractor's] performance as a de facto subdivision of [the hospital],'' and thus the contractor qualified as a recipient for purposes of section 504, *id.* at 1289–90.[14]

The obligation of health insurance agents and brokers as subcontractors is a fact-specific analysis depending on the contractual arrangement with a covered entity. If an Exchange or recipient, such as a health insurance issuer, contracts with an agent or broker to carry out responsibilities of the covered entity's health program or activity and uses Federal financial assistance to pay the agent or broker, then the agent or broker is a subrecipient and thus independently subject to all the provisions of section 1557. If a contractor does not receive Federal financial assistance—either as a primary recipient or subrecipient—it is not a recipient of Federal financial assistance and not subject to section 1557. We note that agents and brokers under contract with an Exchange could also be covered by the final rule as a health program or activity administered by a title I entity under § 92.2(a)(3). Conversely, if the agent or broker is assisting the public with purchasing health insurance coverage without any contractual arrangement on behalf of an Exchange or recipient and is not otherwise receiving Federal financial assistance, then they would not be considered subrecipients or subcontractors subject to the rule.

Comment: Some commenters stated that because the Federal Government now extensively subsidizes both medical care and health insurance coverage and other health-related coverage, the final rule will apply to practically all health care entities. They argued that because of this, it would be nearly impossible for medical professionals to work free of these regulations and, as a result, physicians and faith-based health care entities would effectively be barred from refusing to participate in pregnancy termination procedures.

Response: It has long been established that when an entity receives Federal funds, conditions may be placed on the receipt of those funds.[15] Not all providers receive Federal financial assistance; however, when they do, they must comply with applicable law. The

[11] For further discussion of this issue, *see* U.S. Dep't of Justice, Title VI Legal Manual, sec. V.D.4.

[12] Often, a recipient receives funds with the purpose and expectation that it will distribute the funds to one or more sub-grantees or indirect recipients. For example, in *Moreno* v. *Consol. Rail Corp.,* 99 F.3d 782 (6th Cir. 1996) (en banc), the U.S. Department of Transportation provided funds to the State of Michigan for use in upgrading railroad crossings. The state, in turn, provided these funds to Conrail. The Sixth Circuit found that Conrail was a recipient of Federal financial assistance, noting ''[i]t makes no difference, in our view, that the Federal funds of which Conrail is the recipient come to it through the State of Michigan rather than being paid to it by the United States directly.'' *Id.* at 787.

[13] U.S. Dep't of Justice Title VI Legal Manual, Sec. V.D.5.

[14] *But see Rose* v. *Cahee,* 727 F. Supp. 2d 728, 739 (E.D. Wis. 2010) (court declined to follow *Frazier,* limiting coverage of the funding assistance nondiscrimination cover the contractor of a recipient requirement to those entities receiving the funds directly and that ''are in a position to choose whether to do so'').

[15] The Supreme Court has generally treated these civil rights statutes as enacted based on Congress's Spending Clause Power, which generally permits Congress to attach conditions to the receipt of Federal financial assistance. *See Barnes* v. *Gorman,* 536 U.S. 181, 189 n.3 (2002) (referring to the Rehabilitation Act as ''Spending Clause legislation''); *id.* at 185–86 (''Title VI invokes Congress's power under the Spending Clause, U.S. Const., Art. 1. § 8, cl. 1, to place conditions on the grant of federal funds.'').

rule, however, does not ban physicians and faith-based or other health care entities from refusing to participate in pregnancy termination procedures. On the contrary, the ACA itself provides that ''[n]othing in this Act shall be construed to have any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A).[16] In addition, the rule has been revised at § 92.3(c) to recognize that, ''[i]nsofar as the application of any requirement under this part would violate applicable Federal protections for religious freedom and conscience, such application shall not be required.'' Further, in this final rule, the process regarding exemptions related to religious freedom and conscience protections has been clarified. *See* § 92.302.

Comment: Some commenters supported the restoration of section 1557's application to all health programs or activities administered by the Department under § 92.2(a)(2). These commenters noted that the 2020 Rule exempts from section 1557 most of the Department's programs and activities by limiting the application to only those programs and activities established under title I of the ACA. These commenters opined that such an interpretation is contrary to the statutory text, design, and intent of section 1557 and the ACA generally. Other commenters noted that consistently applying section 1557 requirements throughout various programs, including the Department's programs, creates continuity in the interpretation and implementation of nondiscrimination standards. However, some commenters stated that OCR did not provide adequate explanation as to why this change in application is necessary or appropriate.

Response: For the reasons discussed in the 2022 NPRM, 87 FR 47838, applying this rule to all health programs and activities administered by the Department, not just those programs and activities established under title I of the Act, is the best reading of the statutory text of section 1557. The statutory language provides that section 1557's discrimination prohibitions apply to ''any program and activity that is administered by an executive agency or any entity established under this title.'' 42 U.S.C. 18116(a). As discussed in the 2022 NPRM, the operative word, ''or,'' distinguishes programs and activities operated by an executive agency from those operated by a title I entity. 87 FR 47829. To the extent there is ambiguity in the interpretation, finalizing the rule as proposed better reflects the statutory language as well as Congress's intent.[17] The application of section 1557 to every health program or activity administered by the Department ensures that nondiscrimination standards are interpreted and applied as consistently and as broadly as possible and provides for application of nondiscrimination standards to the Department consistent with the entities to which it provides Federal financial assistance.

Comment: Some commenters noted that under the most straightforward reading of section 1557, the regulatory framework should encompass all of the Department's programs and activities, not just ''health'' programs and activities, and they suggested that the Department extend the regulation's protections accordingly.

Response: We appreciate commenters' views on this issue. As we noted in the 2022 NPRM, OCR considered applying the rule to all programs and activities of the Department and sought comment on this issue. 87 FR 47838. Based on comments received and additional consideration, we are applying the final rule to the Department's health programs and activities, rather than all the Department's programs and activities, at this time. The Department may consider future rulemaking at a later date. For this final rule, however, OCR has determined that it is appropriate to apply the rule to the Department's ''health'' programs and activities given that the ACA itself is principally related to health care and the entirety of this section 1557 rulemaking seeks to regulate ''health'' programs and activities.

Comment: Commenters supported the rule's application to programs and activities administered by title I entities under § 92.2(a)(3), stating it was consistent with statutory text, Congressional intent, and the nondiscrimination purpose of section 1557 and the ACA.

Response: Proposed § 92.2(a)(3) applied section 1557 to ''every program or activity administered by a title I entity.'' In the 2022 NPRM, 87 FR 47838, OCR explained that it was unnecessary to include the modifier ''health'' to programs or activities of a title I entity because title I entities already meet the definition of ''health program or activity'' as set forth under § 92.4. While this remains true, we have reevaluated the regulatory text of § 92.2(b)(3) and determined that it should be revised to add the modifier ''health'' to a title I entity's ''program or activity'' for consistency with our interpretation that section 1557 applies to the Department's ''health'' programs or activities, as discussed in the previous comment. This technical revision does not limit or alter the scope of § 92.2(b)(3)'s application to the programs or activities of a title I entity, as we articulated in the 2022 NPRM. 87 FR 47838.

Comment: A few commenters opined that the rule should apply broadly to recipients of Federal financial assistance from any executive agency, not just the Department. These commenters noted that nothing in the statute suggests that Congress intended to limit the scope of section 1557's application in such a way.

Response: It is OCR's longstanding position that section 1557's discrimination prohibition is not limited to recipients of Federal financial assistance from the Department, but rather covers recipients' health programs or activities regardless of the executive agency providing the funding.[18] However, the final rule only applies to recipients of HHS funding, which is consistent with OCR's delegation of authority to ''develop and direct implementation of the requirements of Section 1557 . . . *as applied to* the Department and recipients of the Department's funds.'' 85 FR 37242 (emphasis added). Other Federal agencies possess section 1557 enforcement responsibility for the health programs and activities they fund and administer.

Comment: Some commenters recommended that the Department provide a model for other agencies to craft their own, more inclusive, and

[16] The application of this final rule to covered entities with conscience or religious freedom objections are discussed more fully below in §§ 92.3 (Relationship to other laws) and 92.302 (Notification of views regarding application of Federal religious freedom and conscience laws).

[17] *See, e.g., Griffin* v. *Breckenridge,* 403 U.S. 88, 97 (1971) (civil rights statutes should be construed broadly); *U.S.* v. *Price,* 383 U.S. 787, 801 (1966) (same); *see also N. Haven Bd. of Educ.* v. *Bell,* 456 U.S. 512, 521 (1982) (''[I]f we are to give Title IX the scope that its origins dictate, we must accord it a sweep as broad as its language.''); S. Rep. No. 64, 100th Cong., 2d Sess. 5–7 (1988), reprinted in 1988 U.S.C.C.A.N. 3, 7–9 (statement of Sen. Humphrey stating that title VI should be interpreted as broadly as necessary to eradicate discriminatory practices in programs that Federal funds supported).

[18] *See* U.S. Health & Hum. Servs., Off. for Civil Rts., Memo. from Jocelyn Samuels, Director, to Directors of Federal Offices for Civil Rights (Nov. 5, 2015), *https://www.hhs.gov/sites/default/files/2015_11_04_fed_civil_rights_section_1557_memo_508.pdf.*

more protective rules for non-health-related programs in line with other applicable non-discrimination statutes.

Response: OCR appreciates this recommendation and reiterates its desire to work with other agencies as necessary and appropriate. OCR only has authority to apply section 1557 to HHS and recipients of Departmental Federal financial assistance. This rule does not apply to programs and activities of other agencies and OCR is unable to regulate other agencies.

Comment: A number of commenters disagreed with the non-application of the rule to employment practices under § 92.2(b). Commenters opined that the categorical exclusion of employers is inconsistent with section 1557's statutory text and creates confusion. Some commenters noted that an agency to whom a complaint is referred may not adequately address claims of discrimination, including those of dependents. Commenters further noted that other employment discrimination laws, such as title VII of the Civil Rights Act of 1964 (title VII), 42 U.S.C. 2000e *et seq.,* and the Age Discrimination in Employment Act of 1967 (ADEA), 29 U.S.C. 621–634, require a claimant to file a complaint with a Federal agency before privately enforcing their rights. Some commenters requested that OCR clarify that this provision concerns only the processing of administrative complaints by OCR and that OCR's decision not to apply this rule to employment practices does not preclude employees from vindicating their section 1557 rights in court.

Other commenters supported proposed § 92.2(b) and noted it will help prevent wasteful duplication with other Federal laws and agencies that already cover unlawful employment discrimination.

Response: The Supreme Court has recognized that section 1557 authorizes a private right of action.[19] This final rule applies only to OCR's administrative enforcement of section 1557. As discussed in the 2022 NPRM, 87 FR 47838, we believe that other Federal agencies are better equipped to review and adjudicate employee health benefits and allegations of employment discrimination given their expertise under the existing employment nondiscrimination statutes they enforce.

Comment: Some commenters noted that employers are usually the sponsors of group health plans and raised concerns that OCR could therefor find an employer liable under section 1557 for the employee benefits it provides.

Response: This rule does not apply to employers or other plan sponsors with regard to their employment practices, including the provision of employee health benefits. As stated in the preamble to the Proposed Rule, 87 FR 47838, previous rules had limited application to employment. The 2016 Rule provided that employment practices included hiring, firing, promotions, or terms and conditions of employment, and therefore the 2016 Rule did not apply to those practices. However, the 2016 Rule applied to an employer with regard to its employee health benefit programs under certain circumstances as set forth under former § 92.208. The 2020 Rule, which repealed the 2016 Rule's reference to employment practices and employee health benefit programs, reverted to enforcing the statutorily referenced nondiscrimination statutes through their existing regulations. As discussed above, the Proposed Rule proposed to exclude employment practices, which included the provision of employee health benefit programs. OCR also recognizes that other sponsors of group health plans undertake similar employment practices, such as the provision of employee health benefits. For example, a joint board of trustees for a multi-employer group health plan (also known as a Taft-Hartley plan) consists of representatives from employers and unions to sponsor a group health plan, and similarly engages in the provision of an employee health benefit like employers that sponsor a single-employer plan. To ensure consistent application of the rule to entities engaging in similar employment functions, the final rule revises § 92.2(b) to provide that the rule does not apply to any employer or other plan sponsor of a group health plan, including but not limited to, a board of trustees (or similar body), association or other group, with regard to employment practices, including the provision of employee health benefits.

Group health plans, employers, and sponsors of group health plans are generally separate entities from one another that require a separate, fact-specific analysis to determine whether each entity is subject to this rule. We discuss the relationship between plan sponsors, such as employers, joint boards of trustees or similar bodies, associations, and other groups that are plan sponsors of multi-employer Taft-Hartley plans or multiple-employer welfare arrangements (MEWAs), and group health plans in more detail in the discussion of group health plans in the ''health program or activity'' definition discussion under § 92.4.

Comment: Some commenters stated that ongoing litigation surrounding section 1557 and previous iterations of OCR's section 1557 regulations, as well as agency course reversal on multiple occasions, has created confusion and compliance burden on covered entities. They urged the Department to reinforce the importance of severability under § 92.2(c) amongst the various regulatory provisions of the rule.

Response: We appreciate concerns around ongoing litigation and agency reversal, and the resulting inconsistency in requirements. OCR has attempted to answer questions and reduce confusion raised by the previous versions of the rule. While this final rule is similar to the 2016 Rule, it provides greater clarity regarding section 1557's statutory protections from discrimination along with various provisions to help alleviate burdens while providing certainty about covered entities' obligations when compared to the 2016 and 2020 Rules. We believe the final rule enhances the benefits to individuals and minimizes the burdens on covered entities.

OCR notes that § 92.2(c) provides that if any provision of this part is held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, it shall be severable from this part and not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other, dissimilar circumstances. For example, if a court were to invalidate the final rule's Notice of availability of language assistance services provision (Notice of Availability) at § 92.11, all other provisions of the rule would remain in effect, as those provisions ''could function sensibly without the stricken provision.'' [20] Thus, if the rule's Notice of Availability provision were invalidated, OCR would not enforce that provision. Or, for example, if a court were to invalidate the final rule's Section 1557 Coordinator requirement at § 92.7, OCR would not require covered entities to fill this position as part of their compliance with this final rule, while otherwise enforcing other administrative requirements such as the Policies and procedures requirement at § 92.8 and the Notice of nondiscrimination requirement at § 92.10.

Comment: Some commenters requested that the final rule restore the 2016 Rule clarification that any age

[19] *Cummings* v. *Premier Rehab Keller, P.L.L.C.,* 596 U.S. 212 (2022) (section 1557 provides a private right of action because the incorporated statutes do so).

[20] *MD/DC/DE Broadcasters Ass'n* v. *F.C.C.,* 253 F.3d 732, 734 (D.C. Cir. 2001) (internal quotations omitted).

distinctions exempt from the Age Act are also exempt from section 1557 enforcement.

Response: OCR appreciates commenters' request for clarity and directs commenters to § 92.101(b)(1) of this regulation, which adopts by reference the permissible uses of age located in the Department's Age Act regulations at 45 CFR part 91 (subpart B).

Comment: Some commenters argued that the Proposed Rule is inappropriate for the Indian Health Services (IHS) facilities because these are not open to members of the public but reserved for patients who are eligible beneficiaries as citizens of Tribal Nations, and as such, tribally operated IHS health facilities [21] should be exempt. These commenters stated that the 2022 NPRM failed to recognize the unique nature of the Indian Health Care System, which is the health care system for members of federally recognized Tribes in the United States. Commenters recommended that OCR acknowledge American Indian/Alaska Native (AI/AN) as a political classification, and not as a race-based classification. Commenters further opined that the 2022 NPRM failed to recognize the diplomatic, nation-to-nation relationship between Tribal Nations and the United States.

Response: OCR appreciates these comments. Similar concerns were raised during the 2022 NPRM Tribal Consultation held on August 31, 2022, pursuant to Executive Order 13175. The IHS, an agency within the Department, is responsible for providing health services to members of federally recognized tribes in 37 states, arising out of the special government-to-government relationship between the Federal Government and Indian tribes.[22]

Membership or eligibility in a federally recognized tribal entity is a political classification rather than a racial classification.[23] Preferences based upon the unique relationship between the United States and federally recognized tribal entities are distinct from the forms of discrimination prohibited by Federal civil rights laws, which aim to protect all individuals on the basis of race, color, or national origin (including AI/AN individuals, regardless of political affiliation).[24] The Department's regulations implementing title VI provide that an individual shall not be deemed subjected to discrimination by reason of their exclusion from benefits limited by Federal law to individuals of a different race, color, or national origin. 45 CFR 80.3(d) (Indian Health and Cuban Refugee Services). IHS is mentioned in the Department's title VI regulation as an example of such a program. *Id.* In § 92.101(b), the final rule adopts this provision by reference, and OCR will fully apply it, as well as other applicable exemptions or defenses that may exist under Federal law.

Programs of the IHS are administered by IHS and tribes, including through self-determination contracts or self-governance compacts, and we intend to address any restrictions on application of the law to IHS programs in the context of individual complaints.

Comment: Some commenters requested that OCR develop an online tool that would help covered entities determine whether the final rule applies either directly or indirectly to an organization or other health program or activity.

Response: OCR provides various tools on our website to help covered entities determine their covered entity status and will continue to ascertain what tools would help the industry ensure widespread compliance. OCR notes that the Department's Office of Grants operates a website that tracks obligated Department grant funds, *https://taggs.hhs.gov/*, which allows the public to identify recipients of Department funding.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.2, with modification. We are revising § 92.2(a)(3) to add the modifier ''health'' to ''program or activity administered by a title I entity.'' We are also revising § 92.2(b) to state that the provisions of this part shall not apply to any employer ''or other a plan sponsor of a group health plan, including but not limited to, a board of trustees (or similar body), association or other group,'' with regard to its employment practices, including the provision of employee health benefits.

Treatment of the Title IX Religious Exception

In the 2022 NPRM, OCR proposed to not import the title IX religious exception into the section 1557 regulation. The title IX statute states that the nondiscrimination requirements ''shall not apply to an educational institution which is controlled by a religious organization'' to the extent that such application ''would not be consistent with the religious tenets of such organization.'' 20 U.S.C. 1681(a)(3), *as amended* Public Law 100–259, section 3(b), Mar. 22, 1988, 102 Stat. 29. The title IX statutory definition of ''program or activity'' further limits the nondiscrimination requirements, in that they do not apply to ''any operation of an entity which is controlled by a religious organization if the application of section 1681 of this title to such operation would not be consistent with the religious tenets of such organization.'' *Id.* at 1687(4).

In the 2022 NPRM, we said that under the most natural understanding of section 1557's text, which bans discrimination ''on the ground prohibited under . . . title IX,'' the statutory term ''ground prohibited'' is best understood as incorporating only the bases on which discrimination is prohibited in the referenced statutes (*i.e.,* ''sex'' in title IX). 87 FR 47839. Rather than import the title IX exception for ''educational institution[s]'' that are controlled by ''religious organization[s],'' OCR proposed that the best way to address religious objections to the application of this rule—and the way most consistent with section 1557's statutory text and structure—would be through the process provided in proposed § 92.302. We sought comment on this approach. We particularly invited comments from covered entities controlled by or affiliated with religious organizations, providers employed by such entities, and people who receive health care from religiously affiliated medical providers.

The comments and our responses regarding this request for comment are set forth below.

Comment: Commenters provided mixed responses to OCR's proposal not to import the title IX religious exception into this rule. Many commenters supported OCR's statutory interpretation that section 1557

[21] Titles I and V of the Indian Self-Determination and Education Assistance Act, Pub. L. 93–638, as amended, provide Tribes the option of exercising their right to self-determination by assuming control and management of programs previously administered by the Federal Government. Since 1992, the IHS has entered into agreements with tribes and tribal organizations to plan, conduct, and administer programs authorized under section 102 of the Act. Today, over sixty percent of the IHS appropriation is administered by tribes, primarily through self-determination contracts or self-governance compacts. U.S. Dep't of Health & Hum. Servs., Indian Health Servs., *IHS Profile, https://www.ihs.gov/newsroom/factsheets/ihsprofile/.*

[23] *See Morton* v. *Mancari,* 417 U.S. 535, 553 & n.24 (1974).

[24] *See Morton* v. *Mancari,* 417 U.S. 535, 550 (1974) (''[a] provision aimed at furthering Indian self-government by according an employment preference withing the [Bureau of Indian Affairs] for qualified members of the governed group can readily co-exist with a general rule prohibiting employment discrimination on the basis of race.'').

incorporated the title IX statute only with respect to the ground of discrimination prohibited (sex) and its enforcement mechanisms (*e.g.,* termination of Federal financial assistance and other means authorized by law). Several commenters stated that this reading is most consistent with the statutory structure, because if Congress intended for the title IX religious exception to apply, the statute would also require the importation of the other title IX exceptions, many of which are by their terms plainly inapplicable in the context of health care.

Several commenters also stated that if Congress wanted to include the title IX religious exception, it could have either explicitly referenced or listed the exception in the section 1557 statutory text. Many commenters stated that any silence regarding the title IX exceptions was not an oversight by Congress, but an intentional decision. Many commenters contended that importing the title IX religious exception is contrary to the purpose of section 1557 and the goal of the ACA: to expand access to health care coverage. Additionally, many commenters said that importing the title IX religious exception is unnecessary given the numerous other Federal laws that allow religious organizations and providers to invoke a conscience or religious objection to providing certain kinds of medical services and care.

Many other commenters disagreed with OCR's interpretation, claiming that Congress intended to incorporate the entire title IX statutory scheme by including the signal ''*et seq.*'' Several commenters also argued that title IX's prohibition on sex discrimination cannot be read separate and apart from all the exceptions included in the title IX statute, in which Congress authorized certain conduct—*i.e.,* otherwise prohibited sex discrimination. Accordingly, several commenters maintained that it is arbitrary and capricious for OCR to rely upon title IX's implementing regulations as a guide to prohibit discrimination on the basis of sex, such as those related to pregnancy-related conditions, or when distinguishing a marital, parental, and family status, while not importing the statute's religious exception.

A few commenters maintained that the differences between educational and health care institutions provide an unconvincing argument for nonimportation of the title IX religious exception because under the Title IX Common Rule of 2000 (Common Rule),[25] title IX already applies to recipients of Federal financial assistance that provide health care. Many commenters also asserted that the court in *Franciscan Alliance* v. *Burwell,* 227 F. Supp. 3d 660 (N.D. Tex. 2016), found that the decision not to import the title IX religious exception into the 2016 Rule, without explanation, was contrary to law. Several commenters also pointed to that court's determination that the Department had previously ''provide[d] that when cross-referencing the provisions of Title IX's use of 'student,' the term 'individual' should be used in the healthcare context.'' *Id.* at 691. Commenters asserted that this finding by the court undermines the Department's claim that the title IX religious exception is specific to education and cannot be adopted more broadly in the health care context.

Response: Title IX applies to ''any education program or activity'' operated by recipients of Federal financial assistance, and the statute creates an exception from coverage for the education programs and activities of ''an educational institution which is controlled by a religious organization if the application of [title IX's prohibition on sex discrimination in education programs and activities] would not be consistent with the religious tenets of such organization.'' 20 U.S.C. 1681(a)(3). In addition, the Civil Rights Restoration Act of 1987 (CRRA)[26] statutorily defined ''program or activity'' for title IX to exclude from coverage ''any operation of an entity which is controlled by a religious organization if the application of section 1681 of this title to such operation would not be consistent with the religious tenets of such organization.'' 20 U.S.C. 1687(4). The preamble to the 2020 Rule stated that section 1557 ''incorporates the statutory scope of Title IX, so it is appropriate for this rule to incorporate the Title IX statutory language concerning religious institutions.'' 85 FR 37208.

OCR notes that as an initial matter, the CRRA's exclusion of any operation of religiously controlled entities from the application of title IX to the extent such operation is inconsistent with the religious tenets of the organization is not incorporated into section 1557. As we explain further in the discussion of ''health program or activity,'' section 1557 includes its own coverage provision that does not incorporate the CRRA's definitions of ''program or activity.'' Moreover, unlike title VI, section 504, and the Age Act,[27] title IX modifies ''program or activity'' with ''education,'' 20 U.S.C. 1681(a), which limited title IX's prohibition on sex discrimination to the ''education'' context; the definitions of ''program or activity'' under title VI, section 504, or the Age Act do not include any comparable exclusion for the operations of religiously controlled entities.[28] Thus, the CRRA's limitation to the application of certain operations of religious entities from title IX's coverage applies only in the ''education'' context and is not part of the definition of ''program or activity'' as that term is used in civil rights statutes more generally. Further, it is inapplicable to the definition of ''health program or activity'' adopted in section 1557. As a result, the sole question is whether the exclusion in title IX, 20 U.S.C. 1681(a)(3), of certain applications of the statute to ''educational institution[s] which [are] controlled by a religious organization'' carries over into section 1557.

Although title IX's prohibition of sex discrimination applies to some health-related activities of covered education programs—such as programs training future health workers—the range of exceptions provided in section 1681(a) are plainly tied to the educational setting (*e.g.,* the membership practices of social fraternities and sororities, YMCA, Girls Scouts, Boys Scouts; voluntary youth service organizations; father-son and mother-daughter activities; and beauty pageant-based scholarships, as well as educational admissions practices). All of these exceptions have little if any application to health programs and activities. Further, exceptions listed in that subsection include limitations regarding ''educational institution[s],'' ''institution[s] of public higher education,'' or ''institution[s] of higher education.'' 20 U.S.C. 1681(a)(1)–(9).

[25] *Nondiscrimination on the Basis of Sex in Education Programs or Activities Receiving Federal Financial Assistance,* 65 FR 52857 (Aug. 30, 2000) (multiagency rulemaking adopting consistent title IX implementing regulations).

[26] Public Law 100–259, 102 Stat. 28 (Mar. 22, 1988).

[27] *See* 42 U.S.C. 2000d (title VI, prohibiting ''discrimination under any program or activity receiving Federal financial assistance''); 42 U.S.C. 6101 (the Age Act, prohibiting discrimination ''in programs or activities receiving Federal financial assistance''); 29 U.S.C. 794(a) (section 504 prohibiting ''discrimination under any program or activity receiving Federal financial assistance or under any program or activity conducted by any Executive agency or by the United States Postal Service'').

[28] S. Rep. No. 100–64, 100th Cong., 1st Sess. (1987), *as reprinted in* 1988 U.S.C.C.A.N. 3, 6, 1987 WL 61447, at *18 (discussing ''education limitation in Title IX''); *see also id.* at *20–*21 (''[The CRRA] leaves the religious tenet exemption in Title IX intact and clarifies that the exemption is as broad as the Title IX coverage of *education programs and activities.*'' (Emphasis added)).

The language and subject matter of the exceptions suggest that Congress, in enacting title IX, did not intend those exceptions to define the statute's basis of discrimination—what section 1557 calls the ''ground prohibited''—under title IX. Title IX prohibits discrimination on the basis of sex, so the ''ground prohibited'' under that statute is sex. Congress intended these exceptions to delineate certain contexts in which otherwise prohibited sex discrimination in the educational context would be excluded from the statute's coverage. Congress could have chosen to draft section 1557 to incorporate additional elements from title IX and the other referenced civil rights statutes (*e.g.,* those statutes' applicability provisions), but did not do so, instead narrowly specifying that only the ''ground[s] prohibited'' are incorporated.

OCR further notes that the inclusion of ''*et seq.*'' is simply part of an ordinary citation to the title IX statute. Congress frequently appends ''*et seq.*'' to statutory citations as a matter of course when legislation includes a generalized reference to a previously enacted statute.[29] Including ''*et seq.*'' does not change the substantive meaning of section 1557, which incorporates only the grounds of prohibited discrimination and the enforcement mechanisms of each referenced statute. Further, section 1557 includes similar parenthetical citations with ''*et seq.*'' for the other referenced civil rights statutes in both 42 U.S.C. 18116(a) and (b). This underscores that Congress merely intended to provide the general, ordinary citation to the statutes being referenced, including title IX.

Section 1557's role as a health care statute further reinforces our reading of the statutory text and Congressional intent. Section 1557 was enacted as part of the ACA, in part, to expand access to health insurance and increase consumer protections. Title IX, as we have explained, relates specifically to education programs and activities. The title IX religious exception in that statute allows some entities to engage in certain conduct without requiring any consideration or mitigation of harm to third parties. If a similar standard were imported into this rule, it could undermine a key purpose of section 1557—ensuring access to health care. And as discussed below, unlike educational settings such as colleges and universities where there is more choice, individuals often have far fewer choices when accessing health care. In the federally funded health care context, the array of statutory conscience provisions enacted by Congress, as well as the general requirements of the First Amendment and the Religious Freedom Restoration Act (RFRA), provide a better fitting approach to addressing the relevant interests. This final rule has been revised to include regulatory text at § 92.3(c) recognizing that, insofar as the application of any rule requirement would violate applicable Federal protections for religious freedom and conscience, such application shall not be required. Also, we have strengthened the process for raising religious freedom and conscience protections under this final rule at § 92.302.

The fact that title IX and agency implementing regulations apply to *some* health programs and activities—those that are part of educational programs and activities [30]—does not suggest that the exceptions set forth in the statute or implementing regulations apply to health programs and activities that are not a part of an educational program. Title IX's limitation to a recipient's education programs and activities has long been established.[31] For example, the Common Rule (adopted by more than 20 Federal agencies) included the statute's limitation that the prohibition on sex discrimination applied *only to the educational components* of a covered entity's program.[32] As we have explained, it is inconsistent with the text and purpose of section 1557, as well as the text and structure of title IX, to apply the title IX exceptions outside of the educational setting. Although the title IX regulations are relevant to informing what constitutes sex discrimination for purposes of this final rule—and we have looked to them for that purpose—that is because section 1557 incorporates the ''ground prohibited'' under title IX. But section 1557 does not incorporate any of the title IX exceptions. 87 FR 47839.

OCR disagrees with the *Franciscan Alliance* decision vacating portions of the 2016 Rule, and in any event, that decision does not prohibit OCR from not importing the title IX religious exception in this final rule. The promulgation of this final rule constitutes new rulemaking, and OCR has provided a detailed explanation for the decision to not import the title IX religious exception and has taken important steps to address religious freedom and conscience protections beyond those in the 2016 Rule. These steps include revisions at § 92.3(c) to recognizes that, ''[i]nsofar as the application of any requirement under this part would violate applicable Federal protections for religious freedom and conscience, such application shall not be required,'' adoption of a voluntary assurance of exemption process based on these protections at § 92.302, and the Department's issuance of a final rule entitled *Safeguarding the Rights of Conscience as Protected by Federal Statutes,* 89 FR 2078 (Jan. 11, 2024).

OCR notes that this final rule does not alter or eliminate a recipient's ability to maintain, seek, claim, or assert a title IX religious exception under title IX if it meets the applicable criteria.[33] And to the extent the recipient is entitled to a religious exception under title IX, OCR's analysis will consider the entire statute, including title IX's specific limitation to the context of educational programs and activities.

Comment: Many commenters supported OCR's proposal not to import the title IX religious exception, highlighting what they characterized as the dangers of doing so in the context of health care and the potential consequences on people's access to health care it might have. For example, many commenters expressed concerns that providers would be able to deny essential health care services based on disapproval of a particular group, thereby putting at risk the health and well-being of already vulnerable individuals. Many commenters asserted that entities have invoked religious beliefs to deny individuals access to health care and coverage for a broad range of health care services. Commenters said that in urgent or emergency care situations, individuals may be unable to identify or use the services of an alternate provider when an institution withholds care based on religious tenets, even when the

[33] 20 U.S.C. 1681(a)(3); 45 CFR 86.12.

individual is aware of such objections by an institution.

Many commenters highlighted the difference between education and health care. Multiple commenters stated that unlike certain health care settings, many parents have the choice to send their children to religious schools, whereas individuals often lack meaningful choices when seeking a health care provider, particularly for time-sensitive care. For example, numerous commenters stated that choice is especially limited in rural areas, and some patients may only have local access to religiously affiliated providers. Commenters worried that importing the title IX religious exception into this rule could have dire implications for health outcomes.

Response: As previously noted, this rule's application to the health care context is central to OCR's interpretation of section 1557. OCR appreciates that religiously affiliated hospitals and health care facilities play an important role in the health care system and recognizes the critical patient care needs they provide, including in underserved communities and areas which otherwise lack access to quality health care. At the same time, OCR believes that Congress chose not to import the title IX religious exception into section 1557 due to concerns about the impact such an action could have on access to health care. The importation of the title IX religious exception would raise unique concerns in the health care context that are not typically present in education programs and activities. As OCR discussed in the 2022 NPRM, health care settings differ from educational settings with respect to both the ability of affected parties to choose (or avoid) certain religiously affiliated health care institutions and the urgency of the need for services provided by the covered entities. 87 FR 47840. While students and families normally make a deliberate choice to attend a religious educational institution, in many cases specifically due to its religious character, individuals seeking health care are far more likely to be driven by other considerations such as availability, urgency, geography, insurance coverage, and other factors unrelated to whether the provider is controlled by or affiliated with a religious organization. *See id.* Rather than importing the title IX religious exception into section 1557, where Congress referenced only the ''ground prohibited under'' and the ''enforcement mechanisms provided'' for in title IX, the process set forth in § 92.302 respects religious freedom and conscience protections. As this final rule makes clear at § 92.3(c), insofar as the application of any requirement under this rule would violate applicable Federal protections for religious freedom and conscience, such application shall not be required. Under § 92.302, recipients may rely on these protections or seek assurance of these protections from OCR, if they wish. In this process, OCR will comply with the applicable legal standards of the governing statutes, which include the protections in the ACA itself, 42 U.S.C. 18023; the Church, 42 U.S.C. 300a–7, Coats-Snowe, 42 U.S.C. 238n, and Weldon Amendments, *e.g.,* Consolidated Appropriations Act, 2024, Public Law 118–47, div. H, tit. V, sec. 507(d)(1), 138 Stat. 460, 703 (Mar. 23, 2024); the generally applicable requirements of RFRA, 42 U.S.C. 2000bb–1; and other applicable Federal laws.

Comment: Many commenters who supported OCR's proposal not to import the title IX religious exception raised concerns that its importation could discourage individuals from seeking necessary medical care. Many commenters also discussed various State laws recently enacted to further expand religious exemptions from health care requirements and how such laws have specifically affected communities with limited access to care. These commenters argued that the effects of these laws further support OCR's goal of ensuring patients have broad access to nondiscrimination protections.

Response: OCR appreciates commenters' concerns regarding the potential harms to individuals with limited or restricted access to health care. OCR appreciates that many religiously affiliated hospitals and providers are providing vital services in areas where people are in the most need and are often motivated by their faith to provide this important care. However, OCR maintains that Congress did not choose to import the title IX religious exception into section 1557. Importing the title IX exception would be inconsistent with the text, structure, and purpose of both title IX and section 1557. Rather, Congress has enacted protections for conscience in the ACA itself; the Church, Coats-Snowe, and Weldon Amendments, among others; the generally applicable requirements of RFRA, and other applicable Federal laws as the means to protect religious freedom and conscience in this context. We are committed to affording full effect to Congress's protections of conscience and religion, as detailed in § 92.302 and the Department's issuance of its final rule, Safeguarding the Rights of Conscience as Protected by Federal Statutes. 89 FR 2078.

Comment: Multiple commenters opposed OCR's proposal not to import the title IX religious exception, stating that doing so would harm providers and hospital systems by compelling covered entities to provide abortion or other care that is contrary to their religious beliefs or that they believe will be harmful to their patients. Various commenters said that compelling such actions would turn many individuals and institutions of faith away from the medical profession.

Several commenters expressed confusion about available religious exceptions and how certain rule requirements would apply to religiously affiliated covered entities. These commenters said that including the title IX religious exception would clarify protections for religious entities.

Some commenters expressed concern that this regulation demonstrated OCR's intent to use section 1557 to force religious hospitals to dispense medication and perform procedures that are prohibited by their faith. Several commenters objected to the inclusion of cites in the 2022 NPRM that explain the increased prevalence of religiously affiliated health care systems and opined that this demonstrated hostility toward faith-based providers. According to these commenters, including these cites prejudices OCR's review of providers' religious exemption requests. Instead, these commenters urged OCR to make clear that providers will not be compelled to perform, cover, or promote procedures or medical interventions to which they have moral or religious objections.

Response: OCR appreciates commenters' concerns and respects their opposition to the proposal not to import the title IX religious exception. OCR reiterates, consistent with the 2022 NPRM, that this final rule does not promote any particular medical treatment, require provision of particular procedures, mandate coverage of any particular care, or set any standard of care; rather, the final rule implements the nondiscrimination requirements of section 1557. *See* 87 FR 47867–68. The full protections of all Federal religious freedom and conscience laws continue to apply.

Additionally, OCR makes clear that the decision not to import the title IX religious exception does not compel any individual provider or covered entity with religious or conscience-based objections to provide abortion or any other care to the extent doing so would conflict with a sincerely-held belief. The ACA itself provides that ''[n]othing in this Act shall be construed to have any

effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). As discussed further below, section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities. A covered entity does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure. In addition, any recipient that believes that it is exempt from certain provisions of this rule due to the application of a Federal conscience or religious freedom law may rely on those provisions, as referenced in § 92.3(c), or choose to seek assurance of the applications of those provisions pursuant to the process provided in § 92.302.

In light of § 92.302 and 42 U.S.C. 18023(c)(2)(A) (section 1303 of the ACA), OCR maintains that although some recipient providers and hospitals may decline to participate in federally funded health programs as a result of this rule, most will choose to continue to participate. To avoid confusion, we have further clarified the process for seeking assurance of an exemption based on religious freedom and conscience laws at § 92.302 and are committed to making available trainings and other resources to assist covered entities in understanding their obligations under section 1557 and the process by which they may seek assurance of an exemption under § 92.302.

Again, OCR appreciates that religiously affiliated hospitals and health care facilities play an important role in the health care system and recognizes the critical patient care needs they provide, including in underserved communities and areas which otherwise lack access to quality health care. Any discussion relating to the prevalence of religiously affiliated care is relevant for OCR to evaluate access issues that patients seeking certain procedures or care could potentially face, although OCR does not assume that all religiously affiliated entities' refusals to provide certain forms of care would result in such access issues. As previously stated, the 2022 NPRM provided factual findings with respect to health care accessibility in the United States based upon health care capacity of providers, population demands, and geographic limitations. 87 FR 47840. A detailed discussion of these considerations can be found in the Regulatory Impact Analysis (RIA).

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, OCR is finalizing the rule as proposed, without importing the title IX religious exception.

Relationship to Other Laws (§ 92.3)

In § 92.3, we provided an explanation of the relationship of the proposed regulation to existing laws. Proposed § 92.3(a) provided that neither section 1557 nor this part shall be interpreted to apply lesser standards for the protection of individuals from discrimination than the standards under title VI, title IX, section 504, the Age Act, or the regulations issued pursuant to those laws.

In § 92.3(b), we proposed that nothing in this part shall be interpreted to invalidate or limit the existing rights, remedies, procedures, or legal standards available under the Federal civil rights laws cited in 42 U.S.C. 18116(b) (title VI, title VII, title IX, section 504, and the Age Act), consistent with 42 U.S.C. 18116(b).

In § 92.3(c), we proposed that nothing in this part shall be interpreted to invalidate or limit the existing rights, remedies, procedures, or legal standards available under Federal religious freedom and conscience laws. Though not specifically referenced in the Proposed Rule, these include the protections in the ACA itself; the Church, Coats-Snowe, and Weldon Amendments; the generally applicable requirements of RFRA; and other applicable Federal laws.

The comments and our responses to this provision are set forth below.

Comment: Commenters expressed a mix of viewpoints regarding the ''lesser standard'' language included in proposed § 92.3(a), concerning civil rights statutes referenced in section 1557. Some commenters recommended removing the ''lesser standard'' language because it is not included in the section 1557 statute. Commenters stated that this language ignores Congress's decision to employ a particular standard to each of the civil rights laws incorporated, such that it would allow OCR to redefine bases for discrimination and improperly preempt State law affecting such categories.

Response: In this final rule, OCR seeks to give all laws their fullest possible effect. OCR appreciates these comments but declines to remove the ''lesser standard'' language included in § 92.3(a). As the 2016 Rule recognized, 81 FR 31381, this interpretation is consistent with a natural reading of section 1557's statutory text that explicitly states that section 1557 shall not be construed to ''invalidate or limit the rights, remedies, procedures, or legal standards'' of the referenced statutes (and title VII) ''or to supersede State laws that provide additional protections against discrimination,'' 42 U.S.C. 18116(b). OCR accordingly reaffirms that the civil rights laws referenced in section 1557 establish the grounds of prohibited discrimination, and nothing in this final rule is intended to provide lesser protections than those found under title VI, title IX, section 504, or the Age Act, or their implementing regulations.

Comment: Several commenters supported the inclusion of the ''lesser standard'' language in § 92.3(a) but suggested that § 92.3(c), concerning Federal religious freedom and conscience laws, is unnecessary and, if included without any limitations, undermines this ''lesser standard'' language of § 92.3(a) and could encourage discrimination.

Response: We decline to remove § 92.3(c), concerning Federal religious freedom and conscience laws. These laws remain applicable and removing the language runs contrary to the Department and OCR's stated commitment to protect the rights of individuals and entities under Federal conscience or religion freedom laws. Indeed, the ACA itself contains a similar provision at 42 U.S.C. 18023(c)(2)(A)(i), which provides that ''[n]othing in this Act shall be construed to have any effect on Federal laws regarding—conscience protection[.]'' As discussed later in this section, we have revised § 92.3(c) to provide additional specificity regarding the application of Federal religious freedom and conscience protections.

Comment: Some commenters suggested that OCR clarify that section 1557 does not limit the rights of individuals to any of the protections afforded under title VI, title IX, section 504, or the Age Act. These commenters suggested that section 1557 is a distinct law and, while it is intended to work in tandem with other civil rights laws, section 1557 stands on its own. Several other commenters requested that the final rule include language that clarifies that administrative exhaustion is not required to bring any claim under section 1557 in Federal court, where for example a claim may involve age as one basis of discrimination among several (*e.g.,* alleging discrimination on the bases of age, sex, and disability at the same time) but the Age Act has a

statutory requirement that claimants first exhaust their administrative remedies.

Response: Section 92.3(b) clearly states that this part does not limit or invalidate the rights, remedies, procedures, or legal standards under the statutes referenced (*i.e.,* title VI, title VII, title IX, section 504, and the Age Act), consistent with the statutory text of section 1557 at 42 U.S.C. 18116(b). In addition to incorporating the ''ground[s] prohibited'' by these other statutes, section 1557 incorporates the ''enforcement mechanisms'' of the statutes. 42 U.S.C. 18116(a). Though the section 1557 rule is informed by the title VI, title IX, Age Act, and section 504 implementing regulations, section 1557 provides an independent basis for regulation of discrimination in covered health programs and activities that is distinct from these statutes. Section 1557's nondiscrimination requirements do not in any way limit or impact the interpretation of those statutes. *See id.* at 18116(b). Section 1557 is a distinct civil rights authority.

Courts have long recognized that section 1557 authorizes a private right of action under any of the bases for discrimination. While we appreciate concerns raised by commenters regarding the heightened risks associated with unnecessary delays in the context of health care, we decline to revise regulatory text to adopt a stance on the appropriate standards that apply to private litigants. This is an issue appropriately addressed by the Federal judicial branch and not via agency rulemaking. Comments and responses regarding OCR procedures for conducting its own administrative enforcement are provided in §§ 92.303 (Procedures for health programs and activities conducted by recipients and State Exchanges) and 92.304 (Procedures for health programs and activities administered by the Department).

Comment: Many commenters raised concerns about the potential conflicts of State and Federal laws. Some commenters expressed that any conflict between State and Federal law or policy would be inconsistent with the principles of federalism. Some commenters had specific concerns regarding the final rule's application to State laws that prohibit transgender patients from receiving certain medically necessary gender-affirming care or those that protect religious freedom and conscience. Other commenters suggested that OCR should include a subsection in the final rule that addresses the interaction between section 1557 and State or local laws, making explicit that a State may set more rigorous standards for nondiscrimination in the provision of health care but not lesser protections than those of section 1557. To the extent State or local law offers lesser protections these commenters recommended OCR make explicit that such laws are preempted by Federal law, consistent with the general preemption standard for title I of the ACA, codified at 42 U.S.C. 18041(d).

Response: OCR appreciates these comments regarding the rule's interaction with State and other Federal laws. We agree with commenters who observed that Federal laws, as a general matter, preempt conflicting State laws. *See* U.S. Const. art. 6, cl. 2. We also note that title I of the ACA itself contains a preemption provision, which courts have interpreted to preempt State laws that serve as an obstacle to or frustrate the purpose of the ACA.[34] *See* 42 U.S.C. 18041(d). Accordingly, we decline to alter the regulation to include any additional language under this provision addressing preemption. OCR recognizes that some States may have laws impacting health programs and activities that are contrary to the final rule's nondiscrimination protections, and as discussed later regarding § 92.206 (Equal program access on the basis of sex), section 1557 preempts those laws, though OCR will consider the specific facts of each case and any other relevant factors in determining whether the recipient has a legitimate, nondiscriminatory reason for taking actions that conflict with section 1557. OCR is adding § 92.3(d) regarding State and local laws to provide: ''Nothing in this part shall be construed to supersede State or local laws that provide additional protections against discrimination on any basis described in § 92.1.''

Comment: Commenters recommended that OCR include in the final rule clarification that the Emergency Medical Treatment and Labor Act (EMTALA) protects emergency care for pregnancy and related conditions, including termination of pregnancy.

Response: This rule concerns section 1557 and does not purport to interpret or enforce EMTALA—indeed, OCR does not enforce EMTALA, nor does EMTALA limit or expand the civil rights protections found in section 1557.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.3, with modifications. We are revising § 92.3(c) to provide that, insofar as the application of any requirement under the part would violate applicable Federal protections for religious freedom and conscience, such application shall not be required. For example, 42 U.S.C. 18023 provides (among other things) that, nothing in section 1557 shall be construed to have any effect on Federal laws regarding conscience protection; willingness or refusal to provide abortion; and discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion. We are also adding a new § 92.3(d) to provide that nothing in the part shall be construed to supersede State or local laws that provide additional protections against discrimination on any basis described in § 92.1.

Definitions (§ 92.4)

In § 92.4 of the Proposed Rule, we set out proposed definitions of various terms. The comments and our responses regarding § 92.4 are set forth below.

Auxiliary aids and services. The term auxiliary aids and services was defined in the 2016 Rule and has not been changed substantively. The proposed definition is consistent with the Americans with Disabilities Act (ADA) regulations at 28 CFR 35.104 and 36.303(b) and provides examples of auxiliary aids and services.

Comment: Commenters generally supported the definition of ''auxiliary aids and services.'' Some commenters recommended that the final rule clarify that ''similar services and actions'' are available for all individuals with disabilities, not just for individuals who are deaf or hard of hearing and individuals who are blind or have low vision.

Response: OCR appreciates this comment; however, effective communication requirements are addressed in § 92.202(a). As § 92.4 is simply providing a definition for the term auxiliary aids and services, which is used in § 92.202(b), we do not believe

[34] *See St. Louis Effort for AIDS* v. *Huff,* 782 F.3d 1016, 1021, 1024 (8th Cir. 2015) (partially affirming lower court preliminary injunction because Missouri law ''frustrates Congress' purpose'' and ''pose[s] an obstacle to the accomplishment and execution of the full purposes and objectives of Congress''); *Coons* v. *Lew,* 762 F.3d 891 (9th Cir. 2014), *as amended,* (Sept. 2, 2014) (''The Affordable Care Act presents a classic case of preemption by implication because the Arizona Act 'stands as an obstacle to the accomplishment and execution of the full purposes and objectives of Congress.' ''), *quoting Gade* v. *Nat'l Solid Wastes Mgmt. Ass'n,* 505 U.S. 88, 98 (1992).

it is appropriate to adopt language suggested by the commenters.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''auxiliary aids and services'' as proposed in § 92.4, with one technical correction in paragraph (1) to provide the correct cite for the title II definition of ''qualified interpreter'' by striking ''36.303(b)'' and replacing it with ''36.104.''

Companion. We proposed to define the ''companion'' to mean ''family member, friend, or associate of an individual seeking access to a service, program, or activity of a covered entity, who along with such individual, is an appropriate person with whom a covered entity should communicate.'' This term appeared in the 2016 Rule and has not been changed substantively.

Comment: Many commenters support the inclusion of the term ''companion'' in the definitions section of the regulation, and some highlighted that companions for persons with certain disabilities, such as brain injuries and other conditions with cognitive effects, as well as individuals with sensory disabilities, are critical to effective communication of very sensitive and important medical information. Some commenters suggested that OCR clarify that such companions should be selected by the patient and not the provider.

Response: OCR appreciates the commenters' support for inclusion of this definition. OCR declines to add additional language, as the definition of ''companion'' in this rule is consistent with the definition from 28 CFR 35.160(a)(2) under title II of the ADA, and with the proposed definition in OCR's notice of proposed rulemaking for section 504 at proposed 45 CFR 84.10.[35] We agree that the individual with a disability should be the one to determine who shall serve as their companion absent any concerns of conflict of interest or suspected abuse.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''companion'' as proposed in § 92.4, without modification.

Federal financial assistance. We proposed to define the term ''Federal financial assistance'' to include grants, loans, and other types of assistance from the Federal Government, consistent with the definition of the term in the section 504 and the Age Act implementing regulations at 45 CFR 84.3(h) and 91.4, respectively. We also proposed to specifically include credits, subsidies, and contracts of insurance, in accordance with the statutory language of section 1557. 42 U.S.C. 18116(a). Consistent with the 2016 Rule, we proposed including a clause to clarify that Federal financial assistance includes Federal financial assistance that the Department plays a role in providing or administering.

Comment: Many commenters supported the inclusion of credits, subsidies, contracts of insurance, and grants and loans in this definition. Some commenters recommended expanding the definition of ''Federal financial assistance'' to include Federal disaster relief loans and pandemic relief grants and loans.

Response: The definition of ''Federal financial assistance'' includes funds provided by the Federal Government, including grants and loans, along with Federal financial assistance that the Department plays a role in providing or administering. Because the types of funds raised by the commenters already fall under the longstanding definition of ''Federal financial assistance,'' and the inclusion of specific types of Federal financial assistance would cause unnecessary confusion and may be read as unintentionally limiting the scope of what constitutes Federal financial assistance, we decline to revise the definition.

Comment: Some commenters requested that OCR clarify whether tax-exempt status is considered Federal financial assistance.

Response: OCR appreciates commenters' request for clarity. Generally, tax benefits, tax exemptions, tax deductions, and most tax credits are not included in the statutory or regulatory definitions of Federal financial assistance. *See, e.g.,* 42 U.S.C. 2000d–1 (title VI); 28 CFR. 42.102(c) (Department of Justice Title VI Regulation). Most courts that have considered the issue have concluded that typical tax benefits are not Federal financial assistance because they are not contractual in nature.[36]

Comment: Many commenters supported the definition's inclusion of Federal financial assistance that ''the Department plays a role in providing or administering, including advance payments of the premium tax credit and cost-sharing reduction payments.'' [37] A commenter expressed support for this definition's application to funds extended via programs operated by States under section 1332 State Innovation Waivers, 42 U.S.C. 18052, which could include funds extended to issuers receiving reimbursement through reinsurance programs and entities participating in programs intended to modify or replace Exchanges that would otherwise be within the scope of section 1557.

Response: OCR appreciates these comments and believes it is important to explicitly state in regulatory text that funds that the Department plays a role in providing or administering constitute Federal financial assistance. As explained in the Proposed Rule, 87 FR 47843, this includes funds the Department administers with the Department of the Treasury under the ACA, including advance payments of the premium tax credit, cost-sharing reductions,[38] and pass-through funding available to States with approved section 1332 waivers. Thus, an issuer participating in any Exchange that receives advance payments of the premium tax credit or cost-sharing reductions on behalf of any of its enrollees is receiving Federal financial assistance from the Department.

Section 1332 of the ACA permits a State to apply for a section 1332 waiver to pursue innovative strategies for providing residents with access to high quality, affordable health insurance while retaining the basic protections of the ACA. Section 1332 waiver funds constitute Federal financial assistance and States receiving such funds are recipients. As discussed in the 2022 NPRM, section 1332 allows States to apply to HHS and the Department of the Treasury to waive certain ACA requirements in the individual and small group markets if the waiver satisfies certain statutory

[35] *See* 88 FR 63392, 63465 (Sept. 14, 2023) (proposing to define ''companion'' consistent with ADA title II regulations).

[36] *See, e.g., Paralyzed Veterans of Am.* v. *Civil Aeronautics Bd.,* 752 F.2d 694, 708–09 (D.C. Cir. 1985); *Johnny's Icehouse, Inca* v. *Amateur Hockey Ass'n of Ill., Inc.,* 134 F. Supp. 2d 965, 971–7297172 (N.D. Ill. 2001); *Chaplin* v. *Consol. Edison Co.,* 628 F. Supp. 143, 145–46 (S.D.N.Y. 1986).

[37] *See* section 1412 of the ACA, codified at 42 U.S.C. 18082 (Advance determination and payment of premium tax credits and cost-sharing reductions).

[38] The Department is not currently making cost-sharing reduction payments to issuers. *See* Memo. from Eric Hargan, Acting Sec'y, U.S. Dep't of Health & Hum. Servs., to Seema Verma, Admin'r, Ctrs. for Medicare & Medicaid Servs. (enclosing Attorney General Jeff Sessions' legal opinion, dated October 11, 2017, regarding cost-sharing reduction payments) (Oct. 12, 2017), *https://www.hhs.gov/sites/default/files/csr-payment-memo.pdf.* If the Department begins making cost-sharing reduction payments in the future, such payments would be considered Federal financial assistance.

requirements.[39] 87 FR 47843. For example, under this provision, several States have utilized section 1332 waivers to introduce new or expanded plan options to consumers that lower premiums and/or expand access to coverage, or implemented reinsurance programs to lower premiums and stabilize the individual or small group market by compensating issuers for eligible high-cost claims for enrollees with significant medical costs. These State reinsurance programs use section 1332 pass-through funding to reimburse eligible issuers for high-cost enrollees. These States establish reimbursement eligibility criteria for issuers under the State's reinsurance program, which may include payments to issuers offering coverage both on and off the Exchange. Health insurance issuers receiving payments through a State's section 1332 waiver reinsurance program are subrecipients and therefore subject to section 1557. To the extent a State's waiver utilizes pass-through funding for provider reimbursement those providers would also be subrecipients and subject to section 1557; however pass-through funding received by individual consumers would not be subject to section 1557.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''Federal financial assistance'' as proposed in § 92.4, without modification.

Health program or activity. OCR proposed to adopt a definition of ''health program or activity.'' In paragraph (1), we proposed defining health program or activity to mean any project, enterprise, venture, or undertaking to provide or administer health-related services, health insurance coverage, or other health-related coverage; provide assistance to persons in obtaining health-related services, health insurance coverage, or other health-related coverage; provide clinical, pharmaceutical, or medical care; engage in health research; or provide health education for health care professionals or others.

In paragraph (2), we proposed further defining ''health program or activity'' to include all of the operations of any entity principally engaged in the provision or administration of health projects, enterprises, ventures, or undertakings described in paragraph (1) (''principally engaged''). We proposed that whether such entities are administered by a government or a private entity, all of their operations would be covered under this part.[40] We also invited comment on the circumstances under which a group health plan might receive funds that could be considered Federal financial assistance from the Department, including the type and prevalence of funds received that could be considered Federal financial assistance under this part.

Comment: Commenters expressed a variety of views regarding the application of the rule to health insurance issuers as health programs or activities and the rule's application to all their operations when principally engaged in any project, enterprise, venture, or undertaking to provide or administer health-related services, health insurance coverage, or other health-related coverage, as set forth under paragraph (2) of the definition of ''health program or activity.''

Many commenters supported the inclusion of health insurance issuers and coverage of all their operations when so principally engaged. These commenters argued the 2020 Rule's approach, which applies to health insurance issuers only to the extent a specific plan receives Federal financial assistance, is contrary to the text of section 1557, the CRRA, and the broad remedial intent of Congress in enacting the ACA to ensure access to health insurance. Specifically, commenters argued the 2020 Rule is arbitrary and contrary to the plain language of section 1557, which applies to ''any health program or activity, *any part of which is receiving Federal financial assistance*'' (emphasis added) and specifically includes three examples of Federal financial assistance that refer to health insurance (''credits, subsidies, or contracts of insurance''). 42 U.S.C. 18116(a). This statutory language, commenters argued, affirms that Congress intended section 1557 to apply to the entire health program or activity, not just the parts that directly receive Federal financial assistance. Commenters noted that the statutory text should be construed broadly and stated that the Proposed Rule's application to health insurance will align with the application to all operations of other covered entities.

Many commenters raised objections to the 2020 Rule's provision at § 92.3(b) that covers all operations of an entity only when principally engaged ''in the business of providing *healthcare*'' (emphasis added), in combination with § 92.3(c) that specified a health insurance issuer was not considered to be principally engaged in the business of providing health care merely by virtue of providing health insurance, which resulted in the 2020 Rule not covering all operations of a recipient health insurance issuer. Commenters stated this approach was inconsistent with Congress's approach in the CRRA, which supports an expansive interpretation of section 1557's application to cover all operations of a recipient if any part of it receives Federal financial assistance. Specifically, one commenter asserted that the section 1557 statute's use of the CRRA language ''program or activity'' and ''any part of which,'' coupled with the statute's reference to title VI, title IX, section 504, and the Age Act, demonstrate Congress's intent to adopt the same broad application for section 1557. Commenters also argued the 2020 Rule's approach is inconsistent with the text of section 1557, which broadly applies to health programs or activities and is not limited to the delivery of health care. Commenters challenged the 2020 Rule's contention that health insurance is not health care, arguing that health insurance issuers are in fact engaged in the business of health care and that other parts of the ACA support this position. For example, ''health care entity'' is defined to include ''a health insurance plan'' under 42 U.S.C. 18113(b) and 42 U.S.C. 300gg–91(b)(1) defines ''health insurance coverage'' to mean benefits consisting of medical care.'' Among other things, commenters cited to section 1551 of the ACA, 42 U.S.C. 18111, which specifies that, unless otherwise indicated, the definitions in 42 U.S.C. 300gg–91 apply to title I of the ACA.

Conversely, other commenters urged the Department to retain the 2020 Rule's approach, asserting that the CRRA limits the scope of section 1557 with regard to all operations of a program or activity to only those that are ''principally engaged in the business of providing . . . *healthcare*'' (emphasis added).

Others argued that the Proposed Rule's application to health insurance is

[39] Sections 1332(a)–(b) of the ACA, codified at 42 U.S.C. 18052(a)–(b). States with approved waivers have specific terms and conditions (STCs) pursuant to which the state must also comply with all applicable Federal statutes relating to nondiscrimination, including section 1557. *See, e.g.,* Ctrs. for Medicare & Medicaid Servs., approval of New Jersey's extension application for a section 1332 State Innovation Waiver, STC 4 (Aug. 15, 2023), *https://www.cms.gov/files/document/1332-nj-extension-approval-letter-stcs-final.pdf.*

[40] *See, e.g., Fain* v. *Crouch,* 545 F. Supp. 3d 338, 343 (S.D.W. Va. 2021), *rehearing en banc granted,* No. 22–1927 (4th Cir. Apr. 12, 2023) (oral argument held Sept. 21, 2023) (argued with *Kadel* v. *Folwell,* No. 22–1721) (holding that defendant health plan was, ''by virtue of its acceptance of Federal assistance under its Medicare Advantage program,'' required to comply with section 1557 ''under its entire portfolio'').

too broad and should not apply to all operations of a health insurance issuer, particularly its lines of business that do not receive Federal financial assistance. Specifically, commenters noted that because health insurance issuers participate in some types of health insurance that receive Federal financial assistance and other types that do not, the Proposed Rule would require compliance even in activities that do not benefit from Federal financial assistance. Commenters opined that this interpretation goes beyond the scope of Congressional intent, where Congress did not apply the protections to *any* entity engaging in health programs and activities, but only to those health programs and activities that specifically receive Federal financial assistance. One organization asserted that the Proposed Rule could result in health insurance issuers incurring substantial costs and declining to participate in or withdrawing from the Exchanges, the Medicaid managed care market, or the Medicare Advantage market, resulting in reduced coverage options in those markets.

Response: In re-evaluating the 2020 Rule's interpretation of ''health program or activity'' as it relates to health insurance and in deciding to add a definition of ''health program or activity,'' OCR considered a number of factors, including the plain language of section 1557, the context of its placement within the ACA, long-standing civil rights principles, and relevant case law.

The 2020 Rule does not include a definition of ''health program or activity,'' but rather addresses the term under § 92.3, the scope of application section. The 2020 Rule provides that ''health program or activity'' encompasses ''all of the operations of entities principally engaged in the business of providing *healthcare*'' (emphasis added) and specifies that a health insurance issuer is not considered to be principally engaged in the business of providing health care merely by virtue of providing health insurance. 45 CFR 92.3. The 2020 Rule further provides that for entities not principally engaged in the business of providing health care, their operations are only covered under the rule to the extent such operation is a health program or activity that receives Federal financial assistance. 45 CFR 92.3(b). Thus, the 2020 Rule limits OCR's jurisdiction over health insurance issuers to only their plans that directly receive Federal financial assistance. This is in contrast to the 2016 Rule, which defined ''health program or activity'' to include all the operations of entities principally engaged in health services, health insurance coverage, or other health-related coverage, including health insurance issuers, at former 45 CFR 92.4.

OCR agrees with commenters' assessment that the Proposed Rule's approach to the inclusion of health insurance coverage and other health-related coverage in the definition of ''health program or activity'' is most consistent with section 1557's statutory text and Congressional intent. The statutory text demonstrates Congress's clear intent to apply section 1557 to health insurance coverage and other health-related coverage. This statutory text does not support the 2020 Rule's limiting ''health program or activity'' to encompass all of the operations of only those entities principally engaged in the business of providing ''healthcare.'' Under the plain language of the statute, section 1557 applies to any ''health'' program or activity not ''healthcare'' program or activity. And the provision of health insurance coverage and other health-related coverage is plainly classified under the term ''health.'' Private health insurance issuers exercise significant control over enrollees' access to health care and play a critical role in the business of health care, as insurance is an essential component of ensuring that people receive care in the current health care system. For example, a district court opinion on this issue held that a health insurance issuer, by virtue of being the ''gatekeeper'' to the plaintiff's health services, qualified as a '' 'health program' that Congress intended to rid of discrimination.'' [41]

Further, as we discussed in the Proposed Rule, 87 FR 47845, the fact that Congress placed section 1557 in title I of the ACA, a title that predominantly regulates health insurance coverage and other health-related coverage with the purpose of increasing access to care and reducing discriminatory insurance practices, demonstrates Congress's intent for section 1557 to protect individuals from discrimination in health insurance coverage and other health-related coverage.

While not dispositive, we do appreciate commenters' thoughts on whether health insurance issuers are in fact engaged in the business of providing health care. Commenters among other things, cited to section 1551 of the ACA, which specifies that, unless otherwise indicated, the definitions in 42 U.S.C. 300gg–91 shall apply with respect to title I of the ACA. Section 300gg–91(b)(1) defines the term ''health insurance coverage'' as ''benefits consisting of *medical care (provided directly, through insurance or reimbursement,* or otherwise and including items and services paid for as medical care) . . . .'' (Emphasis added.) The 2020 Rule specifies that ''medical care'' as used in that provision is limited to the ''amounts paid for'' certain medical services and that a health insurance issuer is not considered to be principally engaged in the business of providing health care merely by virtue of providing health insurance. However, the text of section 1557 does not support the 2020 Rule's position that the rule applies only to the business of providing ''healthcare.''

OCR found commenters' concerns regarding the negative consequences that could result from the Proposed Rule's scope of application to insurance issuers unpersuasive given the lack of information provided to substantiate their concerns. For example, one commenter cited to Exchange participation statistics that indicated certain issuers have limited or no Exchange participation.[42] However, the statistics do not demonstrate the reason for such issuers' lack of participation or provide evidence that an issuer's decision not to participate in an Exchange was due to apprehension that section 1557 would apply to its activities that did not receive Federal financial assistance.

The application of civil rights laws to all operations of an entity receiving Federal financial assistance is not new and did not originate with section 1557. For more than 35 years, under the CRRA, a recipient of Federal financial assistance that accepts Federal funds in any part of its program has been required to comply with title VI, section 504, and the Age Act in ''all of the[ir] operations.'' [43] The CRRA specifies that the entire program or activity, as defined in that statute, is required to comply with title VI, section 504, and the Age Act if any part of the program or activity receives Federal financial

[41] *Fain* v. *Crouch,* 545 F. Supp. 3d 338, 342–43 (S.D.W. Va. 2021) (finding '' 'health program or activity' under Section 1557 necessarily includes health insurance issuers'' and holding that defendant health plan was, ''by virtue of its acceptance of federal assistance under its Medicare Advantage program,'' required to comply with section 1557 ''under its entire portfolio''), *rehearing en banc granted,* No. 22–1927 (4th Cir. Apr. 12, 2023) (oral argument held Sept. 21, 2023) (argued with *Kadel* v. *Folwell,* No. 22–1721).

[42] Mark Farrah Assocs., *http://www.markfarrah.com* (statistics compiled using data from the National Association of Insurance Commissioners, the California Department of Managed Health Care, and CMS).

[43] Public Law 100–259, 102 Stat. 29 (Mar. 1988), codified at 20 U.S.C. 1687; 29 U.S.C. 794(b); 42 U.S.C. 2000d–4(a); 6107(4).

assistance. We note that the terms ''program'' and ''program or activity'' predate the CRRA in the underlying civil rights statutes, and the legislative history of the CRRA indicates that Congress did not believe it was enacting a new definition, but rather overturning an overly narrow construction of the term by the Supreme Court and thereby restoring what Congress and the executive branch had previously understood to be a broad, institution-wide application of the term ''program.'' *See* S. Rep. No. 100–64 (1987). OCR maintains that Congress adopted a similar approach in section 1557 by specifying in the statute that section 1557 applies when ''any part of'' the health program or activity receives Federal financial assistance.[44] Entities must comply with civil rights laws just as they must comply with any other State or Federal law that is applicable to their operations.

The 2020 Rule states it was applying the CRRA's definition of ''program or activity'' to cover all operations of entities under section 1557 only when they are ''principally engaged in the business of providing healthcare.'' We received some comments in support of the approach in that rulemaking, and while we appreciate the importance of the CRRA in shaping the interpretation of the scope of Federal civil rights protections under title VI, section 504, title IX, and the Age Act, it is not applicable here. Section 1557 employs the term ''program or activity'' without adopting by reference the CRRA or any of the underlying civil rights statutes. The 2020 Rule erred in applying the CRRA to narrow the application of section 1557 by excluding a significant portion of the health insurance industry. If Congress had intended to limit section 1557 to entities principally engaged in the business of providing ''healthcare,'' it could have provided as such in the statute. Instead, the statute expressly modified ''program or activity'' with ''health,'' without requiring that that entity be ''principally engaged in the business of providing healthcare.''

While Congress did not incorporate the CRRA into section 1557 wholesale, it stated that section 1557 applies to ''any health program or activity, *any part of which* is receiving Federal financial assistance.'' 42 U.S.C. 18116(a) (emphasis added). By modifying ''program or activity'' with ''health,'' and noting a health programs or activity is covered if ''any part'' of it receives Federal financial assistance, it is reasonable to infer that Congress intended the term ''health program or activity'' to be interpreted broadly and to include all of that entity's operations, if the entity that receives Federal funding is principally engaged in the provision or administration of health insurance coverage or other health-related coverage. And because ''health program and activity'' is undefined in the section 1557 statute, it is also reasonable to infer that those health programs or activities include health-related services, health insurance coverage, or other health-related coverage.

Comment: One commenter argued that, because the CRRA delineates the scope of coverage of section 1557's underlying civil rights statutes, failing to include this limitation in the final rule would expand the notion of Federal financial assistance to ultimate beneficiaries of the funding and would have significant effect on other civil rights laws dealing with funding, including title VI, title IX, and others.

Response: The commenter's concerns regarding interference with the longstanding principle that Federal civil rights laws do not apply to direct, unconditional assistance to ultimate beneficiaries are unsupported. Ultimate beneficiaries are the intended class of private individuals receiving Federal aid,[45] a concept that is not impacted or modified under this rulemaking. In fact, the definition of ''recipient'' in the final rule at § 92.4 adopts standard language that explicitly states that the term ''does not include any ultimate beneficiary.''

Comment: OCR received comments specifically related to the rule's application to health insurance issuers' other products and lines of business that do not receive Federal financial assistance, such as health insurance coverage sold off the Exchange, excepted benefits, short-term, limited-duration insurance, and third party administrator activities.

Response: These comments are addressed in the *Scope of Application* discussion under § 92.207 (Nondiscrimination in health insurance coverage and other health-related coverage).

Comment: Some commenters, including an association representing State insurance regulators, critiqued OCR's ''fungibility of funds'' rationale for including all operations of recipients that are principally engaged in the provision or administration of health insurance coverage. These commenters argued it is inappropriate to consider funding to be fully fungible in the context of health insurance, where issuers justify their premiums based on expected costs in a particular market, not across all operations, and thus Federal financial assistance for one type of coverage does not actuarially support or subsidize an issuer's operations in other markets. Commenters noted that entities have a myriad of corporate structures, and that Federal funds received by one legal entity might not be shared with sibling entities in unrelated business ventures. Commenters pointed to the 2016 Rule's analysis regarding liability of third party administrators, where OCR discussed that a third party administrator that is legally separate from an issuer is unlikely to be covered under the rule. 81 FR 31433.

Conversely, other commenters agreed with OCR's fungibility of funds rationale, and argued that Federal financial assistance going to any part of a health program or activity necessarily benefits the entity receiving such funds as a whole. These commenters noted that a narrower construction, in which nondiscrimination rules apply only to part of a recipient, makes it easier for discriminatory actors to structure their operations to evade responsibility and frustrates the purpose of the statute.

Response: As commenters noted, OCR discussed the fungibility of funds rationale as one means of support for the interpretation that all of a health insurance issuer's operations will be covered by the final rule when the health insurance issuer receives Federal financial assistance. *See* 87 FR 47844. However, we note that reliance on this rationale is not necessary to support OCR's interpretation that this final rule applies to all of the operations of a recipient that is ''principally engaged,'' as discussed above. Under the best reading of the statutory text, where an entity receives Federal financial assistance and that entity is ''principally engaged in the provision or administration of any health projects, enterprises, ventures, or undertakings described in paragraph (1)'' of the definition of ''health program or activity,'' the whole entity is defined as a health program or activity covered under section 1557 and must comply with the final rule.

We acknowledge that covered entities may structure their businesses in a variety of ways. Unless an entity that is principally engaged can demonstrate that part of their operations is truly a separate legal entity, as discussed below, a recipient that is principally engaged is liable for all its operations under the final rule.

[44] *Compare* CRRA, 20 U.S.C. 1687(4) (''any part of which is extended Federal financial assistance'') *with* section 1557, 42 U.S.C. 18116 (''any part of which is receiving Federal financial assistance'').

[45] U.S. Dep't of Justice, Title VI Legal Manual, section V.C.2.F.

Comment: One organization recommended that OCR explicitly identify patient billing and collections activities as ''health programs or activities'' by amending the definition to add a new paragraph (1)(vi) as follows: ''provide or administer billing and collections services for health-related services, including providing assistance to persons to obtain financial help or counseling.''

Response: This final rule, consistent with OCR's other civil rights implementing regulations, prohibits covered entities—directly or through contractual or other arrangements—from discriminating in patient billing and collection activities related to health programs and activities. For example, a hospital's in-house administration of billing would be covered and any contractual arrangement for collections of debt would also be covered. We decline to add the recommended language because it is unnecessary.

Comment: Many commenters strongly supported the Proposed Rule's explicit inclusion of health research in the definition of ''health program or activity.'' Some commenters recommended updating paragraph (1)(iv) to include ''clinical'' research for clarity and to update paragraph (2) to include: ''clinical trial sites including wherever potential clinical trial participants are screened or recruited'' in the list of entities considered ''principally engaged.'' In addition, other commenters recommended that OCR provide technical guidance in what ''inclusion'' in clinical research looks like and how it can be achieved through nondiscriminatory research protocols.

Response: OCR supports the request to include clinical research in the definition of ''health program and activity,'' and have revised paragraph (1)(iv) accordingly. Clinical research is the comprehensive study of the safety and effectiveness of the most promising advances in patient care, and is different from laboratory research as it involves people who volunteer to help the field better understand medicine and health.[46] However, we decline to add reference to physical sites, as the jurisdiction applies to the health program or activity regardless of where it takes place and whether it can be said to take place at a site at all. For example, if a hospital receives a grant from the National Institutes of Health to conduct a clinical study on the effects of Tuberous Sclerosis Complex, the hospital is prohibited from discriminating in its screening and recruitment activities wherever they take place, such as at the hospital itself, at community health fairs, online, or at the home of a hospital researcher who is working out of their own home.

Comment: One organizational commenter requested that OCR clarify section 1557's application to health research projects and activities to explicitly recognize that health research is conducted to answer specific questions, and that research protocols may target or exclude certain populations where nondiscriminatory justifications show that such criteria are appropriate, consistent with the 2016 Rule preamble.

Response: Consistent with the 2016 Rule, OCR does not intend the inclusion of health or clinical research within the definition of ''health program or activity'' to alter the fundamental nature in which research projects are designed, conducted, or funded. 81 FR 31385. As in the 2016 Rule, we note that criteria in research protocols that target or exclude certain populations are warranted where nondiscriminatory justifications establish that such criteria are appropriate with respect to the health or safety of the subjects, the scientific study design, or the purpose of the research. *See* 81 FR 31385.

Comment: Some commenters recommended that OCR narrow the definition of ''health program or activity'' to exclude programs and activities unrelated to health. These commenters also requested that OCR clarify what ''any project, enterprise, venture or undertaking to provide or administer health-related services'' means. For example, these commenters were unclear whether a health-related venture may include such things as vitamin manufacturing.

Response: The final rule applies to health programs and activities that receive Federal financial assistance from the Department (or that are administered by the Department or a title I entity) and does not apply generally to programs and activities that are unrelated to health. However, where an entity is principally engaged as set forth in paragraph (2) of the definition of ''health program or activity,'' all operations of the covered entity must comply with the final rule. This applies even where the covered entities' other operations are not necessarily health-related.

Though not an exhaustive list, ''health-related service'' would include the provision of medical, dental, and pharmaceutical care; preventive health services; physical, occupational, or speech therapy; behavioral health care; clinical trials; and transportation to and from such services when necessary to facilitate access to other health-related services.[47] Should an entity engaged in commercial vitamin manufacturing receive Federal financial assistance from the Department, OCR would conduct an analysis as to whether the program or activity in question meets the definition of ''health program or activity.''

Comment: A few commenters urged the Department to expressly list Medicaid programs, Children's Health Insurance Program (CHIP), or the Basic Health Program in its definition for ''health program or activity.''

Response: The 2016 Rule included Medicaid programs, CHIP and the Basic Health Program in its definition of ''health program or activity'' at former 45 CFR 92.4. As stated in the preamble to the 2022 NPRM, these entities would be covered in their entirety as operations of State or local health agencies and we sought comment on whether such programs should be explicitly referenced in the regulatory language. 87 FR 47844. For clarity and to reduce confusion, OCR accepts the recommendation to include State Medicaid programs, CHIP, and the Basic Health Program in paragraph (2) of the definition of ''health program or activity.''

Comment: Numerous commenters objected to the 2022 NPRM's proposal to not explicitly include group health plans[48] in the list of entities considered to be principally engaged in paragraph (2) of the ''health program or activity''

[46] John Hopkins Medicine, Research, *Understanding Clinical Trials, Clinical Research: What Is It?, https://www.hopkinsmedicine.org/research/understanding-clinical-trials/clinical-research-what-is-it.html.*

[47] *See, e.g.,* 42 CFR 431.53 (requiring a state Medicaid plan to specify that the Medicaid agency will ensure ''necessary transportation for beneficiaries to and from providers'').

[48] ''Group health plan'' is defined in the Employee Retirement Income Security Act (ERISA) as an employee welfare benefit plan to the extent that the plan provides medical care (as defined in paragraph (2) and including items and services paid for as medical care) to employees or their dependents (as defined under the terms of the plan) directly or through insurance, reimbursement, or otherwise. Such term shall not include any qualified small employer health reimbursement arrangement (as defined in 26 U.S.C. 9831(d)(2)). 29 U.S.C. 1191b(a)(1); *see also* 42 U.S.C. 300gg–91(a)(1). ''Employee welfare benefit plan'' is defined in ERISA as any plan, fund, or program which was heretofore or is hereafter established or maintained by an employer or by an employee organization, or by both, to the extent that such plan, fund, or program was established or is maintained for the purpose of providing for its participants or their beneficiaries, through the purchase of insurance or otherwise, (A) medical, surgical, or hospital care or benefits, or benefits in the event of sickness, accident, disability, death or unemployment, or vacation benefits, apprenticeship or other training programs, or day care centers, scholarship funds, or prepaid legal services, or (B) any benefit described in 29 U.S.C. 186(c) (other than pensions on retirement or death, and insurance to provide such pensions). 29 U.S.C. 1002(1).

definition. Expressing concerns that this would result in confusion that the rule excludes group health plans, commenters urged OCR to reinstate the 2016 Rule's approach by expressly including group health plans in the definition of ''health program or activity.'' Former 45 CFR 92.4.

Commenters further suggested that the rule clarify that group health plans are covered entities when the group health plan itself receives Federal financial assistance or when the employer sponsoring the group health plan receives Federal financial assistance, such as through an Employer Group Waiver Plan (EGWP) or Retiree Drug Subsidy (RDS) plan. Some commenters argued that an employer and a group health plan should not be treated as distinct entities for purposes of section 1557 jurisdiction, and that group health plans should be considered indirect recipients of Federal financial assistance when the employer receives Federal funds.

Other commenters stated that employers are usually the sponsors of group health plans and were concerned that OCR's case-by-case analysis may find an employer liable under section 1557 based on the employee benefits it provides. Several commenters expressed concerns with OCR's proposed approach to conduct a case-by-case review to determine whether a group health plan is a covered entity and requested that OCR provide additional clarity on when employers and group health plans are liable under the rule.

Response: Commenters' concerns that group health plans would never be subject to the rule if they are not expressly included in the definition of ''health program or activity'' are unwarranted. The list of entities included as principally engaged, at paragraph (2), is not exhaustive. The fact that a group health plan is not expressly included in paragraph (2) does not affect the determination of whether a group health plan is principally engaged under this definition. As group health plans provide or administer group health coverage, they would be operating a health program or activity under the rule and would be subject to this rule if in receipt of Federal financial assistance. Further, recipient group health plans, like health insurance issuers, would be considered to be principally engaged in the provision or administration of health insurance coverage or other health-related coverage, meaning all their operations would be covered.

In the 2022 NPRM, we declined to expressly include group health plans in the definition of ''health program or activity'' in an attempt to reduce confusion because many group health plans do not receive Federal financial assistance. 87 FR 47845. It remains OCR's understanding that many group health plans do not receive Federal financial assistance, and thus we decline commenters' request to add group health plans to the non-exhaustive list of entities that are considered principally engaged that is provided in paragraph (2) of the definition of ''health program or activity.''

A group health plan that receives Federal financial assistance itself is distinct from other entities that might separately receive Federal financial assistance, such as the plan sponsor of the group health plan or the third party administrator administering the plan. As such, a group health plan does not necessarily become a covered entity under this rule by virtue of the plan sponsor or third party administrator's receipt of Federal financial assistance. Single employers that are plan sponsors of single-employer group health plans and joint boards of trustees or similar bodies, associations, and other groups that are plan sponsors of multiemployer Taft-Hartley plans or multiple employer welfare arrangements (MEWAs) do not become covered entities under the rule due to their employment practices, including the provision of employee health benefits. Later in this section, we address how OCR will determine whether related business entities are considered separate legal entities under section 1557.

When OCR receives a complaint alleging discrimination related to a group health plan, we will conduct a fact-specific analysis to determine if the group health plan is a recipient or subrecipient of Federal financial assistance. We decline to take the position that a group health plan is an indirect recipient of Federal financial assistance whenever the plan sponsor receives Federal financial assistance. Determining whether an entity is an indirect recipient requires a fact-specific inquiry.[49]

Entities that receive Federal financial assistance from the Department for an EGWP or RDS plan would be subject to this rule, though we note that employers and other plan sponsors are not subject to this rule with regard to their employment practices, pursuant to § 92.2(b). This includes when the Federal financial assistance received is for their employee health benefits. For more information about employer and plan sponsor liability, see the previous discussion under § 92.2(b).

In addition, as noted in the Proposed Rule, covered entities that contract with a group health plan could be subject to this rule themselves, regardless of the group health plan's liability. For instance, recipient health insurance issuers may be covered under this rule when offering health insurance coverage to a fully-insured group health plan or when providing third party administrator services for a self-funded group health plan.[50] We also noted in the Proposed Rule at 87 FR 47845 that even if a group health plan is not subject to section 1557, group health plans may be subject to other Federal nondiscrimination requirements.[51]

Comment: Some commenters urged OCR to expressly include pharmacy benefit managers in the definition of ''health program or activity.'' Commenters argued it was important to do so because pharmacy benefit managers play a significant role in developing and administering prescription drug benefits, and section 1557 can serve to prevent certain practices that may result in discriminatory access to medications, such as coverage criteria, utilization management practices, limitations on

[49] *See, e.g., Doe One* v. *CVS Pharmacy, Inc.,* No. 18–CV–01031–EMC, 2022 WL 3139516, slip op. at 7, 9 (N.D. Cal. Aug. 5, 2022) (analyzing whether defendant pharmacy benefit manager is an indirect recipient of Federal financial assistance from defendant pharmacy chain and, relying on the section 1557 statute and 2020 Rule, holding that CVS Pharmacy, Inc. is principally engaged in the business of health care and all of its operations are covered by section 1557, including its pharmacy benefit managers Caremark, L.L.C. and Caremark PCS Health, L.L.C.).

[50] *See, e.g., Tovar* v. *Essentia Health,* 857 F.3d 771, 778 (8th Cir. 2017) (holding that a third party administrator could be liable under section 1557 for damages arising from discriminatory terms in a self-funded employer-provided health plan if the third party administrator provided the employer with a discriminatory plan document, notwithstanding the fact that the employer subsequently adopted the plan and maintained control over its terms); *C.P.* v. *Blue Cross Blue Shield of Ill.,* No. 20–cv–6145, 2022 WL 17788148, *7–9 (W.D. Wash. Dec. 19, 2022) (relying on the section 1557 statute because the ''2020 Rule is contrary to the statutory law, and the rule appears to be arbitrary, capricious and contrary to law,'' and holding that a health insurance issuer acting as a third party administrator for a self-funded employer-provided plan is a covered entity under section 1557, regardless of whether the discriminatory exclusion originated with the third party administrator, and ERISA's requirement that decisions be made in accordance with the plan documents is no defense as ERISA expressly provides that it is not to be construed to invalidate or impair Federal laws like section 1557).

[51] For example, group health plans and health insurance issuers offering group or individual health insurance coverage are generally prohibited from establishing any rule for eligibility, benefits, or premiums or contributions that discriminates based on any health factor. 26 U.S.C. 9802: 29 U.S.C. 1182; 42 U.S.C. 300gg–4; 26 CFR 54.9802–1; 29 CFR 2590.702; 45 CFR 146.121, 147.110.

where medicines can be dispensed, and high out of pocket costs.

Response: We decline to list pharmacy benefit managers expressly in paragraph (2) of the definition of ''health program or activity.'' Pharmacy benefit managers are entities that manage prescription drug benefits for issuers, group health plans, Medicare Part D drug plans, and other payers, such as State Medicaid programs (collectively known as ''payers'').[52] In their role of administering prescription drug benefits on behalf of payers, pharmacy benefit managers develop drug formularies and related policies, create pharmacy networks, reimburse pharmacies for patients' prescriptions, negotiate rebates and fees with drug manufacturers, process enrollees' claims and appeals, and review drug utilization, among other things.[53] These activities constitute the operation of health programs and activities under section 1557.

If pharmacy benefit managers receive Federal financial assistance from the Department, either directly or indirectly, they are subject to this rule. Further, if they are principally engaged under paragraph (2), all their operations are covered by the rule.

As discussed previously, the fact that a type of entity—such as a pharmacy benefit manager—is not expressly included in the definition of ''health program or activity'' does not mean that those entities are excluded from the rule or could never be subject to section 1557 jurisdiction. Even if a pharmacy benefit manager does not receive direct Federal financial assistance, we note that the three largest pharmacy benefit managers are integrated with large health insurance or pharmacy companies, and thus could be covered under the rule as part of the operations of a health program or activity receiving Federal financial assistance.[54]

Determining whether a pharmacy benefit manager is subject to the rule as part of the operations of a recipient health program or activity is a fact-specific analysis based on the corporate structure of the entity.

Comment: Commenters requested that OCR provide more clarity on how it will analyze whether corporate subsidiaries and related business entities are subject to section 1557 as part of a covered entity's operations. Specifically, some commenters were concerned about health insurance issuers that receive Federal financial assistance avoiding responsibility through use of subsidiaries in their other activities, such as third party administrators or pharmacy benefit managers. Conversely, other commenters expressed concerns that the rule would apply too broadly to an issuer's business ventures that are unrelated to their federally funded activities.

Response: As stated throughout this section, if any part of a health program or activity receives Federal financial assistance and the entity administering said health program or activity is principally engaged as provided in paragraph (2), then all the operations of the recipient are subject to the rule. If a part of a recipient's operations is determined to be a separate legal entity independent from its federally funded activities, that part would not be subject to the rule. When determining whether an entity's subsidiaries or other entities are legally separate from the federally funded activities, OCR may consider—among other things—the organizational structure and the interrelatedness between the entities, such as the degree of common ownership, management, and control between the entities, and whether the entities share centralized control of labor relations; whether the entity has some ability to accept or reject the Federal funding or exercise controlling authority over a federally funded program; [55] and whether the purpose of the legal separation was to avoid liability or avoid the application of civil rights law requirements, meaning it is intended to allow the entity to continue to discriminate.[56]

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''health program or activity'' as proposed in § 92.4, with modifications. We have revised paragraph (1)(iv) to include clinical research, such that it will now read: ''Engage in health or clinical research.'' We have also revised paragraph (2) to include ''a State Medicaid program, Children's Health Insurance Program, and Basic Health Program'' as examples of entities principally engaged under this definition.

Information and communication technology (ICT). We proposed to define the term ''ICT'' to mean ''information technology and other equipment, systems, technologies, or processes, for which the principal function is the creation, manipulation, storage, display, receipt, or transmission of electronic data and information, as well as any associated content.'' We also provided examples of ICT in our proposed definition.

Comment: Some commenters urged OCR to include ''electronic health records (EHRs)'' as an example within the definition of ''information and communication technology''.

Response: We appreciate that there are many different examples that can fit within the definition of ''information and communication technology''. We agree that EHRs meet the definition of ''information and communication technology''; however, we believe that it is unnecessary to specify this in the final rule.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''information and communication technology'' as proposed in § 92.4, without modification.

Language assistance services. OCR proposed to define the term ''language assistance services'' to include, but not be limited to: (1) oral language assistance, including interpretation in non-English languages provided in-person or remotely by a qualified interpreter for a limited English proficient individual, and the use of services of qualified bilingual or multilingual staff to communicate directly with limited English proficient

Sept. 15, 2010) (title IX, section 504); *Margeson* v. *Springfield Terminal Railway Co.,* 1993 U.S. Dist. LEXIS 12243, No. CIV.A. 91–11475–Z (D. Mass. Aug. 24, 1993) (section 504).

[56] *Papa* v. *Katy Indus., Inc.,* 166 F.3d 937, 941 (7th Cir. 1999), *cert. denied,* 528 U.S. 1019 (1999).

individuals; (2) written translation, performed by a qualified translator, of written content in paper or electronic form into or from languages other than English; and (3) written notice of availability of language assistance services. The definitions of oral language assistance and written translation appeared in both the 2016 Rule at former § 92.4 and the 2020 Rule at § 92.101 in paragraphs (2)(i) and (iii) and have not been changed. The 2016 Rule did not explicitly include a written notice of availability of language assistance services in the definition of ''language assistance services,'' but rather included the term ''taglines,'' which was defined to mean ''short statements written in non-English languages that indicate the availability of language assistance services free of charge.''

Comment: One commenter recommended that the definition of ''language assistance services'' include assistance with form completion in another language. The commenter noted that many individuals with limited English proficiency (LEP) as well as many others (including older individuals and those with limited access to technology) have difficulty completing online forms to apply for health benefits or report life changes.

Response: OCR appreciates the suggestion and agrees it is critical for individuals with LEP to receive language assistance in completing forms. The definition of ''language assistance services'' is intended to provide a non-exhaustive list of some of the means by which a covered entity may facilitate such access—namely, oral interpretation and written translation as provided by qualified interpreters and translators, respectively. This definition works together with the requirements at § 92.201, which provide that covered entities must take reasonable steps to provide meaningful access to individuals with LEP. If an individual with LEP needs assistance with form completion in a covered health program or activity, a covered entity must provide language assistance services consistent with the requirements at § 92.201. OCR declines to modify the definition of ''language assistance services'' as suggested because the context in which services are provided is not germane to the definition.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''language assistance services'' as proposed in § 92.4, with modification. As discussed in the following summary of regulatory changes to the proposed term ''limited English proficient individual,'' we are revising the term to ''individual with limited English proficiency'' in § 92.4.

Limited English proficient individual. OCR proposed to define the term ''limited English proficient individual'' to mean ''an individual whose primary language for communication is not English and who has a limited ability to read, write, speak, or understand English.'' Further, OCR proposed that a ''limited English proficient individual'' ''may be competent in English for certain types of communication (*e.g.,* speaking or understanding), but still be limited English proficient for other purposes (*e.g.,* reading or writing).'' These definitions appeared in the 2016 Rule and have not changed substantively. Former 45 CFR 92.4 (2016 Rule). OCR sought comment on whether to use the term ''limited English proficient individual'' or ''individual with limited English proficiency'' throughout the rule.

Comment: Some commenters recommended the final rule adopt the language either ''people with limited English proficiency'' or ''individual with limited English proficiency'' instead of ''limited English proficient individual.''

Response: OCR agrees with this recommendation and OCR is finalizing the rule with the term ''individual with limited English proficiency'' throughout.

Comment: Several commenters supported the proposed definition's emphasis that an individual with LEP includes those who may be competent in English for certain types of communication but still have limited English proficiency for other purposes. Commenters explained that this will ensure providers and other covered entities understand that people who have some English competency may still need translated written materials. Commenters noted this will improve language access and have far-reaching consequences for patients who both seek and receive care, which will also reduce barriers to quality health care for individuals with LEP.

Response: We appreciate the support of inclusion of additional details around what it means to be ''limited English proficient'' and are finalizing the definition as proposed.

Comment: A few commenters that agreed with the proposed definition urged that the word ''and'' be replaced with ''or'' to read ''an individual whose primary language for communication is not English *or* who has a limited ability to read, write, speak, or understand English . . .'' These commenters explained that there are many people in the United States whose primary language is English but who have a limited ability to read, write, speak, or understand English, for reasons that may or may not be related to disability, who deserve protection from discrimination.

Response: OCR appreciates the commenters' recommendation and recognizes that there are many individuals whose primary language is English but who have a limited ability to read, write, speak, or understand English. However, section 1557's language access provisions rely on the statute's prohibition on national origin discrimination.[57] For individuals with LEP, the lack of proficiency in English and the use of non-English languages is often tied to their national origin. Changing the definition to include an individual who has a limited ability to read, write, speak, or understand English, but whose primary language is English, would go beyond national origin discrimination. With respect to individuals who have a limited ability to read, write, speak, or understand English related to disability, § 92.202 addresses requirements for effective communication for individuals with disabilities, which is a long-standing requirement.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''limited English proficient individual'' as proposed in § 92.4, with modification. We are changing ''limited English proficient individual'' to ''individual with limited English proficiency'' in § 92.4 and throughout the final rule.

Machine translation. OCR proposed to define the term ''machine translation'' to mean ''automated translation, without the assistance of or review by a qualified human translator, that is text-based and provides instant translations between various languages, sometimes with an option for audio input or output.'' Neither the 2016 Rule nor the 2020 Rule addressed machine translation. We invited comment on the adequacy of this new definition.

Comment: We received many comments in support of the inclusion of a definition of ''machine translation''. One commenter supported the language as proposed but noted the importance of adaptability and potential for future regulation or guidance over time as

[57] *See Lau* v. *Nichols,* 414 U.S. 563, 568–69 (1974).

technology changes. For example, machine translation companies may develop technology that includes some level of human review but remains insufficient for the purposes of conforming with the intent of this rule.

Response: We appreciate commenters' support for the inclusion of this definition. The requirement to provide written translations via a qualified translator included at § 92.201(c)(2) continues to apply, regardless of whether human or machine translation is provided. Section 92.201(c)(3) requires a human translator to review machine translation under certain circumstances. The circumstances outlined in § 92.201(c)(3) set a minimum requirement for when machine translations must be reviewed by a qualified human translator—including circumstances that are critical to one's rights or benefits. Thus, any machine translation technologies that are developed must include such review if they are to meet the requirements of this rule. OCR will continue to monitor the progression of this technology and will revisit regulatory updates as well as consider issuance of future guidance as needed.

Comment: One commenter stated that the definition of ''machine translation'' should include reference to the use of software or automated tools. Specifically, the commenter recommended modifying the language to read ''machine translation is the use of automated translation software or tools, without the assistance of . . .''

Response: OCR appreciates the commenter's suggestion to explicitly refer to software or automated tools; however, the definition as proposed sufficiently accounts for translations that would be generated by software or automated tools as it refers to ''automated translation.''

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''machine translation'' as proposed in § 92.4, with modification. We are making a technical correction to change ''automated translations'' to ''automated translation.''

National Origin. We proposed to define the term ''national origin'' to mean ''a person's, or their ancestor's, place of origin or a person's manifestation of the physical, cultural, or linguistic characteristics of a national origin group.'' This is consistent with the 2016 Rule's definition of ''national origin,'' and with the well-established definition of the term that the Equal Employment Opportunity Commission (EEOC) uses in its interpretation of title VII.[58]

Comment: Various commenters discussed the need to include this definition to address entrenched inequities and practices that can constitute national origin discrimination but are not always recognized. This includes the failure to take reasonable steps to provide meaningful access for individuals with LEP, even though such a failure has been long recognized as a form of national origin discrimination. Commenters added that there are also clear intersections between LEP status and race and ethnicity because the great majority of individuals with LEP are people of color; however, they noted that when individuals seek to vindicate their civil rights, they often must choose between pursuing a claim based on either their LEP status or race. Commenters also provided examples of how some people have been denied benefits they are entitled to due to national original discrimination. Several national organizations and local service providers commented that refugees, migrant workers, and other immigrants experience barriers to federally funded or provided health care due to fears related to their immigration status.

Response: OCR appreciates commenters' support for inclusion of this definition. We recognize that individuals can experience both national origin and race discrimination (or national origin discrimination and discrimination on another protected basis) and are finalizing new regulatory language that provides additional clarity and addresses such instances in which individuals may experience discrimination under multiple bases. *See* discussion regarding § 92.101.

OCR appreciates comments related to immigration status. While section 1557 does not prohibit discrimination on the basis of immigration status, we note that differential treatment such as requiring additional verification or documentation from individuals based on their appearance, name, accent, LEP, or suspected immigration status may violate section 1557 and other civil rights laws.[59]

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''national origin'' as proposed in § 92.4, with modification. We are making a technical correction to change ''ancestor's'' to ''ancestors'.''

Patient care decision support tool. The Proposed Rule described but did not include a definition in § 92.4 for, the term ''clinical algorithms.'' *See* 87 FR 47880. Many commenters supported the inclusion of a provision such as proposed § 92.210, addressing nondiscrimination in the use of clinical algorithms in decision-making, but recommended OCR clarify that the provision applies to tools used to assess health status, recommend care, determine eligibility, allocate resources, conduct utilization review, and provide disease management guidance. Further, commenters requested that OCR define what tools are covered under § 92.210.

Based on comments received, we are replacing the term ''clinical algorithm'' with the more precise term ''patient care decision support tool,'' and we are adding a definition for ''patient care decision support tool'' to mean ''any automated or non-automated tool, mechanism, method, technology, or combination thereof used by a covered entity to support clinical decision-making in its health programs or activities.'' The definition of ''patient care decision support tool'' reaffirms that § 92.210 applies to tools used in clinical decision-making that affect the care that patients receive. This includes tools, described in the Proposed Rule, used by covered entities such as hospitals, providers, and payers (health insurance issuers) in their health programs and activities for ''screening, risk prediction, diagnosis, prognosis, clinical decision-making, treatment planning, health care operations, and allocation of resources'' as applied to the patient. 87 FR 47880. We clarify that tools used for these activities include tools used in covered entities' health programs and activities to assess health status, recommend care, provide disease management guidance, determine eligibility and conduct utilization review[60] related to patient care that is

[58] 29 CFR 1606.1; *see, also,* U.S. Equal Emp. Opportunity Comm'n, *EEOC Enforcement Guidance on National Origin Discrimination, https://www.eeoc.gov/laws/guidance/eeoc-enforcement-guidance-national-origin-discrimination#_Toc451518799.*

directed by a provider, among other things, all of which impact clinical decision-making. Please see our discussion regarding § 92.210, where we discuss ''patient care decision support tool'' in more detail, including examples of tools to which § 92.210 does not apply.

Summary of Regulatory Changes

Considering the comments received, we are finalizing the definition of ''patient care decision support tool'' in § 92.4 to mean ''any automated or non-automated tool, mechanism, method, technology, or combination thereof used by a covered entity to support clinical decision-making in its health programs or activities.''

Qualified Bilingual/Multilingual Staff. OCR proposed to define the term ''qualified bilingual/multilingual staff'' to mean a member of a covered entity's workforce who is designated by the covered entity to provide oral language assistance directly to an individual in their primary language as part of the person's current, assigned job responsibilities and who has demonstrated to the covered entity that they are: (1) proficient in speaking and understanding both spoken English and at least one other spoken language, including any necessary specialized vocabulary, terminology, and phraseology; and (2) able to effectively, accurately, and impartially communicate directly with individuals with LEP in their primary language.

Comment: Some commenters urged that additional attention should be given to assessing qualifications for self-identified bilingual/multilingual staff abilities to provide services in languages other than English, and that policies and procedures should be developed to assess and retain their competency. Additionally, some commenters recommended establishing qualifications for bilingual/multilingual staff who may also be expected to serve as interpreters, and added that they should be compensated appropriately. Commenters stated that research has shown that bilingual staff who are not qualified interpreters often do not feel comfortable serving as interpreters. A commenter posited that bilingual/multilingual staff must be provided training and compensation opportunities to support professional development and prevent staff turnover and burnout.

Response: OCR appreciates the commenters' suggestions to establish assessment requirements for qualified bilingual/multilingual staff; however, we believe the current definition establishes sufficient requirements and guidelines regarding the necessary skills a qualified bilingual/multilingual staff member must have. The definition sets forth a two-prong definition to ensure proficiency, effectiveness, and impartiality in direct communications with individuals with LEP in their primary languages, including any necessary specialized vocabulary, terminology, and phraseology. Similar to the rule's definitions for qualified interpreters and qualified translators, OCR has established the necessary skills that must be held to meet the definition, while providing covered entities the flexibility by which to have these skills assessed. We note that an individual's self-identification as bilingual or multilingual alone is insufficient to determine whether they meet this definition, and covered entities should determine processes by which they will independently determine and periodically assess an individual's qualifications.

While qualified bilingual/multilingual employees may also be qualified interpreters, the ability to interpret is a separate skill. Anyone whom a covered entity allows to serve as an interpreter must be qualified to do so, consistent with the definition of ''qualified interpreter for an individual with limited English proficiency'' in this section, independent of whether they have been identified as a qualified bilingual/multilingual staff member. OCR will consider developing guidance and providing technical assistance for covered entities on mechanisms for covered entities to assess if staff members meet the requirements.

Consistent with the Department's approach on language access, OCR encourages covered entities to provide training and compensation opportunities to support professional development for bilingual/multilingual staff.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''qualified bilingual/multilingual staff'' as proposed in § 92.4, with modification. As discussed in the summary of regulatory changes to the proposed term ''limited English proficient individual,'' we are revising the term to ''individual with limited English proficiency'' in § 92.4.

Qualified interpreter for an individual with a disability. We proposed to define the term ''qualified interpreter for an individual with a disability'' to mean ''an interpreter who . . . is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary.'' Such an interpreter may interpret via a video remote interpreting service (VRI) or in person. We also provided a non-exhaustive list of examples of qualified interpreters, to include sign language interpreters, oral transliterators, and cued-language transliterators.

Comment: Most of the commenters recommended that OCR amend this definition to include the three (3) parts of the definition of ''qualified interpreter for an individual with limited English proficiency'', which requires that the qualified interpreter: (1) has demonstrated proficiency, (2) is able to interpret effectively, accurately, and impartially, (3) and adheres to generally accepted interpreter ethics principles. Commenters noted that these revisions would provide alignment between the different types of interpreters and recognize that similar standards should apply regardless of whether an interpreter is interpreting for an individual with LEP or a person with a disability.

Commenters recommended that the definition include that a qualified interpreter for a person with a disability demonstrate proficiency. For sign language interpreters, this should include proficiency in speaking or communicating in and understanding both English and a relevant sign language, noting that not all individuals who are deaf or hard of hearing are signers of American Sign Language (ASL). Some commenters also recommended that in order to be proficient, Certified Deaf Interpreters (CDI) must have specialized training in Deaf interpreting in addition to the basic CDI training. For transliterators, these commenters recommended that the rule require proficiency in the relevant alternative communication modality, such as cued speech or oral transliteration.

Commenters further stated that an interpreter for an individual with a disability should communicate ''without changes, omissions, or additions while preserving the tone, sentiment, and emotional level of the original statement.''

Finally, commenters stated that an interpreter for an individual with a disability must also adhere to the principles contained in recognized standards of practice and professional codes of ethics for health care interpreters, such as those of the National Council on Interpreting in Health Care and the Registry of Interpreters for the Deaf.

Response: We appreciate commenters' recommendation to revise the definition

of ''qualified interpreter for an individual with a disability'' to align more closely with the definition of ''qualified interpreter for an individual with limited English proficiency''. While the proposed definition is consistent with the ADA, we agree that the standards for a qualified interpreter should be equivalent regardless of whether an individual has LEP or has a disability. We have revised the definition for consistency among the standards, which is also consistent with the 2016 Rule's definition at former 45 CFR 92.4.

Comment: Some commenters recommended aligning the two qualified interpreter definitions but recommended that a revised definition be expanded to recognize qualified interpreters who have demonstrated proficiency in speaking and understanding two non-English languages. These commenters noted that not all interpreters for people with disabilities are interpreting between English and another language. For example, these commenters noted that a CDI may be interpreting between an individual who is deaf and uses a unique version of ASL and a non-American sign language, or home signs unfamiliar to the medical interpreter. Commenters were concerned that a definition that specified interpretation ''between English and non-English language'' would exclude CDIs and cued-language transliterators. These commenters recommended a multi-pronged definition where several contexts are taken into consideration and is inclusive of ASL-to-English interpretation, ASL-to-ASL CDI interpretation, and cued-language transliteration.

Response: As proposed, the definition of ''qualified interpreter for an individual with a disability'' does not reference ''English'' or a ''non-English language,'' but rather included a non-exhaustive list of examples of qualified interpreters inclusive of sign language interpreters, oral transliterators, and cued-language transliterators. However, as previously discussed, we have revised the definition of ''qualified interpreter for an individual with a disability'' to be more aligned with the definition of ''qualified interpreter for an individual with limited English proficiency.'' The revised definition includes language that is inclusive of different types of interpretation and also includes the non-exhaustive list of examples from the proposed definition.

Comment: Some commenters noted that a covered entity must not use the services of staff who use sign language or another communication modality to act as interpreters and relay information to individuals with disabilities unless they meet the definition of a ''qualified interpreter for an individual with a disability'' found within this section, and they meet the unique needs of the individual for whom the services of an interpreter is being provided.

Response: The definition of a ''qualified interpreter for an individual with a disability'' addresses these concerns; and anyone designated by a covered entity to serve as an interpreter for an individual with a disability must be qualified to do so.

Comment: Some commenters recommended that the definition of ''qualified interpreter for a person with a disability'' take into consideration applicable State law governing licensure of interpreters if any are available in the State where the covered entity provides services. These commenters noted that the process of who can serve as a qualified interpreter differs from State to State, and OCR should adopt language that reflects the minimum standards of State laws governing qualifications of sign language interpreters, if any.

Response: OCR understands and appreciates commenters raised concerns. Covered entities may use adherence to State law governing licensure as a means by which to demonstrate compliance with this definition, provided licensure demonstrates the individual possesses the requirements provided in the definition. OCR declines to adopt language that incorporates any State law licensure requirements as a minimum standard of compliance with this rule.

Comment: Some commenters raised concerns over the qualifications of interpreters. Commenters recommended that the definition include the requirement that an interpreter be certified or assessed by a formal process that objectively measures the competency of the individual. Other commenters recommended that health care entities include a screening system to ensure quality assurance of the abilities of the sign language interpreters to meet the needs of the patients.

Response: OCR appreciates the commenters' recommendations to require certification for qualified interpreters and agrees that covered entities should ensure that the use of interpreter services provides for effective communication. OCR will take into account certification in assessing compliance with this regulation; however, as we will discuss below in the response for certification of qualified interpreter for an individual with LEP in § 92.201, we decline to require certification in the definition of ''qualified interpreter for an individual with a disability.''

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''qualified interpreter for an individual with a disability'' in § 92.4, to more closely align with the definition of ''qualified interpreter for an individual with limited English proficiency,'' such that it now means an interpreter who, via a video remote interpreting service (VRI) or an on-site appearance: (1) has demonstrated proficiency in communicating in, and understanding: (i) both English and a non-English language (including American Sign Language, other sign languages); or (ii) another communication modality (such as cued-language transliterators or oral transliteration); (2) is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original statement; and (3) adheres to generally accepted interpreter ethics principles including client confidentiality. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.

Qualified interpreter for a limited English proficient individual. OCR proposed to define the term ''qualified interpreter for a limited English proficient individual'' to mean an interpreter who via a remote interpreting service or an on-site appearance: (1) has demonstrated proficiency in speaking and understanding both spoken English and at least one other spoken language; (2) is able to interpret effectively, accurately, and impartially to and from such language(s) and English, using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original oral statement; and (3) adheres to generally accepted interpreter ethics principles, including client confidentiality. This definition is consistent with both the 2016 Rule at former § 92.4 and the 2020 Rule at § 92.101(b)(3)(i).

Comment: Some commenters who otherwise supported this definition expressed concern that, as written, it may inadvertently create difficulties for interpreting in certain languages, especially indigenous languages of Central and South America. These

commenters recommended that the definition be amended to allow for the use of services of relay interpreters, such as those who are proficient in an indigenous language and another language such as Spanish. Commenters explained that these interpreters may not be fluent in spoken English or trained to interpret to and from spoken English, and that those who are qualified to interpret between two non-English languages are critical in providing meaningful access for many isolated and marginalized communities. Furthermore, a few of these commenters recommended the inclusion of the following definition for relay interpreting: ''relay interpreting means a form of simultaneous interpreting when the speech is rendered from an intermediate language rather than directly from the source language.''

One commenter recommended adding ''and dialect'' after ''spoken language'' under paragraph (1) to acknowledge that speakers of a language may not always be qualified to interpret for a person who speaks a variation in that language and adding ''understanding and'' before ''using necessary specialized vocabulary or terms'' under paragraph (2) to indicate that providing effective interpretation for complex situations, such as communicating a treatment regimen, requires understanding of the terminology being used, particularly given the consequences of a miscommunication.

Response: OCR appreciates and understands concerns that the proposed definition may inadvertently create obstacles for meaningful access in certain languages. For example, if a Zapotec-speaking patient with LEP attended a medical appointment and the hospital could not find an individual qualified to interpret between Zapotec and English after reasonable efforts, the hospital could utilize the services of two qualified interpreters that could perform relay interpretation between Zapotec and Spanish and Spanish and English. While relay interpretation may introduce challenges related to accuracy, it may be necessary to afford meaningful access for individuals who speak languages, dialects, or variants not common to the area where they are receiving services.

For this reason, we are revising the definition of a ''qualified interpreter for an individual with limited English proficiency'' to provide that the qualified interpreter (1) has demonstrated proficiency in speaking and understanding both spoken English and at least one other spoken language (qualified interpreters for relay interpretation must demonstrate proficiency in two non-English spoken languages); and (2) is able to interpret effectively, accurately, and impartially to and from such language(s) and English (or between two non-English languages for relay interpretation), using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original oral statement. This provision makes clear that specialized skills and vocabulary may be needed for less commonly spoken languages as well as dialects.

In light of these modifications to the definition of ''qualified interpreter for an individual with limited English proficiency'', we are also adding and finalizing a definition of ''relay interpretation'' to mean interpreting from one language to another through an intermediate language. This mode of interpretation is often used for monolingual speakers of languages of limited diffusion, including select indigenous languages. In relay interpreting, the first interpreter listens to the speaker and renders the message into the intermediate language. The second interpreter receives the message in the intermediate language and interprets it into a third language for the speaker who speaks neither the first nor the second language.

Lastly, OCR appreciates the commenter's suggestion to add ''understanding and'' before ''using necessary specialized vocabulary or terms'' under paragraph (2). However, the interpreter themself does not need to *understand* complex medical concepts behind medical terms but rather must be able to interpret said terms effectively and accurately. OCR is of the view that the interpretation should directly convey the provider and patient's words and phrases in order to avoid the risk that the individual's message was not accurately communicated. Further, paragraph (1) already requires that the interpreter have ''proficiency in speaking *and understanding*'' the languages at issue (emphasis added).

Comment: A few commenters recommended the definition address how an individual would demonstrate proficiency in English and another language (*i.e.,* through use of an established standard for describing language ability, such as the Common European Framework of Reference of Languages [61]). Some commenters recommended implementing a certification requirement and suggested implementing a national credential requirement that establishes interpretation proficiency for enforcement purposes. Some commenters requested that OCR lay out examples of when it would be appropriate to require qualified interpreters to obtain certification in order to comply with section 1557. Commenters expressed their belief that the proposed definition could be easily misinterpreted and result in assigning the least skilled interpreter for a medical encounter.

Response: OCR appreciates the commenters' suggestions to establish certification requirements for qualified interpreters; however, there are currently no consistent certification standards and there is also a lack of certification available for a significant number of languages. The requirements in this definition provide sufficient standards for determining interpreter qualifications. Individuals that hold a certification will still need to meet the standards provided in this definition. For covered entities seeking information on certification, we encourage covered entities to review the Department of Justice's (DOJ) resource regarding what it means to be a certified linguist.[62]

Comment: One commenter encouraged OCR to include ''via a video remote interpreting service'' to the definition because telehealth can be an important tool for expanding access to interpretation for individuals with LEP.

Response: The definition as proposed and finalized includes interpreter services provided via remote interpreting services and is therefore inclusive of video remote interpreting as drafted.

Comment: One commenter noted that we use the phrase ''use an interpreter'' in our text. They recommended we use the wording ''utilize the services of an interpreter'' instead.

Response: OCR agrees that we are referring to the utilization of interpreter services and have adjusted the use of this phrase accordingly.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments we received, we are revising the definition for a ''qualified interpreter for an individual with limited English proficiency'' as proposed in § 92.4, with modifications. To account for concerns related to relay

[61] Council of Europe, *Common European Framework of Reference for Languages (CEFR), https://www.coe.int/en/web/common-european-framework-reference-languages/introduction-and-context.*

[62] U.S. Dep't of Justice, Fed. Coordination & Compliance Section, *What Does It Mean to Be a Certified Linguist* (2014), *https://www.justice.gov/crt/page/file/1255916/download.*

interpreting, we are revising paragraph (1) to add ''(qualified interpreters for relay interpretation must demonstrate proficiency in two non-English spoken languages).'' As discussed in the summary of regulatory changes to the proposed term ''limited English proficient individual'' we are revising the term to ''individual with limited English proficiency'' in § 92.4. We are also adding a definition of ''relay interpretation'' to § 92.4 to mean interpreting from one language to another through an intermediate language. This mode of interpretation is often used for monolingual speakers of languages of limited diffusion, including select indigenous languages. In relay interpreting, the first interpreter listens to the speaker and renders the message into the intermediate language. The second interpreter receives the message in the intermediate language and interprets it into a third language for the speaker who speaks neither the first nor the second language.

Qualified Reader. We proposed to define the term ''qualified reader'' to mean ''a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary,'' which comes from the ADA title II regulation at 28 CFR 35.160 through 35.164. This definition, which did not appear in the 2016 or 2020 Rules, was included to provide clarity to both covered entities and protected individuals about the necessary qualifications of a reader when required under this regulation.

Comment: Commenters supported the addition of ''qualified reader'' to the proposed list of definitions.

Response: OCR appreciates the commenters support for adding the definition of ''qualified reader'' to the proposed list of definitions.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments we received, we are finalizing the definition of ''qualified reader'' as proposed in § 92.4, without modification.

Qualified Translator. OCR proposed to define the term ''qualified translator'' to mean a translator who: (1) has demonstrated proficiency in writing and understanding both written English and at least one other written non-English language; (2) is able to translate effectively, accurately, and impartially to and from such language(s) and English, using any necessary specialized vocabulary or terms without changes, omissions, or additions and while preserving the tone, sentiment, and emotional level of the original written statement; and (3) adheres to generally accepted translator ethics principles, including client confidentiality. This definition of ''qualified translator'' appeared in the 2016 Rule at § 92.4 and appears in the 2020 Rule at § 92.102(b)(2)(ii) and has not been changed.

Comment: One commenter recommended that the definition of a ''qualified translator'' include the requirement that such individuals, for purposes of providing translation services, be certified or assessed by a formal process that objectively measures the competency of the individual. A number of commenters stated that high quality translation is essential to providing equal access to health care and health services. Some added that oral interpretation is critical to ensuring understanding of written translations, some of which have been inaccurate or insufficient to convey the complicated medical and technical terms translated in the communications.

Response: OCR appreciates the commenter's suggestion to require that a qualified translator be certified or objectively assessed to verify competency in translating. For the reasons we provided when declining to require certification of qualified interpreters for individuals with LEP, we decline to specify the means by which a covered entity may determine that an individual meets the definition of ''qualified translator''. In order to be qualified, translators must meet the definition provided in the rule. OCR also notes that reasonable steps to provide meaningful access may require the provision of both written translation and oral interpreting, and thus utilizing the services of both a qualified translator and a qualified interpreter may be necessary under certain circumstances.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the definition of ''qualified translator'' as proposed in § 92.4, without modification.

State. The 2022 NPRM did not propose a definition of the term ''State.'' However, based on comments received, we became aware that there may be some confusion as to what encompasses ''State'' for purposes of this final rule. We therefore have decided to include a definition of ''State.''

Summary of Regulatory Changes

Considering the comments received, we are finalizing a definition of ''State'' in § 92.4 to mean ''each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Virgin Islands, the Trust Territory of the Pacific Islands, and the Commonwealth of the Northern Mariana Islands.'' This definition is consistent with the ADA regulations at 28 CFR 35.104.

Telehealth. The 2022 NPRM did not propose a definition of the term ''telehealth.'' However, based on comments received, we became aware that there may be some confusion as to what encompasses ''telehealth'' for purposes of this final rule. We therefore have decided to include a definition of ''telehealth.''

Summary of Regulatory Changes

Considering the comments received, we are finalizing a definition of ''telehealth'' in § 92.4 to mean the use of electronic information and telecommunications technologies to support long-distance clinical health care, patient and professional health-related education, public health, and health administration. Technologies include videoconferencing, the internet, store-and-forward imaging, streaming media, and terrestrial and wireless communications. This definition is consistent with the Health Resources and Services Administration and the Office of the National Coordinator for Health Information Technology definitions referenced in the 2022 NPRM, 87 FR 47884.

Assurances Required (§ 92.5)

In § 92.5 of the 2022 NPRM, we proposed retaining the requirement of the 2016 and 2020 Rules, at former § 92.5 and current § 92.4 respectively, for recipients to submit assurances of compliance to OCR. In paragraph (a), we proposed that each entity applying for Federal financial assistance, each issuer seeking certification to participate in an Exchange, and each State seeking approval to operate a State Exchange is required to submit an assurance that its health programs and activities will be operated in compliance with section 1557 and this part, consistent with similar requirements found in the implementing regulations for title VI, title IX, section 504, and the Age Act. The duration of obligation (proposed paragraph (b)), and covenants language (proposed paragraph (c)) adopt the corresponding requirements found in the section 504 regulation at 45 CFR 84.5.

The comments and our responses regarding § 92.5 are set forth below.

Comment: Commenters expressed support for the assurances provision included in the 2022 NPRM because it

is consistent with other Federal civil rights regulations and the 2016 and 2020 Rules, and it is reasonable for OCR to require recipients of Federal financial assistance to comply with section 1557 as a condition of receiving that funding. One organizational commenter recommended revising this requirement to conditioning prospective recipients' receipt of Department Federal financial assistance on recipients': (1) collection of demographic data such as race, ethnicity, spoken and written language, disability status, age, sex, gender identity, sex characteristics, and sexual orientation; and (2) submission of a written proposal (including through written policies and procedures) about how they intend to provide language assistance services, auxiliary aids and services, and whether an entity's proposed budget includes funding to meet these identified needs.

Response: We appreciate the suggestion to include a data collection requirement in this provision, but do not believe such a requirement is appropriate, as this language is longstanding and consistent across civil rights regulations. We address data collection in further detail later in this preamble, when discussing responses to our request for comment on the issue.

We also decline to revise § 92.5 to require Federal financial assistance applicants to provide OCR with budget information and a written proposal about how they intend to provide language assistance services and auxiliary aids and services as a condition of receiving Federal financial assistance. The combined requirements at §§ 92.8 (Policies and procedures), 92.201 (Meaningful access for individuals with LEP), 92.202 (Effective communication for individuals with disabilities), and 92.205 (Requirement to make reasonable modifications) address the commenter's concerns regarding a recipient's obligation and ability to provide language assistance services and auxiliary aids and services.

Comment: One commenter raised concerns that proposed § 92.5's requirement that recipients make assurances to comply with all provisions of the rule does not take into account situations where a third party administrator could otherwise lawfully administer a plan sponsored by a religious employer that does not conform to OCR's current interpretation of section 1557 with regard to the prohibition on sex discrimination. Specifically, the commenter suggested that a third party administrator may be inhibited from submitting an assurance required by § 92.5 because (1) of the Employee Retirement Security Act of 1974 (ERISA), 29 U.S.C. 1104(a)(1)(D), which for example, obligates such a third party administrator to administer the religious employer's self-insured health plan in accordance with terms that may conflict with section 1557's prohibition of sex discrimination; and (2) there are injunctions that currently prohibit OCR from enforcing prohibitions on sex discrimination against religious employers and those acting in concert with them.[63]

Response: OCR complies with court orders, including court-ordered injunctions. If a recipient third party administrator is covered by any current court order or court-ordered injunction, OCR would not find the third party administrator to be in violation of section 1557 or this rule for its activities that are covered by the injunction, and such an entity would not need to provide an assurance under § 92.5 to the extent it conflicts with a current court order or court-ordered injunction by which they are covered.

Regarding the commenter's point that third party administrators are required under ERISA to administer plans consistent with the plan's terms, OCR addresses this issue in detail under the *third party administrator* section of § 92.207. In short, while we acknowledge that ERISA requires plans to be administered consistent with the documents and instruments governing the plan,[64] ERISA further provides that it is not to be construed to impair or supersede other Federal laws, including regulations issued under such laws.[65] Courts have held that ERISA's requirement to comply with the terms of the plan must not be construed to invalidate or impair section 1557.[66]

[63] *Franciscan All.,* 553 F. Supp. 3d at 378.

[64] 29 U.S.C. 1104(a)(1)(D) (''[A] fiduciary shall discharge his duties with respect to a plan solely in the interest of the participants and beneficiaries and . . . in accordance with the documents and instruments governing the plan insofar as such documents and instruments are consistent with the provisions of this subchapter and subchapter III.'').

[65] 29 U.S.C. 1144(d) (''Nothing in this subchapter shall be construed to alter, amend, modify, invalidate, impair, or supersede any law of the United States (except as provided in sections 1031 and 1137(b) of this title) or any rule or regulation issued under any such law.'').

Dec. 19, 2022) (holding that ERISA's requirement at 29 U.S.C. 1104(a)(1)(D) to administer a plan's terms as written ''is subservient to Section 1557, outlawing discrimination, which is dominant''); *Tovar* v. *Essentia Health,* 342 F. Supp. 3d 947, 954 (D. Minn. 2018) (''The Court will not construe ERISA to impair Section 1557. Nothing in Section 1557, explicitly or implicitly, suggests that TPAs are exempt from the statute's nondiscrimination requirements.'').

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.5, without modification.

Remedial Action and Voluntary Action (§ 92.6)

In § 92.6, OCR proposed to include requirements regarding remedial and voluntary action, which would reinstate former § 92.6 in the 2016 Rule and is consistent with parallel requirements in the implementing regulations for section 504, title IX, and the Age Act. The 2020 Rule does not include a similar provision. In § 92.6(a)(1) of the 2022 NPRM, we proposed requiring recipients or State Exchanges that have been found by the Director to have engaged in discriminatory conduct in their health programs and activities in violation of this part to take voluntary actions to remediate the effects of such discriminatory conduct. Similarly, we proposed that under § 92.6(a)(2), where a recipient exercises control over another recipient that has discriminated, the Director may require either or both entities to take remedial action. Under proposed § 92.6(a)(3), a recipient or State Exchange must take remedial action if OCR requires such action to redress the harm experienced by an individual who was subjected to prohibited discrimination. Under proposed § 92.6(b), a covered entity may voluntarily take nondiscriminatory steps to overcome the effects of the conditions that limited an individual's ability to participate in a health program or activity based on their race, color, national origin, sex, age, or disability.

The comments and our responses regarding § 92.6 are set forth below.

Comment: Commenters generally supported the requirement that a recipient remedy instances of confirmed discrimination and the voluntary action provision that allows for covered entities to address effects of past discrimination.

One commenter recommended that we limit the application of this provision to avoid exposing recipients to unfair and specious claims of discrimination. Specifically, the commenter suggested that the remedial action be limited to: (1) individuals who applied to participate in a health program or activity but were unable to participate due to alleged discrimination; or (2) individuals who had been participants in a health program or activity but are no longer participants due to alleged discrimination.

Response: This provision is an essential tool in remediating findings of discrimination and encouraging recipients to take voluntary actions to overcome potential discrimination. The suggested revisions to § 92.6 are unnecessary, as they generally request implementing conditions that are already present. For example, § 92.6(a)(1) requires remedial action by a recipient or State Exchange only *after* a finding of discrimination. Section 92.6(a)(3) limits any required remedial action in the spirit of the commenter's recommendation, namely providing that recipients and State Exchanges take remedial action with respect to individuals who were or would have been participants in the health program or activity had the discrimination not occurred.

Covered entities are prohibited from discriminating and as such should take steps to ensure nondiscrimination, even in the absence of a finding of discrimination by OCR. Where a covered entity has identified conditions that currently or in the past had resulted in limited participation in their health programs and activities by individuals protected by this rule, they are encouraged to take the voluntary action contemplated in § 92.6(b).

We also note that regulations for section 504, title IX, and the Age Act require recipients to take remedial action, and recipients have complied with the remedial action provisions in those civil rights statutes for more than 40 years.[67] For example, where there is a finding that a recipient engaged in disability discrimination, the recipient's remedial action to overcome the effects of the disability discrimination would likely satisfy this provision's remedial action requirement as well as section 504's remedial action requirement at 45 CFR 84.6(a).

Comment: Another commenter expressed concern about the obligation this provision places on a recipient that exercises control over another recipient that is found to have engaged in discrimination prohibited by section 1557. The commenter recommended that OCR revise the provision so that only the recipient that OCR found to have engaged in unlawful discrimination (and not the controlling entity) take remedial action and that OCR enumerate specific remedial actions OCR may require and the circumstances under which OCR may require them.

Response: The word ''control'' has appeared in civil rights regulations enforced by OCR for many years, and its meaning has been established over time. As we explained in the preamble for the 2016 Rule, OCR's experience and the longstanding approach for controlling entities to secure appropriate action from discriminating entities over which they have control has played an important role in remedying discrimination. 81 FR 31393. Given that nothing has changed in OCR's experience in the intervening years regarding the principles of ''control'' as applied here, we decline to define the term ''control.''

While we appreciate the commenter's request to list the remedial actions OCR may require of a recipient or State Exchange found in violation of this part, the remedial actions that a recipient or State Exchange must take to address confirmed discrimination will be subject to the facts involved in a particular case. A review of past resolution agreements provides useful, though not exhaustive, examples of the variety of means by which OCR achieves corrective action.[68]

Comment: One commenter recommended that OCR revise § 92.6 to require a recipient or State Exchange to notify participants, enrollees, and beneficiaries of any finding of discrimination by the Director and the remedial action the recipient has taken or will take to address the confirmed discrimination.

Response: We recognize the benefit that notice of confirmed discrimination and the steps a recipient or State Exchange will take to remedy the discrimination can provide to participants, enrollees, and beneficiaries. While we encourage recipients and State Exchanges to provide notice to participants, we decline to require they do so. Current Federal civil rights regulations with similar remedial and voluntary action provisions do not include a notice requirement, and we do not believe imposing such a requirement on recipients and State Exchanges is warranted at this time. We note, however, it is OCR's practice to notify the public via a press release or posting on our website when a violation has been found or a resolution has been reached.[69] Additionally, OCR has established a Civil Rights listserv to inform the public about civil rights settlement and enforcement activities, press releases, FAQs, guidance, and technical assistance materials. To subscribe to OCR's Civil Rights listserv, please visit *https://list.nih.gov/cgi-bin/wa.exe?SUBED1=OCR-CIVILRIGHTS-LIST&A=1*.

Comment: One commenter recommended that, for § 92.6(b) (voluntary action), we replace ''may'' with ''must'' to require covered entities to take nondiscriminatory steps to overcome effects that result or resulted in limiting participants ability to participate in the covered entity's health program or activities based on the participants' race, color, national origin, sex, age, or disability.

Response: Such a revision would alter the voluntary nature of the provision, which encourages covered entities to take nondiscriminatory steps on their own accord to make their programs more inclusive absent a finding of discrimination. We note that, when there is a finding that prohibited discrimination occurred, § 92.6(a) mandates the offending recipient or State Exchange to take action to remedy such discrimination.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.6, without modification.

Designation and Responsibilities of a Section 1557 Coordinator (§ 92.7)

In proposed § 92.7(a), OCR proposed requiring covered entities with 15 or more employees to designate at least one employee to serve as a Section 1557 Coordinator (''Coordinator'') to coordinate their efforts to comply with and carry out the covered entity's responsibilities under section 1557 and the part. OCR also proposed to permit covered entities to, as appropriate, assign one or more designees to carry out some of the responsibilities of the Coordinator.

In § 92.7(b), we proposed a list of responsibilities of the Coordinator. We invited comment on this requirement, including whether OCR should require covered entities with fewer than 15 employees to designate a Coordinator and, if so, whether there should be a requisite number of employees or whether all covered entities should be required to designate a Coordinator. We further sought comment on whether the enumeration of responsibilities of the Coordinator is beneficial and sufficiently comprehensive. We also requested comment on how the

Department can support Coordinators, including through the provision of training, so that they understand their duties, the protections afforded by section 1557, and the rationales for both.

The comments and our responses regarding § 92.7 are set forth below.

Comment: Commenters on this provision overwhelmingly supported the Coordinator requirement at § 92.7. A number of supportive commenters indicated that civil rights violations often occur due to ignorance, neglect, and administrative indifference, and Coordinators will equip providers with critical civil rights knowledge and the ability to recognize and adequately care for patients at risk for poor health outcomes. Other commenters similarly emphasized that the Coordinator requirement will equip covered entities with an internal resource dedicated to section 1557 implementation and compliance, and that this is especially critical for small covered entities and covered entities in rural communities. Commenters cited a number of other reasons for their support of the Coordinator requirement, including that having a Coordinator will help covered entities proactively protect civil rights; will provide central points of contact for language access; and will allow covered entities and OCR to better identify patterns or practices of discrimination, which will aid covered entities in delivering effective and efficient care.

One commenter expressed concern about the possibility that Coordinators evolve and become ineffective by privileging the institutions they serve rather than appropriately conducting thorough investigations of grievances. Relatedly, another commenter recommended that OCR revise § 92.7 to require covered entities' Coordinators to be independently minded or independent from the covered entity to ensure impartiality and transparency and to require that Coordinators be able to work independently.

Many of these commenters cited the COVID–19 Public Health Emergency as a reason for their support of the Coordinator requirement. Specifically, they stated that the health outcomes resulting from the COVID–19 pandemic highlighted covered entities' ignorance of civil rights regulations with respect to individuals from marginalized communities.

Response: We agree with commenters regarding the myriad benefits of the Coordinator requirement, particularly with regard to increasing covered entities' ability to proactively prevent discrimination before it happens and hopefully more thoroughly address it when it does. Coordinators are expected to perform their impartially, which will also benefit covered entities through ensuring compliance with section 1557.

OCR appreciates commenters' concerns that Coordinators be sufficiently independent from a covered entity to ensure impartiality and transparency. We note that a covered entity may run the risk of noncompliance with section 1557 if an investigation reveals that its Coordinator did not carry out their obligations under section 1557 in an impartial manner. By having a Coordinator, with specific compliance responsibilities, OCR expects that covered entities will be cognizant of the importance of compliance with civil rights requirements, including in times of public health emergencies or other crises.

Comment: Other commenters opposed the Coordinator requirement, contending that it will increase the burdens covered entities will face.

One commenter reiterated the 2020 Rule's reasoning for eliminating the Coordinator requirement by stating that regulations for underlying civil rights statutes requiring coordinators is sufficient for section 1557 enforcement. Another commenter stated covered entities can meet section 1557 compliance obligations without a Coordinator. Yet another commenter recommended that OCR instead encourage practices to adopt a collaborative approach where all staff take an active role in ensuring nondiscrimination.

Response: The role of the Coordinator is to promote effective and efficient implementation of section 1557 and the part, and in so doing decrease compliance inefficiencies and promote meaningful investigations of allegations of potential civil rights violations.

OCR remains confident that the benefits to a covered entity and the public of the Coordinator requirement outweigh any potential burdens. Time spent coordinating a covered entity's section 1557 compliance program is an investment that will likely result in improved, nondiscriminatory health care delivery and saving resources otherwise spent responding to potential OCR investigations and private litigation. Even if a covered entity is subject to a civil rights complaint or litigation, its Coordinator's presence and active coordination efforts may enable the covered entity to more quickly resolve a complaint or litigation.

This rule addresses the confusion that the 2020 Rule creates surrounding the extent to which covered entities were required to maintain a Coordinator for purposes of section 1557 compliance. The 2020 Rule does not clarify, for example, whether a covered entity's existing section 504 coordinator—whose role relates to ensuring a recipient's efforts to comply section 504 alone, per 45 CFR 84.7—must also ensure the covered entity's compliance with section 1557's prohibition of discrimination based on race, color, national origin, age, or sex. OCR is providing for a specific Section 1557 Coordinator, rather than relying on the requirements found in the implementing regulations for the referenced statutes, to resolve any confusion as to covered entities' responsibilities.

Comment: Some commenters requested that OCR clarify that Coordinators are responsible for covered entities' internal section 1557 oversight and that covered entities may have other staff members implement various Coordinator activities. These commenters recommended that OCR revise § 92.7(b) to add ''or designee'' after ''Section 1557 Coordinator'' to confirm that one or more staff can assist the Coordinator with the enumerated Coordinator responsibilities. Some commenters requested clarity about whether a covered entity's Coordinator can also serve in other capacities within the covered entity's organization, and whether the Coordinator requirement obligates covered entities to hire a new employee to serve as a Coordinator, and if so, whether the job description must list all of the Coordinator responsibilities enumerated at § 92.7(b).

Response: Section 92.7(a) expressly states that a covered entity may assign one or more designees to assist the Coordinator in carrying out their responsibilities. However, the Coordinator must retain ultimate oversight for ensuring the covered entity's compliance with this part. In general, it is the covered entity's prerogative to designate any qualified individual to serve as its Coordinator. A covered entity does not need to hire a new employee for the role, and the Coordinator may serve in other capacities and have responsibilities in addition to their Coordinator responsibilities at § 92.7(b); so long as those responsibilities do not create a conflict of interest or otherwise prevent the Coordinator from effectively carrying out their responsibilities.

Comment: Some commenters recommended that OCR not require covered entities to list a Coordinator's name and contact information in their publicly available Notice of Nondiscrimination because of the constant need to update Coordinators'

names and contact information due to turnover and to avoid potential harassment from section 1557 opponents. Instead, these commenters requested that OCR allow covered entities to list the Section 1557 Coordinator job title instead of an individual's name.

Response: OCR appreciates the challenges associated with updating specific contact information; for this reason, nothing in § 92.8 (Policies and procedures) or § 92.10 (Notice of nondiscrimination) require covered entities to include a Coordinator's name. As proposed, and finalized, §§ 92.8(b) and 92.10(a)(1)(v) both require ''contact information'' for the Coordinator; providing the job title rather than an individual's name is sufficient to meet this requirement. However, contact information in the form of a phone number, email address, and mailing address must also be provided. A covered entity may establish a general phone number, email address, and/or mailing address to meet this requirement. Absent this information, individuals who need to reach the Coordinator will have no knowledge of how to do so.

While this rule does not apply to employment practices, as discussed in § 92.2(b), employees of covered entities remain protected against retaliation as provided in §§ 92.303 and 92.304. If a covered entity's staff is harassing the Coordinator because of the Coordinator's job responsibilities, the covered entity should take appropriate measures to address the harassment, and, if the harassment is based on one or more characteristics protected by the Federal laws enforced by the EEOC, the Coordinator may file a charge of discrimination with the EEOC at *https://www.eeoc.gov/filing-charge-discrimination*.[70] If staff, including a covered entity's Coordinator, are being threatened by other covered entity staff or by individuals external to the covered entity, we strongly encourage reporting these threats to the FBI at 1–800–225–5324 or via *www.fbi.gov/tips*.

Comment: One commenter requested that OCR clarify whether a large health system made up of several covered entities can have a single Coordinator for the entire health system or whether each covered entity needs to have its own Coordinator. Another commenter stated that it is impossible for one Coordinator to oversee section 1557 compliance for an entire large health care system, with another suggesting that there should be at least one Coordinator for every 250 employees for covered entities with 500 or more employees.

Response: In order to provide covered entities with flexibility, OCR clarifies that large health systems may customize their Coordinator and designee configurations as long as each individual covered entity has either a Coordinator or designee responsible for section 1557 compliance. Because a covered entity is better positioned to determine how to ensure that the coordinator(s) can effectively perform all of their duties, we decline to revise the Coordinator requirement so that a covered entity is required to designate one Coordinator for every 250 employees.

Comment: A significant number of commenters recommended that all covered entities, regardless of size, have a Coordinator because ensuring section 1557 compliance is integral to providing nondiscriminatory health care services. Another commenter noted that the requirement aligns with the Joint Commission's recent standards requiring accredited hospitals and similar facilities to designate an individual to lead activities to reduce health disparities.

Several commenters stated that the 15-employee threshold is arbitrary, arcane, and inconsistent with protecting civil rights to the maximum extent possible. Others stated the position is critical for smaller covered entities that provide services to individuals with disabilities, particularly in rural and low-income communities, and for covered entities that provide long-term services and supports to older adults and people with disabilities who use home and community-based services. Others referenced that smaller covered entities include mental health providers, social workers, psychologists, counselors, and family and marriage therapists.

One commenter suggested that covered entities with fewer than 15 employees could still voluntarily designate a Coordinator.

Response: OCR appreciates comments received regarding the application of the Coordinator provision. While all covered entities, regardless of size, would benefit from having a dedicated Coordinator on staff, we decline to extend the requirement to all covered entities beyond those with 15 or more employees, in an effort to reduce unnecessary or counterproductive administrative obligations on small providers. OCR does not find this limitation to be arbitrary, as it is consistent with section 504's coordinator requirement, 45 CFR 84.7(a), and was also included in the 2016 Rule at former § 92.7. We note that covered entities with fewer than 15 employees retain the option of designating a Coordinator.

Comment: Other commenters thought the 15-employee threshold was appropriate, and that applying the requirement to smaller entities would result in burdens and costs for small and solo practices. Another commenter recommended increasing the employee threshold so that only covered entities with 50 or more employees be required to designate a Coordinator. Another commenter recommended that covered entities that fall within the Small Business Association's (SBA) classification[71] of a small business not be required to designate a Coordinator. Another commenter recommended that the Coordinator requirement be removed altogether.

Response: The Coordinator requirement is a vital step in encouraging proactive civil rights compliance; therefore, OCR declines to remove this provision. We also decline to increase the employee threshold for the Coordinator requirement to 50 or more employees. Though the coordinator requirement in title II of the ADA is limited to public entities with 50 or more employees, 28 CFR 35.107, the 15-employee threshold in section 504 is more appropriate for section 1557. Section 504 covered entities are more analogous to section 1557 covered entities given that they are recipients of Federal financial assistance of all sizes; ADA title II covered entities, however, are all State or local governments. For similar reasons, we believe that that the SBA classification of a small business—which was set in a very different context serving very different purposes—is inappropriate for this rule.

Comment: Some commenters requested additional clarity about the 15-employee threshold. For example, commenters asked whether part-time, contractor, and sub-contractor employees would count toward a covered entity's employee total or if

[70] The EEOC is responsible for enforcing Federal laws that make it illegal to discriminate against an employee because of the person's race, color, religion, sex (including pregnancy, childbirth or related medical conditions, gender identity, and sexual orientation), national origin, age (40 or older), disability or genetic information. *See* U.S. Equal Emp. Opportunity Comm'n, *Overview, https://www.eeoc.gov/overview*.

[71] U.S. Small Business Ass'n, *Basic Requirements: Meet Size Standards, https://www.sba.gov/federal-contracting/contracting-guide/basic-requirements#section-header-6* (The SBA assigns a size standard to each NAICS code. Most manufacturing companies with 500 employees or fewer, and most non-manufacturing businesses with average annual receipts under $7.5 million, will qualify as a small business.).

only full-time employees would count. One commenter suggested that, without this clarification, some covered entities will engage in hiring and human resources practices that undermine and abuse the 15-employee threshold. Another commenter also sought to clarify whether only clinical staff should count toward the 15-employee threshold and whether administrative staff should count as well.

Response: With respect to the employees who will count towards the 15 or more-employee threshold, OCR will consider the total number of individuals employed by a covered entity. This includes full-time and part-time employees and independent contractors. All employees, regardless of job classification (*e.g.,* clinical versus clerical), will count toward the threshold. We intend for this clarification to reduce concerns that the 15-employee threshold may lead to questionable employment practices.

Comment: One commenter indicated that the Coordinator requirement implicates religiously affiliated covered entities' authority to hire people who share their religious beliefs because requiring religiously affiliated covered entities to have a Coordinator may compromise the religiously affiliated covered entity's religious beliefs if its Coordinator has fundamentally different beliefs or viewpoints.

Response: Nothing in the regulatory text requires a covered entity to designate a Coordinator with a particular viewpoint or particular beliefs. No part of this final rule prevents a religiously affiliated recipient from designating or hiring an employee who shares the entity's religious beliefs as its Coordinator, provided that the individual is qualified to effectively and impartially perform the role required by the regulation. In addition, where title VII applies to a recipient's employment and hiring decisions, section 1557 does not interfere or otherwise conflict with requirements or protections afforded under title VII.

Comment: Several commenters supported the 2022 NPRM's inclusion of an enumerated list of Coordinator responsibilities at § 92.7(b). Many of these commenters appreciate the flexibility for covered entities to spread or delegate responsibilities to one or more designees within a covered entity's organization. Some commenters requested that OCR consider revising § 92.7(b) to add an additional responsibility that Coordinators coordinate with other covered entities, as necessary, to ensure that individuals who are interacting with multiple entities receive the required language assistance services and/or auxiliary aids and services. A different commenter felt that the enumerated list of Coordinator responsibilities at § 92.7(b) is too prescriptive and recommended that OCR allow each covered entity the opportunity to determine their Coordinator's responsibilities.

Response: The responsibilities enumerated at § 92.7(b) provide a baseline for expected duties while allowing covered entities the flexibility, discretion, and ability to structure responsibility for such duties to their Coordinator(s) or designee(s). A covered entity may assign duties beyond those enumerated at § 92.7(b), at its discretion.

With respect to situations where two covered entities are interacting with the same individual with LEP, individual with a disability, or individual with a disability with LEP, both covered entities are responsible for ensuring that individuals receive the appropriate language assistance services and/or auxiliary aids and services required by this rule under §§ 92.201 and 92.202. Some agencies may find that coordination between their Section 1557 Coordinators will help to more effectively meet the needs of these individuals, but OCR declines to implement a requirement to this effect as each covered entity has an obligation under this part regardless of what services they believe another covered entity may be providing.

Comment: Another commenter recommended that a covered entity's Coordinator not handle section 1557 grievances given that a covered entity may have an existing grievance collection point, which allows it to quickly address grievances through existing structures. A different commenter recommended that OCR clarify that a covered entity can assign Coordinator responsibilities to a group or division instead of one or more specific individuals because organizations may already have individuals specifically trained and responsible for ensuring nondiscrimination.

Response: These regulations do not prohibit a Coordinator from working within existing organizational structures that receive and investigate grievances or perform other Coordinator responsibilities identified in § 92.7(b). As discussed above, this provision provides a covered entity wide latitude to designate one or more Coordinator(s) and to assign one or more designee(s) to assist the Coordinator with their responsibilities, including collecting and addressing grievances. A covered entity may also assign Coordinator responsibilities to a group or division, provided that the covered entity identifies an individual Coordinator who retains ultimate oversight for coordinating section 1557 compliance.

Comment: One commenter recommended that OCR make clear that, when performing their grievance responsibilities, the Coordinator is required to collect specific data, including: alleged basis or bases of discrimination; the date the grievance was filed; the date of the alleged discriminatory action; and the grievance resolution. This commenter indicated that this data should not include individually identifying information and indicated that the covered entity, through the Coordinator, should be responsible for the privacy of the data that they collect while fulfilling their coordinator role. A different commenter recommended that OCR require Coordinators to review grievance data in order to identify potential and actual discriminatory trends.

Response: OCR appreciates the commenter's suggestion regarding the data that must be retained for each grievance. However, we decline to include these details here as the data points the commenter suggested are already in § 92.8(c)(2), which discusses the information that must be retained in grievance records. Although this final rule does not require covered entities to collect data on trends across the organization, we highly encourage all Coordinators to review grievance data to identify and address any potential and actual discriminatory trends revealed in such data. We discuss this in greater detail at § 92.8(c) (grievance procedure).

Comment: Multiple commenters requested that OCR provide training and other resources to help covered entities implement the Coordinator requirement. Some commenters requested that OCR provide (1) training for people who are new to the Coordinator role and for providers who are updating the role; (2) facts sheets to introduce section 1557 to the Coordinator and other staff throughout the organization; and (3) checklists that can be consulted and used to confirm the Coordinator's responsibilities. One commenter requested that OCR training for Coordinators include civil rights, cultural, and implicit bias training.

Response: OCR commits to serve as a resource and partner with covered entities that need help regarding their Coordinator obligations. As discussed in further detail at § 92.8 (Policies and procedures), we plan to make various resources available to assist Coordinators with their responsibilities.

Comment: One commenter asked how OCR will audit covered entities'

compliance with the Coordinator requirement and whether the Coordinator post will be eligible for the Federal matching rate as an administrative activity under section 1903(a)(7) of the Social Security Act.

Response: Consistent with current practice, OCR will determine a covered entity's compliance with the Coordinator requirement during complaint investigations and affirmative compliance reviews. With regard to the commenter's inquiry regarding the availability of Federal financial participation under section 1903(a)(7) of the Social Security Act, 42 U.S.C. 1396b(a)(7), OCR does not administer Medicaid and therefore this comment is outside of the scope of this rulemaking.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.7, without modification.

Policies and Procedures (§ 92.8)

At § 92.8 of the 2022 NPRM, OCR proposed requiring covered entities to develop and implement written policies and procedures that are designed to facilitate compliance with the requirements of the part. We proposed requiring each covered entity, in its health programs and activities, to adopt and implement a nondiscrimination policy, grievance procedures (for covered entities employing 15 or more persons), language access procedures, auxiliary aids and services procedures, and procedures for reasonable modifications for individuals with disabilities (collectively, ''Section 1557 Policies and Procedures'').

In § 92.8(a), we proposed a general requirement for covered entities to implement written Section 1557 Policies and Procedures. The policies and procedures must include an effective date and be reasonably designed, taking into account the size, complexity, and the type of health programs or activities undertaken by a covered entity, to ensure compliance with the part.

In § 92.8(b), we proposed requiring each covered entity to implement a written nondiscrimination policy that, at minimum, provides the contact information for the Section 1557 Coordinator (if applicable) and states that the covered entity in its health programs and activities: is prohibited from unlawfully discriminating on the basis of race, color, national origin (including limited English proficiency and primary language), sex (including pregnancy, sexual orientation, gender identity, and sex characteristics), age, or disability; and provides language assistance services and appropriate auxiliary aids and services free of charge, when necessary for compliance with section 1557 or the part.

In § 92.8(c), we proposed addressing the requirements for covered entities with 15 or more employees with regard to grievance procedures and recordkeeping in their health programs and activities, including ensuring that the grievance procedure is accessible to individuals with LEP and individuals with disabilities.

In § 92.8(c)(1), we proposed requiring that covered entities with 15 or more employees establish written civil rights grievance procedures.

In § 92.8(c)(2), we proposed that a covered entity must retain records related to grievances filed with it that allege discrimination on the basis of race, color, national origin, sex, age, or disability in its health programs and activities for no less than three (3) years from the date of the filing of the grievance.

In § 92.8(c)(3), we proposed that a covered entity keep confidential the identity of an individual who has filed a grievance, except as required by law or to the extent necessary to carry out the purposes of this proposed regulation, including the conduct of any investigation.

We invited comment on the record retention requirement, particularly with regard to patient privacy concerns or concerns regarding potentially unauthorized use of information included in such records. We also sought comment on best practices for record retention of grievance procedures, including strategies for ensuring patient privacy.

In § 92.8(d), we proposed requiring covered entities to develop and implement written language access procedures to support compliance with requirements to take reasonable steps to provide meaningful access to individuals with LEP in their health programs and activities under proposed § 92.201.

In § 92.8(e), we proposed requiring covered entities to develop and implement written effective communication procedures to support compliance with requirements to take appropriate steps to ensure that communications in their health programs and activities with individuals with disabilities are as effective as communications with individuals without disabilities under proposed § 92.202.

In § 92.8(f), we proposed requiring covered entities to develop and implement written procedures for making reasonable modifications to their policies, practices, or procedures that allow individuals with disabilities equal opportunity to participate in their health programs and activities as required under proposed § 92.205.

In § 92.8(g), we proposed that a covered entity may combine the content of the policies and procedures required by this provision with any policies and procedures pursuant to other civil rights statutory protections if they clearly comply with section 1557 and the provisions in the part.

We sought comment on this proposed provision and whether there may be alternative measures that OCR should consider to proactively prevent discrimination, and whether they would be more or less burdensome than what was proposed. We also invited comment from all covered entities that had previously implemented or were currently implementing any of the proposed procedures; consumers who interact with covered health programs and activities; and community-based organizations that work with individuals with LEP and individuals with disabilities. We also requested comment on whether covered entities employing fewer than 15 people should be required to have a grievance procedure, including the benefits of a less formal resolution process.

The comments and our responses regarding § 92.8 are set forth below.

General Comments

Comment: Many commenters expressed support for the Section 1557 Policies and Procedures requirement at § 92.8, noting that, in their view, it will help prevent discrimination and health disparities; requires providers to proactively engage in the process of avoiding discrimination; elevates covered entities and their employees' knowledge about their section 1557 obligations; and alleviates the burden on patients to file complaints in order to trigger section 1557 compliance and enforcement. Some commenters supported the requirement because the 2020 Rule leaves requirements for policies and procedures disjointed, confusing, and ineffective.

Some commenters recommended that OCR strengthen this requirement by requiring covered entities to evaluate the effectiveness of their Section 1557 Policies and Procedures and update them when necessary to ensure consistency.

Response: Covered entities' Section 1557 Policies and Procedures should be dynamic and updated to ensure covered entities comply with changes in the law

and meet their section 1557 obligations. In addition, when covered entities' operations change, this may necessitate revising Section 1557 Policies and Procedures to maintain section 1557 compliance.

Accordingly, we have added § 92.8(h) to address when it is required and permissible for a covered entity to revise their Section 1557 Policies and Procedures. Section 92.8(h)(1) explains that a covered entity must review and revise its policies and procedures, as necessary, to ensure they are current and in compliance with section 1557 and this rule. Section 92.8(h)(2) states that a covered entity may change its policies and procedures at any time, provided that the changed policies comply with section 1557 and the part.

Comment: Some commenters who opposed this requirement cited covered entities' existing compliance burdens and the resources needed to draft Section 1557 Policies and Procedures. Some commenters requested that, if OCR maintains the requirement in the final rule, OCR make template Section 1557 Policies and Procedures available for covered entities to use and tailor to their organizations as far in advance of the final rule's effective date as possible.

One commenter stated that existing Federal and State regulations prevent covered entities from focusing on high-quality care, and that this requirement is an unfunded mandate. One commenter recommended that OCR should continue previously permitted flexibility and allow covered entities to develop Section 1557 Policies and Procedures voluntarily.

Response: To assist covered entities' compliance with this requirement, OCR has developed Section 1557 Policies and Procedures templates that are available on OCR's website at *www.hhs.gov/1557*, which are designed to assist covered entities in tailoring their own Section 1557 Policies and Procedures. We reiterate the requirement that a covered entity's Section 1557 Policies and Procedures must be reasonably designed, take into account a covered entity's size, complexity, and the type of health programs or activities provided. A covered entity should view these templates as a starting point for adopting and implementing Section 1557 Policies and Procedures that are specific to their health programs and activities. The templates provided may be insufficient for large covered entities given the range in complexity and structure of those entities, and entities must ensure that their Section 1557 Policies and Procedures reflect the appropriate scope.

Comment: Some commenters recommended that OCR not require covered entities to identify the names of their respective Coordinators in their Section 1557 Policies and Procedures required by § 92.8(b), (d), (e), and (f) because high employee turnover may make coordinators' names obsolete and require constant changes.

Response: OCR notes that nothing in § 92.8 requires a covered entity to identify the Coordinator by name; rather, § 92.8(b), (d), (e), and (f) require the Coordinator's current contact information. The referenced provisions require sufficient information for an individual who needs assistance in implementing the procedures to reach the Coordinator. Thus, a covered entity could choose to list the position title with a phone number, email address, and mailing address.

Comment: One commenter requested that OCR clarify, especially with respect to large health systems (such as hospitals, clinics, home care entities, and home medical equipment retail settings), the regulatory language related to scalability.

Response: OCR recognizes that covered entities—including not only recipients, but also the Department and title I entities—need flexibility when developing and implementing their Section 1557 Policies and Procedures. A covered entity should consider its size, capabilities, the costs of specific measures, the operational impact, and the composition of the patient populations they serve in deciding the appropriate scale of their Section 1557 Policies and Procedures. Thus, OCR expects the scope and detail of a covered entity's Section 1557 Policies and Procedures to vary accordingly.

Comment: Some commenters requested that OCR include additional required policies and procedures, such as policies and procedures regarding service animals, protecting civil rights in public health emergencies, assessing the competency of bilingual/multilingual staff, and telehealth. Specifically, one commenter recommended requiring a telehealth procedure designed to assist covered entity employees communicate with patients before, during, and after telehealth visits, and that this telehealth procedure could address pre-appointment telehealth screenings to ensure that patients have the necessary equipment or technology for their appointments and to determine whether the patient has the requisite technological skills to participate in a telehealth session. The proposed telehealth procedure would require covered entities to provide telehealth training resources for patients who lack skills or familiarity with telehealth prior to their appointments. Other commenters recommended that covered entities' procedures ensure accessibility for individuals with physical and/or behavioral health disabilities and specifically comply with the U.S. Access Board's Standards for Accessible Medical Diagnostic Equipment. 82 FR 2810 (Jan. 9, 2017).

Response: OCR recognizes the benefit of policies and procedures to support civil rights compliance. However, we recognize that developing and implementing such policies and procedures is not without an initial burden on the covered entities, and the continued—though much diminished—effort of maintaining the procedures and employee familiarity with such procedures. For that reason, we decline to require additional policies and procedures at this time. However, covered entities are encouraged to develop and implement policies and procedures related to service animals, protecting civil rights during public health emergencies, assessing bilingual and multilingual staff members' competency, nondiscriminatory provision of telehealth,[72] accessible medical equipment, or any other situation they choose in order to ensure compliance with section 1557. For more about section 1557's accessibility requirements, please refer to our discussion for § 92.204, which requires covered entities to make their buildings and facilities accessible to individuals with disabilities. In addition, please see the discussion of medical diagnostic equipment under § 92.207. Please also see the discussion of § 92.211 related to nondiscrimination in the delivery of health programs and activities through telehealth services.

Summary of UUegulatory changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the policies and procedures requirement provision at § 92.8 as proposed, with modifications. We have added a paragraph (h) that explains that a covered entity must review and revise its policies and procedures, as necessary, to ensure they are current and in compliance with section 1557 and this rule and that a covered entity

[72] *See, e.g.,* U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts.; U.S. Dep't of Justice, Civil Rts. Div., *Guidance on Nondiscrimination in Telehealth: Federal Protections to Ensure Accessibility to People with Disabilities and Limited English Proficient Persons, https://www.hhs.gov/sites/default/files/guidance-on-nondiscrimination-in-telehealth.pdf.*

may change its policies and procedures at any time, provided that the changed policies comply with section 1557 and this rule.

Nondiscrimination Policy

Comment: Many commenters supported the Nondiscrimination Policy at proposed § 92.8(b). Some commenters recommended that OCR revise the language in this Policy so that the description of prohibited sex discrimination is consistent with the description of sex discrimination included in § 92.101 (*i.e.,* revise to include sex stereotypes and pregnancy or related conditions). Some of these commenters further recommended that OCR also specify that ''pregnancy or related conditions'' includes termination of pregnancy. Other commenters requested that OCR further revise § 92.8(b)'s reference to sex discrimination and make a corresponding revision to § 92.101(a)(2) by adding ''transgender status'' to the description of sex discrimination for both provisions.

Response: OCR appreciates the need for consistency across the regulation, and to ensure that the public is aware of the various types of discrimination included under the umbrella of sex discrimination. We clarify that a Nondiscrimination Policy's prohibition of sex discrimination encompasses protections afforded for various types of sex discrimination such as pregnancy, including termination of pregnancy or related conditions, and we have revised the parenthetical in § 92.8(b) to explain that this provision's reference to sex discrimination is consistent with the various types of sex discrimination described at § 92.101(a)(2), which includes ''gender identity.'' We decline to add ''transgender status'' to the regulatory text, as the term ''gender identity'' necessarily encompasses ''transgender status'' and these terms are often used interchangeably.[73]

At the same time, we want to emphasize that the ACA itself provides that ''[n]othing in this Act shall be construed to have any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). HHS will comply with this provision.[74] For further discussion regarding what constitutes sex discrimination, including the application of religious freedom and conscience protections in this context, please see the discussion at § 92.101(a)(2).

Comment: One commenter expressed opposition to § 92.8(b) because it would increase paperwork without benefiting or improving the quality of care.

Response: As we noted above, many commenters, some of which are providers and professional medical associations, support the requirement to have a Nondiscrimination Policy. Peer-reviewed medical publications acknowledge that a health care organization's written policies and procedures can improve quality of care and mitigate the legal risk of causing patient harm.[75] Indeed, research suggests that the mere existence of policies that prohibit discrimination helps reduce health and other inequities.[76] Thus, we disagree with the commenter's contention that § 92.8(b) increases paperwork without benefitting or improving quality of care particularly for individuals who belong to communities with a history of experiencing discrimination in health care settings.

Comment: A few commenters expressed First Amendment concerns related to the overarching Section 1557 Policies and Procedures requirement, particularly the Nondiscrimination Policy requirement. One of these commenters recommended that, with respect to the Section 1557 Policy and Procedures requirement, OCR should clarify that covered entities retain free speech protections to the extent that sex discrimination does not result if a covered entity acknowledges a patient's sex assigned at birth. An organizational commenter stated that the Nondiscrimination Policy is problematic under the First Amendment because requiring a covered entity to state that it does not discriminate on the bases of pregnancy, sexual orientation, gender identity, and sex characteristics constrains freedom of speech and freedom of association.

Response: OCR acknowledges the comments regarding protections on the basis of sex, particularly as they relate to nondiscrimination on the basis of pregnancy or related conditions, sexual orientation, and gender identity. As noted above, we have revised § 92.8(b) by removing descriptions of sex discrimination and by cross-referencing § 92.101(a)(2) and that provision's description of sex discrimination. Thus, a covered entity's Nondiscrimination Policy need not explicitly include the various forms of prohibited sex discrimination to address any potential First Amendment concern. However, we emphasize that these concerns do not negate a covered entity's obligation to implement Section 1557 Policies and Procedures.

We also note here that we have amended the regulatory text to add, as a best practice towards compliance, that a recipient's Nondiscrimination Policy reflect assurance of exemptions that have been triggered or that have been granted to that recipient under § 92.302.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the Nondiscrimination Policy requirement at § 92.8(b) as proposed, with modifications. We are revising § 92.8(b)(1) to adjust the explanatory parenthetical for sex in the Nondiscrimination Policy to state ''consistent with the scope of sex discrimination described at § 92.101(a)(2).'' We are revising § 92.8(b) to add paragraph (b)(2) that states, ''OCR considers it a best practice toward achieving compliance for a covered

entity to provide information that it has been granted a temporary exemption or granted an assurance of exemption under § 92.302(b) in the nondiscrimination policy required by paragraph (b)(1) of this section.''

Grievance Procedures

Comment: In general, commenters supported the grievance procedures requirement at § 92.8(c), including because allowing patients to voice concerns to providers builds trust between patients and providers.

Response: OCR's enforcement experience reveals that grievance procedures help covered entities lower compliance costs and provide covered entities the opportunity to resolve grievances—through direct communication with the individual raising the grievance—in the quickest possible manner without OCR's involvement.

Comment: Some commenters recommended that OCR require covered entities to adjudicate grievances quickly, and some of these commenters specifically requested that OCR add timeframes by which section 1557 grievances must be both acknowledged and resolved because covered entities may either belatedly or never acknowledge a complaint or take longer than perceived as necessary to resolve grievances. Others requested that OCR define ''prompt and equitable'' resolution, with one stating that ''equitable'' is a subjective construct and suggested that OCR consider requiring covered entities to resolve grievances by affording the aggrieved individual appropriate access to the health program or activity at issue. Relatedly, another commenter asked that OCR consider differentiating between pretreatment grievances and other grievances, because denials of care and coverage can result in the postponement or foregoing of care altogether and can require patients to wait for the resolution of a grievance before seeking care from an alternate provider.

Response: We appreciate these commenters' desire for additional specificity regarding what is meant by ''prompt and equitable'' resolution of a grievance. This terminology is consistent with grievance procedures requirements found in the Department's section 504 and title IX regulations at 45 CFR 84.7(b) and 86.8(b), respectively.

Imposing a single timeframe by which a covered entity must resolve a grievance does not account for the fact that covered entities vary in size, resources, and capabilities, and so one timeframe may not be appropriate for all entities. Multiple factors may impact the length of time required to evaluate and resolve a particular grievance and to ensure a fair process and reliable outcome, including the nature of the grievance. This is balanced by the fact that prompt resolution of complaints is necessary to further section 1557's nondiscrimination objective. We encourage individuals to file complaints with OCR if they have filed a grievance that they do not believe has been resolved in a prompt and equitable manner. OCR's investigation of such a complaint may determine whether a covered entity's grievances procedures truly provide for prompt and equitable resolutions, and if they do not, OCR may seek corrective actions from the covered entity. For these reasons, we decline to add timeframes within which covered entities are required to address grievances, and we decline to define the term ''prompt and equitable.''

Comment: Some commenters recommended that OCR require covered entities to notify individuals of the ability to file a grievance. Other commenters requested that OCR revise § 92.8(c) to require a covered entity's process for filing grievances be simple, not burdensome, and accessible to individuals with LEP and individuals with disabilities.

Response: To the extent covered entities are required to have grievance procedures, covered entities are also required to include information about the availability of their grievance procedures and how to file a grievance in their Notice of Nondiscrimination, per § 92.10(a)(1)(vi). All covered entities, regardless of size, must also include information in the Notice of Nondiscrimination on how to file a discrimination complaint with OCR, per § 92.10(a)(1)(vii).

In addition, the grievance process must be accessible to individuals with LEP and individuals with disabilities, consistent with section 1557 and this regulation. If an individual finds that a covered entity's grievance process is generally overly burdensome to the point it is ineffective or nonexistent and thus hindering the prompt and equitable resolution of grievances, we recommend the individual file a complaint with OCR.

Comment: Many commenters on this provision recommended that OCR require all covered entities (not just those with 15 or more employees) to have grievance procedures, while others either requested that OCR maintain the 15-employee threshold or eliminate the requirement altogether.

Commenters in support of eliminating the 15-employee threshold contended that a covered entity's size does not protect patients from discrimination and the threshold is inequitable because it deprives patients of smaller covered entities the opportunity to directly engage with the covered entity to address alleged discrimination. According to commenters, individuals with disabilities face significant barriers to care when seeking and receiving services from smaller covered entities, and the 15-employee threshold unjustly deprives individuals with disabilities of the opportunity to address these barriers through grievances.

Further, commenters remarked that regulatory carve outs and distinctions are confusing and difficult for both covered entities and patients when determining applicable requirements and protections. Commenters expressed concern that individuals from marginalized communities would be confused about why they could not submit a grievance with a covered entity with fewer than 15 employees simply due to the size of the covered entity, when other requirements in the rule apply regardless of covered entity size.

Commenters also raised the following issues countering inclusion of a 15-employee threshold: the statutory text of section 1557 is not so limited; the limitation is inconsistent with expanding section 1557's application; an individual should have the ability to address discrimination in the first instance directly to the covered entity; and a covered entity with fewer than 15 employees that has grievance procedures will be able to resolve discrimination complaints more promptly at an earlier stage without formal OCR investigation.

Citing the burden on smaller covered entities, some commenters requested that OCR maintain the grievance procedures requirement only for covered entities with at least 15 employees, eliminate the procedures altogether or utilize the SBA's definition of small business.

Response: We appreciate commenters' concerns about the 15-employee threshold and recognize that individuals are not immune from experiencing discrimination when interacting with smaller covered entities. However, OCR declines to apply this requirement to all covered entities and note that this approach is consistent with OCR's section 504 regulation, which similarly limits the grievance procedure requirement. *See* 45 CFR 84.7(a). Individuals remain able to file complaints with OCR when they experience discrimination in health programs and activities and may also raise concerns to smaller covered

entities outside of a formal grievance process.

Given the benefits of having grievance procedures, we encourage smaller covered entities to voluntarily implement such procedures, which may help them more meaningfully engage with all individuals, including members of underserved communities, and better identify potential barriers to accessing their health programs and activities.

Comment: Some commenters pointed to the Health Insurance Portability and Accountability Act of 1996 (HIPAA) as precedent and demonstrable evidence that the Department believes providers of all sizes have the ability to comply with a Federal requirement to implement a process for handling complaints. These commenters suggested that all HIPAA-covered entities, including those with fewer than 15 employees, have experience implementing a process for receiving, handling, and investigating privacy complaints, which these covered entities can modify or replicate, if necessary, to include section 1557 discrimination grievances.

Response: OCR appreciates commenters' observation that HIPAA-covered entities of all sizes have experience implementing a complaint process. However, we are unpersuaded that the potential burden to smaller covered entities with existing HIPAA complaint processes would be minimal because these entities would need to revise their existing policies, train relevant staff, and process civil rights-related grievances in addition to processing HIPAA-related complaints. This is similar to our position in response to comments received in response to the 2015 NPRM. 81 FR 31395. Nothing in this rule prohibits entities of fewer than 15 employees from voluntarily creating a grievance process.

Comment: In support of requiring all covered entities to have grievance procedures, commenters suggested that covered entities could have less extensive or detailed grievance procedures, and that such a procedure would not need to involve significant staff or resources. These commenters recommended that OCR develop model grievance procedures for smaller covered entities to help them comply with the grievance procedures requirement.

Response: To assist all covered entities—including those with fewer than 15 employees that may wish to voluntarily implement a grievance procedure—we have made available sample grievance procedures on OCR's website at *www.hhs.gov/1557*. We note that the sample grievance procedure available on OCR's website is more appropriate for smaller covered entities, and we remind covered entities that the rule's general Section 1557 Policies and Procedures requirement is founded on the principle of scalability. Accordingly, the sample grievance procedure on our website may not be adequate for a larger covered entity or health system made up of several covered entities.

Comment: Many commenters supported the record retention requirement at § 92.8(c)(2). Under this provision, we proposed that covered entities must retain records for a minimum of three (3) calendar years, and each record must include the name and contact information of the complainant, the alleged discriminatory action and alleged basis or bases of discrimination, the date the grievance was filed, the grievance resolution, and any pertinent information.

Some commenters expressed that this requirement will help covered entities identify potential patterns and practices of discrimination of which they may not have otherwise been aware. Other commenters who supported this requirement expressed concern about patient privacy and recommended that OCR require covered entities to deidentify information related to the grievance during the retention period.

Response: We appreciate commenters' support for this new provision and recognize the importance of ensuring patient privacy related to recordkeeping. Section 92.8(c)(3) requires covered entities to keep confidential the identity of the individual who submits a grievance, subject to limited exceptions. We decline to revise the records retention requirement to require covered entities to deidentify that information related to the grievance.

Many section 1557 covered entities must also comply with the HIPAA Privacy and Security Rules, which requires HIPAA covered entities to protect and secure all protected health information that a covered entity or business associate creates, receives, maintains, or transmits. If a covered entity discloses an individual's protected health information in violation of the HIPAA Rules, then the covered entity is subject to OCR's HIPAA enforcement measures.[77] If a section 1557 covered entity maintains grievance records beyond three (3) calendar years, the covered entity may deidentify the information after the records retention period has elapsed. Even where a section 1557 covered entity is not subject to HIPAA, that section 1557 entity must still comply with all applicable Federal and State privacy laws.

Comment: One commenter requested that OCR revise § 92.8(c)(2) so that a covered entity be required to retain only ''actionable'' grievances because large, covered entities may receive grievances that are not related to section 1557's protections. This commenter gave an example that a complaint may be employment-related, and therefore § 92.8(c)(2) should not require a covered entity to retain such a grievance.

Another commenter raised a similar concern and recommended that OCR completely eliminate any record retention requirement as they relate to grievances because it is difficult to know when a grievance triggers the retention requirement. This commenter requested that, if OCR retains the grievance records retention requirement, that it only apply to covered entities with 15 or more employees.

Response: Section 92.8(c)(2) applies only to covered entities that are required to have grievance procedures (*i.e.,* those with 15 or more employees), and this provision expressly specifies that covered entities retain grievances it receives pursuant to the grievance procedures requirement at § 92.8(c)(1) that allege discrimination on the basis of race, color, national origin, sex, age, or disability in the covered entity's health programs or activities. Thus, covered entities need not retain records pertaining to employment-related grievances or grievances that do not allege discrimination based on race, color, national origin, sex, age, or disability in the covered entity's health programs or activities. If a covered entity cannot determine whether a complaint relates to section 1557, the covered entity should contact the complainant to obtain sufficient information to either investigate the grievance or determine if the complaint should be handled under a different process. We note that a covered entity's dismissal of a grievance constitutes its resolution of the grievance.

Comment: One commenter who expressed support for the retention requirement opined that the proposed three-year retention period is less burdensome than the seven-year retention requirement applicable to most records for hospice and palliative care. Another commenter recommended that covered entities be required to retain grievance-related records permanently due to the low costs associated with maintaining these records electronically, and a covered entity could find older records useful in

[77] *See* 45 CFR 160.312 and 160.400 through 160.414.

litigation. Another commenter recommended that OCR adopt a four-year retention period to match section 1557's four-year statute of limitations [78] because a retention period shorter than section 1557's statute of limitations would prevent private litigants from obtaining grievance-related evidence relevant to a section 1557 claim. One commenter also recommended that OCR revise § 92.8(c)(2) so that the timeframe for covered entities to retain grievance records starts once the covered entity resolves the grievance rather than when the covered entity receives it.

Response: OCR has determined that the three-year record retention requirement strikes the appropriate balance between covered entities' burden concerns and the need for OCR to access this vital information in the course of a complaint investigation or compliance review. As stated in the 2022 NPRM, we understand that many covered entities already have a practice of retaining grievance records, and nothing in this rule prevents a covered entity from retaining records longer if they so choose. 87 FR 47849.

We appreciate commenters' recommendation that OCR specify that the retention obligation starts on the date that the covered entity resolves the grievance rather than on the date that the complainant filed the grievance, and we are revising § 92.8(c)(2) to reflect this change. Grievances take varying amounts of time to resolve, and starting the retention obligation on the date of receipt could potentially result in a covered entity disposing of records pertaining to a grievance prior to the resolution of the grievance. This change necessitates that we further revise § 92.8(c)(2) to require a covered entity's grievance records also include the date that the covered entity resolved a grievance.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the Grievance Procedure requirement provision at § 92.8(c) as proposed, with modifications. We are revising § 92.8(c)(2) to explain that the grievances that a covered entity must retain are those filed pursuant to its grievance procedures required by § 92.8(c)(1) that allege discrimination based on race, color, national origin, sex, age, and disability in a covered entity's health programs or activities, and that the records include the date the grievance was resolved. We are also clarifying at § 92.8(c)(2) that the retention period for grievance procedures starts on the date the covered entity resolves the grievance.

Language Access Procedures

Comment: Most commenters on this provision expressed support for the proposed language access procedures requirement at proposed § 92.8(d). Some commenters recommended that OCR revise § 92.8(d) to make clear that a covered entity's language access obligations extend to companions of patients, beneficiaries, enrollees, and applicants.

Response: It has been OCR's practice to require covered entities to provide language assistance services for LEP companions of patients, beneficiaries, enrollees, and applicants when necessary. Rather than revising § 92.8(d), we are revising § 92.201 (Meaningful access for individuals with LEP) to codify this requirement. We discuss this further when addressing comments related to § 92.201. Because the language access procedures are intended to assist covered entities in complying with their language access obligations under § 92.201, they should ensure that companions are included.

Comment: One commenter recommended that OCR allow covered entities the flexibility to identify the process and business rules that they currently use to identify individuals with LEP, how to provide language assistance services, and how to create and store translated materials and resources. This commenter suggested that § 92.8(d) reads as if it is intended for smaller covered entities that provide language assistance services in an ad hoc manner.

Response: Section 92.8(d) applies to covered entities of all sizes, allowing flexibility for covered entities to scale their language assistance services procedures as needed. Section 92.8(d) does not restrict the manner in which a covered entity implements its language access procedures, which may include the use of pre-existing business tools that meet the necessary requirements. For example, § 92.8(d) does not dictate how covered entities' employees identify individuals with LEP or how covered entities obtain language assistance services from qualified interpreters and translators (*i.e.,* through contract interpreters, in-house interpreters, etc.).

Comment: Some commenters indicated that often patients with LEP have to repeat a language access intake process with every visit to a covered entity, even when they have already gone through such a process and their language access needs have been previously identified by the covered entity. To avoid this situation, commenters recommended that OCR require covered entities to note in a patient's records whether the patient needs language assistance services, and if so, the specific language and services needed.

Response: OCR understands that repeatedly having to request necessary language assistance services from the same covered entity can be frustrating and may result in wasted time or the cancellation of an appointment if the needed services are unavailable. While the commenters' suggestion for covered entities to document the specific language assistance services needs in the patient with LEP's record is a best practice that we encourage for inclusion in a covered entities' language access procedures, OCR declines to revise § 92.8(d). As drafted, the provision allows covered entities the flexibility needed to comply.

Comment: Some commenters requested that OCR revise § 92.8(d) with text: (1) directly from § 92.201 related to covered entities' obligation to provide each individual with LEP with meaningful access; and (2) that aligns with Executive Order 13166 (''Improving Access to Services for Persons with Limited English Proficiency''); [79] title VI*;* Medicaid's commitment to enhancing access through culturally competent care as defined in 42 CFR 440.262; and the Agency for Healthcare Research and Quality's ''Improving Patient Safety Systems for Patients with Limited English Proficiency'' guide.[80]

Response: Section 92.8(d) already references covered entities' obligations under § 92.201, so it is unnecessary to restate that language here. We decline to modify the provision to add language from the suggested requirements and resources, as this provision relates to covered entities' obligation under section 1557.

Comment: Many commenters sought clarity about whether the language

[78] *See, e.g., Tomei* v. *Parkwest Med. Ctr.,* 24 F.4th 508, 515 (6th Cir. 2022) (holding the catchall Federal statute of limitations at 28 U.S.C. 1658(a) applies to claims under section 1557 because section 1557 lacks an express statute of limitations); *but see Solis* v. *Our Lady of the Lake Ascension Cmty. Hosp., Inc.,* No. CV 18–56–SDD–RLB, 2020 WL 2754917, at *4 (M.D. La. May 27, 2020) (applying the Rehabilitation Act statute of limitations to a section 1557 claim of disability discrimination).

[79] E.O. 13166, 65 FR 50121 (Aug. 11, 2000).

[80] U.S. Dep't of Health & Hum. Servs., Agency for Healthcare Rsch. and Quality, *Improving Patient Safety Systems for Patients With Limited English Proficiency: A Guide for Hospitals* (2012), *https://www.ahrq.gov/sites/default/files/publications/files/lepguide.pdf.*

access ''procedures'' required by § 92.8(d) differ from documents commonly referred to as language access ''plans.'' Noting OCR's longstanding recognition of the benefits of having a language access plan, as expressed in the Department's ''2003 Guidance to Federal Financial Assistance Recipients Regarding Title VI Prohibition Against National Origin Discrimination Affecting Limited English Proficient Persons'' (HHS LEP Guidance), 68 FR 47311 (Aug. 8, 2003), many commenters recommended that OCR modify § 92.8(d) to clarify that covered entities must develop and implement a language access plan before developing language access procedures because developing effective policies and procedures require such advance planning and give covered entities clear policies to follow when seeing patients with LEP.

According to these commenters, formal language access plans require a covered entity to consider and evaluate the needs of a service area, providing a better understanding of populations, prevalence of specific language groups, language access needs, and scope of services needed to provide meaningful access. Commenters highlighted the rapid growth of pockets of individuals with LEP with distinct language and cultural conventions, including indigenous immigrant populations from Central and South America, and the changing language needs for recent arrival of refugees from Afghanistan, Ukraine, Russia, and other non-English speaking countries.

In contrast, one commenter appreciated that the Proposed Rule did not require covered entities to implement language access plans and noted that small, covered entities lack resources, including time, administrative effort, and financial resources to implement a language access plan. Citing the 2015 NPRM, the commenter stated the cost to develop a language access plan at $1,135 per small, covered entity,[81] and recommended that OCR finalize the rule without requiring covered entities to develop and implement a language access plan.

Response: OCR appreciates commenters' emphasis on the value of language access plans, which as commenters noted, are distinct from the language access procedures required under this section. Covered entities are not explicitly required to analyze the specific populations with LEP in their service areas. However, in order to develop effective language access procedures and ensure compliance with the obligations at § 92.201, a covered entity will need to engage in some form of analysis to identify the language access needs in their service area.

For example, when finalizing a list of preferred language assistance services providers, a covered entity will need to determine which providers are most capable of meeting the language needs of the individuals with LEP within the service area. To best inform its decision-making process, a covered entity may first attempt to identify the non-English languages most spoken in the relevant service area and confirm that interpreter and translation service providers can accommodate those languages. The HHS LEP Guidance, cited by commenters, is still instructive and relevant and provides helpful information in how to develop a strategy for delivery of language assistance services. *See* 68 FR 47313–22. Covered entities are also encouraged to use the language access planning resources provided at *https://www.lep.gov/language-access-planning* or reference HHS's 2023 Language Access Plan for guidance at *https://www.hhs.gov/sites/default/files/Language-Access-Plan-2023_0.pdf*.

Covered entities with language access plans are often better prepared to provide individuals with LEP with meaningful access to their health programs and activities. For covered entities that have developed, implemented, and maintained language access plans, we highly encourage those covered entities to sustain that practice and to consider modifying their plans to include the elements required by § 92.8(d), to the extent it is not already included. To the extent a covered entity's language access plan meets the requirements of § 92.8(d), a separate procedures document will not be required regardless of whether the document is referred to as a ''plan'' or ''procedures.''

Comment: Some commenters recommended that OCR delete the requirement in § 92.8(d) for covered entities to identify the names of qualified bilingual/multilingual staff members due to employee turnover, with one commenter also requesting that OCR eliminate the requirement to maintain a list and location of electronic and written translated materials because such a requirement would be an onerous, inefficient use of time due to frequent changes to translated materials. Another commenter indicated that these requirements are especially difficult for large, covered entities, and that health insurance issuers in particular should have the option to provide business rules and rationale with respect to how and where they store documents rather than create a duplicative process. This commenter also recommended that OCR allow covered entities to articulate the process for accessing language services and contact information for the covered entity's department or functional group responsible for translations.

Response: OCR acknowledges that covered entities may need to periodically revise their language access procedures to reflect changes to qualified bilingual/multilingual staff; however, these staff members play a critical role in the delivery of timely language assistance services and therefore it is imperative that employees be able to identify qualified bilingual/multilingual staff members as quickly as possible through the use of a current directory. We decline to remove the requirement that language access procedures include a current list of qualified bilingual/multilingual staff members.

Timely and effective language assistance services are also best served by maintaining a current list of translated materials. OCR notes commenters' concerns regarding the practicality and burden of maintaining a list of the physical location of all written translated materials. For this reason, we are revising the requirement to no longer require the location of written translated materials, but only how to access electronic translated materials (*i.e.,* their location on a covered entity's network, intranet, or external-facing website).

Section 92.8(d) requires covered entities to include contact information for their Coordinator and how employees obtain services of qualified interpreters, translators, and multilingual/bilingual staff. This allows for covered entities to articulate the process for accessing language services; if this function has been delegated to a department or functional group, contact information for that department or functional group should be included in the language access procedures.

Comment: Some commenters recommended that the Department secure resources for small, covered entities to support their provision of language assistance services. For example, one commenter recommended that OCR contract with a telephonic interpretation service and allow small, covered entities to opt-in to using that service. Another commenter suggested that OCR partner with the U.S. Department of Education to invest in medical interpreter training for smaller language communities because investing in these communities would

[81] The $1,135 figure is derived from the 2015 NPRM for section 1557 on ''training costs'' for small entities. *See* 80 FR 54213.

result in higher quality health care. Another commenter requested that OCR make available sample policies and procedures; best practices for working with language assistance companies, identifying qualified (and unqualified) interpreters, and producing accurate and quality translations; and training videos.

Response: OCR appreciates these commenters' suggestions for providing resources to assist small, covered entities and, we are committed to making sample language access procedures available on our website at *www.hhs.gov/1557*. However, it is not appropriate for OCR, as a Federal agency, to endorse private interpreter or translator service providers. We are also unable to provide a telephonic interpretation contract into which small, covered entities could voluntarily participate.

OCR also appreciates the importance of interpreter training for less frequently encountered languages and is committed to developing a robust health care work force. To illustrate this commitment, the Department announced a ''Promoting Equitable Access to Language Services in Health and Human Services'' initiative in Fall 2022, for which grants were awarded to 11 organizations to develop and test methods of informing individuals with LEP about the availability of language assistance services in health care settings.[82]

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the Language Access procedures requirement provision at § 92.8(d) as proposed, with modifications. We are revising § 92.8(d) to require language access procedures to strike the requirement to include the location of any written or electronic materials and adding a requirement to include ''how to access electronic translations.'' We replaced ''publication date'' with ''date of issuance'' to better account for translated materials that may be in hard copy or electronic format. We are also making one technical revision. We are replacing ''limited English proficient individual'' with ''individual with limited English proficiency,'' consistent with modifications elsewhere.

Servs., Off. of Minority Health, *FY 2022 Grants Awards: Promoting Equitable Access to Language Services in Health and Human Services* (October 11, 2022), *https://minorityhealth.hhs.gov/fy-2022-grant-awards#:~:text=Grant%20period%3A%20 2022%2D2025,in%20health%20care%2D related%20settings.*

Effective Communication Procedures

Comment: Comments related to proposed § 92.8(e), regarding effective communication procedures, were similar to the language access procedures comments. Many commenters requested that OCR require covered entities to develop and implement a broad ''communication access plan,'' which would address effective communication and accessibility for individuals with disabilities, including individuals with disabilities who also have LEP. Commenters recommended that covered entities be required to develop communication access plans prior to developing their effective communication procedures. Some commenters suggested that a covered entity's effective communication procedures should also include how to determine the sign language an individual with a communication disability uses and whether the individual needs the services of an interpreter team, such as a certified deaf interpreter and an American Sign Language interpreter. One commenter recommended that we add a requirement for covered entities to create section 1557, ADA, and section 504 communication access plans along with the effective communication procedures requirement.

Response: Advance planning is an essential component of developing and implementing effective procedures that will ensure compliance with the obligations at § 92.202, which necessitate consideration of the various aids and services that may be required to deliver effective communication. Thus, while covered entities are not explicitly required to engage in advance planning, their ability to comply with § 92.202 will be best supported though robust procedures that are developed though a thoughtful and thorough process.

Covered entities may include more information in their respective effective communication procedures than § 92.8(e) requires, and we encourage covered entities that are already implementing communication access plans to maintain that practice. Covered entities with active communication access plans are permitted to modify such plans to include the information required by § 92.8(e); to the extent a covered entity's communication access plan meets the requirements of § 92.8(e), a separate procedures document will not be required regardless of whether the document is referred to as a ''communication access plan'' or ''effective communication procedures.'' While OCR appreciates the similarities between section 1557, section 504, and ADA's effective communication requirement, section 1557 is a distinct statute and imposing requirements for a similar procedure under the ADA and section 504 is outside the authority of this rulemaking.

Comment: One commenter requested that OCR make clear in the final rule that covered entities must implement effective communication and language access requirements in a well-coordinated, comprehensive, seamless, and equally effective manner such as through a standard operating procedure. This commenter also recommended that we inform covered entities that effective communication and language access requirements are of equal, paramount importance and closely interdependent with each other, and the commenter suggested that we issue guidance recommending effective communication and language access coordination.

Response: We agree with the commenter that effective communication and language access requirements are equally important, and effective communication and language access requirements can be interdependent, particularly when communicating with individuals with disabilities who have LEP. Though covered entities would ideally implement their effective communication and language access requirements in a well-coordinated, comprehensive, seamless, and equally effective manner, we decline to revise either paragraph (d) or (e) of § 92.8 or include any additional regulatory provisions imposing such standards on covered entities, in part, because such standards would be difficult to objectively measure.

Comment: Another commenter recommended that we revise § 92.8(e) to require covered entities' effective communication procedures include information about how covered entities will assess staff members' competency as qualified interpreters or qualified readers.

Response: We discuss assessment of interpreters at § 92.4; because of the flexibility allowed by the definition regarding how a covered entity chooses to assess the qualifications of interpreters (and readers), we decline to require this information be included in the procedures.

Comment: Some commenters recommended that OCR clarify that a covered entity's effective communication procedures apply to individuals with any disability that affects an individual's ability to communicate. Further, these

commenters also requested that we clarify that a covered entity's auxiliary aids and services options are not limited to qualified interpreters. Another commenter recommended that we include examples of accommodations, assistance, and opportunities for individuals with speech-related disabilities in the preamble and accompanying guiding documents.

Response: Covered entities' effective communication responsibilities, further discussed at § 92.202, apply to communication with all people with disabilities and a covered entity's effective communication procedures must equip employees with the information and tools necessary to meet the needs of individuals with many different types of disabilities. These may include, but are not limited to, sensory, manual, or speaking disabilities. Covered entities' obligations to provide auxiliary aids and services extend beyond qualified interpreters. A non-exhaustive list of auxiliary aids and services can be found in the definition of ''auxiliary aids and services'' in § 92.4.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the Effective Communication Procedures requirement provision at § 92.8(e) as proposed, without modifications.

Reasonable Modification Procedures

Comment: Many commenters supported the reasonable modification procedures requirement under proposed § 92.8(f), with some noting that many covered entities, particularly smaller covered entities, are unaware of their obligation to reasonably modify their policies and procedures when necessary to avoid discrimination on the basis of disability. Some commenters recommended that OCR proactively provide examples of the types of reasonable modifications that covered entities should consider as a means of increasing the likelihood that a covered entity's reasonable modifications procedures are adequate. One commenter urged OCR to include a statement in the final rule's preamble or guidance that a reasonable modification can include communicating in a more accessible modality (*e.g.,* via email), if the patient requests it.

Response: It is OCR's intent that requiring a reasonable modification procedure will address the lack of knowledge on behalf of covered entities that commenters raised, and will increase covered entities' ability to respond appropriately to requests. OCR believes this will raise overall compliance with the requirement at § 92.205 to provide reasonable modifications, and will benefit both covered entities and individuals seeking access to health programs or activities.

The vast range of potential reasonable modifications available or necessary do not lend themselves to an exhaustive list and so we are not able to include such a list here. However, many reasonable modifications involve reasonable changes in the way that an entity does something or permits an individual to do something. For example, a covered entity that generally communicates with patients via phone but receives a request from an individual with a disability to receive communication via email as a modification should generally grant that request, unless the covered entity can demonstrate that doing so would fundamentally alter the nature of the health program or activity. Other examples include allowing an individual with a disability whose disability makes attending morning appointments difficult to schedule afternoon appointments when appointments may not generally be available at that time, or allowing an individual with a disability to attend appointments via telehealth instead of in person when such modification does not fundamentally alter the nature of the service being provided. To be clear, there is no exhaustive list of what constitutes a reasonable modification, nor must covered entities develop one. Rather, covered entities are required to implement written procedures describing their process by which an individual with a disability may request a reasonable modification and how a covered entity processes and responds to such requests.

Comment: One commenter stated that a covered entity must provide reasonable modifications to an individual with a disability in the absence of an affirmative request for the modification if the covered entity had knowledge of the individual's disability or when the individual's disability is obvious. Relatedly, another commenter requested that OCR revise § 92.8(f) to reflect that an individual's failure to request a reasonable modification does not always excuse the covered entity from providing a reasonable modification if the modification does not result in a fundamental alteration.

Response: Section 92.8(f) is an administrative requirement to implement a procedure by which a reasonable modification can be requested, evaluated, and granted. However, as noted in the 2022 NPRM, failure to request a reasonable modification does not always excuse the covered entity from providing a reasonable modification to avoid discrimination on the basis of disability, as long as the modification would not result in a fundamental alteration of the health program or activity. 87 FR 47850. For example, when a covered entity has knowledge of an individual's disability and needs, or when an individual's disability and needs are obvious, a covered entity must provide modifications in the absence of a request.[83]

Comment: Some commenters noted a common occurrence where patients with disabilities must repeatedly request the same reasonable modifications or auxiliary aids and services from the same covered entity for each visit. These commenters urged OCR to include additional language in the final rule preamble and guidance for covered entities to minimize patients' burdens of having to repeatedly notify, request, monitor, and enforce the covered entity's obligation to remove access barriers.

Response: These commenters' recommendations mirror similar comments related to experiences of patients with LEP who must repeatedly request the same language assistance services from the same covered entity. Such a practice may be inefficient and may violate the requirements of this part if they result in the delay or denial of access to a health program or activity. *See* discussion of § 92.201. While we strongly recommend that covered entities engage in the best practice of documenting in patients' medical records the specific reasonable modifications requested by patients with disabilities, in an effort to avoid overly prescriptive requirements we decline to revise § 92.8(f).

Comment: Commenters recommended that OCR require covered entities to appoint an individual to ensure compliance with the reasonable modification requirement. This person would: inquire whether patients need communications-related modifications; ensure such modifications are provided promptly; and monitor the patient's stay

[83] *See, e.g., Greer* v. *Richardson Indep. Sch. Dist.,* 472 F. App'x 287, 296 (5th Cir. 2012) (holding that a ''failure to expressly 'request' an accommodation is not fatal to an ADA claim where the defendant otherwise had knowledge of the individual's disability and needs but took no action''); *Duvall* v. *Cnty. of Kitsap,* 260 F.3d 1124, 1139 (9th Cir. 2001) (''When the plaintiff has alerted the public entity to his need for accommodation (or where the need for accommodation is obvious . . .), the public entity is on notice that an accommodation is required . . .'').

to ensure the modification is provided through the duration of the entire stay. This person would also be responsible for ensuring the covered entity is otherwise complying with the requirement to provide auxiliary aids and services.

Response: This rule, at § 92.7, requires designation of a Section 1557 Coordinator by covered entities that employ 15 or more persons. The Coordinator is responsible for ensuring compliance with section 1557's requirements, including the requirement to provide auxiliary aids and services at § 92.202 and to make reasonable modifications at § 92.205. A covered entity may delegate responsibility for the actual provision of auxiliary aids and reasonable modifications, and implementation of the corresponding procedures, to an individual other than the Coordinator, such as a designee; however, we decline to require the designation of an additional employee to implement these requirements.

Comment: One commenter recommended that OCR revise the regulatory text for § 92.8(f) to substitute the modifier ''reasonable'' with ''reasonable and appropriate.''

Response: We decline to adopt the commenter's suggested regulatory revision because ''reasonable modification'' is a term of art with a long history of enforcement in the disability context. We note that, consistent with similar longstanding disability rights law enforcement, we use ''appropriate'' in §§ 92.8(e) and 92.202(b) when describing the auxiliary aids and services that a covered entity must use to effectively communicate with individuals with disabilities.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the Reasonable Modification Procedures requirement provision at § 92.8(f) as proposed, without modifications.

Training (§ 92.9)

In § 92.9, we proposed requiring covered entities to train relevant employees in their health programs and activities on their Section 1557 Policies and Procedures.

In § 92.9(a), we proposed a general requirement that covered entities train relevant employees of their health programs and activities on the Section 1557 Policies and Procedures required by proposed § 92.8.

In § 92.9(b), we specified when covered entities must train relevant employees on their Section 1557 Policies and Procedures.

In § 92.9(b)(1), we proposed that covered entities would be required to train existing relevant employees on their Section 1557 Policies and Procedures as soon as practicable, but no later than one (1) year after the effective date of the final rule.

In § 92.9(b)(2), we proposed that covered entities train new relevant employees within a reasonable period of time after they join a covered entity's workforce.

In § 92.9(b)(3), we proposed requiring covered entities to train relevant employees whose roles are affected by material changes to the covered entity's Section 1557 Policies and Procedures and any other civil rights policies or procedures the covered entity has implemented.

In § 92.9(c), we proposed requiring covered entities to contemporaneously document their employees' completion of the training required by this section in written or electronic form and maintain said documentation for no less than three (3) calendar years.

We invited comment on the experiences of covered entities in implementing training such as that required by proposed § 92.9, examples of where training made a difference in compliance, the timing of required training, whether covered entities would like the flexibility to include this required training as part of their existing annual compliance training, what types of changes would constitute a material change such that a covered entity would need to retrain staff, and how long training records must be retained. We also sought general comment on this proposal, including the effectiveness of civil rights training programs, the benefits experienced by covered entity staff and the people they serve, as well as the costs associated with the proposed training requirements. We further requested comment on whether the Section 1557 Policies and Procedures requirements and training requirements may increase the likelihood of compliance with the substantive legal requirements of section 1557.

The comments and our responses regarding § 92.9 are set forth below.

Comment: Many commenters on this provision expressed support for the training requirement and provided a range of reasons, including because the training is intended to impart knowledge and awareness of civil rights requirements and responsibilities; it will serve as an additional safeguard against discrimination and help reduce health disparities; and it will help providers connect patients to the services they need.

Commenters believed that a covered entity's staff need to understand section 1557 requirements, especially considering increased instances of employee turnover. One commenter also encouraged OCR to repeat the language in the Proposed Rule and remind covered entities that ''the more thoroughly a covered entity trains its staff on its Section 1557 Policies and Procedures, the more likely it is that the covered entity will successfully provide services to individuals in a nondiscriminatory manner.'' 87 FR 47850.

Some commenters said that civil rights violations occur due to lack of awareness and that training on covered entities' Section 1557 Policies and Procedures will help eliminate discrimination in health care because it promotes knowledge about how to deliver and administer health programs and activities to all patients, including patients who are members of communities that have experienced discrimination in health care services.

Some commenters suggested that OCR provide additional detail regarding the contents and delivery of the training, including by being more explicit about the nature and standards for determining adequacy of training. Conversely, one commenter recommended that OCR not make the training requirement overly prescriptive, and another asked OCR to give covered entities the authority to determine the training elements that best fit covered entities' operations.

Some commenters opposed the training requirement, referencing existing compliance burdens for providers, particularly small providers. Some commenters requested that OCR abandon the training requirement in the final rule because the requirement lacks specificity, is weak, vague, difficult to enforce, ineffective, will require more paperwork, and will confuse specialty clinics like dental offices; one commenter requested that OCR specifically exempt dermatology practices from the training requirement.

Many of the commenters that opposed the training requirement added that, if the rule is finalized as proposed, OCR should develop and provide educational materials and training resources, including materials to test trained employees' understanding of the new requirements.

Response: Section 92.9 requires covered entities to train relevant employees on their tailored Section 1557 Policies and Procedures, which will serve as a proactive safeguard against discrimination. Given this benefit, we decline to remove this

provision or exempt specific fields of practice from compliance with this requirement.

Recognizing the resources needed to comply with the training requirement, § 92.9 allows covered entities flexibility in designing the training they provide. However, the efficacy of the training—and its civil rights compliance benefit—will depend on a covered entity's effort in developing and conducting the training. OCR's experience with enforcing HIPAA's training requirement, 45 CFR 164.530(b), has found that employee-related violations are more limited where the required HIPAA training is routinely provided compared to where it is not. We anticipate that the section 1557 training requirement will similarly result in covered entities' employees being more aware of section 1557's discrimination prohibitions and establish a foundation by which covered entities' employees more consistently comply with nondiscrimination requirements.

With respect to the commenters' view that the training requirement will be difficult to enforce, the document retention requirement in § 92.9(c) is designed to assist with this. Moreover, OCR has been successfully enforcing HIPAA covered entities' compliance with HIPAA training requirements for more than 20 years. Through investigations, OCR evaluates covered entities' compliance with training requirements, and, when necessary, OCR ensures that a covered entity takes corrective actions to comply with said requirement.

To support compliance with this rule, OCR has made materials available on our website at *www.hhs.gov/1557*; however, the training required under § 92.9 must be based on the covered entity's own policies and procedures. Thus, while OCR is providing general resources on section 1557 requirements, they must be supplemented by the covered entity to include information regarding their specific Section 1557 Policies and Procedures.

Comment: Several commenters asked OCR to clarify whether covered entities could incorporate training on their Section 1557 Policies and Procedures with existing employee and annual compliance training instead of mandating a stand-alone training. One commenter recommended that covered entities train their employees on their respective Section 1557 Policies and Procedures separately because combining this training can result in information overload if employees are trained on multiple issues at the same training.

Response: This rule does not require or prohibit covered entities from incorporating the training required under § 92.9 with pre-existing employee or annual compliance trainings. We encourage covered entities to regularly train employees on their Section 1557 Policies and Procedures, possibly alongside other annual compliance trainings, and we recommend that covered entities offer section 1557 trainings in a manner that will result in maximum knowledge retention. While the rule does not specify the frequency with which trainings must be provided, covered entities should keep in mind that they must train new employees within a reasonable period of time after the employee joins a covered entity's workforce.

Comment: We received several comments recommending that OCR clarify the term ''relevant employees'' who must be trained under § 92.9. Many commenters recommended that we define ''relevant employees'' in the final rule's definitions section at § 92.4 or within § 92.9 itself. Some commenters suggested that ''relevant employees'' should include: employees whose roles and responsibilities require interfacing with patients and the public; employees who make decisions about patient care and covered entity operations that impact patient care; employees in leadership and supervisory roles who make decisions that affect nondiscrimination; and employees, including C-suite leadership (*i.e.,* the chief executive officer, chief financial officer, chief operating officer, and chief information officer), who are responsible for executing and making decisions regarding financial assistance, patient billing, and collections. Citing the importance of interactions between covered entities and patients in the long-term services and supports context, one commenter recommended that ''relevant employees'' should include temporary staff who interact with the public or clients.

Response: We appreciate commenters' recommendations to define ''relevant employee.'' Though we described a covered entity's relevant staff who must receive the training required in the 2022 NPRM, 87 FR 47851, based on comments received, we agree that including more specificity in the final rule text will add additional clarity for covered entities. We have provided a description of ''relevant employee(s)'' in new § 92.9(b)(4), which that, for purposes of the section, ''relevant employees'' includes employees whose roles and responsibilities entail interacting with patients and members of the public; making decisions that directly or indirectly affect patients' health care, including the covered entity's executive leadership team and legal counsel; and performing tasks and making decisions that directly or indirectly affect patients' financial obligations, including billing and collections. Below, we specify that relevant employees may include temporary employees in addition to permanent employees and have revised the regulatory text accordingly.

Comment: Other commenters recommended that OCR require covered entities to train all of their employees on the covered entities' Section 1557 Policies and Procedures because all employees may encounter a patient at any time, and they should understand basic section 1557 concepts. One commenter suggested that if OCR does not require covered entities to train all of their employees, then we should broaden who we consider to be ''relevant employees'' because employees who do not have direct patient interaction or policy-making roles may still have section 1557 responsibilities, and many of these employees are likely to engage in incidental patient interaction during the course of their work.

Response: A covered entity has the discretion to train all of its employees to eliminate the burden of determining who the covered entity believes is and is not a relevant employee. OCR notes that an employee who makes decisions that indirectly affect patients' health care or financial obligations meets the definition for ''relevant employee'' at § 92.9(b)(4), and therefore a covered entity would need to train such an employee pursuant to this provision. However, given the diversity of covered entities under this rule, we decline to mandate training for all staff. For example, to do so may cause confusion for covered entities that operate a health program that is part of a larger operation (*e.g.,* a retail grocery store that also operates a covered pharmacy).

Comment: Some commenters recommended that, due to high staff turnover and the common practice of hiring temporary, contract, or travel staff, OCR should consider allowing temporary staff to transfer prior, completed training from one facility to another to limit burden and redundancy. These commenters also asked OCR to permit training completion documentation from one covered entity to meet the documentation requirement for another covered entity as a means to limit burden and redundancy.

Response: Section 92.9 requires a covered entity to train employees on its

specifically tailored Section 1557 Policies and Procedures. Thus, Covered Entity A's Section 1557 Policies and Procedures will be different from Covered Entity B's Section 1557 Policies and Procedures, and therefore a temporary employee's training on Covered Entity A's policies and procedures will not be transferable to Covered Entity B. Though temporary, contractor, and travel employees may be with an entity for a limited amount of time, that does not minimize the likelihood that these employees may still encounter an individual with LEP or an individual with a disability who may need language assistance services, effective communication, or a reasonable modification. Covered entities that hire temporary, contract, and travel employees will still need to train these employees, document such training, and maintain that documentation for the requisite amount of time. We note that this approach is consistent with OCR's enforcement of the HIPAA training requirement.

Comment: Several commenters requested that OCR require covered entities to train their employees beyond their respective Section 1557 Policies and Procedures. For example, commenters suggested that OCR require covered entities to train their employees on a variety of issues including: how to work with interpreters (in person, over the telephone, and via remote video); cultural competence, including how employees should address stigma experienced by individuals with LEP and individuals with disabilities; interacting with people with disabilities (including individuals who are deaf, hard of hearing, deafblind, and deaf-disabled); and how to competently address transgender and nonbinary patients.

Some commenters recommended that covered entities invite individuals with disabilities and other diverse backgrounds to help conduct required training because learning from people with lived experiences will help covered entities achieve effective communication and reduce biases. Another commenter recommended that OCR work with stakeholders to develop appropriate training materials.

Response: We encourage covered entities to consider investing in their workforces by providing employees additional civil rights and nondiscrimination training beyond what § 92.9 requires. For example, covered entities may deploy interactive civil rights trainings that involve questions and answers and that more actively engages participants rather than the use of training formats like pre-recorded sessions to maximize comprehension of complex civil rights concepts. OCR also acknowledges that hiring, collaborating with, or otherwise engaging individuals with disabilities and other individuals from underserved communities to provide input on training (and the underlying Section 1557 Policies and Procedures) is a best practice. Further, engaging with these same groups to provide training regarding best practices and other civil rights-related issues will give a covered entity's employees valuable perspective about the importance of delivering compassionate, inclusive, and responsive health care.

However, we decline to expand the scope of the training requirement at this time. It is our position that the training on the Section 1557 Policies and Procedures required in § 92.9 strikes the appropriate balance between covered entities' burden concerns and the need for awareness of this vital information. We note that OCR has provided a general resource on section 1557 requirements that can supplement covered entities' Section 1557 Policies and Procedures training, available at *www.hhs.gov/1557*.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing § 92.9 as proposed, with modifications. We are revising § 92.9(b)(1) to specify that a covered entity must begin training its relevant employees no later than 30 days after a covered entity implements its policies and procedures required by § 92.8 and no later than 300 days after the effective date of the part. We are including a definition of ''relevant employee(s),'' for purposes of the section only, at § 92.9(b)(4) to provide: ''for the purposes of this section 'relevant employees' includes permanent and temporary employees . . . .'' Lastly, we are modifying § 92.9(c) to clarify that covered entities are required to retain (rather than ''maintain'') training documentation for the requisite time period.

Notice of Nondiscrimination (§ 92.10)

In § 92.10(a), we proposed requiring covered entities to provide a notice of nondiscrimination, relating to their health programs and activities, to participants, beneficiaries, enrollees, and applicants of their health programs and activities, and to members of the public (''Notice of Nondiscrimination''). Section 92.10(a)(1) proposed the required contents of the Notice of Nondiscrimination. Section 92.10(a)(2) proposed when and where covered entities must provide the Notice of Nondiscrimination.

In § 92.10(b), we proposed that a covered entity may combine the content of the notice required by § 92.10(a) of this section with the notices required by title VI, section 504, title IX, and the Age Act implementing regulations [84] if the combined notice clearly informs individuals of their civil rights under section 1557 and the part and meets the requirements outlined in proposed § 92.10(a)(1).

We invited comment on whether the Notice of Nondiscrimination requirement as proposed is practical, likely to be effective, and responsive to concerns raised regarding the 2016 and 2020 Rules, including the sufficiency of the contents of the notice and requirements regarding when and where covered entities must provide this notice. We sought comment on the best ways to provide an accessible notice to individuals with disabilities who may require auxiliary aids and services and the best way in which to provide the notice in a manner accessible to individuals with LEP.

The comments and our responses regarding § 92.10 are set forth below.

Comment: Many commenters strongly support the notice requirements set forth in §§ 92.10 and 92.11 (Notice of Availability), stating that such notices are needed to help people know their rights and will reduce health disparities, especially for persons with LEP and persons with disabilities. Some organizational commenters added that when the 2016 Rule's notice requirement, former 45 CFR 92.8, was removed by the 2020 Rule, many people did not know their rights, how to access interpreters or auxiliary aids and services, or how to file a grievance. Several commenters added that a clear explanation of rights and contact information for the Section 1557 Coordinator, as set forth in § 92.10(a)(1)(v), is crucial. Some disability rights groups commented that not only should the Section 1557 Coordinator's contact information be included, but also that of the ADA Coordinator.

Response: The Notice of Nondiscrimination is a critical means by which to inform individuals of their civil rights, which is part of a proactive civil rights compliance structure that functions—in part—through grievances and complaints raised by individuals. We decline to require inclusion of contact information for an ADA

[84] 45 CFR 80.6(d) (title VI); 84.8 (section 504, federally assisted); 85.12 (section 504, federally conducted); 86.9 (title IX); 91.32 (Age Act).

Coordinator as this regulation is limited to section 1557; further, not all covered entities under this rule are subject to the ADA.

Comment: Various covered entities commented that the burden of the notice provisions is compounded by the complexity of having two separate notices (*i.e.,* the Notice of Nondiscrimination and the Notice of Availability) and the requirements to provide information in 15 languages.

Response: OCR takes seriously the concerns raised by some commenters regarding burden. In crafting the two distinct notice requirements, OCR considered comments received in response to the 2015 and 2019 NPRMs regarding the burden of a notice requirement. The provisions in the final rule reflect careful consideration of what must be included in each notice, and they include substantially more clarity regarding when and where each notice must be provided compared to the 2016 Rule.

We note that there is not a requirement that ''all information'' be provided in multiple languages; the requirement is that the Notice of Availability required by § 91.11 be provided in 15 non-English languages to inform individuals of the availability of language assistance services and auxiliary aids and services. Further discussion of this requirement can be found in our discussion related to the Notice of Availability (§ 92.11).

Comment: Many commenters noted that the parenthetical for sex discrimination included in proposed § 92.10(a)(1)(i) differs from the language of § 92.101(a)(2) and that it should be consistent, such that it should include sexual orientation and gender identity as well as pregnancy-related conditions.

Response: OCR appreciates the need for consistency across the regulation, and to ensure that the public is aware of the various bases for discrimination included under the umbrella of sex discrimination. As such, OCR has revised the parenthetical in § 92.10(a)(1)(i) to directly cite to § 92.101(a)(2), rather than listing examples of discrimination on the basis of sex. This is consistent with edits made to the Nondiscrimination Policy required by § 92.8(b).

Comment: Various commenters requested that OCR require any entity receiving a religious exemption to include notice of the exemption in the Notice of Nondiscrimination; they said it would be misleading to have a notice stating that the entity does not discriminate if it has been granted permission to do so in certain circumstances. They stated that the information is needed for LGBTQI+ persons seeking health care.

Response: OCR appreciates these comments. OCR declines to revise § 92.10 to impose an affirmative obligation on a recipient to identify any exemptions it has received under applicable Federal religious freedom and conscience laws. OCR additionally notes that it is a best practice for a recipient to include in its Notice of Nondiscrimination language when it has received a temporary exemption or an assurance of exemption. OCR is also subject to the Freedom of Information Act (FOIA), and information may be released to a requestor or made available for public inspection consistent with the agency's obligations under that statute and its implementing regulations.

Comment: Several commenters stated that the Notice of Nondiscrimination should be provided in the same non-English languages required by § 92.11 (Notice of Availability). Several commenters urged OCR to create a model Notice of Nondiscrimination, and to issue translations of this notice.

Response: The Notice of Nondiscrimination is among the materials that must be accompanied by a Notice of Availability, per § 92.11(c)(5)(i), which must be provided in multiple languages. While we have declined to require translation of the Notice of Nondiscrimination into a set number of languages, covered entities may still be required to provide translations when necessary to ensure meaningful access as required under § 92.201. OCR will provide a sample Notice of Nondiscrimination and may provide translations of the sample Notice of Nondiscrimination.[85]

Comment: Some commenters argued that the requirement for when and where the Notice of Nondiscrimination must be provided, § 92.10(a)(2), is too burdensome; others commented that it eases financial burdens compared to the 2016 Rule requirements, while also ensuring that people receive information about the covered entities' civil rights obligations. Some commenters supported the requirement of prominent posting on websites, including because of the low cost, while another commenter observed that poor and rural areas sometimes cannot be reached by internet and described the need to reach historically underserved and marginalized populations.

Various commenters agreed with the proposal to provide the Notice of Nondiscrimination annually and upon request as opposed to the 2016 Rule's ''significant communications'' [86] requirement, including because the current proposal is clearer than the 2016 Rule requirement. Others stated that OCR should require the Notice of Nondiscrimination in all significant communications, such as Explanations of Benefits and patient intake forms. Some opposed annual notices as costly and annoying to patients, recommending that notice instead be upon enrollment, upon request, and prominently in health care plan documents. Others argued for using the HIPAA model, which requires notice at first point of service and then upon request only.

Response: In developing the points of contact at which a Notice of Nondiscrimination must be provided, OCR considered the concerns raised by covered entities regarding burden, consumer fatigue, and lack of clarity and specificity in prior requirements. However, we also considered comments that stated the Notice of Nondiscrimination is important to ensure that persons are informed of their civil rights and without this knowledge, including the right to language assistance services and effective communication, health disparities may continue to increase as they did during the COVID–19 pandemic. The provision is a reasonable and balanced approach that reduces the number of communications in which this essential notification is required compared to the 2016 Rule requirements,[87] while preserving its necessary function.

While OCR appreciates that many individuals lack internet access, we note that the regulation as drafted requires posting in physical locations, as well as being provided upon request, § 92.10(a)(2)(ii) and (iv); therefore, access to the Notice of Nondiscrimination is not dependent on internet access.

Comment: Various commenters recommended that the Notice of Nondiscrimination be posted prominently where frontline employees can see it, and that it be in large sans serif font (at least 18-point font).

Response: OCR appreciates these comments and the importance of ensuring that the Notice of Nondiscrimination posted in physical

[85] U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Translated Resources for Covered Entities, https://www.hhs.gov/civil-rights/for-individuals/section-1557/translated-resources/index.html* (translated Notice of Nondiscrimination. [87] *Id.*

locations can be seen and is accessible to individuals who may have low vision. For this reason, we are finalizing § 92.10(a)(2)(iv) to require that posted notices be in a sans serif font, no smaller than 20-point font.[88]

Comment: Several commenters argued that the Notice of Nondiscrimination and Notice of Availability must be provided together, because they are so intertwined, adding that this may also reduce the burden for covered entities.

Response: OCR appreciates this comment and directs commenters to the requirement at § 92.11(c)(5)(i), which requires that the Notice of Availability be provided with the Notice of Nondiscrimination. Covered entities may choose to integrate the Notice of Availability into its Notice of Nondiscrimination.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.10, with modifications. OCR is revising the explanatory parenthetical for sex at § 92.10(a)(1)(i) to read ''consistent with the scope of sex discrimination described at § 92.101(a)(2).'' We are also providing a technical revision to § 92.10(a)(1)(iii) to replace ''necessary'' with ''a reasonable step'' for consistency with the standard articulated in § 92.201(a), that ''[a] covered entity must take reasonable steps to provide meaningful access to each individual with limited English proficiency (including companions with limited English proficiency) eligible to be served or likely to be directly affected by its health programs and activities.'' We are revising § 92.10(a)(2)(iv) to require that posted notices be provided ''in no smaller than 20-point sans serif font.'' Finally, we are making a technical revision to replace ''limited English proficient individual'' with ''individual with limited English proficiency,'' consistent with modifications elsewhere.

Notice of Availability of Language Assistance Services and Auxiliary Aids and Services (§ 92.11)

In § 92.11, we proposed requiring covered entities to notify the public of the availability of language assistance services and auxiliary aids and services for their health programs and activities (''Notice of Availability'').

In § 92.11(a), we proposed requiring a covered entity to provide a notice that, at minimum, states that the covered entity provides language assistance services and appropriate auxiliary aids and services free of charge in its health programs and activities, when necessary for compliance with section 1557 or the part. This notice must be provided to participants, beneficiaries, enrollees, and applicants of the covered entity's health program or activity, and members of the public.

In § 92.11(b), we proposed requiring the Notice of Availability to be provided in English and at least the 15 most common languages spoken by individuals with LEP of the relevant State or States, and in alternate formats for individuals with disabilities who require auxiliary aids and services to ensure effective communication.

In § 92.11(c), we proposed requiring the notice be provided on an annual basis to participants, beneficiaries, enrollees (including late and special enrollees), and applicants, and upon request at any time; we also proposed that the notice be provided online (when applicable) and in a clear and prominent physical location where it is reasonable to expect individuals seeking services from the health program or activity to be able to read or hear the notice. In § 92.11(c)(5), we proposed a list of specific electronic and written communications that the Notice of Availability must accompany. We invited comment as to whether requiring a Notice of Availability for all Explanation of Benefit (EOB) documents is the most appropriate approach, balancing the burden of providing Notices of Availability with all EOBs against the burdens associated with determining which EOBs must include the notice.

In § 92.11(d), we proposed alternative, optional methods by which a covered entity may be deemed in compliance with proposed § 92.11(a).

We sought comment on whether the Notice of Availability requirement as proposed is practical and responsive to concerns raised regarding the 2016 and 2020 Rules, including the sufficiency of the content of the Notice of Availability and requirements for when and where covered entities must provide the notice. We also invited comment as to whether the proposed requirements adequately address the specific concerns raised regarding the burdens associated with the 2016 Rule requirements by providing a list of specific documents with which the Notice of Availability must be provided. Additionally, we invited comment on how to best provide the Notice of Availability to individuals with disabilities to ensure they know how to request and receive relevant materials and documents in formats that meet their disability-related needs, and whether covered entities should be required to provide the Notice of Availability in sign language. Similarly, we sought comment on how to best provide the Notice of Availability to individuals with LEP, including individuals with LEP with disabilities, to ensure they know how to request and receive language assistance services and auxiliary aids and services to provide meaningful access to relevant materials and documents. We also sought comment on whether the proposed list of electronic and written communications that the Notice of Availability must accompany adequately captures the documents for which individuals with LEP and individuals with disabilities should receive the Notice of Availability. We further invited comment on the anticipated costs to covered entities of various sizes to comply with the proposed requirements.

The comments and our responses regarding § 92.11 are set forth below.

Comment: Many commenters stated that the Notice of Availability is needed because people are unaware of their rights to language assistance and auxiliary aids and services, leaving them unable to advocate for themselves and leading to health disparities. Commenters agreed that the 2019 NPRM and 2020 Rule fail to address the costs borne by participants, beneficiaries, and enrollees in the absence of notice, and the additional costs to the health care system that could result. 87 FR 47853. Many commenters provided examples of how individuals with LEP experience disparities in health care, including poor care and outcomes; higher uninsured status; lower health literacy; longer hospital stays; greater difficulty understanding health instructions; and general health care underuse. The commenters emphasized that providing Notice of Availability is the most essential element to decreasing language barriers and that with proper notice of their rights, health disparities for individuals with LEP would be reduced.

Response: OCR appreciates commenters highlighting the importance of providing individuals with LEP notice of their right to receive language assistance services, and the negative consequences of failure to do so. As discussed, OCR considered the concerns raised in response to the 2019 NPRM and 2020 Rule's failure to include a similar notice provision, as well as concerns raised in response to the 2016 Rule's notice provision. As proposed and finalized, § 92.11 provides

[88] *See* Am. Council of the Blind, *Best Practices and Guidelines for Large Print Documents Used by the Low Vision Community* (2011), *https://archive.org/details/bestpracticesgui00coun.*

an appropriate balance between the approaches of these prior rules and is an important tool for combatting and preventing health disparities based on communication barriers.

Comment: Numerous commenters stated that the requirement to provide the Notice of Availability in 15 non-English languages was too many, providing examples of places in which they believe fewer languages were needed. For example, one provider commented that in California, 95 percent of their communications were requested in the top five languages in the State, therefore translations into the top five languages would be sufficient. Other commenters noted that smaller entities would be particularly burdened by the proposed standards. One commenter stated that requiring pediatric dental offices to offer the Notice of Availability as proposed would be burdensome and cause confusion.

Conversely, many other commenters stated that 15 languages is too few and that, under the proposed requirements, the Notice of Availability would not reach enough individuals with LEP, giving examples of language populations that would not be reached. Some commenters expressed a belief that covered entities should ensure each individual with LEP receives information about their rights in their preferred language, and that a 15-language requirement would not adequately provide that assurance. Some commenters stated that the identification of languages required should not be determined at the State level but should instead be based on the covered entity's entire program area in various states. On the other hand, some commenters expressed that the required languages should always be determined at the State level only, rather than ''State or States.''

Commenters said that because OCR will provide model notices translated into the required languages, and because of the need for meaningful notice of auxiliary aids and language assistance services, the burden for providing notices in the top 15 languages per State is lessened and reasonable. A few local government commenters stated that their jurisdiction currently requires translation in more than 100 languages and recommended that this rule incorporate State and local norms.

Response: In determining the formula for the Notice of Availability translation requirement, OCR considered the 2016 Rule requirement, evaluated national- and State-level language proficiency data issued by the U.S. Census Bureau (Census), as well as potential the costs and burdens for covered entities.

The need to provide individuals with LEP notice of the availability of language assistance services remains clear and there is ample evidence that failure to provide meaningful language access in a health care setting can lead to higher costs to the health care system and have grave consequences to individuals with LEP. 87 FR 47853–54. Since the ACA was enacted, the percentage of the U.S. population with LEP (defined as those who speak English less than ''very well,'' as collected by the Census) has remained at roughly 10 percent.[89]

OCR has received complaints and entities have sued the Department for rescinding the 2016 Rule's notice requirements.[90] Litigants in *Chinatown Services Center* v. *U.S. Department of Health & Human Services* raised specific concerns that older members of the Asian American, Native Hawaiian, and Pacific Islander community, who have high rates of limited English proficiency, experienced disparities because they are not aware of their right to receive language assistance services or how to raise a concern when such services are not provided.[91] Although one Federal court ultimately held that a plaintiff health system was not likely to prevail on the merits of its Administrative Procedure Act challenge to the 2020 Rule's repeal of the 2016 Rule's notice requirements, the court notably acknowledged that a consequence of the 2020 Rule was that the plaintiff health system provided ''costlier and more difficult treatment'' because patients with LEP likely received inadequate health care elsewhere and arrived to their system sicker than they otherwise may have.[92]

OCR appreciates concerns regarding proposed § 92.11, which would require a covered entity operating in all 50 States to aggregate the populations with LEP across those States to determine the top 15 languages spoken by individuals with LEP in its service area. While this may result in a failure to reach some in-State LEP populations due to geographical variances, no single formula, including a State-level formula, will cover all individuals with LEP. However, this formula would cover a significant majority (over 93 percent) of individuals with LEP, even for covered entities that operate on a national level.[93]

Thus, while OCR appreciates the request to increase the number of languages into which the Notice of Availability must be translated, we have determined that this would likely increase burdens while yielding additional coverage of marginally few individuals with LEP. However, covered entities are reminded that they must still take reasonable steps to provide meaningful access to *all* individuals with LEP, regardless of whether the individual's primary language is one of the 15 most frequently spoken non-English languages in their State or States, per § 92.201. Further, nothing in this rule prevents jurisdictions from requiring that the Notice of Availability be translated into more languages; covered entities wishing to provide more languages may also do so.

OCR recognizes concerns raised in the comments regarding the potential cost of translating the Notice of Availability into the required languages. To offset this concern, OCR has provided translations of the model Notice of Availability in the top 15 languages in each State, at *www.hhs.gov/1557*. Additionally, § 92.11(c) reduces the number of documents for which provision of the translated notices is required from the 2016 Rule, and § 92.11(d) provides two options for how a covered entity may otherwise meet the requirements of this provision. OCR anticipates that efficiencies created by this formula—complemented by the availability of OCR-translated Notices of Availability—will benefit covered entities and the communities they serve. These benefits will reduce harmful impacts of the failure to take reasonable steps to provide meaningful access—such as unnecessary hospital readmissions, lower rates of outpatient follow up, limited use of preventive services, poor medication adherence, and lack of understanding of discharge

instructions [94]—thereby alleviating burdens on community organizations that have been providing notice of language access as well as providers who have seen negative impacts such as increased costs and sicker patients since the repeal of the 2016 Rule's notice requirements. *See* 87 FR 47853–54. Given these efforts, the requirement of providing notice of language access rights is not overly burdensome when balanced with the need to provide notice of the availability of language assistance services to individuals with LEP.

Comment: A few commenters suggested that a hybrid method should be used to calculate which languages are required for translation under this provision, such as the higher or lower of a percentage or absolute number (for example, a threshold of five percent or 1,000 individuals with LEP, whichever is lower). Some commenters recommended OCR adopt the standard found in Tri-Departmental regulations at 26 CFR 54.9815–2719(e), 29 CFR 2590.715–2719(e), and 45 CFR 147.136(e), which applies a county-level formula and is applicable to the internal claims and appeals and external review processes for group health plans and health insurance issuers in the group and individual health insurance markets, to decrease costs and avoid confusion. Some added that a hybrid method, such as allowing for calculations at the county- instead of State-level, is especially critical for small practices operating at only the county level. They stated these practices may not have resources to translate the Notice of Availability into the top 15 languages spoken in the State and may serve language communities that are different from those represented by the top 15 languages at the State-level.

Response: OCR appreciates these suggestions but, as we discussed in the Proposed Rule, OCR declined to adopt a population threshold due to variances among urban and rural communities. 87 FR 47855. We are concerned about similar results if a percentage threshold is used, and we decline to adopt this approach.

While OCR appreciates that some covered entities will have to comply with both OCR and Tri-Departmental regulations, we decline to adopt the county-level formula found in the referenced Tri-Departmental regulations, 26 CFR 54.9815–2719(e), 29 CFR 2590.715–2719(e), and 45 CFR 147.136(e), which provides that a non-English language is an applicable non-English language if ten percent or more of the population residing in the county is literate only in the same non-English language, as section 1557 applies to a wider range of covered entities, communications, and individuals with LEP. We will continue to monitor issues related to this area and work with CMS as appropriate in the future to ensure compliance.

Comment: Some commenters suggested that OCR work with covered entities and community groups to develop additional effective ways to inform individuals with LEP about their language access rights. A health insurance entity suggested convening a stakeholder process to develop and test a pilot with easy-to-understand, universal language access symbols to connect persons with LEP to language assistance services.

Response: OCR appreciates this recommendation and welcomes the opportunity to collaborate with covered entities and community groups to develop effective means for informing individuals with LEP of their language access rights.

Comment: Many commenters supported the list of documents requiring a Notice of Availability in § 92.11(c), emphasizing the critical importance of clear communications in health care settings. Some commenters noted the provision fills information gaps and that receiving information multiple times is sometimes needed for effective notice, particularly for older adults. Others expressed support for the balanced approach of including opt-out provisions so that covered entities are not overly burdened, but participants and beneficiaries know their rights. Several commenters urged OCR to add medical bills to the list, providing examples of negative impacts of bills being sent without notice of how to access effective communication.

Many other commenters expressed concerns about administrative burdens and costs of notice in relation to the number of communications in which the Notice of Availability would be required under § 92.11(c), while others pointed out that the list is effectively shorter than in the past.

Several commenters wrote generally about language assistance services and auxiliary aids and services, with some asking for flexibility in the language access rules to allow for translation of the most important documents with the provision of oral interpretation for other information. Another argued that translation and interpretation as well as auxiliary aids and services rules should not apply to physician practices or health centers. Others requested that health insurance issuers or the Federal Government reimburse providers for disseminating these items.

Response: We appreciate the comments and believe that the list of documents identified in § 92.11(c), which provides clarity and prioritizes inclusion of the Notice of Availability in critical health care documents, strikes the appropriate balance between potential burdens to covered entities and the benefits to individuals with LEP and individuals with disabilities. OCR appreciates commenters raising concerns regarding the accessibility of medical billing, which can have long-term negative financial impacts on patients.[95] Similarly, accessible notices of expected costs and benefits, such as the good faith estimate, can help patients make informed, cost-conscious decisions about their care and reduce the risk of unexpected medical bills.[96] The potential financial impact of making these estimates accessible is particularly significant for individuals with LEP and individuals with disabilities who are uninsured (or self-pay), because these individuals have the right to dispute medical bills that are substantially in excess of the expected charges on their good faith estimate [97] and exercise of this right depends on the ability of such individuals to understand both their good faith estimates and their medical bills. For these reasons, we are adding § 92.11(c)(5)(ix), which requires a covered entity to provide its Notice of Availability along with billing-related documents and reads: ''Communications related to the cost and payment of care with respect to an individual, including medical billing and collections materials, and good faith estimates required by section 2799B–6 of the Public Health Service Act.''

Comment: Regarding an alternative, optional means of compliance at § 92.11(d), one covered entity commenter requested that OCR specify that entities in compliance with other

[96] Internal Revenue Code section 9816(f), ERISA section 716(f), and PHS Act section 2799A–1(f), as added by section 111 of title I of division BB of the Consolidated Appropriations Act, 2021 (CAA); PHS Act section 2799B–7, as added by section 112 of title I of division BB of the CAA; 45 CFR 149.610.

[97] PHS Act section 2799B–6, as added by section 112 of title I of division BB of the CAA; 45 CFR 149.620.

Department requirements related to language access and auxiliary aids are deemed to have complied with section 1557. One commenter stated that the Notice of Availability should be combined with the Notice of Nondiscrimination, as well as HIPAA notices; another suggested OCR work with CMS and other HHS agencies to leverage existing practices and make these requirements technically operational.

Response: As discussed elsewhere, OCR appreciates that covered entities may have compliance requirements under other Department regulations similar to those found in this provision. However, given the range of health programs and activities to which section 1557 and the part apply—including those where inaccessible communication can have life-or-death consequences—it is imperative to have an independent requirement. Covered entities' compliance with § 92.11(b) will increase the likelihood of compliance with similar Department translation requirements. While we appreciate commenters' suggestion to combine the Notice of Availability with the Notice of Nondiscrimination and the HIPAA notices, § 92.11(c)(5) requires the Notice of Availability to additionally be included with a list of important health care documents because the ability of patients to avail themselves of language access services is foundational to improving health outcomes for individuals with LEP. OCR will therefore maintain this requirement under § 92.11(c)(5) for covered entities.

Comment: Various commenters expressed support for the alternate compliance provisions found in § 92.11(d). One group raised the idea of an ''opt-in'' provision, in which individuals with LEP would have to state that they want Notice of Availability, in lieu of the proposed opt-out provision, and sought clarification about whether the opt-out provision can be combined with Notice of Availability.

Some commenters argued that the alternate compliance options could be difficult to implement and lead to additional costs, cause confusion, or be generally burdensome, with one commenter stating they would be more burdensome than the 2016 Rule requirements because they require customizing documents. One commenter requested OCR delay implementation of the opt-out provision until 2024; other commenters suggested replacing the option with a less burdensome approach, asking that it be only electronic.

On the other hand, commenters stated that the opt-out provision strikes a reasonable balance that is effectively narrower than the 2016 Rule's ''significant communications'' requirement. Another commenter agreed, commenting that the proposal could be both more consumer friendly and helpful, as well as less duplicative and costly than the 2016 Rule. One commenter encouraged OCR to provide robust oversight of opt-out processes in order to protect civil rights.

Response: OCR appreciates the range of comments received on this new provision. We emphasize that the options included in § 92.11(d) are options, and not requirements. Thus, we appreciate that covered entities may wish to have a delayed applicability date, to pursue these options only through electronic means, or not pursue them at all. OCR is not requiring any actions under § 92.11(d) be taken; rather, OCR is providing alternate means to satisfy the requirements of § 92.11 without including the full Notice of Availability with all communications listed at § 92.11(c).

OCR declines to make further changes clarifying that a person should only be asked about their language needs once, because § 92.11(d)(1) permits this if the individual exercises the option to opt-out. Moreover, § 92.11(d)(2) allows a covered entity to document an individual's primary language, any appropriate auxiliary aids and services, and to communicate with them in that manner.

OCR intends to provide robust review of opt-outs, as well as technical assistance, to ensure that covered entities that choose to exercise this option do so in a manner consistent with the requirements at § 92.11(d).

Comment: Many commenters submitted recommendations to increase guarantees of accessibility of the Notice of Availability for individuals with disabilities, such as requiring that: (1) notices be provided in large sans serif print, at a minimum of 18-point font; (2) notices be on the first page or otherwise at the beginning of documents or publications; (3) the needs of persons who are illiterate be taken into account through provision of audio or video notices; (4) all written notices be in plain language (fourth grade reading level), accompanied by visual aids when practicable; and (5) notice should be provided via audio, video, and American Sign Language. A coalition also discussed recommendations to ensure effective communication. Other accommodations recommended included: (1) screen readers and audio/video accessibility; (2) alternatives to braille (*e.g.,* large print, qualified reader) because braille may not be economically feasible for all entities; (3) accessible tagline requirements or cross-references to language access rights; and (4) ''Easy Read'' text, images, brief sentences, large and simple fonts, and location on the first page.

Many also commented that the Notice of Availability should be posted where frontline employees can readily see it, that employees should be trained to provide it, and that it be available upon request. Various commenters urged that covered entities must proactively ask people if they have communications barriers. Further, commenters stated that primary consideration should be given to what a person with a disability asks for in terms of auxiliary aids or services. Another commenter added that provision of the notice should be clarified so it applies to listening devices and the other range of auxiliary aids.

Response: OCR appreciates all the suggestions and reminds commenters and others that the meaningful access and effective communication requirements (§§ 92.201 and 92.202, respectively) regarding the provision of language access and auxiliary aids apply to the Notice of Availability. Covered entities have existing effective communication obligations under section 504 and section 1557, which may include providing the notice in an alternate format or providing another auxiliary aid or service. Thus, if an individual is in need of the notice in an alternate format or through another auxiliary aid or service, that would likely already be required when it is necessary to ensure effective communication. We decline to affirmatively require the notice be provided in any additional formats at this time. However, OCR agrees that larger print should be required to ensure the accessibility of the Notice of Availability when posted in physical locations, and that this requirement is relatively straightforward to implement; accordingly, § 92.11(c)(4) has been amended to require print no smaller than 20-point in a sans serif font.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.11, with modifications. We are revising § 92.11(b) to clarify the relevant State or States are those ''in which a covered entity operates.'' We are modifying § 92.11(c)(4) to clarify that posted notices be provided ''in no smaller than 20-point sans serif font.'' We are adding

§ 92.11(c)(5)(ix) to read: ''Communications related to the cost and payment of care with respect to an individual, including medical billing and collections materials, and good faith estimates required by section 2799B–6 of the Public Health Service Act.'' We are also making technical revisions, including replacing ''limited English proficient individual'' with ''individual with limited English proficiency,'' consistent with modifications elsewhere.

Data Collection

We solicited comments on requiring covered entities to collect additional data, beyond those required by the referenced statutes and their regulations, on race, ethnicity, language, sex, gender, gender identity, sexual orientation, disability, and age, to inform a final rule and OCR's overall civil rights work.

We also sought comment on whether covered entities are already collecting disaggregated demographic data in their health programs and activities and, if so, for which categories of data, through what systems, and at what cost. We also invited comment on how a section 1557 civil rights data collection requirement could impact current data collection efforts, either positively or negatively. We also requested comment on whether the adoption of a regulatory standard for a recurring civil rights data collection would benefit civil rights enforcement, as well as how frequently the data should be submitted to OCR. We also sought comment on whether the data collection requirements should vary by type of entity, as recipients of Federal financial assistance include a variety of entities, including State and local agencies, health insurance issuers, providers, health care facilities and clinics, hospitals, Federally Qualified Health Centers, and health-related educational and training programs. Accordingly, we invited comment on which types of recipients (if any) should be covered; if recipients under a certain size should be exempt from the data collection requirement, and if so, whether that exemption should be based on employee number, the number of beds (if relevant), or some other metric; what types of data should be collected; what definitions should be used; the potential costs associated with such a requirement; and the potential benefits of such a requirement.

The comments and our responses regarding data collection are set forth below.

Comment: Some commenters recommended that OCR not mandate the collection of data, with some strongly suggesting that we minimize provider burden and utilize existing data collection systems.

Response: OCR is not including a data collection requirement in the final rule. OCR has the authority independent of this rulemaking to conduct data calls to ensure recipient compliance with Federal civil rights laws.[98] OCR is actively engaged with other agencies within the Department and throughout the Federal Government related to responsible data collection and recognizes the importance of data collection to meet its mission. We will continue to work with covered entities and beneficiaries to determine whether an additional data collection requirement is needed in a future rulemaking.

Comment: Some commenters recommended that OCR adopt data collection standards. They noted that with any demographic data collection requirement, OCR must provide appropriate training and technical assistance resources to programs and grantees and make clear that data cannot be used for negative actions such as immigration or law enforcement, redlining, or targeting of specific groups.

Response: OCR appreciates the comments regarding standards and safeguards to ensure that programs and grantees have the appropriate training. OCR also understands the concerns that some commenters have regarding data being used for adverse actions. While OCR is not including a data collection requirement in the final rule, OCR will continue to research the benefits of civil rights data collection and how to mitigate potential negative impacts.

Comment: Some commenters urged OCR to require covered entities to collect data regarding a core set of disaggregated categories to include race, ethnicity, language, sex, gender, gender identity, sexual orientation, pregnancy status, sex characteristics, disability, and age from patients and providers. Commenters stated that data are essential to identify and address unmet needs, and for many populations data remain largely uncollected. Some commenters also noted that collecting disaggregated data could allow OCR to distinguish the impact of intersectional discrimination on those seeking access to health care. Some commenters also urged that if individuals volunteer such information, it should be self-reported to ensure accuracy and privacy.

Response: OCR agrees that better standards and practices for collecting data can have a positive impact on reducing disparities. OCR will continue to work to ensure that any civil rights data collection yields accurate data that adequately protects the privacy of individuals.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing the rule without a data collection provision.

Subpart B—Nondiscrimination Provisions

In subpart B, OCR proposed provisions related to the prohibition of discrimination on the basis of race, color, national origin, sex, age, and disability in covered health programs and activities.

Discrimination Prohibited (§ 92.101)

In § 92.101(a), we proposed a general prohibition of discrimination on the basis of race, color, national origin, sex, age, or disability under any health program or activity to which section 1557 or the part applies and provided additional detail regarding what constitutes discrimination on the basis of sex.

In § 92.101(a)(1), we proposed general prohibitions on discrimination under section 1557 by restating the core objective of section 1557. In § 92.101(a)(2), we clarified that discrimination on the basis of sex includes discrimination on the basis of sex stereotypes; sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; and gender identity.

In § 92.101(b), we identified several specific forms of prohibited discrimination under section 1557. Proposed § 92.101(b)(1)(i) specifically referred to recipients of Federal financial assistance and State Exchanges; proposed § 92.101(b)(1)(ii) referred to the Department's health programs and activities, including Federally-facilitated Exchanges.

In § 92.101(b)(2), we proposed that the enumeration of specific forms of discrimination in 92.101(b) does not limit the general application of the prohibition in proposed § 92.101(a).

The comments and our responses regarding § 92.101 are set forth below.

Comment: Numerous commenters supported the Proposed Rule's nondiscrimination provisions, stating that these provisions would promote the health equity for communities of color and increase access to coverage and care for those who have been historically underserved because of race, ethnicity, language, age, disability, and sex. Many commenters stated that OCR should finalize the provisions without delay.

[98] *See, e.g.,* 45 CFR 80.6(b).

Another commenter supported the proposed discrimination prohibitions as consistent with the ACA, and another requested that more support be provided for educating the public about the nondiscrimination obligations of health programs and activities.

Response: OCR agrees that the nondiscrimination provisions are one important tool to address health disparities and advance health equity. OCR will continue to provide technical assistance and public education related to compliance with section 1557 and encourages covered entities to continue to visit our website for technical assistance materials.

Comment: Numerous commenters stated that section 1557's explicit prohibition on discrimination based on multiple grounds fills a critical gap by protecting patients who may experience multiple forms of discrimination. Commenters provided numerous examples of simultaneous discrimination on more than one protected basis, including, but not limited to, discrimination against LGBTQI+ individuals of color, with disabilities, with LEP, or who are immigrants; and Black and Hispanic/Latino older adults. Numerous commenters recommended that OCR revise § 92.101(a)(1) to include ''or any combination thereof'' to explicitly account for intersectional discrimination within the regulatory text.

Response: OCR agrees that simultaneous discrimination on multiple prohibited bases, is important to account for and is prohibited by section 1557. As we noted in the Proposed Rule, a recent study examined disability and pregnancy as intersecting traits and how this may impact risk for maternal morbidity and mortality, underscoring the importance of ensuring nondiscrimination against women with disabilities. 87 FR 47837. The Proposed Rule also provided information regarding Black maternal health and the alarming disparities in maternal mortality rates for Black women and American Indian/Alaska Native women. 87 FR 47832.

Therefore, to account for the fact that individuals can experience discrimination based on two or more protected bases (race, color, national origin, sex, age, and disability), we have amended the language of § 92.101(a)(1) to include ''or any combination thereof.'' This language has also been amended throughout the final rule for consistency. The addition intends to clarify that an individual is protected from discrimination on more than one protected basis that occurs at the same time.

Comment: A commenter provided a discussion of the harms and unaddressed discrimination faced by patients with rare diseases and requested that OCR explicitly prohibit discrimination against patients with rare diseases. Some commenters requested that specific recognition also be made for patients with liver diseases. A commenter requested that the proposed regulatory text or accompanying guidance provide examples of discrimination on the basis of disability.

Response: Discrimination against an individual with a rare or specific disease that meets the definition of ''disability'' will be addressed under section 1557's prohibition on discrimination on the basis of disability, which already appears in the rule. The commenter's request for further guidance will be taken into consideration. For additional information related to disability discrimination, please see the discussions under subpart C. OCR also provides guidance and examples, as well as answers to frequently asked questions related to disability discrimination on our website.

Comment: A number of commenters asked that vaccination status be added as a ground of prohibited discrimination, stating that their right to make their own health care decisions should be protected.

Response: Section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, and disability. To the extent vaccination status is not related to these prohibited bases of discrimination specified by Congress in section 1557, we decline to include it as a ground of prohibited discrimination under this rule.

Comment: Some tribal organizations recommended that OCR acknowledge American Indian/Alaska Native (AI/AN) people as holding a political classification as compared to a race-based classification and to exempt Tribal health programs from the final rule. These commenters stated that recognizing the political classification of AI/AN people allows AI/AN providers to only serve AI/AN patients, which commenters said is necessary because of logistical capacity constraints.

Response: As discussed at § 92.2, OCR recognizes the unique relationship between the United States and federally recognized tribal entities. Federal Government preferences based on an individual's membership or eligibility in a federally recognized tribal entity are based on political classifications. Such classifications are not race-based. As such, preferences on this basis do not violate the Equal Protection Clause,[99] title VI,[100] or section 1557. As discussed at § 92.2, preferences based on the unique relationship between the United States and federally recognized Tribes are distinct from the protections afforded under Federal civil rights laws, which protect all individuals from discrimination on the basis of race, color, or national origin (including AI/AN individuals, regardless of tribal enrollment or affiliation). This final rule adopts by reference the Department's title VI regulatory provision at 45 CFR 80.3(d), which provides that an individual shall not be deemed subjected to discrimination by reason of their exclusion from benefits limited by Federal law—such as the Indian Health Service—to individuals of a different race, color, or national origin. OCR will fully apply this provision as well as other applicable exemptions or defenses that may exist under Federal law. OCR intends to address any restrictions on application of section 1557 to Tribal entities in the context of individual complaints or compliance reviews.

Comment: A commenter suggested that nondiscrimination protections should be extended to health care workers, indicating that health care workers often experience discrimination, especially on the basis of race and that additional protections are needed.

Response: While OCR acknowledges that health care workers can face discrimination as they provide health care, OCR does not have jurisdiction over patients who may discriminate against health care workers, as patients are not covered entities under section 1557. Separately, and as previously noted, OCR does not intend for this rule to apply to employment discrimination. If OCR receives a complaint from a health care worker, we will determine if we have jurisdiction to investigate. Complaints received by OCR from health care workers alleging discrimination experienced in the context of employment will be referred to an appropriate agency, per §§ 92.303(b) and 92.304(a) (incorporating 45 CFR 85.61(e)), as this regulation does not apply to employment practices.

Comment: Many commenters expressed support for the explicit references to discrimination on the basis of sex stereotypes; sex characteristics, including intersex traits; pregnancy or related conditions; sexual orientation; and gender identity as forms of

[99] *See Morton* v. *Mancari,* 417 U.S. 535 (1974).

[100] 45 CFR 80.3(d).

discrimination on the basis of sex in § 92.101(a)(2). Commenters pointed to evidence of health disparities and barriers to accessing health care faced by LGBTQI+ people, and how ongoing health care discrimination contributes to higher rates of substance use, mental health conditions, HIV, cancer, and cardiovascular disease for LGBTQI+ people relative to non-LGBTQI+ people.[101] Several commenters stated that § 92.101(a)(2)'s prohibitions should be mirrored in the CMS regulations addressed in section IV.

Response: It is well documented that LGBTQI+ people face significant health disparities and barriers to health care and insurance coverage,[102] and section 1557's protections are critical tools to combat those disparities. We appreciate commenters' view that CMS regulations within this rulemaking should mirror the language provided in § 92.101(a)(2), and we refer readers to section IV (CMS Amendments).

Comment: A number of comments addressed discrimination in the context of organ transplantation. Several commenters noted that people with disabilities are routinely denied access to organ transplants due to stereotypical assumptions about compliance with post-operative care and policies that deny transplants to otherwise eligible individuals with disabilities.[103]

Several commenters noted that existing practices in organ transplants appear to discriminate against Black, Hispanic/Latino, and Native American/Alaska Native individuals, as those individuals are more likely to develop end stage renal disease but are less likely to receive a kidney transplant than white individuals.[104] Another commenter stated that providers may discriminate against immigrant patients during the assessment process by assuming they lack social support or the ability to care for themselves after organ transplantation, resulting in a denial of care.[105]

Response: Discrimination on the basis of disability and race in the provision of health care, including organ transplantation, is a continuing issue that limits opportunities for life-saving treatment. This final rule provides OCR with a powerful tool to help address this ongoing issue. While section 1557 does not prohibit discrimination on the basis of immigration status, section 1557's protections apply regardless of someone's citizenship or immigration status, and individuals who believe they have been discriminated against based on certain characteristics such as race, color, and national origin can file a complaint. We will continue to address discrimination in organ transplantation through robust enforcement of not only section 1557, but all Federal civil rights laws.[106]

Comment: Numerous commenters generally supported the inclusion of the prohibition of discrimination on the basis of gender identity and sexual orientation as prohibited types of sex discrimination in proposed § 92.101(a)(2). They maintained that inclusion was consistent with *Bostock* v. *Clayton County,* 590 U.S. 644 (2020), in which the Supreme Court held that title VII's prohibition of discrimination because of sex includes discrimination on the basis of sexual orientation and gender identity. Commenters supported the application of the reasoning in *Bostock* to title IX by citing several cases, DOJ resource materials, and Executive Order (E.O.) 13988.[107] Another commenter cited several cases stating that courts have treated title VII and title IX protections as consistent with one another in support of the application of *Bostock* to title IX.[108] A few commenters cited *City of Los Angeles Department of Water and Power* v. *Manhart,* 435 U.S. 702 (1978), as indicating that, for decades, sex discrimination prohibitions have covered sex stereotypes. The commenters also cited several opinions from district courts and one appellate court as indicating that discrimination on the basis of gender identity, gender transition, sex stereotypes, or transgender status are, similarly, unlawful types of sex discrimination.[109] Other commenters provided cites to numerous other cases as including gender identity and sexual orientation as characteristics protected by sex discrimination law.[110]

Conversely, several commenters stated that *Bostock* does not support § 92.101(a)(2) as written. Some commenters stated that *Bostock* defined sex to include only ''biological distinctions between male and female'' and used the term ''transgender status''

rather than ''gender identity.'' A commenter argued that title VII should be treated as distinct from title IX because title IX uses the term ''on the basis of sex''—language the commenter described as requiring more than ''but for causation''—while title VII uses ''because of . . . sex.'' Other commenters discussed title IX to support arguments that discrimination on the basis of sex does not include discrimination on the basis of sexual orientation or gender identity, and that title IX only protects people on the basis of ''biological sex.''

Some commenters cited to various cases in opposition to the inclusion of gender identity and sexual orientation in proposed § 92.101(a)(2), including *State of Tennessee* v. *Department of Education,* 615 F. Supp. 3d 807 (E.D. Tenn. 2022), to support the belief that agencies cannot rely on the reasoning in *Bostock* to interpret what constitutes sex discrimination under title IX. Another commenter stated that E.O. 13988 improperly expands the application of *Bostock* and cited *Franciscan Alliance* v. *Burwell,* 227 F. Supp. 3d 660 (N.D. Tex. 2016) in support. Some commenters stated that RFRA's religious protections may supersede the sex discrimination protections described in *Bostock,* and one commenter cited *Hosanna-Tabor Evangelical Lutheran Church and School* v. *EEOC,* 565 U.S. 171 (2012), for the proposition that that First Amendment protections may supersede employment discrimination laws. Another commenter stated that OCR's interpretation of what is prohibited sex discrimination is contrary to law, citing to *Franciscan Alliance, Inc.* v. *Becerra* [111] and *Christian Employers Alliance* v. *EEOC.*[112]

Response: Case law offers strong support for the position that sex discrimination under section 1557 includes discrimination on the basis of gender identity and sexual orientation. As previously noted, a body of developing case law explains how to identify unlawful sex discrimination. As part of its prohibition on sex discrimination, this rule prohibits discrimination against individuals who do not conform with stereotypical notions of how an individual is expected to present as male or female, regardless of gender identity. This is consistent with longstanding case law; more than 30 years ago, a plurality of the Supreme Court held in *Price Waterhouse* that discrimination based on sex stereotypes was a prohibited form of sex discrimination. We have included a number of examples throughout the preamble discussion to help covered entities better understand their obligations. OCR is also committed to providing technical assistance to support compliance with this final rule and may consider additional guidance that may assist covered entities with their obligations.

As noted in the Proposed Rule, the inclusion of ''sexual orientation'' and ''gender identity'' in § 92.101(a)(2) is consistent with the Supreme Court's reasoning in *Bostock.* 87 FR 47858. Title IX and section 1557 prohibit discrimination ''on the basis of sex.'' [113] And the *Bostock* Court used the phrase ''because of sex'' and ''on the basis of sex'' interchangeably.[114] Because the statutory prohibitions against sex discrimination in title VII and title IX are similar, the Supreme Court and other Federal courts look to interpretations of title VII to inform title IX.[115] Thus, *Bostock's* discussion of the text of title VII informs the OCR's analysis of title IX and section 1557. Given the similarity in nondiscrimination language between title VII and title IX, many Federal courts that have addressed the issue have interpreted section 1557 and title IX consistent with *Bostock's* reasoning.[116] Since *Bostock,* three Federal courts of appeals have held that the plain language of title IX's prohibition on sex discrimination must be read similarly to title VII's prohibition.[117] OCR agrees with the reasoning in these cases.[118] Additionally, there is a significant amount of case law, pre-and post-*Bostock* that affirms that sex discrimination includes discrimination based on gender identity.[119]

We disagree with commenters' assertion that the Court's use of the term ''transgender status'' in *Bostock,* rather than ''gender identity,'' results in any meaningful distinction regarding protections afforded to transgender individuals or other individuals experiencing discrimination on the basis of their gender identity. The Court's choice of language reflects that it was addressing the gender identity of the plaintiff before it, who was transgender, and does not preclude the case's application to other gender identities. Indeed, even the dissent stated that ''there is no apparent difference between discrimination because of transgender status and discrimination because of gender identity.'' 590 U.S. at 686, n.6 (Alito, J. joined by Thomas, J., dissenting).

Additional citations by those opposing the language in § 92.101(a)(2) are either not applicable, already discussed in the Proposed Rule, or outdated. To begin, this rule does not

[118] OCR acknowledges that at least one court has held that it would be a misapplication of *Bostock* to interpret the definition of ''sex discrimination'' under section 1557 and title IX to include gender identity and sexual orientation. In *Neese* v. *Becerra,* 640 F. Supp. 3d 668, the U.S. District Court for the Northern District of Texas held that the Department misapplied *Bostock* when it issued a public notice, 86 FR 27984 (May 25, 2021), stating that it would interpret section 1557 and title IX's prohibition on sex discrimination to include discrimination on the basis of sexual orientation and gender identity. The Department appealed that decision to the U.S. Court of Appeals for the Fifth Circuit and oral argument was held on January 8, 2024. The Department is not applying the challenged interpretation to members of the *Neese* class pending the appeal.

rely on E.O. 13988 for its authority, so criticisms of that order do not undermine the final rule. *State of Tennessee* is inapposite. There, the court held that the plaintiffs had demonstrated a reasonable likelihood of success on the claim that two other Federal agencies violated the Administrative Procedure Act by foregoing notice-and-comment procedures.[120] That is not at issue here, as this is notice-and-comment rulemaking and not the issuance of informational documents. *Hosanna-Tabor* involved First Amendment limitations on the application of employment discrimination laws—specifically the ''ministerial exception'' that precludes application of employment discrimination laws to ''claims concerning the employment relationship between a religious institution and its ministers.'' 565 U.S. at 188. As discussed throughout the Proposed Rule, beginning at 87 FR 47826, OCR is aware of and discusses both *Franciscan Alliance* v. *Becerra* and *Christian Employers Alliance* v. *EEOC,* and the Department is not prohibited from finalizing this rule by either decision. 87 FR 47826. Additionally, the final rule adopts new procedures for recipients wishing to invoke Federal religious freedom and conscience protections. For more on those procedures, see § 92.302.

Finally, OCR disagrees with the commenters who cited *Franciscan Alliance* v. *Burwell,* 227 F. Supp. 3d 660 (N.D. Tex. 2016), in support of the view that section 1557 and title IX's prohibition on sex discrimination does not include discrimination on the basis of sexual orientation and gender identity. The legal landscape in this area has changed since that decision issued and the publication of the Proposed Rule. The *Franciscan Alliance* v. *Burwell* court concluded that the 2016 Rule's definition of ''sex'' as including ''gender identity'' was contrary to section 1557 because ''Title IX and Congress' incorporation of it in [section 1557 of] the ACA unambiguously adopted the binary definition of sex.'' *Id.* at 689. Four years later, the Supreme Court held that the prohibition on discrimination ''because of . . . sex'' under title VII covers discrimination on the basis of gender identity and sexual orientation, even assuming that ''sex'' refers ''only to biological distinctions between male and female.'' *Bostock,* 590 U.S. at 655. The *Bostock* Court held that the statute's prohibition on employment discrimination ''because of sex'' encompasses discrimination on the basis of sexual orientation and gender identity. *Id.* at 670–71.

Comment: Several commenters generally asserted that sex is an immutable, biological binary. Some commenters relayed that their religious beliefs include that sex is an immutable binary. A commenter stated that sex has a biological component that impacts medical care.

A commenter argued that if the rule does not recognize that sex is a biological binary, there will be increased confusion in the provision of medical services. Another commenter expressed concern that the rule would diminish the quality of health care received by some patients because some health conditions, such as symptoms of heart attacks, are based on ''biological sex characteristics.'' A commenter said that a prohibition of discrimination on the basis of gender identity would validate the recognition of gender identity and increase gender dysphoria.

Response: OCR recognizes that sex has biological components and knowledge of an individual's biological attributes is an essential component of providing high quality health care for all patients. For example, in the Proposed Rule, we discussed the various health disparities experienced by women, which require that providers have adequate knowledge of biology and anatomy to effectively address. 87 FR 47833–34.

OCR disagrees with commenters suggesting that nondiscrimination protections on the basis of gender identity will either cause confusion in the medical profession or lead to diminished quality of care. Health care providers are highly trained in issues of biology, anatomy, and physiology. This rule requires that individuals be treated without discrimination on the basis of sex. There is no evidence that demonstrates that compliance with civil rights protections, including on the basis of sex, has caused any confusion in the medical field. On the contrary, evidence suggests that when patients are protected on the basis of sex in health care programs, quality of care improves because patients at risk of discrimination are more likely to seek and receive high quality care. For example, research shows that individuals who are experiencing gender dysphoria—defined by the American Psychiatric Association to include ''clinically significant distress or impairment related to gender incongruence''—have a clinically significant decrease in distress if they have access to medically necessary care.[121]

Moreover, section 1557 prohibits discrimination on certain prohibited bases, and does not interfere with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or whether the clinician has the appropriate expertise to provide care. There is no part of section 1557 that compels clinicians to provide a service that they do not believe is medically appropriate for a patient or that they are not qualified to provide.

With respect to commenters' concerns about potential conflicts between the final rule and individuals' or organizations' sincerely held religious beliefs, we refer commenters to the discussion of this topic at § 92.302.

Comment: Some commenters stated that because OCR relied on *Bostock,* it is bound by the definition of ''sex'' in *Bostock* and that definition should be included in the final rule. These commenters opined that the term ''sex characteristics'' as used by OCR is sometimes contrary to a binary understanding of the term ''sex,'' and accordingly ''sex characteristics'' either must be avoided in the regulations or used in a manner not to contradict the term ''sex'' being binary.

Response: OCR has determined it is not necessary to define ''sex'' in this rule, as we have addressed a non-exhaustive list of what constitutes discrimination on the basis of sex at § 92.101(a)(2). The Supreme Court did not define the term ''sex'' in *Bostock,* but rather noted that nothing in their approach to the cases considered turned on the debate over whether ''sex'' was limited to ''biological distinctions between male and female,'' and the Court therefore proceeded on the assumption that ''sex'' carried that meaning. 590 U.S. at. 655.

OCR declines to remove reference to ''sex characteristics'' (including intersex traits) from § 92.101(a)(2). Discrimination on the basis of sex characteristics, including intersex variations, is a prohibited form of sex discrimination because discrimination based on anatomical or physiological sex characteristics is inherently sex-based. *See* 87 FR 47858.

Comment: Numerous commenters supported the explicit inclusion of

[120] *Tennessee* v. *U.S. Dep't of Educ.,* 615 F. Supp. 3d 807 (E.D. Tenn. 2022); *appeal docketed,* No. 22–5807 (6th Cir. Sept. 13, 2022) (oral argument held April 26, 2023).

[121] Jack Turban, M.D., M.H.S., *What is Gender Dysphoria?,* Am. Psychiatric Assoc., *https://www.psychiatry.org/patients-families/gender-dysphoria/what-is-gender-dysphoria* (Aug. 2022).

discrimination based on sex characteristics, including intersex traits, stating that discrimination based on intersex traits is inherently sex-based. Several commenters supported this proposal, citing barriers to appropriate care and coverage resulting from discrimination suffered by intersex patients.[122] These commenters cited a report in which more than half of intersex respondents reported that a provider refused to see them because of their sex characteristics or intersex variation and that almost two-thirds reported having concerns that if they disclosed their intersex status to a provider, they could be denied quality medical care.[123] A few commenters recommended that § 92.101(a)(2) include concrete examples of sex discrimination, specifically on the basis of intersex traits.

Response: Discrimination based on sex characteristics is a prohibited form of sex discrimination because discrimination based on anatomical or physiological sex characteristics is inherently sex-based. 87 FR 47858. It follows that discrimination on the basis of intersex traits is prohibited sex discrimination because the individual is being discriminated against based on their sex characteristics.

Comment: Numerous commenters generally supported the inclusion of pregnancy or related conditions as protected bases of sex discrimination at § 92.101(a)(2) and recommended that OCR include examples of pregnancy-related discrimination. Commenters recommended including protection for pregnancy-related conditions as a standalone provision to emphasize the importance of these protections. Commenters stated that protection against discrimination on the basis of pregnancy or related conditions would protect many patients. Commenters also pointed out that as drafted, the Proposed Rule does not consistently define sex discrimination to include pregnancy-related conditions because other sections just state ''pregnancy'' as opposed to ''pregnancy or related conditions.'' The commenters urged OCR to be consistent throughout the rule.

Response: The inclusion of ''pregnancy or related conditions'' is consistent with the longstanding interpretation of the ''ground'' of discrimination prohibited under title IX because pregnancy-based discrimination has long been understood as a form of sex-based discrimination under title IX. For many years preceding the enactment of the ACA, the Department (along with other agencies) determined that discrimination based on pregnancy or related conditions is discrimination based on sex.[124] Discrimination on the basis of pregnancy or related conditions may include, but is not limited to, instances of individuals who experience discrimination throughout pregnancy, labor and delivery, or the postpartum period. OCR agrees that the explicit inclusion of pregnancy or related conditions in the rule text is important for protecting many patients from discrimination.

As discussed in the Proposed Rule, OCR considered inclusion of a provision to specifically address discrimination on the basis of ''pregnancy or related conditions.'' 87 FR 47878. We received comments stating that a separate section was not appropriate. Those comments recommended that this issue be addressed under either § 92.101 (Discrimination prohibited) or § 92.206 (Equal program access on the basis of sex). Accordingly, we maintain the inclusion of ''pregnancy or related conditions'' here under § 92.101(a)(2). For a further discussion of ''pregnancy or related conditions,'' please refer to the preamble discussion at § 92.208 (Prohibition on sex discrimination related to marital, parental, or family status).

Comment: A commenter stated that protections from pregnancy-based discrimination should include an informed consent requirement for abortion and childbirth, because the commenter asserted that consent for a Cesarean delivery is often obtained through coercion.

Response: As noted in the Proposed Rule, 87 FR 47868, informed consent to any medical treatment is both a legal and ethical standard, regardless of the type of care, and serves as a basis for shared decision making.[125] OCR declines to make any changes in response to this comment.

Comment: Numerous commenters recommended that, in light of the Supreme Court's decision in *Dobbs* v. *Jackson Women's Health Organization,* 142 S. Ct. 2228 (2022), and increased restrictions on reproductive health, OCR should provide that ''pregnancy or related conditions'' includes termination of pregnancy in the final rule. A group of commenters opined that the definition of ''pregnancy or related conditions'' should expressly exclude an abortion.

Several commenters stated that OCR should clarify that this provision protects patients from discrimination on the basis of actual or perceived prior abortions. Several commenters stated that, as a result of abortion bans that have gone into effect post-*Dobbs,* women have been denied critical care, such as cancer treatment, because of abortion-related concerns. A commenter wrote that abortion is often necessary to save patients' lives, especially from complications like ectopic pregnancy or premature rupture of membrane.

Response: OCR appreciates commenters' concerns and recognizes that the Supreme Court decision in *Dobbs* changed the legal landscape as to abortion access. While we agree that protections afforded for pregnancy or related conditions include termination of pregnancy, OCR declines to revise the language at § 92.101(a)(2) to include or exclude specific examples and will interpret section 1557's protections on the basis of sex consistent with applicable case law addressing discrimination on the basis of sex, including pregnancy or related conditions.

OCR has concluded as a matter of statutory interpretation that section 1557 does not require the Department to incorporate the language of title IX's abortion neutrality provision, *see* preamble discussion at § 92.208 (Prohibition on sex discrimination related to marital, parental, or family status). At the same time, OCR emphasizes that a covered provider's decision not to provide abortions does not itself constitute discrimination in violation of section 1557. Also, a covered provider's willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion also is not discrimination under section 1557. Section 1557 prohibits discrimination on the basis of race, color, national origin, sex, age, or disability in covered health programs or activities. A covered provider that generally offered abortion care could violate that prohibition if, for example, it refused to provide an abortion to a particular patient because of that patient's race or disability. But a covered provider does not engage in

[124] *See* 45 CFR 86.21(c)(2), (3); 86.40(b)(1), (4), and (5); 86.51(b)(6); 86.57(b)(d) (title IX regulation).

[125] Am. Med. Ass'n, *Informed Consent, https://www.ama-assn.org/delivering-care/ethics/informed-consent.*

discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure, based on a professional or business judgment about the scope of the services it wishes to offer, or for any other nondiscriminatory reason.

It bears emphasis that nothing in the ACA, including section 1557, has ''any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). In addition, nothing in the ACA, including section 1557, preempts or has any effect on State laws regarding ''the prohibition of (or requirement of) coverage, funding, or procedural requirements on abortions'' as provided in section 1303 of the ACA, 42 U.S.C. 18023(c)(1).

Against this legal landscape, OCR will evaluate specific claims of discrimination on prohibited bases on a case-by-case basis, and we decline to revise the language at § 92.101(a)(2). We note also that, as commenters suggested, this provision protects patients from discrimination on the basis of actual or perceived prior abortions. For example, a recipient's denial of unrelated medical care that the provider generally provides to other patients to an individual based solely on the fact they had a prior abortion would constitute prohibited discrimination within the meaning of section 1557. Moreover, both the 2016 and 2020 Rules recognized that discrimination on the basis of pregnancy termination can be a form of sex discrimination.

Comment: Conversely, a commenter argued that OCR should not interpret ''pregnancy or related conditions'' to include ''termination of pregnancy'' because of a concern that it will force health care providers to participate in abortions and requested that OCR provide further clarification as to what types of conduct would be prohibited discrimination under the rule. Another commenter stated the Proposed Rule wrongly treats abortion as a right protected from sex discrimination and that title IX contains an abortion neutrality provision that the rule would contravene.

Response: As discussed above, a covered provider's decision not to provide abortions does not itself constitute discrimination in violation of section 1557. A covered provider does not engage in discrimination prohibited by section 1557 if it declines to provide abortions based on religious or conscience objections to performing the procedure, based on a professional or business judgment about the scope of the services it wishes to offer, or for any other nondiscriminatory reason. A covered entity that chooses to provide abortion care but refuses to provide an abortion for a particular individual on the basis of a protected ground—such as race—would violate section 1557. For discussion regarding the title IX abortion neutrality provision, please see § 92.208.

Comment: Several commenters requested that OCR clarify that § 92.101(a)(2) prohibits discrimination against individuals when they are seeking or accessing fertility care, maternity care, and other reproductive health care specifically. A commenter recommended that OCR clarify that pregnancy-related care applies throughout pregnancy, childbirth, and the postpartum period.

Response: Section 1557 protects individuals against prohibited discrimination in all covered health programs and activities regardless of the type of care they are seeking or accessing, including fertility care, maternity care, and other reproductive health care. Similarly, section 1557 protects individuals seeking or accessing health programs and activities provided for or during preconception, pregnancy, childbirth, and postpartum recovery. Ensuring that section 1557's protections apply throughout the continuum of care is especially critical for Black women and other people of color, who face worse health outcomes and experience higher rates of discrimination throughout pregnancy and the postpartum period.[126]

Comment: Many commenters raised concerns about barriers to reproductive health care faced by LGBTQI+ patients. A commenter strongly urged more explicit inclusion of ''fertility'' as a form of impermissible sex-based discrimination—so that § 92.101(a)(2)(ii) prohibits discrimination on the basis of ''pregnancy, fertility, or related conditions''—as infertility is a serious issue that impacts many LGBTQI+ populations. Commenters stated that LGBTQI+ people continue to face barriers to fertility treatment, such as in vitro fertilization (IVF), and that coverage of fertility treatments often limit or exclude LGBTQI+ patients.

Response: OCR acknowledges the unique challenges faced by LGBTQI+ individuals seeking fertility treatment. Individuals are protected from discrimination regardless of the type of health care they seek, and we have concluded it is unnecessary to provide provisions for each specific form of health care available. Whether discrimination on the basis of sexual orientation or gender identity occurred in the provision or coverage of assistive reproductive technology—such as IVF—is necessarily fact specific. However, if a covered entity elects to provide or cover fertility services but categorically denies them to same-sex couples, it may violate section 1557's prohibition on sex discrimination.

Comment: Numerous commenters generally supported inclusion of sexual orientation as a protected basis for sex discrimination, and said that its inclusion would improve health care for LGBTQI+ individuals. Many commenters stated that LGBTQI+ individuals face discriminatory challenges to accessing health care and that the rule would alleviate these issues. Many commenters wrote that LGBTQI+ individuals often anticipate that they will experience discrimination in health care and thus often may not seek out care.

Response: It is well documented that LGBTQI+ individuals face discrimination when accessing or attempting to access health care and health insurance. Section 1557 is a critical tool in combating such discrimination and addressing the resulting health disparities and other negative impacts.

Comment: Numerous commenters generally supported the inclusion of discrimination on the basis of gender identity as a prohibited form of sex discrimination. Other commenters recommended including ''transgender or nonbinary status,'' ''nonbinary and gender-nonconforming,'' and ''including status as transgender, nonbinary, gender nonconforming, two-spirit, or other gender.''

Response: OCR recognizes that individuals use various terminology to describe their gender identity. For this reason, we decline to provide a definition of ''gender identity'' or ''transgender status'' in the regulation. We reiterate here that OCR will investigate discrimination against an individual based on having a gender identity that is different from their sex assigned at birth as discrimination on the basis of gender identity, regardless of whether the individual identifies with or uses the term ''transgender'' or another identity.

OCR is aware that the *Bostock* majority uses the term ''transgender

[126] Saraswathi Vedam et al., *The Giving Voice to Mothers Study: Inequity and Mistreatment During Pregnancy and Childbirth in the United States,* 16 Reprod. Health 1 (2019), *https://doi.org/10.1186/s12978-019-0729-2.*

status'' exclusively. But *Bostock* reasoned that when a person discriminates ''against transgender persons, the employer unavoidably discriminates against persons with one sex identified at birth and another today'' such that ''[a]ny way you slice it, the employer intentionally refuses to hire applicants in part because of the affected individuals' sex, even if it never learns any applicant's sex.'' *See Bostock,* 590 U.S. at 669. This therefore includes discrimination against a person because they are transgender, or because they identify in some other way that is inconsistent with their sex assigned at birth, *e.g.,* because they are gender nonconforming. Such discrimination is also based on requiring persons to conform to stereotypical norms about sex and gender, which can also serve as the basis for impermissible sex discrimination. *See, e.g., Whitaker,* 858 F.3d at 1048–49 (*citing Price Waterhouse,* 490 U.S. at 251). Therefore, the prohibition against discrimination based on gender identity, rather than just transgender status, more fully protects individuals from prohibited sex discrimination. Indeed, the *Bostock* dissent stated that, as defined by the American Psychological Association, ''there is no apparent difference between discrimination because of transgender status and discrimination because of gender identity.'' 590 U.S. at 686, n.6 (Alito, J. joined by Thomas, J., dissenting).

Comment: Several commenters supported OCR's general goal at § 92.101(b) of explicitly incorporating the prohibitions on discrimination found in title VI, section 504, title IX, and the Age Act and thought this approach is prudent, given that some health care entities may not be readily familiar with the specific regulatory standards and obligations that apply to them under civil rights laws. A few commenters noted that incorporating section 504 regulations pertaining to accessibility could create conflicting obligations and specifically objected to incorporating 45 CFR 84.23(c), which applies an outdated standard (the Uniform Federal Accessibility Standards) to new facility constructions. These commenters recommended including additional language in § 92.101(b)(1)(i) that expressly states ''(except for § 84.23(c)).''

Response: We appreciate commenters' concerns regarding inclusion of § 84.23(c). Because the rule has a separate subsection with respect to ''Accessibility for buildings and facilities,'' commenters should refer to this preamble's discussion of § 92.203.

Comment: Some commenters requested that OCR restore the 2016 Rule clarification that any age distinctions exempt from the Age Act are also exempt from section 1557 enforcement.

Response: OCR appreciates commenters' request for clarity regarding the Age Act's permitted age distinctions. This rule adopts by reference the Age Act implementing regulation provisions at 45 CFR part 91 (subpart B), which explicitly recognize that some age distinctions may be necessary to the normal operation of a program or activity or to the achievement of any statutory objective. *See* 45 CFR 91.13 (adopting statutorily permissive age distinctions found at 42 U.S.C. 6103(b)(1)).

Comment: A commenter stated that OCR should exercise its authority to enforce disparate impact claims in order to address systemic discrimination in health care.[127] Another commenter supported the approach taken by OCR in the Proposed Rule to not include the site location provision from the 2016 Rule, stating they believed section 1557's context, structure, and text make evident that Congress did not intend to import multiple, piecemeal legal standards and burdens of proof derived from different statutory contexts into the doctrinal patchwork; and that section 1557 provides the full range of enforcement mechanisms and remedies available to any person pursuing a discrimination claim under section 1557, regardless of their protected characteristic.

Response: After reviewing comments, OCR declines to include provisions similar to former 45 CFR 92.101(b)(3)(ii) and (iii), which are not included in the 2020 Rule. OCR will preserve the longstanding treatment of discrimination in the referenced statutes' implementing regulations consistent with relevant case law.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing the provision as proposed in § 92.101, with modifications. We added ''or any combination thereof'' after disability and deleted the ''or'' before disability in § 92.101(a)(1).

Subpart C—Specific Applications to Health Programs and Activities

Because of section 1557's specific application to health programs and activities, subpart C provides additional detail regarding nondiscrimination requirements in these settings. The provisions in this subpart are responsive to the nature and importance of health care, health insurance coverage, and other health-related coverage, and related health programs and activities as those health-related issues impact individuals and communities protected by section 1557's prohibition of discrimination. These provisions are intended to provide clear instruction to covered entities and are informed by OCR's experience in both enforcement and in providing technical assistance as well as outreach to interested parties.

Meaningful Access for Individuals With Limited English Proficiency (§ 92.201)

In proposed § 92.201, we proposed provisions to effectuate section 1557's prohibition on national origin discrimination as it is applied to individuals with LEP in covered health programs and activities. In § 92.201(a), we proposed that covered entities ''must take reasonable steps to provide meaningful access to each limited English proficient individual eligible to be served or likely to be directly affected by its health programs and activities.''

In § 92.201(b), we proposed that language assistance services required under § 92.201(a) must be provided free of charge, be accurate and timely, and protect the privacy and independent decision-making ability of an individual with LEP.

In § 92.201(c), we proposed specific requirements for interpreter and translation services. Section 92.201(c)(1) proposed that when interpreter services are required under this part, a covered entity must offer a qualified interpreter. Section 92.201(c)(2) proposed that when translation services are required under this part, a covered entity must use a qualified translator.

In § 92.201(c)(3), we proposed regulatory language requiring a covered entity that uses machine translation to have translated materials reviewed by a qualified human translator when the underlying text is critical to the rights, benefits, or meaningful access of an individual with LEP; when accuracy is essential; or when the source documents or materials contain complex, non-literal, or technical language. We sought

comment on the use of machine translation in health programs and activities generally, other possible approaches to address this issue, and whether there should be an exception to this provision to allow for the limited use of machine translation in exigent circumstances.

In § 92.201(d), we addressed how the Director will evaluate compliance with this section. In § 92.201(d)(1), we proposed that the Director shall evaluate, and give substantial weight to, the nature and importance of the health program or activity and the particular communication at issue, to the individual with LEP. Proposed § 92.201(d)(2) provides that the Director shall take into account other relevant factors, including the effectiveness of the covered entity's written language access procedures for its health programs and activities, that the covered entity has implemented pursuant to proposed § 92.8(d).

In § 92.201(e), we proposed restrictions on the use of certain persons to provide language assistance services for individuals with LEP. In § 92.201(e)(1), we proposed prohibitions on covered entities from requiring individuals with LEP to provide, or pay for, their own interpreters. Proposed § 92.201(e)(2) provided for very limited situations in which an adult, not qualified as an interpreter, accompanying an individual with LEP can serve as an interpreter. Section 92.201(e)(3) proposed to prohibit a covered entity from relying on a minor child to interpret or facilitate communication, except as a temporary measure while finding a qualified interpreter in an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no qualified interpreter for the individual with LEP immediately available. In § 92.201(e)(4), we proposed prohibiting reliance on staff other than qualified interpreters, qualified translators, or qualified bilingual or multilingual staff to communicate directly with individuals with LEP.

In § 92.201(f), we proposed standards for video remote interpreting (VRI).

In § 92.201(g), we proposed standards for audio remote interpreting services.

In § 92.201(h), we proposed that nothing in this section shall be construed to require an individual with LEP to accept language assistance services.

The comments and our responses regarding § 92.201 are set forth below.

Comment: Many commenters were very supportive of § 92.201(a)'s requirement that covered entities must take reasonable steps to provide meaningful access to ''each'' individual with LEP eligible to be served or likely to be directly affected by its health programs and activities. Commenters also supported OCR's revision concerning individuals with LEP ''likely to be directly affected'' by a health program or service, as opposed to the previous ''likely to be encountered,'' as it provides greater clarity about the applicability of this rule and reduces some burden on health care practices. Commenters maintained that this standard provides a better description for providers to understand. Other commenters supported inclusion of ''eligible to be served or likely to be directly affected'' because they believe it expands the definition of who can receive language access and better reflects how language service needs are experienced by people seeking health care. Many commenters recommended that OCR clarify that companions are expressly included, noting that this is especially important for caretakers of minor children or those accompanying older adults.

Response: OCR appreciates commenters' thoughts on the language at § 92.201(a) and confirms that covered entities' language access obligations also apply to companions (defined in § 92.4), as companions are ''directly affected by [a covered entity's] health programs and activities'' by virtue of their relationship with the person whom they are accompanying. For example, a covered entity will need to take reasonable steps to provide meaningful access to a parent with LEP whose minor child is being treated or an individual with LEP who may be assisting their spouse with post-operative care. To reinforce this requirement, OCR is adding a parenthetical to the text of § 92.201(a) to clarify that individuals with LEP who are covered under this part include companions with LEP. This language is consistent with the requirement to provide effective communication for companions with disabilities under § 92.202.

Comment: Various commenters appreciated OCR providing clarity on the terms ''reasonable steps'' and ''meaningful access,'' noting that the 2020 Rule's deletion of meaningful access requirements was detrimental to the health of communities with LEP. A few commenters recommended that clearer directives should be included as to what types of services constitute ''reasonable steps,'' suggesting this could be clarified by providing examples of ''reasonable steps,'' or by adding definitions of ''reasonable steps'' and ''meaningful access'' to § 92.4 (Definitions). Another commenter cautioned that the lack of clarity could result in covered entities coming to the determination that no services are required of them. Others stated that additional guidance is needed specifically for providers and payers.

Response: OCR appreciates the request for additional definitions; however, we decline to provide a definition for ''reasonable steps'' or ''meaningful access,'' as these terms are not unique to section 1557 and reflect longstanding requirements under title VI. OCR will consider developing additional guidance on this topic but also refers commenters to the Department's longstanding HHS LEP Guidance, 67 FR 47311, as well as the Department's 2023 Language Access Annual Progress Report. The 2023 Progress Report describes the Department's reconstituted Language Access Steering Committee based on the HHS Equity Action Plan issued under E.O. 13985, clarifies benchmarks for meaningful language access in key areas such as developing best practices for oral interpretation and internet-based access to written translation, and sets forth current plans to update the Department's Language Access Plans and issue related guidance.[128]

Comment: A number of commenters stated that failure to provide meaningful access may violate both section 1557's national origin prohibition and the prohibition on race discrimination. Several commenters stated that there are instances in which an individual experiences discrimination based on their limited English proficiency, in addition to another protected characteristic. For example, a person who is Black and has limited English proficiency is more likely to experience discrimination in health care settings than an individual who is Black but does not have limited English proficiency or an individual with limited English proficiency but who is not Black.[129] Commenters stated that this type of discrimination may deter patients from seeking critical health care services, leading to adverse health outcomes and decreased trust in the health care system.[130] Commenters also

provided data showing that almost one in four health center patients communicate in a language other than English;[131] 63 percent of individuals with LEP identify as Hispanic/Latino;[132] language barriers have been proven to contribute to health inequities for Asian American, Native Hawaiian, and Pacific Islander individuals in particular;[133] and people with LEP are less likely to receive primary care and preventive care, such as breast and cervical cancer screenings.[134]

Some commenters also specifically addressed the importance of language assistance services for older individuals with LEP. These commenters submitted research demonstrating that it is especially difficult for older adults with LEP to communicate with providers because of limited English proficiency, low health literacy, and lack of translators and interpreters.[135] Many commenters argued that to ensure access to quality care, covered entities must have translators and interpreters available at all points of contact at no cost to an individual. This is because older adults may be less inclined to ask for language assistance or may rely on family members who are not qualified to interpret health information. Additionally, the commenters noted that language assistance services are critical for people at the end of life who, absent these services, cannot give true informed consent or thoroughly understand their end-of-life care options.

Response: OCR appreciates these comments and the data submitted. As discussed elsewhere in this preamble, section 1557's language access requirements derive from the statute's prohibition on discrimination against national origin. OCR also appreciates, and agrees with, comments highlighting the ways in which individuals may experience discrimination on multiple grounds as well as comments about the importance of language assistance services for older individuals with LEP. The provisions for § 92.201(a) enhance health access and reduce discrimination by requiring covered entities to take reasonable steps to provide meaningful access to each individual with LEP.

Comment: Many commenters stated that language assistance has often been costly to the individuals with LEP, and translations have often been inaccurate, incomplete, or both. Commenters additionally noted that language assistance has often been provided later in time than other services and that interpretation has not been done in a way that protects patient privacy. Other commenters submitted examples of individuals with LEP being provided with incomplete information, such as being told of only one treatment option, rather than be told of other available treatment options.

Response: We appreciate concerns raised regarding cost, timeliness, and privacy concerns, which we address in § 92.201(b). Consistent with language access requirements in the 2016 and 2020 Rules, required language assistance services must be provided free of charge, be accurate and timely, and protect the privacy of the individual with LEP. Inaccurate or incomplete translations or interpretation may violate the accuracy standard found in this provision and the overarching requirement to take reasonable steps to provide meaningful access. Accuracy issues are further addressed by requiring covered entities to use the services of qualified interpreters and translators, at § 92.201(c).

Comment: Commenters noted a lack of definition for timeliness in § 92.201(b), and one recommended OCR establish time, distance, and wait time standards. Another commenter suggested that the timeliness standard take into account the geographic location of the covered entity and the hour of the day when the need for language assistance services arises.

Response: As OCR discusses in the HHS LEP Guidance, timeliness may depend on multiple variables and so no one definition would be reasonable or applicable to ''all types of interactions at all times by all types of recipients.'' 68 FR 47316. However, language assistance should be provided at a time and place that avoids the effective denial of the service, benefit, or right at issue or the imposition of an undue burden on or delay in important rights, benefits, or services to the person with LEP. 68 FR 47316. When evaluating a complaint, OCR will consider the context, including the urgency and importance of many health care services. We encourage covered entities to review the HHS LEP Guidance for additional guidance.

Comment: Several commenters stated that language assistance services should be required to include cultural competency and that providers should reflect the community around them in order to build trust. One commenter noted that during listening sessions they conducted, participating health centers emphasized the important role that bilingual and bicultural staff who represent the community served to provide accurate and culturally comprehensible interpretation. A few commenters recommended requiring covered entities to ensure sufficient staff with appropriate training and to administer language proficiency assessments to confirm competency of bilingual and multilingual staff.

Some commenters urged that translators and interpreters be from or a part of the impacted community in which they serve, with some suggesting that community-based interpreters and translators may be more qualified for a number of reasons, including familiarity with local dialect and cultural competency. Others, however, stated that family members and community service providers or other external groups should not have to bear the burden of interpreting.

Response: OCR generally agrees that cultural competency is essential for

equitable language access and communications.[136] This is especially important considering variations in dialects, expressions, or ''regionalisms.'' For example, a Spanish word that may be understood to mean something for someone from Puerto Rico may mean something else for someone from Mexico. Thus, cultural competency is a key factor in providing accurate interpretation and translation, and accuracy is a necessary component of meaningful access.

OCR recognizes that community members may be more likely to be culturally competent but declines to include in the regulatory text a requirement that translators and interpreters be from the community they serve. Covered entities are free to determine their own hiring and contracting processes for utilizing the services of qualified interpreters and translators, and hiring bilingual/multilingual staff, as long as these individuals meet the requirements for their respective positions as provided in § 92.4 (Definitions).

Comment: Many commenters supported the novel proposal to address machine translation in this regulation, with some requesting that machine translation *always* be checked by a qualified human translator and that patients be advised when a translation has been completed by machine translation due to high error rates. One commenter specified that covered entities should not use Google Translate as the only resource for translations as it generates errors, pointing to a State Department of Health website translating ''the vaccine is not required'' for COVID–19 to ''the vaccine is not necessary'' in Spanish (since corrected). Other commenters stated that the rule does not adequately account for future innovations and that the final rule should include an exception for exigent circumstances. Insurance entities and other providers commented that machine translation is a viable option to reduce costs in some instances.

Response: OCR recognizes that machine translation is an evolving technology. However, given that it still carries significant potential for error, we believe this provision strikes an appropriate balance between the convenience some may find in this technology and the critical nature of communications in the health care context. We appreciate commenters' concerns regarding exigent circumstances, where use of machine translation technology may provide immediate language assistance capabilities in very urgent circumstances. As provided under § 92.201(a), ''[a] covered entity must take reasonable steps to provide meaningful access to each individual with limited English proficiency (including companions with limited English proficiency) eligible to be served or likely to be directly affected by its health programs and activities.'' For example, if an emergency medical technician must provide urgent medical care to an individual with LEP, and no other language assistance services are available, it may be reasonable to use machine translation technology to communicate with that person while a qualified interpreter is identified. We note that the definition for machine translation found at § 92.4 under this final rule ''means automated translation . . . that is text based and provides instant translations between various languages,'' which includes automated translation covers speech as well as written communications. However, given the importance of communication and understanding in the health care and services setting, OCR requires that in such circumstances, the machine translation must be subsequently checked by a qualified human translator as soon as practicable. OCR also recommends that, if machine translation is used in circumstances that do not require human review (*i.e.,* those circumstances that do not meet the criteria set forth in § 92.201(c)(3)), the patients should be warned that it may contain errors. OCR directs commenters to § 92.4 (Definitions) for further discussion on machine translation and future technology.

Comment: OCR received limited comments on our proposed revisions to the factors the Director will take into account when evaluating compliance with language access obligations (proposed § 92.201(d)). Several commenters supported discontinuing the 2020 Rule's use of the ''four-factor analysis,'' 45 CFR 92.101(b)(1), found in the HHS LEP Guidance, 68 FR 47314–16, to determine compliance with a covered entity's language access requirements under section 1557. These commenters stated that the four-factor analysis is too vague to be useful for oversight of compliance and does not provide direction on how each of the factors would be weighed against each other. Conversely, a few commenters recommended that OCR retain the four-factor analysis since it provides covered entities more flexibility. These commenters noted that recipients must have flexibility in achieving compliance with requirements for language access because of their limited resources and patient populations.

A few commenters noted that the phrase ''other relevant factors'' in § 92.201(d) is vague and should either be removed or clarified. Specifically, they said that compliance has been an ongoing problem and more information is needed to help covered entities understand the factors that will be used for evaluation of compliance. Additionally, one commenter recommended that the final rule include the geographic location of the covered entity and the hour of the day when the need for language assistance services arises as one of the factors for OCR to consider in evaluating compliance. For example, the ability of a small, rural provider to find an interpreter for an individual with LEP at midnight on a Saturday is going to be substantially more challenging than it would be for a provider in an urban setting.

Response: As discussed in the 2022 NPRM, 87 FR 47862, after additional consideration OCR determined that the four-factor test was not a sufficiently precise or flexible compliance tool. Section 92.201(d)(1) provides flexibility that allows the Director to take into account a range of relevant factors, including the ''nature and importance of the health program or activity and the particular communication at issue, to the individual with limited English proficiency.'' Additionally, § 92.201(d)(2) allows for the consideration of ''other relevant factors,'' including those that relate to whether ''reasonable steps'' were taken in a given situation. Thus, the Director may take into account the geographic location and timing considerations posed by the commenter's example in evaluating whether ''reasonable steps'' were taken.

Comment: Many commenters supported the inclusion of an explicit prohibition on the use of certain persons to interpret or facilitate communication, including the expectation that in an emergency situation, reliance on an accompanying adult or minor should be ''a temporary measure'' at § 92.201(e).

[136] *See* U.S. Dep't of Health & Hum. Servs., Off. of Minority Health, *Think Cultural Health, National Standards for Culturally and Linguistically Appropriate Services (CLAS) in Health and Health Care, https://thinkculturalhealth.hhs.gov/assets/pdfs/EnhancedNationalCLASStandards.pdf* (recommending that health organizations: ''[p]rovide effective, equitable, understandable, and respectful quality care and services that are responsive to diverse cultural health beliefs and practices, preferred languages, health literacy, and other communication needs,'' through providing language assistance and ''[e]stablish[ing] culturally and linguistically appropriate goals, policies, and management accountability, and infuse them throughout the organization's planning and operations'').

Commenters stated that children oftentimes are asked to interpret medical information for which they do not have the vocabulary or content knowledge. Some also stated that older adults with LEP may feel pressure to rely on family members as interpreters, even if those family members are not qualified to interpret health information, which can inhibit the older adult's understanding of their health status and instructions from their provider.

Response: We appreciate the commenters' support and underscore that untrained ''interpreters'' are more likely to make errors, violate confidentiality, and increase the risk of poor outcomes. Research has shown that the ability of a provider to accurately diagnose a patient's condition can be jeopardized by untrained interpreters, such as family and friends, and especially minor children who are prone to omissions, additions, substitutions, volunteered opinions, semantic errors, and other problematic practices.[137] Additionally, the use of children as interpreters raises not only the same concerns as those of an accompanying adult who is not qualified as an interpreter, but also poses other problems including exposing children to complex health care interactions for which they are not developmentally prepared, upsetting a family power dynamic, causing embarrassment, and conveying incorrect or incomplete information. 87 FR 47863.

Comment: Some commenters requested that OCR provide emergency exceptions for using bilingual/multilingual staff as interpreters. These commenters noted that covered entities should be able to use their staff's skills in different languages when needed in emergency situations.

Response: We appreciate commenters' concerns regarding obtaining the services of a qualified interpreter in emergency situations. Under § 92.201(e)(2) introductory text, a covered entity may ''[r]ely on an adult, not qualified as an interpreter, accompanying a limited English proficient individual to interpret or facilitate communication'' as a temporary measure in an emergency pending the retention of a qualified interpreter. OCR has revised § 92.201(e)(2) introductory text to remove references limiting reliance on a non-qualified interpreter to only an adult ''accompanying an individual with LEP.'' This provision now allows for a covered entity to rely on a bilingual/multilingual staff member—or other adult not accompanying an individual with LEP—to serve as an interpreter as a temporary measure in such emergency situations. Furthermore, the interpreter services of bilingual/multilingual staff who are also qualified interpreters may be utilized in any situation, including emergency situations. However, covered entities should consider how to obtain the services of a qualified interpreter as quickly as possible in emergency and exigent circumstances, and only rely upon other persons in highly exceptional circumstances.

Comment: A couple of commenters recommended that OCR revise § 92.201(e)(2)(ii) to allow a covered entity to use a qualified interpreter even in situations where the patient has requested that a family member or friend interpret or facilitate communication. These commenters explained that if a provider believes that the family member or friend may not be accurately communicating with the patient or appears to be struggling when interpreting or if a health provider suspects in good faith that an individual may be a victim of trafficking or abuse, then the health provider should be able to utilize a qualified interpreter.

Another commenter recommended that OCR clarify that an accompanying adult may only facilitate communication at the request of an individual with LEP when the request is made in private, without the adult present. The commenter expressed concern that the exception as written could interfere with the autonomy of the individual with LEP seeking sexual or reproductive health services, especially if the individual is accompanied by an abusive partner that objects to certain sexual and reproductive health services.

Additionally, one commenter noted that the prohibition of an accompanying adult acting as an interpreter—absent the individual with LEP's consent or in the case of an emergency—is particularly important for survivors of domestic and sexual violence. The commenter stated that without such a restriction, victims and survivors are faced with situations where their abuser, child, or family member may be used to interpret traumatic and sensitive information, compounding the risk to victims and trauma to themselves as well as their children. Another commenter recommended OCR specify that if an individual with LEP requests an accompanying adult to facilitate one time, this does not mean the covered entity can assume the individual with LEP will continue to bring that same adult or choose to use that adult as an interpreter for future interactions. The covered entity must offer language services each and every time it encounters an individual with LEP.

One commenter requested OCR also address nonemergency situations where the patient does not ''specifically request'' that an accompanying adult interpret or facilitate communication, but where, despite best efforts to find a qualified interpreter, it is not possible to find a qualified interpreter for the individual with LEP, such as when a patient speaks a rare dialect of a language.

Response: We appreciate the commenters' concerns regarding when it may or may not be appropriate to grant an adult with LEP's request for an individual not qualified as an interpreter to interpret or facilitate communication. When considering reliance on an accompanying adult to interpret, the covered entity must consider whether that reliance is appropriate—this includes whether the covered entity believes the accompanying adult can adequately convey the information being discussed and whether they may have a conflict or bias, as in the case of intimate partner violence. Any agreement by a covered entity to allow an accompanying adult to interpret or facilitate communication may only be at the affirmative and independent request of the individual with LEP so as to protect individuals in situations such as intimate partner violence, abuse, or trafficking. We clarify that OCR appreciates the critical role parents and guardians play in medical decision-making for their children and that the rule does not prevent parents from being involved in their children's health care decisions. To address the concern of coercion and the like, we are finalizing § 92.201(e)(2)(ii) to include a requirement that the individual with LEP make their request without the accompanying adult present and with the services of a qualified interpreter, which does not include the exigent circumstances exception found at § 92.201(e)(2)(i).

Comment: One commenter encouraged OCR to include a specific provision at § 92.201(e) ensuring privacy and confidentiality for individuals with LEP, such as not having sensitive discussions in waiting rooms and other public spaces.

Response: We appreciate the commenter's concern regarding privacy and confidentiality for individuals with

[137] Joseph R. Betancourt et al., The Disparities Solutions Ctr., *Mongan Inst. for Health Pol'y, Mass. Gen. Hosp., Improving Patient Safety Systems for Patients with Limited English Proficiency: A Guide for Hospitals,* pp. 3–5, 10–11, 14–16 (2012), *https://www.ahrq.gov/sites/default/files/publications/files/lepguide.pdf.*

LEP and restate that one of the key components of the definition of ''qualified interpreter for an individual with limited English proficiency'' is that they must adhere to generally accepted interpreter ethics principles, including client confidentiality. Additionally, covered entities that are subject to both HIPAA and section 1557 must comply with the requirements of both laws.[138]

Comment: Several commenters supported the restoration of requirements related to video remote interpreting (VRI) for individuals with LEP. Commenters noted that the 2020 Rule removed requirements related to VRI for individuals with LEP, yet many covered entities use video interpreting not only for deaf or hard of hearing patients but also patients with LEP. Further, these commenters noted that the quality of video interpreting should be the same for all individuals who use it. A couple of commenters specifically noted the importance of high-quality picture, video, and transmissible audio for all parties in order for interpreters to perform their job effectively. For example, one commenter noted the importance of restoring VRI standards for individuals with LEP given frequent concerns about the poor quality of interpreter services using VRI. A couple of other commenters mentioned that the use of such technology will facilitate discussion between qualified interpreters and individuals with LEP and will also assist individuals who may have disabilities who are aided by using such technology. One commenter, who supported inclusion of VRI standards, recommended in-person interpretation should be sought as a first step because it is more responsive than VRI.

Response: We agree with commenters that it is important to have parity in VRI quality standards for all individuals who use it. The final rule reinstates the VRI standards from the 2016 Rule, former 45 CFR 92.201(f), which were based on standards found in the implementing regulations for title II of the ADA.[139] This provision is designed to achieve parity with the VRI requirements found in § 92.202 regarding effective communication for people with disabilities.

We recognize that VRI is not always the most appropriate method for providing language assistance services. This provision does not require a covered entity to provide VRI but rather ensures that when such services are used, they meet a minimum quality standard. To also clarify that the language assistance services delivered via VRI must provide meaningful access, we are revising § 92.201(f) to require that when a covered entity uses VRI services, it ''must ensure the modality allows for meaningful access.''

Comment: A few commenters raised concerns with the proposed technical requirements for VRI services. A couple of commenters requested OCR provide emergency exceptions for performance standards for video remote interpreting. These commenters also expressed concern with the requirement that VRI must be over a dedicated high-speed, wide-bandwidth video connection or wireless connection since it may be difficult to meet that standard in an emergency, such as a natural disaster that disrupts access to the high-speed connection.

Another commenter suggested revising the rule to require covered entities to use audio and video communications for interpretation services that are consistent with those available in the community served by the health program or activity. The commenter explained the communications framework in a community, such as a rural community, may not fully meet the standards proposed.

Response: We appreciate commenters' concerns regarding the ability to meet the VRI standards proposed. In the event of a natural disaster or locations where high-speed wide-bandwidth video capabilities may not be available, covered entities may not be able to meet the required standards. In these circumstances, a reasonable step to achieving meaningful access may be through using the services of a qualified interpreter via telephone (or in-person, if available). As in all circumstances, OCR will consider the specific facts of whether a covered entity has taken reasonable steps to provide meaningful access under the circumstances.

Comment: A couple of commenters recommended that VRI requirements be reflective of and adaptable to the specific community or individual. One organizational commenter recommended that the rule clarify that covered entities should follow an individual's preference with respect to interpreter services where appropriate. The commenter noted that the majority of their members and patients with LEP communicate through telephonic interpretation services and that there are also situations where a member or patient may express a preference to use an audio interpreter service rather than be required to participate in a video session.

Response: We appreciate commenters' suggestions regarding prioritizing an individual with LEP's preference when determining the manner in which interpreting services will be provided. However, we decline to revise the requirements for VRI standards. These standards set minimum requirements for when language assistance services are provided via VRI; they do not, however, *require* a covered entity to use such technology. Covered entities are free to use audio-only interpretation if that is a reasonable step to provide meaningful access to an individual with LEP, including if it is the expressed preference of an individual with LEP.

Comment: A few commenters recommended OCR establish further requirements with respect to VRI. These commenters suggested OCR specify that the covered entity should be held responsible for ensuring that the VRI device connects to a qualified interpreter within five minutes of the arrival of the VRI device in the room and ensure that there are no interruptions in communication, such as disconnections or screensavers. Further, commenters recommended that health care entities should have personnel available on a 24-hour basis who are trained and able to operate the VRI system efficiently. These commenters stressed that hospitals are already responsible for the maintenance and upkeep of multiple types of equipment necessary for health care and, as such, the same strict standards for optimal operation and upkeep should apply to VRI technology as well. A few commenters stated that covered entities should have policies and procedures in place to procure video remote interpretation.

Response: OCR appreciates the commenters' recommendations for providing further requirements related to VRI. The rule requires that language assistance services be provided in a timely manner. We decline to mandate a specific time period in which an interpreter must be made available once

[138] Determining the relationship between the interpreter and the covered entity is a covered entity's HIPAA obligation and is unchanged by section 1557 or the part. We encourage covered entities to review OCR's HIPAA Frequently Asked Questions (FAQ) regarding business associates. *See* U.S. Health & Hum. Servs., Off. for Civil Rts., *Health Information Privacy FAQs, https://www.hhs.gov/hipaa/for-professionals/faq/760/must-a-covered-provider-obtain-individual-authorization-to-disclose-to-an-interpreter/index.html.*

[139] *See* 28 CFR 35.160(d)(1)–(4). In contrast to 28 CFR 35.160(d)(2), which regulates the size of the video image to ensure that the screen shows one's face, arms, hands, and fingers, § 92.201(f)(2) in this final rule does not regulate the size of the video image because this component is less relevant for oral interpretation between English and non-English languages or two non-English spoken languages.

a VRI device is present, as it does not allow for the necessary flexibility that may be required to account for the specific circumstances giving rise to the interaction, such as whether it is scheduled or unscheduled. We agree it is important to ensure a covered entity has personnel who can maintain and efficiently set up and operate VRI technology. To this end, the rule requires covered entities to maintain language access procedures per § 92.8(d), and to provide adequate training to users of the technology and other involved persons so that they may quickly and efficiently set up and operate the VRI device per § 92.201(f)(4). Although we support covered entities having policies and procedures in place related to the procurement of video remote interpretation, we decline to require them to do so because we do not believe imposing such a requirement is warranted at this time.

Comment: OCR received a few comments on the standards for audio remote interpreting services at § 92.201(g), which were generally supportive. One commenter expressed that audio-only interpretation is often a poor substitute for video remote or in-person interpretation and recommended OCR consider audio-only interpretation to be a last resort.

Response: We appreciate the commenter's concern and recognize that audio remote interpreting may not be adequate to provide meaningful access to an individual with LEP. However, there are situations in which audio remote interpreting may be the only option available to a covered entity and so we decline to place further restrictions on its use. To address concerns that audio remote interpreting may fail to provide meaningful access, we are revising § 92.201(g) to require that when a covered entity uses audio remote interpreting services, it ''must ensure the modality allows for meaningful access.''

Comment: One commenter recommended OCR explicitly prohibit covered entities from coercing individuals with LEP to decline language assistance services, which was stated in the preamble to the 2015 NPRM. 80 FR 54185. The commenter noted that the 2022 NPRM did not capture this important concept and covered entities should be prohibited from discouraging individuals with LEP from exercising their rights, which may be a form of discrimination.

Response: We appreciate the commenter's concern and reiterate that a covered entity may not coerce an individual with LEP to decline language assistance services. In the same way that a covered entity is prohibited from requiring an individual with LEP to accept language assistance services, § 92.201(h), a covered entity similarly cannot require or coerce an individual to decline such services.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, OCR is finalizing the provisions as proposed in § 92.201, with modifications. In § 92.201(a), we are adding ''(including companions with limited English proficiency)'' after the term ''individual with limited English proficiency.'' In § 92.201(e)(2), we are deleting the clause ''accompanying a limited English proficient individual.'' In § 92.201(e)(2)(i), we are replacing ''the accompanying adult'' with ''an initial adult interpreter.'' In § 92.201(e)(2)(ii) we are adding the phrase ''in private with a qualified interpreter present and without an accompanying adult present,'' after ''where the individual with limited English proficiency specifically requests.'' In § 92.201(f), we are adding the phrase ''ensure the modality allows for meaningful access and must . . .'' after ''through video remote interpreting services in the covered entity's health programs and activities must . . .'' In § 92.201(g), we are adding the phrase ''ensure the modality allows for meaningful access and must . . .'' after ''through audio remote interpreting services in the covered entity's health programs and activities must . . .''

We are also making technical revisions. Throughout § 92.201, we are replacing the term ''limited English proficient individual'' with ''individual with limited English proficiency.'' In § 92.201(c)(2), we are replacing the phrase ''a covered entity must use a qualified translator'' with ''a covered entity must utilize the services of a qualified translator.'' In § 92.201(e)(2)(ii), we are replacing the word ''the'' in the phrase ''by the accompanying adult is documented'' with ''by an accompanying adult is documented.'' In § 92.201(e)(4) we are striking the word ''directly'' as technically incorrect to describe the manner in which a covered entity communicates to an individual with LEP via the services of a qualified interpreter or qualified translator.

Effective Communication for Individuals With Disabilities (§ 92.202)

Proposed § 92.202 addressed requirements related to providing effective communication for individuals with disabilities.

In § 92.202(a), we proposed requiring a covered entity to take appropriate steps to ensure that communications with individuals with disabilities, and companions with disabilities, are as effective as communications with individuals without disabilities in its health programs and activities, incorporating the standards found at 28 CFR 35.130 and 35.160 through 35.164 of the regulation implementing title II of the ADA.

In § 92.202(b), we proposed to require covered entities to provide appropriate auxiliary aids and services to individuals with impaired sensory, manual, or speaking skills, where necessary to afford such individuals an equal opportunity to benefit from the service in question.

The comments and our responses regarding § 92.202 are set forth below.

Comment: While commenters generally expressed support for § 92.202, many discussed the extensive lack of compliance with current effective communication requirements under section 1557, section 504, and title II of the ADA by covered entities. Some referenced costs as the key issue, and one commenter stated that some providers have a policy of only providing an interpreter if the cost is covered by the patient's health insurance. Another commenter stated that even when the State has a Medicaid billing code, the patients still are faced with the burden of having to educate prospective providers about the availability of the code and the provider's obligation to provide auxiliary aids and services.

Other commenters mentioned that compliance will require implementing programs to develop, maintain, and communicate clear policies, and train on the provision of language assistance services and auxiliary aids and services for effective communication.

Response: OCR is aware that some covered entities fail to comply with their responsibility to ensure effective communication with individuals with disabilities, including through requiring an individual to bring their own interpreter, only providing interpreter services when covered by the individual's health insurance coverage or other health-related coverage, or incorrectly citing health privacy laws as a reason to not provide interpreter services.

In an effort to proactively address compliance concerns and resulting lack of access to covered health programs and activities, we are requiring all covered entities to develop and

maintain effective communication procedures, per § 92.8(e). OCR encourages covered entities to include any necessary billing codes in such procedures. We are further requiring covered entities to train relevant employees on these procedures, per § 92.9.

Comment: A patient advocacy group recommended requiring that states establish a medical communication access fund that pools fees from State-mandated medical licenses to pay for effective communication. The commenter expressed that this method spreads out the costs of auxiliary aids and services so that no single covered entity bears the costs.

Response: All covered entities must provide auxiliary aids and services when needed to communicate effectively with people with disabilities. OCR encourages covered entities to develop creative approaches to support the provision of these required aids and services. OCR declines to include a specific requirement for states to establish mandatory medical communication access funds in this rulemaking as such a requirement would exceed the authority granted to OCR for this rulemaking.

Comment: Some commenters expressed appreciation and support for the inclusion of ''companions'' in the text of § 92.202. One commenter added that doctors and hospitals have told patients that their legal counsel informed them that they are not obligated to provide communication access to anyone who is not a patient. One commenter recommended that OCR include that the selection of ''appropriate'' companion(s) be made by the individual not the provider.

Response: Section 1557 requires that covered entities ensure effective communication for individuals with disabilities, including companions. The definition in § 92.4 is consistent with the definition of ''companion'' from the implementing regulations for title II of the ADA, which similarly requires that a public entity ''take appropriate steps to ensure that communications with . . . companions with disabilities are as effective as communications with others.'' 28 CFR 35.160(a).

Comment: A couple of commenters mentioned that patients are sometimes told that due to confidentiality they cannot have a friend, family member, advocate, or attorney be present for an appointment for effective communication purposes. One commenter provided the following example: An individual with Autism Spectrum Disorder (ASD) was required to enter the hospital without his mom, who could assist him in communicating, and likely because of that he was misdiagnosed and required to return to the emergency room within a week.

Response: Unless a covered entity has a specific confidentiality concern regarding the presence of a specific companion, the individual with a disability should be permitted to select a companion and have them present when accessing a covered health program or activity. Further, and consistent with instruction under the ADA, a companion may need to help the patient with information or instructions given by hospital personnel.[140] Companions may be an essential part of ensuring an individual with a disability is afforded effective communication and should not be separated from an individual with a disability outside of extenuating circumstances. However, we note that a covered entity may not rely on a person accompanying an individual with a disability to interpret or otherwise facilitate communication; this is only permitted when the individual with a disability specifically requests that an accompanying adult interpret or facilitate communication, the accompanying adult agrees to provide such assistance, and reliance on that adult for such assistance is appropriate under the circumstances. *See* 28 CFR 35.160(c)(2)(ii), incorporated by § 92.202.

Comment: Several commenters thanked OCR for proposing to restore the requirements for quality measures in VRI, while some raised concerns regarding the appropriateness of VRI in various circumstances. They shared that, for example, VRI may not be effective for a person lying on their back for a medical procedure due to challenges with viewing the screen and that VRI has been inappropriately used during high-risk childbirth. Yet another commenter mentioned that VRI is not appropriate for individuals who are deafblind (*i.e.,* individuals who have combined hearing and vision loss that limit access to both auditory and visual information). One commenter expressed concern that a provider made it a policy that their facility only uses VRI and never uses the services of in-person interpreters.

Response: We acknowledge the concerns with VRI and note that it may not provide effective communication for all individuals in all situations. Covered entities are required to take appropriate steps to ensure that communications with individuals with disabilities are as effective as communications with individuals without disabilities in their health programs and activities. If the use of VRI does not provide an individual equal opportunity to participate in or benefit from the service in question, then the communication is ineffective and does not meet section 1557 requirements.

Several cases have found that VRI was ineffective due to hospital staff's lack of knowledge about how to operate the VRI equipment or technology issues with the equipment itself, including the attempted use of VRI during labor.[141] Settlement agreements with the United States have similarly found concerns with VRI, including one settlement decree that specified that VRI would not be considered effective in specific situations, including situations due to: ''(1) a patient's limited ability to move his or her head, hands or arms; vision or cognitive issues; or significant pain; (2) space limitations in the room; (3) the complexity of the medical issue; or (4) any other time when there are indicators that VRI is not providing effective communication.'' [142]

This enforcement activity suggests that VRI may not always afford a person with a disability an equal opportunity to participate in and enjoy the benefits of the program or activity of a covered entity. Thus, policies that require the exclusive use of VRI, or the exclusive use of any particular auxiliary aid or service, are likely to result in the eventual failure to provide effective communication and therefore should not be adopted.

Comment: One patient advocacy group recommended that OCR emphasize that family members should not act as interpreters for a deaf or hard of hearing patient, except in certain exigent circumstances.

Response: Covered entities are responsible for providing effective communication, including through utilizing the services of a qualified interpreter, and cannot require an individual to bring someone to interpret for them. Persons with disabilities can, however, bring an interpreter of their choosing, including a family member, and OCR declines to add the suggested language prohibiting this choice. This approach is consistent with existing ADA title II regulations, 28 CFR 35.160(c), and with the approach OCR has followed in the section 504 proposed rule. 88 FR 63392, 63508 (Sept. 14, 2023) (proposed 45 CFR 84.77(c)(2)(ii)).

Comment: One group recommended that the final rule include language that requires health care entities to consider a patient's preference for gender of the interpreter as a means of ensuring more effective communication. This group noted that given the intimate nature of medical assessments and treatments, patients may not be comfortable with an interpreter of a different gender than themselves, particularly in settings that involve nudity such as in an obstetrics and gynecology appointment.

Response: While OCR appreciates that a patient may prefer an interpreter of a particular gender and recommends consideration of a patient's preference for a particular gender whenever possible, including when the request is made based on an individual's religious practices and beliefs, we decline to include such language in the rule regarding the gender of a qualified interpreter for an individual with a disability. OCR notes that some organizations, such as the National Association of the Deaf and Deaf Seniors of America, have issued position statements to guide providers in adopting internal VRI policies, and have stated that medical providers ''shall honor the preference of the deaf or hard of hearing patient and/or companion with respect to the gender of video interpreter.'' [143] However, OCR notes that whether a covered entity has ensured their communication is effective for an individual with disability does not inherently depend on whether the covered entity is able to satisfy a patient's preference regarding the interpreter's gender.

Comment: An organizational commenter said that providers should be required to ''affirmatively ask'' patients what they need to make documents accessible and should document that requirement so that it does not need to be repeatedly asked and answered.

Response: OCR understands the frustration experienced by individuals who have to inform their providers of their need to receive communication in accessible formats multiple times. We note that the Department has implemented a process by which Medicare beneficiaries who are blind or have low vision can request Medicare Summary Notices in an accessible format, and following the initial request, the required accessible format will be the default format of the document mailed to the beneficiary.[144] We recognize this as a best practice, and while we decline to require that such need be documented, we encourage covered entities to implement such a practice in the written effective communication procedures required under § 92.8(e).

Comment: Some organizational commenters urged OCR to incorporate the following OCR guidance documents directly into the final regulations, as well as all subsequent similar guidance, technical assistance, and enforcement activities: enforcement efforts related to support persons in hospital settings[145] and Bulletin on Civil Rights, HIPAA, and the Coronavirus Disease 2019.[146]

Response: OCR thanks commenters for their suggestion to incorporate guidance and enforcement materials into the final rule. Guidance documents advise members of the public how an agency understands its legal authorities.[147] Similarly, covered entities and others may be able to look to OCR's enforcement to gain clarity regarding regulatory requirements. As guidance, technical assistance, and enforcement activities are constantly evolving, we decline to codify the referenced materials in this rule.

Comment: Multiple commenters, including organizations, recommended that § 92.202(b) explicitly parallel the language in § 92.201(b) by stating that auxiliary aids and services must be provided free of charge, be accurate and timely, and protect the privacy and the independent decision-making of the individual with a disability. The commenters noted that while this section adopts by reference 28 CFR 35.160 through 35.164 (ADA title II communication requirements), some covered entities may simply read the regulatory language and note the difference in language between §§ 92.201 and 92.202. Noting this difference, several commenters also requested that OCR develop technical assistance materials on 28 CFR 35.160 through 35.164 in plain language.

Response: Like multiple places in this regulation, the text of § 92.202 adopts ADA title II standards by reference, including the requirements related to auxiliary aids and services. OCR appreciates the concerns raised by commenters regarding the apparent lack of parity between §§ 92.201(b) and 92.202(b), and how this may lead to confusion on behalf of covered entities and the public and may increase the likelihood that individuals with disabilities may either not receive or may be required to pay for auxiliary aids and services. Therefore, in light of comments received and continued compliance concerns, we are revising § 92.202(b) as follows.

First, OCR is revising the text, consistent with 28 CFR 35.160(b)(1), to clarify that all individuals with disabilities must be afforded appropriate auxiliary aids and services and an equal opportunity to ''participate in and enjoy the benefits of'' the health program or activity in question.

Further, OCR agrees with commenters that it is important that those reading this regulation can immediately identify that appropriate auxiliary aids and services must be provided free of charge. Some commenters and our enforcement experience demonstrate that this requirement, similar to that in the ADA and section 504, is not always clear or adhered to by covered entities. Thus, OCR is adding a sentence to § 92.202(b) stating that auxiliary aids and services must be provided free of charge. OCR notes that this is similar to the approach taken in DOJ's implementing regulations for title II and title III of the ADA, which forbid surcharges on persons with disabilities or groups of persons with disabilities to

[143] Nat'l Ass'n of the Deaf, *Minimum Standards for Video Remote Interpreting Services in Medical Settings, https://www.nad.org/about-us/position-statements/minimum-standards-for-video-remote-interpreting-services-in-medical-settings/.*

cover the provision of auxiliary aides and services. 28 CFR 35.130(f) (title II), 36.301(c) (title III). For parity with 28 CFR 36.160(b)(2) and 45 CFR 92.201(b), we are also revising the text to clarify that auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way to protect the privacy and the independence of the individual with a disability.

OCR appreciates commenters' suggestion to develop technical assistance materials regarding effective communication under 28 CFR 35.130 and 35.160 through 35.164. These are regulations promulgated and enforced by DOJ, and we will continue to coordinate and collaborate with DOJ to develop technical assistance materials related to effective communication requirements under our respective authorities.[148]

Comment: A few organizational commenters argued that the provision of auxiliary aids and services is necessary but not a sufficient tool for avoiding and remedying effective communication discrimination. The commenters said that individuals who cannot rely on natural speech for effective communication require ''effective access to the robust language-based alternative and augmentative communication they need to express themselves and be understood.'' Another group said that OCR should expand on the definition of ''auxiliary aids and services'' to include plain language and screen reader capabilities.

Response: Covered entities are required take appropriate steps to ensure effective communication. Though the provision of appropriate auxiliary aids and services is addressed in § 92.202(b), the examples of auxiliary aids and services provided at § 92.4 (Definitions) is non-exhaustive and covered entities may use additional auxiliary aids and services to achieve effective communication.

Effective communication for patients with cognitive, neurological, and psychiatric disabilities may require auxiliary aids and services or strategies different from those employed with patients with other disabilities. For example, while an individual who is deaf or hard of hearing may require an ASL interpreter to effectively communicate with a provider, an individual with a cognitive disability may require additional time with the provider to ask questions and receive plain language answers about a specific health care decision.

In addition, one type of auxiliary aid or service that may be required is the acquisition or modification of equipment or devices, including for augmentative and alternative communication, and the provision of training and assistance to the individual with a disability on how to use them. Augmentative and alternative communications devices include, but are not limited to, speech generating devices, single-message devices, computers, tablets, smartphones, amplification devices, telecommunications devices, voice amplifiers, artificial phonation devices, picture and symbol boards, paper-based aids, and other equipment or devices used to compensate for impairments to speech-language production or comprehension, including spoken and written modes of communication. In some instances, the use of augmentative and alternative communication is necessary for individuals with certain disabilities that impair speech production and comprehension to access vital health and human services programs and activities. Often, the most effective way for recipients to ensure effective communication is to provide training on the use of this equipment.

Comment: A health care organization requested that this provision should be modified to state that covered entities ''must make a reasonable attempt'' to provide auxiliary aids and services, ''unless the covered entity can demonstrate that providing such auxiliary aids or services would fundamentally alter the nature of the service in question or result in an undue burden, *i.e.,* significant difficulty or expense.''

Response: OCR declines to modify the standard for effective communication, which requires that covered entities ensure that communications with people with disabilities are as effective as communications with others. The language on fundamental alteration or undue burden related to the provision of communications, found in 28 CFR 35.164, is already adopted into this section by reference.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.202, with modification. We are revising § 92.202(b) to read: ''A covered entity must provide appropriate auxiliary aids and services where necessary to afford individuals with disabilities an equal opportunity to participate in, and enjoy the benefits of, the health program or activity in question. Such auxiliary aids and services must be provided free of charge, in accessible formats, in a timely manner, and in such a way to protect the privacy and the independence of the individual with a disability.''

Accessibility for Buildings and Facilities (§ 92.203)

In § 92.203, we proposed adding a general provision establishing that no qualified individual with a disability shall, because a covered entity's facilities are inaccessible to or unusable by individuals with disabilities, be denied the benefits of, be excluded from participation in, or otherwise be subjected to discrimination under any health program or activity to which this part applies, consistent with OCR's section 504 regulation. OCR also proposed incorporating the identical language found in the 2020 Rule at § 92.103, except that the definitions for 1991 Americans with Disabilities Act Standards for Accessible Design (1991 ADA Standards), 2010 ADA Standards for Accessible Design (2010 ADA Standards), and Uniform Federal Accessibility Standards (UFAS), Public Law 90–480; 42 U.S.C. 4151 *et seq.,* are now located in § 92.4.

OCR also notes that the section 504 regulatory provisions incorporated into subpart B in this regulation contain program accessibility requirements that apply to existing facilities as well as new construction and alterations. Title II of the ADA and section 504 require that covered entities operate their programs and activities so that, when viewed in their entirety, they are readily accessible to individuals with disabilities; neither statute has been interpreted to require that each existing facility be made accessible.[149] Nearly all of the entities subject to the facility access requirements in the final rule are also subject to facility access requirements under section 504 and the ADA. Section 92.203 establishes specific accessibility standards for new construction and alterations under section 1557.

The comments and our responses regarding § 92.203 are set forth below.

Comment: Some commenters emphasized the importance of a

[148] U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Disability Resources for Effective Communication, https://www.hhs.gov/civil-rights/for-individuals/special-topics/hospitals-effective-communication/disability-resources-effective-communication/index.html*; *see also Medicaid.gov, Unwinding Documents, https://www.medicaid.gov/resources-for-states/coronavirus-disease-2019-covid-19/unwinding-and-returning-regular-operations-after-covid-19/state-letters/index.html.*

[149] *See* 28 CFR 35.150(a); 45 CFR 84.22(a); *Bird* v. *Lewis & Clark Coll.,* 303 F.3d 1015, 1021 (9th Cir. 2002) (''the central inquiry [under the ADA and section 504] is whether the program, when viewed in its entirety is readily accessible to and usable by individuals with disabilities'').

continued push towards universal compliance with the 2010 ADA Standards. Many commenters also noted how critical it would be for OCR to provide oversight to ensure that covered entities' buildings and facilities come into compliance with the 2010 ADA Standards. These commenters also noted that the uniform application of the 2010 ADA Standards will also enable greater consistency among implementing agencies.

Response: OCR appreciates the comments regarding the existing standards and the push towards universal compliance with the 2010 ADA Standards and will continue to retain the requirement that new construction or alteration of buildings or facilities must comply with the 2010 ADA Standards.

Comment: Some commenters did not support the incorporation of 45 CFR 84.23(c) at § 92.101(b) because they stated it would allow facilities to only conform with UFAS instead of the more recent 1991 ADA Standards or 2010 ADA Standards. They also expressed concern that the application of the UFAS to new facilities would be outdated. These commenters believe that the UFAS permits facilities to maintain barriers that exclude people with disabilities that impact their mobility or strength.

Response: OCR appreciates the commenters concerns regarding the incorporation of the UFAS. However, this rule does not allow UFAS to be used as the accessibility standard for new facilities. UFAS is only used to determine if a building built before July 18, 2016, was designed and constructed in accordance with the standards at the time. Any alteration or addition of any building or facilities built after July 18, 2016, must follow the 2010 ADA Standards.

Comment: Some commenters also recommend incorporating existing standards relating to accessible Medical and Diagnostic Equipment (MDE) that were developed by the U.S. Access Board. 82 FR 2810 (Jan. 9, 2017), codified at 36 CFR part 1195 (U.S. Access Board 2017 Standards for MDE). Commenters also noted that the lack of access to MDE should constitute both a discriminatory benefit design and network inadequacy.

Response: On September 14, 2023, OCR published a NPRM proposing modifications to the implementing regulations for section 504. The NPRM proposes adopting the U.S. Access Board 2017 Standards for MDE used by recipients of Federal financial assistance to ensure accessibility for patients with disabilities. 88 FR 63450–55, 63511 (proposed 45 CFR 84.92). OCR will continue to address accessible MDE in that rulemaking.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing the provisions as proposed in § 92.203 with modification. We are making two technical corrections to add ''or alteration'' after ''construction'' in § 92.203(b) and (c) for consistency with the description of the 2010 Standards elsewhere in the provision. We have replaced the phrase ''and such facility was not covered by the 1991 Standards or 2010 Standards'' in § 92.203(c) with ''and such facility would not have been required to conform with a different accessibility standard under 28 CFR 35.151'' for clarity and consistency. We have also added language clarifying the timeframes for compliance with either the 2010 Standards or the UFAS standards for existing facilities where construction or alteration was begun on or after July 18, 2016, and on or before January 18, 2018, in conformance with UFAS but the facility or part of the facility was not covered by the 2010 Standards. That addition reads, ''If construction or alteration was begun on or after July 18, 2016, and on or before January 18, 2018, in conformance with UFAS, and the facility or part of the facility was not covered by the 2010 Standards prior to July 18, 2016, then it shall be deemed to comply with this section requirements of this section and with 45 CFR 84.23(a) and (b).''

Accessibility of Information and Communication Technology for Individuals With Disabilities (§ 92.204)

Proposed § 92.204 addressed the accessibility of information and communication technology (ICT) for individuals with disabilities.

In § 92.204(a), OCR proposed requiring covered entities to ensure that their health programs and activities provided through ICT are accessible to individuals with disabilities, unless doing so would result in undue financial and administrative burdens or a fundamental alteration in the nature of the health programs or activities. If an action required to comply with this subpart would result in such an alteration or burdens, a covered entity is required to take any other action that would not result in such an alteration or burdens but would nevertheless enable, to the maximum extent possible, individuals with disabilities to receive the benefits or services of the health program or activity provided by the covered entity.

In § 92.204(b), OCR proposed requiring recipients and State Exchanges to ensure that their health programs and activities provided through websites and mobile applications comply with the requirements of section 504 as interpreted in a manner consistent with title II of the ADA.

Given the crucial role that ICT can play for individuals with disabilities accessing health programs and activities, OCR sought comment on whether the section 1557 rule should include a provision requiring covered entities to comply with specific accessibility standards, such as the Web Content Accessibility Guidelines (WCAG) developed by the Web Accessibility Initiative. Additionally, OCR invited comments on whether to adopt a safe harbor provision under which covered entities that are in compliance with established specific accessibility standards are deemed in compliance with proposed § 92.204(a) and (b); whether OCR should require covered entities to comply with the most recent edition of a published standard; and the timeline necessary for covered entities to come into compliance with a new standard.

The comments and our responses regarding § 92.204 are set forth below.

Comment: Many commenters, including civil rights groups, health care organizations, and a group of Federal elected officials, expressed general support for the ICT requirements for people with disabilities in the Proposed Rule. Several commenters said they are concerned that this section only focuses on accessibility for individuals with disabilities, saying that this section should be applicable to all individuals covered by section 1557. These commenters noted that section 1557's nondiscrimination mandate guards against discrimination on the basis of race, color, national origin, sex, and age, as well as disability. Therefore, these commenters recommended that § 92.204 provide that covered entities must ensure that their health programs or activities provided through ICT are accessible to individuals on all protected bases, not just disability.

Response: Section 92.204 prohibits discrimination based on disability in health programs and activities provided through ICT because individuals with certain disabilities are often unable to access certain aspects of ICT when that ICT is not developed to be accessible. For example, OCR has received complaints from people with disabilities, including those who are blind or have low vision, alleging that the ICT of covered entities is

inaccessible to them and not compatible with screen reader software, resulting in a denial of access to health programs and activities. While § 92.204 addresses ICT accessibility issues for individuals with disabilities, it does not limit the application of general nondiscrimination principles found throughout section 1557 regulations to the accessibility of health programs and activities offered through ICT to other groups. Thus, the general prohibition against discrimination set forth in § 92.101(a) requires the accessibility of health programs and activities offered through ICT, without discrimination on the basis of race, color, national origin, sex, age, or disability.

Comment: Several groups recommended adding that ''covered entities must procure, design, maintain and use accessible ICT in all aspects of providing health programs and activities'' to remind covered entities that their civil rights obligations apply in procurements. One group said that OCR should clarify that covered entities should be aware that third-party providers of ICT are not directly covered by this regulation, and that covered entities are obligated to ensure that they procure ICT that is accessible. Several commenters suggested the use of a Voluntary Product Accessibility Template,[150] a document that indicates compliance with section 508 standards,[151] should be completed by the third-party vendors.

Response: Regardless of the method that a covered entity uses to acquire ICT, the health programs and activities it provides through that ICT must be accessible to individuals with disabilities. Due to the increasing importance of ICT in the provision of health care, health insurance coverage, and other health-related coverage, OCR will continue to closely monitor this area. Both OCR and DOJ recently issued NPRMs addressing the accessibility of web content and mobile apps used by recipients of Federal financial assistance and public entities, respectively.[152] Those rulemakings provide greater clarity on obligations to ensure that web content and mobile applications are accessible.

Comment: An organizational commenter asked OCR to provide more guidance on what constitutes undue burden or fundamental alteration.

Response: This rulemaking does not create a different standard for fundamental alteration or undue burden beyond the standards in section 504 and the ADA. As DOJ noted in its August 4, 2023 NPRM, Nondiscrimination on the Basis of Disability; Accessibility of Web Information and Services of State and Local Government Entities, there are current undue burden and fundamental alteration limitations in the ADA title II regulation that are familiar to public entities. 88 FR 51948, 51978. The current limitations are in the ADA title II implementing regulation at 28 CFR 35.150(a)(3) (program accessibility) and 35.164 (effective communication) for fundamental alteration and undue burden limitations and 28 CFR 35.130(b)(7) (reasonable modifications in policies, practices, or procedures) for fundamental alteration limitations. DOJ also provides additional context for fundamental alteration and undue burden on its ADA.gov website.[153] Additionally, DOJ's technical assistance manual on title III of the ADA provides guidance on what constitutes fundamental alteration and undue burden for public accommodations under title III.[154]

Comment: A professional association asked OCR to work with small, independent, and under-resourced physician practices to ensure they have the resources, tools, and financial assistance necessary to ensure ICT accessibility for patients with disabilities.

Response: OCR will continue to develop technical assistance and educational materials to assist covered entities' compliance with section 1557 and this regulation. However, we are unable to provide other resources or financial assistance to ensure ICT accessibility.

Comment: One organizational commenter said that OCR should provide technical assistance to covered entities servicing populations with digital inequities, such as populations of older adults that may not be as digitally savvy or individuals who do not have stable internet connections.

Response: OCR recognizes that many people lack internet connectivity and may therefore be unable to access web-based tools and resources provided by covered entities, and OCR encourages entities to develop creative means to meet the needs of these individuals. However, though this issue may raise civil rights concerns in some contexts, it is outside the scope of this regulation.

Covered entities have general nondiscrimination obligations under § 92.101(a), including that a covered entity may not discriminate based on age. Accordingly, covered entities that use web-based health programs and activities must ensure that older adults are not denied participation, denied benefits, or otherwise discriminated against in the provision of those web-based health programs and activities. For example, a covered entity may not decline to provide an electronic appointment reminder to an older individual because of a stereotype that older individuals may experience difficulties using such technology.

Comment: One organizational commenter recommended extending the full ICT requirements to recipients and State exchanges.

Response: Recipients and State Exchanges are required to comply with both § 92.204(a) and (b), per the text of the section.

Comment: Multiple commenters requested the explicit inclusion of mobile applications within this section. They stated that it would spur greater awareness among software developers of the need for fully accessible mobile applications that are also compatible with mobile devices and internet platforms. One organizational commenter warned that there could be privacy concerns with certain mobile apps used for substance use disorder treatment and recommended that OCR collaborate with the Substance Abuse and Mental Health Services Administration (SAMHSA) to determine if Federal privacy laws apply to mobile application health information, and communicate that information to consumers.

Response: OCR appreciates these comments. Mobile applications are a form of information and communication technology and are explicitly included in the regulatory text under § 92.204(b); thus, to the extent covered entities use mobile applications as part of their health programs and activities they must be accessible for individuals with disabilities. Though privacy protections are outside of the scope of this rulemaking, OCR reminds commenters

[150] Section508.gov, *Voluntary Product Accessibility Template (VPAT), https://www.section508.gov/sell/vpat/.*

[151] 36 CFR part 1194, appendix A. Section 508 of the Rehabilitation Act imposes accessibility requirements for information and communication technology that Federal departments and agencies develop, procure, maintain, or use.

[153] *See* U.S. Dep't of Justice, *State and Local Governments, https://www.ada.gov/topics/title-ii/.*

[154] *See* U.S. Dep't of Justice, ADA Title III Technical Assistance Manual, *https://www.ada.gov/resources/title-iii-manual/.* This guidance document on title III of the ADA defines fundamental alteration as ''a modification that is so significant that it alters the essential nature of the goods, services, facilities, privileges, advantages, or accommodations offered.'' It defined undue burden as a ''significant difficulty or expense'' that can be determined based on the nature and cost of the action, the overall financial resources of the site involved, geographical separateness, overall financial resources of the parent entity, and the type of operation of the parent entity.

that it has issued guidance on the application of the HIPAA Privacy, Security, and Breach Notification Rules to mobile health apps.[155]

Comment: Many commenters recommended OCR require covered entities to comply with specific accessibility standards, such as section 508 standards, the WCAG 2.0 standards, the WCAG 2.1 standards, or other standards that provide equal or greater accessibility. Several commenters, including organizations, recommended requiring covered entities to comply over time with the latest WCAG as they are updated by the Web Accessibility Initiative of the World Wide Web Consortium (W3C). The commenters also said that a requirement to adhere to the latest standards could offer a range of time for compliance, with larger entities that have more resources being required to comply with a new WCAG standard within a shorter timeline than smaller entities. A technology company said that OCR should not establish a requirement to conform to the latest standard, but rather a requirement to conform to technical specifications that are proven and generally accepted for achieving and maintaining reasonable levels of accessibility; currently that is WCAG 2.1 levels A and AA.

Some organizational commenters suggested that OCR should incorporate a functional, evergreen standard for accessibility that will adapt to changes in technology and accessibility practices. Such a standard would require the ICT to be perceivable, operable, understandable, and robust, and ''enable individuals with disabilities to access the same information as, to engage in the same interactions as, to communicate and to be understood as effectively as, and to enjoy the same services offered to other individuals with the same privacy, same independence, and same ease of use as, individuals without disabilities.''

Several commenters, including health care organizations, advocacy groups, and a trade association, offered suggestions for the timeline for compliance with new standards. These included 60 days, 12 months, 18 months, and 2 years. A health care organization recommended that OCR only require initial compliance in fields that are ''critical to utilizing telehealth services'' and that covered entities be required to meet the minimum conformance levels of the two most recent versions of the W3C guidelines.

Some commenters supported compliance with accessibility standards, provided that OCR conducts real-world testing with successful results across a variety of physician offices before requiring compliance. The commenter also suggested that OCR work with the Office of the National Coordinator for Health Information Technology and vendors to ensure that compliance does not place an undue financial or administrative burden on physician practices. Expressing concern about the cost of compliance, a professional association requested an exemption for businesses classified as small businesses by the Small Business Administration.

A few commenters, including a trade association, health care organizations, and health insurance entities, suggested that OCR establish a safe harbor by which covered entities compliant with WCAG 2.1 Level AA are deemed in compliance with the section 1557 requirements. Other commenters argued that OCR should not establish a safe harbor because compliance with a set of accessibility standards is not necessarily evidence of compliance with accessibility requirements; there may be ICT that meets published standards but remains inaccessible. Another commenter said OCR should not establish a safe harbor because the ADA, the Rehabilitation Act, and other Federal laws must continue to provide standalone protections.

Response: OCR appreciates commenters' input on this important topic but has decided not to adopt specific accessibility standards or a safe harbor at this time. This is in part due to OCR and DOJ recently publishing NPRMs proposing specific accessibility requirements for section 504 and title II of the ADA, respectively.[156] Those NPRMs propose to require that recipients of Federal financial assistance and public entities must ensure that their web content and mobile applications comply with set accessibility standards. In this rulemaking, OCR continues to require covered entities to ensure that health programs and activities provided through ICT are accessible to individuals with disabilities sufficient to provide equal access to the health program or activity, unless doing so would impose undue financial and administrative burdens or would result in a fundamental alteration in the nature of the entity's health program or activity. OCR strongly encourages covered entities that offer health programs and activities through ICT to incorporate current WCAG standards as they take steps to ensure that those programs and activities comply with requirements of this regulation and other Federal civil rights laws.

Summary of Regulatory Changes

For the reasons set forth in the Proposed Rule and considering the comments received, we are finalizing the provisions as proposed in § 92.204, without modifications.

Requirement To Make Reasonable Modifications (§ 92.205)

In § 92.205, we proposed requiring covered entities to make reasonable modifications to policies, practices, or procedures when such modifications are necessary to avoid discrimination on the basis of disability, unless the covered entity can demonstrate that making the modifications would fundamentally alter the nature of the health program or activity. Section 92.205 is the same as § 92.205 in the 2016 Rule and § 92.105 in the 2020 Rule. The term ''reasonable modifications'' will be interpreted as set forth in the regulation implementing title II of the ADA at 28 CFR 35.130(b)(7), such that ''[a covered entity] shall make reasonable modifications in policies, practices, or procedures when the modifications are necessary to avoid discrimination on the basis of disability, unless the [covered entity] can demonstrate that making the modifications would fundamentally alter the nature of the [health] service, program, or activity'' and ''[a covered entity] is not required to provide a reasonable modification to an individual who meets the definition of 'disability' solely under the 'regarded as' prong of the definition of 'disability' at § 35.108(a)(1)(iii).''

The comment and our response regarding § 92.205 are set forth below.

Comment: One commenter urged OCR to strengthen the section by adding language to clarify that a modification to add something that is medically necessary for individuals with disabilities, or to eliminate exclusions related to medically necessary services, are not considered fundamental alterations to the nature of the health program.

Response: OCR appreciates the commenter's request for clarifying language related to fundamental alterations. In promulgating this rule, OCR cannot address how the requirements of section 1557 apply to every scenario that may arise. OCR also

[155] U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Resources for Mobile Health Apps Developers, https://www.hhs.gov/hipaa/for-professionals/special-topics/health-apps/index.html*; U.S. Dep't of Health & Hum. Servs., Off. for Civil Rts., *Protecting the Privacy and Security of Your Health Information When Using Your Personal Cell Phone or Tablet, https://www.hhs.gov/hipaa/for-professionals/privacy/guidance/cell-phone-hipaa/index.html.*

cannot state every modification that could result in a fundamental alteration because determining whether a modification is a fundamental alteration is a fact-specific process.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing the provisions as proposed in § 92.205, without modification.

Equal Program Access on the Basis of Sex (§ 92.206)

OCR proposed a section clarifying covered entities' obligation to ensure equal access to their health programs and activities without discrimination on the basis of sex.

In proposed § 92.206(a), we described a covered entity's general obligation to provide individuals equal access to the covered entity's health programs or activities without discrimination on the basis of sex.

In proposed § 92.206(b)(1) through (4), we clarified certain types of discriminatory actions that would be prohibited for a covered entity in its provision of access to health programs or activities.

In § 92.206(b)(1), we proposed prohibiting a covered entity from denying or limiting health services, including those that are offered exclusively to individuals of one sex, to an individual based on the individual's sex assigned at birth, gender identity, or gender otherwise recorded.

In § 92.206(b)(2), we proposed prohibiting covered entities from denying or limiting a health care professional's ability to provide health services on the basis of a patient's sex assigned at birth, gender identity, or gender otherwise recorded.

In § 92.206(b)(3), we proposed prohibiting a covered entity from applying any policy or practice of treating individuals differently or separating them on the basis of sex in a manner that subjects any individual to more than *de minimis* harm.

In § 92.206(b)(4), we proposed prohibiting a covered entity from denying or limiting health services sought for the purpose of gender-affirming care that the covered entity would provide to a person for other purposes if the denial or limitation is based on a patient's sex assigned at birth, gender identity, or gender otherwise recorded.

In § 92.206(c), we proposed that nothing in this section requires the provision of any health service where the covered entity has a legitimate, nondiscriminatory reason for denying or limiting that service, including where the covered entity reasonably determines that such health service is not clinically appropriate for that particular individual.

In § 92.206(d), we proposed that the enumeration of specific forms of discrimination in paragraph (b) does not limit the general applicability of the prohibition in paragraph (a).

The comments and our responses regarding § 92.206 are set forth below.

Comment: Numerous commenters supported OCR's proposal to specifically address equal access on the basis of sex in the final rule. A supporter of the provision argued that patients who trust their provider not to discriminate against them will share better information, enabling better treatment. Some commenters specifically requested this section be strengthened by including specific examples of what constitutes discrimination based on sex characteristics.

Response: OCR agrees that open communication between a provider and their patient is a bedrock of the provision of quality care, and that cannot happen where the patient experiences or expects that they will face discrimination by the provider. In addition, we note that the question of whether prohibited discrimination has occurred is often context specific and fact intensive, so it is difficult to provide succinct examples of scenarios that would constitute prohibited discrimination in each and every instance.

Comment: Commenters urged OCR to include specific language related to reproductive health care and fertility treatments in §§ 92.206 and 92.207. A few commenters urged OCR to specify the full range of reproductive health care protected from discrimination under section 1557, including protections against discrimination based on reproductive health decisions. A few commenters said the final rule should make clear that section 1557 prohibits discrimination related to maternity care, such as failing to provide accessible medical equipment or transfer assistance, leaving wheelchair users unable to access care. Another commenter opined that the final rule should make clear that section 1557 prohibits discrimination relating to treating pregnancy emergencies and complications, including termination of pregnancy, miscarriage management, and other pregnancy outcomes.

Response: Matters related to reproductive health care, fertility, pregnancy, family status, and maternity care are addressed in § 92.208, and OCR refers commenters to that section. Covered entities must ensure accessibility of their health programs and activities for individuals with disabilities, which includes accessible equipment and transfer assistance.

Comment: Some commenters argued that it would be more appropriate to address the impacts of the *Dobbs* decision and protections against discrimination on the basis of obtaining an abortion in § 92.206 rather than in § 92.208 (Prohibition on sex discrimination related to marital, parental, or family status), because addressing abortion in the section on marital, parental, or family discrimination could convey that denying abortion care is only discriminatory in those contexts.

Conversely, many commenters expressed opposition to the inclusion of termination of pregnancy within the scope of equal program access on the basis of sex, primarily stating that the rule would force health care professionals to perform abortions or deem their refusal to do so discrimination.

Response: OCR appreciates commenters' feedback regarding the addition of pregnancy or related conditions in § 92.206 rather than in § 92.208. Based on a review of the totality of the comments, additional language has not been added to § 92.206, and we discuss this issue further in § 92.208. Further, the ACA itself provides that ''[n]othing in this Act shall be construed to have any effect on Federal laws regarding—(i) conscience protection; (ii) willingness or refusal to provide abortion; and (iii) discrimination on the basis of the willingness or refusal to provide, pay for, cover, or refer for abortion or to provide or participate in training to provide abortion.'' 42 U.S.C. 18023(c)(2)(A). OCR will comply with this provision. For further discussion regarding a health care professional's decision not to provide an abortion, including due to a sincerely held religious belief or conscience objection to performing the procedure, *see* §§ 92.208 and 92.302.

Comment: Many commenters recommended that in addition to the specific forms of discrimination based on gender identity, it is important to include specific forms of reproductive health and pregnancy-related care discrimination in § 92.206(b). Many commenters recommended incorporating a provision or provisions under § 92.206(b) to clarify that covered entities are prohibited from denying or limiting services—or denying or limiting a health professional's ability to provide services—based on a patient's

pregnancy or related conditions, including termination of pregnancy, contraceptive use, miscarriage management, assisted reproduction, fertility care, and pregnancy-related services. One of these commenters recommended that the language of this provision not be limited to reproductive or sexual ''health *care* decisions,'' as covered entities also discriminate based on reproductive and sexual health histories such as past experiences with sexual violence, which exist beyond the realm of services and that including ''care'' here could limit how covered entities understand this form of discrimination. Some commenters also stated that failure to codify some of the most prevalent forms of sex discrimination will directly undermine efforts to implement proposed §§ 92.101 and 92.206.

Response: OCR appreciates the recommendations regarding discrimination based on pregnancy or related conditions, including the request to provide additional examples, and directs commenters to the discussion at § 92.208. The rule does not include language related to discrimination based on health *care* decisions. The rule is not so limited—it prohibits discrimination in health programs and activities generally. This includes discrimination on the basis of sex in the context of health decisions or histories related to reproductive and sexual health.

Comment: Many commenters supported § 92.206 as important to ensure access to necessary health services that might otherwise be denied to people due to discrimination on the basis of sexual orientation or gender identity, with many providing specific examples of discrimination faced by LGBTQI$_+$ individuals. Some commenters recommended specifically addressing protections for LGBTQI$_+$ people seeking fertility treatments. A commenter recommended that OCR consider adding a subsection to § 92.206 or § 92.208 to discuss the prohibition of discrimination on the basis of sexual orientation and gender identity in access to fertility services, and provided examples of the numerous barriers that LGBTQI$_+$ individuals and same-sex couples face in accessing this type of reproductive health care.

Response: Section 1557 and this rule prohibit discrimination on the basis of sex, including sex characteristics, sexual orientation, and gender identity, in health care access. Depending on the specific facts at issue, barriers described may rise to the level of discrimination and would be evaluated under this rule's general prohibition of discrimination under § 92.101(a)(1), to make a case-by-case determination as to whether prohibited discrimination has occurred. In general, OCR anticipates that if a covered entity elects to provide or cover fertility services, but categorically denies them to same-sex couples or to individuals on the basis of sexual orientation or gender identity, such a denial of care or coverage may violate section 1557's prohibition on sex discrimination. We decline to add such specific language to the regulatory text as proposed.

Comment: Commenters recommended that OCR should add language to § 92.206(b) affirming that section 1557 prohibits covered entities from denying, limiting access to, or otherwise placing special caps, costs, or additional procedural requirements on medications or treatments needed specifically by people with disabilities, irrespective of whether those medications or treatments can also be used to end or complicate pregnancies or fertility.

Response: We address special caps, costs, or additional procedural requirements related to health insurance coverage and other health-related coverage in § 92.207, and direct commenters to that section. A discussion of medications and treatments related to pregnancy and fertility care is in § 92.208.

Comment: Many commenters recommended including ''transgender status'' in § 92.206(b)(1), (2), and (4) because there have been instances in which those seeking to permit discrimination against transgender people have justified it by pressing distinctions between transgender status and gender identity.

Response: As noted in the discussion for § 92.101(a)(2), the term ''gender identity'' necessarily encompasses transgender status and the two terms are often used interchangeably.[157] We decline to enumerate the full range of identities protected under the term ''gender identity.''

Comment: Multiple commenters expressed support for the rule's prohibition on denying or limiting care on the basis of a patient's assigned sex at birth, gender identity, or gender otherwise recorded at § 92.206(b)(2). A commenter expressed support for the rule's prohibition on covered entities denying or limiting a clinician's ability to provide clinically appropriate care when the failure to do so would constitute discrimination.

Another commenter supported this provision, arguing that it is necessary to ensure that specialists and providers who see LGBTQI+ patients every day do not experience retaliation for providing care. Pointing to State legislative efforts seeking to restrict or ban providers from offering safe and effective treatment to LGBTQI$_+$ patients, the commenter argued that such protections are particularly important to alleviate providers' fears that they may be subject to retaliation or loss of licensure for providing gender-affirming care. Another commenter similarly argued that covered entities sometimes discriminate against transgender patients by prohibiting their providers from providing certain services.

Response: As noted in the Proposed Rule, 87 FR 47866, this provision recognizes that prohibited discrimination may take the form of restrictions on individual providers, such as attending physicians, that have the effect of discriminating against patients. Where a covered entity imposes such a restriction based on a patient's gender identity or sex assigned at birth, the restriction may constitute prohibited discrimination in violation of this rule, even if the form that the restriction takes is a limitation on the ability of providers to prescribe or provide care.

Regarding providers' fears that they may be subject to retaliation by their employer or loss of licensure, this rule does not apply to employment practices, as discussed in § 92.2(b), but employees of covered entities remain protected against retaliation as provided in §§ 92.303 and 92.304. Not all State licensure boards receive Federal financial assistance from the Department; upon receipt of a complaint against a licensure board, OCR would need to first determine whether we have jurisdiction before commencing an investigation.

Also, we note that a health care provider's decision not to provide any service due to a sincerely held religious belief or conscience objection is discussed further in §§ 92.208 and 92.302.

Comment: Many commenters suggested that § 92.206(b)(2) would be clearer if the following phrase was deleted because it is redundant: ''if such denial or limitation has the effect of excluding individuals from participation in, denying them the benefits of, or otherwise subjecting them to discrimination on the basis of sex under a covered health program or activity.''

Response: OCR appreciates the suggestion and has considered it, but we

[157] *See, e.g., Bostock* v. *Clayton Cnty., Georgia,* 590 U.S. 644, 658–59 (2020); *Doe* v. *Mass. Dep't of Correction,* No. CV 17–12255–RGS, 2018 WL 2994403 (D. Mass. June 14, 2018); *Whitaker* v. *Kenosha Unified Sch. Dist. No. 1 Bd. of Educ.,* 858 F.3d 1034 (7th Cir. 2017).

will maintain the proposed language, as the phrase provides additional explanation of what would constitute discrimination. As we noted in the Proposed Rule, 87 FR 47866, this is modeled on the provision in the title VI regulations that notes that certain discriminatory employment practices may be prohibited to the extent that they result in discrimination against program participants, even though the primary objective of title VI is not to regulate employment practices. *See* 45 CFR 80.3(c)(3). Likewise, the phrase commenters propose deleting here clarifies that these restrictions on providers are prohibited only insofar as they result in discrimination against individuals on the basis of sex in a covered health program or activity. This phrase is necessary to establish a violation because a discriminatory act under this rule is one in which the individual is excluded from, denied the benefits of, or otherwise subjected to discrimination under a health program or activity on the basis of sex.

Comment: A few commenters stated that it appears that § 92.206(b)(2) is directly aimed at the United States Conference of Catholic Bishops' Ethical and Religious Directives for Catholic Health Care Services.[158] These commenters recommended that OCR disavow this provision and affirm support for the value of religiously affiliated health care and the right of faith-based hospitals to operate in accordance with their convictions.

Response: As stated throughout this preamble, OCR values the vital role that faith-based hospitals and other health care providers and systems play in our nation's health care system. With respect to concerns about potential conflicts between provisions of the final rule and individuals' or organizations' sincerely held religious beliefs, we refer commenters to the discussion at § 92.302. The aim of § 92.206(b)(2) is to address discrimination that has a secondary effect on the ability of individuals to participate meaningfully in and/or to receive health care from a covered health program in a nondiscriminatory manner. OCR did not, nor did it intend to, single out any religious teachings and will respect all guarantees of Federal religious freedom and conscience laws.

Comment: Commenters highlighted that transgender and nonbinary people face unique discrimination in inpatient settings that are separated by sex, particularly those that have only male and female facilities available. These commenters noted that this results in nonbinary people not having access to facilities consistent with their gender identity.

A few commenters raised concerns about the application of § 92.206(b)(3) to arrangements and practices involving patients who share intimate space with, or require intimate personal assistance from, other individuals. The commenters argued that the requirement to treat individuals consistent with their gender identity may raise concerns for privacy.

Response: OCR appreciates the commenters' feedback. As specified in the preamble discussion for § 92.101, this final rule protects all people regardless of gender identity, including transgender and nonbinary people. Nothing in this rule prohibits a covered entity from operating sex separated programs and facilities, so long as it does not subject anyone, including transgender and nonbinary individuals, to more than *de minimis* harm on the basis of sex. When a nonbinary individual seeks participation in a single-sex health program or activity or a health program or activity that maintains sex separate facilities, the covered entity should work with that individual to determine where they will best be served and where they can benefit the most from the health program or activity without experiencing trauma, distress, or threats to their safety due to an incorrect placement. A covered entity must not deny a nonbinary individual access to a health program or facility on the basis that the program or facility separates patients based on sex or offers separate male and female programs or facilities.

Courts have held that all individuals' safety and privacy can be protected without also excluding transgender individuals from accessing sex-separate facilities and activities consistent with their gender identity.[159] Nothing in the rule prevents covered entities from implementing policies or procedures to preserve any patient's privacy—consistent with the requirements of this rule and any other applicable laws. Providers have a range of tools at their disposal to accommodate individuals' privacy concerns and patient interests in a nondiscriminatory manner. For example, a provider generally may accommodate a patient's preferences about roommate assignments. A covered entity will be in violation of this rule if they refuse to admit a transgender person for care or refuse to place them in facilities consistent with their gender identity, because doing so would result in more than *de minimis* harm. We also note that no application of this rule shall be required insofar as it would violate Federal religious freedom and conscience laws. Recipients may rely on those protections directly, *see* § 92.3(c), or they may seek an assurance of a religious freedom or conscience exemption, *see* § 92.302(b).

Comment: A commenter opposed the rule on the grounds that it would violate the U.S. Constitution's Equal Protection Clause standard for sex discrimination claims, which the commenter asserted allows men and women to be treated differently based on inherent differences in biology when such differences are real and not based on stereotypes. The commenter argued that proposed § 92.206(b)(3) would inappropriately prohibit providers from using any sex-based distinction unless they can prove it does not cause more than *de minimis* harm. This commenter alleged that the true purpose of such a provision is not equal treatment for all patients but special treatment for transgender individuals, particularly with respect to the use of sex-separate facilities. This commenter also argued that the provision would contradict the Voluntary Resolution Agreement the Department entered into with Michigan State University (MSU) under section 1557, which requires the presence of a chaperone—the sex of whom should be determined by the wishes and comfort of the patient—for all sensitive examinations.[160]

Response: Not all differential treatment on the basis of sex constitutes unlawful discrimination under section 1557, and the final rule does not prohibit all differential treatment.[161] If a

No. 1 Bd. of Educ.,* 858 F.3d 1034,

Continued

sex-based distinction has only a *de minimis* impact, it is not prohibited discrimination.[162] But treating individuals differently on the basis of sex constitutes sex discrimination where it imposes a more-than-*de minimis* level of harm. Under the rule, providers may use sex-based distinctions to administer individualized care, provided those distinctions do not cause more than *de minimis* harm.

We disagree with the proposition that purpose of § 92.206(b)(3) is special treatment for transgender individuals, particularly with respect to the use of sex-specific facilities. The purpose of this section is to prevent unlawful discrimination on the basis of sex. The prevention of discrimination on the basis of gender identity is an important government objective that is substantially achieved by this rule.

Further, the Voluntary Resolution Agreement entered into with MSU, provides that a patient may request a chaperone to be present at any time and that the patient's ''wishes and comfort should determine the sex of the chaperone.'' [163] It further specifies that MSU ''shall accommodate, to the extent practicable, the Patient's request for a same-sex chaperone.'' [164] The final rule does not prohibit patients from requesting or receiving a chaperone of the sex of their choosing.

Finally, OCR disagrees with the commenter that the rule violates the Equal Protection Clause. OCR's authority to promulgate this rule stems from a Federal non-discrimination statute, section 1557. This rule does not purport to interpret the Equal Protection Clause. Thus, even assuming the commenter is correct that the rule bans certain sex-based distinctions that would be permitted under the Equal Protection Clause, such a discrepancy would not mean the rule is unlawful. OCR may promulgate a rule that imposes different non-discrimination requirements on recipients of Federal funds than the non-discrimination requirements the Equal Protection Clause imposes on the government.[165]

Comment: A health research organization expressed support regarding § 92.206(b)(3)'s discussion of the impact on health research and clinical trials. The commenter commended OCR on its guidance on sex-specific health research. This commenter stated that the standard for limiting research outlined by OCR in the 2022 NPRM was reasonable and health researchers will typically be able to demonstrate the requisite justification for a sex-specific research project or clinical trial based on research protocols. However, the commenter requested OCR provide similar guidance for the final rule on whether health research protocols that target or exclude individuals with disabilities would be considered discriminatory.

Conversely, another organizational commenter disagreed with the statement on sex-specific clinical trials because the commenter believed it would pressure clinical researchers and organizations to disregard sex-based distinctions for fear of inviting a gender identity discrimination claim. The commenter claimed that the rule would contradict National Institutes of Health (NIH)'s expectation for clinical trials, which the commenter claimed required specifying the ''biological sex'' of subjects, by laying down an ''unscientific marker'' that sex-specific clinical trials can only be justified in limited circumstances.[166] The commenter further argued that this would represent a backward step for women's health, because the evaluation of diseases and treatments improved when researchers recognized that sex must be taken into account as a biological variable in medicine.

Response: OCR appreciates these comments regarding the application of this provision to sex-specific health research and clinical trials and the standard proposed for evaluating claims of discrimination in such health programs and activities. We agree that researchers should not have challenges showing necessary justifications for nondiscriminatory research distinctions grounded in a participant's reproductive, anatomical, and genetic characteristics.

We disagree with the proposition that OCR is disregarding sex-based distinctions in medicine. Health research and clinical trial protocols are not prohibited from specifying an individual's sex consistent with their reproductive, anatomical, and genetic characteristics, where those characteristics are relevant to the clinical trial. However, there are ways in which health research and protocols may result in discrimination, such as disallowing participation based on gender identity rather than on the basis of scientific requirement of the research.

Should the need arise, OCR will consider issuing guidance on the impacts of disability protections on research participation.

Comment: Several commenters supported the rule's prohibition on sex-specific health programs or activities that subject any individual to more than *de minimis* harm. One supportive commenter argued that this approach recognizes harm as the primary measure of discrimination and creates flexibility to identify new forms of harm, and another argued the standard of no more than *de minimis* harm is consistent with applicable case law, including *Bostock.* A commenter expressed appreciation for the Proposed Rule's detailed explanation of *de minimis* harm and the difference between clinical care for a patient.

Conversely, another commenter stated the Proposed Rule ''cherry picks'' a title IX court decision to justify a standard of ''more than *de minimis* harm'' as the basis for ''adjudicating gender identity,'' arguing that title IX has never required sex to be recognized as anything but ''objectively, biologically based.'' Similarly, another commenter argued the rule applies beyond denial or limitations on health services. The commenter argued that the rule would prohibit health care professionals, medical facilities, and insurance companies from using any sex-based distinction unless they can prove it does not cause more than *de minimis* harm, and that if a provider asks the wrong question or asks an appropriate question in the wrong manner then the provider will likely face a claim of discrimination on the basis of gender identity.

Response: OCR appreciates the range of comments provided on the proposed language regarding *de minimis* harm, and after careful review, OCR is finalizing the language as proposed. The rule does not prohibit all sex-based distinctions in health programs or activities, nor does it broadly prohibit any policy or practice of treating

1048 (7th Cir. 2017), *abrogated on other grounds as recognized by Ill. [165] *Cf. Fitzgerald* v. *Barnstable Sch. Comm.,* 555 U.S. 246, 257 (2009) (recognizing that the liability standards under title IX and the Equal Protection Clause ''may not be wholly congruent'').

[166] The commenter does not provide a citation when making this statement; however earlier in their comment, the commenter cites a Notice from the National Institutes of Health (NIH): U.S. Dep't of Health & Hum. Servs., Nat'l Inst. of Health, *Consideration of Sex as a Biological Variable in NIH-funded Research,* NOT–OD–15–102 (June 9, 2015), *https://grants.nih.gov/grants/guide/notice-files/not-od-15-102.html.*

individuals differently based on sex. As noted in the Proposed Rule, although intentional differential treatment on the basis of sex would generally be considered prohibited discrimination, separation by sex or differential treatment on the basis of sex is permissible under section 1557 where it does not cause more than *de minimis* harm. 87 FR 47866. This distinction generally allows for sex-specific clinical trials when sex is relevant to the trial, for example, while still prohibiting differential treatment that causes harm.

Providers often need to make inquiries about a patient's sex-related medical history, health status, or physical traits related to sex in the course of providing care and this rule does not prohibit or inhibit that. 87 FR 47867–68. Such inquiries are not per se discriminatory, even where they touch on intimate or sensitive matters. For example, it is not discriminatory for a provider treating a patient presenting with symptoms consistent with an ectopic pregnancy to inquire about the possibility that the patient could be pregnant, regardless of that patient's gender identity. Similarly, when providing appropriate care to a patient, asking medically relevant questions about a patient's anatomy or medical history in a way that causes inadvertent distress—on its own—would not violate section 1557. However, it is important to note that if such questions are not relevant to assessing the patient's condition, or the patient has answered the questions and makes clear that further questions are unwelcome, the inquiries may rise to the level of harassment on the basis of sex. For example, if the conduct is so severe or pervasive that it denies a patient access to medical care, it would no longer be permissible. OCR will evaluate these types of harassment claims on a case-by-case basis to determine whether the alleged harassment was ''sufficiently severe, pervasive, and objectively offensive,'' to meet the standards for discriminatory harassment.[167]

In response to commenters that questioned the legal basis for our *de minimis* standard, we discussed in the 2022 NPRM, 87 FR 47866, n. 412, that sex-based distinctions that have only *de minimis* impact are not the type of discrimination that Congress envisioned.[168]

Comment: A commenter recommended that, based on existing racial disparities in maternal health and overall poor maternal health outcomes in the United States, § 92.206(b)(3) be amended to specify that harm exceeding the threshold of *de minimis* harm with respect to pregnancy and maternal health can include policies or practices that subject people to rough handling, harsh language, undertreatment of pain or pregnancy-related conditions, or other discriminatory mistreatment during childbirth or the prenatal or postpartum periods.

Response: OCR recognizes that there is ample research demonstrating the significant racial disparities in maternal health outcomes.[169] Section 92.206(b)(3) specifically addresses different treatment on the basis of sex, such as through sex-separate health programs and activities. Depending on the specific facts at issue, the treatment described by the commenter may rise to the level of discrimination and would be evaluated under this rule's general prohibition of discrimination under § 92.101.

Comment: An organizational commenter strongly supported the additional guidance provided by proposed §§ 92.206 and 92.207 and noted that the forms of discrimination highlighted in proposed §§ 92.206(b)(3) and (4) and 92.207(b)(3) through (5), in particular, affect many intersex people.

Response: OCR appreciates the commenter's feedback regarding the discrimination addressed in §§ 92.206(b)(3) and (4) and 92.207(b)(3) through (5) affecting intersex people as well. This final rule makes explicit in regulatory text that sex discrimination includes discrimination based on sex characteristics, including intersex traits, as reflected in § 92.101(a)(2).

Comment: Many commenters expressed support for the proposed provisions related to gender-affirming care at § 92.206(b)(4). These commenters stated that such care can be critical to the well-being of transgender and nonbinary people, and that accessing such care can reduce the risk of negative physical and mental health outcomes associated with gender dysphoria. Commenters discussed the negative impact of widespread health care discrimination against transgender people, stating that transgender people of color and transgender people with disabilities are at particularly high risk of discrimination and associated harms.

Response: OCR appreciates these comments and agrees that the nondiscrimination protections are important to transgender and nonbinary people's ability to access clinically appropriate care, especially those who may face elevated risk of harm due to discrimination on multiple protected bases.

In determining whether a covered entity violated section 1557 by denying or limiting a health service sought for the purpose of gender-affirming care, OCR will continue to consider evidence that the covered entity would provide that same service for other purposes. Evidence that OCR may consider to establish that the type of care is ordinarily provided could include, among other things, statements by the provider, information showing that the provider has provided similar care in the past, or documentation regarding the provider's scope of practice.

Where there is other evidence that the covered entity has subjected the individual to differential treatment on the basis of sex apart from the denial of care itself, OCR may investigate and make a case-by-case determination as to whether prohibited discrimination has occurred.

Comment: A few commenters stated that OCR is explicitly asserting that it has authority under section 1557 to regulate the practice of medicine according to its own determination of what is appropriate and non-discriminatory care, along with authority to definitively determine what is the current standard of medical care. Some commenters requested OCR amend the provision to specify that care standards cannot facially discriminate or otherwise result in discrimination based on a protected characteristic, such that covered entities cannot mask discrimination behind clinical policies or criteria.

Response: Section 1557 prohibits discrimination on certain prohibited bases, and does not (and cannot) require a specific standard of care or course of treatment for any individual or otherwise interfere with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or

[167] *Cf. Davis by Next Friend LaShonda D.* v. *Monroe Cnty. Bd. of Educ.,* 526 U.S. 629, 650 (1999) (Under title IX, discriminatory harassment must be ''severe, pervasive, and objectively offensive'').

[168] *See also Elborough* v. *Evansville Cmty. Sch. Dist.,* 636 F. Supp. 2d 812, 820–21 (W.D. Wis. 2009) (noting that Title IX does not ''authorize[ ]lawsuits for damages in all cases of differential treatment, no matter how isolated or minimal. The maxim that 'the law doesn't concern itself with trifles' applies to civil rights cases as it does to any other case.'').

[169] Donna L. Hoyert, U.S. Dep't of Health & Hum. Servs., Ctrs. for Disease Control & Prevention, *Maternal Mortality Rates in the United States* (Feb. 2022), *https://www.cdc.gov/nchs/data/hestat/maternal-mortality/2020/E-stat-Maternal-Mortality-Rates-2022.pdf*; Marian F. MacDorman et al., *Racial and Ethnic Disparities in Maternal Mortality in the United States Using Enhanced Vital Records, 2016–2017,* 111 a.m. J. Pub. Health 1673, 1671 (2021), *https://ajph.aphapublications.org/doi/10.2105/AJPH.2021.306375*.

whether the clinician has the appropriate expertise to provide care. There is no part of section 1557 that compels clinicians to provide a service that they do not believe is medically appropriate for a patient or that they are not qualified to provide.

Section 92.206(c) is consistent with the general principle in nondiscrimination law that entities facing allegations of discrimination have the opportunity to articulate a legitimate, nondiscriminatory basis for their challenged action or practice but that such a basis may not be a pretext for discrimination.

Comment: Some commenters expressed concern that OCR is setting standards of care for gender-affirming care in this rule, and that is outside the scope of OCR's authority. Many commenters weighed in with their views on the state of medical evidence relating to gender-affirming care and submitted citations to research studies and other data. Some comments characterized the evidence as lacking or mixed, and highlighted their concerns relating to gender-affirming care for minors. Others stated that there is robust evidence, including from major medical associations, supporting the provision of gender-affirming care, including that such medically necessary care benefits the health and well-being of transgender patients.

Response: This final rule prohibits discrimination on the basis of sex, consistent with Federal law. As such, nothing in this rule impedes covered entities from taking nondiscriminatory actions based on current medical standards and evidence, such as making decisions about the timing or type of protocols appropriate for care. The rule does not (and cannot) require a specific standard of care or course of treatment for any individual, minor or adult. Section 1557 prohibits discrimination on certain prohibited bases, and does not interfere with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or whether the clinician has the appropriate expertise to provide care.

Comment: A number of commenters had concerns or questions about the scope of how OCR would define gender-affirming care. Some commenters requested a definition or an enumeration of what types of procedures would fall within this term. Others raised concerns about the impact of such care and the benefits of such care.

Response: As with the 2016 Rule, 81 FR 31435, OCR declines to provide a regulatory definition for gender-affirming care. However, when we used the term ''gender-affirming care'' in both §§ 92.206 and 92.207, we are generally referring to care designed to treat gender dysphoria that may include, but is not necessarily limited to, counseling, hormone therapy, surgery, and other related services. 87 FR 47834 n.139. As noted elsewhere, the rule does not impose a categorical requirement that covered entities must provide gender-affirming care. Further, while we acknowledge comments in support of and opposed to gender affirming care and its subsequent impacts on individuals, we are not making any additional edits to the rule in response.

Comment: Some commenters opposing the rule raised First Amendment concerns and questioned the scope of what would be required of providers in terms of expressing support of transgender people who wish to access gender-affirming care, using the name and pronouns requested by patients, and speaking about gender-affirming care.

Response: OCR takes seriously concerns about, and is fully committed to upholding, the First Amendment, and nothing in these regulations restricts conduct protected by the First Amendment.[170] Whether discrimination is unlawful or considered harassment is necessarily fact-specific. This final rule does not purport to identify all of the circumstances that could constitute unlawful harassment. It is unlikely that an isolated incident with no other indications of animus or ill treatment would meet the standards for discriminatory harassment. Conversely, OCR notes that conduct, including verbal harassment, that is so severe or pervasive that it creates a hostile environment on the basis of sex is a form of sex discrimination.

Comment: A few commenters argued that providing gender-affirming care poses high malpractice lawsuit risks to providers, and therefore OCR should not categorically require providers to provide such services.

Response: As discussed elsewhere in this preamble, this final rule prohibits discrimination in the provision of health programs and activities and does not require provision of any specific services, including gender-affirming care. Section 1557 prohibits discrimination on certain prohibited bases, and does not interfere with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or whether the clinician has the appropriate expertise to provide care.

Comment: One commenter expressed concern that the rule would result in decreased access to health care, as providers may choose to leave Federal health care programs based on a belief that they will be required to provide gender-affirming care, especially if there is no avenue for providers with religious or conscience objections to certain types of care to request exemptions.

Response: Section 1557 requires that health care providers who receive Federal financial assistance must provide nondiscriminatory care. However, providers do not have an affirmative obligation to offer any health care, including gender-affirming care, that they do not think is clinically appropriate or if religious freedom and conscience protections apply. OCR believes that the majority of providers already provide nondiscriminatory care to their patients and will continue to do so. This commenter presented no evidence that a significant exodus of providers is likely, and we are not aware of any data to support a significant concern on this front. Providers with religious freedom or conscience concerns, however, may rely upon §§ 92.3 and 92.302.

Comment: A few commenters expressed support for nondiscrimination protections that prohibited discriminating against an individual because of their gender identity but opposed interpreting such protections to protect access to gender-affirming care.

Response: OCR appreciates these commenters' support for the rule's nondiscrimination protections on the basis of gender identity. We respectfully disagree, however, that such protections have no implications for the provision of gender-affirming care. A fact-specific analysis is necessary to determine whether prohibited discrimination has occurred, but the rejection of a practice closely linked with a protected status may, in conjunction with other evidence, lead to a finding of discrimination. This rule does not require or mandate the provision of any particular medical service. Section 1557 prohibits discrimination on certain prohibited bases, and does not interfere

[170] *See, e.g., W. Va. State Bd. of Educ.* v. *Barnette,* 319 U.S. 624, 642 (1943) (''We think the action of the local authorities in compelling the flag salute and pledge transcends constitutional limitations on their power and invades the sphere of intellect and spirit which it is the purpose of the First Amendment to our Constitution to reserve from all official control.'').

with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or whether the clinician has the appropriate expertise to provide care.

Comment: An organizational commenter supported reference to the multi-factor test found in *Arlington Heights* v. *Metro. Housing Dev. Corp.,* 429 U.S. 252 (1977), and the burden-shifting framework of *McDonnell Douglas Corp.* v. *Green,* 411 U.S. 792 (1973), among a non-exhaustive list of tools that OCR may utilize for investigating discrimination claims. The commenter asserted that sex discrimination claims are hard to prove, and that together these approaches are appropriate for their adjudication by allowing people to rely on different types of circumstantial evidence to collectively demonstrate a discriminatory act by a covered entity and by placing the onus on the covered entity to provide a legitimate, nondiscriminatory reason for its actions. Similarly, another commenter encouraged OCR to clearly state in the final rule that the familiar but-for causation test applies to establishing a violation of section 1557; that the use of the phrase ''legitimate, nondiscriminatory reason'' in these sections should not be construed in any way to limit the method of proof for any section 1557 claim to the *McDonnell Douglas* burden-shifting framework; and that this method cannot be used to defend an express sex-based classification that causes injury. Another commenter recommended that OCR clarify in the preamble to the final rule that the *McDonnell Douglas* burden-shifting framework and legitimate non-discriminatory reason framework apply to circumstantial evidence cases but not where there is direct evidence of discrimination.

Response: OCR agrees that different methods of proof drawn from civil rights case law should be used in analyzing claims of discrimination under this section including, but not limited to, the *Arlington Heights* multi-factor test and the *McDonnell Douglas* burden-shifting framework. For cases where the alleged discrimination is not based on a facially discriminatory policy, we are clarifying that the phrase ''legitimate, nondiscriminatory reason'' in these sections is taken from, but should not be construed to limit, the method of proof to the *McDonnell Douglas* burden-shifting framework. As we noted in the Proposed Rule, *Arlington Heights* provides a method of proof that uses a number of different types of evidence—*e.g.,* direct, circumstantial, statistical, and anecdotal—that, taken collectively, can demonstrate that the covered entity acted because of a protected basis; the *McDonnell Douglas* burden-shifting framework is an inferential method of proof most commonly applied in cases alleging discrimination in individual instances where a plaintiff alleges that a defendant treated similarly situated individuals differently because of a protected basis. 87 FR 47865. Under the *Arlington Heights* framework, *McDonnell Douglas* evidence identifying similarly situated comparators can also be considered but is not required.[171]

Comment: Many commenters supported the rule's clarification that while providers may exercise clinical judgment when determining if a particular service is appropriate for an individual patient, they may not refuse gender-affirming care based on a belief that such care is never clinically appropriate. A great number of individuals and organizations provided comment on the types of rationales that might constitute a legitimate, nondiscriminatory basis for a provider declining to provide gender-affirming care. Some commenters opined that it should not be considered discriminatory to deny care when a provider categorically objects to gender-affirming care. Other commenters appreciated the clarification that a provider's personal belief that gender-affirming care is never appropriate is not a legitimate, nondiscriminatory basis for denying such care. The majority of commenters opined that the rule provides adequate protection for providers exercising nondiscriminatory clinical judgment about the appropriateness of particular care for a specific patient, though some commenters disagreed.

Response: OCR appreciates commenters' views on proposed § 92.206(c). In light of comments received, we are modifying the language in this provision to provide additional specificity regarding how OCR will evaluate a covered entity's proffered legitimate, nondiscriminatory reason for denying care. We also add a reference to § 92.302 to make clear that this provision does not limit a recipient's ability to seek assurance of an exemption based on religious freedom or conscience laws. Also, we note that while many commenters specifically discuss providers' personal beliefs, these changes clarify that the rule applies to covered entities rather than specific individuals.

To provide additional specificity, we are striking the second sentence of § 92.206(c), which previously read, ''[h]owever, a provider's belief that gender transition or other gender-affirming care can never be beneficial for such individuals (or its compliance with a State or local law that reflects a similar judgment) is not a sufficient basis for a judgment that a health service is not clinically appropriate,'' in its entirety and replacing it with: ''A covered entity's determination must not be based on unlawful animus or bias, or constitute a pretext for discrimination. Nothing in this section is intended to preclude a covered entity from availing itself of protections described in §§ 92.3 and 92.302.'' Our reasons for this change are as follows:

First, many commenters strongly urged OCR to consider that providers may have a nondiscriminatory reason to not provide some aspects of or all gender-affirming care. OCR understands that a provider may have a legitimate nondiscriminatory reason not to provide a health service, which the newly revised § 92.206(c) makes clear. While this section has application in the gender-affirming care context, the revised language is also intended to make clear that it is not limited to that context. When OCR investigates claims of discrimination based on the denial of care, OCR will consider the covered entity's rationale for such denial, any supporting information the covered entity offers for its position, and any evidence of unlawful animus, bias, or other discriminatory factors in the case.

Second, and as discussed, section 1557 prohibits discrimination on certain prohibited bases, and does not interfere with individualized clinical judgment about the appropriate course of care for a patient. OCR has a general practice of deferring to a clinician's judgment about whether a particular service is medically appropriate for an individual, or whether the clinician has the appropriate expertise to provide care. There is no part of section 1557 that compels clinicians to provide a service that they do not believe is medically appropriate for a particular patient or that they are not qualified to provide.

Since the rule does not (and cannot) set a standard of care for gender-affirming care, the focus of any investigation will not be to generally

[171] *Pac. Shores Props., LLC* v. *Newport Beach,* 730 F.3d 1142, 1158–59 (9th Cir. 2013) (noting that a plaintiff need not rely on the *McDonnell-Douglas* approach to intentional discrimination but may instead produce other circumstantial evidence of intentional discrimination using *Arlington Heights,* as *McDonnell Douglas* ''is not a straightjacket requiring the plaintiff to demonstrate that such similarly situated entities exist'').

review a covered entity's clinical judgment but rather to determine whether the assertion of that judgment reflects unlawful animus or bias, or is a pretext for discrimination. Similarly, outside of the gender-affirming care context, OCR may find an invocation of clinical appropriateness to be pretextual if, for example, the evidence demonstrates that the covered entity asserted that pain medication was not clinically appropriate for a patient because of the belief that women exaggerate pain symptoms and inaccurately relay information about their symptoms.

Third, because many commenters expressed concern about the relationship between § 92.206(c) and religious or moral beliefs concerning gender-affirming care, we added an explicit reference in § 92.206(c) to § 92.302. The new language clarifies that § 92.206(c) does not preclude the process set forth in § 92.302 where a recipient's objection to gender-affirming care may be protected under religious freedom and conscience laws.

Comment: Many commenters also cited religious or moral objections to gender-affirming care, urging that these should be considered a legitimate, nondiscriminatory reason to decline to provide such care.

Response: OCR understands that recipients may have religious or conscience objections to the provision of certain types of care. Such an objection can serve as a legitimate, nondiscriminatory reason where it is neither pretextual nor discriminatory. If a provider typically declines to provide a particular health service to any individual based on a religious belief, regardless of individual's sex assigned at birth or gender identity, the provider likely meets § 92.206(c)'s standard for a ''legitimate, nondiscriminatory reason.'' And where a provider's religious belief causes the provider to treat individuals differently based on sex assigned at birth or gender identity, the provider may rely on the protections afforded by religious freedom and conscience laws or choose to seek assurance of those protections by making use of § 92.302(b)'s assurance of religious freedom and conscience exemption process, a feature that both the 2016 and 2020 Rules lacked. As discussed in more detail below, OCR is making several modifications to § 92.302 to strengthen and clarify this process.

Comment: Many commenters supported the inclusion of § 92.206(c) but recommended that OCR strengthen the language pertaining to providers complying with a State or local law as a justification for denying gender-affirming care, abortions, or other reproductive health care to clarify that as a Federal civil rights law, the rule preempts any such State or local law restricting access to such care. Some commenters suggested including language in the preamble to make clear that the majority of States' policies that restrict transgender and nonbinary people's access to health care would be barred. Another commenter expressed support for explicit preemption language, because otherwise providers would be forced to attempt to comply with State and local laws, while also trying not to run afoul of OCR's case-by-case judgment concerning what conduct may be considered discriminatory. Some commenters expressed concern that the rule could deem physicians' conduct discriminatory when declining to provide services because of State or local laws restricting those services, leaving them in an untenable position. Other commenters criticized the rule because they believe it preempts State laws restricting abortion and gender-affirming care and seeks to preempt State laws on religious freedom and conscience. A commenter expressed confusion as to how the rule would preempt State law as opposed to simply disallowing Federal funds from entities that do not comply.

Response: OCR understands providers' concerns that the provision's reference regarding compliance with State or local law would place them in a difficult position with regard to the conflicting demands of this rule's nondiscrimination requirements and various State and local laws restricting access to abortion or gender-affirming care. While we have removed the language from § 92.206(c) that many commenters supported, section 1557's nondiscrimination requirements nevertheless generally preempt conflicting State law for the reasons stated earlier in this preamble. That said, in exercising and determining its enforcement priorities, OCR will consider the specific factual record of each complaint on a case-by-case basis. This may include, among other things, consideration of whether any covered entity that is taking discriminatory actions under the rule is doing so because it believes in good faith it is obligated to do so by State or local law, whether that covered entity demonstrated a willingness to refer or provide accurate information about gender-affirming care, or is otherwise engaging in good faith efforts to ensure patients are receiving medically necessary care.

Comment: Several commenters expressed support for § 92.206(d)'s clarification that the enumeration of specific forms of prohibited discrimination in § 92.206(b) does not limit the general prohibition against discrimination in § 92.206(a), while recommending that additional preamble language be added to the final rule citing additional examples of discrimination and to provide confirmation that OCR's investigations will not be limited by the enumerated examples in § 92.206(b).

Response: We emphasize that § 92.206(b) is not an exhaustive list of all scenarios that would constitute of sex discrimination under the rule. We have provided additional examples of sex discrimination in this preamble, and OCR's investigations will not be limited by the enumerated forms of discrimination addressed in § 92.206(b) or elsewhere.

Comment: One commenter stated that OCR ignored *Burwell* v. *Hobby Lobby,* 573 U.S. 682 (2014), in the Proposed Rule and that the Proposed Rule is comparable to the Department's actions in that case, in which the Court found that the government's compelling interest in protecting women's health could be accomplished in a less restrictive manner.

Response: OCR has considered *Hobby Lobby* and will be mindful of it when carrying out enforcement of the final rule. For a further discussion of views regarding application of Federal conscience or religious freedom laws, refer to § 92.302.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing the provision as proposed in § 92.206, with modifications. We have revised § 92.206(b)(1) to state: ''Deny or limit health services, including those that have been typically or exclusively provided to, or associated with, individuals of one sex . . . .'' We are revising § 92.206(c) to remove the sentence that reads: ''However, a provider's belief that gender transition or other gender-affirming care can never be beneficial for such individuals (or its compliance with a state or local law that reflects a similar judgment) is not a sufficient basis for a judgment that a health service is not clinically appropriate.'' To the end of § 92.206(c) we are adding sentences that read: ''A covered entity's determination must not be based on unlawful animus or bias, or constitute a pretext for discrimination. Nothing in this section is intended to preclude a covered entity from availing itself of protections described in §§ 92.3 and 92.302.''

Nondiscrimination in Health Insurance Coverage and Other Health-Related Coverage (§ 92.207)

In § 92.207, OCR proposed to prohibit discrimination on the basis of race, color, national origin, sex, age, or disability in the provision or administration of health insurance coverage and other health-related coverage. This proposed section would apply to all covered entities that provide or administer health insurance coverage or other health-related coverage that receive Federal financial assistance, and the Department in the administration of its health-related coverage programs.

In § 92.207(a), OCR proposed a general nondiscrimination requirement, and § 92.207(b) proposed specific examples of prohibited actions.

In § 92.207(b)(1), OCR specified that covered entities are prohibited from denying, cancelling, limiting, or refusing to issue or renew health insurance coverage or other health-related coverage, or denying or limiting coverage of a claim, or imposing additional cost sharing or other limitations or restrictions on coverage, on the basis of race, color, national origin, sex, age, or disability.

In § 92.207(b)(2), OCR proposed prohibiting marketing practices or benefit designs that discriminate on the basis of race, color, national origin, sex, age, or disability.

In § 92.207(b)(3), OCR proposed that it is prohibited discrimination to deny or limit coverage, deny or limit coverage of a claim, or impose additional cost sharing or other limitations or restrictions on coverage to an individual based upon the individual's sex at birth, gender identity, or gender otherwise recorded. We invited comment on this provision, including whether it sufficiently addresses the challenges transgender and gender nonconforming individuals are experiencing when seeking access to medically necessary care due to a discordance between their sex assigned at birth and their sex as recorded by their issuer.

In § 92.207(b)(4), OCR proposed to prohibit a covered entity from having or implementing a categorical coverage exclusion or limitation for all health services related to gender transition or other gender-affirming care.[172]

In § 92.207(b)(5), OCR proposed to ensure that a covered entity does not impose discriminatory limits on coverage for specific health services related to gender transition or other gender-affirming care, which would generally be the case if such limits are not applied when those same health services are not related to gender transition or other gender-affirming care.

In § 92.207(b)(6), OCR proposed an integration provision that prohibits covered entities from having or implementing a benefit design that does not provide or administer health insurance coverage or other health-related coverage in the most integrated setting appropriate to the needs of qualified individuals with disabilities.

OCR sought comment on the scope and nature of the benefit design features that result in unjustified segregation or institutionalization of qualified individuals with disabilities or place such individuals at serious risk of institutionalization or segregation. We were interested in feedback on the application of the integration requirement to a wide variety of health services and were particularly interested in comments on the application of the integration requirement to coverage of post-acute services, mental health services, and other services commonly provided by non-State payers (*i.e.,* health insurance issuers, self-insured group health plans, and other payers). OCR was also interested in feedback on the application of the integration requirement to the Medicaid program and its statutory framework at title XIX of the Social Security Act. Specifically, we requested input on how State Medicaid agencies are able to achieve compliance with the integration requirement through benefit design, such as through reimbursement, service scope, and service authorization that do not incentivize institutional services over community services. In addition, OCR requested input on the amount of time needed to reach compliance with needed benefit design modifications.

In § 92.207(c), OCR stated that nothing in this section requires the coverage of any health service where the covered entity has a legitimate, nondiscriminatory reason for determining that such health service fails to meet applicable coverage requirements, such as medical necessity requirements, in an individual case.

Finally, in § 92.207(d), OCR made clear that the enumeration of specific forms of discrimination in § 92.207(b) does not limit the general applicability of the prohibition in § 92.207(a).

OCR generally invited comment on how section 1557 might apply to: provider networks; how provider networks are developed, including factors that are considered in the creation of the network and steps taken to ensure that an adequate number of providers and facilities that treat a variety of health conditions are included in the network; the ways in which provider networks limit or deny access to care for individuals on the basis of race, color, national origin, sex, age, or disability; and the extent to which the lack of availability of accessible medical diagnostic equipment in a provider network limits or denies access to care for individuals with disabilities. We also sought comment on the extent, scope and nature of value assessment methods that discriminate on the basis of race, color, national origin, sex, age, or disability. We were interested in feedback on the civil rights implications of value assessment across a wide variety of contexts, including utilization management, formulary design, price negotiations, alternative payment models and other relevant applications. Finally, OCR invited comment on all aspects of this section. In particular, we sought comment on the anticipated impact of the proposed application to excepted benefits and short-term, limited duration insurance (STLDI) when such products are offered by a covered entity; how the Proposed Rule's nondiscrimination requirements would impact the industry that offers excepted benefits and STLDI and the consumers who rely upon those products; the prevalence of excepted benefits and STLDI offered by covered entities and the standard industry practices under which such plans are designed and administered; and excepted benefits and STLDI plans' scope of coverage, types of exclusions and limitations, underwriting practices, premium setting, and actuarial or business justifications for industry practices (as applicable), that may raise concerns about discrimination under section 1557.

The comments and our responses regarding § 92.207 are set forth below.

For ease of reference, OCR may simply refer to ''health insurance issuers'' or ''issuers'' throughout the preamble, but other covered entities may also be subject to the section under

[172] As noted in the discussion of § 92.206 above, this preamble uses the terms ''gender transition'' and ''gender affirmation'' interchangeably in discussing the range of care that transgender individuals (including those who identify using other terms, for example, nonbinary or gender nonconforming) may seek to treat gender dysphoria and support gender transition or affirmation. Because insurance coverage provisions and medical-necessity determinations more often use the term gender transition, within these provisions, the term gender affirmation encompasses gender transition, that is the terminology used in the text of the regulation. The use of the term ''gender transition'' in the regulation, however, is not intended to convey a narrower meaning than the term ''gender affirmation.''

discussion. In addition, for purposes of this preamble only, OCR uses the term ''health plan'' or ''plan'' interchangeably to refer generally to health insurance coverage and other health-related coverage that is subject to this rule. As used in this preamble, ''health plan'' or ''plan'' may include health insurance coverage or other health-related coverage offered in the group and individual markets, group health plan coverage, Medicare Advantage plans, Medicare Part D plans, and Medicaid programs that are subject to this rule. OCR does not intend ''health plan'' or ''plan'' to be regulatory terms in this regulation or to replace any existing or proposed term in Federal law.

OCR notes that a variety of entities may be considered covered entities subject to § 92.207, including but not limited to health insurance issuers, group health plans, Medicare Advantage Organizations, Medicare Part D plan sponsors, Medicaid managed care plans, pharmacy benefit managers, third party administrators (as part of a covered entity's operations when it meets the criteria in paragraph (2) of the definition of ''health program or activity'' under § 92.4), and the Department.

Comment: Commenters strongly supported the inclusion of an explicit provision related to prohibited discrimination in health insurance coverage and other health-related coverage, noting that it will help provide clarity for covered entities. Many commenters stated that it is clear from the statutory text of the ACA that Congress intended for section 1557 to apply to health insurance. Commenters stated that the 2020 Rule's rescission of similar protections created confusion, was contrary to the intent and purpose of the ACA, and increased the burden on States to monitor and enforce nondiscrimination laws. Commenters noted that ensuring covered entities provide health insurance coverage and other health-related coverage in a nondiscriminatory manner will reduce adverse health outcomes and address some of the barriers vulnerable communities face in accessing health insurance coverage and other health-related coverage. Commenters from the health insurance industry were generally supportive of reinstating the section with some suggested modifications. This includes one commenter noting that, as an employer, they appreciated the Proposed Rule's clarification prohibiting categorical exclusions, noting that the 2016 Rule's similar prohibition had allowed them to negotiate a nondiscriminatory plan to cover their employees.

One organizational commenter opposed to the inclusion of § 92.207 argued that health insurance issuers could face substantial costs, including compliance costs and claims costs, as a result of having to alter their coverages and business practices, which would result in higher premiums. This commenter also argued OCR is engaging in expansive and detailed regulation of numerous issuer business decisions in an arbitrary and capricious manner that could result in issuers facing heightened business risks and increased liability exposure.

Response: OCR agrees that section 1557 applies broadly, including to prohibit discrimination by covered entities that provide or administer health insurance coverage and other health-related coverage. As discussed throughout this preamble, particularly under the discussion of the definition of ''health program or activity'' under § 92.4, the ACA is clearly intended to apply to health insurance coverage and other health-related coverage and prohibit the discriminatory practices therein.

OCR disagrees that § 92.207 imposes expansive regulation of health insurance issuers and their business decisions in an arbitrary and capricious manner. The plain text of section 1557 applies to health insurance coverage and other health-related coverage; OCR is implementing Congressional intent to prohibit discrimination in health insurance coverage and other health-related coverage in § 92.207. In addition to section 1557, health insurance issuers are required to comply with myriad State and Federal laws regulating the practice of health insurance coverage and other health-related coverage. These laws include other Federal laws that regulate health insurance coverage and other health-related coverage practices, including nondiscrimination requirements.[173] Compliance with legal requirements, such as section 1557, is a standard business practice as a health insurance issuer. Further, health insurance issuers were subject to former § 92.207's requirements[174] from either July 18, 2016, or January 1, 2017 (if plan design changes were required as a result of the 2016 Rule), through August 18, 2020, the effective date of the 2020 Rule.

Comment: Some commenters supported § 92.207(b)(1), related to coverage denials and limitations. Some commenters asked OCR to state that cost sharing must not be used by covered entities in a discriminatory manner. Commenters acknowledged that cost sharing can be an effective tool, but they also expressed concern that insurance companies and pharmacy benefit managers are increasingly employing high cost sharing that disproportionately affects people with disabilities, chronic conditions, and other significant health needs. Commenters cited several studies that show patients who are uncertain about their ability to afford their out-of-pocket care expenses delay or forgo care or fall out of compliance with recommended follow-up steps.[175] Commenters noted that such gaps in care can have deadly consequences for individuals with certain conditions, such as people living with HIV/AIDS.

Commenters also provided examples of concerns related to cost sharing and patient financial assistance. A few commenters raised concerns about treatment of patient financial assistance, accumulator adjustment programs, copay maximizers, and alternative funding programs. Other commenters raised concerns about issuers designating drugs as ''non-essential-health-benefits'' to avoid certain

essential health benefits (EHB) requirements.[176]

One organizational commenter expressed concerns about § 92.207(b)(1) and argued that this provision would impose new nondiscrimination tests on issuer business decisions that result in the denial or limitation of payment for a claim, on variations in cost sharing under the terms of a health plan, or on the imposition of other limitations or restrictions on coverage. The commenter argued this would result in expansive and detailed regulation of numerous issuer business decisions in an arbitrary and capricious manner.

Response: OCR appreciates commenters' concerns regarding cost sharing, which is explicitly addressed in § 92.207(b)(1). Covered entities are prohibited from ''impos[ing] additional cost sharing or other limitations or restrictions on coverage, on the basis of race, color, national origin, sex, age, or disability.'' We disagree with the commenter's concerns that this provision arbitrarily or capriciously imposes new nondiscrimination tests on issuer business decisions. Covered entities subject to this rule are prohibited from engaging in unlawful discrimination in their health programs or activities, including in health insurance coverage or other health-related coverage. Cost sharing is standard industry practice that is a feature of an issuer's health insurance coverage or other health-related coverage. Nothing in this rule dictates the business decisions an issuer should make in establishing its coverage limitations, including with regard to cost sharing. To the extent an issuer imposes cost sharing in its coverage, it cannot do so in a discriminatory manner. Comments related to violations of EHB requirements are outside the scope of this regulation.[177]

Comment: Commenters generally supported the prohibition on discriminatory marketing practices in § 92.207(b)(2). Commenters discussed that covered entities might use marketing practices to dissuade enrollment by individuals with high-cost conditions. For example, commenters noted that plans present inaccurate or confusing information about formularies and hide or fail to provide information about certain drugs. Several commenters referenced a 2022 study by the AIDS Institute that found 57.9 percent of the 299 Exchange plan documents reviewed did not list PrEP (pre-exposure prophylaxis to prevent HIV infection) as a free preventive service, though health insurance issuers were required to include such coverage for all plans offered through the Exchanges in 2022.[178] Commenters asked OCR to provide an example of discriminatory marketing practices in regulatory text. They further requested that OCR coordinate the study of marketing practices with other regulatory agencies.

Response: OCR concurs with the importance of ensuring that an issuer's marketing practices are not designed or implemented in a way that discriminates against individuals with a specific disability or on any other basis prohibited under section 1557. Inaccuracies or omissions in plan marketing materials may impede an individual's ability to determine what treatments and services are covered. While certain inaccuracies or omissions in marketing materials may not be prohibited discrimination under this section, inaccuracies or omissions that were intended to or resulted in discouraging individuals from enrolling in health insurance coverage and other health-related coverage or steering individuals away from enrolling in health insurance coverage and other health-related coverage on the basis of disability or other prohibited basis would raise concerns of prohibited discrimination. The determination of whether a particular marketing practice is prohibited under this section requires a case-by-case analysis dependent on the facts of the challenged marketing practice. Accordingly, OCR declines to specify particular examples in the regulation, though we included an example in the Proposed Rule, stating that covered entities that avoid advertising in areas populated by a majority of people of color to reduce the enrollment of people of color in their health insurance coverage could violate § 92.207. 87 FR 47869–70. We note that covered entities may be subject to other Departmental and Federal regulations governing marketing practices.[179] While OCR declines to coordinate a study of marketing practices, we continue to coordinate with other regulatory agencies on health insurance-related matters.

We note that individuals with LEP or disabilities may face challenges in accessing a covered entity's marketing materials. This final rule addresses such concerns in multiple ways, including by requiring covered entities to provide a Notice of Nondiscrimination under § 92.10; a Notice of Availability under § 92.11 (including in member handbooks at § 92.11(c)(5)(x)); taking reasonable steps to provide meaningful access to individuals with LEP under § 92.201; and taking appropriate steps to ensure effective communication for individuals with disabilities under § 92.202.

Comment: Numerous commenters supported the prohibition on discriminatory health plan benefit designs in § 92.207(b)(2). Commenters stated that covered entities employ many features of benefit design and delivery to deny coverage or discourage people with significant or high-cost health needs from enrolling in their plans. These include exclusions, cost sharing, formularies, visit limits, provider networks, service areas, benefit substitutions, prior authorization, and other utilization management that the commenters allege are arbitrary and not clinically based or appropriate.

Some commenters requested that OCR define the term ''benefit design'' or include specific examples of benefit design features in the regulatory text of § 92.207(b)(2). While some commenters expressed concern that failing to define benefit design in the regulation would result in a lack of clarity as to what the rule prohibits, other commenters supported OCR's proposed approach to avoid defining the term in a prescriptive manner.

One organizational commenter opposed § 92.207(b)(2) as imposing nondiscrimination tests on insurance benefit design, which the commenter argued would result in expansive and detailed regulation of a number of issuer business decisions in an arbitrary and capricious manner.

Response: Benefit design features may result in a discriminatory denial of access to medically necessary care, particularly for individuals with disabilities who have significant health needs. To address this concern, covered entities are explicitly prohibited from having or implementing benefit designs

[176] *See* section 1302 of the ACA, codified at 42 U.S.C. 18022.

[177] *See* 42 U.S.C. 18022, 300gg–6(a); 45 CFR 156.100 through 165.155.

[178] Letter from The AIDS Institute to Dr. Ellen Montz, Deputy Admin'r & Dir. (June 9, 2022), *https://www.theaidsinstitute.org/letters/marketplace-insurance-plan-prep-compliance*. In general, under section 2713 of the PHS Act and its implementing regulations, plans and issuers must provide coverage, without cost sharing, for recommended preventive services for plan years (in the individual market, policy years) that begin on or after the date that is 1 year after the date the recommendation or guideline is issued. 26 CFR 54.9815–2713(b); 29 CFR 2590.715–2713(b); 45 CFR 147.130(b).

[179] *See, e.g.,* 45 CFR 147.104(e) (health insurance issuers offering coverage in the individual and group markets) and 156.225(b) (qualified health plans); 42 CFR 423.2263 (Medicare Part D marketing requirements).

that discriminate on any protected basis as set forth under § 92.207(b)(2).

We decline to define ''benefit design'' or specify types of benefit design features in the regulatory text. Section 92.207(b)(2) sufficiently notifies covered entities that discriminatory benefit designs are prohibited under this rule. In addition, we seek to avoid being overly prescriptive or unintentionally inconsistent with other Departmental regulations that may define benefit design.[180] While OCR declines to provide examples of specific benefit design features in the regulatory text, for purposes of applying section 1557 and this final rule, examples of benefit design features include, but are not limited to, coverage, exclusions, and limitations of benefits; prescription drug formularies; cost sharing (including copays, coinsurance, and deductibles); utilization management techniques (such as step therapy and prior authorization); medical management standards (including medical necessity standards); provider network design; and reimbursement rates to providers and standards for provider admission to participate in a network.

OCR disagrees with the organizational commenter's concern that this provision arbitrarily or capriciously imposes new nondiscrimination tests on issuer business decisions. This section does not dictate what business decisions an issuer must make in establishing its benefit design and does not specify any particular design feature must be included. OCR acknowledges that issuers have discretion in designing their plans; however, they must do so in a nondiscriminatory manner as discussed throughout this section.

Comment: Commenters requested that OCR provide a non-exhaustive list of presumptively discriminatory benefit design examples. Some commenters also suggested that OCR incorporate the presumptively discriminatory benefit design examples provided in CMS' EHB regulations [181] or otherwise rely on other nondiscrimination provisions in CMS regulations implementing the ACA. Commenters stated that allowing plan discretion on every benefit other than gender dysphoria undercuts the regulation. Many commenters stated that OCR should recognize that most benefit design elements are inherently discriminatory as they apply disproportionately to individuals with disabilities and chronic conditions. Commenters expressed concerns that without presumptively discriminatory benefit design examples, issuers will adopt designs that exclude or make lifesaving treatments unaffordable for individuals in protected categories. Commenters noted that such designs include cost-sharing requirements, restrictive medical necessity standards, narrow networks, drug formularies, adverse tiering, benefit substitution, utilization managements, exclusions, visit limits, quantity limits, waiting periods, service areas, and coercive wellness programs.

Response: OCR declines to provide specific examples of presumptively discriminatory benefit designs in the rule due to the fact-intensive analysis needed to determine whether a particular benefit design feature is discriminatory under this section. We also decline to give examples of presumptively discriminatory benefit designs similar to those in EHB regulations applicable to non-grandfathered health insurance coverage in the individual and small group markets that CMS finalized in the preamble of its Notice of Benefit and Payment Parameters for 2023 final rule.[182] Essential health benefits are governed by CMS regulations and not by this final rule. While many of the practices cited by CMS would raise concerns of prohibited discrimination under this rule, OCR's determinations that a particular benefit design is discriminatory will be a fact-specific inquiry that OCR will conduct on a case-by-case basis. OCR's process for analyzing claims of discrimination in benefit design is discussed in more detail under the *Benefit Design Analysis* discussion later in this section. OCR will consider issuing guidance on discriminatory practices prohibited under this section in future guidance.

OCR disagrees that the prohibition against categorical exclusions or limitations of coverage for all health services related to gender transition or other gender-affirming care under § 92.207(b)(4) undercuts the regulation. Such explicit, categorical exclusions or limitations impermissibly single out an entire category of services based on an individual's transgender status and are presumptively discriminatory on the basis of sex as prohibited under this section. As discussed in detail under § 92.206, this rule includes specific provisions related to gender-affirming care given the widespread discriminatory denial of care for such services and its direct connection to an individual's transgender status.[183] As discussed in more detail below, covered entities may raise a defense under § 92.207(c) where they contend that they have a legitimate, nondiscriminatory basis for a coverage limitation that may otherwise appear to constitute discrimination. Recipients may also rely upon §§ 92.3 and 92.302(a) or request an assurance of exemption under § 92.302(b) based on their view that religious freedom or conscience protections apply.

We also decline to incorporate examples of presumptively discriminatory benefit designs similar to those in EHB regulations applicable to non-grandfathered health insurance coverage [184] in the individual and small group markets that CMS finalized in the preamble of its Notice of Benefit and Payment Parameters for 2023 final rule. Essential health benefits are governed by CMS regulations and are not addressed by this final rule. While many of the practices cited by CMS would raise concerns of prohibited

[182] Patient Protection and Affordable Care Act; HHS Notice of Benefit & Payment Parameters for 2023, 87 FR 27208, 27301–05 (May 6, 2022) (providing the following examples of presumptively discriminatory benefit designs under CMS' EHB nondiscrimination regulations applicable to non-grandfathered health insurance coverage in the individual and small group markets: (1) limitation on hearing aid coverage based on age; (2) autism spectrum disorder coverage limitations based on age; (3) age limits for infertility treatment coverage when treatment is clinically effective for the age group; (4) limitation on foot care coverage based on diagnosis (whether diabetes or another underlying medical condition); and (5) access to prescription drugs for chronic health conditions (adverse tiering)). We note these regulations are enforced by CMS and are distinct from section 1557 and other civil rights laws enforced by OCR.

[183] *See, e.g., Bos. All. of Gay, Lesbian, Bisexual & Transgender Youth* v. *U.S. Dep't of Health & Hum. Servs.,* 557 F. Supp. 224, 239 (D. Mass. 2021) (''[p]laintiffs have shown a substantial risk that insurers will deny reimbursement for treatment they previously covered based on the elimination of the prohibition on categorical coverage exclusions. Out2Enroll's analysis indicates that ''the number of insurers using transgender-specific exclusions . . . more than doubled'' after HHS promulgated the 2020 Rule.'').

[184] In general, health coverage is considered grandfathered if it was in existence and has continuously provided coverage for someone (not necessarily the same person, but at all times at least one person) since March 23, 2010, provided the plan (or its sponsor) or the issuer has not taken certain actions resulting in the plan relinquishing grandfathered status, as more fully described at 26 CFR 54.9815–1251, 29 CFR 2590.715–1251, and 45 CFR 147.140.

discrimination under this rule, OCR's determinations that a particular benefit design is discriminatory will be a fact-specific inquiry that OCR will conduct on a case-by-case basis. OCR's process for analyzing claims of discrimination in benefit design is discussed in more detail under the *Benefit Design Analysis* discussion later in this section. OCR will consider issuing guidance on discriminatory practices prohibited under this section in future guidance.

Comment: Commenters asked OCR to include examples of discriminatory benefit design specifically related to prescription drug formularies. These commenters provided examples of practices they considered to be discriminatory, such as issuers placing most or all drugs used in the treatment of certain conditions into the highest cost sharing tier; excluding single tablet regimens even when they are the standard of care for a condition; requiring the use of specialty pharmacy programs that require mail delivery even when that adds unnecessary and burdensome administrative barriers and delays to obtaining drugs; and using quantity limits for an entire class of medications without scientific or clinical explanation. Commenters expressed concerns that discriminatory prescription drug formularies discourage enrollment among certain populations, including individuals with HIV, mental health needs, or other chronic conditions. Commenters noted that enrollees who need high-cost medications often must choose between plans that will provide adequate coverage of their medication or plans that cover their preferred providers. A commenter cited a study that showed that Black and Hispanic/Latino people are more likely to abandon medications at the pharmacy because of high cost.[185] Finally, some commenters recommended that OCR develop specific mechanisms to monitor prescription drug formulary practices and coverage of physician-administered ''medical benefit'' drugs to ensure that formularies are not used to discriminate against patients with specific disabilities.

Response: Benefit design practices related to prescription drugs have an enormous impact on individuals' access to medically necessary medication. Coverage of prescription drugs could pose concerns of prohibited discrimination and OCR would investigate such practices under the rule on a case-by-case basis. OCR declines to state that specific practices are per se discriminatory under the rule because each investigation is a fact-specific inquiry, based on nondiscrimination principles and relevant case law,[186] including consideration of the covered entity's reason for the design feature in question.

As discussed in the Proposed Rule, several benefit design practices related to drug formularies could be discriminatory under this section, including prescription drug formularies that place utilization management controls on most or all drugs that treat a particular condition regardless of their costs without placing similar utilization management controls on most or all drugs used to treat other conditions, and benefit designs that place utilization management controls on most or all services that treat a particular disease or condition but not others. 87 FR 47874. OCR notes that coverage of physician-administered ''medical benefit'' drugs would be considered part of a plan's benefit design and therefore subject to this rule.

While we identify some prescription drug practices above that may raise concerns under section 1557, this rule does not prohibit covered entities from engaging in nondiscriminatory practices related to prescription drug benefit design. For example, covered entities may utilize preferred drug lists, such as preferred drug lists under the Medicaid program under title XIX of the Social Security Act, as long as the coverage criteria does not constitute prohibited discrimination. In addition, as discussed in more detail below, covered entities are not prohibited from applying nondiscriminatory utilization management techniques in their drug formularies.

Comment: Many commenters expressed concerns about benefit designs that impose coverage limitations or exclusions related to health services that could result in discrimination on the basis of disability. For example, some commenters argued that plans should not be permitted to have blanket exclusions for services related to ASD or applied behavioral analysis (ABA) therapy, a therapeutic intervention sometimes recommended for autistic children.

Several commenters raised concerns about how frequently insurance benefit design practices inappropriately limit coverage of durable medical equipment. Commenters noted that issuers place unique annual coverage caps on items such as wheelchairs, ventilators, and hearing aids. A commenter noted an example of an individual with hearing loss that requires treatment other than cochlear implants being denied coverage of hearing aids and outpatient visits to an audiologist due to their issuer's blanket exclusion of programs or treatments for hearing loss other than cochlear implants. Another commenter noted that issuers limit coverage of multiple-use speech-generating devices, which are most useful and effective for autistic individuals, even when those devices are less expensive than single-use speech generating devices.

Other commenters expressed concerns that covered entities include clinically inappropriate limits on the coverage of habilitative and rehabilitative services and devices. Commenters noted that such limitations, including on the number of covered visits, discriminate against people with more significant disabilities who need extensive habilitation or rehabilitation in order to gain, regain, or maintain functioning. Commenters requested that OCR clarify that blanket limitations or exclusions of habilitative services for individuals with specific disabilities are prohibited discrimination under section 1557 when those same services are allowed for rehabilitation of nondisabled persons. Commenters noted that people with developmental disabilities are routinely denied coverage for habilitative services needed to gain skills or improve functioning while an identical service is covered for individuals who require it for rehabilitative care to restore functioning. For example, a commenter noted that coverage of ''speech therapy to restore speech'' results in excluding all children with developmental delays who need the therapy to *attain* speech. Commenters noted that habilitative services are important for children who are delayed in walking or talking or need to learn other muscular skills for the first time and for individuals with disabilities to be able to live as independently as possible.

Response: OCR appreciates the variety of concerns raised by commenters. A coverage limitation or exclusion that is based on a specific disability or condition (or other basis prohibited by section 1557, such as age, discussed below), would be investigated as

[185] PhRMA, *Patient Experience Survey: Barriers to Health Care Access in the Patient Experience,* pp. 10–11 (2021), *https://phrma.org/-/media/Project/PhRMA/PhRMA-Org/PhRMA-Org/PDF/P-R/PES-Report_100621_Final.pdf* (stating that utilization management disproportionately impacts people of color (Black Americans (56 percent) and Hispanic Americans (60 percent) versus white Americans (36 percent)) and that barriers imposed by utilization management can contribute to poor medication adherence or prescription abandonment).

[186] *See, e.g., Doe* v. *CVS Pharmacy, Inc.,* 982 F.3d 1204, 1212 (9th Cir. 2020); *Doe* v. *BlueCross BlueShield of Tenn.,* 926 F.3d 235, 241 (6th Cir. 2019).

potentially discriminatory under this rule. Blanket exclusions of all treatments related to a particular condition, such as ASD or hearing loss, would raise significant concerns of prohibited discrimination on the basis of disability such that OCR would expect the covered entity to provide a legitimate, nondiscriminatory reason for the exclusion. Non-categorical exclusions or limitations for certain treatments related to a specific disability or condition may also raise concerns under the rule. This rule, however, does not require covered entities to cover all services related to a specific disability or condition. Application of standard disability discrimination principles requires a specific analysis of each claimed exclusion. We therefore decline to expressly state that a particular coverage exclusion or limitation is per se discriminatory on the basis of disability under this rule. Determinations of whether a particular coverage exclusion or limitation is discriminatory will be evaluated on a case-by-case basis, in accordance with longstanding civil rights principles and relevant case law, as discussed throughout this section. When investigating a potentially discriminatory exclusion or limitation, OCR will consider whether the covered entity has a legitimate, nondiscriminatory reason for the challenged design feature. If OCR determines that the covered entity's reason is a legitimate, nondiscriminatory reason that is not a pretext for discrimination, OCR will conclude that the challenged exclusion or limitation is not prohibited under the rule.

Regarding durable medical treatment, the commenters' example of exclusions of coverage for programs or treatments for hearing loss other than cochlear implants has been the subject of at least two court cases where the courts have held that such exclusions do not state a claim for proxy disability discrimination under section 1557.[187]

We also note that health insurance issuers may be subject to other Departmental authorities that are relevant to issues raised by commenters.[188] For example, to the extent durable medical equipment is an EHB, like hearing aids are in some states, covered entities may also be subject to CMS' EHB nondiscrimination regulations at 45 CFR 156.125 applicable to non-grandfathered health insurance coverage in the individual and small group markets.[189] Further, CMS' EHB regulations require coverage of habilitative services and devices, and specify that plans may not impose limits on coverage of habilitative services and devices that are less favorable than limits imposed on coverage of rehabilitative services and devices.[190]

Comment: Many commenters raised concerns related to mental health services. Commenters asked OCR to require both public and private payers to remedy the current inadequacies and inequities in mental health service reimbursement rates and policies, explaining that reimbursement rates have been historically lower for mental health services than physical health services. Commenters also identified a range of specific mental health benefit design inequities, including the need for intermediate-care facility coverage for high-use patients with non-urgent care needs to mobile crisis response that is on par to that of physical emergency response. Commenters also requested that the rule align with the mental health parity protections in the Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA).

Response: OCR acknowledges commenters' concerns regarding coverage for mental health services. Mental health services may be needed by people who may or may not be individuals with disabilities under this rule. OCR will examine complaints alleging less favorable treatment for mental health coverage as compared to physical health coverage on a case-by-case basis to determine if the coverage discriminates against people with disabilities. Reimbursement rates and policies are subject to § 92.207 as part of a plan's benefit design, and thus must be provided in a nondiscriminatory manner. We also discuss reimbursement rates in the context of the integration provision under § 92.207(b)(6).

We decline to incorporate or align this rule with MHPAEA, as section 1557 is a distinct Federal civil rights law. We note that coverage limitations found to violate section 1557 may also be prohibited under MHPAEA.[191]

Comment: Commenters expressed concerns about issuers discriminating against enrollees based on age through certain benefit designs. Commenters provided examples of practices they believed to be discriminatory, such as issuers requiring an ASD diagnosis by a certain age to access coverage for ASD-related health care; not covering hearing aids for adults when otherwise covered for children; and imposing limitations on wheelchair and mobility device replacement for children that fail to align with how quickly children outgrow such devices. One commenter asked that OCR require issuers to attest that their pediatric benefit packages are comprehensive and age-appropriate by demonstrating that physical and mental health benefits do not have age, visit, or coverage limits that are not based on medical necessity or that are based on adult metrics. Commenters noted that plans that limit coverage to specific conditions or a child's capacity to attain a certain functional status will unfairly prevent many children with special health care needs from accessing critically important services.

Response: Section 1557 prohibits discrimination on the basis of age, consistent with the Age Act and its implementing regulations. The Age Act allows age distinctions under certain circumstances, including distinctions

[188] *See, e.g.,* Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA).

[189] *See* Patient Protection and Affordable Care Act; HHS Notice of Benefit and Payment Parameters for 2023, 87 FR 27208, 27301–02 (May 6, 2022) (concluding that age limitations on hearing aid coverage are presumptively discriminatory under 45 CFR 156.125 when applied to EHB and there is no clinical basis for the age distinction). We note these regulations are enforced by CMS and are distinct from section 1557 and other civil rights laws enforced by OCR.

[190] 45 CFR 156.110(a)(7) and 156.115(a)(5)(ii).

[191] The Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA), Public Law 110–343; 42 U.S.C. 300gg–26 (HHS); 29 U.S.C. 1185a (Department of Labor); 26 U.S.C. 9812 (Department of Treasury), and implementing regulations at 45 CFR 146.136 and 45 CFR 147.160, 29 CFR 2590.712, and 26 CFR 54.9812–1, respectively; The Departments of the Treasury, Labor, and HHS also published proposed rules on August 3, 2023 (88 FR 51552), to amend existing regulations and establish new regulations for the nonquantitative treatment limitation comparative analyses required under MHPAEA, as amended by the Consolidated Appropriations Act, 2021. The proposed rules would amend the existing rules to prevent group health plans and health insurance issuers offering group or individual health insurance coverage that provides both medical and surgical benefits and mental health or substance use disorder benefits from using nonquantitative treatment limits to place greater limits on access to mental health and substance use disorder benefits as compared to medical/surgical benefits; *see also* U.S. Dep't of Labor, U.S. Dep't of Health & Hum. Servs., U.S. Dep't of the Treasury, 2022 MHPAEA Report To Congress: *Realizing Parity, Reducing Stigma, and Raising Awareness: Increasing Access to Mental Health and Substance Use Disorder Coverage* (2022), *https://www.dol.gov/sites/dolgov/files/EBSA/laws-and-regulations/laws/mental-health-parity/report-to-congress-2022-realizing-parity-reducing-stigma-and-raising-awareness.pdf*; U.S. Dep't of Labor, *Self-Compliance Tool for the Mental Health Parity and Addiction Equity Act (MHPAEA),* p. 38 (2020), *https://www.dol.gov/sites/dolgov/files/EBSA/laws-and-regulations/laws/mental-health-parity/self-compliance-tool.pdf*.

that reasonably take into account age as a factor necessary to the normal operation or the achievement of any statutory objective [192] of a program or activity; are based on age-related factors that bear a direct and substantial relationship to the normal operation of the program or activity or to the achievement of a statutory objective; provide special benefits to the elderly or children; or are contained in a rule or regulation issued by the Department.[193] As a result, not all age-related distinctions in State or Federal law, including Department regulations, are prohibited by section 1557.[194] As noted above, these permissible age distinctions form part of the ''ground'' of discrimination prohibited under the Age Act, because they identify distinctions that either are not forbidden age discrimination, 42 U.S.C. 6103(b)(1)(A) (''reasonably takes into account age as a factor necessary to the normal operation or the achievement of any statutory objective of such program or activity''), or are not age discrimination at all, *id.* section 6103(b)(1)(B) (''based upon reasonable factors other than age'').

When investigating a benefit design with an age distinction, OCR will first determine whether the distinction is permitted under the Age Act (and therefore section 1557). If it is not, OCR will then investigate the age distinction to determine whether it violates section 1557. As with other benefit design investigations, OCR's analysis will involve a fact-specific inquiry and will consider a covered entity's reason for the age distinction in its benefit design. The covered entity's justification must be a legitimate, nondiscriminatory reason, as discussed under § 92.207(c). For example, if an issuer is not able to provide a legitimate, nondiscriminatory reason to substantiate an age distinction in ASD coverage, such an age distinction would likely violate section 1557. We reiterate that this rule does not require a covered entity to provide coverage for all health services related to a particular disability or condition; rather, it requires covered entities to design their plan benefits in a nondiscriminatory manner. We note that covered entities may also be subject to relevant CMS EHB nondiscrimination regulations regarding presumptively discriminatory age distinctions.[195]

OCR does not agree that it is necessary to require a separate attestation related to pediatric benefit packages. As recipients of Federal financial assistance, issuers are required to submit an Assurance of Compliance with section 1557 under § 92.5, which attests that they will not discriminate on the basis of age, among other prohibited bases.

Comment: A commenter requested that OCR clarify the obligation of issuers and plan administrators to ensure that their staff, as well as the staff of any subsidiary entities with which they do business, receive explicit training on the relationship between benefit design choices and practices and activities that can amount to discrimination based on race, color, national origin, sex, age or disability.

Response: Covered entities are responsible for ensuring their staff, subrecipients, and subcontractors are compliant with section 1557. Section 92.9 requires covered entities to provide training to relevant employees on their section 1557 Policies and Procedures, and while we note that it is in a covered entity's best interest to ensure that relevant staff are adequately trained, we decline to specify additional training requirements at this time.

Comment: Commenters requested that the final rule expressly state that section 1557 prohibits proxy discrimination in benefit design, either in the preamble or regulation. Commenters expressed concern that absent express incorporation of proxy principles, covered actors may attempt to evade section 1557's nondiscrimination provisions. A commenter requested that the final rule incorporate established discrimination principles and noted that issuers continue to justify discriminatory plan designs by taking the position that health plans that target a particular medical service rather than a disability are neutral or uniform with respect to all enrollees. As an example, the commenter noted that plans restricting coverage of dialysis justify it as not being discriminatory against enrollees with end-stage renal disease. The commenter requested that the final rule declare that discriminatory plan designs that limit dialysis treatment are a form of prohibited disability discrimination under section 1557 due to the fact that dialysis services are a near perfect proxy for end-stage renal disease, according to the commenter.

Response: Proxy discrimination occurs when a policy or practice treats individuals differently on the basis of seemingly neutral criteria that are so closely associated with the disfavored group that discrimination on the basis of such criteria is, constructively, facial discrimination against the disfavored group.[196] Proxy discrimination is one of many basic civil rights theories available to OCR when investigating complaints under section 1557 and which courts have applied in cases alleging discrimination under section 1557.[197] Due to the fact-intensive nature of the analysis necessary, including determinations of whether a particular benefit design is discriminatory,[198] we decline to expressly include this theory of discrimination in the rule text. As we have noted above, all claims under this section will be evaluated on a case-by-case basis.

Comment: Some commenters noted that health insurance coverage and other health-related coverage may employ coverage limitations that are facially neutral and apply to all enrollees but have a disparate impact on a basis protected under section 1557. Specifically, commenters observed that these limitations and exclusions can have a particular discriminatory effect on individuals with disabilities who have chronic conditions and significant health needs.

Response: OCR utilizes all applicable causes of action when investigating potential discrimination under section 1557 consistent with relevant case law. For further discussion related to OCR's enforcement procedures, see § 92.301.

[192] 45 CFR 91.12(b) (Defining ''Statutory objective'' to mean ''any purpose of a program or activity expressly stated in any Federal statute, State statute, or local statute or ordinance adopted by an elected, general purpose legislative body.'').

Comment: Commenters requested that the final rule make clear the language in § 92.207(b), which addresses sex-related health services, includes the full spectrum of reproductive health services and treatments and medications for people with disabilities that may prevent, complicate, or end fertility or pregnancies.

Response: OCR appreciates the unique challenges faced by people with disabilities seeking reproductive health care. Section 1557 prohibits discrimination on prohibited bases regardless of the type of care an individual is seeking or receive. Therefore, we do not believe it is necessary to provide specific provisions related to each form of care an individual may seek.

Comment: Commenters requested that the final rule expressly state that infertility diagnoses, treatment, and services, including assisted reproductive technology, if offered, must be covered without regard to sexual orientation, gender identity, sex characteristics (including intersex traits), or any other protected basis. Commenters raised several examples of benefit design or coverage related to assisted reproductive technology that they stated should be prohibited as discriminatory against individuals based on their relationship status and sexual orientation. As examples, commenters cited requiring enrollees to use their spouse's sperm to fertilize their eggs for in vitro fertilization and requiring that single enrollees or those in non-heterosexual relationships pay out of pocket for a predetermined number of failed intrauterine insemination cycles before providing coverage when heterosexual couples do not have to meet the same standard. Commenters stated that issuers justify these types of benefit design features on outdated definitions of infertility. A commenter argued that in vitro fertilization coverage should include screening for genetic abnormalities that are unique to enrollees' lineage as a matter of reproductive justice and religious freedom.

Response: OCR agrees that to the extent plans cover infertility diagnosis, treatment, and services, including assisted reproductive technology, they must do so on a nondiscriminatory basis, including for same-sex couples. Due to the fact-intensive nature of the analysis necessary, determinations of whether a particular benefit design is discriminatory under this section will be evaluated on a case-by-case basis.

Comment: Commenters recommended that OCR add a new paragraph to § 92.207(b) affirming that denying or limiting coverage of, or coverage of a claim for, health services because they may prevent, cause complications to, or end fertility or pregnancies is prohibited. Commenters asserted this language would address discrimination by a State program that otherwise provides coverage of contraceptives but excludes a specific contraceptive because of a medically inaccurate assertion that the contraception causes an abortion, or a provider network that only includes facilities that refuse to provide certain types of contraception. Commenters emphasized that individuals are currently being improperly denied access to medications or treatments for care unrelated to abortion because the medicine is also used for abortion care.

Response: Denying access to specific medication or health services that may potentially be used for medication abortion purposes but are prescribed for reasons unrelated to abortion care may constitute discrimination under section 1557.[199] OCR finds it unnecessary to add any additional regulatory language to prohibit such discrimination on the basis of disability and sex. As noted above, simultaneous discrimination on multiple prohibited bases is important to account for and is prohibited by section 1557.

Comment: A commenter asked OCR to provide confirmation that while nothing in the regulation would require a covered entity to cover abortions, to the extent plans do cover abortions, they must do so on a nondiscriminatory basis.

Response: As the commenter stated, nothing in this rule requires the provision of any particular medical care, including abortion. To the extent plans offer coverage for termination of pregnancies and related services, they must do so on a nondiscriminatory basis.

Comment: Commenters recommended that OCR revise the regulatory text of proposed § 92.207(b)(4) and (5) to address sex discrimination related to pregnancy or related conditions by adding discrimination related to abortion, fertility care, and contraception. Some commenters requested that OCR specifically add ''termination of pregnancy, contraception, fertility care, miscarriage management, pregnancy loss, maternity care, other reproductive and sexual health services, or any health services'' to the prohibitions on exclusions, limitations, and cost sharing related to gender transition or other gender-affirming care in § 92.207(b)(4) and (5).

Response: OCR declines this suggestion. Section 92.207(b)(4) and (5) are not intended to list all types of potentially prohibited exclusions. The general prohibition on discriminatory limitations under § 92.207(b)(1) would apply to any exclusion or limitation related to all types of care that resulted in discrimination on the basis of sex.

Comment: Some commenters stated that they oppose § 92.207 to the extent it violates religious freedom and conscience protections. Other commenters stated that they opposed § 92.207 because it prevents plans from excluding coverage of all gender affirming care.

Response: Section 92.207 does not violate such protections because providers may rely on the protections of Federal religious freedom and conscience laws or choose to seek assurance of those protections from OCR under this final rule. With respect to concerns about potential conflicts between provisions of the final rule and individuals' or organizations' conscience or religious freedom, please refer to the preamble discussion of § 92.302. Additionally, we are revising § 92.207(c) to specify that nothing in this section precludes a covered entity from availing itself of protections described in § 92.3 and § 92.302. This modification is consistent with the revised language in § 92.206(c). As noted elsewhere in this preamble, and in § 92.3(c), insofar as the application of any rule requirement would violate applicable Federal protections for religious freedom and conscience, such application shall not be required.

Comment: Many commenters expressed strong support for the provisions in § 92.207(b)(3) through (5), citing the extensive discrimination faced by transgender people in the health insurance coverage and other health-related coverage context. Several legal service providers described their experiences assisting clients facing various types of discrimination in their health plans, even where State law or the plan terms provided some protection for gender-affirming care. Some commenters noted these provisions also addressed forms of discrimination commonly faced by intersex people. Commenters noted that the physical, mental health, and financial costs of such discrimination could be high, with individuals forgoing necessary care, facing extreme financial

[199] *See* U.S. Dep't of Health & Hum. Servs., *Guidance to the Nation's Retail Pharmacies: Obligations Under Federal Civil Rights Laws to Ensure Nondiscriminatory Access to Health Care at Pharmacies* (Sept. 29, 2023), *https://www.hhs.gov/civil-rights/for-individuals/special-topics/reproductive-healthcare/pharmacies-guidance/index.html.*

burdens, and experiencing distress when denied access to necessary medical care.

Both supporters and opponents of the Proposed Rule raised many of the same issues discussed in § 92.206(b)(4) (prohibiting categorical coverage exclusions on gender transition or other gender-affirming care) and (c) (discussing legitimate, nondiscriminatory reasons for denying or limiting care) above. As with § 92.206, some commenters asked OCR to define gender-affirming care or provide more detail about what types of care must be covered.

Response: OCR agrees that transgender and intersex people have long faced discrimination in the health insurance coverage and other health-related coverage context. Many of OCR's responses to the comments in § 92.206(b)(4) (prohibiting categorical coverage exclusions on gender transition or other gender-affirming care) and (c) (discussing legitimate, nondiscriminatory reasons for denying or limiting care) above are applicable to the comments in this section as well. For example, for the reasons we discussed above, we will not provide a definition of ''gender-affirming care'' in the regulation text.

Comment: Commenters noted that even plans without categorical exclusions will exclude certain types of gender-affirming care as ''cosmetic.'' Commenters noted that categorizing procedures as cosmetic when needed for gender-affirming care is contrary to established standards of care for the treatment of gender dysphoria and urged OCR to explicitly prohibit such procedure-specific exclusions. Some commenters further noted that plans will often consider these procedures on a case-by-case basis when not related to gender transition but will not do so when the care is related to gender transition.

Many commenters recommended deleting the word ''all'' from § 92.207(b)(4) to make clear that the exclusion of *any* gender-affirming care from coverage is prohibited. Some commenters stated that this change would be more consistent with § 92.207(b)(5), which more generally prohibits discriminatory limits on gender-affirming care coverage.

Response: OCR appreciates commenters' feedback and concern about forms of discrimination beyond broad categorical coverage exclusions. While we understand that some gender-affirming care exclusions are limited to the specific type of care at issue, we decline to revise the language of § 92.207(b)(4). Section 92.207(b)(5)'s general prohibition on limitations or restrictions on coverage for gender transition or other gender-affirming care reaches the narrower exclusions or restrictions on gender-affirming care.

We also decline to state that any denial of gender-affirming care will necessarily be discriminatory regardless of context or rationale. We will instead consider claims of discrimination raising non-categorical denials on a case-by-case basis. Where OCR receives complaints about such exclusions or restrictions, we will investigate on a case-by-case basis whether they constitute prohibited discrimination under § 92.207(b)(5) or any other applicable provision of the rule. Since section 1557 only prohibits discrimination and does not prescribe any specific standard of care, such denials will violate the final rule only where they entail discrimination on the basis of sex. As stated throughout this section, covered entities will have the opportunity to provide a legitimate, nondiscriminatory reason for such exclusions or restrictions.

Comment: Some commenters proposed striking the phrase ''if such denial, limitation, or restriction results in discrimination on the basis of sex'' from § 92.207(b)(5), stating that the elimination would make this provision clearer. Commenters viewed this phrase as confusing and redundant, as they stated that limiting or restricting coverage for services related to gender-affirming care is necessarily discriminatory. Another commenter noted the intersectionality of discrimination and stated that this language may be limiting.

Response: For the reasons discussed above, we disagree that any restriction impacting gender-affirming care will necessarily constitute prohibited discrimination. For example, if an insurance plan places restrictions on coverage for gender-affirming surgeries that are no more stringent than the restrictions placed on any other type of surgical care, those restrictions will not violate the rule. As such, we decline to make the deletion proposed by these commenters.

OCR agrees that the rule prohibits discrimination in the provision or coverage of gender-affirming care whether it is on the basis of sex or on the basis of race, color, national origin, age, or disability. That said, allegations about such discrimination are best brought under § 92.207(b)(1), as § 92.207(b)(5) is aimed at the types of denials or limitations on coverage that are based on a person's gender identity and are thus a form of sex discrimination.

Comment: Commenters noted that even plans without categorical exclusions of gender-affirming care may adopt barriers to accessing such care, such as more stringent pre-approval processes. The commenters noted that these requirements could result in transgender people ultimately not receiving necessary care or having to invest significant time and resources to navigate the barriers. Some commenters additionally noted the high mental health toll on individuals facing discriminatory limitations on medically necessary care.

Response: OCR appreciates the commenter's feedback and concern about the forms of discrimination transgender people encounter in seeking coverage for gender-affirming care but declines to revise § 92.207(b)(3) as suggested. Section 92.207(b)(5) prohibits limitations or restrictions on coverage for gender transition or other gender-affirming care.

Comment: Many commenters supported the provisions limiting issuers' ability to deny care based on a person's sex assigned at birth, gender identity, or gender otherwise recorded, noting that transgender, nonbinary, and intersex people can all face such discriminatory denials. Other commenters objected to these provisions, expressing concern that this would compel issuers to pay for care that was not medically necessary or appropriate for a given individual.

Response: Section 92.207(c) makes clear that a nondiscriminatory determination that care is not medically necessary based on a patient's anatomy or medical need is permissible. For example, this final rule would not prohibit a covered entity from denying coverage for preventive health services for a transgender patient where such care is not medically necessary, such as a prostate exam for a transgender man who does not anatomically have a prostate. In contrast, the rule may prohibit a covered entity from denying coverage for medically necessary preventive care for a transgender patient.

Comment: One provider group urged OCR to work with the Office of the National Coordinator for Health Information Technology (ONC) and electronic health record vendors to ensure that there are options for separately identifying a patient's gender identity and anatomy to reduce the risk of improper denials.

Response: OCR appreciates the suggestion that discriminatory denials could be reduced if the records systems used by providers, issuers, and other covered entities provide better options

for recording gender identity and sex characteristics. While minimum standards for record systems are not within the scope of the rule, we are committed to working with ONC and other relevant stakeholders to explore solutions to this issue.

Comment: Commenters noted that transgender people often have difficulty getting their health coverage to update their records to reflect their correct name and gender. Commenters noted that gender marker mismatches in health insurance records can result in denial of coverage for clinically appropriate care, and one commenter urged OCR to make clear that claims processing procedures that automatically deny coverage for care based on a perceived mismatch of sex or gender is a form of impermissible sex discrimination.

Response: OCR appreciates commenters' concerns about coverage denials due to a sex mismatch in claims processing procedures, which can result in transgender patients being denied coverage for a medically necessary and clinically appropriate services. However, we decline to categorically state that sex mismatch denials are always discriminatory. Instead, OCR will consider and investigate complaints raising this issue on a case-by-case basis under § 92.207(b)(3). While we refrain from categorically stating that initial sex mismatch or coding denials are prohibited under this rule, we caution that denials resulting in an undue delay or denial of services, such as repeated denials, could result in a finding of prohibited discrimination. For more information on OCR's view of this issue, please see the 2016 Rule preamble's discussion on computer systems with gender coding resulting in gender mismatches at 81 FR 31436.

Comment: With respect to cases where coverage for comparable treatments is relevant to the discrimination analysis, some commenters urged OCR to clarify that the question of what is comparable can be construed broadly, rather than parsing minor differences in broadly similar types of care.

Response: OCR declines to identify a bright line of how similar care must be to be considered comparable when such considerations are relevant to a discrimination claim, as there are many factors that may be relevant to this analysis, and our approach is case by case.

Comment: Commenters who addressed the integration requirement in § 92.207(b)(6) overwhelmingly supported the newly proposed provision, which clarifies the prohibition on having or implementing benefit designs that do not provide or administer health insurance coverage or other health-related coverage in the most integrated setting appropriate to the needs of qualified individuals with disabilities. Several noted the particular importance of this provision and access to community integration in light of the COVID–19 pandemic and the higher infection risks associated with congregate settings. A few commenters noted the role that discrimination on multiple bases may play with regard to community integration, highlighting the overrepresentation of people of color in institutional settings, and the relationship between access to effective communication and community integration. Numerous comments included examples of current practices that may violate the integration provision.

Commenters agreed that this provision should apply to both benefit design and implementation of a benefit design, including: coverage, exclusions, and limitations of benefits; prescription drug formularies; cost sharing (including copays, coinsurance, and deductibles); utilization management practices; medical management standards (including medical necessity standards); provider network design; provider reimbursement; standards for provider admission to participate in a network; benefits and service administration contracted to third parties, such as pharmacy benefit managers; and quality measurement and incentive systems. Many commenters requested that OCR clarify that the convenience or potential cost-saving of administering treatments in institutional settings are not legitimate, nondiscriminatory reasons for not providing comparable benefits in less restrictive settings.

Commenters suggested that providing coverage to qualified individuals with disabilities in the most integrated setting appropriate should not be done in a way that unnecessarily increases costs for all enrollees or compromises individual health benefits.

Response: We appreciate support for the inclusion of this provision. OCR recognizes the importance of providing and administering health coverage in the most integrated setting appropriate to the needs of qualified individuals with disabilities; we also recognize that discrimination on multiple bases heightens barriers and are committed to addressing allegations of discrimination on all bases protected under section 1557. As discussed in the Proposed Rule, 87 FR 47873, this provision encompasses both the benefit design of the benefit being offered by a covered entity as well as the indirect mechanisms that affect the implementation of the benefit design within a covered entity's control, such as utilization management practices, provider reimbursement, contracting out to third-party contractors such as pharmacy benefit managers, and quality measurement and incentive systems. OCR is not prescriptive in the list of potential mechanisms that could result in prohibited discrimination through implementation of a benefit design because it is a case-by-case analysis depending on the facts of each situation.

With respect to concerns about unnecessarily increasing costs to comply with this provision, OCR notes that institutional care is generally more expensive than community-based care and that increased cost alone is not necessarily a fundamental alteration.[200] However, concerns related to cost can be raised through a fundamental alterations defense.[201]

Comment: Nearly all commenters who addressed this provision agreed with the 2022 NPRM preamble language stating that requiring prior authorization, step therapy, or other utilization management when individuals access treatment in the community but not in an institution, would constitute discrimination if the discrepancy results in unnecessary segregation or a serious risk of unnecessary segregation. Commenters noted that these practices place additional terms and conditions on the receipt of certain benefits in integrated settings that are not in place within segregated or institutional settings, and that they can often delay care and cause unnecessary institutionalization. For example, commenters asserted that people with physical and sensory disabilities, complex medical needs, and people with psychiatric and mental disabilities are often required to try less expensive and often unsuccessful medication (*i.e.,* step therapy) before being able to access effective treatments in the community. If utilization management techniques are only required for community-based treatment and not for institutional care, commenters argued this may push individuals urgently in need of care into institutional setting so they can access treatment more quickly. In contrast, one commenter suggested that it may be clinically appropriate to distinguish between institutional settings and home and community-based settings (HCBS) through the use of medical management

[200] *Fisher* v. *Okla. Health Care Auth.,* 335 F.3d 1175, 1183 (10th Cir. 2003).

[201] *Id.* at 1182.

tools like prior authorization and step therapy due to closer monitoring by medical professionals in institutional settings.

Response: OCR shares commenters' concerns about the potential discrimination associated with the serious risk of institutionalization. The integration mandates of the ADA and section 504 apply to people with disabilities who are at serious risk of segregation or institutionalization, not only to people with disabilities who are currently in institutions.[202] For example, an individual could show sufficient risk of institutionalization such that it would constitute a violation of this provision if a covered entity's failure to provide community services or its cut to such services will likely cause a decline in health, safety, or welfare that result in the serious risk of institutionalization or segregation.

As articulated in the Proposed Rule, 87 FR 47873, step therapy and other utilization management practices that impose different standards on members or beneficiaries in the community than in institutional settings are discriminatory if the discrepancy results in unnecessary segregation or a serious risk of unnecessary segregation. Section 1557's incorporation of section 504's integration provision through § 92.101(b)(1) makes clear that serious risk of institutionalization is covered under section 1557 as well, given that the vast majority of courts have found section 504 and title II of the ADA prohibits actions, omissions, policies, and practices that place individuals at serious risk of unjustified isolation. Indeed, nearly every court of appeals to address the issue has held that the integration mandate of the ADA and section 504 apply not only to people with disabilities who are currently in institutions, but also to people with disabilities who are at serious risk of segregation or institutionalization.[203] As noted in *Fisher* v. *Oklahoma,* the integration mandate's ''protections would be meaningless if plaintiffs were required to segregate themselves by entering an institution before they could challenge an allegedly discriminatory law or policy that threatens to force into segregated isolation.'' [204] Likewise, section 1557's integration mandate would ring hollow if individuals were required to show that they have already had to submit to institutionalization in order to assert their right to receive services in the most integrated setting appropriate to their needs.

Further, even if a serious risk of unnecessary institutionalization was not an actionable claim in and of itself, it would still be appropriate for courts to grant relief to those at serious risk in order to prevent the unnecessary institutionalization prohibited by law.[205] For these reasons, the rule's integration provision explicitly prohibits benefit design that results in a serious risk of institutionalization.

Plans continue to be able to limit services, use utilization review standards, and employ other limitations to manage costs as long as they are not discriminatory in doing so.

OCR has revised the regulation text to clarify that the integration requirement under section 1557 extends to practices that result in the serious risk of institutionalization or segregation. We recognize that the question of what constitutes ''serious risk'' is a fact-based inquiry, which is why the Federal courts to have considered the question have provided only general guidance on determining risk rather than an exhaustive test.[206]

Comment: Several commenters strongly disagreed with the 2022 NPRM preamble language that stated that a State Medicaid program would generally not be required to provide a new benefit because that would fundamentally alter the nature of the program. Commenters noted that a State Medicaid program or other covered entity may have to expand its HCBS waiver programs or modify eligibility for particular services where necessary to satisfy the integration provision, and that there are many situations in which a State program has been required to create a ''new'' community-based benefit, where that benefit was previously only available in institutional settings. For example, commenters stated that a covered entity that provides for residential treatment for certain substance use disorder conditions and does not provide coverage of such services in appropriate community-based settings may need to create a ''new benefit'' by offering an existing institutional benefit in the community.

Response: After considering these comments, we clarify here that while a State Medicaid program is not required to create ''new'' programs to assist people with disabilities, nor are states required to provide a particular standard of care or level of benefits, covered entities must nevertheless adhere to section 1557's disability nondiscrimination requirements—including the integration requirement—with regard to the services they in fact provide. When a covered entity chooses to provide a service, it must do so in a nondiscriminatory fashion by ensuring access to that service in the most integrated setting appropriate to the needs of the qualified individual.[207] States may be required to offer services in an integrated setting that they have only been offering in segregated settings; that is not offering a ''new service,'' but instead is ensuring the service is offered in integrated settings and not just in segregated settings.[208]

[202] *See, e.g., Waskul* v. *Washtenaw Cnty. Cmty. Mental Health,* 979 F.3d 426, 460–62, (6th Cir. 2020) (''Plaintiffs may thus state a claim by sufficiently alleging that they are at serious risk of institutionalization''); *Steimel* v. *Wernert,* 823 F.3d 902, 911–12 (7th Cir. 2016) (agreeing that the mandate applies to ''persons at serious risk of institutionalization or segregation''); *Davis* v. *Shah,* 821 F.3d 231, 262–64 (2d Cir. 2016) (''We thus hold that a plaintiff may state a valid claim . . . by demonstrating that the defendant's actions pose a serious risk of institutionalization for disabled persons.''); *Pashby* v. *Delia,* 709 F.3d 307, 322 (4th Cir. 2013) (individuals state claims under the ADA and the Rehabilitation Act when ''they face a risk of institutionalization''); *M.R.* v. *Dreyfus,* 663 F.3d 1100, 1117–18 (9th Cir. 2011), *amended by* 697 F.3d 706 (9th Cir. 2012) (plaintiff must ''show that the challenged state action creates a serious risk of institutionalization''); *Fisher* v. *Okla. Health Care Auth.,* 335 F.3d 1175, 1181–82 (10th Cir. 2003) (plaintiffs who ''stand imperiled with segregation'' because of state action may state a claim under the ADA's integration mandate); *but see U.S.* v. *Miss.,* No. 21–60772, 2023 WL 6138536, at *5–*9 (5th Cir. [208] *See* U.S. Dep't of Justice, Civil Rts. Div., *Statement of the Dep't of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and Olmstead* v. *L.C.,* Question 8 (February 28, 2020), *https://www.ada.gov/olmstead/q&a_olmstead.htm* (stating that ''(p)ublic entities cannot avoid their obligations under the ADA and Olmstead by characterizing as a ''new

Continued

OCR clarifies that a program providing community-based services that are already available in institutional settings is not a new program for purposes of evaluating a fundamental alteration defense.[209] In addition, states may be required to offer services in an integrated setting that have only been offered in a segregated setting. Providing services beyond what a State currently covers under its Medicaid program may not be a fundamental alteration under § 92.205 (Requirement to make reasonable modifications), and existing nondiscrimination law, including section 504 and the ADA,[210] may require states to provide those services, under certain circumstances. In addition, to the extent that a benefit, including an optional benefit, is already provided in institutions as part of the State's program, the same or a substantially similar benefit must be offered in the community in a manner that does not incentivize institutional services over community services.

Comment: OCR received many comments in response to our request for comment on the application of the integration provision to State Medicaid programs. A number of comments related to Medicaid program designs required by title XIX of the Social Security Act. One commenter recommended that any action by a State Medicaid authority to reduce the existing scope of Medicaid-funded home and community-based long term services and supports, or to more strictly limit eligibility for them, that would have the effect of forcing people with disabilities who currently do, or could, live in their own homes and participate in unrestricted community activities into segregated, congregate, and/or institutional residential or day settings, or to cease their current level of community participation, on the basis of any general categorization of disability would be discriminatory under this provision.

Response: We appreciate the many comments highlighting potential issues related to community integration and State Medicaid programs. This rule does not impact the ability of states to target benefits under section 1915(c), section 1915(i), or section 1937 of the Social Security Act, consistent with Medicaid law. At the same time, the fact that a State chooses to use a Medicaid authority to target a particular disability population does not relieve a State of its obligations towards other populations. We will continue to work with our partners in CMS to ensure the robust provision of services in a nondiscriminatory manner to the maximum extent possible. We remind covered entities that obligations under the Medicaid statute are distinct from obligations under section 1557, and compliance with Medicaid requirements does not per se constitute compliance with section 1557.

Comment: A significant number of commenters raised concerns with ''use-in-the-home'' policies, where an insurance issuer will cover the provision of a benefit or service solely for use ''in the home.'' For example, commenters discussed that a covered entity might offer supplemental oxygen equipment for use in the home but decline to provide sufficient oxygen or equipment for an individual to access the broader community. Similarly, commenters noted that issuers might decline to cover medically necessary wheelchairs with functions that an individual needs to access the broader community outside their home. Commenters also provided examples of other kinds of medical diagnostic equipment, durable medical equipment, and home-use devices that are often not covered, but which would replace services provided in an institution and enable individuals to receive care in their home and community.

Commenters expressed concern that many State Medicaid programs, delegated managed care companies, and employer-sponsored private health plans have adopted the Medicare Mobility Assistive Equipment Coverage Policy [211] (a policy designed specifically to apply in the context of Medicare Part B) as their policy, despite what commenters see as the statutory differences between Medicare Part B and other authorities. Commenters contended that the unnecessary and unmandated adoption of such a policy in all programs unnecessarily restricts benefits to a low bar, denying people the ability to live in the most integrated setting possible.

Response: We appreciate the concerns raised by commenters. Each covered entity should review any legal authority governing the coverage they may provide to ensure that they are not interpreting it in a manner that results in discrimination. For example, Medicaid programs that impose homebound or ''in-the-home'' criteria that are not statutorily required under Federal law may be unnecessarily restricting services in the community in violation of civil rights laws. Where an in-the-home restriction is included in a statute, covered entities may not automatically deny coverage for any good or service that may also have use outside of the home, but must assess each claim to determine whether the denial will violate the most integrated setting requirement.

Comment: Many commenters expressed the need for § 92.207(b)(6), due to states increasingly turning to managed care plans to deliver Medicaid benefits. These commenters expressed concern that large issuers that administer a range of private employer plans and individual plans, as well as public Medicare and Medicaid plans, could employ uniform coverage policies across their plans that do not adequately support community integration. Commenters additionally noted that that Medicaid agencies should monitor whether Medicaid Managed Care Organizations (MCOs) are appropriately authorizing services in the community and that under current law states contracting with MCOs cannot escape liability when MCOs discriminate against people with disabilities.

Response: We appreciate the concerns raised by commenters. We recognize the increasing reliance on alternative payment models for the delivery or management of services to individuals with disabilities. The shift towards managed care in State Medicaid programs and other changes, such as quality incentives, quality assurance activities, and risk-sharing arrangements, requires addressing unnecessary segregation in these emerging models in this rule.

As we noted in the Proposed Rule, 87 FR 47873, covered entities designing contracts with MCOs, pharmacy benefit managers, or other third-party entities taking on financial risk for the delivery of health services should carefully scrutinize their capitation,

service'' services that they currently offer only in institutional settings.''); *see also Townsend* v. *Quasim,* 328 F.3d 511, 517 (9th Cir. 2003) (''Here, the precise issue is not whether the state must provide the long term care services sought by Mr. Townsend and the class members—the state is already providing these services—but in what location these services will be provided.'').

[209] *See Townsend,* 328 F.3d at 517 (''[c]haracterizing community-based provision of services as a new program of services not currently provided by the state fails to account for the fact that the state is already providing those very same services. If services were to constitute distinct programs based solely on the location in which they were provided, *Olmstead* and the integration regulation would be effectively gutted.'').

[210] While this final rule periodically references the ADA and section 504, the requirements under this rule are under section 1557, a separate legal authority. Accordingly, the integration requirements, like other requirements under this section 1557 rule, do not limit or impact the interpretation of integration requirements under the ADA and section 504.

[211] U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *National Coverage Determination, Mobility Assistive Equipment (MAE)* (2005), *https://www.cms.gov/medicare-coverage-database/view/ncd.aspx?NCDId=219.*

reimbursement, quality measurement, and incentive structures to ensure that they do not result in the unjustified segregation of individuals with disabilities or place individuals with disabilities at serious risk of institutionalization or segregation. When responsibility for services is shared across multiple entities, for example, under a managed care contract, both the State Medicaid agency and the contracted entity have obligations under this provision if they are both recipients of Federal financial assistance.

Comment: Many commenters discussed challenges related to mental health services, noting that the lack of available and funded community alternatives to institutional mental health care will continue to result in the institutionalization of individuals with serious mental illness, whether in hospitals, inpatient psychiatric facilities, prisons, or other secure facilities.

Many commenters voiced concern related to discharge planning, as people requiring intensive mental health services are often referred only to institutional or otherwise congregate care options, rather than comparably intensive services in community-based settings. Commenters recommended that OCR clarify that this can constitute a violation of the integration provision if it forces people with psychiatric disabilities to enter segregated settings in order to receive access to adequate services.

Other commenters discussed the disparity in access to community-based care for children who need mental health care.

Response: OCR appreciates the significant concerns related to the availability of community-based behavioral health services, particularly services to address youth mental health. With respect to discharge planning, a hospital or acute care provider that routinely discharges individuals with disabilities, including those with serious mental illness, to nursing homes, psychiatric residential treatment facilities, or other segregated care settings due to discharge planning procedures that do not assess for home-based support services or refer individuals to community-based providers may violate this provision. Covered entities are prohibited from implementing planning, service system design, and service implementation practices that result in the serious risk of institutionalization or segregation.

Comment: Several commenters provided insight into the relationship between community integration and reimbursement rates necessary to sustain a direct care workforce. Commenters explained that individuals receiving care in the community often fail to receive all of the hours of care for which they are approved due to a lack of provider capacity to fully staff the approved hours. Commenters noted that nurse's aides and other individuals who provide assistance in institutional settings are often paid at a higher rate than home health aides and other direct care professionals, resulting in an imbalanced direct care workforce. Commenters emphasized the importance of rate setting to incentivize HCBS.

Response: Reimbursement rates and network adequacy both constitute methods of program administration. As such, these are factors that OCR would consider as reimbursement practices or methods of administration related to this provision.

Comment: Commenters suggested additional guidance clarifying implementation of this provision, including incorporating DOJ's guidance on enforcement of the integration requirement under title II of the ADA describing how to provide the most integrated setting appropriate for an individual or group of individuals; [212] addressing the remedies available for violations of the integration provision; and explaining how OCR will undertake a fundamental alteration analysis. One commenter recommended incorporating the fundamental alteration defense into regulatory text. Commenters underscored the importance of setting a high bar for a fundamental alteration, noting that programs must alter an essential aspect of the health program or activity. Other commenters urged OCR to clarify how the fundamental alteration analysis applies to the integration provision, including whether and how OCR will incorporate DOJ guidance and case law related to the ADA's fundamental alteration defense for ADA title II entities. Commenters also requested clarification on whether covered entities will be required to establish an *Olmstead* integration plan [213] to raise the fundamental alteration defense, and if so, guidance related to that requirement.

Commenters also asked OCR to explain in future guidance how covered entities, including Medicaid programs, must coordinate community-based primary care and specialty mental health care and offer case management to avoid discrimination on the basis of disability and to avoid placing individuals with mental disabilities at serious risk of institutionalization.

Commenters further suggested guidance to covered entities explaining the specific HCBS that are essential to achieving compliance with the integration requirement, including as part of EHB. Commenters suggested that it would be discriminatory if EHB plans set higher reimbursement rates for a service or item for individuals in segregated settings rather than community-based settings; if rehabilitation services for physical conditions are covered, but not psychiatric rehabilitation services; and if a particular benefit (such as personal care services) is offered in greater amounts to individuals in segregated settings by virtue of the plan benefit design.

Finally, commenters encouraged OCR to develop joint guidance with DOJ on section 1557, section 504, and titles II, III, and IV of the ADA to ensure the rights of people with disabilities to access community integration in health care settings.

Response: We appreciate the comments requesting clarification through sub-regulatory guidance. We will consider future guidance after this rule has been finalized and are committed to our continued partnership with DOJ in developing shared guidance on civil rights requirements. The availability of the fundamental alteration defense is clear as drafted and so we decline to specifically incorporate this recommendation into regulation text. In this final rule, we clarify that a program is not required to provide coverage for a service in the most integrated setting appropriate to an individual's needs if it would fundamentally alter the program to do so.

Comment: Commenters, primarily representatives of the insurance industry, supported proposed § 92.207(c) that specified nothing in this section requires coverage of any health service where the covered entity has a legitimate, nondiscriminatory reason for determining that such health service fails to meet applicable coverage

[212] U.S. Dep't of Justice, Civil Rts. Div., *Statement of the Dep't of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and Olmstead* v. *L.C.* (June 22, 2011), *https://www.ada.gov/olmstead/q&a_olmstead.htm.*

[213] Under the ADA, an *Olmstead* plan is a public entity's plan for implementing its obligation to provide individuals with disabilities opportunities to live, work, and be served in integrated settings. U.S. Dep't of Justice, Civil Rts. Div., *Statement of the Dep't of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and Olmstead* v. *L.C.* (June 22, 2011), *https://www.ada.gov/olmstead/q&a_olmstead.htm.*

requirements, such as medical necessity requirements, in an individual case. Commenters appreciated that OCR acknowledged that a covered entity's legitimate, nondiscriminatory reason for its actions may serve as a defense under this section.

Some commenters requested clarification that use of the phrase ''legitimate, nondiscriminatory reason'' not be construed in any way to limit the method of proof for any section 1557 claim to the *McDonnell Douglas* burden-shifting framework; that this method cannot be used to defend an express sex classification that causes injury; that the familiar but-for causation test applies to establishing a violation of section 1557; and that the *McDonnell Douglas* burden-shifting framework and legitimate nondiscriminatory reason framework apply to circumstantial evidence cases but not where there is direct evidence of discrimination.

Response: OCR appreciates commenters' support of this provision. As discussed throughout this section and in the Proposed Rule, in instances where there is not a facially discriminatory policy and OCR is investigating whether a particular action or practice is discriminatory under this rule, covered entities have the opportunity to defend the challenged action or practice by providing a legitimate, nondiscriminatory reason for its actions that is not pretext for discrimination. OCR will then evaluate whether the reason given by the covered entity is a pretext for prohibited discrimination. When considering whether a proffered reason is pretextual, OCR will consider, among other things, whether a denial of a health service is based on medical necessity standards or other reasonable medical management techniques that are not discriminatory, as discussed in more detail below.

To provide additional clarity about OCR's analysis when evaluating whether a covered entity's legitimate, nondiscriminatory reason is pretextual, OCR is revising § 92.207(c) to state that a covered entity's denial or limitation of a health service must not be based on unlawful animus or bias, or constitute a pretext for discrimination. This modification is consistent with the revised language in § 92.206(c). Under either section, in instances where there is no evidence of a facially discriminatory policy, covered entities may assert a legitimate, nondiscriminatory basis for actions that could otherwise give rise to the inference of discrimination. Consistent with general principles of civil rights law, OCR will consider such asserted bases but may also investigate to determine whether such asserted bases are pretextual and whether there is evidence that the challenged action was taken because of unlawful animus, bias, or other discriminatory factors.

In evaluating claims of discrimination, OCR relies on general nondiscrimination principles and longstanding civil rights case law. Such principles include, but are not limited to, the multi-factor test articulated in *Arlington Heights* and the *McDonnell Douglas* burden-shifting framework, which were discussed in detail in the Proposed Rule at 87 FR 47865. *Arlington Heights* sets forth a method of proof that utilizes different types of evidence that collectively may demonstrate that a covered entity acted, at least in part, because of a protected basis. The *McDonnell Douglas* burden-shifting framework is an inferential method of proof used to show that a covered entity treated similarly situated individuals differently because of a protected basis. Under *McDonnell Douglas,* where non-facial evidence of discrimination exists, a covered entity must articulate a legitimate, nondiscriminatory reason for its actions. The entity's legitimate, nondiscriminatory reason may refute the evidence of discrimination, unless it can be established that this reason is a mere pretext for prohibited discrimination. In response to the commenters' concerns about how § 92.207(c) may be interpreted inconsistently with the principles set forth in *McDonnell Douglas* and other civil rights principles, please see our response to the same comments under § 92.206 in which we affirm commenters' interpretations are correct—*McDonnell Douglas'* burden-shifting framework and legitimate nondiscriminatory reason framework apply to circumstantial evidence cases but not in cases where there is direct evidence of discrimination based on a facially discriminatory policy.

Comment: Some commenters appreciated OCR clarifying that medical management techniques based on clinical evidence are permitted, including the use of reasonable medical necessity and utilization management techniques based on clinical standards and evidence-based guidelines, when applied in a neutral manner. Commenters noted that medical management tools provide an important role in promoting quality care and reducing health care costs.

Other commenters raised concerns about medical necessity criteria and other medical management tools, noting that such tools may limit access to needed services and treatment. Commenters noted that discriminatory decisions often occur under the guise of medical necessity determinations. Some commenters argued that medical management practices such as prior authorization, step therapy, and durational or quantity limits are inherently discriminatory and inconsistent with patient health and safety. Many commenters strongly supported OCR clarifying that excessive use or administration of benefit utilization management tools that target particular disabilities could violate section 1557. Commenters asked OCR to expressly note the limitation on the use of utilization management tools in the text of the regulation.

Commenters asked OCR for examples of excessive medical management and suggested the following examples: requiring step therapy for new enrollees who are already on a working course of treatment; transferring management of particular medicines to niche vendors that apply more extensive medical management through specialty carve-out programs; requiring the use of off-label medications within step therapy; and imposing categorical prior authorization and step therapy requirements on most or all drugs required to treat a particular disease. Commenters noted that issuers apply such medical management techniques to discourage individuals with high-cost needs from enrolling in their plans. A commenter cited evidence that plans have restricted access to lower-cost brand drugs and generics when demand for those drugs attracts patients who have overall high health costs.[214] Other commenters noted that information about treatment limitations can be difficult to find for enrollees and cited evidence of issuers building arbitrary coverage denials into their business plans.[215] Commenters cited a study that found that more than half of step therapy policies developed by commercial health plans were more

(2022), *https://www.kff.org/private-insurance/issue-brief/claims-denials-and-appeals-in-aca-marketplace-plans/* (finding nearly 17 percent of in-network claims in non-group qualified health plans were denied in 2021; insurer denial rates varied widely around this average, ranging from 2 to 49 percent; about 14 percent were denied because the claim was for an excluded service, 8 percent were due to lack of preauthorization or referral, 2 percent were based on medical necessity, and 77 percent were classified as ''all other reasons'').

restrictive than recommended clinical guidelines.[216]

Some commenters requested that OCR revise the text of § 92.207(c) to state that, in addition to medical necessity requirements, covered entities may employ reasonable medical management techniques.

Response: OCR appreciates the variety of comments and recommendations put forth by commenters related to the rule's coverage of medical management techniques, including medical necessity standards and utilization management techniques.

OCR agrees that revising the regulatory text to reference reasonable medical management techniques would provide clarity and would be consistent with other provisions in the ACA and the Proposed Rule. Therefore, OCR is revising § 92.207(c) to state that applicable coverage requirements include reasonable medical management techniques, including medical necessity.

Further, as stated in the Proposed Rule, covered entities are not prohibited from employing reasonable medical management techniques as long as they are not discriminatory and are not otherwise prohibited under other applicable Federal and State law. 87 FR 47873–74. As just one example, covered entities participating in the Medicaid program under title XIX of the Social Security Act are not prohibited from implementing nondiscriminatory utilization management techniques, such as prior authorization.[217]

Under § 92.207(c), an issuer may assert a legitimate, nondiscriminatory reason for its denial or limitation of coverage of a health service that asserts the denial was based on medical necessity standards—or any other medical management technique. When assessing whether the challenged action was based on prohibited discrimination rather than on nondiscriminatory medical necessity standards, OCR will review a medical necessity determination only to make sure that it is a bona fide medical judgment, not conduct a review of the medical judgment underlying the medical necessity determination, but rather will assess whether the rationale for the denial was based on impermissible discriminatory considerations. In its review, OCR may require a covered entity to provide the following information: its medical necessity standards or guidelines; the clinical, evidence-based criteria or guidelines [218] relied upon to make the medical necessity determination; and the medical substantiation for the medical necessity determination. As discussed previously, OCR will evaluate a covered entity's assertion that its actions were based on legitimate, nondiscriminatory reasons to determine if it is pretextual. Medical necessity determinations that are not based upon general medical judgments or based on clinical, evidence-based criteria or guidelines may be considered evidence of pretext for discrimination.

Similarly, as noted in the Proposed Rule, 87 FR 47872, we affirm that covered entities are not prohibited from using other reasonable medical management techniques, such as utilization management tools, when applied in neutral, nondiscriminatory manner and not otherwise prohibited under other applicable Federal and State law. Utilization management techniques include prior authorization,[219] step therapy (or ''fail-first''),[220] and durational or quantity limits.[221]

OCR shares commenters' concerns about potentially discriminatory practices related to medical management techniques and the negative impacts of excessive utilization management. As such, when relying on medical necessity requirements and other medical management techniques to deny coverage for a health service, covered entities must ensure that such tools are developed and applied in a neutral, nondiscriminatory manner. OCR would have concerns about guidelines that establish more restrictive requirements for certain diseases or conditions without a nondiscriminatory justification. In addition, OCR expects that limitations within such guidelines should be applied consistently with clinical standards within each patient population disease state, condition level, and diagnostic category to ensure equal clinical treatment across protected bases. That is, all patients diagnosed with a particular disease state must receive the same treatment that is deemed clinically appropriate, regardless of their race, color, national origin, sex, age, or disability.

We affirm that excessive use or administration of utilization management practices that target a particular condition that could be considered a disability or other prohibited basis under section 1557 could be discriminatory under this rule. OCR declines to state in preamble or regulatory text that specific practices are per se discriminatory under section 1557. As discussed throughout this section, OCR must conduct a fact-specific inquiry into allegations of discriminatory actions and consider a covered entity's proffered reason for the challenged action.

Comment: OCR received a number of comments discussing costs as a legitimate, nondiscriminatory reason for benefit designs under § 92.207(c). Commenters supported the rule allowing clinical evidence to support a benefit design and requested that OCR allow covered entities to use extraordinary costs as justification for certain benefit designs. Commenters stated that covered entities use utilization management controls, such as drug tiering, as part of their benefit design to keep coverage affordable. Commenters noted concerns that high-cost drugs or other services could lead to health plans becoming insolvent if they are unable to apply utilization management controls where all treatments for a particular condition are high cost, particularly when they are expensive new drugs or gene therapies. Commenters argued that issuers and plans must retain some flexibility in their approach to covering and paying for high-cost drugs and services. Commenters expressed concern that § 92.207 would prohibit covered entities from having utilization management controls on all or most drugs or services

[216] Kelly L. Lenahan et al., *Variation in Use and Content of Prescription Drug Step Therapy Protocols, Within and Across Health Plans,* 40 Health Affairs 11, 1749–57 (2021), *https://www.healthaffairs.org/doi/abs/10.1377/hlthaff.2021.00822?journalCode=hlthaff* (finding that plans applied step therapy in 38.9 percent of drug coverage policies, with varying frequency across plans (20.6–57.5 percent); 34.0 percent were consistent with corresponding clinical guidelines, 55.6 percent were more stringent, and 6.1 percent were less stringent).

[217] *See, e.g.,* 42 U.S.C. 1396r–8(d).

[218] *See also* Patient Protection and Affordable Care Act; HHS Notice of Benefit and Payment Parameters for 2023, 87 FR 27208, 27296–300 (May 6, 2022) (discussing newly promulgated 45 CFR 156.125(a), which states ''[a] non-discriminatory benefit design that provides [EHB] is one that is clinically-based'').

[219] Medicare defines ''prior authorization'' as ''the process through which a request for provisional affirmation of coverage is submitted to CMS or its contractors for review before the service is provided to the beneficiary and before the claim is submitted for processing.'' 42 CFR 419.81 (Medicare definition of ''prior authorization'' for hospital outpatient department services). *See also* Ctrs. for Medicare & Medicaid Servs., *Prior Authorization Process for Certain Hospital Outpatient Department (OPD) Services Frequently Asked Questions (FAQs),* Q1 (Dec. 27, 2021), *https://www.cms.gov/files/document/opd-frequently-asked-questions.pdf.*

[220] Medicare defines ''step therapy'' for the Medicare Advantage Program as a ''utilization management policy for coverage of drugs that begins medication for a medical condition with the most preferred or cost effective drug therapy and progresses to other drug therapies if medically necessary.'' 42 CFR 422.2.

[221] Durational or quantity limits place limits on the frequency or number of benefits to be provided, such as limiting therapy visits to once per week or limiting prescription drug coverage to a 30-day supply of a medication.

that treat a particular condition or disease, regardless of their cost, and asked OCR to affirm that placing all treatments for a certain disease or condition in one tier may not in fact be discriminatory by default, but rather an appropriate benefit design due to the high cost of those particular items or services.

Conversely, other commenters asked OCR to clarify that covered entities cannot justify benefit designs that disfavor coverage for medically necessary services based on cost savings. Commenters noted that as costs of medications and therapies have increased, covered entities have significantly increased the use of utilization management, including adding arbitrary prior authorization processes not based in clinical evidence for new cancer therapies. They added that rare disease patients face the additional challenge of having no or few treatment alternatives if a preferred medication or therapy is not covered.

Response: OCR reiterates that § 92.207 does not prohibit a covered entity from engaging in reasonable utilization management techniques applied in a neutral, nondiscriminatory manner and that are not otherwise prohibited under other applicable Federal and State law. As noted above, excessive use or administration of utilization management tools that target a particular condition that could be considered a disability or other prohibited basis could violate section 1557. Where there is an alleged discriminatory practice or action that is not based on a facially discriminatory policy, § 92.207(c) provides that the covered entity has the opportunity to provide a legitimate, nondiscriminatory reason for the practice. Covered entities are not restricted in what information they elect to provide to OCR as part of their justification for the challenged practice or action. OCR will carefully review a covered entity's proffered reason to ensure it is not pretext for discrimination.

OCR discussed previously that determinations on whether a particular benefit design feature is discriminatory, such as utilization management or drug tiering, will be made on a case-by-case basis. Accordingly, OCR declines to specify whether certain benefit design practices are per se discriminatory.

Comment: One organization raised concerns that OCR is asserting *de facto* authority over the relationship between health insurance and medical care, and that OCR is asserting that it has authority under section 1557 to regulate the practice of medicine and the structure of health insurance coverage according to its own determination of what is ''appropriate'' and ''nondiscriminatory,'' along with the authority to definitively determine what is, or is not, the current standard of medical care. The commenter further states that OCR may in the future assert and exercise similar claims of authority with respect to other medical practices, standards of care, or health insurance coverages.

Response: As previously discussed throughout this preamble, section 1557 was intended to prohibit discrimination in health insurance coverage and other health-related coverage, as the statute's plaint text makes apparent. Congress expressly granted the Secretary the authority to promulgate regulations to implement section 1557. 42 U.S.C. 18116(c). Therefore, OCR is acting within its statutory authority in promulgating this final rule to regulate health insurance coverage or other health-related coverage provided or administered by a recipient health insurance issuer or other covered entity. OCR disagrees with the commenter that this rule establishes a standard of medical care, or requires certain health insurance coverages. As specified in the preceding discussion, when assessing whether a challenged action was based on prohibited discrimination rather than on nondiscriminatory medical necessity standards, OCR will not conduct a general review of the medical judgment underlying the medical necessity determination, but rather will assess whether there is facial or other direct evidence of discriminatory intent or if a proffered rationale for the denial was pretext for discrimination. Further, this final rule does not require coverage of a particular health service; rather, it requires that the coverage being offered must be provided in a neutral and nondiscriminatory manner.

Comment: Commenters stated that issuers should provide transparent information on coverage details, utilization management practices, denial rates, and reasons for denials. Specifically, a commenter requested that this section be strengthened by implementing a requirement for health plans to disclose medical necessity determinations when care or coverage is denied based on medical necessity to individual enrollees. The commenter further suggested that OCR adopt the approach in the MHPAEA final rule, requiring disclosure of medical necessity criteria to potential beneficiaries or enrollees and the reasons behind denials of coverage or reimbursement. Commenters emphasized that disclosure would help providers and consumers to identify and challenge discriminatory denials of medically necessary care, which can be difficult to do when data regarding the coverage they need either does not exist or the issuer holds the data on details of coverage, denial rates, and reasons for denial.

Response: OCR agrees with commenters that transparency about medical management policies and coverage determinations and denials is useful information for the public, and we encourage issuers to disclose such information to all enrollees. OCR considered requiring issuers to affirmatively disclose certain plan information to the public, but we decline to do so at this time. We have determined that placing a transparency requirement on health insurance issuers covered under section 1557 would not be helpful on issuers if required in every situation, and because the scope and application of section 1557 is broader than, and imposes different requirements from, MHPAEA. We stress that OCR has the authority to request and receive information from a covered entity on the details of coverage, medical management policies, denial rates, and reasons for denials, among other things, when necessary to determine compliance with section 1557.[222] In addition, we note that appeals processes that subject individuals protected by section 1557 to excessive administrative burdens in accessing coverage benefits that other enrollees are not required to navigate when accessing coverage may be discriminatory under section 1557.

Comment: OCR received many comments on the use of value assessment methods in benefit design and pricing and coverage decisions, and their impacts on treatments for people with disabilities and older adults, particularly in access to prescription drugs and benefit design. Commenters suggested that some payers use these assessment methods to steer patients away from newer or more innovative treatments to less effective options. Commenters on this issue appreciated OCR's recognition in the Proposed Rule that these methods can have discriminatory impacts, though commenters did not provide uniform input about how to address these impacts.

Several commenters called for increased oversight of value assessment methods by OCR, and some called on OCR to ban the use of the quality-

[222] 45 CFR 92.303 (section 1557); 80.6 (title VI); 84.61 (section 504, incorporating title VI's § 80.6); 86.71 (title IX, incorporating title VI's § 80.6); 91.34 (Age Act).

adjusted life year (QALY) framework and similar methods. Commenters supporting a ban on the use of QALYs stated that these methods are inherently discriminatory because they assign a lesser numerical value to extending the lives of people with disabilities and older adults compared to people without disabilities or younger persons, especially when applied to benefit design or access to prescription drugs.[223]

Response: OCR recognizes that value assessment methods can be helpful tools in making decisions in various contexts within health care and are used widely. The use of value assessment methods that result in discrimination on the basis of race, color, national origin, age, disability and sex are prohibited under section 1557's general mandate of nondiscrimination. That is, where a value assessment uses methods that penalize patients or groups of patients on a ground protected by section 1557 and where such methods then result in limiting access to an aid, benefit, or service, they may violate section 1557. In response to commenters, we note that value assessment tools cannot be used to, to deny or afford an unequal opportunity to qualified individuals with disabilities or on the basis of age with respect to the eligibility or referral for, or provision or withdrawal of any aid, benefit, or service, including the terms or conditions under which they are made available. We further note that methods of value assessment are permissible so long as they do not discriminate in discounting the per-year value of life extension on the basis of age or disability under section 1557.

In addition, OCR has proposed a prohibition against the discriminatory use of value assessment methods in pending rulemaking under section 504. 88 FR 63409. Proposed § 84.57, which applies to recipients of Federal financial assistance from HHS, prohibits, directly or through contractual, licensing, or other arrangements, using any measure, assessment, or tool that discounts the value of life extension on the basis of disability to deny or afford an unequal opportunity to qualified individuals with disabilities with respect to the eligibility or referral for, or provision or withdrawal of any aid, benefit, or service, including the terms or conditions under which they are made available.

Given that many different measures exist for use in value assessment and may be applied in different ways, this discussion applies to evaluating any value assessment methodology rather than commenting on specific measures at this time. However, we appreciate the concerns raised by the commenters and will take them into account as OCR proceeds with future work on value assessment.

Comment: Many comments on value assessment also requested further development of new value assessment measures and the incorporation of input from patients with disabilities (and, per some commenters, their family members and providers) into value assessment schema. Commenters urged the Department to support the development and dissemination of these methodologies. Another commenter noted that cultural barriers existed in institutions that prevented the adoption of new metrics.

Response: OCR appreciates commenters' input and encourages and supports the development of such metrics and the incorporation of input from people with disabilities and other interested groups protected under section 1557, as reflected in research priorities elsewhere in the Department. Numerous research and grantmaking initiatives from the National Institutes of Health (NIH) and the National Institute on Disability, Independent Living, and Rehabilitation Research (NIDILRR) support this and similar efforts.[224] In addition, OCR notes that the National Council on Disability issued an updated policy brief released in November 2022.[225]

Benefit Design Analysis

The comments and our responses regarding benefit design are set forth below.

In the Proposed Rule, we discussed that OCR will apply basic nondiscrimination principles to the facts of the particular plan or coverage when analyzing allegations of discrimination under this section to determine if the challenged action is unlawful. We discussed that, consistent with general principles in civil rights law, covered entities will have the opportunity to articulate a legitimate, nondiscriminatory justification for an alleged discriminatory action or practice, and that OCR will scrutinize the justification to ensure it is not a pretext for discrimination.

Comment: Some commenters requested that OCR provide additional guidance explaining how it intends to investigate potential violations by health programs or activities engaged in providing or administering health insurance coverage or other health-related coverage and to ensure ongoing compliance with Federal law. Commenters urged OCR to establish clear, predictable standards that covered entities can rely upon when designing their plans and that will ensure OCR's ''case-by-case'' analysis does not result in only retroactive reviews of existing plans or lead to arbitrary results.

Another commenter noted that if OCR will not provide presumptively discriminatory benefit design examples, OCR should provide more information to educate covered entities about what OCR interprets to be best practices other than the information, corrective plans, and resolution agreements it stated it would publish on its website in the 2016 Rule. The commenter urged OCR to publicly publish deidentified information on each and every investigation that it pursues, including the specific actions purported to be discriminatory by a covered entity, the alleged basis of discrimination, and OCR's resolution of the complaint so that covered entities can educate themselves on best practices and actions that OCR may deem to be discriminatory.

Response: We appreciate the comments requesting further specificity regarding OCR's analysis when investigating potential violations under this section. We agree that providing clarity to covered entities promotes compliance and reduces prohibited discrimination. Each potentially discriminatory action involves unique

[223] These concerns were also highlighted in testimony at a recent Congressional hearing on proposed legislation to ban the use of QALYs in all Federal health programs. *See Lives Worth Living: Addressing the Fentanyl Crisis, Protecting Critical Lifelines, and Combatting Discrimination Against Those with Disabilities: Hearing on H.R. 467, H.R. 498, H.R. 501, and H.R. 485 Before the Subcomm. on Health of the H. facts and circumstances that must be independently investigated on a case-by-case basis before OCR can determine whether a challenged action is considered discriminatory under this section, particularly considering that each covered entity's reason for engaging in the challenged action may be specific to that covered entity and the circumstances surrounding its decision process. For example, when determining whether a challenged design feature is discriminatory, OCR considers the benefit design of the plan as a whole, whether similar limitations or restrictions are placed on other types of health services, and whether the covered entity consistently relies on neutral, nondiscriminatory criteria when developing the design feature, among other things. Therefore, OCR reaffirms the investigative approach set forth in the Proposed Rule, 87 FR 47875, whereby OCR's determination of whether a challenged action is discriminatory is necessarily a fact-specific, case-by-case analysis dependent on the facts of the particular situation. When analyzing whether an action violates this section, OCR will apply basic nondiscrimination principles to the facts of the particular health insurance coverage or other health related coverage, consistent with civil rights case law. This includes the opportunity for covered entities to articulate a legitimate, nondiscriminatory justification for an alleged discriminatory action, which OCR will scrutinize to ensure it is not a pretext for discrimination. Where a covered entity's justification relies upon medical standards or guidelines, we note that such standards or guidelines may be subject to additional scrutiny if they are not based on clinical, evidence-based criteria or guidelines. For more information related to OCR's consideration of a covered entity's legitimate, nondiscriminatory reason, please see previous discussion under § 92.207(c).

OCR reiterates that this rule does not require a covered entity to provide coverage for any particular health service in its health insurance coverage or other health-related coverage when provided in a nondiscriminatory manner; however, to the extent a covered entity provides coverage for a particular health service, the covered entity must provide the health service to all individuals in a neutral, nondiscriminatory manner consistent with this rule.

Regarding our analysis when investigating potential discrimination in the benefit design of excepted benefits and short-term, limited duration insurance (STLDI), we provide additional information below in the discussion under this section on *Scope of Application to Health Insurance and Health-Related Coverage (Including Excepted Benefits and STLDI).*

OCR acknowledges that the nature of our complaint-driven investigative process results in OCR reviewing existing plans and making determinations on the benefit designs of existing plans. However, OCR's case-by-case analysis is necessary in order to consider the fact-specific nature of each challenged action and to apply relevant case law to each situation. OCR investigates each allegation in a consistent manner and treats all complainants and covered entities evenly.

We appreciate commenters' suggestions to provide more information to educate covered entities about what OCR interprets to be best practices; OCR will consider issuing such guidance in the future. To educate both the public and covered entities, OCR posts its resolution agreements on its website and issues press releases when cases are resolved, and we intend to continue this practice.

Comment: Commenters recommended that OCR specify in the final rule that a nondiscriminatory benefit design is one that is clinically based. While expressing support for OCR considering clinical guidelines and standards of care when evaluating plan benefit designs, these same commenters also cautioned that OCR should not exclusively rely on clinical guidelines and journal articles in its analysis of discriminatory design because clinical guidelines may perpetuate racial bias and health disparities, and entities could cite a single peer-reviewed article as a shield to escape valid claims of discriminatory benefit design.

Response: An analysis of whether a benefit design is discriminatory under this rule is a fact-specific inquiry that will be made in accordance with general civil rights principles and applicable case law. As discussed under § 92.207(c), covered entities may provide a legitimate, nondiscriminatory reason as a defense to a potentially discriminatory coverage determination. A covered entity has latitude to submit any legitimate reason for its actions as long as it is not discriminatory or pretext for discrimination. However, if the justification given is not based on clinical, evidence-based criteria or guidelines, OCR will consider that evidence of pretext. When a covered entity submits a justification that relies upon medical standards or guidelines, OCR may conduct additional investigation to ensure the justification is not pretextual, including a review on whether the standards or guidelines are or are not based on clinical, evidence-based criteria or guidelines. OCR's review of a covered entity's justification will not rely solely on a covered entity's provision of one piece of literature but will consider a variety of factors, as discussed in detail above under §§ 92.206(c) and 92.207(c). We further note that OCR will not conduct a general medical review of the medical judgment undergirding the determination.

Comment: Commenters noted that OCR could ensure higher quality health care for all enrollees through stronger oversight and regulation. These commenters urged OCR not to rely solely on complaints and to engage in proactive oversight by affirmatively reviewing covered entities' plan designs.

Response: We agree that robust enforcement of section 1557 is critical to ensure individuals' ability to receive medically necessary health services, unencumbered by discriminatory conduct. OCR will employ all available means of investigating health insurance coverage and other health-related coverage under this rule, including through compliance reviews and complaint investigations.

Comment: Commenters requested that OCR clarify how it will coordinate with State and Federal agencies that establish specific plan requirements and approval processes. Commenters noted that many facets of benefit design are heavily regulated by other agencies within the Department, including CMS' regulation of nondiscriminatory plan design in EHB and qualified health plans, retail pharmacy network adequacy of Medicare Part D plans, and benefit coverage requirements under Medicare Advantage and Medicaid. Commenters suggested that OCR should not enforce a discrimination claim if the underlying design is accepted by the plan's regulator and should defer enforcement action to existing review processes where appropriate. Some commenters also suggested that the Department should establish a safe harbor for health insurance issuers to comply with section 1557 in cases where there are State law interactions to avoid creating multiple or duplicative standards.

Response: OCR acknowledges commenters' concerns about harmonization in the regulation and enforcement of benefit design requirements across State and Federal laws. We note that covered entities offering health insurance coverage and other health-related coverage, such

Medicaid or qualified health plans in the Exchanges, are subject to a host of other laws and regulations, at both the State and Federal level. OCR does not view a covered entity's compliance with other State or Federal laws, which were adopted under different requirements and for different purposes, to be determinative in all cases of a covered entity's compliance with section 1557, unless otherwise specified in this rule.[226] OCR commits to coordinating with other Federal agencies as appropriate to avoid inconsistency and duplication in enforcement efforts and will consider issuing guidance in coordination with other agencies, such as CMS, after publication of the rule. We will give consideration to a covered entity's compliance with other Federal laws when those requirements overlap with section 1557's requirements and will work closely with covered entities when compliance with this final rule requires additional action. That said, as the lead enforcement agency for section 1557, OCR maintains sole authority to determine a covered entity's compliance with this final rule.

Comment: Commenters requested clarity on which covered entity is liable for potentially discriminatory plan benefit designs when several covered entities provide or administer elements of the benefit design. Commenters requested that OCR state that all entities, including third party administrators, benefits advisers, and consultants, that participate in discriminatory plan design with respect to group or individual insurance plans are covered entities under section 1557. A commenter requested that benefits advisers or consultants working with employers to design self-funded group health plans specifically should be considered a covered entity presumptively where the employer, the plan, or the third party administrator receives Federal financial assistance. The commenter noted concern that such advisers and consultants are a driving force behind discriminatory plan design and should be put on notice that their conduct is subject to section 1557 in many circumstances. A commenter requested that OCR make clear that any entity itself covered by section 1557 violates the statute by outsourcing the implementation or design of discriminatory plans to entities that might themselves not be covered by the statute.

Response: OCR clarifies that in situations where multiple covered entities provide or administer elements of a discriminatory benefit design, all of the entities may be found liable under section 1557. In the discussion of the definition of ''Federal financial assistance'' in § 92.4, we explained that both the direct recipient and subrecipient (or subcontractor) are responsible for complying with applicable civil rights laws. We also note that covered entities are responsible for the conduct of their subcontractors and cannot outsource or contract away their civil rights obligations by entering into contractual arrangements with subcontractors. The responsibility of third party administrators is discussed later in this section. As noted, this final rule does not apply to employment practices. *See* § 92.2(b).

Comment: Commenters expressed concern that the proposed regulation may unintentionally limit covered entities' ability to develop effective programs and initiatives to close care gaps and address unique needs to reduce health disparities. Commenters explained that they currently conduct individual outreach to members of a subgroup through care management processes, invest in social determinants of health interventions, tailor marketing to subgroups to address particular health concerns, provide plans that restrict enrollment to special needs individuals with specific chronic conditions, and develop targeted quality programs and chronic care management programs to reduce health disparities for their members. A commenter noted that issuers take those actions to more efficiently provide care to particularly vulnerable populations without an intent to discriminate. Another commenter noted that if health plans are required to provide services that address chronic care, social determinants of care, or other similar programs ''equally'' to all enrollees rather than ''equitably'' target services to those in need based on health or socioeconomic condition, plans will be limited in their ability to provide appropriate services and scale and sustain these programs. To address these concerns, commenters requested that OCR clarify in the final rule that actions taken to reduce health disparities and those designed to improve health for specific populations are not discriminatory for purposes of section 1557. Commenters also recommended that OCR consider an approach similar to language in the Department's Group Health Insurance Market regulations prohibiting prohibition on discrimination based on health status that explicitly permits group health plans and health insurance issuers to treat individuals with adverse health conditions more favorably. 45 CFR 146.121(g).[227]

Response: We appreciate commenters raising this concern and applaud efforts to mitigate and address health disparities. Nothing in this rule prohibits programs designed to improve health outcomes for specific populations so long as the programs do not discriminate on the basis of race, color, national origin, age, sex, or disability. For example, programs could be developed using social determinants of health or other metrics that serve to identify underrepresented individuals that are not based on protected bases under section 1557. To illustrate, a ''Special Needs Plan'' is a specialized Medicare Advantage coordinated care plan that exclusively enrolls ''special needs individuals,'' who are not limited to individuals with disabilities, and do not violate section 1557.[228] In addition, covered entities are permitted and encouraged to develop programs that address health disparities related to a person's age. Under the Age Act and section 1557, age distinctions in programs that provide special benefits to older adults or children are permitted. 45 CFR 91.17 (Age Act); 92.101(b)(1) (section 1557, incorporating 45 CFR 91.17).

Scope of Application to Health Insurance Coverage and Other Health-Related Coverage (Including Excepted Benefits and STLDI)

In the 2022 NPRM, we sought comment on excepted benefits and short-term, limited-duration health insurance (STLDI), and the Proposed Rule's application to these products. Consistent with the definition of ''health program or activity'' under § 92.4, we proposed that the rule would apply to all the operations of any covered entity principally engaged in the provision or administration of health insurance coverage or other health-related coverage. 87 FR 47875–76.[229] As an example, we explained that an issuer participating in the Exchange and thereby receiving Federal financial assistance would be covered by the rule for its qualified health plans offered on the Exchange, as well as for its health

[226] *E.g.,* 45 CFR 92.203, which requires covered entities to comply with certain accessibility requirements in the ADA.

[227] In this final rule, we cite to HHS regulations, but note that the Departments of Labor and the Treasury have parallel regulatory citations.

[228] *See* sections 1859(b)(6), 1859(f)(2)–(4) of the Social Security Act (42 U.S.C. 1395w–28(b)(6), (f)(2)–(4)).

[229] However, per § 92.2(b), this rule does not apply to employers with regard to their employment practices, including the provision of employee health benefits.

plans offered outside the Exchange, including, for example, large group market plans,[230] grandfathered plans,[231] grandmothered plans,[232] excepted benefits,[233] and STLDI,[234] as well as for its operations related to acting as a third party administrator for self-insured group health plans. 87 FR 47876.

The comments and our responses regarding the scope and application to all operations of a covered health insurance issuer and to excepted benefits and STLDI specifically are set forth below.

Comment: Several commenters, including those representing the health insurance industry and some State insurance regulators, raised concerns about how the Proposed Rule's application to all operations of a recipient health insurance issuer would result in covering an issuer's other operations and lines of business that do not receive Federal financial assistance, including, for example, plans sold off the Exchange, grandfathered plans, grandmothered plans, employer plans, excepted benefits, STLDI, third party administrator activities and pharmacy benefit manager activities. Commenters noted that these plans are treated separately under the ACA and are not subject to some or all of the ACA's health insurance market reforms. Commenters suggested that plans that do not receive Federal financial assistance should not be subject to section 1557. Comments about particular types of plans are discussed in turn below.

Commenters argued the Proposed Rule's application was too broad and went beyond Congressional intent and urged OCR to retain the 2020 Rule's approach that the rule cover a health insurance issuer's operations only to the extent the operations directly receive Federal financial assistance.

In addition, commenters argued that applying the rule to a covered issuer's operations that do not receive Federal financial assistance would create an unlevel playing field among health insurance issuers that accept Federal funding and those that do not, placing those that receive Federal funding at a competitive disadvantage. For example, commenters stated that issuers that do not receive Federal financial assistance may underwrite excepted benefits or STLDI by age or sex, or exclude higher cost health care services, which may result in non-covered entities offering lower-cost coverage to a pool of individuals whose coverage is less costly, while the pool of individuals under a covered entity's coverage could be costlier, leading to higher premiums. Commenters also argued that covered entities would be subject to increased compliance costs to which competitors are not subject. For example, these commenters stated that compliance with the rule's nondiscrimination notices would result in tremendous costs to which non-covered entities are not subject. Some commenters argued that this competitive disadvantage could discourage issuers from participating in the Exchanges.

A few commenters that supported the proposed application to all an issuer's operations also raised concerns that the rule would create an unlevel playing field that would disadvantage plans that support Federal programs like Medicare and Medicaid while giving an unfair competitive advantage to competitors that are not required to comply with nondiscrimination requirements. To level the playing field, these commenters and others suggested that OCR work with other Federal agencies and develop a tri-Department rule with the Departments of Labor and the Treasury to subject all health plans to similar nondiscrimination and accessibility requirements.

A number of commenters, including some members of Congress, supported the broad application of the rule to an issuer's other operations and argued the 2020 Rule's approach is contrary to Congress's intent in passing the ACA to prohibit discrimination in health care. Commenters argued that a private insurance company receiving financial assistance from the Federal Government should not be allowed to engage in discriminatory practices in its other lines of business. Commenters observed that issuers offering plans that receive Federal financial assistance, such as qualified health plans or Medicare Advantage plans, often also offer plans that do not receive Federal financial assistance. Noting that many of these other types of plans are not currently subject to any or all nondiscrimination requirements under the ACA's health insurance market reforms, these commenters argued that the Proposed Rule's broad application will increase protections from discriminatory practices for individuals enrolled in those plans.

Response: OCR appreciates the concerns raised by some commenters regarding the Proposed Rule's application to all operations of a recipient health insurance issuer; however, these concerns do not abrogate a recipient's obligation to comply with section 1557. Under the definition of ''health program or activity'' at § 92.4, a recipient of Federal financial assistance that is principally engaged in the provision or administration of health insurance coverage or other health-related coverage is covered under this rule for all of its operations. Section 1557 applies to ''any health program or activity, *any part of which* is receiving Federal financial assistance,'' 42 U.S.C. 18116(a) (emphasis added). As we explain in detail under the discussion of the definition of ''health program or activity'' in § 92.4, it is reasonable to infer that Congress intended the term ''health program or activity'' to be interpreted broadly and to include all of that entity's operations if the entity that receives Federal funding is principally engaged in the provision or administration of health insurance coverage or other health-related coverage.[235]

[230] 42 U.S.C. 300gg–91(e)(3); 45 CFR 144.103.

[231] 42 U.S.C. 18011; 45 CFR 147.140.

[232] Grandmothered plans are certain non-grandfathered health insurance coverage in the individual and small group market that are not considered to be out of compliance with certain specified market reforms under certain conditions. *See* U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *Extended Non-Enforcement of Affordable Care Act-Compliance With Respect to Certain Policies* (Mar. 23, 2022), *https://www.cms.gov/files/document/extension-limited-non-enforcement-policy-through-calendar-year-2023-and-later-benefit-years.pdf.*

[233] 42 U.S.C. 300gg–21(b), 300gg–63, and 300gg–91(c); 45 CFR 144.103, 146.145(b), and 148.220(b). The Departments of HHS, Labor, and the Treasury share interpretive jurisdiction over the definition of ''excepted benefits''. We cite to HHS regulations but note that the Departments of Labor and the Treasury have parallel statutory and regulatory citations.

[234] Short-term limited duration insurance is a type of health insurance coverage that is generally exempt from the provisions of title XXVII of the PHS Act because it is specifically excluded from the definition of ''individual health insurance coverage'' in the PHS Act. See 42 U.S.C. 300gg–91(b)(5). Short-term limited duration insurance is currently defined in Federal regulations as health insurance coverage issued under a contract that is effective for less than 12 months, and, taking into account renewals or extensions, has a duration of no longer than 36 months in total. 45 CFR 144.103. Short-term limited duration insurance is defined by the Departments of HHS, Labor, and the Treasury (Tri-Departments). The Tri-Departments issued a Notice of Proposed Rulemaking on Short-Term, Limited-Duration Insurance; Independent, Noncoordinated Excepted Benefits Coverage; and Tax Treatment of Certain Accident and Health Insurance that would revise the definition of ''Short-Term Limited-Duration Insurance'' to limit the length of the initial contract period to no more than three months and the maximum coverage period to no more than four months, taking into account any renewals or extensions. 88 FR 44596 (July 12, 2023). In this final rule, we cite to HHS regulations, but note that the Departments of Labor and the Treasury have parallel regulatory citations.

[235] *See, e.g., Fain* v. *Crouch,* 545 F. Supp. 3d 338, 342–43 (S.D.W. Va. 2021) (finding '''health program or activity' under Section 1557 necessarily includes health insurance issuers'' and holding that defendant health plan was, ''by virtue of its acceptance of federal assistance under its Medicare Advantage program,'' required to comply with section 1557 ''under its entire portfolio''), *rehearing*

In response to comments that this obligation might cause a competitive disadvantage with entities that do not accept Federal funds, this obligation is consistent with statutory text as set forth by Congress, as discussed above. Further, the risk of competitive disadvantage is low given that the majority of health insurance issuers offer some type of product that receives Federal financial assistance, such as Medicare Advantage plans, Medicare Part D prescription drug plans, Medicaid managed care plans, and qualified health plans through the Exchanges.[236] In any event, by accepting the benefit of Federal funds, a recipient is prohibited from discriminating in its health programs and activities under section 1557, as discussed previously under the definition of ''health program or activity.'' Any recipient of Federal financial assistance from the Department is subject to this same requirement and prohibited from discriminating in its health programs and activities, including all of its operations when principally engaged, as set forth in this final rule.

Section 1557 does not authorize OCR to require a health plan or insurance issuer not otherwise subject to section 1557 to comply with the statute. Whether the Department could issue a rule, under different authority, with the Departments of Labor and the Treasury, to apply similar nondiscrimination and accessibility standards to all health plans or health insurance issuers, is outside the scope of this rule.

We further address comments about particular types of plans and their coverage under this final rule in various comment responses below.

Comment: Some commenters requested that grandfathered and grandmothered plans should be exempt from the rule because they are not subject to many of the ACA's provisions. These plans benefit consumers, commenters stated, by allowing them to maintain affordable existing coverage as long as it continues to meet their needs. Commenters argued that applying section 1557 to these plans would be inconsistent with the longstanding regulatory treatment of the plans. Further, commenters argued that the costs of complying with section 1557, including but not limited to notice and tagline requirements, could result in increased costs for issuers, which would be passed on to consumers, and could lead to a decision to discontinue plans.

Response: OCR understands commenters' concerns and acknowledges that grandfathered and grandmothered plans are not subject to many of the ACA's provisions. However, the statutory text of the grandfathered health plan provision [237] indicates that Congress did not intend to exclude them from dection 1557. The statute sets forth the specific provisions of the PHS Act that apply to grandfathered plans and then provides that except for those provisions, ''this subtitle and subtitle A (and the amendments made by such subtitles) shall not apply'' to grandfathered plans. 42 U.S.C. 18011(a)(2). ''This subtitle'' refers to subtitle C of title I of the ACA, while ''subtitle A'' refers to subtitle A of title I of the ACA, both of which contain market reforms. Section 1557 is in subtitle G of title I of the ACA and therefore is not one of the subtitles that Congress specified should not apply to grandfathered health plans.

Grandmothered plans [238] were not established in the ACA or the PHS Act; they are not exempt from the ACA or the PHS Act by statute or regulation. Rather, CMS specified that it will not take enforcement actions against grandmothered plans that are out of out of compliance with certain specified ACA market reforms under certain conditions (CMS Non-Enforcement Policy).[239] The CMS Non-Enforcement Policy has been in place since 2013 [240] and has provided relief from the same ACA market reform provisions continuously since that time.[241] Section 1557 has never been one of the provisions for which enforcement relief was provided; therefore, grandmothered plans are not exempt from section 1557.

When offered by a recipient health insurance issuer, grandfathered and grandmothered plans would be covered under the rule as part of the issuer's operations when the issuer is principally engaged in the business of providing or administering health insurance coverage or other health-related coverage. If OCR were to receive a complaint about a grandfathered plan or grandmothered plan, OCR would carefully consider the facts and circumstances of the challenged action or practice. As discussed throughout this section, the health insurance issuer may provide a legitimate, nondiscriminatory reason for the action or practice. Further, in cases of alleged disability discrimination, covered entities may also prove that modifying a plan to comply with section 1557 would result in a fundamental alteration to their health program or activity.

Comment: A commenter requested clarification on how the rule would apply to Medicare Employer Group Waiver Plan (EGWP) participants.

Response: EGWPs are types of Medicare Part C (Medicare Advantage) plans [242] or Medicare Part D prescription drug plans [243] that qualify for waivers of certain Medicare regulations because they are offered exclusively to the employees, former employees, members or former members of an employer, union or labor organization, or the trustees of a fund established by one or more employers or labor organizations (or combination thereof). Entities that receive funding through the Department's Medicare Part C or Medicare Part D program are subject to the rule as recipients of Federal financial assistance. This includes entities providing Medicare

en banc granted, No. 22–1927 (4th Cir. Apr. 12, 2023) (oral argument held Sept. 21, 2023) (argued with *Kadel* v. *Folwell,* No. 22–1721).

[236] U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *Medical Loss Ratio Data and System Resources* (2022), *https://www.cms.gov/CCIIO/Resources/Data-Resources/mlr.*

[237] Grandfathered health plans were established by Congress in title I of the ACA to permit the continuation of coverage for certain plans in effect as of the date of enactment of the ACA (March 23, 2010) in which individuals were enrolled at that time. 42 U.S.C. 18011; 45 CFR 147.140. Grandfathered health plans are statutorily subject to only certain market reforms in the ACA, 42 U.S.C. 18011(a)(3)–(5), and thus are not subject to certain market reforms related to nondiscrimination, such as fair health insurance premiums and EHB. To maintain grandfathered status, plans cannot make certain changes to the terms of the plan or coverage. Specifically, certain changes to benefits, cost-sharing requirements, and contribution rates will cause a plan or coverage to relinquish its grandfather status.

[238] Grandmothered plans are certain non-grandfathered health insurance coverage in the individual and small group market that are not considered to be out of compliance with certain specified market reforms under certain conditions, including those related to nondiscrimination, such as fair health insurance premiums, the prohibition of preexisting condition exclusions or other discrimination based on health status with respect to adults (except with respect to group coverage), the prohibition of discrimination based on health status (except with respect to group coverage), and EHB.

[239] *See* U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *Extended Non-Enforcement of Affordable Care Act-Compliance With Respect to Certain Policies* (Mar. 23, 2022), *https://www.cms.gov/files/document/extension-limited-non-enforcement-policy-through-calendar-year-2023-and-later-benefit-years.pdf.*

[241] *See* U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *Extended Non-Enforcement of Affordable Care Act-Compliance With Respect to Certain Policies* (Mar. 23, 2022), *https://www.cms.gov/files/document/extension-limited-non-enforcement-policy-through-calendar-year-2023-and-later-benefit-years.pdf.*

[242] 42 U.S.C. 1395w–27(i); 42 CFR 422.106.

[243] 42 U.S.C. 1395w–132(b); 42 CFR 423.458.

Advantage plans or Medicare Part D plans, including EGWPs, or qualified retiree prescription drug plans (as defined at 42 CFR 423.882) (also known as RDS plans). Because employers and other plan sponsors are not subject to this rule with regard to their employment practices, pursuant to § 92.2(b), an employer or other plan sponsor would not be liable for discrimination related to these plans under this rule. This applies even if an employer directly contracts with CMS to offer a Medicare Advantage or Part D plan as an EGWP and receives Federal financial assistance for that EGWP.[244] In circumstances where an employer offers an ''800 series'' EGWP through a Medicare Advantage organization or Part D plan sponsor,[245] the health insurance issuer or entity offering the EGWP would be subject to the rule for the EGWP plan due to receipt of either Medicare Part C or Part D funding.

Comment: One commenter requested clarification as to whether self-funded non-Federal Governmental plans, such as municipal plans, that opt out of certain Federal market reforms are covered under this rule if they receive funds from the Department directly or indirectly.

Response: A self-funded non-Federal Governmental plan is a governmental plan established or maintained by a non-Federal Governmental agency, such as a State, county, school district, or municipality, for its employees.[246] As with any other type of group health plan coverage, a non-Federal Governmental plan would be subject to this rule if it directly or indirectly receives Federal financial assistance from the Department. The non-Federal Governmental agency sponsoring the employee health benefit plan would be excluded from liability under this rule an employer or plan sponsor, as applicable, pursuant to § 92.2(b).

Comment: Commenters requested that the rule clarify when group health plans are subject to the rule.

Response: A group health plan is subject to this rule if it is a recipient (or subrecipient) of Federal financial assistance as set forth under § 92.2(a)(1). We address the rule's applicability to group health plans in more detail in the discussion above under §§ 92.1 (Applicability) and 92.4 (definition of ''health program or activity'').

Comment: Several commenters expressed concerns with the rule's proposed application to excepted benefits as part of a covered health insurance issuer's operations and urged OCR to exclude excepted benefits from the rule. Commenters argued that the rule's coverage of excepted benefits is inconsistent with Congressional intent and likely subject to legal challenge. These commenters explained that excepted benefits are statutorily defined benefits that Congress has long recognized as distinct from traditional health insurance coverage by excluding them from health insurance and group health plan coverage mandates under the PHS Act, ERISA, and the Internal Revenue Code, as long as they meet certain requirements.[247] Commenters argued that the ACA retained this exclusion and that Congress therefore intended excepted benefits to be excluded from the ACA. To further demonstrate Congressional intent to exclude excepted benefits, commenters stated that since Congress first recognized excepted benefits in 1996 as part of HIPAA by incorporating their provisions into the PHS Act, ERISA, and the Internal Revenue Code, Congress has had several opportunities to redefine excepted benefits or to impose new requirements on them in subsequent laws, including the ACA, but it has not chosen to do so.[248]

While acknowledging that section 1557 does not explicitly exclude excepted benefits, commenters asserted that OCR cannot use its regulatory authority to impose new requirements that are inconsistent with the carefully crafted statutory provisions governing excepted benefits where Congress has clearly chosen not to do so. As support, commenters cited to *Central United Life* v. *Burwell,* 827 F.3d 70 (D.C. Cir. 2016). Commenters stated the court in *Central United* struck down a Department rule that revised the requirements related to fixed indemnity excepted benefit insurance in the individual market as an unconstitutional exercise of regulatory authority because the ACA maintained the HIPAA excepted benefit exemption for these benefits and the law did not authorize the Department's proposed requirement. *Central United,* commenters argued, illustrates that nothing in the ACA changes the excepted benefits governing statutes and demonstrates that agencies must adhere to the boundaries set forth in Federal statute.

Commenters stated that the ACA is entirely focused on comprehensive medical coverage, while excepted benefits are not intended to serve as such coverage. They maintained that excepted benefits are not used to finance the delivery of health care services but are meant to provide benefits for a wide variety of costs associated with accidents or illnesses not covered by comprehensive medical insurance, or to defray costs that are not fully covered by comprehensive medical coverage. For example, commenters stated that some of these products, such as dental and vision plans and Medicare supplemental insurance (Medigap), can cover additional benefits not included in comprehensive medical plans. Commenters stated that noncoordinated excepted benefits, such as fixed indemnity excepted benefits and specified disease excepted benefits coverage, must pay benefits regardless of whether the medical event triggering benefits is covered under another plan. Commenters stated that while comprehensive medical insurance coverage is regulated through HIPAA or the ACA, excepted benefits are subject to separate long-standing and extensive State regulatory regimes whereby Congress and State policymakers have consistently maintained excepted benefits are not meant to be a type of comprehensive health insurance that pays for medical benefits, and therefore, commenters argue, should not be within the purview of the ACA, including section 1557.

Commenters further expressed concerns that applying the rule to excepted benefits could severely disrupt the market for these benefits and may drive competitors out of the market,

[244] CMS may contract directly with an employer, union or labor organization, or the trustees of a fund established by one or more employers or labor organizations (or combination thereof) for the entity to offer a Medicare Advantage plan or Part D plan to its employees, former employees, members or former members. 42 U.S.C. 1395w–28(i) and 1395w–132(b); 42 CFR 422.106(d) and 423.458(c).

[245] In these situations, a Medicare Advantage organization or a Part D plan sponsor contracts with CMS to offer the Medicare health or drug plan and separately contracts with the employer, union or labor organization, or trustee of a fund established by one or more employers or labor organizations (or combination thereof) for the Medicare Advantage organization or Part D plan sponsor to offer an EGWP. ultimately increasing health care costs and premiums and reducing product choice for consumers and employers, and thereby reducing access to care. Commenters also asserted that applying the rule to excepted benefits could result in increased costs that are passed onto consumers as increased premiums, which could result in individuals dropping coverage due to lack of affordability and thereby result in reducing access to care, particularly in dental plans where consumers are highly price sensitive when selecting coverage.

Conversely, many other commenters supported applying the rule to excepted benefits as part of an issuer's operations. Commenters noted that excepted benefits are under-regulated and not otherwise subject to nondiscrimination requirements. Commenters argued this would provide comprehensive nondiscrimination protections for individuals enrolled in excepted benefits, particularly individuals with disabilities who face barriers to accessing care.

Response: OCR appreciates the breadth of comments received and the concerns raised. Excepted benefits are statutorily defined benefits that are exempt from the Federal consumer protection and market reforms applicable to comprehensive coverage under title XXVII of the PHS Act, part 7 of ERISA, and Chapter 100 of the Internal Revenue Code (hereinafter the Federal consumer protections and market reform requirements applicable to comprehensive coverage). Some excepted benefits are exempt from the Federal consumer protection and market reform requirements applicable to comprehensive coverage in all circumstances, such as coverage only for accident, workers' compensation or similar coverage, disability income coverage, and coverage for on-site medical clinics. 42 U.S.C. 300gg–21(b), 300gg–63(a), and 300gg–91(c)(1).

Other types of coverage, known as limited excepted benefits, are exempt from the Federal consumer protection and market reform requirements applicable to comprehensive coverage when the benefits are offered under a separate policy, certificate or contract of insurance, or are otherwise not an integral part of the plan. 42 U.S.C. 300gg–21(c)(1), 300gg–63(b), and 300gg–91(c)(2). Examples of limited excepted benefits include certain limited scope vision insurance and limited scope dental insurance (though stand-alone dental plans sold through the Exchange are subject to certain qualified health plan requirements),[249] and long term care insurance.

Another type of coverage, known as independent, noncoordinated excepted benefits, are exempt from the Federal consumer protection and market reform requirements applicable to comprehensive coverage when certain conditions are met. 42 U.S.C. 300gg–21(c)(2), 300gg–63(b), and 300gg–91(c)(3). This category of excepted benefits includes coverage only for a specified disease or illness (such as cancer-only policies) and hospital indemnity or other fixed indemnity insurance.

The final type of excepted benefit coverage is supplemental excepted benefits. Benefits are supplemental excepted benefits only if they are provided under a separate policy, certificate, or contract of insurance and are Medicare supplemental health insurance (also known as ''Medigap''), coverage supplemental to the coverage provided under 10 U.S.C. chapter 55 (also known as TRICARE supplemental programs), or similar supplemental coverage provided to coverage under a group health plan. 42 U.S.C. 300gg–21(c)(3), 300gg–63(b), and 300gg–91(c)(4).

Excepted benefits offer more limited coverage than, and are generally not intended to be an alternative to or replacement for, comprehensive coverage. These products are not subject to the Federal consumer protections and market reform requirements applicable to comprehensive coverage when applicable criteria are met. As we stated in the 2016 Rule, 81 FR 31431, and the 2022 NPRM, 87 FR 47875, and restate here, the fact that excepted benefits are exempt from the Federal consumer protections and market reform requirements applicable to comprehensive coverage, including the ACA's consumer protections and market reforms, and are not intended to serve as comprehensive coverage does not justify their exclusion from section 1557.[250] In addition, section 1557 does not limit its protections only to health programs and activities that are themselves subject to other provisions of the ACA or that are comprehensive coverage, but also applies to all operations of any covered entity that is principally engaged, as defined under the term ''health program or activity'' in § 92.4. Further, section 1557 is an independent provision, which Congress did not codify in the PHS Act or co-locate in the ACA with the ACA's market reforms. Further, section 1557 uses the broad term ''health program or activity,'' in contrast to elsewhere in the ACA where Congress specifically made distinctions between various types of insurance. If Congress had intended to limit section 1557's reach to only certain types of insurance in the PHS Act or to carve out excepted benefits from the scope of section 1557, it could have done so.

OCR is mindful of comments raised about potential market disruption and reduced health care options for the public. However, as we discussed previously in the definition of ''health program or activity'' under § 92.4, commenters did not provide sufficient evidence to support this contention. Further, we note that when OCR has determined that a particular plan is discriminatory under this final rule, a covered entity may provide a legitimate, nondiscriminatory reason for the plan's benefit design. This could include evidence that compliance with § 92.207 would result in making the plan unaffordable to the extent the covered entity could no longer offer the plan. When such a reason is proffered, OCR will carefully consider the evidence presented by the covered entity in making our determination as to whether the reason is legitimate and not pretext for discrimination. In the case of alleged disability discrimination, covered entities may also prove that modifying a plan to comply with section 1557 would result in a fundamental alteration to their health program or activity.

For these reasons, we are not excluding excepted benefits from requirements established in this final rule. If a recipient health insurance issuer is principally engaged in the provision or administration of health insurance coverage or other health-related coverage, all of its operations are covered, including its provision of excepted benefits. Further, we note that a principally engaged issuer would not be covered under this rule for its excepted benefits subsidiary if the issuer can prove that the subsidiary is legally separate from its federally funded activities.[251]

Commenters' reliance on *Central United* to argue that this rule exceeds OCR's regulatory authority by imposing new requirements that are inconsistent

[249] *See, e.g.,* 45 CFR 155.1065 and 156.150.

[250] We further note that none of the statutory provisions that establish the exemption for these products from the PHS Act Federal consumer protections and requirements applicable to comprehensive coverage extend beyond the requirements in title XXVII of the PHS Act. *See* 42 U.S.C. 300gg–21(b)–(c), 300gg–63, and 300gg–91(c).

[251] For more information on how OCR will analyze such claims, see discussion of subsidiary liability under the definition of ''health program or activity'' in § 92.4 and under the *Application to Third Party Administrators* in this section.

with statutory provisions regarding excepted benefits is misplaced. In *Central United,* the court invalidated the requirement at 45 CFR 148.220(b)(4)(i) that an individual must attest to having minimum essential coverage prior to purchasing fixed indemnity excepted benefits coverage in the individual market. The court held that imposing that requirement went beyond what Congress required under the PHS Act. 827 F.3d at 74. The PHS Act statutes at issue in *Central United* contain statutory language specifically addressing excepted benefits, while section 1557 does not expressly mention or address excepted benefits. Further, Congress could have but did not extend the exemption under the PHS Act for these products to section 1557.[252] OCR therefore maintains that this rule's interpretation and application to all operations of a recipient health insurance issuer when principally engaged, including an issuer's excepted benefits, is the best reading of the section 1557 statutory language, which applies to ''any health program or activity, *any part of which is receiving Federal financial assistance.*'' 42 U.S.C. 18116(a) (emphasis added).

Comment: A few commenters raised concerns with the sufficiency of the Proposed Rule's discussion on excepted benefits. These commenters asserted the Proposed Rule did not adequately explain why subjecting excepted benefits to the rule is necessary or appropriate. Commenters stated that the regulatory text does not address excepted benefits and that the preamble discussion does not explain how the rule would apply to excepted benefits. Thus, according to commenters, there was insufficient notice for public comment, which they assert would likely subject the final rule to legal challenge as violative of the Administrative Procedure Act. These commenters argued OCR should issue a new Proposed Rule with comment period that explains how OCR intends to address excepted benefits and provides additional clarity on how the rule will apply to excepted benefits, taking into account the specific nature and legal structure of such products that Congress made statutorily distinct from major medical products. Commenters also objected to the Proposed Rule's investigative approach to evaluate claims of discrimination on a case-by-case basis, with one commenter arguing the case-by-case approach indicated a ''regulation-by-audit scheme.''

Response: We disagree that the Proposed Rule failed to adequately provide notice and opportunity to comment on OCR's reasoning regarding the applicability of section 1557 to all operations of a recipient health insurance issuer that is principally engaged in the provision or administration of health insurance coverage or other health-related coverage. We fully discussed OCR's legal authority and reasoning regarding this scope of coverage in the Proposed Rule's discussion of the definition of ''health program or activity'' under § 92.4. 87 FR 47844–45. We also disagree that the Proposed Rule did not provide notice to the public of the terms or substance of how OCR intends to address excepted benefits for purposes of applying section 1557. In the preamble to the Proposed Rule, we clearly stated that all operations of a covered issuer principally engaged would include its other plans, explicitly mentioning excepted benefits. 87 FR 47875–76. Further, in the Proposed Rule, 87 FR 47875, we described the subject and the issues involved in how OCR will analyze claims of discriminatory benefit design by specifically stating that we acknowledged the unique nature of these products as being exempt from the Federal consumer protections and market reform requirements applicable to comprehensive coverage, and discussed how OCR proposes to investigate such plans by considering the nature, scope, and contours of the specific plan at issue and evaluating on a case-by-case basis an alleged discriminatory design feature in light of the entity's stated coverage parameters.[253] We also reiterated that covered entities have the opportunity to articulate a legitimate, nondiscriminatory basis for their challenged action or practice. As discussed throughout this section and in the Proposed Rule, OCR's analysis for investigating a potentially discriminatory benefit design—as well as for all OCR investigations—is necessarily a fact-specific, case-by-case analysis. This is true for allegations related to benefit design features in all plans, including major medical coverage as well as excepted benefits.

Comment: Some commenters raised concerns specific to Medicare supplemental health insurance (known as ''Medigap''), which is an excepted benefit, and requested that the rule not apply to such plans.

Commenters argued that applying section 1557 to Medigap plans would be inconsistent with Congress's intent and the interlocking Federal-State regulatory framework set forth by Congress. A commenter noted that when Congress wants to alter this regulatory scheme, it speaks clearly,[254] and because Congress made no such specific reference to Medigap when enacting section 1557, Congress intended Medigap to be beyond the scope of section 1557. Commenters discussed that Medigap is highly standardized coverage comprehensively regulated under both Federal and State law over which issuers have little discretion with respect to plan benefit design.[255] Commenters explained that Federal law prescribes ten different types of Medigap benefit packages, with each offering a different set of standardized benefits.[256] Commenters noted that Congress established a Federal-State regulatory framework that prescribes the benefits, eligibility, and rating methodologies permissible for Medigap plans, with States establishing State-specific requirements for Medigap policies sold in their State. For example, a commenter noted that State laws may regulate Medigap plans in several ways, such as premium rating based on age, sex/gender, or medical underwriting, with some states requiring sex/gender rating; Medigap eligibility criteria based on an individual's age, disability, or end-stage renal disease, with some States specifying that Medigap plans are not available to such individuals; and State-specific standardized Medigap plans over which issuers have no control with respect to benefit design, communications, or other factors.

Commenters stated that Medigap is commonly underwritten after an initial open enrollment period to prevent adverse selection, and that Medigap

Easley by Easley* v. *Snider,* 36 F.3d 297, 301–05 (3d Cir. 1994) (examining the ''essential nature of the program'' as intended by the state when determining that a state's Attendant Care Program did not discriminate against individuals with mental disabilities under the ADA by excluding adults with disabilities who were not mentally alert).

[254] For example, the commenter noted that Congress revised the Medigap statute when it wanted to expressly apply section 104 of the Genetic Information Nondiscrimination Act to Medigap. Public Law 100–360, 102 Stat. 683, sec. 221 (1988) (codified in 42 U.S.C. 1395ss).

[256] *See* 42 U.S.C. 1395ss. *See also* U.S. Dep't of Health & Hum. Servs., Ctrs. for Medicare & Medicaid Servs., *Choosing a Medigap Policy: A Guide to Health Insurance for People with Medicare,* 11 (2023), *https://www.medicare.gov/publications/02110-medigap-guide-health-insurance.pdf.*

issuers are generally limited to competing along two dimensions: price and customer service.[257] Commenters argued that subjecting Medigap to section 1557 could result in adverse selection that could force covered issuers to leave the Medigap market, resulting in reduced consumer choice, higher Medigap premiums, and lower quality of service for seniors.

If the final rule does not exclude Medigap from section 1557, commenters requested at minimum that the rule specify that covered issuers are not responsible for possible discriminatory benefit designs, decisions, or actions that are a result of complying with a Federal or State requirement, including State-approved commercial underwriting practices.

Response: OCR appreciates the concerns raised by commenters about Medigap, which is a statutorily defined excepted benefit.[258] Medigap is a type of private supplemental health insurance coverage designed to cover cost-sharing gaps in original Medicare, such as deductibles, coinsurance, and copayments.[259] Medigap is regulated by both Federal and State law. 42 U.S.C. 1395ss. Congress standardized Medigap plans to establish standard plan designs.[260] While the plan benefits are standardized, the premiums and availability of the plans may vary by issuer depending on Federal and State law requirements. Medigap plans are statutorily prohibited from medical underwriting based on health status or imposing preexisting condition exclusions under certain circumstances, including during a six-month Medigap open enrollment period that begins when an individual turns 65 and enrolls in Medicare Part B and other specific times when guaranteed issue rights are available, 42 U.S.C. 1395ss(s), after which they are generally not prohibited from such practices under Federal law. States may enact their own State-specific requirements on Medigap, including whether the plans are guaranteed issue and whether the premiums may be rated based on age, health status, sex, or other factors.[261] In addition, while there generally is no Federal Medigap open enrollment period during which time Medigap plans must be sold to individuals with disabilities under the age of 65, some States may require it.[262]

Like other excepted benefits, Medigap is not designed to serve as comprehensive coverage and does not receive Federal financial assistance. As an excepted benefit, Medigap plans would be subject to the rule in the same fashion as other excepted benefits: if a Medigap plan is offered by a recipient health insurance issuer that is principally engaged in the provision or administration of health insurance coverage or other health-related coverage as specified under the definition of ''health program or activity'' in § 92.4, the Medigap plan would be subject to the rule as part of the issuer's operations.

That said, we acknowledge commenters' concerns about State law requirements that might result in benefit design features that could violate section 1557. When investigating a discriminatory design feature in a Medigap plan, OCR will evaluate the covered entity's legitimate, nondiscriminatory reason for the challenged feature. If the reason is based on a Federal or State law requirement, OCR will take this information into account when evaluating the context of the challenged design feature and will work with the covered entity to achieve compliance to help ensure that issuers do not leave the Medigap market or lower quality of products for consumers; however, section 1557 would preempt a State law Medigap requirement—or any other excepted benefit requirement—that compelled conduct prohibited by section 1557 as applied to a recipient health insurance issuer subject to section 1557.

Comment: Many commenters supported the Proposed Rule's application to STLDI as part of a principally engaged covered entity's operations. Commenters argued that the proposed broad application is crucial to protect against discrimination in these products.

Commenters stated that STLDI plans are marketed, often misleadingly and fraudulently, as an alternative to comprehensive coverage, but have significant gaps that lead to high out-of-pocket costs and little financial protection for consumers.[263] Commenters stated that STLDI plans are under-regulated and use a lax regulatory environment to market and sell products that can harm individuals, especially those with complex health needs. For example, a commenter stated that a person with cancer would pay anywhere from $23,000 to $100,000 in out-of-pocket expenses during the first six months following diagnosis under an STLDI plan.[264]

Commenters discussed that STLDI plans charge higher prices based on an applicant's age, sex, or disability and exclude or severely limit coverage for benefits related to preexisting conditions, prescription medications, mental health, and preventive services for women, contraception, and maternity care, all of which adversely impact individuals with disabilities, women, and individuals who are or who may become pregnant.[265] Commenters suggested that the plans appear to be designed to discourage enrolling women of child-bearing age and that one study revealed that all plans reviewed discriminated against women through various practices, including gender rating and coverage exclusions.[266] Commenters stated that including

coverage under section 1557 for these plans is particularly important for individuals with disabilities, including those with HIV, hepatitis, and mental health and substance use disorder disabilities who are harmed by discriminatory practices, such as including more frequent application of prior authorization and fail-first protocols and denials of medically necessary services.

Because STLDI plans are not subject to traditional oversight of their provider networks, commenters stated that the plans may be designed in a way that limits care for LGBTQI+ people, individuals with disabilities, older individuals, individuals with LEP, or people of color.[267] In addition, commenters observed that STLDI plans retroactively cancel coverage and are not guaranteed renewable, leaving people with serious health conditions without coverage and often unable to enroll if the denial occurred outside of an ACA open enrollment period.[268]

One insurance industry commenter raised detailed concerns about applying the rule to STDLI in its discussion opposing the rule's application to excepted benefits. The commenter argued that similar to arguments above regarding excepted benefits, Congress excluded these products from most of the ACA's requirements and that applying the rule to these products would create a competitive disadvantage for covered entities that must comply with section 1557 as compared to non-recipient competitors that can offer lower-cost coverage due to the ability to vary premium rates on the basis of factors otherwise prohibited under section 1557 or exclude higher cost benefits. The commenter also argued recipients would be subject to greater costs due to compliance with section 1557's procedural requirements.

Response: OCR appreciates commenters' support and shares the concerns raised by commenters about the misleading and deceptive practices of some issuers of STLDI plans. STLDI is excluded from the definition of ''individual health insurance coverage'' under the PHS Act.[269] As a result, it is generally exempt from the Federal consumer protections and market reform requirements applicable to comprehensive coverage offered in the individual market, such as the prohibition on discrimination based on health status, 42 U.S.C. 300gg–4, the prohibition of preexisting condition exclusions, 42 U.S.C. 300gg–3, and the prohibition on lifetime and annual dollar limits on EHB, 42 U.S.C 300gg–11, among others. These plans were traditionally not designed to serve as comprehensive coverage and were intended to fill temporary coverage gaps when an individual was transitioning between comprehensive coverages. *See* 81 FR 38020, 38032 (June 10, 2016).[270]

OCR acknowledges the commenter's concerns about competitive disadvantage and compliance costs. However, as discussed previously, the risk of competitive disadvantage is low given that the majority of health insurance issuers offer some type of product that receives Federal financial assistance, and by accepting the benefit of Federal funds, a recipient is prohibited from discriminating in its health programs and activities under section 1557. For the same reasons set forth above explaining why this rule applies to a principally engaged recipient issuer's excepted benefits, STLDI would be covered under this final rule as part of a recipient issuer's operations if the issuer is principally engaged as set forth in the definition of ''health program or activity'' at § 92.4. That Congress excluded STLDI from the PHS Act definition of individual health insurance coverage does not exclude such coverage from section 1557. Congress could have but did not extend the exemption for these products to section 1557. section 1557 applies to ''health programs or activities'' and contains no exceptions for certain types of plans or coverage, nor is it limited to plans or coverage that are subject to other provisions in the ACA. OCR therefore maintains that this rule's interpretation and application to all operations of a recipient health insurance issuer when principally engaged, including an issuer's products, is the best reading of the section 1557 statutory language, which applies to ''any health program or activity, *any part of which is receiving Federal financial assistance.*'' 42 U.S.C. 18116(a) (emphasis added).

Application to Third Party Administrators

In the Proposed Rule, we discussed that an issuer's or other entity's operations related to third party administrative services also would be subject to the rule when the issuer receives Federal financial assistance and is deemed to be principally engaged in the provision or administration of health insurance coverage or other health-related coverage as set forth in the definition of ''health program or activity'' under § 92.4. 87 FR 47876–77. We stated that we will engage in a fact-specific analysis to evaluate whether a third party administrator is appropriately covered under section 1557 as a recipient of Federal financial assistance in circumstances where the third party administrator is legally separate from the issuer that receives Federal financial assistance.

When investigating complaints relating to third party administrators that are appropriately covered under section 1557, we stated that OCR will determine whether responsibility for the decision or alleged discriminatory action lies with the plan sponsor or with the covered third party administrator. Where the alleged discrimination relates to the administration of the plan by a covered third party administrator, we stated that OCR will process the complaint against the third party administrator because it is the entity responsible for the decision or other action being challenged in the complaint. We also stated that OCR will pursue claims against the covered third party administrator in circumstances where the third party administrator is the entity responsible for developing the discriminatory benefit design feature that was adopted by the employer. Where the alleged discrimination relates to the benefit design of self-insured group health plan coverage that did not originate with the third party administrator, but rather with the plan sponsor, OCR will refer the complaint to the Equal Employment Opportunity Commission (EEOC) or DOJ for potential investigation. We discussed that we would refer complaints related to the Federal Employees Health Benefits (FEHB) Program, the Federal Employees Dental and Vision Insurance Program (FEDVIP), or the Federal Long Term

Care Insurance Program (FLTCIP) to the Office of Personnel Management (OPM).

The comments and our responses regarding coverage of third party administrator activities are set forth below.

Comment: Several commenters supported the rule's application to third party administrators as part of the operations of a principally engaged recipient health insurance issuer. Commenters stated that issuers often serve as third party administrators and the rule's application to an issuer's third party administrator activities will help achieve health equity, improve health outcomes, and ensure that all individuals can access health care without unnecessary barriers. Commenters stated that third party administrators play an outsized role in administering and designing health coverage for millions of people enrolled in self-funded employer group health plan coverage,[271] which may contain discriminatory provisions prohibited by section 1557.[272] Commenters discussed how third party administrators do more than simply process claims. These commenters stated that, similar to issuers, third party administrators make significant decisions about critical health plan features and often design benefits, formularies, payment structures, and networks; conduct prior authorization; and establish and evaluate other clinical coverage criteria. One commenter stated that third party administrators rely on their own clinical criteria, which may result in discriminatory denials of coverage despite the plan providing coverage generally. For example, the commenter discussed that where a self-funded plan might provide coverage for gender-affirming care, the third party administrator might rely on its own clinical criteria to categorically exclude coverage for certain types of gender-affirming care.

Other commenters opposed the rule covering third party administrators. These commenters argued the rule should exclude third party administrators from the scope of the final rule and that section 1557's application should not extend beyond the legal entity that provides or offers the ''health program or activity.'' Several commenters argued that the rule's coverage of third party administrators would create an unlevel playing field and result in a competitive disadvantage for health insurance issuers that accept Federal financial assistance. For example, commenters argued the administrative costs of complying with section 1557, such as the nondiscrimination notice requirements, would place covered third party administrators at a competitive disadvantage with non-covered third party administrators that are not subject to the same requirements. Commenters asserted that third party administrators generally do not receive Federal financial assistance and argued that applying section 1557 to third party administrators would result in subjecting all their clients to section 1557's requirements when neither the client nor the third party administrator receives Federal financial assistance. Commenters argued this would create a disincentive for clients to engage a third party administrator that is subject to section 1557 and so would create an unlevel playing field between third party administrators covered by section 1557 and those that are not. Commenters further suggested this could result in entities deciding not to participate in federally funded or conducted programs, such as the Exchanges.

One commenter asserted OCR did not explain the need for this proposed change from the 2020 Rule, which does not cover an issuer's third party administrator activities, and that the uncertainty of how the rule will apply to covered third party administrators would likely result in higher third party administrator charges to employers, which would be passed through to enrollees.

Response: We appreciate the diversity of comments received on our proposal to apply section 1557 to third party administrators when certain criteria are met. The final rule applies to all the operations of a recipient principally engaged in the provision or administration of health insurance coverage or other health-related coverage, including its third party administrator activities, as discussed in detail previously under the definition of ''health program or activity'' under § 92.4. This position is also supported by a decision of the District Court for the Western District of Washington, which held that third party administrators operated by health insurance issuers are subject to section 1557 even if the third party administrators do not receive Federal financial assistance.[273] In addition, a third party administrator could be covered under the rule if it is a subrecipient of Federal financial assistance. We also note that where a third party administrator is not covered under section 1557, a covered entity that contracts with a third party administrator, such as a health insurance issuer or group health plan, may be liable for the third party administrator's actions as a subcontractor. Please see the earlier discussion on subrecipients and contractors in the sections on Application, § 92.2, and the definition of ''Federal financial assistance,'' § 92.4.

We acknowledge commenters' concerns that this may result in a competitive disadvantage for health insurance issuers that accept Federal financial assistance. This argument, however, is not unique to health insurance issuers or their third party administrator activities. Any covered entity that accepts Federal funding from the Department knowingly agrees to comply with section 1557 and other civil rights laws that apply to recipients of Federal financial assistance.

Comment: Some commenters were opposed to the rule holding a third party administrator liable for plan benefit designs even if the discriminatory terms originated with the third party administrator. Commenters stated this approach was inconsistent with the 2016 Rule's approach that a third party administrator was liable only where the third party administrator was ''responsible for the decision or action . . . as the decision-making entity.'' 81 FR 31432. These commenters requested that OCR clarify that a third party administrator will be held responsible for actions only when it is the entity that controls whether or not the action must be taken. Commenters argued that third party administrators should not be liable for plan benefit designs simply because a third party administrator suggested or helped develop the benefit design ultimately chosen by the group health plan because the third party administrator is not the decision-making entity that adopted the benefit design. Accordingly, commenters argued that third party administrators should not be held responsible for administering benefits based on benefit design decisions made solely by a plan sponsor and urged OCR to clarify that the rule will not apply to third party

[271] Commenters noted that 64 percent of workers in the United States receive health coverage through self-insured employer plans. administrators in cases where a plan sponsor adopts a potentially discriminatory plan design that the third party administrator played no role in selecting.

Commenters also noted that, under ERISA, third party administrators generally must administer self-insured plans according to the plans' terms. 29 U.S.C. 1104(a)(1)(D). These commenters asserted that a third party administrator should not be liable for the benefit design of a plan, including utilization management techniques, when it is administering the plan consistent with the plan terms as adopted by the group health plan or plan sponsor. Otherwise, commenters argued, the rule would effectively hold a third party administrator responsible for decisions made by another entity, namely, the plan's named fiduciary or plan administrator. Commenters further stated that ERISA does not require the third party administrator to be responsible for plan terms, but does require the plan sponsor to have a ''named fiduciary'' that has ultimate control over the plan's operation.[274] A commenter argued it would be unreasonable for OCR to take the position that a third party administrator is legally obligated under section 1557 to violate its obligation under ERISA to honor its contract with the plan sponsor and honor the plan's terms.

Commenters also argued that covering third party administrators is contrary to Congressional intent. Commenters stated that under ERISA, Congress made the group health plan responsible for the benefits it chooses to provide, and that OCR should not shift that responsibility to third party administrators through section 1557. These commenters argued that had Congress intended for third party administrators to be subject to section 1557, it would have said so clearly.

In contrast, several commenters expressed support for the rule that would make a covered third party administrator liable when the discriminatory plan feature originated with the third party administrator. These commenters asserted that third party administrators cannot insulate themselves from liability by arguing that ERISA requires a group health plan to be administered according to its terms (including by a third party administrator contracted by a plan sponsor). ERISA, commenters noted, does not exempt group health plans or their service providers (including third party administrators) from complying with other Federal laws, like section 1557.[275] These commenters, citing to case law,[276] argued that third party administrators should be held liable under section 1557 for discriminatory plan administration and when discriminatory plan terms originate with the third party administrator, even when the plan sponsor subsequently adopts the plan designed by the third party administrator and maintains control over its terms. Commenters noted that many large health insurance issuers design and market self-funded plans to plan sponsors and contract to serve as third party administrators.[277] Commenters noted that third party administrators are largely responsible for designing plans except for those offered by the most sophisticated employers. Commenters stated that issuers administer the self-funded plans using the same coverage policies that they use in their fully insured plans, and therefore the discriminatory terms in self-funded plans are often directly traceable to and redressable by third party administrators.

Some commenters suggested that third party administrators should be liable for administering a plan with discriminatory benefit design features even when the plan design did not originate with the third party administrator. Commenters argued that third party administrators that agree to administer discriminatory plans play a role in discriminating against protected individuals and should not be given immunity when administering plans with discriminatory designs.

Response: OCR carefully considered the variety of views expressed by commenters relating to the liability of a third party administrator covered under this rule. We agree with commenters that a third party administrator should not be held responsible for discriminatory plan design features over which the third party administrator exercised no control.

We disagree with commenters that believe a covered third party administrator should not be liable for discriminatory benefit design features that originated with the third party administrator simply because the plan sponsor is ultimately the entity responsible under ERISA for adopting the plan and maintaining control over its terms. Our interpretation is consistent with case law, which has held that a third party administrator may be liable for discriminatory plan terms that originated with the third party administrator, notwithstanding the fact that the plan sponsor subsequently adopted the plan and maintained control over the terms.[278] Further, as commenters noted, health insurance issuers operating as third party administrators often design the plans that they offer to self-insured group health plans and offer standard plan design options, often to small and midsize employers while only offering flexibility in the plan design to larger employers.[279]

We recognize that ERISA requires group health plans to be administered consistent with the terms governing the plan, as long as the terms are consistent with the provisions of the same

There is additional flexibility for custom designed benefit plans for groups with more than 50 employees enrolled.'').

subchapter in ERISA.[280] ERISA then provides in the same subchapter that it is not to be construed to impair or supersede other Federal laws, including regulations issued under such laws.[281] This rationale finds support in the cases that have held that ERISA's requirement that a plan's terms must be administered as written must not be construed to invalidate or impair section 1557.[282]

For these reasons, we affirm our general approach as discussed in the Proposed Rule at 87 FR 47876–77. When OCR investigates a potentially discriminatory action or plan design related to a self-insured group health plan coverage administered by a covered entity acting as a third party administrator, OCR will take into account the party responsible for the alleged discriminatory conduct. Recognizing that third party administrators might not be responsible for the benefit designs of the self-insured group health plan coverage that they administer, OCR does not intend to enforce this rule against a third party administrator for a plan design that it did not design and over which it has no control. Where the discriminatory terms of the plan originated with the covered third party administrator rather than with the plan sponsor, the third party administrator could be liable for the discriminatory design feature under section 1557.

Accordingly, when analyzing a claim against a covered third party administrator, OCR will determine whether responsibility for the decision or alleged discriminatory action lies with the third party administrator, group health plan, or the plan sponsor. Where the alleged discrimination relates to the administration of the plan by a covered third party administrator, OCR will process the complaint against the covered third party administrator because it is the entity responsible for the decision or other action being challenged. For example, if a covered third party administrator applies a plan's neutral, nondiscriminatory utilization management guidelines in a discriminatory way against an enrollee, OCR will proceed against the covered third party administrator as the entity responsible for the decision. In addition, OCR will pursue claims against a covered third party administrator in circumstances where the third party administrator is the entity responsible for developing the discriminatory benefit design feature that was adopted by the employer. For instance, if a covered third party administrator develops standard plan designs that it offers to employers, the covered third party administrator is liable for any discriminatory design feature in the plans because the plans originated with the third party administrator. Where the alleged discrimination relates to the benefit design of self-insured group health plan coverage that did not originate with the covered third party administrator, but rather with the plan sponsor or the group health plan, and where the third party administrator played no role in the development of the plan's benefit design, OCR will refer the complaint to the EEOC or DOJ for potential investigation.

As discussed in the Proposed Rule at 87 FR 47877, as part of OCR's enforcement authority, OCR has the option of referring or transferring matters to other Federal agencies with jurisdiction over the entity. Accordingly, OCR will transfer matters to the EEOC or DOJ where OCR lacks jurisdiction over an employer responsible for the benefit design of employer-sponsored group health plan coverage. OCR will refer to OPM complaints alleging discrimination in the FEHB Program (including the Postal Service Health Benefits Program), FEDVIP, and FLTCIP. This Rule does not determine how or whether any other agency will investigate or enforce any matter referred or transferred by OCR.

As part of OCR's analysis, we will also engage in a fact-specific inquiry to evaluate whether a third party administrator is appropriately covered under section 1557 in circumstances where the third party administrator is legally separate from the issuer that receives Federal financial assistance, as discussed in more detail below.

Comment: Commenters requested that OCR provide additional clarity on the circumstances under which OCR would hold a third party administrator liable under the rule. Commenters stated that plan sponsors and third party administrators may place blame on each other for the discriminatory features. Another commenter said that a self-insured plan sponsor could direct a third party administrator on the goals or parameters of the design it seeks or refer the third party administrator to other plan designs and request that the third party administrator develop a plan design in accordance with those parameters. The commenter argued that in these cases, where the third party administrator is not the decision-making entity that ultimately controls and determines whether to implement the design or feature, it should not be liable under section 1557 for that design or feature.

Response: If a third party administrator is a covered entity under section 1557, it is responsible for ensuring that its actions do not discriminate on the basis of race, color, national origin, sex, age, or disability. Where a covered third party administrator plays a role in designing benefits for self-insured group health plan coverage, it must not do so in a manner that results in discrimination on a prohibited basis. This is so even if the plan sponsor requests that the covered third party administrator develop a certain plan design that includes a discriminatory feature. For example, if a plan sponsor requested that a covered third party administrator develop a plan design that excluded all enrollees of a certain race, there would be no question that a third party administrator could not design such a plan without violating section 1557. This is true for any other discriminatory design feature that would violate section 1557. In these cases, while the plan sponsor may be the entity requesting the particular design feature for a group health plan, the covered third party administrator would still be liable as the entity that designed such a plan, notwithstanding the plan sponsor's request.

Comment: Several commenters requested that OCR provide clarity on the rule's application to pharmacy benefit managers. Many commenters argued that pharmacy benefit managers, similar to third party administrators, make significant decisions about critical health plan features and should be liable when they are responsible for discriminatory formulary benefit designs. Commenters noted that plan sponsors often defer to the expertise of pharmacy benefit managers. Commenters opposed to the rule's application to third party administrators argued that pharmacy benefit managers similarly should not be liable under the

[280] 29 U.S.C. 1104(a)(1)(D) (''[A] fiduciary shall discharge his duties with respect to a plan solely in the interest of the participants and beneficiaries and . . . in accordance with the documents and instruments governing the plan *insofar as such documents and instruments are consistent with the provisions of this subchapter and subchapter III.*'' (emphasis added)).
